

# **An investigation of an integration tool to improve access to information resources in clinical software**

**Jean-Pierre Calabretto  
Bryn Lewis  
James Reeve**

**National Prescribing Service**

**HIC August 2009**

National Prescribing Service Limited

# Presentation Overview

- Background
- Challenges of information use
- Project aims
- Project conduct
- Prototype
  - Features
  - Testing
  - Technology
- Key findings
  - Information resources
  - Search tool
  - Information triggers
  - 'Biblical' reference
- Conclusions
- Update

# Background

- Health system challenges
- Increasing reliance on evidence-based information to achieve best practice
- Promise of decision support
  - Variability of implementation approaches
  - Effectiveness
  - Approach in different settings
- Other NPS experience

# Challenge of information use

- Amount and complexity
- Challenge of information integration into clinical software
  - Few standard approaches or specifications
  - Low frequency of access of computerised information
  - Little user experience
  - Poorly investigated area
- Clinical software on General Practitioners' desktops
- Potential for improved decision-making

# Project Aims

- Enable a context-based information search based on triggers in GP clinical software
- Information from **high quality clinical resources**
- Inform decision-making at the point of care

# Conduct of the project

- Observational study
- Project Reference Group
  - Clinical pharmacologist
  - Two experienced GPs
  - GP Registrar
  - GP Academic
- Prototyping and User Needs Assessment
  - Demonstration
  - Testing using clinical scenarios
  - Observation of workflow and information use
  - Validation of findings

# Knowledge Linked into Clinical Software (KLICS) Prototype

- Proof of concept
- Independent information integration
  - Clinical software systems
  - Information resources
- Monitoring of clinical system
  - Unobtrusive
  - Mechanisms transparent to user
- Searching of context relevant information
  - Parameters from 'triggers'
    - e.g. diagnoses, medication
- Passive information display
  - 'floating window'
  - No interference to workflow

Medical Director 2.93 - [Jocelyn Kliks1]

Search results

# Scenarios for prototype testing

- For GPs
  - Recall for HbA1c result and ongoing diabetes
  - Influenza immunisation & question about osteoporosis
  - New mother, tiredness and fatigue (breast feeding)
  - Otitis media (paediatric)
  - Rash and itching, scabies (pregnancy)
- Clinical pharmacologist

# Scenario example

## Recall for HbA1c result and ongoing diabetes

Jocelyn, 65 year old retiree presenting for review.

### History

- History includes hypertension and Type 2 Diabetes.
- She has no known allergies
- Non-smoker, consuming 2 glasses of wine per week and walks daily. Is careful with her diet.
- Over the last 6 months, self-monitored daily blood sugars have increased to between 11.0 and 13.0 mmol/L in the last three weeks.
- Her HbA1c six months ago was 8.5% but a recent reading two weeks ago was 9%.

Her medications for the past 6 months have been:

- aspirin 100 mg daily, perindopril 4 mg daily, metoprolol 25 mg twice daily, simvastatin 20 mg daily, metformin 850 mg three times a day; and gliclazide 120 mg twice daily with food

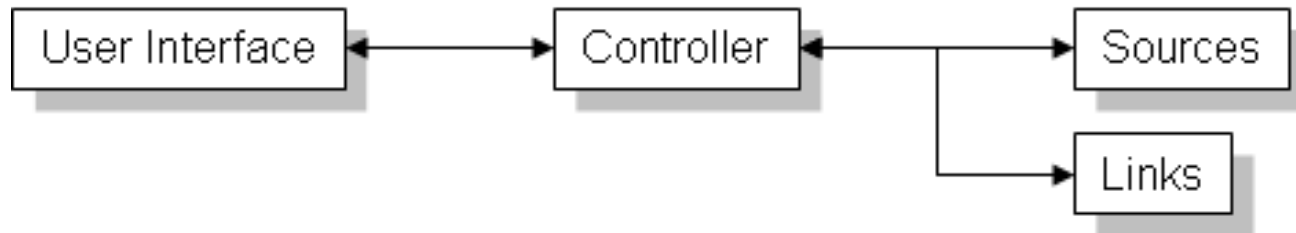

### Current presentation

Examination reveals:

- blood pressure is 135/80 mmHg, heart rate regular 65 beats per minute, weight 68 kg, height 170 cm (BMI 23.5 kg/m<sup>2</sup>), waist circumference 76 cm.

# Technology

- Delphi 7 (incorporating XML, XSL, HTML, JavaScript and CSS)
- Four major modules
  - User Interface (presents results to the user and allows the user to control the application)
  - Controller (coordinates search activity)
  - Sources (manages searching and presentation of search results)
  - Links (manages links)

## Some key findings - Information resources

- Greater accessibility equates to greater likelihood of use
- Speed and perceived 'usability'
- This information a complement to that existing in clinical software
- Information resources that best suit inclusion
  - support clinical areas of least experience
  - likely to be updated regularly
- General information resources may be of limited use for specialists

## Some key findings - Search tool

- Useful as a combined search over a range of resources
- Potential refinements?
  - Partial string searching, search string completion etc.?
  - Preferences for resources searched?
  - Highlight the search item in the returned document?
- Additional use as an educational tool

## Some key findings – Software triggers

- Limited (routine) use for more experienced prescribers
- Decisions about treatment will often be made without use of the clinical software (especially where there is more experience)
- Opportunistic use of triggers will be limited because of the individuals' workflows
- Particular trigger points may often be turned off by individual GPs within a general practice
- Use unlikely to help diagnosis, but more likely to help decisions about treatment
- Input of 'trigger data'
  - retrospectively may improve quality of the patient record?
  - possibly influence workflow over time?

# Some selections from the '10 commandments'

- Speed is everything
- Anticipate needs and deliver in real time
- Fit into the user's workflow
- Little things can make a big difference
- Recognize that physicians will strongly resist stopping
- Simple interventions work the best
- Monitor impact, get feedback, and respond
- Manage and maintain your knowledge-based systems

Bates, DW et al. 2003, 'Ten Commandments for Effective Clinical Decision Support: Making the Practice of Evidence-based Medicine a Reality', *Journal of the American Medical Informatics Association*, vol. 10, no. 6, pp. 523-530.

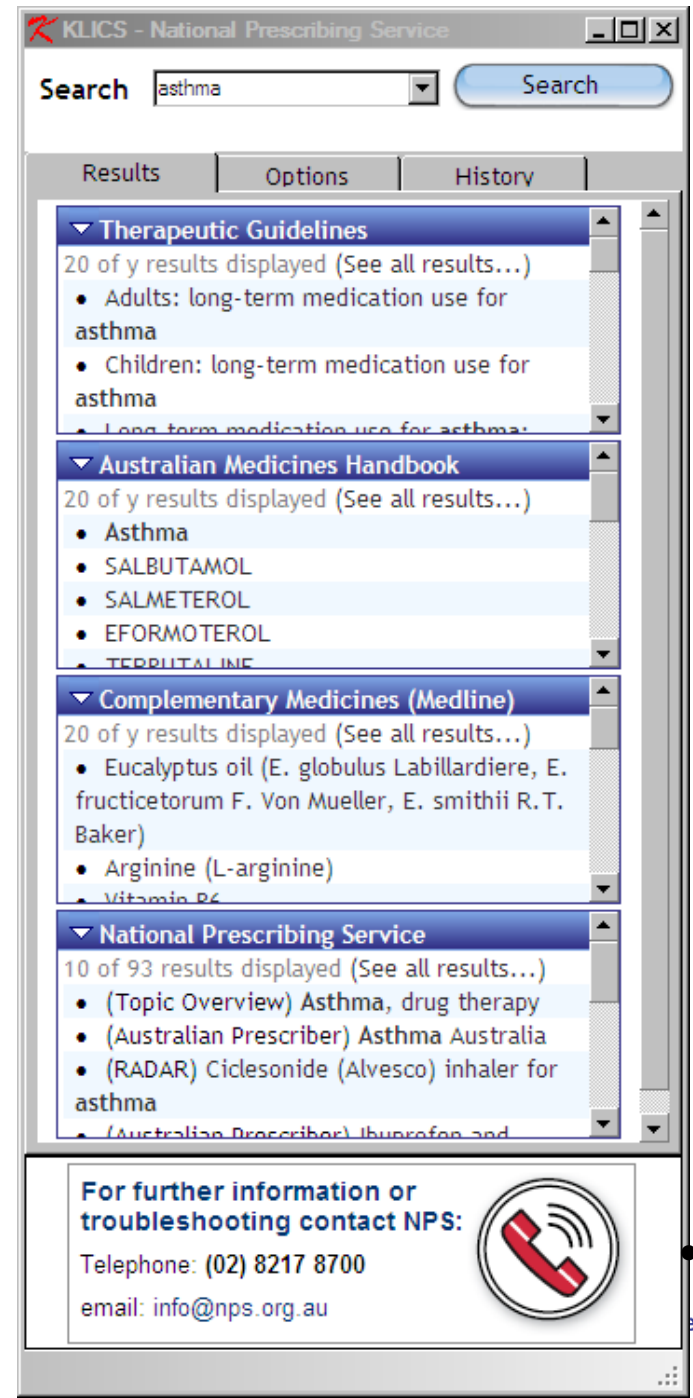

# Conclusions

- Limitations
  - time frame and small number of participants
- Independent information is valued by GPs
- Complements existing information in software
- Federated searching over evidence-based information resources is useful
- **Access**, simplicity and speed are critical
- Workflow will be a major determinant of how a tool is used
- Triggers seem to offer few opportunities for information interventions
- The outcomes from this project are first steps towards providing clinicians with independent evidence-based information resources to support decision-making during patient

# Update

- Evaluation of the interface
- Redevelopment using .NET
- Pilot project
  - Roll out for field testing
  - Wider GP engagement (up to 50)
  - Additional GP systems
  - Evaluation
    - Use and useability
    - Information use
    - Effect on decision-making
