

# Music Perception with Combined Stimulation

Kate Gfeller<sup>1,2,4</sup>, Virginia Driscoll,<sup>4</sup> Jacob Oleson,<sup>3</sup> Christopher  
Turner,<sup>2,4</sup> Stephanie Kliethermes,<sup>3</sup> Bruce Gantz<sup>4</sup>

School of Music,<sup>1</sup> Department of Communication Sciences & Disorders,<sup>2</sup> Department of  
Biostatistics,<sup>3</sup>

Iowa Cochlear Implant Clinical Research Center,<sup>4</sup>

Department of Otolaryngology,

The University of Iowa Hospitals and Clinics

# Acknowledgements

This study was supported by grant 2 P50 DC00242 from the NIDCD, NIH; grant RR00059 from the General Clinical Research Centers Program, NCRR, NIH; Grant 1R01DC012082-01A1 from NIH-NIDCD, and the Iowa Lions Foundation.

# Background

- Low-frequency information available through preserved acoustic hearing can assist CI recipients in segregating the target speech signal from background noise.

(Gantz & Turner, 2003; Gantz et al., 2006; Turner et al., 2004)

- Low-frequency information available through preserved acoustic hearing can also assist CI recipients in perception of **salient features of music** (Dorman et al., 2008; El Fata et al., 2009; Galvin et al., 2009; Gantz et al., 2006; Gfeller et al., 2006, 2007, 2009; Kong et al., 2004; Turner et al., 2005, 2007)

# Salient Features of Music

- Rhythm
  - Tempo, basic beat
  - Duration of individual notes
- Timbre
  - Identification of voices, instruments, blends
  - Sound quality
- Pitch
  - Interval size, direction of pitch change = melody
  - Concurrent pitches=harmony

# Salient Features of Music

- Rhythm
  - Tempo, basic beat
  - Duration of individual notes
- Timbre
  - Identification of voices, instruments, blends
  - Sound quality
- Pitch
  - Interval size, direction of pitch change = melody
  - Concurrent pitches=harmony
- Lyrics in vocal music

# Technical Issues: Music vs. Speech

- Differences in acoustic input of speech and music
  - Frequency range
    - Speech: 250-8000 Hz
    - Music: 27-well above 8000 Hz
  - Spectrum
    - Speech: well controlled spectrum
    - Music: highly variable and rapidly changing spectrum.
  - Intensity
    - Speech: 53-83 dB SPL
    - Music: 10-120 dB SPL; rapid changes in amplitude
- Music requires better resolution of pitch/spectral shape

# Music Perception

## Stimuli

- Isolated structural features
  - Pitch, timbre, duration
- Computer-generated combinations
  - e.g., pitch + rhythm
- Real-world combinations
  - pitch (melody, harmony), timbre, duration, amplitude, lyrics.

## Measure

- Perceptual accuracy
  - Detection, discrimination, recognition
- Appraisal
  - Sound quality and enjoyment

# Pitch Ranking

Gfeller et al., 2007

# Melody Recognition

(Gfeller et al., 2006, 2007, 2010)

# Interval Normalization

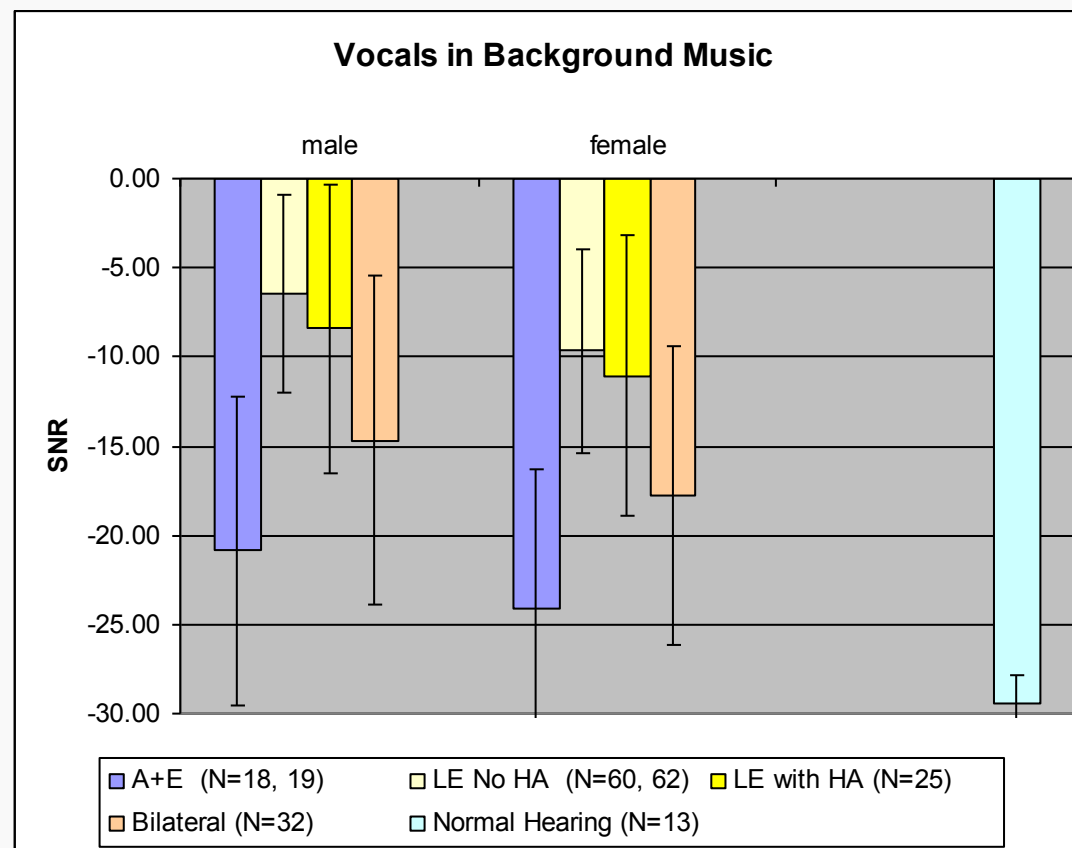

# Timbre Recognition

Gfeller et al., 2006

# Lyrics Recognition

# Music as Background Noise

- Music functions as a masker of speech sounds in many real-life situations (e.g., music at a party, MUZAK, music scores in movies).

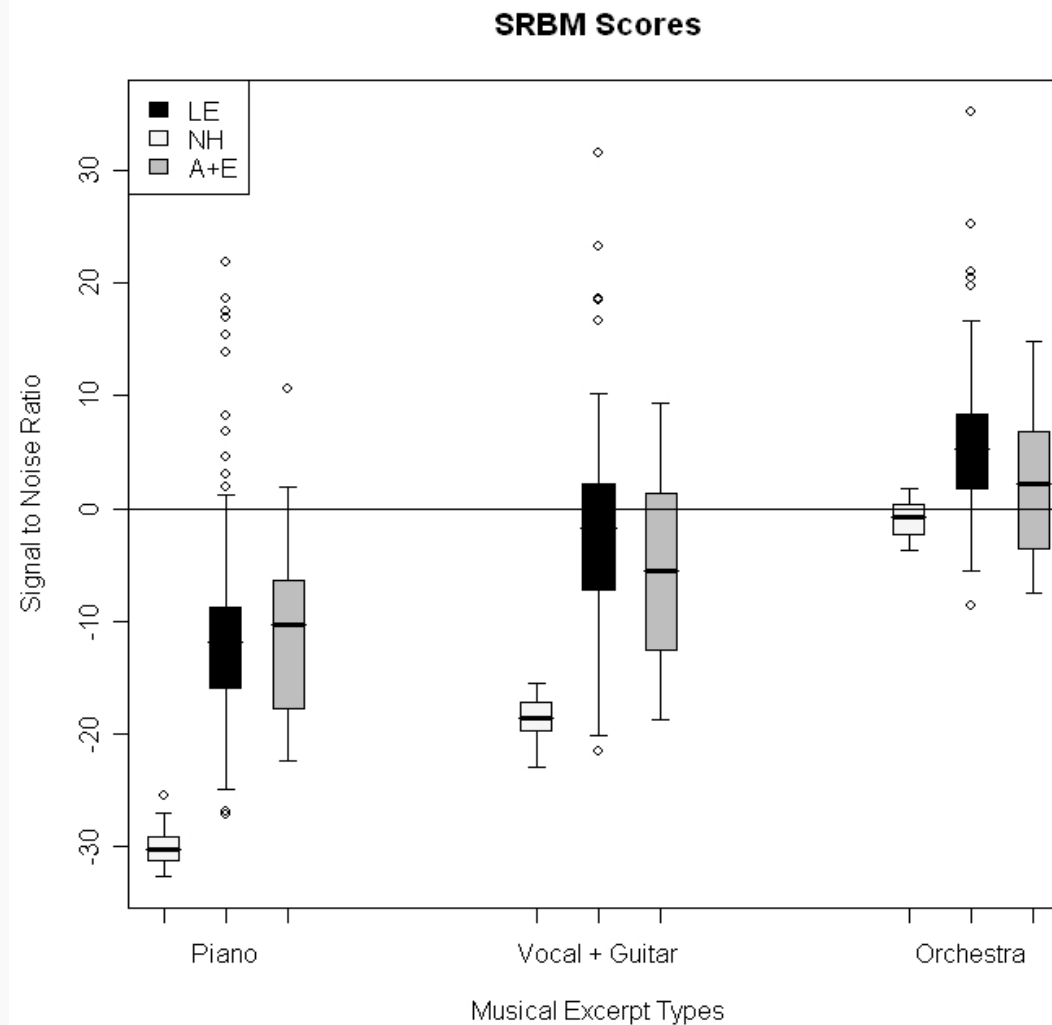

# Speech Recognition in Background Music Test (SRBM)

- **Recognition of 12 spondees** (as described in Turner et al., 2004)
  - against 3 types of background music
    - piano solo
    - vocal solo + bass and guitar accompaniment
    - large orchestra
- **Participants**
  - 154 long electrode CI recipients (LE); 21 Hybrid recipients (A+E); 49 normal hearing adults (NH)

# Speech Recognition in Background Music

Gfeller et al., 2012

# Pitch and Speech

- Pitch perception correlated with
  - Speech in background noise (Gantz & Turner, 2003; Gantz et al., 2006; Gfeller, Turner, et al., 2012; Turner et al., 2004)
  - Recognition of prosody marking linguistic contrasts (See, Driscoll, Gfeller et al., 2013)
  - Tone discrimination in Mandarin Chinese (Xu, 200x)
  - Talker discrimination (recognition) (Johnson, Driscoll, Gfeller et al., 2011)

# Correlations:

## SRBM X Pitch Ranking, Ripple Test

	<b>SRBM</b>
<b>Pitch Ranking</b> (N=165)	-.26 ( $p<.001$ )
<b>Spectral Ripple</b> (N=15)	-.60 ( $p<.02$ )

# SRBN X SNR: Noise, Babble

	<b>SRBM</b>
<b>SNR</b> (N=124)	
<b>Noise</b>	.72 (p<.001)
<b>Babble</b>	.66 (p<.001)

# Conclusions

- Preserved residual hearing benefits
  - perception of pitch (melody), timbre
  - better extraction of a target speaker from background noise or music

## Spectral Analyses of Musical Stimuli

Piano  
solo
