3D Vision – Children

60 Seconds

3D movies are fun and exciting, but many children can't see 3D...

3D viewing can be made difficult by a variety of vision disorders. Even if your child passed a vision screening, a vision problem could still be making it difficult to enjoy 3D movies.

Watch for the following signs during or even right after watching a 3D movie: Does your child get headaches, feel dizzy or nauseous, not respond to the 3D images the same way his or her friends do? These are signs your child may have a correctable vision problem.

You need to see an optometrist who provides an in-office program of vision therapy to get the help your child needs.

To find out more information about 3D vision, vision therapy and to find a doctor near you, call (888) COVD-770 or visit covid.org, the website for the College of Optometrists in Vision Development that's [COVD.org](http://covid.org) or (888) COVD-770.

The College of Optometrists in Vision Development is a non-profit 501(c)(3).
We thank you for helping us with our mission of *"Improving lives by advancing excellence in optometric vision therapy through education and board certification."*
