| **Policy No. 230, Cardiac Computed Tomography, Cardiac Computed Tomography Angiography (CPT 75574, 75573,75572)**  
*Last reviewed May 2018* |

Cardiac Computed Tomography (CCT), Cardiac Computed Tomography Angiography (CCTA) using a 64-slice or greater CT scanner meets Blue Cross and Blue Shield of Alabama’s medical criteria for coverage for any of the following conditions:

**Detection of CAD symptomatic evaluation of chest pain syndrome:**
- Intermediate pre-test probability of CAD and ECG uninterpretable or unable to exercise
- Evaluation of intra-cardiac structures
- Evaluation of suspected coronary anomalies
- Acute chest pain intermediate pre-test probability of CAD and no ECG changes and serial enzymes negative

**Detection of CAD with prior test results:**
- Evaluation of chest pain syndrome uninterpretable or equivocal stress test (exercise, perfusion, or stress echo)

**Evaluation of acute chest pain in the Emergency Room/Emergency Department of the hospital:**

Patients with low to moderate pre-test probability of CAD that meet all of the following criteria:
- No known coronary artery disease. No elevated serum biomarkers including creatine kinase-myocardial band, myoglobin and/or troponin I
- No ischemic EKG changes such as ST-segment elevation or depression ≥1mm in 2 or more contiguous leads, and or T-wave inversion ≥2mm
- No previously known cardiomyopathy with an estimated ejection fraction ≤ 45%

**Structure and Function**
- Assessment of complex congenital heart disease including anomalies of coronary circulation, great vessels, and cardiac chambers and valves
- Evaluation of coronary arteries in patients with new onset heart failure to assess etiology
- Evaluation of intra- and extra-cardiac structures
- Evaluation of cardiac mass (suspected tumor or thrombus) and patients with technically limited images from echocardiogram, MRI or TEE
- Evaluation of pericardial conditions (pericardial mass, constrictive pericarditis, or complications of cardiac surgery) and patients with technically limited images from echocardiogram, MRI or TEE
- Evaluation of pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation (e.g., pulmonary vein isolation)
- Non-invasive coronary vein mapping prior to placement of biventricular pacemaker or placement of automatic implantable cardioverter defibrillator (AICD)
- Non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization
- Evaluation of aortic and pulmonary disease
- Evaluation of suspected aortic dissection or thoracic aortic aneurysm ii. Evaluation of suspected pulmonary embolism

Computed tomography, heart, without contrast material including image post-processing and quantitative evaluation of coronary calcium meets Blue Cross and Blue Shield of Alabama’s medical criteria for coverage when a CCT or CCTA meets the coverage criteria noted above, but when a review of the initial non-contrast CT images is reviewed it is determined that based on the calcium volume the patient is not a candidate for the arterial phase component of the study. (In this case only code 75571 should be reported.)

<tr>
<td></td>
<td>Evaluation of a suspected anatomical coronary artery anomaly is considered medically necessary with documentation of ALL of the following:</td>
</tr>
<tr>
<td></td>
<td>- Unexplained dyspnea, chest pain, palpitations, recurrent syncope, arrhythmia or cardiac arrest</td>
</tr>
<tr>
<td></td>
<td>- Current diagnostic tests, including chest X-ray, treadmill stress test, holter and/or event monitor, are inconclusive or normal, or images from MRI or TEE are technically limited.</td>
</tr>
</tbody>
</table>

Emergency evaluation of individuals with acute chest pain and without known coronary artery disease is considered medically necessary.

Evaluation of congenital heart defects, including cardiac chambers, valves, great vessels and vasculature is considered medically necessary as part of the pre-and post-operative assessment for cardiac surgery with documentation of ANY of the following:

   - Contraindications to cardiac MRI (e.g., pacemaker)
   - Evaluation of coronary heart abnormalities with respect to origin and distribution (e.g., anomalous coronary artery arising from the pulmonary artery, left coronary artery from the right sinus of Valsalva)
   - Following coronary artery implantation after aortic root replacement or after transposition of the great artery repair
   - Primary evaluation of vascular ring or pulmonary artery sling lesions
   - Evaluation of the pulmonary artery in an individual with pulmonary atresia, hypoplasia or agenesis of the pulmonary artery
   - Following stent implantation in the pulmonary artery or aortic arch
   - Suspected aortic arch abnormality
   - Need to visualize extracardiac structures related to the congenital heart defect (e.g., tracheobronchial tree, esophagus, lung parenchyma)
   - Complex congenital heart defect to evaluate ventricular function
Contrast-enhanced coronary CT angiography for coronary artery evaluation for all indications not previously listed or if above criteria not met is considered experimental.

Examples include, but are not limited to:

- Coronary artery bypass graft patency
- Coronary artery stenosis
- Measurement of cardiac perfusion
- Evaluation of coronary artery disease or atherosclerosis in an asymptomatic or symptomatic individual
- Screening for coronary artery disease or atherosclerosis in an asymptomatic individual.

### Coronary Computed Tomography Angiography with Selective Noninvasive Fractional Flow Reserve; Last reviewed July 18, 2017 (CPT 0501T, 0502T, 0503T, 054T)

The use of noninvasive fractional flow reserve following a positive coronary computed tomography angiography to guide decisions about the use of invasive coronary angiography in individuals with **stable chest pain at intermediate risk of coronary artery disease** (i.e., suspected or presumed stable ischemic heart disease) is considered medically necessary.

The use of noninvasive fractional flow reserve for all other indications not previously listed or if above criteria not met is considered experimental or investigational.

### Computed Tomography to Detect Coronary Artery Calcification; Last reviewed October 24, 2017 (CPT 75571)

No CAC coverage

#### Policy 6.01.43, Contrast Enhanced Coronary Computed Tomography Angiography for Coronary Artery Evaluation; effective November 1, 2017 ((CPT 75574, 75573, 75572)

- may be considered medically necessary for evaluation of patients without known coronary artery disease and acute chest pain in the emergency department setting.
- may be considered medically necessary for evaluation of patients with stable chest pain and meeting guideline criteria for a noninvasive test in the outpatient setting.
- may be considered medically necessary for evaluation of anomalous (native) coronary arteries in patients in whom they are suspected.
- (CCTA) for coronary artery evaluation is considered investigational for all other indications.

#### Policy 6.01.03, Computed Tomography to Detect Coronary Artery Calcification; effective November 1, 2017 (CPT 75571)

No CAC coverage – investigational.

#### Policy 6.01.59, Coronary Computed Tomography Angiography with Selective Noninvasive Fractional Flow Reserve; effective February 1, 2018 (CPT 0501T, 0502T, 0503T, 054T)

following a positive coronary computed tomography angiography may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with **stable chest pain at intermediate risk of coronary artery disease** (i.e., suspected or presumed stable ischemic heart disease). The use of noninvasive fractional flow reserve not meeting the criteria outlined above is considered investigational.
CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T,0502T, 0503T,054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary: (CPT 75572, 75573,) Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
- Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
- Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
- As a technique to evaluate cardiac function.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals;
- in conjunction with a coronary CT angiography (CCTA).

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T,0502T, 0503T,054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary: (CPT 75572, 75573,) Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
- Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
- Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
- As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered not medically necessary for all other indications when the above criteria are not met.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:
• as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
• as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
• as a diagnostic test in symptomatic individuals;
• in conjunction with a coronary CT angiography (CCTA).

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
• In pediatric individuals (age less than 18 years), either before or after conventional angiography
• In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary: (CPT 75572, 75573,)
• Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
  • Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  • Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  • As a technique to evaluate cardiac function.
  • Fractional flow reserve derived from computed tomography (FFRCT) is considered not medically necessary for all other indications when the above criteria are not met.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:
• as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
• as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
• as a diagnostic test in symptomatic individuals;
• in conjunction with a coronary CT angiography (CCTA).

Policy X-116-001 Last reviewed November 2017 (CPT 75572, 75573)

Adult Congenital Heart Disease

* Assessment of anomalies of coronary arterial and other thoracic arteriovenous vessels
  (*For “anomalies of coronary arterial vessels” coronary computed tomographic angiography (CCTA) preferred and for “other thoracic arteriovenous vessels” Heart CT preferred)
* For evaluation of structural heart disease, such as transposition of the great arteries (TGA), when magnetic resonance imaging (MRI) might be preferable but cannot be performed.
* Further assessment of complex adult congenital heart disease after confirmation by transthoracic echocardiogram (TTE).

Evaluation of left ventricular function,
• Following acute myocardial infarction (MI) or in heart failure (HF) patients.
• Inadequate images from other noninvasive methods.

Quantitative evaluation of right ventricular function,
• Assessment of right ventricular morphology.
• Suspected arrhythmogenic right ventricular dysplasia.
Assessment of myocardial viability
- Prior to myocardial revascularization for ischemic left ventricular systolic dysfunction.
- Other imaging modalities are inadequate or contraindicated.

Evaluation of Intra and Extra Cardiac Structures
Characterization of native cardiac valves.
- Suspected clinically significant valvular dysfunction.
- Inadequate images from other noninvasive methods.
- Re-evaluation (less than one (1) year) of the size and morphology of the aortic sinuses and ascending aorta in patients with a bicuspid aortic valve (AV) and an ascending aortic diameter greater than 4 cm with ONE of the following: Aortic diameter greater than 4.5 cm; or Rapid rate of change in aortic diameter; or Family history (first-degree relative) of aortic dissection.
- Alternative imaging modality: CMR A (8), TTE A (7).
- Characterization of prosthetic cardiac valves.
- For assessment of prosthetic valve thrombosis for suspected clinically significant valvular dysfunction.
- Inadequate images from other noninvasive method.
- Severe tricuspid regurgitation (TR) and suboptimal TTE images, for assessment of RV systolic function and systolic and diastolic volumes.
- Alternative imaging modality is cardiac magnetic resonance (CMR) A (8)
- Evaluation of cardiac mass (suspected tumor or thrombus).
- Inadequate images from other noninvasive methods.
- Evaluation of pericardial anatomy.
- Evaluation of pulmonary vein anatomy.
- Prior to radiofrequency ablation for atrial fibrillation.
- Noninvasive coronary vein mapping.
- Prior to placement of biventricular pacemaker.
- Localization of coronary bypass grafts and other retrosternal anatomy (for “localization of coronary bypass grafts” CCTA preferred and for “other retrosternal anatomy” Heart CT preferred)
- Prior to preoperative chest or cardiac surgery.

Policy X-54-008, CTA Coronary Arteries and Fractional Flow Reserve CT; Last reviewed October 2017 (CPT 75574 0501T,0502T, 0503T,054T)

FFR-CT may be considered medically necessary when ALL of the following are met:
1. Prior to CCTA, the patient was stable with a pre-test probability between 20% and 80% of significant, ischemia-producing CAD, based upon reliable calculations, (i.e., Diamond Forrester, ESC Consortium, University of Washington, or similar calculators); and
2. The patient had at least ONE of the following scenarios:
   a. A pretest probability of 20-50% (low-to-moderate) prior to CCTA and was selected for evaluation with CCTA as a non-invasive test for significant CAD. The CCTA result shows lesions of greater than or equal to 50%; or
   b. A pretest probability of 51-80% (moderate or high moderate) prior to CCTA and was selected for evaluation with CCTA as a non-invasive test for significant CAD. The CCTA result shows lesions of 30-50%

Florida 5/18

Policy 04-70450-03, Computed Tomographic Angiography Heart; Last revised 5/15/2018 ( 75572,75574)
- Computed tomographic angiography (CTA/CCTA) meets the definition of medical necessity when the member meets appropriate use criteria, for indications with an appropriate use score of 4 to 9 (A= Appropriate (7-9), U= Uncertain (4-6))

Policy 04-70450-26, Computed Tomography Heart; Last reviewed 4/26/18; effective 5/15/18 (75573)
- Cardiac computed tomography (heart CT) meets the definition of medically necessity when the member meets the appropriate use criteria, for indications with an appropriate use score of 4-9 (A= Appropriate (7-9), U= Uncertain (4-6).
**Policy 04-78000-22; Noninvasive Fractional Flow Reserve Measurement; 12/8/17(0501T,0502T, 0503T,054T)**

The use of noninvasive fractional flow reserve following a positive coronary computed tomography angiography **meets the definition of medical necessity** to guide decisions about the use of invasive coronary angiography in members with stable chest pain at intermediate risk of coronary artery disease (i.e., suspected or presumed stable ischemic heart disease).

**Policy 04-70450-02, Computed Tomography to Detect Coronary Artery Calcification (CPT 75571) Last revised November 2015**

No CAC coverage.

**Georgia 5/18 (follows Anthem and uses AIM)**

**CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T,0502T, 0503T,054T)**

**Medically Necessary:**
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered **medically necessary** for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered **medically necessary** for the evaluation of **stable chest pain in individuals at intermediate risk of coronary artery disease** as an alternative to invasive coronary angiography.

**Not Medically Necessary:** (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered **not medically necessary** for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered **not medically necessary** for all other indications when the above criteria are not met.

**RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered **investigational and not medically necessary** for the detection of coronary artery calcium, including, but not limited to, the following indications:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals;
- in conjunction with a coronary CT angiography (CCTA).

</tr>
</tbody>
</table>
• Assess a pericardial condition (such as, pericardial mass, constrictive pericarditis, pericardial effusion, or complications of cardiac surgery in patients) with technically limited images from ECG, MRI, or TEE;
• Perform non-invasive coronary vein mapping prior to placement of a biventricular pacemaker;
• Perform non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization;
• Evaluate pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation;
• Evaluate cardiac aneurysm and pseudoaneurysm;
• Evaluate thoracic aortic aneurysm (TAA) (such as suspected aneurysm in individuals who have not undergone computed tomography (CT) or MRI within the preceding 60 days, confirmed TAA in individuals with new or worsening symptoms, or suspected aortic dissection (with or without worsening symptoms or pre-operative planning);
• Assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

considered experimental, investigational and/or unproven for all other indications, including but not limited to:

• Screening asymptomatic individuals for CAD
• Evaluating asymptomatic individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing;
• Evaluating individuals for any other indication not listed above, including but not limited to high or low pretest probability (low risk defined as <10% and high risk as >90%) of CAD
• CCTA performed using a multi-detector row CT scanner with less than 64-slice scanner is considered experimental, investigational and/or unproven.

Noninvasive Fractional Flow Reserve Computed Tomography (CPT 0501T, 0502T, 0503T, 054T)

The use of noninvasive fractional flow reserve (FFR) following a positive CCTA may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of CAD (i.e., suspected or presumed stable ischemic heart disease).

The use of noninvasive FFR computed tomography (FFR_CT) simulation not meeting the criteria above is considered experimental, investigational and/or unproven.

NOTE 2: If CT imaging is done of the blood vessels it is not necessarily a CCTA. A CCTA must include reconstruction post-processing of the angiographic images and interpretations, which is a key distinction between a CCTA and conventional CT. If the reconstruction post-processing is not done, it is not considered a CCTA study.

RAD 604.009, Computed Tomography to Detect Coronary Artery Calcification, Last reviewed March 2017 (CPT 75571)
No CAC coverage (except for Texas contracts)

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
• In pediatric individuals (age less than 18 years), either before or after conventional angiography
• In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary: (CPT 75572, 75573,)
• Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
  • Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  • Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  • As a technique to evaluate cardiac function.
**Rad 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:

- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals;
- in conjunction with a coronary CT angiography (CCTA).

**Iowa (Wellmark) 5/18**

**Policy 06.01.20 – Computed Tomography Angiography of the Coronary Arteries, Last reviewed April 2016; (no longer listed on the web as of January 10, 2018). Policy likely under revision now. (CPT 75574, 75573, 75572)**

May be considered medically necessary for the following indications:

Evaluation of suspected cardiac chest pain when all of the following are met:
- No known history of coronary artery disease (CAD);
- Low or intermediate pre-test probability of coronary artery disease (CAD) (using Framingham risk score calculation);
- ECG normal/non-diagnostic for etiology of chest pain

Evaluation of suspected coronary artery disease (CAD) including those individuals with prior abnormal cardiac testing (myocardial perfusion imaging (MPI) or stress echo)
- Individual with abnormal MPI or stress echo within the preceding 90 days suspected to be false positive on the basis of low coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation).
- Individual with an equivocal MPI or stress echo within the preceding 90 days who have low or intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation).

Individuals with congestive heart failure/cardiomyopathy/left ventricular dysfunction
- For exclusion of coronary artery disease in patients with left ventricular ejection fraction <55% and intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation) in whom coronary artery disease has not been excluded as the etiology of the cardiomyopathy.

Evaluation for non-coronary artery cardiac surgery
- Individual with intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation) and being evaluated for non-coronary artery cardiac surgery (including valvular and ascending aortic surgery) to avoid an invasive angiogram. All the necessary pre-operative information can be obtained using cardiac CT.

Congenital coronary artery anomalies
- For evaluation of suspected congenital anomalies of the coronary arteries

**Medical Policy 06.01.06, Coronary Artery Calcium Scoring; Last reviewed July 2017 (CPT 75571)**

Coronary artery calcium scoring by means of computed tomography is considered investigational for all indications.

**Kansas 5/18**

**Cardiac Computed Tomography; Last revised April 2018 (CPT 75574, 0501T, 0502T, 0503T, 0547T)**

1. Evaluation of patients with symptoms of stable ischemic heart disease and meeting guideline criteria for a noninvasive test in the outpatient setting is considered medically necessary.
2. Evaluation of patients without known coronary artery disease and acute chest pain in the emergency room/emergency department setting is considered medically necessary.
3. Evaluation of anomalous (native) coronary arteries in patients in whom they are suspected may be considered medically necessary.
**Kentucky (Anthem) 5/18**

**CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)**

**Medically Necessary:**
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered **medically necessary** for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

**Not Medically Necessary:** (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered **not medically necessary** for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered **not medically necessary** for all other indications when the above criteria are not met.

**Louisiana 5/18**

**Policy No. 00153, Contrast Enhanced Computed Tomography for Coronary Artery Evaluation; Effective May 2017 (CPT 75574, 75573, 75572)**

May consider to be eligible for coverage when using at least a 64-slice multidetector row helical computed tomographic scanner for ANY of the following conditions:
- Evaluation of anomalous (native) coronary arteries in symptomatic patients when conventional angiography is unsuccessful or equivocal and when the results will impact treatment
- Assessment of complex congenital heart disease including anomalies of coronary circulation, great vessels and cardiac chambers and valves
- Evaluation of pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation
- Evaluation of patients with chest pain who do not have known coronary artery disease (CAD) in the emergency room/emergency department setting
- For exclusion of coronary artery disease (CAD) in patients with left ventricular ejection fraction < 55% and low or intermediate coronary heart disease risk in patients whom coronary artery disease (CAD) has not been excluded as the etiology of the cardiomyopathy
- Patients at intermediate coronary heart disease risk being evaluated for non-coronary artery cardiac surgery (including valvular and ascending aortic surgery) to avoid an invasive angiogram, where all of the necessary preoperative information can be obtained using cardiac computed tomography (CT)
- Evaluate patients with suspected coronary artery disease (CAD) who have low or intermediate coronary heart disease risk and have had an equivocal myocardial perfusion imaging (MPI) or stress echo within the preceding 60 days
- Evaluate patients with suspected coronary artery disease (CAD) who have a low coronary heart disease risk who have had an abnormal myocardial perfusion imaging (MPI) or stress echo within the preceding 60 days suspected to be a false positive.
- Contrast enhanced coronary computed tomographic angiography for evaluation of patients with symptoms consistent with myocardial ischemia, is considered medically necessary as an alternative to myocardial perfusion imaging (MPI) or stress echocardiography (SE) when guideline criteria for MPI are met.

Based on review of available data, the Company considers contrast-enhanced coronary computed tomographic angiography (CCTA) for coronary artery evaluation to be investigational for all other indications.

Policy No. 00031, Computed Tomography to Detect Coronary Artery Calcification; Last reviewed January 2018 (CPT 75571)
No CAC coverage – investigational

Policy No. 00537, CCTA with Selective Noninvasive Fractional Flow Reserve; effective October 2017 (CPT 0501T,0502T, 0503T,054T)

Based on review of available data, the Company may consider the use of noninvasive fractional flow reserve (FFR) following a positive coronary computed tomography angiography (CCTA) to guide decisions about the use of invasive coronary angiography (ICA) in patients with stable chest pain at intermediate risk of coronary artery disease (CAD i.e., suspected or presumed stable ischemic heart disease [SIHD]) to be eligible for coverage.

The use of noninvasive fractional flow reserve (FFR) not meeting the criteria outlined above is considered to be investigational.

Maine (Anthem) 5/18

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T,0502T, 0503T,054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary:  (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
- Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
- Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
- As a technique to evaluate cardiac function.
**RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:

- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals in conjunction with a coronary CT angiography (CCTA).

**Policy 6.01.035 Cardiac Computed Tomography and Coronary CT Angiography (next review December 2018)**

The following indications for use of CT of the heart and CTA to evaluate cardiac structure and morphology for (CPT 75573, 75572)

- Congenital heart disorders
- Evaluation of pulmonary veins prior to a pulmonary vein isolation procedure for atrial fibrillation
- Identification of coronary veins prior to insertion of a biventricular pacemaker.

Computed tomography angiography (CTA) using scanners of 64 slices or greater for evaluating coronary circulation (CPT 75574)

- As an alternative to conventional invasive coronary angiography in patients who have had an equivocal stress ECG;
- For the evaluation of suspected congenital anomalies of the coronary circulation
- For the evaluation of symptoms consistent with cardiac ischemia in patients determined to be at low to intermediate risk (Framingham criteria) for coronary artery disease
- Not recommended for screening in asymptomatic patients

**Policy 6.01.003; Computed Tomography to Detect Coronary Artery Calcification; Last reviewed February 2017**

The following indications for use of Coronary Artery Calcifications are (CPT 75571)

- Symptomatic individuals who have had an equivocal non-invasive workup where additional diagnostic information is required, but are not immediate candidates for cardiac catheterization
- Asymptomatic adults at intermediate risk of a cardiac event (10% to 20% ten year risk).

**Policy 831, CCTA and CT Derived Fractional Flow Reserve (CPT 75574, CPT 0501T, 0502T, 0503T, 054T)**

Chest pain

- With intermediate or high pretest probability of CAD; OR
- With low or very low pretest probability of CAD and high risk of CAD (SCORE)

Atypical symptoms: syncope, shortness of breath (dyspnea), neck, jaw, arm, epigastric or back pain, 2 or sweating (diaphoresis)

- With moderate or high risk of CAD (SCORE)

Other symptoms: palpitation, dizziness, lightheadedness, near syncope, nausea, vomiting, anxiety, weakness, fatigue, etc.

- With high risk of CAD (SCORE)

Patients with any cardiac symptom who have diseases/conditions with which CAD commonly coexists, such as:

- Abdominal aortic aneurysm; OR
- Chronic renal insufficiency or renal failure; OR
- Diabetes mellitus; OR
- Established and symptomatic peripheral vascular disease; OR
- Prior history of cerebrovascular accident (CVA), transient ischemic attack (TIA) or carotid endarterectomy (CEA) or high-grade carotid stenosis (>70%)

**FFR-CT not required**

Congenital Coronary arteries:
For evaluation of suspected congenital anomalies of the coronary arteries

**FFR-CT may be appropriate but is not a required capability of the performing imaging facility.**

Congestive Heart failure/ cardiomyopathy/ left ventricular dysfunction
- For exclusion of CAD in patients with LVEF <55% and low to moderate coronary heart disease risk, in whom CAD has not been excluded as the etiology of the cardiomyopathy.

Preoperative evaluation for patients undergoing non-coronary cardiac surgery
- Evaluation of symptomatic or asymptomatic patients at moderate coronary heart disease risk to avoid an invasive angiogram, where all the necessary preoperative information can be obtained using cardiac CT
- Procedures include open and percutaneous valvular procedures or ascending aortic surgery

Suspected coronary artery disease in patients who have had abnormal exercise EKG test (performed without imaging) within the past 60 days (When both of the following apply)
- Patient is symptomatic
- During testing the patient had exercise-induced chest pain, ST segment change, abnormal BP response or complex ventricular arrhythmias

Suspected coronary artery disease in patients who have had equivocal MPI or SE within the past 60 days (When both of the following apply)
- Patient is symptomatic
- The imaging portion of the study is neither clearly normal nor clearly abnormal

**FFR-CT may be appropriate and is required capability of the imaging facility.**

Suspected coronary artery disease in symptomatic patients who have abnormal resting EKG
- When resting EKG abnormalities (left bundle branch block, electronically paced ventricular rhythm, left ventricular hypertrophy with repolarization abnormalities, resting ST segment depression 1 mm or more, digoxin effect or pre-excitation syndrome) would render an exercise treadmill test (without imaging) uninterpretable

Suspected coronary artery disease in symptomatic patients who have not had recent CAD evaluation
- When no CAD imaging evaluation (MPI, cardiac PET, stress echo, CCTA or coronary angiography) has been performed within the preceding sixty (60) days

**Policy 832, Cardiac CT for Quantitative Evaluation of Coronary Calcification (CPT 75571)**
No coverage of CAC – investigational.  Follows AIM Guidelines for Advanced Cardiac Imaging.

**Policy 833, Cardiac CT for Cardiac Structure (CPT 75572, 75573)**

Congenital heart disease
- For evaluation of suspected or established congenital heart disease in patients whose echocardiogram is technically limited or non-diagnostic; OR
- For further evaluation of patients whose echocardiogram suggests a new diagnosis of complex congenital heart disease; OR
- For evaluation of complex congenital heart disease in patients who are less than one year post- surgical correction; OR
- For evaluation of complex congenital heart disease in patients who have new or worsening symptoms and/or a change in physical examination; OR
- To assist in surgical planning for patients with complex congenital heart disease; OR
- For surveillance in asymptomatic patients with complex congenital heart disease who have not had cardiac MRI or cardiac CT within the preceding year

Cardiomyopathy
- Evaluation of patients with suspected arrhythmogenic right ventricular dysplasia; OR
- To assess LV function in patients with suspected or established cardiomyopathy when all other non-invasive imaging is not feasible or technically suboptimal
- To assess RV function in patients with suspected RV dysfunction when all other non-invasive imaging is not feasible or technically suboptimal
Valvular heart disease

- Evaluation of suspected dysfunction of native or prosthetic cardiac valves when all other cardiac imaging options are not feasible or technically suboptimal
- Evaluation of established dysfunction of native or prosthetic cardiac valves when all other cardiac imaging options are not feasible or technically suboptimal
- Evaluation of patients with established coronary artery disease for the Non-invasive localization of coronary bypass grafts or potential grafts (including internal mammary artery) and/or evaluation of retrosternal anatomy in patients undergoing repeat surgical revascularization

Intra-cardiac and para-cardiac masses and tumors

- In patients with a suspected cardiac or para-cardiac mass (thrombus, tumor, etc.) suggested by transthoracic echocardiography, transesophageal echocardiography, blood pool imaging or contrast ventriculography who have not undergone cardiac CT or cardiac MRI within the preceding 60 days; OR
- In patients with established cardiac or para-cardiac mass (thrombus, tumor, etc.) who are clinically unstable; OR
- In patients with established cardiac or para-cardiac mass (thrombus, tumor, etc.) who are clinically stable and have not undergone cardiac CT or cardiac MRI within the preceding year; OR
- In patients with established cardiac or para-cardiac mass (thrombus, tumor, etc.) who have undergone treatment (chemotherapy, radiation therapy, thrombolysis, anticoagulation or surgery) within the preceding year and have not had cardiac CT or cardiac MRI within the preceding 60 days

Cardiac aneurysm and pseudoaneurysm

Evaluation of pericardial conditions (pericardial effusion, constrictive pericarditis, or congenital pericardial diseases)

- In patients with suspected pericardial constriction; OR
- In patients with suspected congenital pericardial disease; OR
- In patients with suspected pericardial effusion who have undergone echocardiography deemed to be technically suboptimal in evaluation of the effusion; OR
- In patients whose echocardiogram shows a complex pericardial effusion (loculated, containing solid material)

Evaluation of cardiac venous anatomy

- For localization of the pulmonary veins in patients with chronic or paroxysmal atrial fibrillation/flutter who are being considered for ablation; OR
- Coronary venous localization prior to implantation of a biventricular pacemaker

Evaluation of the thoracic aorta

- In patients with suspected thoracic aortic aneurysm / dilation who have not undergone CT or MRI of the thoracic aorta within the preceding 60 days; OR
- In patients with confirmed thoracic aortic aneurysm / dilation with new or worsening signs/symptoms; OR
- For ongoing surveillance of stable patients with confirmed thoracic aortic aneurysm / dilation who have not undergone surgical repair and have not had imaging of the thoracic aorta within the preceding six months; OR
- In patients with suspected aortic dissection; OR
- In patients with confirmed aortic dissection who have new or worsening symptoms; OR
- In patients with confirmed aortic dissection in whom surgical repair is anticipated (to assist in preoperative planning); OR
- For ongoing surveillance of stable patients with confirmed aortic dissection who have not undergone imaging of the thoracic aorta within the preceding year; OR
- In patients with confirmed aortic dissection or thoracic aortic aneurysm / dilation who have undergone surgical repair within the preceding year and have not undergone imaging of the thoracic aorta within the preceding six months; OR
- In patients who have sustained blunt chest trauma, penetrating aortic trauma or iatrogenic trauma as a result of aortic instrumentation; OR
In patients being evaluated for potential transcatheter aortic valve implantation/replacement (TAVI or TAVR) provided that the patient has not undergone cardiac CT or cardiac MRI within the preceding 60 days.

**CCT/CCTA; effective May 2017 (CPT 75574,75573,75572)**

Coronary computed tomography-angiography (CCTA) is an established procedure. **CCTA may be done in an inpatient, outpatient or emergency room setting**

The following patients are considered appropriate candidates for CT angiography by the American College of Cardiology:

- Stress test results that are equivocal or discordant with other clinical evidence, in lieu of invasive coronary angiography
- Low-intermediate risk acute chest pain in order to exclude coronary artery disease in the emergency department or inpatient setting
- New onset chest pain in low-intermediate risk patients in the outpatient setting
- Evaluation of coronary bypass graft or coronary stent patency, in order to facilitate decision making for invasive angiography
- Suspected coronary anomalies
- Cardiac or major thoracic surgery, such as aortic valve replacement or aortic aneurysm repair, in order to exclude coronary artery disease, as an alternative to invasive coronary angiography
- Incomplete invasive catheterization results as an alternative to repeat invasive catheterization
- Patients anticipating cardiac surgery who require an assessment of coronary or pulmonary venous anatomy: This application of CTA for the coronary and pulmonary veins is primarily for pre-surgical planning.
- Evaluation of coronary venous anatomy to place a pacemaker lead in the lateral coronary vein in order to resynchronize cardiac contraction in patients with heart failure. This may be helpful to guide biventricular pacemaker placement.
- Pulmonary vein catheter ablation can isolate electrical activity from the pulmonary veins and allow for the elimination of recurrent atrial fibrillation.
- Assessment of complex congenital heart disease including anomalies of coronary circulation, great vessels, and cardiac chambers and valves:
  - a. Anomalous pulmonary venous drainage
  - b. Other complex congenital heart diseases
  - c. Sinus venosus atrial septal defect
  - d. Kawasaki’s disease
  - e. Consideration for surgical repair of tetralogy of Fallot or other congenital heart disease.
  - f. Pulmonary outflow tract obstruction
- Evaluation of cardiac mass (suspected tumor or thrombus) and patients with technically limited images from echocardiogram, MRI or TEE.
- Evaluation of pericardial conditions (pericardial mass, constrictive pericarditis, or complications of cardiac surgery) and patients with technically limited images from echocardiogram, MRI or TEE.
- Evaluation of pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation (e.g., pulmonary vein isolation).
- Non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization.
- Evaluation of suspected aortic dissection or thoracic aortic aneurysm.
- Evaluation of suspected pulmonary embolism.

Exclusions: • Those individuals who do not meet the criteria stated above. • For screening purposes • Multidetector CT scanners that have fewer than 64 detectors • Computed tomography of the heart, without contrast material, with quantitative evaluation of coronary calcium. Calcium scoring reported in isolation is considered a screening service. See JUMP policy “Computed Tomography to Detect Coronary Artery Calcification.”

**CPT 75571**

No CAC coverage – investigational.
**Minnesota**

Will use eviCore management guidelines effective August 1, 2018 (CPT 75572, 75573, 75574, CPT 0501T, 0502T, 0503T, 054T)

---

**Mississippi**

Policy L.6.01.415, CCTA; Last reviewed June 2016 (CPT 75574, 75573, 75572)

Providers must be accredited by IAC or ACR.

A diagnosis of chest pain (acute or non-acute) is not in itself an eligible indication for performing CCTA. CCTA using a 64-slice or greater CT scanner is considered medically necessary for the following:

**Detection of CAD in Symptomatic Patients**

Evaluation of chest pain syndrome
- Intermediate pre-test probability of CAD (see Table A below) and electrocardiogram (ECG) (EKG) uninterpretable or unable to exercise

Evaluation of intra-cardiac structures
- Evaluation of suspected coronary anomalies

Acute chest pain
- Intermediate pre-test probability of CAD (see Table A below) and no electrocardiogram (ECG) (EKG) changes and serial enzymes negative

Abnormal electrocardiogram (ECG) (EKG)
- Left bundle branch block/left ventricle hypertrophy with ST segment changes

**Detection of CAD with Prior Test Results**

Evaluation of chest pain syndrome
- Un-interpretable or equivocal stress test (exercise, perfusion, or stress echo)
- Conventional angiography is unsuccessful or equivocal

**Evaluation of Acute Chest Pain in the Emergency Room/Emergency Department**

Patients with intermediate pre-test probability of CAD (see Table A) that meet ALL of the following criteria:
- No known coronary artery disease
- Normal or equivocal serum biomarkers such as creatine kinase-myocardial band, myoglobin and/or troponin I
- Normal or equivocal ischemic electrocardiogram (ECG) (EKG) changes such as ST-segment elevation or depression ≥1mm in 2 or more contiguous leads, and or T-wave inversion ≥2mm

**Evaluation of Cardiac Structure and Function**

- Assessment of congenital heart disease including anomalies of coronary circulation, great vessels, and cardiac chambers and valves
- Evaluation of coronary arteries in patients with new onset heart failure to assess etiology
- Evaluation of intra- and extra-cardiac structures
- Evaluation of cardiac mass (suspected tumor or thrombus) and patients with technically limited images from echocardiogram, MRI or TEE
- Evaluation of pericardial conditions (pericardial mass, constrictive pericarditis, or complications of cardiac surgery) and patients with technically limited images from echocardiogram, MRI or TEE
- Evaluation of pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation (e.g., pulmonary vein isolation)
- Non-invasive coronary vein mapping prior to placement of biventricular pacemaker or, placement of automatic implantable cardioverter defibrillator (AICD)
- Non-invasive coronary arterial and venous bypass mapping, including internal mammary artery and bypass grafts prior to repeat cardiac vascularization
- Evaluation of aortic and pulmonary disease
- Evaluation of suspected aortic dissection or thoracic aortic aneurysm
- Evaluation of suspected pulmonary embolism

Policy a.6.01.03; Last reviewed October 2016 (CPT 75571)

No CAC coverage.
**CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT**

**Medically Necessary:**
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

**Not Medically Necessary:**
- Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
  - Fractional flow reserve derived from computed tomography (FFRCT) is considered not medically necessary for all other indications when the above criteria are not met.

**RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**
The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals in conjunction with a coronary CT angiography (CCTA).

**Policy 6.01.59 Coronary Computed Tomography Angiography with Selective Noninvasive Fractional Flow Reserve; Last reviewed August 2017; next review August 2018 CPT 75574, 0501T,0502T, 0503T,054T)**
The use of noninvasive fractional flow reserve following coronary computed tomography angiography to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of coronary artery disease (ie, suspected or presumed stable ischemic heart disease) may be considered medically necessary.

**RAD 604.007 Coronary Computed Tomography Angiography, Including Noninvasive Fractional Flow Reserve; Last reviewed December 2017 (CPT 75574, 75573,75572)**
Evaluation of individuals without known coronary artery disease (CAD) who present with acute chest pain in the emergency room or emergency department setting may be considered medically necessary.

Evaluation of symptomatic individuals with suspected ischemic heart disease, who meet guideline criteria for a noninvasive test in the outpatient setting may be considered medically necessary.

The choice of test will depend on:
1. Interpretability of the electrocardiogram; and
2. Ability to exercise; and
3. Presence of comorbidities.
Evaluation of anomalous (native) coronary arteries in individuals in whom abnormal coronary arteries are suspected may be considered medically necessary. CCTA, with or without contrast enhancement, as an adjunct to other testing, may be considered medically necessary for the evaluation of cardiac structure and function to:

- Assess complex congenital heart disease, including anomalies of coronary circulation, great vessels, and cardiac chambers and valves;
- Assess suspected arrhythmogenic right dysplasia, left ventricular function when cardiomyopathy is suspected or established, and right ventricular function when right ventricular dysfunction is suspected in individuals with technically limited images from echocardiography (ECG), magnetic resonance imaging (MRI), or transesophageal echocardiography (TEE);
- Assess suspected or established dysfunction of prosthetic cardiac valves in individuals with technically limited images from ECG, MRI, or TEE;
- Assess coronary arteries in individuals with new onset heart failure when ischemia is the suspected etiology and cardiac catheterization and nuclear stress test are not planned;
- Assess a cardiac mass (suspected tumor or thrombus) in individuals with technically limited images from ECG, MRI, or TEE;
- Assess a pericardial condition (such as, pericardial mass, constrictive pericarditis, pericardial effusion, or complications of cardiac surgery in patients) with technically limited images from ECG, MRI, or TEE;
- Perform non-invasive coronary vein mapping prior to placement of a biventricular pacemaker;
- Perform non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization
- Evaluate pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation;
- Evaluate cardiac aneurysm and pseudoaneurysm
- Evaluate thoracic aortic aneurysm (TAA) (such as suspected aneurysm in individuals who have not undergone computed tomography (CT) or MRI within the preceding 60 days, confirmed TAA in individuals with new or worsening symptoms, or suspected aortic dissection (with or without worsening symptoms or pre-operative planning);
- Assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

considered experimental, investigational and/or unproven for all other indications, including but not limited to:

- Screening asymptomatic individuals for CAD
- Evaluating asymptomatic individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing;
- Evaluating individuals for any other indication not listed above, including but not limited to high or low pretest probability (low risk defined as <10% and high risk as >90%) of CAD
- CCTA performed using a multi-detector row CT scanner with less than 64-slice scanner is considered experimental, investigational and/or unproven.

Noninvasive Fractional Flow Reserve Computed Tomography (CPT 0501T,0502T, 0503T,054T)

The use of noninvasive fractional flow reserve (FFR) following a positive CCTA may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of CAD (i.e., suspected or presumed stable ischemic heart disease).

The use of noninvasive FFR computed tomography (FFR_CT) simulation not meeting the criteria above is considered experimental, investigational and/or unproven.

NOTE 2: If CT imaging is done of the blood vessels it is not necessarily a CCTA. A CCTA must include reconstruction post-processing of the angiographic images and interpretations, which is a key distinction between a CCTA and conventional CT. If the reconstruction post-processing is not done, it is not considered a CCTA study.

RAD 604.009, Computed Tomography to Detect Coronary Artery Calcification, Last reviewed March 2017 (CPT 75571)
No CAC coverage (except for Texas contracts)

Nebraska Medical Policy IV.62 CCTA; Last review August 2017; Next review August 20, 2018 (CPT 75574,75573,75572)

Computed tomography angiography (CTA) of the coronary arteries may be considered medically necessary for ANY of the following indications:
<table>
<thead>
<tr>
<th>Evaluation of a member with no known CAD, who presents with suspected cardiac chest pain and has a low to intermediate pretest probability of CAD based on Framingham risk scoring or American College of Cardiology (ACC) criteria.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Evaluation of a member with no known CAD, who is asymptomatic and has an intermediate pretest probability of CAD based on Framingham risk scoring or American College of Cardiology (ACC) criteria.</td>
</tr>
<tr>
<td>Evaluation of a member with or without CAD in whom exercise stress testing, stress echo or stress nuclear scan (including SPECT) is equivocal or indeterminate.</td>
</tr>
<tr>
<td>Evaluation of a member with suspected cardiac chest pain or angina equivalent e.g. dyspnea, who has a history of coronary artery bypass graft surgery (CABG) or coronary artery stent placement.</td>
</tr>
<tr>
<td>Evaluation of a member to exclude CAD as the cause of ANY of the following clinical presentations:</td>
</tr>
<tr>
<td>1. Left bundle branch block (LBBB) OR 2. congestive heart failure (CHF) OR 3. systolic or diastolic myocardial dysfunction.</td>
</tr>
<tr>
<td>Evaluation of suspected congenital anomalies of the coronary arteries.</td>
</tr>
<tr>
<td>Evaluation of a member with suspected arrhythmogenic Right ventricular dysplasia (ARVD) to assess right ventricular function and morphology.</td>
</tr>

**CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T,0502T, 0503T,054T)**

**Medically Necessary:**
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

**Not Medically Necessary:** (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
- Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
- Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
### New Hampshire (Anthem) 5/18

- As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered **not medically necessary** for all other indications when the above criteria are not met.

**RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered **investigational and not medically necessary** for the detection of coronary artery calcium, including, but not limited to, the following indications:

- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals; in conjunction with a coronary CT angiography (CCTA).

### CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)

**Medically Necessary:**

Contrast-enhanced coronary computed tomography angiography (CCTA), is considered **medically necessary** for the evaluation of suspected anomalous coronary arteries:

- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered **medically necessary** for the evaluation of **stable chest pain in individuals at intermediate risk of coronary artery disease** as an alternative to invasive coronary angiography.

**Not Medically Necessary:** *(CPT 75572, 75573,)*

- Coronary computed tomography angiography (CCTA) is considered **not medically necessary** for all other indications, including, but not limited to, the following:
- Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
- Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
- As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered **not medically necessary** for all other indications when the above criteria are not met.

**RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)**

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered **investigational and not medically necessary** for the detection of coronary artery calcium, including, but not limited to, the following indications:

- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals in conjunction with a coronary CT angiography (CCTA).

### New Jersey (Horizon) 5/18

**Policy 149, CCTA; Last reviewed March 2017 (CPT 75574, 75573, 75572)**

**Symptomatic individuals who have a ‘very low’, ‘low’, or ‘intermediate’ pretest probability of CAD*, CCTA may be used in the following situations:**

- Unable to perform either an exercise or pharmacologic imaging stress test
- Stress test (treadmill or imaging stress test) is uninterpretable, equivocal, or a false positive is suspected
• Replace performance of invasive coronary angiogram

For symptomatic individuals, evaluate post-CABG graft patency when only graft patency is a concern and imaging of the native coronary artery anatomy is not needed, such as in early graft failure.

For symptomatic individuals with unsuccessful conventional coronary angiography.

Re-do CABG

To identify whether bypass grafts are located directly beneath the sternum, so that alternative ways to enter the chest can be planned.

Evaluate coronary artery anomalies and other complex congenital heart disease of cardiac chambers or great vessels

Report CPT 75574 for coronary anomalies

Report CPT 75573 for congenital heart disease

To evaluate the great vessels, Chest CTA (71275) can be performed instead of CCTA or in addition to CCTA

For anomalous pulmonary venous return, can add CT abdomen and pelvis with contrast (CPT 4177)

Anomalous coronary artery(ies) suspected for diagnosis or to plan treatment and less than age 40 with a history that includes one or more of the following

• Persistent exertional chest pain and normal stress test
• Full sibling(s) with history of sudden death syndrome before age 30 or with documented anomalous coronary artery
• Resuscitated sudden death and contraindications for conventional coronary angiography

Unexplained new onset of heart failure

• Evaluation of newly diagnosed congestive heart failure or cardiomyopathy
• No prior history of coronary artery disease, the ejection fraction is less than 50 percent, and low or intermediate risk on the pre-test probability assessment AND
• No exclusions to cardiac CT angiography
• No cardiac catheterization, SPECT, cardiac PET, or stress echocardiogram has been performed since the diagnosis of congestive heart failure or cardiomyopathy
• Ventricular tachycardia (6 beat runs or greater) if CCTA will replace conventional invasive coronary angiography
• Equivocal coronary artery anatomy on conventional cardiac catheterization.
• Newly diagnosed dilated cardiomyopathy

Preoperative Assessment

• Preoperative assessment of the coronary arteries in patients who are going to undergo surgery for aortic dissection, aortic aneurysm, or valvular surgery if CCTA will replace conventional invasive coronary angiography”
• Vasculitis/Takayasus’s/Kawasaki’s disease

No. 176, CCTA with FFR; Last review July 2017 (CPT 0501T,0502T, 0503T,054T)

• The use of noninvasive fractional flow reserve following a positive coronary computed tomography angiography is considered medically necessary to guide decisions about the use of invasive coronary angiography in members with stable chest pain at intermediate risk of coronary artery disease (i.e., suspected or presumed stable ischemic heart disease).
• The use of noninvasive fractional flow reserve not meeting the criteria outlined above is considered investigational.

No. 149, CAC Policy; Last review 3/14/17 (CPT 75571)

Computed tomography of the heart for calcium scoring (75571) is considered medically necessary based on the following criteria when there is no coronary calcium scoring in the last 5 years, no prior abnormal imaging stress test, coronary
revascularization or prior catheterization or cardiac CT angiogram documenting coronary artery disease:
1. ATP* risk less than 10 percent and either of the following:
   a. Father or brother with coronary heart disease diagnosed at age 55 years or less; OR
   b. Mother or sister with coronary heart disease diagnosed at age 65 years or less
2. ATP* risk 10-19 percent AND the member has no symptoms of chest pain or shortness of breath.

RAD 604.007 Coronary Computed Tomography Angiography, Including Noninvasive Fractional Flow Reserve; Last reviewed December 2017 (CPT 75574, 75573,75572)

Evaluation of individuals without known coronary artery disease (CAD) who present with acute chest pain in the emergency room or emergency department setting may be considered medically necessary.

Evaluation of symptomatic individuals with suspected ischemic heart disease, who meet guideline criteria for a noninvasive test in the outpatient setting may be considered medically necessary.

The choice of test will depend on:
1. Interpretability of the electrocardiogram; and
2. Ability to exercise; and
3. Presence of comorbidities.

Evaluation of anomalous (native) coronary arteries in individuals in whom abnormal coronary arteries are suspected may be considered medically necessary.

CCTA, with or without contrast enhancement, as an adjunct to other testing, may be considered medically necessary for the evaluation of cardiac structure and function to:

- Assess complex congenital heart disease, including anomalies of coronary circulation, great vessels, and cardiac chambers and valves;
- Assess suspected arrhythmogenic right dysplasia, left ventricular function when cardiomyopathy is suspected or established, and right ventricular function when right ventricular dysfunction is suspected in individuals with technically limited images from echocardiography (ECG), magnetic resonance imaging (MRI), or transesophageal echocardiography (TEE);
- Assess suspected or established dysfunction of prosthetic cardiac valves in individuals with technically limited images from ECG, MRI, or TEE;
- Assess coronary arteries in individuals with new onset heart failure when ischemia is the suspected etiology and cardiac catheterization and nuclear stress test are not planned;
- Assess a cardiac mass (suspected tumor or thrombus) in individuals with technically limited images from ECG, MRI, or TEE;
- Assess a pericardial condition (such as, pericardial mass, constrictive pericarditis, pericardial effusion, or complications of cardiac surgery in patients) with technically limited images from ECG, MRI, or TEE;
- Perform non-invasive coronary vein mapping prior to placement of a biventricular pacemaker;
- Perform non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization
- Evaluate pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation;
- Evaluate cardiac aneurysm and pseudoaneurysm
- Evaluate thoracic aortic aneurysm (TAA) (such as suspected aneurysm in individuals who have not undergone computed tomography (CT) or MRI within the preceding 60 days, confirmed TAA in individuals with new or worsening symptoms, or suspected aortic dissection (with or without worsening symptoms or pre-operative planning);
- Assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

considered experimental, investigational and/or unproven for all other indications, including but not limited to:

- Screening asymptomatic individuals for CAD
- Evaluating asymptomatic individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing;
- Evaluating individuals for any other indication not listed above, including but not limited to high or low pretest probability (low risk defined as <10% and high risk as >90%) of CAD
- CCTA performed using a multi-detector row CT scanner with less than 64-slice scanner is considered experimental, investigational and/or unproven.
Noninvasive Fractional Flow Reserve Computed Tomography (CPT 0501T, 0502T, 0503T, 054T)

The use of noninvasive fractional flow reserve (FFR) following a positive CCTA may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of CAD (i.e., suspected or presumed stable ischemic heart disease).

The use of noninvasive FFR computed tomography (FFR\textsubscript{CT}) simulation not meeting the criteria above is considered experimental, investigational and/or unproven.

**NOTE 2:** If CT imaging is done of the blood vessels it is not necessarily a CCTA. A CCTA must include reconstruction post-processing of the angiographic images and interpretations, which is a key distinction between a CCTA and conventional CT. If the reconstruction post-processing is not done, it is not considered a CCTA study.

RAD 0001; Last reviewed May 2017
No CAC coverage.

No published policies found for CCT/CCTA or calcium score or FFR
Medically appropriate for any of the following:

Evaluation of known coronary artery disease (CAD) documented by prior imaging stress test, cardiac catheterization, cardiac CT angiogram, coronary revascularization, carotid stenosis or stroke, peripheral artery disease or aortic aneurysm:

- Prior coronary bypass grafting in the setting of new chest pain or shortness of breath and/or to evaluate graft patency and no exclusions to cardiac CT angiography; To identify whether bypass grafts are located directly beneath the sternum, so that alternative ways to enter the chest can be planned.
- Evaluation of known coronary artery disease (CAD) documented by a prior calcium scores less than 400
- Evaluation of new chest pain or dyspnea, no imaging stress test is planned, and there are no exclusions to cardiac CT angiography.
- For symptomatic individuals who have a very low, low, or intermediate pretest probability of CAD and:
  - Unable to perform either an exercise or pharmacologic imaging stress test.
  - Stress test (treadmill or imaging stress test) is normal, uninterpretable, equivocal, or a false positive is suspected.
  - Replace performance of invasive coronary angiogram or for unsuccessful conventional angiogram.

Left ventricular function evaluation: unexplained new onset of heart failure or dilated cardiomyopathy

Evaluation of suspected coronary artery disease with suspected anomalous coronary artery; and

Cardiac catheterization was performed, all coronary arteries were not identified, and no exclusion to cardiac CT angiography.

New onset of congestive heart failure without known coronary artery disease to assess coronary arteries and:

- Low or intermediate risk on the pre-test probability assessment, the ejection fraction is less than 50%; and
- No exclusion to cardiac CT angiography; and
- No cardiac catheterization, SPECT, cardiac PET, or stress echocardiogram has been performed since the diagnosis of congestive heart failure or cardiomyopathy.

Ventricular tachycardia (6 beat runs or greater) if CCTA will replace conventional invasive coronary angiography.

Equivocal coronary artery anatomy on conventional cardiac catheterization

Preoperative assessment of the coronary arteries in patients who are going to undergo surgery for aortic dissection, aortic aneurysm, or valvular surgery if CCTA will replace conventional invasive coronary angiography

Vasculitis/Takayasu’s/Kawasaki’s disease.

Cardiac Trauma: to detect aortic and coronary injury and can help in the evaluation of myocardial and pericardial injury.

Based upon our criteria and review of the peer-reviewed literature, cardiac computed tomographic angiography is considered investigational for all other indications.

3D Imaging is considered inclusive when performed as part of the Cardiac Computed Tomographic Angiography

Policy 6.01.13; Last reviewed Feb 2018 (CPT 75571)

- coronary calcium scoring is considered investigational as a screening technique for asymptomatic patients.
- it is medically appropriate for patients who are candidates for cardiac computed tomographic angiography (CTA) to have calcium scoring performed as part of a CTA procedure, since pre-test knowledge of extensive calcification of the coronary segment in question may diminish the interpretive value of cardiac CTA
The use of CT Coronary Angiography (CCTA), with or without Fractional Flow Reserve assessed by CT (FFR-CT) may be covered when accompanied by pre-test considerations as well as supporting clinical data and prerequisite information based on the following diagnostic indications:

**Indications where FFR-CT will not be required in conjunction with CCTA:**

- For evaluation of suspected congenital anomalies of the coronary arteries.
- Indications where FFR-CT may be appropriate but is not a required capability of the performing imaging facility:
  - Congestive heart failure/cardiomyopathy/LV dysfunction
  - For exclusion of coronary artery disease in patients with left ventricular ejection fraction <55% and low to moderate coronary heart disease risk in whom coronary artery disease has not been excluded as the etiology of the cardiomyopathy.
  - Pre-operative evaluation for patients undergoing non-coronary cardiac surgery
  - Evaluation of symptomatic or asymptomatic patients at moderate coronary heart disease risk to avoid an invasive angiogram, where all the necessary pre-operative information can be obtained using cardiac CT.
  - Procedures include open and percutaneous valvular procedures or ascending aortic surgery
  - Suspected coronary artery disease in symptomatic patients who have not had evaluation of coronary artery disease (MPI, cardiac PET, stress echo, CCTA or cardiac catheterization) within the preceding sixty (60) days
  - When both of the following (1-2) apply: 1. Patient has low or moderate coronary heart disease risk AND during testing the patient had exercise-induced chest pain, ST segment change, abnormal BP response or complex ventricular arrhythmias
  - Suspected CAD in symptomatic patients who have had equivocal MPI or SE within the past 60 days
  - When the patient has low or moderate coronary heart disease risk AND the imaging portion of the study is neither clearly normal nor clearly abnormal.
  - Suspected CAD in symptomatic patients who have had abnormal MPI or SE within the past 60 days
  - When an abnormal MPI or stress echo is suspected to be false positive on the basis of low coronary heart disease risk AND the imaging portion of the study is abnormal.

**Indications where FFR-CT may be appropriate and is a required capability of the imaging facility**

- Suspected CAD in symptomatic patients who have abnormal resting EKG
- When resting EKG abnormalities (left bundle branch block, electronically paced ventricular rhythm, left ventricular hypertrophy with repolarization abnormalities, resting ST segment depression 1 mm or more, digoxin effect or pre-excitation syndrome) would render an exercise treadmill test (without imaging) uninterpretable
- Suspected CAD in symptomatic patients who have not had recent CAD evaluation
- When no CAD imaging evaluation (MPI, cardiac PET, stress echo, CCTA or coronary angiography) has been performed within the preceding sixty (60) days

*For the purposes of this guideline, a patient is considered to be “symptomatic” when one of the following (A-D) applies:

A. Chest pain With intermediate or high pretest probability of CAD; OR low or very low pretest probability of CAD and high risk of CAD (SCORE)
B. Atypical symptoms: syncope, shortness of breath (dyspnea), neck, jaw, arm, epigastric or back pain, or sweating (diaphoresis) with moderate or high risk of CAD (SCORE)
C. Other symptoms; palpitation, dizziness, lightheadedness, near syncope, nausea, vomiting, anxiety, weakness, fatigue etc. with high risk of CAD (SCORE)
D. Patients with any cardiac symptom who have diseases/conditions with which coronary artery disease commonly coexists such as: Diabetes mellitus; OR Abdominal aortic aneurysm; OR Established and symptomatic peripheral vascular disease; OR Prior history of cerebrovascular accident (CVA), transient ischemic attack (TIA) or carotid endarterectomy (CEA) or high grade carotid stenosis (>70%); OR Chronic renal insufficiency or renal failure
### North Dakota

Contrast Enhanced Coronary Computed Tomography Angiography for Coronary Artery Evaluation; Last updated March 2018 (CPT 75574)
- Evaluation of patients without known coronary artery disease and acute chest pain in the emergency department setting is considered **medically necessary**.
- Evaluation of patients with stable chest pain and meeting guideline criteria for a noninvasive test in the outpatient setting (see Policy Guidelines) is considered **medically necessary**.
- Evaluation of anomalous (native) coronary arteries in patients in whom they are suspected may be considered **medically necessary**.
- Contrast-enhanced coronary computed tomography angiography for coronary artery evaluation is considered **investigational** for all other indications.

Computed Tomography to Detect Coronary Artery Calcification; Last updated March 2018 (CPT 75571)
No coverage for CAC - investigational

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)

**Medically Necessary:**
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered **medically necessary** for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered **medically necessary** for the evaluation of **stable chest pain in individuals at intermediate risk of coronary artery disease** as an alternative to invasive coronary angiography.

**Not Medically Necessary:** (CPT 75572, 75573)
- Coronary computed tomography angiography (CCTA) is considered **not medically necessary** for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered **not medically necessary** for all other indications when the above criteria are not met.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered **investigational and not medically necessary** for the detection of coronary artery calcium, including, but not limited to, the following indications:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals in conjunction with a coronary CT angiography (CCTA).
RAD 604.007 Coronary Computed Tomography Angiography, Including Noninvasive Fractional Flow Reserve; Last reviewed December 2017 (CPT 75574, 75573, 75572)

Evaluation of individuals without known coronary artery disease (CAD) who present with acute chest pain in the emergency room or emergency department setting may be considered medically necessary.

Evaluation of symptomatic individuals with suspected ischemic heart disease, who meet guideline criteria for a noninvasive test in the outpatient setting may be considered medically necessary.

The choice of test will depend on:

1. Interpretability of the electrocardiogram; and
2. Ability to exercise; and
3. Presence of comorbidities.

Evaluation of anomalous (native) coronary arteries in individuals in whom abnormal coronary arteries are suspected may be considered medically necessary.

CCTA, with or without contrast enhancement, as an adjunct to other testing, may be considered medically necessary for the evaluation of cardiac structure and function to:

- Assess complex congenital heart disease, including anomalies of coronary circulation, great vessels, and cardiac chambers and valves;
- Assess suspected arrhythmogenic right dysplasia, left ventricular function when cardiomyopathy is suspected or established, and right ventricular function when right ventricular dysfunction is suspected in individuals with technically limited images from echocardiography (ECG), magnetic resonance imaging (MRI), or transesophageal echocardiography (TEE);
- Assess suspected or established dysfunction of prosthetic cardiac valves in individuals with technically limited images from ECG, MRI, or TEE;
- Assess coronary arteries in individuals with new onset heart failure when ischemia is the suspected etiology and cardiac catheterization and nuclear stress test are not planned;
- Assess a cardiac mass (suspected tumor or thrombus) in individuals with technically limited images from ECG, MRI, or TEE;
- Assess a pericardial condition (such as, pericardial mass, constrictive pericarditis, pericardial effusion, or complications of cardiac surgery in patients) with technically limited images from ECG, MRI, or TEE;
- Perform non-invasive coronary vein mapping prior to placement of a biventricular pacemaker;
- Perform non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization
- Evaluate pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation;
- Evaluate cardiac aneurysm and pseudoaneurysm
- Evaluate thoracic aortic aneurysm (TAA) (such as suspected aneurysm in individuals who have not undergone computed tomography (CT) or MRI within the preceding 60 days, confirmed TAA in individuals with new or worsening symptoms, or suspected aortic dissection (with or without worsening symptoms or pre-operative planning);
- Assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

Considered experimental, investigational and/or unproven for all other indications, including but not limited to:

- Screening asymptomatic individuals for CAD
- Evaluating asymptomatic individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing;
- Evaluating individuals for any other indication not listed above, including but not limited to high or low pretest probability (low risk defined as <10% and high risk as >90%) of CAD
- CCTA performed using a multi-detector row CT scanner with less than 64-slice scanner is considered experimental, investigational and/or unproven.

Noninvasive Fractional Flow Reserve Computed Tomography (CPT 0501T, 0502T, 0503T, 0504T)

The use of noninvasive fractional flow reserve (FFR) following a positive CCTA may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of CAD (i.e., suspected or presumed stable ischemic heart disease).
The use of noninvasive FFR computed tomography (FFR\textsuperscript{CT}) simulation not meeting the criteria above is considered experimental, investigational and/or unproven.

**NOTE 2:** If CT imaging is done of the blood vessels it is not necessarily a CCTA. A CCTA must include reconstruction post-processing of the angiographic images and interpretations, which is a key distinction between a CCTA and conventional CT. If the reconstruction post-processing is not done, it is not considered a CCTA study.

**MAY BE CONSIDERED MEDICALLY NECESSARY** for any of the following indications:

A. Detection of coronary artery disease (CAD) in:

Symptomatic individuals (such as, chest pain syndrome as described by the American College of Cardiology [ACC]) who:

1. Have intermediate pre-test probability of CAD (as identified by the ACC guidelines) AND
2. Had a non-diagnostic stress electrocardiograph (ECG or EKG) (as defined by the ACC guidelines) AND
3. Have a contraindication to an exercise stress test or for whom the results are equivocal or suspected to be inaccurate

Symptomatic individuals with unexplained chest pain or anginal equivalent symptoms (as described by the ACC) who:

1. Have intermediate pre-test probability of CAD (as identified by the ACC guidelines); AND
2. Had no ECG changes suggestive of ischemia or infarction; AND
3. Had negative cardiac enzymes and cardiac marker results; AND
4. Have a contraindication to an exercise stress test or for whom the results are equivocal or suspected to be inaccurate.

B. Evaluation of cardiac structure and function:

1. To assess complex congenital heart disease, including anomalies of coronary circulation, great vessels and cardiac chambers and valves; OR
2. To assess coronary arteries in individuals with new onset heart failure when ischemia is the suspected etiology and cardiac catheterization and nuclear stress test are not planned; OR
3. To assess a cardiac mass (suspected tumor or thrombus) in individuals with technically limited images from echocardiography, magnetic resonance imaging (MRI) or transesophageal echocardiography (TEE); OR
4. To assess a pericardial condition (such as, pericardial mass, constrictive pericarditis or complications of cardiac surgery in patients) with technically limited images from echocardiography, MRI or TEE; OR
5. For non-invasive coronary vein mapping prior to placement of a biventricular pacemaker; OR
6. For non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization; OR
7. For evaluation of pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation; OR
8. To assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

Evaluation of Chest pain in the Emergency Department:

CTA, with or without contrast enhancement or media, utilizing 64-slice or greater MDCT scanner: acute chest pain and without known CAD in the emergency room or emergency department MAY BE CONSIDERED MEDICALLY NECESSARY.

CTA, using MDCT, to screen asymptomatic individuals for CAD or to evaluate individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing IS CONSIDERED INVESTIGATIONAL.

CTA, using MDCT, for any other indication not listed above IS CONSIDERED INVESTIGATIONAL

CAM 60103; Computed Tomography to Detect Coronary Artery Calcification; Last reviewed July 2017; Next review July 2018 (CPT 75571)
CCTA is investigational.

**South Dakota (Wellmark)**

Policy 06.01.20 – Computed Tomography Angiography of the Coronary Arteries; Last reviewed April 2016 (no longer listed on the web as of January 10, 2018). Policy likely under revision now. (CPT 75574)

The use of CCTA is considered not medically necessary as a screening study for asymptomatic individuals because its effectiveness for this indication has not been established.

Computerized Tomographic Angiography Coronary Arteries (CCTA) may be considered medically necessary for the following indications:

Evaluation of suspected cardiac chest pain when all of the following are met:

- No known history of coronary artery disease (CAD); and
- Low or intermediate pre-test probability of coronary artery disease (CAD) (using Framingham risk score calculation); and
- ECG normal/non-diagnostic for etiology of chest pain
Evaluation of suspected coronary artery disease (CAD) including those individuals with prior abnormal cardiac testing (myocardial perfusion imaging (MPI) or stress echo)

- Individual with abnormal MPI or stress echo within the preceding 90 days suspected to be false positive on the basis of low coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation).
- Individual with an equivocal MPI or stress echo within the preceding 90 days who have low or intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation).

Individuals with congestive heart failure/cardiomyopathy/left ventricular dysfunction

- For exclusion of coronary artery disease in patients with left ventricular ejection fraction <55% and intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation) in whom coronary artery disease has not been excluded as the etiology of the cardiomyopathy.

Evaluation for non-coronary artery cardiac surgery

- Individual with intermediate coronary heart disease risk (using standard methods of risk assessment such as the SCORE risk calculation) and being evaluated for non coronary artery cardiac surgery (including valvular and ascending aortic surgery) to avoid an invasive angiogram. All the necessary pre-operative information can be obtained using cardiac CT.

Congenital coronary artery anomalies

- For evaluation of suspected congenital anomalies of the coronary arteries

Medical Policy 06.01.06, Coronary Artery Calcium Scoring; Last reviewed July 2017 (CPT 75571)

Coronary artery calcium scoring by means of computed tomography is considered investigational for all indications.

Medical Policy Manual: CCTA, Last reviewed February 2018 (CPT 75574)

MEDICAL APPROPRIATENESS

Coronary computed tomographic angiography (CCTA) is considered medically appropriate if ALL of the following are met:

Indicated for ANY ONE of the following:

Evaluation of suspected coronary artery disease if ALL of the following are met:

- Symptomatic individual
- Very low to intermediate risk on the pre-test probability assessment

Indicated for ANY ONE of the following:

- Individual is unable to perform exercise or pharmacologic imaging stress test
- Stress test is uninterpretable, equivocal, or a false positive is suspected CCTA will replace invasive coronary angiogram

Evaluation of post-CABG graft patency if ALL of the following are met:

- Symptomatic individual
- Imaging of native coronary artery anatomy is not necessary
- Evaluation of bypass graft location for planned CABG revision
- Symptomatic individual with unsuccessful conventional coronary angiography

Coronary artery anomalies suspected and ANY ONE of the following:
- Persistent exertional chest pain and normal stress test
- Full sibling(s) with history of sudden death syndrome
- Full sibling(s) with documented anomalous coronary artery
- Resuscitated sudden death and contraindications for conventional coronary angiography

New diagnosis of congestive heart failure or cardiomyopathy if **ALL** of the following are met:

- No prior history of coronary artery disease
- Ejection fraction less than 50 percent
- Low or intermediate risk on pre-test probability assessment

**ABSENCE** of **ALL** of the following since diagnosis

- Cardiac catheterization
- SPECT
- Cardiac PET
- Stress echocardiogram
- Equivocal coronary artery anatomy on conventional cardiac catheterization

Preoperative assessment of coronary arteries for **ANY ONE** of the following surgeries:

- Aortic dissection
- Aortic aneurysm
- Valvular surgery

Evaluation of coronary arteries in **ANY ONE** of the following conditions:

- Unexplained new onset of heart failure
- New diagnosis of dilated cardiomyopathy
- Vasculitis
- Takayasu's Disease
- Kawasaki's Disease
- Ventricular tachycardia (6 beat runs or greater)
- Cardiac trauma

**ABSENCE** of **ALL** of the following:

- Use in asymptomatic individuals
- Evaluation of coronary arteries following heart transplantation
- Evaluation of coronary stent patency
- Evaluation of left ventricular function following myocardial infarction or in chronic heart failure
- Used to identify plaque composition and morphology
- Used for myocardial perfusion and viability studies
- Preoperative assessment for non-cardiac, non-vascular surgery
- Repeat or for use in follow-up of CAD
- BMI of 40 or greater
- Multifocal atrial tachycardia
- Renal insufficiency
- Irregular heart rhythms (e.g., atrial fibrillation/flutter, frequent irregular premature ventricular contractions or premature atrial contractions, and high grade heart block)

CPT 75571
No coverage for CAC. Last reviewed April 2017.
Evaluation of individuals without known coronary artery disease (CAD) who present with acute chest pain in the emergency room or emergency department setting may be considered medically necessary.

Evaluation of symptomatic individuals with suspected ischemic heart disease, who meet guideline criteria for a noninvasive test in the outpatient setting may be considered medically necessary.

The choice of test will depend on:
1. Interpretability of the electrocardiogram; and
2. Ability to exercise; and
3. Presence of comorbidities.

Evaluation of anomalous (native) coronary arteries in individuals in whom abnormal coronary arteries are suspected may be considered medically necessary.

CCTA, with or without contrast enhancement, as an adjunct to other testing, may be considered medically necessary for the evaluation of cardiac structure and function to:

- Assess complex congenital heart disease, including anomalies of coronary circulation, great vessels, and cardiac chambers and valves;
- Assess suspected arrhythmogenic right dysplasia, left ventricular function when cardiomyopathy is suspected or established, and right ventricular function when right ventricular dysfunction is suspected in individuals with technically limited images from echocardiography (ECG), magnetic resonance imaging (MRI), or transesophageal echocardiography (TEE);
- Assess suspected or established dysfunction of prosthetic cardiac valves in individuals with technically limited images from ECG, MRI, or TEE;
- Assess coronary arteries in individuals with new onset heart failure when ischemia is the suspected etiology and cardiac catheterization and nuclear stress test are not planned;
- Assess a cardiac mass (suspected tumor or thrombus) in individuals with technically limited images from ECG, MRI, or TEE;
- Assess a pericardial condition (such as, pericardial mass, constrictive pericarditis, pericardial effusion, or complications of cardiac surgery in patients) with technically limited images from ECG, MRI, or TEE;
- Perform non-invasive coronary vein mapping prior to placement of a biventricular pacemaker;
- Perform non-invasive coronary arterial mapping, including internal mammary artery prior to repeat cardiac surgical revascularization;
- Evaluate pulmonary vein anatomy prior to invasive radiofrequency ablation for atrial fibrillation;
- Evaluate cardiac aneurysm and pseudoaneurysm;
- Evaluate thoracic aortic aneurysm (TAA) (such as suspected aneurysm in individuals who have not undergone computed tomography (CT) or MRI within the preceding 60 days, confirmed TAA in individuals with new or worsening symptoms, or suspected aortic dissection (with or without worsening symptoms or pre-operative planning);
- Assess coronary arteries in asymptomatic patients scheduled for open heart surgery for valvular heart disease in lieu of invasive coronary arteriography.

Considered experimental, investigational and/or unproven for all other indications, including but not limited to:

- Screening asymptomatic individuals for CAD;
- Evaluating asymptomatic individuals with cardiac risk factors in lieu of cardiac evaluation and standard non-invasive cardiac testing;
- Evaluating individuals for any other indication not listed above, including but not limited to high or low pretest probability (low risk defined as <10% and high risk as >90%) of CAD;
- CCTA performed using a multi-detector row CT scanner with less than 64-slice scanner is considered experimental, investigational and/or unproven.

Noninvasive Fractional Flow Reserve Computed Tomography (CPT 0501T, 0502T, 0503T, 054T)

The use of noninvasive fractional flow reserve (FFR) following a positive CCTA may be considered medically necessary to guide decisions about the use of invasive coronary angiography in patients with stable chest pain at intermediate risk of CAD (i.e., suspected or presumed stable ischemic heart disease).

The use of noninvasive FFR computed tomography (FFRCT) simulation not meeting the criteria above is considered experimental, investigational and/or unproven.
NOTE 2: If CT imaging is done of the blood vessels it is not necessarily a CCTA. A CCTA must include reconstruction post-processing of the angiographic images and interpretations, which is a key distinction between a CCTA and conventional CT. If the reconstruction post-processing is not done, it is not considered a CCTA study.

RAD 604.009, Computed Tomography to Detect Coronary Artery Calcification, Last reviewed March 2017 (CPT 75571)

CAC coverage

Utah (Regence) 5/18

Indications as of Nov 2015; no Coronary CTA current policy published on website as of 5/18. (CPT 75574)

a. Anomalous coronary artery mapping
b. ED evaluation of CAD in patients with acute chest pain without known CAD

d. Other indications as of 5/18

Policy No. 6, Computed Tomography to Detect Coronary Artery Calcification; Last reviewed October 2017, next review October 2018 (CPT 75571)

No CAC coverage.

Vermont 5/18

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary: (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered not medically necessary for all other indications when the above criteria are not met.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)

The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following indications:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals in conjunction with a coronary CT angiography (CCTA).
6.01.035 Cardiac Computed Tomography and Coronary CT Angiography next review December 2018

The following indications for use of CT of the heart and CTA are based on the Appropriateness Criteria established by the American College of Cardiology Foundation.

(CPT 75573,75572) Computed tomography (CT) of the heart, with or without angiography, to evaluate cardiac structure and morphology for:
• Congenital heart disorders
• Evaluation of pulmonary veins prior to a pulmonary vein isolation procedure for atrial fibrillation
• Identification of coronary veins prior to insertion of a biventricular pacemaker.

(CPT 75574) Computed tomography angiography (CTA) using scanners of 64 slices or greater for evaluating coronary circulation:
• As an alternative to conventional invasive coronary angiography in patients who have had an equivocal stress ECG
• For the evaluation of suspected congenital anomalies of the coronary circulation
• For the evaluation of symptoms consistent with cardiac ischemia in patients determined to be at low to intermediate risk (Framingham criteria) for coronary artery disease
• Not recommended for screening in asymptomatic patients

Policy 6.01.003; Computed Tomography to Detect Coronary Artery Calcification; Last reviewed February 2017

(CPT 75571) The indications for the use of EBCT to detect coronary artery calcification have been updated based upon the Appropriateness Criteria established by the American College of Cardiology Foundation (2013) and include:
• symptomatic individuals who have had an equivocal non-invasive workup where additional diagnostic information is required, but are not immediate candidates for cardiac catheterization
• asymptomatic adults at intermediate risk of a cardiac event (10% to 20% ten year risk).

  • Prior to myocardial revascularization for ischemic left ventricular systolic dysfunction.  
  • Other imaging modalities are inadequate or contraindicated.  
  
  **Evaluation of Intra and Extra Cardiac Structures**  
  **Characterization of native cardiac valves.**  
  • Suspected clinically significant valvular dysfunction.  
  • Inadequate images from other noninvasive methods.  
  • Re-evaluation (less than one (1) year) of the size and morphology of the aortic sinuses and ascending aorta in patients with a bicuspid aortic valve (AV) and an ascending aortic diameter greater than 4 cm with ONE of the following: vAortic diameter greater than 4.5 cm; or Rapid rate of change in aortic diameter; or Family history (first-degree relative) of aortic dissection.  
  • Alternative imaging modality: CMR A (8), TTE A (7).  
  • Characterization of prosthetic cardiac valves.  
  • For assessment of prosthetic valve thrombosis for suspected clinically significant valvular dysfunction.  
  • Inadequate images from other noninvasive method.  
  • Severe tricuspid regurgitation (TR) and suboptimal TTE images, for assessment of RV systolic function and systolic and diastolic volumes.  
  • Alternative imaging modality is cardiac magnetic resonance (CMR) A (8.  
  • Evaluation of cardiac mass (suspected tumor or thrombus.  
  • Inadequate images from other noninvasive methods.  
  • Evaluation of pericardial anatomy.  
  • Evaluation of pulmonary vein anatomy. |
Prior to radiofrequency ablation for atrial fibrillation.
Noninvasive coronary vein mapping.
Prior to placement of biventricular pacemaker.
Localization of coronary bypass grafts and other retrosternal anatomy (for “localization of coronary bypass grafts” CCTA preferred and for “other retrosternal anatomy” Heart CT preferred)
Prior to preoperative chest or cardiac surgery.

Policy X-54-026, CTA Coronary Arteries and Fractional Flow Reserve CT; Last reviewed October 2017 (CPT 075574 0501T, 0502T, 0503T, 054T)

FFR-CT may be considered medically necessary when ALL of the following are met:
Prior to CCTA, the patient was stable with a pre-test probability between 20% and 80% of significant, ischemia-producing CAD, based upon reliable calculations, (i.e., Diamond Forrester, ESC Consortium, University of Washington, or similar calculators); and
The patient had at least ONE of the following scenarios:
A pretest probability of 20-50% (low-to-moderate) prior to CCTA and was selected for evaluation with CCTA as a non-invasive test for significant CAD. The CCTA result shows lesions of greater than or equal to 50%; or
A pretest probability of 51-80% (moderate or high mode rate) prior to CCTA and was selected for evaluation with CCTA as a non-invasive test for significant CAD. The CCTA result shows lesions of 30-50%.

Wisconsin (Anthem) 5/18

CG-MED-58, Coronary Artery Imaging: Contrast Enhanced CT Angiography, Fractional Flow Reserve Derived from CT (CPT 75574, 0501T, 0502T, 0503T, 054T)

Medically Necessary:
Contrast-enhanced coronary computed tomography angiography (CCTA), is considered medically necessary for the evaluation of suspected anomalous coronary arteries:
- In pediatric individuals (age less than 18 years), either before or after conventional angiography
- In adults (age 18 and over) when conventional angiography has been unsuccessful or has provided equivocal results and the results could impact treatment.

Fractional Flow Reserve derived from Computed Tomography (FFRCT) is considered medically necessary for the evaluation of stable chest pain in individuals at intermediate risk of coronary artery disease as an alternative to invasive coronary angiography.

Not Medically Necessary:  (CPT 75572, 75573,)
- Coronary computed tomography angiography (CCTA) is considered not medically necessary for all other indications, including, but not limited to, the following:
  - Screening for coronary artery disease (CAD), either in asymptomatic individuals or as part of a preoperative evaluation
  - Diagnosis of CAD, in individuals with acute or non-acute symptoms, or after a coronary intervention; or
  - As a technique to evaluate cardiac function.
- Fractional flow reserve derived from computed tomography (FFRCT) is considered not medically necessary for all other indications when the above criteria are not met.

RAD 00001, Computed Tomography to Detect Coronary Artery Calcification; Last review date: May 4, 2017 (CPT 75571)
The use of electron beam computed tomography (EBCT), helical CT or multi-slice spiral (also known as multi-row detector) CT (MSCT) is considered investigational and not medically necessary for the detection of coronary artery calcium, including, but not limited to, the following:
- as part of a cardiac risk assessment in asymptomatic or symptomatic individuals;
- as a diagnostic test in individuals considered at intermediate risk for coronary artery disease, where other cardiac tests have been inconclusive;
- as a diagnostic test in symptomatic individuals;
in conjunction with a coronary CT angiography (CCTA).

Wyoming 5/18

Policy 601430, Contrast Enhanced Computed Tomography for Coronary Artery Evaluation; Last review date September 2017; next review date September 2018 (CPT 75574)
- Evaluation of patients without known coronary artery disease and acute chest pain in the emergency department setting is considered **medically necessary**.

- Evaluation of patients with stable chest pain and meeting guideline criteria for a noninvasive test in the outpatient setting (see Policy Guidelines) is considered **medically necessary**.

- Evaluation of anomalous (native) coronary arteries in patients in whom they are suspected may be considered **medically necessary**.

CCTA is considered **investigational** for all other indications.

**Policy 601030, Computed Tomography to Detect Coronary Artery Calcification; Last review date September 2017; next review date September 2018 (CPT 75571)**

**6.01.035 Cardiac Computed Tomography and Coronary CT Angiography next review December 2018**

The following indications for use of CT of the heart and CTA are based on the Appropriateness Criteria established by the American College of Cardiology Foundation.

(CPT 75573, 75572) Computed tomography (CT) of the heart, with or without angiography, to evaluate cardiac structure and morphology for:
- Congenital heart disorders
- Evaluation of pulmonary veins prior to a pulmonary vein isolation procedure for atrial fibrillation
- Identification of coronary veins prior to insertion of a biventricular pacemaker.

(CPT 75574) Computed tomography angiography (CTA) using scanners of 64 slices or greater for evaluating coronary circulation:
- As an alternative to conventional invasive coronary angiography in patients who have had an equivocal stress ECG
- For the evaluation of suspected congenital anomalies of the coronary circulation
- For the evaluation of symptoms consistent with cardiac ischemia in patients determined to be at low to intermediate risk (Framingham criteria) for coronary artery disease
- Not recommended for screening in asymptomatic patients

**Policy 6.01.003; Computed Tomography to Detect Coronary Artery Calcification; Last reviewed February 2017**

(CPT 75571) The indications for the use of EBCT to detect coronary artery calcification have been updated based upon the Appropriateness Criteria established by the American College of Cardiology Foundation (2013) and include:
- Symptomatic individuals who have had an equivocal non-invasive workup where additional diagnostic information is required, but are not immediate candidates for cardiac catheterization
- Asymptomatic adults at intermediate risk of a cardiac event (10% to 20% ten year risk).
