The following list of study references is NOT a definitive, exhaustive list for preparing for the ACVPM examinations in the five subject areas:

1. Environmental Health and Toxicology
2. Epidemiology and Biostatistics
3. Food Protection
4. Infectious and Parasitic Diseases
5. Public Health Administration and Education

Subcategories and Exam topics within each subject area are more comprehensively listed within the ACVPM Model Curriculum. The Model Curriculum is an excellent resource to identify topic areas for focused study. A systematic reading of every listed resource is not an expectation of the Exam Committee, particularly since some of the resources have considerable overlap in content. Rather, each candidate should select references within each subject area to build upon and strengthen their own existing set of skills and knowledge. Supplementary titles are provided for those who wish to do additional reading. The current scientific and professional literature (ProMed, JAVMA, MMWR, Lancet, NEJM, Science, etc.) is also necessary to properly prepare for the examinations.

Primary references applicable to more than one subject area:

1. ENVIRONMENTAL HEALTH AND TOXICOLOGY

The Environmental Health and Toxicology section includes nine subcategories: Air; Land/soil; Water; Waste; Emergency Preparedness and Response; Occupational Health; Vectors; Radiation; and Toxicology. An equal number of questions will be drawn from each subcategory in the multiple choice section of the exam. The Toxicology subcategory draws upon the principles of toxicology and toxic substances in general. Applied knowledge of toxicology is incorporated into many of the subcategories areas.
2. EPIDEMIOLOGY AND BIOSTATISTICS

The Epidemiology and Biostatistics section of the multiple choice exam includes questions that are drawn from subcategories listed within the Model Curriculum.

Epidemiology is the basic science with tools to support decision making processes in veterinary public health and preventive medicine. It deals with the investigation of diseases, production losses, and health issues in animal and human populations. Essential activities within epidemiology encompass the broad areas of study design, data collection, analysis, and interpretation. Biostatistical methods and techniques are relied upon to objectively identify factors associated with specific outcomes.
Preventive medicine professionals and other practitioners must be able to integrate and synthesize epidemiological findings with their knowledge from other basic and clinical sciences to design effective disease control and health maintenance programs. This includes the ability to plan surveillance or research activities and to evaluate the results.

Additionally, the ACVPM Exam will require biostatistical knowledge that is essential for a diplomate to operate within the preventive veterinary medicine fields. Candidates will need to demonstrate the ability to use and interpret basic biostatistics used in epidemiologic studies and investigations. More specific examples of hypothesis tests and statistical techniques are listed within the Model Curriculum. General biostatistics books will provide the underlying knowledge but may need to be supplemented with an analytic epidemiology text.

3. FOOD PROTECTION

Food science in the ‘Farm to Fork” spectrum is essential for a diplomate to operate within the veterinary preventive medicine fields. See the ACVPM Model Curriculum for Food Protection subcategories.

- Review food science basics in a food science text of choice.
- Review hot topics in journals such as the Journal of Food Protection and above cited references.
- Review basics of foodborne outbreak investigations and calculations in an appropriate food science and/or epidemiology textbook. No specific text required.

4. INFECTIOUS AND PARASITIC DISEASES

The Infectious Diseases section includes eight subcategories: Immunology and Pathogenesis; Transmission; Pharmaceuticals; Biologics; Diagnostics and Chemicals; Bacterial, Viral, Rickettsial, Parasitic, TSE, and Mycotic Agents; Foreign Animal Diseases; and, General.

5. PUBLIC HEALTH ADMINISTRATION AND EDUCATION

The Public Health Administration and Education section includes nine subcategories: Risk Assessment; Communications (including Risk Communication); Governmental Function; Governmental Organization; Laws, Policies and Plans; Leadership; Prevention; Surveillance/Monitoring; and Evaluation.

General Public Health Administration and Education study objectives include:

- Describe governmental functions (regulatory/rule-making and enforcement, policies, responsibilities, information/data collection and management) that directly impact public health.
- Understand the organizational structure and define the major federal agencies and departments with functions and responsibilities that pertain to public health.
- Describe governmental interactions and relationships (local, state, federal) pertaining to public health, including the relationship, responsibilities, and distinctions between environmental services, wildlife services, agriculture and public health.
- Understand the ten essential public health services.
- Describe the three levels of prevention (primary, secondary, tertiary).
- Describe the benefits of a multidisciplinary team of public health professionals working at the local level.
- Define necessary steps to develop and implement public health plans.
- Define the responsibilities and integrated relationships of public health with partners in public health preparedness/bioterrorism preparedness, and the veterinary practitioner in emergency management/public health preparedness. Define the benefits of a multidisciplinary team of public health professionals working at the local level.
- Define steps to conduct a risk assessment.
- Understand basics of risk communication and message mapping. Understand the public health communication interactions with diverse sectors of the public-at-large, the media, and government officials.
