Course Description

This course will feature techniques for designing connections for wood members utilizing AWC’s 2015 National Design Specification® (NDS®) for Wood Construction and Technical Report 12 - General Dowel Equations for Calculating Lateral Connection Values (TR12). Topics will include connection design philosophy and behavior, an overview of common fastener types, changes in the 2015 NDS related to cross-laminated timber, and design examples per TR12.
Learning Objectives

• On completion of this course, participants will:

1. Be familiar with current wood member connection solutions and applicable design requirements.
2. Be familiar with Technical Report 12 and provisions for connection design beyond NDS requirements.
3. Be able to recommend fastening guidelines for wood to steel, wood to concrete, and wood to wood connections.
4. Be able to describe effects of moisture on wood member connections and implement proper detailing to mitigate issues that may occur.

Polling Question

1. What is your profession?
   a) Architect
   b) Engineer
   c) Code Official
   d) Building Designer
   e) Other
Outline

- Wood connection design philosophy
- Connection behavior
- Serviceability challenges
- Connection hardware and fastening systems
- Connection techniques
- Design software
- Where to get more information

Basic Concepts

- Model wood cells as a bundle of straws
- Bundle is very strong parallel to axis of the straws

Parallel

Stronger

Perpendicular

Less strong
Connecting Wood - Philosophy

- Wood likes compression parallel to grain
  - makes connecting wood very easy
Connecting Wood - Philosophy

- Wood likes to take on load spread over its surface

- Wood and tension perpendicular to grain
  - Not recommended

Initiators:
- notches
- large diameter fasteners
- hanging loads
Notching

Problem

Solution

Beam to Concrete

- Notched Beam Bearing
- may cause splitting
- not recommended
Beam to Concrete

- Notched Bearing Wall
- alternate to beam notch

Hanger to Beam

- Load suspended from lower half of beam
- Tension perpendicular to grain
- May cause splits
Hanger to Beam

Lower half of beam
- may cause splits
- not recommended

Exception: light load
- <100 lbs
- >24” o.c.

Full wrap sling option
- Load supported in upper half of beam
- Extended plates puts wood in compression when loaded
Connecting Wood - Philosophy

• Splitting happens because wood is relatively weak perpendicular to grain
• Nails too close (act like a wedge)

Connecting Wood - Philosophy

Staggered Nailing

- Framing
- Wood Structural Panel
- Nail
- 1/8" Gap Between Panels

Nailing not staggered  Nailing staggered
Connecting Wood - Philosophy

Splitting will not occur perpendicular to grain, no matter how close nails are.

Splitting occurs parallel to grain.

Staggering a line of nails parallel to wood grain minimizes splitting.

Connecting Wood - Philosophy

- Wood, like other hygroscopic materials, moves in varying environments.
Connecting Wood - Philosophy

- Fastener selection is key to connection ductility, strength, performance

Polling Question

51 Whqvlrq#shushgg1ExalKr#ulR#dQ#eH#dXvHg#
e|B
  a) Notches in the beam
  b) Hanging loads
  c) Large diameter fasteners
  d) All of the above
Outline

- Wood connection design philosophy
- Connection behavior
- Serviceability challenges
- Connection hardware and fastening systems
- Connection techniques
- Design software
- Where to get more information

Connection Behavior

- Balance
  - Strength –
  - Ductility-

![Graph showing load vs. displacement with three types of behavior: high strength, poor ductility; good strength, good ductility; low strength, good ductility.](image)
Connection Behavior

Connection Behavior
Connection Behavior

- Balance
- Strength –
  - Size and number of fasteners
- Ductility–
  - Fastener slenderness
  - Spacing
  - End distance

![Diagram showing load vs. displacement with three curves: high strength, poor ductility; good strength, good ductility; low strength, good ductility.]

Wood Frame Shear Walls

- **Elements of a wood shear wall**

Shear Wall Test

- **8 ft x 8 ft wood structural panel shear wall cyclic test**
Shear Wall Test

- Typical failure of sheathing nailing

Outline

- Wood connection design philosophy
- Connection behavior
- Serviceability challenges
- Connection hardware and fastening systems
- Connection techniques
- Design software
- Where to get more information
Connection Serviceability

- Issue: direct water ingress
- Water is absorbed most quickly through wood end grain

No end caps or flashing

Connection Serviceability

- Issue: direct water ingress
- Re-direct the water flow around the connection

end caps and flashing
Connection Serviceability

- Issue: direct water ingress
- Or, let water out if it gets in...

Moisture trap - No weep holes

Moisture Changes In Wood

Causes dimensional changes perpendicular to grain
Growing tree is filled with water
As wood dries, it shrinks perp. to grain
Wood Shrinks

Connection Serviceability

• Moisture Effects

Figure 1.1
Shrinkage due to moisture loss.
**Wet Service Factor, \( C_M \)**

- Dowel-type connectors
  - bolts
  - drift pins
  - drift bolts
  - lag screws
  - wood screws
  - nails

<table>
<thead>
<tr>
<th>Condition</th>
<th>CM (Lateral Load)</th>
<th>CM (Withdrawal Load)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Saturated</td>
<td>1.0</td>
<td>1.0</td>
</tr>
<tr>
<td>19% MC</td>
<td>0.7</td>
<td>0.25</td>
</tr>
<tr>
<td>Dry</td>
<td>0.4</td>
<td>0.25</td>
</tr>
</tbody>
</table>

Lateral load (*\( CM = 0.7 \) for \( D < 1/4" \))

Withdrawal load - lag & wood screws only

Withdrawal load - nails & spikes

---

**Wet Service Factor, \( C_M \)**

\( C_M = 1.0 \) if:

- 1 fastener
- 2+ fasteners
- split splice plates

Table 11.3.3 footnote 2
Beam to Column

- Full-depth side plates
- may cause splitting
- wood shrinkage

Beam to Column

- Smaller side plates
- transmit force
- allow wood movement
Beam to Column

• Problem
  • shrinkage
  • tension perp

Beam to Wall

• Solution
  • bolts near bottom
  • minimizes effect of shrinkage

Slotted hardware
Connection Serviceability

- Avoid contact with cementitious materials
  - Beam on Shelf
    - prevent contact with concrete
    - provide lateral resistance and uplift

Beam to Concrete

- Beam on Wall
  - prevent contact with concrete
  - provide lateral resistance and uplift
  - slotted to allow longitudinal movement
  - typical for sloped beam
Beam to Masonry

- Application

Need 1/2” air gap between wood and masonry

Column to Base

- Problem
  - no weep holes in closed shoe
  - moisture entrapped
  - decay can result
Column to Base

- Angle brackets
  - anchor bolts in brackets

Hidden Column Base

- Floor slab poured over connection
  - will cause decay
  - not recommended
Polling Question

3. Proper detailing of wood members and connections exposed to the exterior environment include:
   a) Re-directing the water flow around the connection.
   b) Separating wood from concrete and masonry
   c) Protecting the end grain
   d) Incorporating weep holes
   e) All of the above

NDS Dowel-fastener Connections

- 2015 NDS Chapter 12 (New location)
- Can be used for any dowel-shaped fastener
- Includes lateral and withdrawal provisions
  - Bolts
  - Lag screws
  - Wood screws
  - Nails
  - Spikes
  - Drift bolts
  - Drift pins
Dowel-fastener withdrawal

- Withdrawal calculated based on fastener penetration
  - W value is per inch of fastener penetration
    - Threaded fasteners use thread penetration
- Lag screws
  - W = 1800 G^{3/2} D^{3/4}
- Wood screws
  - W = 2850 G^2 D
- Nails (smooth shank)
  - W = 1380 G^{5/2} D

Yield Modes

**MODE I**
- bearing-dominated yield of wood fibers

**MODE II**
- pivoting of fastener with localized crushing of wood fibers
Yield Modes

Mode III
• fastener yield in bending at one plastic hinge and bearing – dominated yield of wood fibers

Mode IV
• fastener yield in bending at two plastic hinges and bearing – dominated yield of wood fibers

</tbody>
</table>

- 4 Modes of failure
- 6 Yield equations
- Single & double shear

Notes:

\[ k_1 = \frac{\sqrt{R_g + 2R_g^2(1+R_t + R_g^2) + R_t^2R_g^3} - R_g(1+R_g)}{(1+R_g)} \]

\[ k_2 = -1 + \sqrt{\frac{2(1+R_g)}{3F_{em}\ell_s^2} + \frac{2F_{yb}(1 + 2R_g)D^2}{3F_{em}\ell_s^2}} \]

\[ k_3 = -1 + \sqrt{\frac{2(1+R_g)}{3F_{em}\ell_s^2} + \frac{2F_{yb}(2 + R_g)D^2}{3F_{em}\ell_s^2}} \]

- D = diameter, in. (see 12.3.7)
- \( F_{yb} \) = dowel bending yield strength, psi
- \( R_d \) = reduction term (see Table 12.3.1B)
- \( R_e = F_{em}/F_{es} \)
- \( \ell_t = \ell_m/\ell_s \)
- \( \ell_m \) = main member dowel bearing length, in.
- \( \ell_s \) = side member dowel bearing length, in.
- \( F_{em} \) = main member dowel bearing strength, psi (see Table 12.3.3)
- \( F_{es} \) = side member dowel bearing strength, psi (see Table 12.3.3)
Yield Limit Equations

<table>
<thead>
<tr>
<th>Fastener Size</th>
<th>Yield Mode</th>
<th>Reduction Term, $R_d$</th>
</tr>
</thead>
<tbody>
<tr>
<td>$0.25^o \leq D \leq 1^o$</td>
<td>I$<em>{II}$, I$</em>{III}$</td>
<td>$4K_0$</td>
</tr>
<tr>
<td>II</td>
<td>3.6 $K_0$</td>
<td></td>
</tr>
<tr>
<td>III$<em>{II}$, III$</em>{II}$, IV</td>
<td>3.2 $K_0$</td>
<td></td>
</tr>
<tr>
<td>$D &lt; 0.25^o$</td>
<td>I$<em>{II}$, I$</em>{III}$, III$_{II}$, IV</td>
<td>$K_0^1$</td>
</tr>
</tbody>
</table>

Notes:
- $K_0 = 1 + 0.25(\theta - 90)$
- $\theta$ = maximum angle between the direction of load and the direction of grain ($0^o \leq \theta \leq 90^o$) for any member in a connection
- $D$ = diameter, in. (see 12.3.7)
- $K_0 = 2.2$ for $D \leq 0.17^o$
- $K_0 = 10D + 0.5$ for $0.17^o < D < 0.25^o$

1. For threaded fasteners where nominal diameter (see Appendix L) is greater than or equal to 0.25" and root diameter is less than 0.25", $R_d = K_0^1 K_0$.

Spacing, End, & Edge Distance

• Unless special detailing is provided to accommodate cross-grain shrinkage of the wood member.

### Polling Question

4. The NDS Yield Limit Equations are used to determine:
   a) Lateral capacity of connections
   b) Withdrawal capacity of connections
   c) Lateral and withdrawal capacities of connections
   d) None of the above
NDS Appendix E

- Appendix E – Local Stresses in Fastener Groups (Non-mandatory)
  - Groups of closely spaced fasteners loaded parallel to grain
    - Net Section Tension Capacity
    - Row Tear-Out Capacity
    - Group Tear-Out Capacity
  - Example problems
    - Staggered rows of bolts
    - Single row of bolts
    - Row of split rings

Chapter 12-Dowels

12.3.7 Dowel Diameter

12.3.7.1 Where used in Tables 12.3.1A or 12.3.1B, the fastener diameter shall be taken as D for unthreaded full-body diameter fasteners and D, for reduced body diameter fasteners or threaded fasteners except as provided in 12.3.7.2.

12.3.7.2 For threaded full-body fasteners (see Appendix L), D shall be permitted to be used in lieu of D, where the bearing length of the threads does not exceed 1/4 of the full bearing length in the member holding the threads. Alternatively, a more detailed analysis accounting for the moment and bearing resistance of the threaded portion of the fastener shall be permitted (see Appendix I).
Chapter 12-Dowels

Appendix L (Non-mandatory) Typical Dimensions for Dowel-Type Fasteners and Washers

Table L1 Standard Hex Bolts

| D = diameter |
| D₀ = root diameter |
| T = thread length |
| L = bolt length |
| F = width of head across flats |
| H = height of head |

Full-Body Fastener

Table L2 Standard Hex Lag Screws

| D = diameter |
| D₀ = root diameter |
| S = unthreaded body length |
| T = minimum thread length |
| E = length of tapered 6p |
| L = lag screw length |
| N = number of threads/inch |
| F = width of head across flats |
| H = height of head |

Dowel Diameters

Dia. Fastener = D

Dia. Fastener = D
**Dowel Diameters**

Dia. Fastener = $D_t$

- NDS Chapter 12 Tables use $D_t$ for lateral yield equations
- Assumes shear plane passes through threads

---

**Chapter 12 – Dowel-type Fasteners**

12.2.1.5 Where lag screws are loaded in withdrawal from the narrow edge of cross-laminated timber, the reference withdrawal value, $W$, shall be multiplied by the end grain factor, $C_{es} = 0.75$, regardless of grain orientation.
Chapter 12 – Dowel-type Fasteners

12.2.2.4 Wood screws shall not be loaded in withdrawal from end-grain of laminations in cross-laminated timber ($C_{eg}=0.0$).

12.2.3.6 Nails, and spikes shall not be loaded in withdrawal from end-grain of laminations in cross-laminated timber ($C_{eg}=0.0$).

---

Chapter 12 – Dowel-type Fasteners

12.3.3 Dowel Bearing Strength

12.3.3.5 Dowel bearing strengths, $F_d$, for dowel-type fasteners installed into the panel face of cross-laminated timber shall be based on the direction of loading with respect to the grain orientation of the cross-laminated timber ply at the shear plane.

12.3.3.6 Where dowel-type fasteners are installed in the narrow edge of cross-laminated timber panels, the dowel bearing strength shall be $F_{d1}$ for $D \geq 1/4''$ and $F_{d2}$ for $D < 1/4''$.

---

| Specific Gravity, $G$ | Dowel Bearing Strength, $F_d$, for Dowel-Type Fasteners in Wood Members |
|----------------------|------------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|----------------|

| 0.53                 | 5150             | 5950            | 4850            | 4350            | 3950            | 3650            | 3450            | 3050            | 2800            | 2650            |
12.3.5 Dowel Bearing Length

12.3.5.1 Dowel bearing length in the side member(s) and main member, \( \ell_m \) and \( \ell_m' \), shall be determined based on the length of dowel bearing perpendicular to the application of load.

12.3.5.2 For cross-laminated timber where the direction of loading relative to the grain orientation at the shear plane is parallel to grain, the dowel bearing length in the perpendicular plies shall be reduced by multiplying the bearing length of those plies by the ratio of dowel bearing strength perpendicular to grain to dowel bearing strength parallel to grain (\( F_{\|} / F_{\perp} \)).

New

\[ \ell_m = t_{1\perp} + t_{2\perp} + t_{3\perp} = 3(1.5) = 4.5'' \]

\[ \ell_{m-adj} = t_{1\perp} + t_{2\perp} \left( F_{\perp}/F_{\perp} \right) + t_{3\perp} \]

\[ = 1.5 + 1.5(3650/6150) + 1.5 = 3.9'' \]

---

Chapter 12 – Dowel-type Fasteners

12.5.2 End Grain Factor, $C_{eg}$

12.5.2.2 Where dowel-type fasteners are inserted in the end grain of the main member, with the fastener axis parallel to the wood fibers, reference lateral design values, $Z$, shall be multiplied by the end grain factor, $C_{eg} = 0.67$.

12.5.2.3 Where dowel-type fasteners with $D \geq 1/4''$ are loaded laterally in the narrow edge of cross-laminated timber, the reference lateral design value, $Z$, shall be multiplied by the end grain factor, $C_{eg} = 0.67$, regardless of grain orientation.

- Lateral – any end grain
  - $D < 1/4''$: $C_{eg} = 0.67$
  - Lateral – any CLT edge
    - $D \geq 1/4''$: $C_{eg} = 0.67$
Technical Report 12

- Background and derivation of the mechanics-based approach for calculating lateral connection capacity used in the NDS
- Provides additional flexibility and broader applicability to the NDS provisions
  - Connections with gaps between members
  - Connecting wood to members with hollow cross sections

2. See Section 1.6 for notation.
Technical Report 12

• Allows for evaluation of connections with gaps between connected members

---

Technical Report 12

• Tapered tip fasteners
  • NDS 12.5.3 defines "E" as length of tapered tip
    • Lag screws – E defined in Appendix L
    • Wood screws, nails – E assumed to be 2D
  • **Tapered tip does not count towards bearing length (L_m) in TR12 Tapered tip equations.**
Technical Report 12

- Tapered tip equations
  - Mode I
    \[ P = q_a \left( P - \frac{E}{2} \right) \]
  - Mode II
    \[ P = q_1 \left( \frac{L_s - E}{2} \right) \]
  - Mode III
    \[ p^2 \left( \frac{1}{4q_1} + \frac{1}{4q_2} + \frac{1}{4q_3} \right) + P \left( \frac{L_s}{2} + g + \frac{P}{2} - \frac{E}{4} \right) \]
    \[ - \frac{q_1L_1^4}{4} - \frac{q_2L_2^4}{4} - \frac{q_3L_3^4}{4} - \frac{q_4E}{4} - \frac{q_5E}{4} = 0 \]
  - Mode IV
    Single Shear:
    \[ P^2 \left( \frac{1}{2q_1} + \frac{1}{2q_2} + \frac{1}{2q_3} \right) + Pg - (M_d + M_m) = 0 \]
    Double Shear:
    \[ P^2 \left( \frac{1}{2q_1} + \frac{1}{2q_2} + \frac{1}{2q_3} \right) + Pg - (M_d + M_m) = 0 \]

Technical Report 12

- TR12 presents mechanics-based equations
- Gives same results as NDS energy-based approach
- Equations in TR12 calculate \( P \), must be divided by \( R_d \) (NDS Table 12.3.1B) to convert to NDS Z basis
- TR12 Appendix being released later in 2015
Technical Report 12 Appendix

- New for 2015!
  - Contains additional data for TR12 equation inputs
  - Dowel bearing values for:
    - Wood
    - Steel
    - Concrete
    - Stainless steel
    - Aluminum
  - Dowel bending values for fastener materials:
    - Steel and stainless steel bolts and lag screws
    - Low-to-medium carbon steel nails
    - Hardened steel nails (including post-frame ring-shank)

### Example Problem #1

- Calculate W for ¼" diameter, 2.5" long lag screw connecting 2-2x SYP (G = 0.55) members
- \[ W = 1800 \frac{G^{3/2}}{D^{1/6}} \times 260 \text{ lbs/in} \] (calculate or NDS Table 12.2A)
- Calculate penetration into main member for withdrawal capacity
  - NDS Appendix L gives lag screw dimensions
    - Length of unthreaded section = ¼"
    - Length of threaded section (including tip) = 1¾"
    - Length of threaded section (excluding tip) = 1 19/32"
  - \[ p = \text{length of screw} - \text{length of side member} - \text{length of tip} \]
  - \[ p = 2.5" - 1.5" - (1 ¾" - 1 19/32") = 0.84\" \text{ of penetration} \]
  - Unadjusted capacity = \[ W \times p = (260 \text{ lbs/in} \times 0.84 \text{ in}) = 219 \text{ lbs} \]
  - Apply adjustment factors per Table 11.3.1 to get adjusted W'
Example Problem #2

• Calculate unadjusted Z for ½” diameter bolt connecting two 2x DF-L (G = 0.5) members with a 1” gap between them
  • Both members loaded parallel to grain (K_θ = 1)
    • D = 0.5”
    • F_{eq} = 5600 psi (NDS Table 12.3.3); q_o = q_m = F_{eq} * D = 5600 psi * 0.5” = 2800 lb/in
    • L_s = L_m = 1.5”
    • F_{yb} = 45,000 psi
    • g = 1”

• \[ P = q_o L_s \] \[ P = q_m L_m \]

<table>

Example Problem #3

- Compare lateral Z values for single shear nail connection at 6D, 8D, 10D, and 12D penetration using TR12 tapered tip equations

- 8d common nail D = 0.131”, tapered tip length, E = 2D = 0.262”

- Main member $F_{em} = 4,700$ psi (loaded parallel to grain); ASTM A653, Grade 33 steel side member, thickness = 0.06”, $F_{es} = 61,850$ psi

- $L_m = p$ (penetration into main member); $L_s = 0.06”$ (side member thickness)

Take Home Messages...

- Transfer loads in compression / bearing whenever possible
- Allow for dimensional changes in the wood due to potential in-service moisture cycling
- Avoid the use of details which induce tension perp stresses in the wood
- Avoid moisture entrapment in connections
- Separate wood from direct contact with masonry or concrete
- Avoid eccentricity in joint details
- Minimize exposure of end grain
Connections

...and you thought connecting wood was complicated!
