People are contagious two days before they start having symptoms until at least 10 days after they have symptoms. People without symptoms are considered contagious at least 2 days before they get tested until at least 10 days later.

Symptoms may include but are not limited to fever, chills, shortness of breath, difficulty breathing, body aches, and sore throat.

***A false negative test result is when the test result is negative, but you are actually infected with COVID-19. Avoid a potential false negative test result by waiting 6-8 days after exposure before getting tested.

NOTE: Anyone who lives with you should quarantine for 14 days since their last contact with you.
