

## Public Service Announcement

### 3D Vision – Adults

60 Seconds

**3D movies are fun and exciting, but do your friends enjoy 3D movies more than you do?**

3D viewing can be made difficult by a variety of vision disorders. Even if you have no problem seeing the letters on the eye chart, you could still have a vision problem that makes it difficult to enjoy 3D movies.

If you get headaches, feel dizzy or nauseous during or after watching a 3D movie, these are signs you may have a correctable vision problem.

It doesn't matter how young or old you are, help is possible. You need to see an optometrist who provides an in-office program of vision therapy to get the help you need.

To find out more information about 3D vision, vision therapy and to find a doctor near you, call (888) COVD-770 or visit [covid.org](http://covid.org), the website for the College of Optometrists in Vision Development that's [covid.org](http://covid.org) or (888) COVD-770.

The College of Optometrists in Vision Development is a non-profit 501(c)(3).  
We thank you for helping us with our mission of *"Improving lives by advancing excellence in optometric vision therapy through education and board certification."*
