

Finding a Reflection's Normal Line

Michael W. Ecker, Pennsylvania State University, Wilkes-Barre Campus, retired

It is well known that a ray of light in a vacuum or air meeting a flat surface reflects so that the angle of incidence equals the angle of reflection. In this article, we take a look at a kind of converse. Specifically, what if we know only a point A on the ray going to the surface and a second point B on the ray leaving the surface? Can we determine the location of the normal?

Michael W. Ecker retired as associate professor of mathematics at Pennsylvania State University's Wilkes-Barre campus in 2016. He received his PhD in mathematics from the City University of New York in 1978. Published regularly in different venues, he created the *AMATYC Review's* Problem Section, serving as its first editor, 1981–1997. He served on various national committees creating competitive national exams. He also proudly labored over his own newsletter, *Recreational & Educational Computing*, 1986–2007, featuring the interplay of mathematics, computers, and recreations. Besides owning a whopping hundred-plus computers, he is the author of 500 newsletters, columns, reviews, articles, and books in mathematics or computing.
