AIPG recognizes that changes in climate are occurring and placing great demand on society to prepare for and mitigate the resulting consequences. As an organization of diverse geoscience disciplines, AIPG chooses to serve domestic and international communities with a fact-based objectivity in addressing and reducing the impacts of climate change. AIPG encourages research into the causes of, and monitoring and mitigation of, the effects of climate change. AIPG expects application of the best geoscience in order to uphold the health and safety of all societies, a vigorous economy, and the availability of natural resources that support the ever-growing populations in developed and undeveloped countries. AIPG recognizes that complexities and uncertainties must be navigated carefully to understand the types of changes occurring on our planet. AIPG recognizes that climate change and a growing world population magnifies the need for the knowledge and experience of geoscientists and encourages economic development that considers the long-term welfare of future generations.
