

Curious Calculus Questions from Students and Colleagues—Part II

Keith Nabb, University of Wisconsin–River Falls

Daniel Nghiem, Moraine Valley Community College

Abstract

Curious questions are those questions based on a hunch or personal interest. While these questions may baffle students and teachers alike, pursuing an answer can potentially lead to a fascinating mathematical journey. Students may be led to important mathematical generalizations while teachers may stumble upon ideas for challenging projects and enrichment. Either way, the situation is a win–win for student and teacher. This article discusses many questions that have been asked over the years, addresses the enduring nature of such questions, and details how to encourage curiosity and investigation in classroom environments.

Keith Nabb teaches mathematics at the University of Wisconsin–River Falls. He earned his PhD in mathematics education from the Illinois Institute of Technology in Chicago, IL. His interests include nonroutine problems, student questioning, and the mathematical knowledge that teachers bring to instruction.

Daniel Nghiem is an instructor at Moraine Valley Community College in Palos Hills, IL. He earned a BS in mathematics at the University of California, Los Angeles, and a MS in pure mathematics at the University of Illinois at Chicago. He is interested in exploring the role of proofs in undergraduate mathematics education.
