Book of

Accepted Abstracts

ACSP 2020 Annual Conference

This book includes the abstracts accepted for presentation at the 2020 Annual Conference. This book was completed and posted to www.acsp.org 06/15/20; revised and reposted 06/25/2020

Notes about this Book

This book includes only the abstracts accepted for presentation at the 2020 Annual Conference. This book was completed and posted to www.acsp.org on June 15, 2020; revised and re-posted June 25, 2020.

Abstract ID

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number that authors should reference to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

Proposal

Organizers of groups of authors intending to submit as a pre-organized session used the abstract submission system to provide an overview or intent of the session, the name of a proposed discussant, and the authors and paper titles of those confirmed to be part of the session. The system assigned a proposal number to the grouping of these abstracts. This number stays with the session throughout the conference. When scrolling through this book and through each track, you'll find the pre-organized session *proposals*. Each proposal will indicate which of the abstracts in the track belong to that session. After the pre-organized session proposals are all of the numerically ordered accepted abstracts within that track. The abstract will also indicate if it is related to a pre-organized session.

Indexes Available

Separate indexes for Author Name and Keywords reference the Abstract ID #. These indexes can be found at the end of this book.

Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract, then sorted numerically by abstract ID.

1) Pre-organized Session Summaries – the overview describes the intent of the session and lists the abstract ID numbers for the included abstracts.
2) Abstracts with the pre-organized sessions
3) Roundtables
4) Paper abstracts
5) Posters

Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For papers (individual paper abstracts, and abstracts within pre-organized sessions) and poster abstracts** - Authors of abstracts in this book and in the final program will be indicated as presenting, primary, or co-authors of the paper. The presenting author is always listed first. No more than eight authors for one paper are included.
- **Roundtables** will have a moderator and participants. The names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will have an organizer included with the summary abstract.

Multiple Program Placement Policy

Multiple abstract submissions on behalf of one author will be reviewed and may possibly be accepted and included in this book. However, more than one presentation of a paper and more than one appearance as a roundtable participant during the conference will not be allowed on the final schedule of presentations. It is, however, possible to present both a poster and a paper, if both proposals are accepted.

Participants on the final program will be limited to:

- one presentation of a paper whether in a formed paper session, or involved in a pre-organized paper session;
- one placement on a roundtable;
- one placement as a discussant of a paper session; and
- one placement in the poster session.

These roles are not interchangeable. If you have more than one submitted paper abstract accepted and are invited to participate on more than one accepted roundtable, in fairness to everyone, we will ask you to limit your participation.

Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the text within the abstracts will not be edited. This book is edited only for formatting consistency.

We do understand the importance of names; that paper titles change as time goes on; and authors are added or dropped. In these instances, any necessary changes for the final program should be sent to abstracts@acsp.org.

Searching this PDF

This document well more than 1000 pages including the Author Index and Key Word Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard Ctrl F.

- Search by Abstract ID: Type the words "Abstract ID: with one space followed by the number. If you try to search for just the number, you'll likely find it in many of the bibliographical references provided by authors. Sample: Abstract ID: 12
- To scan an entire track, use the word Track followed by a track number 1-15. Sample: Track 14
- To get to the Author Index, search for Author Index
- To search by key word, search for Key Word and then scroll alphabetically.

TRACK 1 – PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

EXPERIMENTS IN PLANNING
Pre-Organized Session 12 - Summary
Session Includes 48, 49, 51, 52

HONEY-ROSES, Jordi [University of British Columbia] jhoney@mail.ubc.ca, organizer

Experimental methods remain largely underused by planning researchers and professionals. By adopting experimental research designs, scholars and practitioners can develop research programs that test theory, measure impact, build evidence, and learn about key relationships. While not all planning policies are amenable to experimentation, there is untapped potential to apply experimental approaches in many contexts. This pre-organized session will discuss recent papers that use experimental methods in planning. We follow up on a roundtable organized at the ACSP in Buffalo, New York on the same topic. Since then, our small community of experimentalist in planning has grown. This session will help consolidate an emerging group of scholars in planning that are interested in the use of experimental methods to address pressing planning questions. We would also like to organize a sister-session on "Experiments in Planning" at AESOP in Bristol in July 2020 with the goal of fostering inter-continental collaboration and knowledge exchange.

Objectives:

- Illustrate how planning scholars and practitioners are learning about planning topics such as perceptions of public space, travel behaviour and public engagement
- De-mystify the use of experimental research designs in planning
- Inspire planning scholars to consider the use of experiments in their research

THE IMPACT OF RESIDENTIAL DENSIFICATION ON PERCEPTIONS OF PUBLIC SPACE: A FIELD EXPERIMENT
Abstract ID: 48
Abstract within Pre-Organized Session 12

HONEY-ROSES, Jordi [University of British Columbia] jhoney@mail.ubc.ca, presenting author
ZAPATA, Oscar [University of Regina] Oscar.Zapata@uregina.ca, co-author

Problem, research strategy, and findings: City leaders are under pressure to increase urban residential density in order to provide affordable housing and met sustainability objectives. Yet despite the advantages of urban densification, communities throughout North America persistently oppose new developments and housing projects in their neighborhood. The impact of residential densification on the quality of life for existing residents is ambiguous. We focus on measuring the impact of one key aspect of urban densification: the perceived quality of public space. We use an experimental design to increase pedestrians and stationary users in a residential street for randomly selected periods over three weeks. We collect surveys with and without our pedestrian treatment (N=504) and find that adding users to a

residential street decreased the perceived quality of the public space overall. The changes in perceptions were small yet significant, and illustrate the real tradeoffs that planners must consider when increasing urban density in cities, especially in lower density residential communities.

Takeaway for practice: Increasing the number of public users in a residential neighborhood may slightly decrease the perceived quality of the public space. We present experimental evidence showing that perceptions of women differ from those of men, and women are more sensitive to the addition of public users. Finally, we illustrate how planners may use public life experiments to anticipate how the public might respond to future changes in the public realm.

RANDOMIZED CONTROLLED TRIAL OF COMMUNITY GARDENS: EARLY EXPLORATION OF STUDY APPROACH AND FINDINGS
Abstract ID: 49
Abstract within Pre-Organized Session 12

LITT, Jill [University of Colorado at Boulder] jill.litt@isglobal.org, presenting author
ALAIMO, Katherine [Michigan State University] katherine.alaimo@msu.edu, co-author

HEBERT, James [University of South Carolina] jhebert@mailbox.sc.edu, co-author

Background: Consuming a healthy diet rich in fiber, fruits and vegetables, being active and less sedentary, maintaining a healthy weight, and living in supportive social and built environments are consistently and significantly associated with lower rates of cancer. Despite this, low fruit and vegetable dietary intake, sedentary lifestyle, high BMI, and less supportive environment are more pronounced in low-income communities, and among those who lack access to the social networks and physical amenities that support healthy living. Reducing disparities in cancer preventive behaviors requires theory-informed, socio-ecological approaches. Our research aimed to evaluate the impact of community gardening on BMI, health diet, physical activity and social connectedness in multi-ethnic and low-income communities in Denver, CO using a randomized controlled trial design in a community setting (Alaimo et al., 2016; Litt et al., 2018).

Methods: We randomized participants on Denver Urban Gardens' waitlists to a community garden plot or wait-list control using a stratified, permuted block randomization protocol. Dietary intake, physical

activity, sedentary time, body composition, perceived stress, anxiety and social connectedness data were collected at baseline, mid-intervention, and follow up using objective, observed and self-report data. Using an intent-to-treat analysis and general mixed models, we will present early findings on the association of garden participation with weight status, fruit and vegetable intake and physical activity.

Results: 296 participants were recruited into the study and 234 participants completed the study, achieving a 79% retention goal. We will describe quantitative outcome data for treatment and control groups including anthropometric measurements of height, weight, and waist circumference; accelerometer measured physical activity and sedentary time; repeated 24-hour food intake; and self-reported measures of perceived stress, anxiety, and general well-being.

Conclusion: This project examined the role of community gardens, an environmental amenity in neighborhoods with a strong social organization, as a way to promote positive health behavior change among low income and minority adults in a large urban metropolitan area. Results from this trial, if successful, will provide evidence for a low-cost community-level environmental intervention that supports and sustains healthy and active lifestyles, is accessible to people across social and demographic groups, and reduces cancer risk.

COULD CHANGING NEWS COVERAGE OF TRAFFIC CRASHES SAVE LIVES? EVIDENCE FROM AN EXPERIMENT
Abstract ID: 51
Abstract within Pre-Organized Session 12

RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, presenting author
GODDARD, Tara [Texas A&M University] goddard@tamu.edu, co-author

Car crashes kill thousands of pedestrians in the United States each year, yet have failed to generate substantial, sustained outrage as a public health crisis. We find evidence that media coverage of crashes is partly to blame and argue that simple changes to editorial practices could garner public support for road safety improvements.

This evidence comes from two studies. In a 2018 study, we reviewed 200 local news stories, each describing a car crash involving a person walking or biking. We found that crash coverage has two key shortcomings: 1) it tends to blame the victim through subtle grammatical choices and 2) it treats crashes

as isolated incidents rather than as a recurring, systematic problem.

With that foundation, we sought to measure how much addressing these shortcomings could affect perceptions. To find out, we conducted an experiment in which 999 people read three slightly different descriptions of the same crash. Next, they answered questions about who was to blame for the crash and what should be done to improve pedestrian safety.

Group 1 read typical coverage with sentences like "A pedestrian was hit" and "A pedestrian was hit by a car", both of which make the pedestrian the focus of the sentences and omit the role of the driver entirely. Group 2 read a slightly modified text which shifted the focus to the driver instead of the pedestrian or the vehicle. Group 3 also read a driver-focused text, but with added contextual details about the crash location and the number of crashes in the area.

The results confirm that readers are indeed affected by crash coverage. We find that readers of the driver-focused text were 30 percent less likely to blame the pedestrian and in turn, were 30 percent more likely to blame the driver. More promising still, we found that thematic framing had two effects on readers. First, they were much more likely to attribute the crash to "other factors" (as opposed to the driver or pedestrian) than those who read the other texts. In addition, readers who encountered the thematically framed article preferred different approaches for improving road safety. Namely, they were less likely to support a Walk Smart! Campaign to "train pedestrians to cross the street more safely" and instead were more likely to support new pedestrian infrastructure and lower speeds.

Given these results, we implore journalists to alter their editorial patterns. An easy-to-implement—albeit incomplete—fix is to shift focus away from the pedestrian and instead focus on the driver. A more complete overhaul—and the approach we recommend—is for journalists to connect the dots between seemingly isolated crashes by employing thematic framing. In particular, journalists should describe the crash setting (based on Google Street View if necessary), include local and national data on crashes, and mention strategies to improve safety.

Planning practitioners have a role to play as well. Practitioners should embrace the best practices identified above in all of their own materials. They should not assume that overstretched journalists will have the time to seek them out. Instead, practitioners should proactively reach out to journalists before crashes take place and explicitly make themselves available for comment when a crash inevitably occurs. Finally, transportation practitioners are uniquely positioned to discuss strategies for reducing road deaths such as adding pedestrian infrastructure, narrowing traffic lanes, lowering the default speed limit, and employing automatic speed enforcement.

Simple changes by transportation practitioners and journalists can help the public draw connections between seemingly disparate crashes and increase support for institutional-level changes that will save lives.

Housing abandonment poses a major public health burden that has grown significantly over the past several decades in the US. Understanding ways to mitigate the problems of abandoned housing with cost-effective remediation approaches is a challenge. We will discuss our efforts to address this question through a partnership between university researchers, nonprofit service providers, and city agencies in Philadelphia to conduct a citywide field experiment on hundreds of randomly selected abandoned houses. Abandoned houses were assigned at random to receive the installation of working windows and doors with minimal maintenance (n=59, full treatment); bi-monthly clean-up of graffiti and trash around housing (n=93, graffiti/trash treatment), and no housing remediation or clean-up (n=80, no treatment control). We will discuss the effort to pull off this disorder experiment in the real world, including an analysis of the legal issues that needed to be addressed and policy barriers to implementing the remediation treatment once houses were selected. We will present a qualitative analysis of the implementation of the project to assess how well the intervention changed the physical appearance of disorder around abandoned houses and their surrounding blocks. Finally, we will discuss how the experience from this urban disorder experiment provides lessons for others in urban planning interested in using field experiments to implement and test how changes to the built environment impact populations living in cities.

RICHTER, Steven [The University of Texas at Austin] steven.richter@utexas.edu, organizer, moderator

The recent proliferation of urban data and computing power has allowed planning scholars to conduct nationwide, and in some cases, longitudinal studies of urban form. These studies exhibit increasing diversity in data sources, units-of-analysis, and methodological approaches. There has simultaneously been growing awareness of the many ways in which urban form affects human and environmental well-being from local to global scales. This panel comprises scholars central to this research trajectory. It first reflects on the evolution of these studies, identifying how early obstacles were later overcome. Then it discusses open challenges facing nationwide studies of urban form today. Finally, a dialogue on emerging methodologies and data sources will shed light on the future of urban form research, emphasizing how different approaches might be synthesized into more comprehensive and integrative research that better supports evidence-based planning and policymaking for a more sustainable urban future.

Scholarly and public debates about smart city technology have typically focused on broad issues (e.g., surveillance) or the implications of specific technologies on cities (e.g. autonomous connected vehicles). Smart city implementation--whether through citywide programs such as in Columbus, Ohio, or in smart districts such as Toronto's Quayside--have raised the question of how such initiatives should relate to established planning practices like plans and governance frameworks like zoning. This roundtable will address the question: what changes are needed to the planning process itself to substantively and ethically shape smart city technologies to meet public goals? Reflecting upon how evolving projects like Toronto's Quayside have interacted with existing planning processes, this roundtable will explore the limits of current governance regimes, planning frameworks, and tools, and seek to lay the groundwork for next-generation smart city planning.

BIG DATA AND URBAN PLANNING
Abstract ID: 939
Roundtable

PARK, JIYOUNG [University at Buffalo, SUNY] jp292@buffalo.edu, participant
KANG, Myounggu [University of Seoul] mkangcity@gmail.com, Co-Author, moderator
LEE, Dong Kun [Seoul National University] dklee7@snu.ac.kr, participant

In 2019, a special forum about "Technology revolution and the network of spaces" was offered with Korean colleagues, which provided an opportunity about how new technologies associated with the fourth industrial revolution can affect individual locational choice, and hence, how spatial network would change in the future. As a continuing brainstorm, another forum at this ACSP 2020 will provide an opportunity to discuss how big data has been contributing to forming urban areas and what urban planners need to prepare and utilize in the big data era. Digital transformation, so called the fourth industrial revolution requires full capacity of processing unlimited data to hyper-connect us and our areas via internet. Experiencing the technical revolution and transformation of life is in maintaining super-high speed of internet so that all the data can be processed properly and correctly without any missing. Indeed, various science and technology fields, such as quantum computing technologies, AI (artificial intelligence), IoT (Internet of Things), AV (autonomous vehicles), Robotics, AR/VR (augmented reality/ virtual reality), BT/NT (bio- and nano-technologies) 3D-printing, and so on, have been evolving to figure out problems in achieving the digital revolution. To urban planners, yet, we have not realized how the digital revolution can be adapted to the urban planning process. For example, some cities already applied digital twin concept to urban areas by constructing a 3D-based city model. A common issue in the 3D model is who, what and how we can fill in each building, land, and 3D space of specific city. If considering dynamic flows of people and business by time, the mobility information would be another challenge in collecting data. This forum will be composed of three journal editors who have handled big data, urban planning, environments, and various science and technology policy issues in South Korea. They will discuss and share academic, teaching and professional experiences with urban planners. The issues will cover from research and pedagogical education. Therefore, this forum will be helpful to other planners and practitioners who are preparing a new course or research topics related with big data and digital-based development. It is highly expected to discuss land use changes in commuting, public transportation, and various urban environments, and the future of urban and regional planning.

Cities have been revolutionized by technologies throughout history – from the sewage pipe to the shipping container – and these technologies go hand in hand with the policies that both enable and regulate them (Rip and Kemp 1998). Transform happens at the pace of public problem-solving processes (Yankelovich and Friedman 2010). What is the role of planners in deciding what new ideas are fostered, what selection criteria choose them, and how 'good' technologies are integrated into our cities?

Contemporary cities are presented with many different possible futures founded on widely varying models. The private sector sees opportunities for disruption (the startup accelerator YCombinator has a strategic focus on cities; see Yates 2017: Cheung 2016); national governments and international frameworks see opportunities for simultaneous solution-finding and economic development (Mazzucato 2017); and individuals see opportunities for citizen science or bottom-up creativity (like Pittsburgh's public library patrons, who can check out air pollution monitors to quantify and mitigate exposures specific to their communities, or Amsterdammers with 'Smart Citizen Kits' from de Waag Society).

How do these different approaches intertwine? Are they moving our cities in a desirable direction? How do we know? How do we decide? And who is included in the "we" that does the knowing and deciding? These questions will define who cities are optimized for (and habitable to) in the future, setting the terms and the tradeoffs of urban life (Greenfield 2017). This roundtable will bring together scholars of urban planning, practitioners of technology and policy, and philanthropists with expertise in outcomes-based work to discuss urban innovation as a public problem-solving process, with a focus on ideation, deliberation and incorporation (Campbell 1979). Key questions include:

1. Sensors and other digital trace data quantify individuals with unprecedented granularity -- but the usefulness of this quantification often remains elusive. How is data best put to work? How can initiatives balance outcomes-driven and evidence-based initiatives with a continued need for inductive work on more unruly yet important contemporary problems?

2. There seems to be a divergence between directed technical evolution – like the missions (Mazzucato 2017) that Europe has enthusiastically embraced – and stochastic evolution – as in civic tech ecosystems of start-ups and citizen-directed initiatives (Thierer 2017). Are these approaches mutually exclusive? Does one supersede the other?

3. Former New York City Mayor Michael Bloomberg argued "If you can't measure it, you can't manage it" (Yates 2017: Goldsmith & Crawford 2014). Critical challenges like gentrification, social justice, and equity evade easy quantification, but a dearth of adequate metrics should not be an excuse to deprioritize critical concerns. Are planning problems, by their nature, "wicked" problems (Webber & Rittel 1973) that have no clear solution; or can wicked problems be tamed with data?

4. Technological initiatives often become salient (and politicized) only when they fail – but an initiative that can only produce positive results is a performance, not an experiment (Callon 2001). When can and should people involved in this work acknowledge failure? What processes can help us to better learn from unsuccessful initiatives?

5. Critiques of the Smart City often emphasize two possible dystopian futures: an Orwellian surveillance state or a Huxleyan future in which residents cash in autonomy and privacy for technologically enhanced lives (Yates 2017; Zuboff 2019). Can we imagine alternative futures in

which the benefits of big data and sensing are realized without undermining privacy? What major legal, social, or technological challenges would need to be overcome?

Reflecting on contributors' work and case studies, we will focus on the lessons learned and guidance for future practice.

Relatively recent advances in processing power, "big" data availability, and algorithmic development and application in decision-making have changed the way that urban planning scholars can understand cities and inform policy. Information sensed from smartphones, scraped from websites like Craigslist and Twitter, and crowdsourced are just a few examples of emerging urban data sources. Using these data, and employing some combination of advanced computing and statistical analyses, planning scholars are doing and teaching "urban data science" [1].

New data sources, computational tools, and analysis techniques can, perhaps, offer us a different or more nuanced perspective of how people interact with and within cities, and how planners can work to create more sustainable, diverse, and equitable urban futures [2], This certainly makes urban data science seem like an attractive toolkit for planners seeking insight on urban processes in order to understand and manage cities in the present and predict how particular phenomena or interventions will produce certain outcomes or achieve stated goals looking ahead [3] But is it? Under what conditions is it attractive to whom, and for what? Provided we see in early stages that there are multiple definitions of "urban data science" and plural understandings of how it's done [4], do we collectively understand what urban data science is, and importantly, how it ought to be done? How does urban data science fit into ethical conceptions of contemporary planning? [5].

This roundtable gathers together a group of distinguished scholars, experts in data science and urban planning, to discuss the challenges and opportunities that planning scholars and practitioners are facing as

they attempt to move urban data science beyond the hype. We envision this conversation will help the planning community to gain a better understanding of the opportunities and challenges of doing and teaching urban data science. We also hope that this roundtable will provoke continued reflection on whether urban data science has or needs an uncontested definition; whether urban data science lends itself well or poorly to relevant paradigms in planning that address issues of equity and justice; and what embracing urban data science means for planning as an academic discipline, and for planning stakeholders—including individuals and institutions—in practice.

ANALYSIS OF HUMAN MOBILITY PATTERNS USING WIFI SENSING TECHNOLOGY: A CASE STUDY OF A UNIVERSITY CAMPUS
Abstract ID: 5
Individual Paper Submission

PARK, Juhyeon [Ulsan National Institute of Science and Technology] net070@nate.com, presenting author
KIM, Jeongseob [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, primary author

Understanding how people walk and interact with their environment has been critical to urban planning, geography, and many other disciplines. Concise measurement of pedestrian movement and activities on a street enables practitioners to design and qualify policies for a lively pedestrian-friendly city. Conventional measurement has been performed manually, and is limited by cost, time and data accuracy. Furthermore, it is not easy to track a large group of people even with GPS, impeding identification of individual mobility patterns.

We developed a methodological framework which generates individual trajectories with activity patterns using WiFi tracking technology. Most pedestrians today carry smart devices equipped with WiFi network interfaces, and each WiFi packet includes unique 48-bit addresses, known as a Media Access Control (MAC) addresses, enabling a device to be tracked by multiple WiFi sensors. An attempt to count pedestrians at several points by detecting unique devices performed well; However, few studies have explored the generation of pedestrian trajectories and activity patterns, especially in outdoor environments, because sparse and irregular WiFi signals are difficult to track.

We conducted a pilot test on the campus of Ulsan National Institute of Science and Technology (UNIST) to collect WiFi and ground truth data. We deployed 42 WiFi sensors (26 outdoor and 15 indoor) for 26

days, including mid-term examination week, the campus festival period, and days reserved for university admission interviews. By covering the entire campus region (0.224 km² in total), we gathered 745,050,937 WiFi signals from 36,947 non-randomized devices. The ground truth data was obtained from 100 recruited participants who installed a GPS application on their smartphone, each of which gave us a GPS log containing time-stamped latitude and longitude every five seconds with their WiFi MAC addresses.

After joining the GPS log with WiFi data from participants' smartphone in time, we assigned the WiFi data to the sensor network by developing a model based on WiFi features (e.g., detection frequency and signal strength) and the network topology. When these assigned WiFi points were connected, WiFi trajectories were made, and a path inference model based on Hidden Markov Model was applied to predict uncertain routes. Finally, we separated the trajectories into several sections and extracted some features (e.g., speed and group status) to classify them into several types, namely: necessary activity (e.g., attending class) and optional activity (e.g., sitting and resting for a while) based on Jan Gehl's types of outdoor activities.

We created a great opportunity for identifying human mobility patterns using WiFi tracking technology in the outdoor environment. We suggested that overall activity decreased during the mid-term periods and the number of optional and social activities during the festival periods increased near the festival booths. When applied this framework in a commercial district with public WiFi infrastructure, which allowed us to find visitors' major routes, quantify pedestrian activities at street-level and then consider which elements interact and which do not.

MAJOR QUALITY-OF-LIFE DETERMINANTS: AN ANALYSIS OF THEIR RELATIVE AND STRATEGIC IMPORTANCE
Abstract ID: 26
Individual Paper Submission

GIM, Tae-Hyoung Tommy [Seoul National University] taehyoung.gim@snu.ac.kr, presenting author

Based on data from a quality of life survey in Seoul, South Korea, particularly its five-year data of 2013–2017 in which an item on overall happiness is included, this study attempts to evaluate the relative importance of ten happiness determinants as consistently analyzed variables in the literature or transformed from the variables (gender, age, marriage, residential location, educational level, household income, subjectively perceived socioeconomic class, pride as a Seoul citizen, and political orientation as well as survey years for statistical control of the maturation and history biases). Accordingly, the study aims at designing happiness improvement strategies. To this aim, it evaluates not only the importance, but also the current satisfaction level in order to present why a group of people is overall less happy, that is,

among the five independent happiness components (health, finance, relationship with close friends/relatives, home life, and social life), which components are equipped with high importance, but low satisfaction. The evaluation of the importance of the overall happiness determinants is conducted through partial least squares (PLS) regression and the combined evaluation of the importance and satisfaction in relation to individual happiness components through importance–satisfaction analysis (ISA).

PLS regression finds that in the order of the importance, high pride as a Seoul citizen, high perception of socioeconomic class, survey years other than 2014, high household income, and non-elderliness result in higher happiness and albeit small magnitudes, education, residence in Gangnam (affluent districts in Seoul), marriage, and political liberalism have positive effects on overall happiness. Notably, low happiness in 2014 probably reflects the history effect of the sinking of MV Sewol, followed by enormous social costs. Most variables (pride, class perception, income, education, residence in affluent areas, and marriage) turn out to have positive relationships with happiness along with the findings of Western studies. The positive relationships that non-elderliness and political liberalism have with happiness are inconsistent with the findings, but in line with those of previous Japanese and Korean studies.

According to ISA, happiness components with the highest importance are identical or different between the groups of discrete variables, but if the importance and satisfaction are considered together, those with strategic priority turn out to be similar. Thus, if the importance is the only consideration, a judgment on strategic components may be incorrect. Indeed, ISA presents that a strategic priority according to the high importance and low satisfaction is generally to increase the financial happiness of a group of people with lower overall happiness. In addition to financial care, programs on health and home life need to be considered for the older population and those on health, home life, and social life for political conservatives.

ASSESSING SEASONAL VARIATION OF URBAN PARK USAGE USING SMARTPHONE DATA
Abstract ID: 28
Individual Paper Submission

GUAN, ChengHe [New York University Shanghai] chenghe.guan@nyu.edu, presenting author
SONG, Jihoon [Harvard University] jihoon.song99@gmail.com, co-author
KEITH, Michael [University of Oxford] michael.keith@compas.ox.ac.uk, primary author

Urban green space is an important component to achieve the goal of planning sustainable future cities, by offering health benefits to urban dwellers and providing socio-economic and environmental benefits to society. Recent literature focused on the usage of urban parks through park catchment and service areas. However, few has addressed seasonal variation of park visitors. This paper takes advantage of the smartphone data to analyze park usage and park service area in Tokyo. We applied spatial analytical methods in geographical information system using over 1 million anonymous mobile phone samples collected from January to December 2011. We chose six district level parks in center Tokyo. The results

show that (1) significant monthly variation of park service areas exists in the study area; (2) social and cultural events are highly associated with the fluctuation of park usage, as well as climate and temperature. However, extreme events are not affecting urban park usages significantly as expected. The contribution of this paper includes (1) deepening our understanding of seasonal variation of park service area using smartphone data; (2) combining smartphone data with field observation to provide empirical evidence for park planning policy making. We discuss the impact of incorporating seasonal variation of park service area in planning urban green space and we suggest that the information and methods produced can aid urban park policy-making.

APPLYING OAXACA-BLINDER DECOMPOSITION AND JACCARD SIMILARITY INDEX TO MEASURE RACIAL/ETHNIC DISPARITIES AND SPATIAL MISMATCH: FOOD INSECURITY AND THE SNAP FOOD RETAIL ENVIRONMENT
Abstract ID: 38
Individual Paper Submission

EICHINGER, Michelle [Clemson University] meichin@clemson.edu, presenting author

Food insecurity is the lack of adequate food to live a healthy life, thus contributing to malnutrition and undernutrition that lead to chronic diseases, such as diabetes. Racial minorities are disproportionately affected by food insecurity. Food deserts are more common in low-income, urban areas and often these communities face food swamps, or a higher density of unhealthy food retailers, such as convenience stores are the most common food access point among communities with high levels of food insecurity. Further, residential segregation is associated with unhealthy food retail environment and food insecurity.

The United States Department of Agriculture (USDA) Supplemental Nutrition Assistance Program (SNAP), commonly known as "food stamps", aims to improve food security by providing financial assistance on food purchases to income-eligible households. SNAP participants redeem their benefits at SNAP-authorized retailers. The USDA assist interested retailers in meeting requirements to be an authorized SNAP vendor. There is little research in the link of SNAP-authorized food retail types and their proximity to residents participating in SNAP, especially racial minorities. This study applies methods uncommon in planning research to examine racial/ethnic disparities in SNAP retail access.

From the USDA Food and Nutrition Services website, all 2018 SNAP-authorized retailers of the 48 contiguous United States were downloaded and geocoded using Geographic Information System (GIS) technology. Each retailer was codified by retail type (i.e. supermarket, pharmacy, convenient stores, etc.) and whether retailer is "healthy" or "unhealthy" using the North American Industry Classification System codes and criteria. Demographic and socioeconomic status characteristics of households, such as Race/Ethnicity and SNAP participation, were collected at the census tract and county levels from the American Community Survey.

The first analysis examined racial/ethnic differences of food insecurity in counties by performing the Oaxaca-Blinder Decomposition analysis. The Oaxaca-Blinder Decomposition distinguishes differences

between groups into a part that is "explained" in predictor variables, but it is in the "unexplained" part that is often used to measure for discrimination. SNAP retailers were aggregated to the county and each county was coded as High Black, Low Black, High Hispanic and Low Hispanic based on the national rate of Black and Hispanic populations, respectfully. With the outcome variable being food insecurity, predictor variables included Segregation Index by race, population density, Household Median Income and SNAP retail density per households participating in SNAP by county. While food insecurity is driven by median household income, preliminary findings suggest racial/ethnic discrimination in SNAP food retail type.

After analyzing racial/ethnic differences, spatial mismatch between SNAP retailers and residents who participate in SNAP were measured performing the Jaccard Similarity analysis. Using GIS software, kernel density estimate maps at 1-, 2- and 5-mile radius were created of SNAP unhealthy and healthy retailers, as well SNAP retail density and weighted household SNAP participation by census tracts. The Jaccard Index is a measurement of similarity and is determined by taking the Intersection of both raster maps divide by the union of both raster maps. The Jaccard Distance measures the dissimilarity between sets and is determined by subtracting the Jaccard Index from 1. Preliminary findings suggest spatial mismatch of retail type in all distances in urban areas. Further, SNAP participants travel further to access SNAP healthy retailers.

Local food planning is not common for planning practitioners. This study applies two methodologies that examine racial/ethnic differences in food insecurity and SNAP retail environment. These approaches provide planning researchers with alternative tools to better examine spatial differences to inform planning and policy differences and engage retailers to become an authorized vendor in needed areas. This study demonstrates the role planners have in local food planning to improve food security among the most vulnerable populations.

MASSIVE LAND-USE SUITABILITY ANALYSIS BASED ON PARALLEL COMPUTING: A CASE STUDY IN ORANGE COUNTY, FLORIDA
Abstract ID: 41
Individual Paper Submission

CHEN, Changjie [University of Florida] chj.chen@ufl.edu, presenting author

Research Question

Land-use planning is one of the most influential planning routines in directing and managing the development of a city. Although its introduction dates back to the late 1960s, Geographic Information System (GIS)-based suitability analysis still plays a crucial role in contemporary practices of land-use

planning. The notion of suitability wins favor with land-use practitioners because of its capacity for effectively synthesizing community values, planners' expertise, and results from GIS analysis. However, the time cost of performing such analyses conventionally—working with GIS software on a desktop computer—largely constrains land-use practitioners' ability to sift through a variety of alternative future land-use scenarios to make better informed decisions about land use. To help overcome this obstacle, I present a case study integrating parallel computing with land-use suitability modeling.

Methodology

This study chose the Land-Use Conflict Identification Strategy (LUCIS), developed by Peggy Carr and Paul Zwick at the University of Florida in the early 2000s, as a platform on which to integrate high-performance computing with land-use suitability analysis. LUCIS is a goal-driven GIS model—initially developed with ModelBuilder in Esri ArcGIS software—that supports land-use decisions through measuring and analyzing suitability based on various sets of criteria for different land-use types. To implement parallel computing in the LUCIS model, I first developed Python for Land-Use Suitability Analysis Tools (PyLUSAT), a cross-platform open-source Python package that contains a series of vector-based functions for geospatial analysis. Built on these functions, a set of analyzing modules was developed for each land-use type that: (1) transforms LUCIS from raster-based to vector-based GIS; (2) empowers the model to work across different operating systems; and (3) can be run in parallel via any pythonic and/or system-specific means.

The computational efficiency raised by parallel computing also enables fast simulation of many future land-use scenarios. Since LUCIS uses the Analytic Hierarchy Process (AHP) to perform multiple criteria decision making (MCDM), one possible approach to conduct massive simulation is through randomizing the priority vector (a vector of weights) generated by AHP. Moreover, to allow concurrent data connections and to secure high-speed data reading, the study introduced the PostGIS/PostgreSQL database as the mechanism for both spatial and non-spatial data storage.

Case Study

A job that involved 45,909 land parcels in Orange County, Florida, was assigned to the parallel-computing-enhanced version of LUCIS—pLUCIS. Specifically, I tested and compared the performance of running this job in both a symmetric multiprocessing (SMP) environment—a quad-core desktop computer—and a cluster computing environment—a computing cluster with ninety-five cores on HiPerGator, a supercomputer built and hosted by the University of Florida.

Implication

It cost roughly five and a half minutes to run the LUCIS model on HiPerGator for the study area. The substantially diminished runtime for modeling established the viability of integrating parallel computing into land-use suitability analysis, which in turn assured that the method I implemented is broadly replicable. Moreover, during these five and a half minutes, I conducted a simulation of 120 scenarios within the study area. This capacity of massively simulating alternative scenarios gives rise to a new strategy of practicing land-use planning that is based on probabilistic models and statistical inference and can be applied on multiple scales. For individual parcels, the method can be used for site search/selection. And on a regional scale, it can be used to support the formulation of land-use plans for entire municipalities. To sum up, the noticeable speed gain in rapidly simulating large numbers of land-use scenarios demonstrates a promising application of the technology in land-use planning.

DEPLOYING A GIS-BASED SCENARIO URBAN PLANNING TOOL IN A GLOBAL SOUTH MEGA-CITY
Abstract ID: 74
Individual Paper Submission

YUNDA, Juan [Pontificia Universidad Javeriana] juanyunda@gmail.com, presenting author

Bogotá, one of the largest cities in South America, have been unable to update its Comprehensive Plan and Land Development Code since 2004. Mayor´s with different ideologies have presented drafts in 2013 and 2019, but the City Council rejected both in frame public controversies around city expansion or densification, in the quantity of mixed uses in neighborhods, in choosing mass transit technologies and regarding public inquiries about who is benefiting from development. These failures highlight arising challenges in participatory planning of global south cities, which now resemble those present in cities of the global north. The different interests, distrust and lack of communication among authorities, developers, community activists and environmentalists immobilized the debate about the more sustainable policies and objectives of Bogotá's comprehensive planning. The introduction of new technologies in the field of Bottom-up GIS may help, in this case aiding communication among stakeholders, building consensus, and advancing the implementation of policies that are more sustainable and equitable for the city (Talen, 2000).

For this purpose, this project aims to deploy in Bogotá an open-source urban planning scenario builder software, Envision Tomorrow (ET) developed in the United States. The purpose of using ET is contributing to the local participatory planning process, rapidly presenting to authorities and the different stakeholders several planning scenarios for the city with on the fly sustainability indicators that allow their comparison (Fregonese Associates, n.d.). The process of calibrating ET for its use in Bogota includes, among several tasks, the development of a new building library that reflects the different urban landscapes present in Colombian cities, changing values of land and development costs, new sustainability indicators, and gathering the necessary local GIS databases.

Preliminary findings point to usual issues implementing planning support systems (Chakraborty, & McMillan, 2015; Pettit et al., 2018) but a rising interest about implementing GIS-based planning solutions from citizens, now more aware of their planning processes. Bottom-up GIS planning solutions in Colombia are important because authorities have traditionally drafted codes from the top to the bottom, and monopolized urban data preventing an effective citizen participation in planning. Often these obscure processes have benefited owners of wide tracts of land and large developers while harming local communities and the environment (Yunda & Sletto, 2020). In terms of local built landscapes, it is worth highlighting the quantitative sustainability indicators found in settlements developed informally; these indicators are higher in some topics in comparison with formal development. This puts into question the long-established view that cities in Latin America should incentivize the development of large mono-functional compounds with low-cost housing in peri-urban areas, instead of exploring other less formal alternatives to solve the affordable housing shortages.

EQUITABLE TRANSPORTATION ACCESS TO COMMERCIAL AREAS: AN AUTOMATED ANALYTIC APPROACH USING GPS TRACES
Abstract ID: 124
Individual Paper Submission

JIANG, Zhiqiu [University of Virginia] zj3av@virginia.edu, presenting author
MONDSCHEIN, Andrew [University of Virginia] mondschein@virginia.edu, co-author

Urban commercial districts and centers provide concentrated opportunities for shopping, dining, leisure, and other services. Rapid development in these areas has made them critical for local economic development as well as exerting significant influence on urban society and culture. Investment in these areas is often shaped by local urban planning, but how these plans affect accessibility and behavior of residents living nearby and beyond is often unexamined, despite the fact that land use and transportation plans and investments have a major effect on urban mobility and accessibility. Traditionally, data for travel behavior analysis has been derived from travel surveys with limited sample sizes that impede temporally and spatially fine-grained analysis. When small sample travel survey data is applied to specific destinations, such as businesses of a specific type, or travel times, such as evenings, travel survey data often cannot supply enough information to validly assess local patterns, or to do so in a way that obscures the behavior of specific individuals. However, recent advances in communication technologies have enabled researchers to collect travel data based on ubiquitous and location-aware smartphones, with massive GPS space-time data at a fine scale. These advances hold out the promise of allowing an automated detection of trip characteristics such as the mode of transport, travel purpose, travel time, and other travel characteristics to specific districts at specific times, with sufficient data to supply statistical validity and greater protection of anonymity than typical surveys.

In this study, we develop a data fusion framework to integrate fine-grained individual GPS trace data from smartphones of a month period, land use and built environment data, and demographic data from the U.S. census to quantify residents' accessibility to specific commercial districts in the Phoenix metropolitan region. In particular, this study develops a machine learning-based approach to identify trip information, including mode of transport and trip purpose (activity), and residence based on the data fusion framework. We train and validate several prediction models to predict the trip and dwelling characteristics. Model performance compares favorably with previous studies during cross-validation.

This analysis makes two contributions to urban planning research, one regarding inequitable access to commercial districts, and the second regarding methods for using GPS traces to analyze travel behavior at specific places and times. The results show travel patterns and accessibility for Phoenix residents to specific areas at specific times of day, such as during the evening. Travel patterns demonstrate substantial implications for equitable access to locations with major economic and social opportunities. We find that this machine learning-based approach to support trip and dwelling information extraction for large and fine-scale individual travel data can be a reliable and efficient (in terms of cost and human resources) data analysis method for planners.

PLANNING AND TECHNOLOGICAL INNOVATION: THE GOVERNANCE CHALLENGES FACED BY ENGLISH LOCAL AUTHORITIES IN ADOPTING #PLANTECH
Abstract ID: 177
Individual Paper Submission

DEVLIN, Ciaran [University of Warwick] c.devlin@warwick.ac.uk, presenting author

Technological innovation has the potential to change how people engage with and experience their city. Multinational corporations are developing pervasive physical infrastructures, data mining techniques and predictive analytics to open the cities usually opaque, unquantified flows of information. The term 'Smart City' has become synonymous with a technologically cultivated utopia, where urban problems can be solved computationally. This approach to urban development has been touted as a method of enabling city administrations to become more proactive when dealing with issues including pollution, traffic flow and congestion, public safety, energy use and urban planning.

This trend towards using technology in urban management and planning has sparked research and development initiatives across the planet. In the United Kingdom technological innovation is a key objective of the Conservative Government. It has published numerous policy documents that aim to achieve digital transformation of the economy, including public services. Urban planning is one of these public services that has been identified for transformation and to enable innovation in this field, the government funded Connected Places Catapult (CPC) has been given a remit of stimulating research and development into technologies that can improve the efficiencies of the planning system and simultaneously deliver a better planning service and outcomes for citizens, developers and other stakeholders. The #PlanTech movement is a CPC initiative that aims to improve engagement between various actors in the planning system, including local authorities and central government, with tech start-ups and digital entrepreneurs who can design solutions to the problems currently experienced by planners, developers and citizens alike. To date this approach has achieved some modest gains yet it is characterised by piecemeal and lacklustre uptake. Despite the significant opportunities that technologies offer planning departments in city councils in terms of productivity, existing governance models could represent a significant obstacle to implementation.

This paper uses a case study analysis of two English city councils, Coventry and Leeds, to examine how the existing governance framework supports and facilitates urban planning in English local authorities. Utilising the information gained from a combination of semi-structured interviews, literature review and stakeholder engagement exercises, it investigates the growing role of technology in planning practice within the public sector and discusses the potential implications that it may have for current governance arrangements. Finally, it suggests a framework for future urban planning governance in the era of the Smart City within an English political context. This timely and important study provides an essential analysis of the challenges facing urban planning practice in English city councils during a period of economic transition and political uncertainty. It offers a critical view of how current urban planning practice and governance procedures are being quickly subsumed by digital technologies which offer novel and effective methods for professional planners yet undermine or are inhibited by current governance arrangements. Based on ethnographic research techniques, this paper proposes a future planning paradigm

based around the use of technology, that is urban planning in the Smart City.

SPATIAL PATTERN ANALYSIS OF PM 2.5 CONCENTRATIONS IN DENSELY-BUILT AREAS USING THE RANDOM FOREST: A CASE STUDY OF AUSTIN AND HOUSTON IN TEXAS
Abstract ID: 290
Individual Paper Submission

CHUN, Bumseok [Texas Southern University] bum.chun@tsu.edu, presenting author

Particulate matter (PM) may generate a variety of negative effects on health, such as heart or lung disease, asthma, and respiratory symptoms. The pollutants in the atmosphere primarily result from human activities, like social-economic, and industrial activities through vehicular travel (Guttikunda and Calori, 2013, Kim et al., 2015). Hence, the amount of such particles continues to elevate as population grows in urban areas. However, the poor air ventilation of urban area may cause the effects of PM worse by increasing PM concentration as air pollutants are isolated in densely built-up urban environments. As a result, high PM concentration deteriorates the quality of urban residents' lives. Therefore, it is indispensable to reduce PM 2.5 pollutants in order to achieve urban environmental sustainability. However, few studies have investigated the quantity and spatial patterns of PM concentrations in highly developed urban areas.

As an extension of our previous research (Chun, Choi, and Pan, 2020), this study explores the quantity and spatial patterns of PM 2.5 concentrations and investigates the driving forces of this formation. To do so, we employ the geographically weighted regression (GWR) and the random forest (RF) algorithms with spatial big data. Our empirical study focused on two highly built-up urban areas, i.e. Austin and Houston in the Texas Triangle region. We first estimate the PM 2.5 concentrations by using satellite images and GWR algorithms at local scale. Second, various two- and three-dimensional urban characteristics are built in the Geo-Spatial domain. Third, the RF algorithm, one of machine learning algorithms, is implemented to determine which urban characteristics has dominantly affected the PM 2.5 variations. The findings will contribute to developing and evaluating the environmental policy for achieving long-term local sustainability.

WHO HAS ACCESS TO STREET GREENERY CORRIDORS? EVIDENCE FROM GOOGLE STREET VIEW AND COMPUTER VISION ALGORITHMS
Abstract ID: 339
Individual Paper Submission

CHOI, Dong-ah [University of Utah] dongachoi@gmail.com, presenting author
RIGOLON, Alessandro [University of Utah] alessandro.rigolon@utah.edu, co-author
PARK, Keunhyun [Utah State University] keunhyun.park@usu.edu, co-author

Urban green space is a critical amenity that promotes physical activity, mental health and wellbeing, and social interactions (Sugiyama and Thomson, 2008; Lee and Maheswaran, 2011; Astell-Burt, Mitchell, and Hartig, 2014; Thompson Coon et al., 2011). Easily accessible street greenery, including trees, grass, and shrubs, might have a higher potential to support active transportation, regular physical activity, and outdoor social engagement than distant public parks, especially for groups with limited mobility (e.g., low-income households, seniors, children, and people with disabilities). With regard to development and policy implementation, the U.S. Environmental Protection Agency (EPA) emphasizes fair treatment of all people regardless of race, color, national origin, or income in order to achieve environmental justice. Nevertheless, only a few recent studies have analyzed whether street greenery is equitably distributed across socioeconomic, racial/ethnic, and age groups (Nesbitt et al., 2019; Schwarz et al., 2015), and this is in part due to the lack of secondary datasets describing street greenery. Recently, the landscape and urban planning literature has increasingly applied computer vision techniques to analyze street-level physical elements by using publicly-available street imagery data, such as Google Street View (Li et al., 2015; Gong et al., 2018).

In light of recent shifts in the collection of street data, (1) this study presents a novel method of identifying street greenery corridors using computer vision techniques and (2) examines the distributional equity of street greenery in Salt Lake County, Utah. We hypothesize that ample greenery along neighborhood streets is more likely to be available for privileged neighborhoods that have the ability to invest in front-yard gardening and community designs.

We collected Google Street View images using Google Static Image API and the coordinates of sample point locations along streets in study areas. Scene-parsing algorithms with state-of-the-art performance (e.g., PSPNet, which achieved the highest accuracy in predicting streetscape objects as of 2017) were employed to quantify street-level greenery. The automated extraction of street greenery was validated from the results of manual extraction. Then, street greenery corridors were identified as street segments with continuous (low greenery variance within a street segment), ample (above-median greenery density), and connected (between segments) greenery. Finally, we used descriptive statistics and regression analysis to examine whether street greenery corridors are distributed disproportionately according to socioeconomic and racial/ethnic status, and different age groups. In the models, control variables included population density, land use diversity, presence of parks and trails along the street segment, and neighborhood age.

The evaluation of access to urban green space has focused primarily on urban parks and their spatial distribution, but our understanding of the distribution of easily accessible street greenery is still limited. This study will add a valuable layer to the environmental justice discussion in planning by offering a framework for understanding street-level greenery and its distributional characteristics. From a more

practical perspective, our study can inform the work of cities that are implementing long-term tree planting initiatives, such as "Million Trees LA" in Los Angeles, the 4,000-tree initiative in Salt Lake City, and the "Urban Forest Plan" in San Francisco. By mapping street greenery corridors and quantifying access to them, this study will guide proper identification of priority streets for implementing various active living and sustainability policies, including Complete Streets, Urban Trails, and Open-Street Programs.

MATCHING BEHAVIOURAL THEORIES AND RULES WITH SPATIAL PLANNING METHODS
Abstract ID: 342
Individual Paper Submission

KWON, Heeseo Rain [University of Cambridge] hk394@cam.ac.uk, presenting author
SILVA, Elisabete A. [University of Cambridge] es424@cam.ac.uk, co-author

The concept of "behavioural" approach is receiving increasing attention in many disciplines. Many academics and practitioners are interested in applying various behavioural theories in their research, however, there is yet a lack of guidance on the selection and use of appropriate theories for specific purposes. This paper addresses the following research question: Can we create a guidance on the selection and use of appropriate behavioural theories, rules and research methods for urban planning-related disciplines?

Building on "Mapping the Landscape of Behavioral Theories: Systematic Literature Review" (Kwon and Silva, 2019), this research zooms into the behavioural theories and rules used in spatial planning-related fields. First, a literature review was performed on 29 journals, composed of the top 10 journals in "Urban Studies", "Geography" and "Transportation". A total of 318 articles that contain "behavio(u)r" in the title (2010-18) were reviewed to produce a portfolio of behavioural theories by types of behaviour, key variables, rules, and research methods. Second, interview and survey were conducted on 22 international experts from various backgrounds in planning-related fields at various conferences and workshops. The survey asked experts to identify gaps in the list of behavioural theories presented and how they currently use or could use such theories linked with what kind of rules and research methods. In addition, this paper presents a diagram that summarizes types of behaviour, a flowchart that illustrates the relationship among theories and concepts, and a table that shows the use of these theories in six domains of planning related fields: 'planning and governance', 'geography and spatial analysis', 'transportation', 'architecture and urban design', 'economics, real estate and housing', and 'environmental sciences'.

Based on the literature review and expert interview/survey, this paper discusses the following six points. First, each planning-related field has different focus of types of behaviour and hence some theories can be more applicable in one field than another. Second, the two kinds of meaning to behaviour (in the sense of behaviourism and cognitive psychology) can play complementary roles for behavioural modelling. Third, a systematic approach can be useful for modelling behaviour: defining types of behaviour in detail (e.g. by agent and activity, habitual or occasional, personal or social) to select applicable determinants and behavioural theories, extracting applicable variables and gathering relevant data, and choosing appropriate research methods, which can include analysis method and use of equations or language-based rules or both. Here, using both deductive and inductive approaches can be of great benefit for setting behavioural rules for microsimulation (e.g. Scalco et al., 2017). Fourth, there has been too much emphasis on quantitative approach in modelling until now, and there is much to gain from using mixed methods where approaches like agent-based modelling (ABM) can be useful. Fifth, ABM allows researchers to deal with not only individual but also large-scale behaviours. For example, government and policy behaviour can be included as super-agents (Chang and Harrington, 2006) and certain large-scale patterns can be understood as the emergent and self-organizing property of the system, resulting from the interaction among individual agents. Finally, philosophical discussions are important as computer-based models of behaviour remain as a technical activity until we take it to public policy with value judgements. Understanding and applying various theories to behavioural modelling can help the shift from top-down, regulation-oriented and often authoritarian behavioural interventions to a more bottom-up approach that encourages individuals to make proactive and lasting behavioural change especially regarding pro-environmental and pro-health behaviour. In parallel, an empirical case study is being carried out, applying some of these theories in an ABM using data from a city of the Republic of Korea.

BEYOND THE SUPPLY SIDE: USE AND IMPACT OF MUNICIPAL OPEN DATA IN THE U.S.
Abstract ID: 343
Individual Paper Submission

WILSON, Bev [University of Virginia] bw6xs@virginia.edu, presenting author
CONG, Cong [University of Illinois at Urbana-Champaign] ccong2@illinois.edu, co-author

While the number of open government data initiatives has increased considerably over the past decade, the impact of these initiatives with respect to government accountability, civic engagement, and economic innovation is uncertain. Recent studies have been critical of the "bias toward the supply side" and lack of "sufficient attention to the user perspective" in the way that open government data initiatives are implemented. While the commitment to open data is not uniform across local governments, it has the potential to create both commercial and social value with private firms, civic hackers, and non-profit organizations as examples of key actors already leveraging these resources. Prior studies have provided limited empirical evidence, which constrains our understanding of how actors and institutions interact with open data, related technologies, and governing policies to co-produce social and commercial value. This paper focuses on these research questions: (1) Who is using municipal open government data resources and for what purposes? (2) What impact are municipal open government data having in cities

where they have been implemented?

This study relies on a qualitative analysis of 26 semi-structured telephone interviews conducted with government staff, civic technologists, and private sector stakeholders in nine cities around the United States. Each of these 30 to 45-minute telephone interviews were transcribed and analyzed to distill insights regarding the use and impact of municipal open government data and the creation of commercial and social value in the nine cities considered. We find that the array of actors within open government data ecosystems at the local level is expanding as distinctions between the public and private sectors becomes increasingly blurred. The demands of managing and sustaining these initiatives has led to changes in the services offered by local government as well as in the duties of government staff. The impact of these data resources has been primarily felt within local government itself, although the lack of monitoring mechanisms makes it difficult to systematically evaluate their broader effects. We highlight examples of commercial and social value derived, summarize best practices, and argue that a larger role for planners in the design and governance of open government data initiatives could help to more fully realize their public engagement aims.

SCENARIO DISCOVERY FOR UNCERTAINTY PLANNING: THE NEXT BIG THING OR OVERKILL?
Abstract ID: 463
Individual Paper Submission

ENGELBERG, Daniel [Massachusetts Institute of Technology] dengelberg2@gmail.com, presenting author

For half a century, urban planning scholarship has acknowledged the difficulty of planning for the deeply uncertain future. Unfortunately, the central analytic tools, particularly urban simulation models, remained tied to the assumption that the future will look similar to the present. However, in the past two decades, the environmental modeling community has introduced exploratory modeling approaches for policy making under uncertainty. Scenario discovery in particular seeks to understand the effectiveness of policy solutions under uncertain future conditions. This approach is increasingly relevant as planners cannot assume a static behavioral, environmental, economic, and political substrate for action. Scenario discovery promises to deliver robust policies, that work in all plausible futures, and contingent policies, that should be applied as circumstances dictate.

Exploratory modeling and scenario discovery are still new to urban simulation. The United States Department of Transportation Model Improvement Program is developing a tool that integrates with transport simulators to parameterize, execute, and analyze exploratory modeling exercises. The approach remains more novel in land use planning. Only one published journal article that I am aware of explores the method. Though the approach is theoretically appealing, it remains practically untested. In particular,

the several-hour run times of urban simulation models pose a challenge to experimental designs that require hundreds or thousands of runs.

This research paper explores the potential use of exploratory modeling in land use simulation. With the Simple Integrated Land Use Orchestrator, this experiment uses scenario discovery to examine policy approaches to managing the land use impacts autonomous vehicles. Value of time, fuel costs, and transportation network efficiency are all treated as uncertainties. In addition, I compare the results of this simulation to more parsimonious explorations of the uncertainty space that are designed to mimic traditional scenario planning exercises. The paper demonstrates that scenario discovery is a viable method for planning under uncertainty when the researchers limit the dimensions of uncertainty. It also demonstrates that the more parsimonious explorations of the uncertainty space provide plausibly similar results with far fewer model runs. However, they are not as useful in understanding the circumstances under which to implement contingent policies.

Researchers have been using a handcrafted feature engineering (HFE) paradigm to investigate the relationship between built environment (BE) and travel behavior (TB) for decades. However, this paradigm is limited due to measurement difficulty, information loss, incomplete prior knowledge, and low model performance. This study analyzes the relationship between BE and TB by using a wide and deep convolutional neural network (WD-CNN) and aerial images as a composite measure of BE factors, presenting a novel automatic feature engineering (AFE) paradigm. Our experiments investigate how WD-CNNs predict automobile ownership, trip purposes, and travel mode choices, in comparison to the classical choice models that use numerical indicators of BE factors, based on the large-scale national household travel survey 2017 (NHTS2017) augmented with aerial images. We found that using the aerial images and even the simplest WD-CNN can achieve about 10 percentage points higher prediction accuracy than choice models, and this higher model performance is consistent with all three types of travel behaviors. With more advanced CNN architectures, the prediction accuracy can achieve as high as 75% for automobile ownership, 85% for trip purposes, and 88% for travel mode choice when the aerial images and the individual characteristics are combined. Besides prediction, we interpret models by ranking the importance of individual features, and found that BE is one of the most important factors in

influencing TB. Overall, this study provides a new benchmark result and a new analytical paradigm to explore the relationship between BE and TB: when BE is measured by raw aerial images rather than refined numerical values, BE is highly informative for TB. The past finding of a modest relationship between BE and TB does not reflect the reality but is largely caused by the caveats of the HFE paradigm. Future studies can continue to use deep learning methods and unstructured data sets (such as images) to explore the relationship between BE and TB by interpreting CNNs for policy and planning interventions, combining the classical BE indicators and the new end-to-end AFE paradigm, and testing the generalizability of our work in other contexts.

A STUDY ON THE CHANGE OF PLAN FACTORS OF DANGIN-RI POWER PLANT THROUGH THE ANALYSIS OF TEXT MINING
Abstract ID: 534
Individual Paper Submission

PARK, Hyo Jin [Yonsei University] ljmlonly@yonsei.ac.kr, presenting author
NAM, Kalam [POSCO] mckalam@gmail.com, primary author
LEE, Jea-Sun [Yonsei University] jeasunlee@yonsei.ac.kr, co-author

The purpose of this study is to analyze the planning elements (keywords) in the 10-year big data of Dangin-ri Power Plant, a representative example of the modern industrial heritage of Korea, using the text mining research method (analysis tool: RStudio).

Through big data analysis, we look at the patterns of change (frequency and distribution of each section) according to the change in major periods (by section) and visualize the connection network between the elements through network analysis. The network analysis could help to more quantify the relationship between components.

The process of deriving the planning elements by period (section) was carried out as follows.

First, data were collected during the analysis preparation phase: For five years prior to 2013 (2008 ~ 2013), Korean journals (15 journals, 2,223 words) and research papers selected by searching as "Dangin-ri Power Plant" from Korea's largest academic research information service (RISS) (13) 6 papers, 6,807 words), For five years since 2013 (2013-2018), the 2013 Basic Initiative Report (344 pages, 42,428 words) was published by the Ministry of Culture, Sports and Tourism and published by the Expert Group, 2014 Basic Plan Report (357 pages, 48,122 words), 2015 Dangin-ri Cultural Creative Power Plant Development Plan Research Report (276 pages, 11,108 words), 2018 Cultural Space Creation and Operations Plan Report (235 pages, 32,195 words) and Space Usage Plan Report (70 pages, 11,394 words). All report PDF files were converted into text files, and natural language processing and nouns (keywords) were extracted using RStudio program. Second, in the big data analysis phase, matrix data was visualized in the order of frequent keywords, major keywords and connections were clustered using

the word cloud, and network connections were visualized using networkD3. Third, in the interpretation and evaluation stage, the process of change of major keywords was analyzed in terms of connectivity, contiguity, and betweenness centrality. Finally, the NNet package, a machine learning method, was used to derive eight high-frequency keywords (plan elements) from the first 31 keywords (plan elements) through the artificial neural network algorithm.

As one of the future research methodologies in urban planning, we hope that there will be many attempts to utilize big data methodologies (it is already used in predicting crime/disaster/climate change, analyzing tourist images (trends) and developing strategies for smart cities). Also, we hope that this research will help prevent the increasing slumming of modern industrial heritage and establish a direction for planning elements utilizing modern industrial heritage with many potentials.

EXPLORING GROWTH MACHINE USING TEXT-MINING: THE ROLE OF LOCAL NEWS MEDIA IN PROMOTING LOCAL GROWTH
Abstract ID: 552
Individual Paper Submission

SEO, Jungseok [Ulsan National Institute of Science and Technology] jsseo0627@gmail.com, presenting author
KIM, Jeongseob [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, primary author
OH, Jihun [Ulsan National Institute of Science and Technology] wlgnsdl414@unist.ac.kr, co-author

"The city as a growth machine" is one of the political economy theories that explain a locality which is constantly seeking growth and development by shaping a local growth coalition majority (Logan and Molotch, 1987). The local growth coalition keeps pursuing urban growth through land development, arguing that the benefits from the growth return to citizens with more jobs and their quality of life. In the urban growth machine, local news media, as one of the local elite groups, plays a crucial role in fostering public opinion in favor of growth and development (Scott, 2009). It is because journalists have voices to make the readers support specific positions by more exposing newsworthy events with their tones, and they are likely to support growth-inducing investment for their regions throughout the overemphasis on the relationship between improved lives and growth (Logan and Molotch, 1987; Munro, 2018; Scott, 2009). In other words, local newspapers can have hegemonic power to have a biased ideology, such as urban growth and development supported by local elite groups (Logan and Molotch, 1987; Munro, 2018; Scott, 2009).

To explore whether this growth machine theory actually works in cities in developing Asia, this study conducts an empirical analysis to examine the relationship between local new media and urban growth in South Korea. Our study areas include the three largest metropolitan areas in South Korea: (1) Seoul, (2) Busan, (3) Daegu. We assume that the trends of the housing market and urban development in the Seoul

capital region are related to the national newspapers because the Seoul capital region accounts for over 50% of the population in Korea and all headquarters of national newspapers located in Seoul. On the other hand, we hypothesize that the housing market and urban development trends in local cities are related to the local news media rather than the national one based on the growth machine theory. We test whether the tone of local news media is more positive to local growth and development by making a monthly sentiment index of local news media about urban growth and development using a text-mining technique.

For data sources, we collect headlines of news articles published in ten national newspapers, four Busan local newspapers, and three Daegu local newspapers between January 2012 and December 2018 through web crawling using a specific keywords search related to urban growth and development. And then, we conduct lexicon-based sentiment analysis, one of the useful text-mining techniques to extract polarity from a text. Also, we use only headlines of news articles, which represent the body, to quantify the tone of each news article because it is a less complex but effective method to apply the sentiment analysis (Nasssirtoussi et al., 2015). The sentiment dictionary used for the sentiment analysis is newly created to reflect words' networks that are customized to explain the urban growth and development. Finally, throughout the sentiment analysis, we develop monthly sentiment indexes of news media for three case regions. The role of the local news media in local growth and development is finally examined using the Granger causality analysis between the sentiment index and the trends of local growth and development.

The preliminary results show that the trends of the local growth are more related to local media than national media. Namely, the positive tones of local news articles towards local growth and development are likely to promote the upward trend of the local growth. This study provides a better understanding of the role of local news media in promoting growth coalition's objectives, implying planners need to be more careful in gathering public opinion on urban growth and development.

The re-emergence of design as a major concern in planning has included greater environmental concern with the sustainability of development at the macro and micro scale and a more strategic view of urban design as a shaper of urban form (Punter 2007). Hence, McDonalds (2016), Schmitt (2012), and deschiller (2004) advocated for a sustainable urban design practice in which plans at a range of scales help make connections between the different elements of sustainable urban form at each scale with the planning policies, regulations, and processes. The complexity of the city, however, becomes difficult to

grasp, as the interrelations, dependencies, and connectivity between all subsystems require new pathways for sustainable urban design (Roggema2017).

Traditional methods of planning have reached their limits. Planners as such need a radical re-thinking, alternative approaches, and creative design methods to support their decisions (Schmitt2012). Some experts proposed to design the process around dynamics and scale by viewing cities within dynamic urban metabolisms that apply flow simulations to all scales whereas others recommended simpler methods (Roggema2017).

Providing designers with reliable simulation tools is essential to develop innovative solutions and to achieve a sustainable urban form (Peters & Peters2018). However, they are still in the experimental stage of development and are neither effectively nor widely used. Critical studies showed that urban planning decisions still are made without reliable methods and in many cases tend to be subjective and dependent on the opinion of decision-makers (Zagorskas and Veteikyte2012). There are few cities in the world, perhaps Portland, Seattle and Vancouver where the design dimension of planning responds fully to the challenges design principles pose to sustainable urban form.

To have a clear picture of the limitations, methods, and impact of their usage, there is a need to understand how those tools are being used within the urban design process in planning departments. This research departs from the hypothesis that simulation tools may support the urban design process and result in shaping various aspects of the sustainable urban form. Planning departments that use those tools in their practice may help to gather evidence regarding this hypothesis.

The research has addressed critical questions:

1. To what extent have planning professionals used simulation techniques and at what phases?
2. How has the usage of those techniques supported planning professionals in:
   1. Developing a city-wide design strategy across both micro and macro scales,
   2. Addressing various aspects of sustainability of the urban form.

This research consists of three phases: first, a review of the related literature has been pursued to construct theoretical propositions to which the empirical results have been compared. In the second phase, an Internet questionnaire survey has been forwarded to all planning professionals working at the Department of planning, City of Portland, Oregon. The semi-structured interviews with key informants have helped gather rich qualitative data that have been used to triangulate the quantitative data collected from the survey.

The results showed that the impact of simulation tools' usage on the planners' capabilities to design a sustainable urban form across scales is correlated with several procedural and substantive factors that were influenced by the tools' capabilities, availability, and relevance, as well as the designer's skills and expertise in their usage. The limited impact of usage was due in part, to ineffective methods and inconsistent usage across all design phases. The results did not provide any clear evidence that a new approach to designing a sustainable urban form in mainstream practice seems to exist. They suggest further research that connects emerging tools' capabilities with their methods of usage through new concepts and modes of thinking and communication.

STUDY ON THE ACCURACY OF MOBILE PHONE DATA: FOR ANALYZING RESIDENTS' TRAVEL BEHAVIOR
Abstract ID: 558
Individual Paper Submission

HAN, Binli [Tongji University] 1830082@tongji.edu.cn, presenting author

Residents' travel is an increasingly concerned field of urban geography and urban transportation. The main data source of the traditional study is resident travel survey, which has problems such as difficulty in investigation and limitation of samples. Due to the large sample size, high update speed, easy access, mobile phone data has been widely used in this field. However, its reliability remains to be verified due to the limitations in spatial and temporal accuracy. It's the premise of travel study using mobile phone data, and also the main question to be answered in this study to find out the accuracy and errors of mobile phone data, the scope of application, and the methods of checking and correcting the data.   This paper conducts a comparative study of residents' travel based on both mobile phone data and resident travel survey data, and analyzes the causes of differences, so that we can understand the features, limitations and application value of these two types of data, and to reveal the characteristics of residents' travel more realistically and comprehensively, and also to provide more accurate parameter information for urban traffic planning and traffic simulation.

This study used mobile phone data and resident travel survey data to study residents' travel behavior in Shanghai, China. Firstly, we compared the difference between these two types of data from such aspects as travel volume, travel duration, travel distance, travel spatial distribution and time variation, travel patterns of different crowds, etc. Secondly, we explored reasons resulting in these differences, and measure the accuracy of mobile phone data in all aspects. Next, the travel survey data were used as the basis for checking, and the identification method of mobile phone data was optimized.

It is found that the mobile phone data has larger errors in travel duration and travel distance, and the proportion of short-distance travel is lower, but it is more accurate in travel frequency. According to the mobile phone data, the difference between peak and off-peak is smaller than that of travel survey data, so is the difference between morning peak and evening peak. The travel survey data left out some of midday travel and evening travel, and mobile phone data made up for this lack. Besides, residents' travel patterns based on mobile phone data were more abundant. The commuters' travel characteristic based on mobile phone data had smaller error, while the non-commuters' travel had larger error. The quality of the mobile phone data is greatly affected by the night shutdown. The accuracy of mobile phone data can be greatly improved by repairing the missing data at night through multi-day data combination. The accuracy can also be improved by selecting samples with high-quality records. At the end of the paper, we summarized the errors of mobile phone data in all aspects of travel study, and how these two types of data can complement and modify each other to provide more accurate parameter information for traffic planning and urban management.

MANUFACTURING SOCIAL CAPITAL: VISUALIZING SOCIAL NETWORKS THROUGH CIVIC INNOVATION INITIATIVES IN URBAN MANUFACTURING CLUSTERS UNDER DEVELOPMENT PRESSURE
Abstract ID: 563
Individual Paper Submission

AHN, Chaewon [Massachusetts Institute of Technology] chaewon_@mit.edu, presenting author

Manufacturing clusters, a concentration of manufacturing firms and businesses in geographical proximity, are known to enjoy economic benefits through reduced transportation costs, localized knowledge flows, shared economic advantages, and the flexibility to adapt to changing economic structures (Granovetter 2005,Gordon and McCann, 2000; Safford 2006). In post-industrial societies, these clusters have been displaced from cities through planning measures, fueled by profit driven development (Zukin, 1989; Rast 2001; Hamnett, 2003; Curran & Hanson, 2005). Recently, new innovation district projects emerged to connect manufacturers to entrepreneurs, designers and makers to respond to the paradigm shift towards more decentralized 'smart' processes powered by advanced technologies. Local governments invest in this 'manufacturing innovation ecosystem' (E. B. Reynolds & Uygun, 2018) to foster connections between manufacturing and R&D networks of universities and startups through extensive governance projects.

As these initiatives actively take place in the same productive space, involving overlapping actors, it becomes important to visualize how these new innovation policies connect the traditional manufacturing community with new actors to evaluate their efficacy. How do these initiatives change the social network in manufacturing clusters? And are the new spaces for collaboration and technological innovation also generating stronger manufacturing communities by connecting heterogeneous groups?

The objective of this research project is to analyze how civic engagement planning programs as part of innovation initiatives engage the manufacturing community, and characterize the community they create. The research builds on the scholarship of social network analysis to explain how urban planning programs generate 'bonding' and 'bridging ties' and create social capital to address mutual problems in heterogeneous communities (Dempwolf & Lyles, 2012; Gittell & Vidal, 1998; M. S. Granovetter, 1977; R. Putnam et al., 2004). My focus lies in understanding how innovation initiatives generated 'bonding' and 'bridging' ties, and in interrogating the new capabilities these new ties generated under persistent development pressure of these sites.

Given the informal nature of traditional manufacturing business operations, the research choses a small data approach utilizing social network data collected through a survey instrument called the name generator, originally developed for the General Social Survey (GSS) in 1984. I collect egocentric social network data through structured interviews based on the GSS name generator between the manufacturing community and the new actors which include government officials, community organizers, artists and entrepreneurs. With the network data, I use egocentric social network analysis methods to visualize and characterize the network between governance actors and manufacturing firms to measure 1) the network size, 2) the multiplexity of different networks the ego is part of, 3) the strength of the connections derived from the frequency and the duration of the bond and 4) the composition of alters based on industry types.

Measuring the composition of the ties allows me to clarify whether the programs that generated 'bridging ties' and 'bonding ties'. In addition, using the network size, multiplexity, and strength of the connections, I compare how strong each of these new ties are to characterize the change of these relation building programs.

The research fills an important gap in the planning literature of innovation, relation-building governance systems and community engagement through first making the old and new social networks in urban manufacturing communities visible. While the scholarship largely focuses on measuring the outcomes of such policies, this research takes a step back and elucidates the mechanisms through which governance actors connect to the community and foster new relationships. Ultimately, I aim to clarify the pathway of network building practices in urban manufacturing communities towards bridging heterogeneous groups and strengthening the social capital.

Over the past decade there has been a rise in the use of social network analysis in planning literature. Here, we expand network analysis techniques and methods applicable to planning networks. This paper examines the structure of planning networks, which consist of organizations involved in hazard mitigation planning, in four major US cities: Boston, Baltimore, Fort Lauderdale, and Seattle. Extant research has examined planning networks to a minimal extent and have typically been focused on strategies for stakeholder selection in planning processes in a single geographic area. Efforts have not been focused on highlighting differences and similarities in multiple cities. Furthermore, only recently have stakeholder network studies been dedicated to furthering understanding of planners in hazard mitigation or emergency management situations.

The network literature highlights several reasons why networks connections are important in hazard mitigation. The argument, however, is quite simple. Individuals and organizations that are well-connected to the mitigation network have increased access to resources, such as information or tools, to reduce vulnerability to hazards and rebuild after a disaster. Access to planning coalitions and processes allows those lacking strong ties to prepare and advocate for equitable planning and infrastructure repair, which may reduce vulnerability to disasters. Less connected organizations and representative community groups may experience increased challenges in advocating or influencing city or county governments to make upgrades and changes which reduce vulnerability to flooding or other events. Those organizations with better connections to planning agencies, stakeholders, and local or regional decision-makers may be better able to influence the mitigation processes, both on-the-ground and in public policy, than less well-connected organizations. Essentially, network ties provide access to resources that may increase an organization's power and status, resulting in an imbalanced planning environment.

The data for this paper was collected with support from a collaborative NSF grant. We first examined a series of plans from each city and identified the names of organizations that were listed as implementation partners and planning participants. We surveyed these organizations as well as each city agency within each of the four cities asking them, among other things, about their level of connectivity with the other organizations identified in the plans. We asked the organizations to list other organizations that they had collaborated with on hazard mitigation efforts and sent those organizations (referred to as snowball organizations) a survey to get their levels of collaboration as well. We surveyed each city individually which resulted in a survey period that lasted between August, 2019 and January, 2020.

There are several takeaways from the network analysis in this project. The most observable is the level of connectivity of each individual actor as well as the network as a whole of those involved in the planning process. We also examine the planning networks in each city and compare and contrast them with each other. This is the first step in understanding differences between cities and also provides additional avenues for further analysis on the types of planning networks across varying geographies. In addition, we ask about the importance of each collaboration relationship in resilience building efforts. This outcome yields important information about which network ties may be higher importance from the perspective of those involved.

We conclude with a discussion about the importance of increasing diversity of actors involved in local and regional planning as well as commentary on planning uniformity across cities. This is important on multiple levels, but particularly for developing an inclusive planning process.

INCREASING GREEN SPACE TO REDUCE STREET CRIME IN TORONTO: EVIDENCE FROM A SPATIAL ANALYSIS STUDY AT THE NEIGHBOURHOOD LEVEL
Abstract ID: 591
Individual Paper Submission

ONIFADE, Moses [University of Waterloo] omonifad@uwaterloo.ca, presenting author
LAW, Jane [University of Waterloo] jane.law@uwaterloo.ca, primary author

This study investigates the association between street crime rates and greenspace in Toronto while controlling for specific sociodemographic factors. Applying spatial analysis at the neighbourhood level, we aim to address two main research questions for urban planning of green space to reduce street crime:

1. Is there a variation in yearly and monthly crime trends? Does seasonal variation influence street crime in Toronto?
2. What is the relationship between street crime rate and greenspace variables after controlling for socioeconomic factors? Is the relationship consistent across the study area?

We used line graphs to explore the trends of street crime occurrences as well as seasonal variation and a spatial statistical approach on the tree inventory data to derive the greenspace variables. Street crime extracted from police records (open data) and the three street crimes were classified into property (auto-theft) and violent (assault & robbery) crime. Multivariate spatial regression analyses (spatial lag & spatial error) were carried out on the street crime rates and greenspace variables to account for spatial autocorrelation using GeoDa.

There were changing trends and seasonal variations for the three types of street crime. From the tree inventory data, we estimated three greenspace variables, namely, stem density, basal area density, and tree density. We included covariates of median housing income, unemployment rate, lone parent, high school, housing unit occupied by owner, and housing unit occupied by renter, in the regression analyses to control for socioeconomic factors. The stem density and tree density are negatively associated with the three street crime rates at the 5% significance level, but the basal area density is insignificant. All of the above socioeconomic factors have a significant association with the three crime rates.

The findings from this study reveal that greenspace deters street crime in the city of Toronto. The sociodemographic factors studied, which all have a significant association with street crime, should warrant further investigation for the reduction of street crime. The importance of green space in urban cities cannot be understated. Law enforcement planners, urban planners, and landscape architects should collaborate to achieve a collective goal of sustainable development as well as greenspace equity.

FORECASTING SCOOTER-SHARE TRAVEL BEHAVIOR BASED ON ORIGIN-DESTINATION LOCATION AND TIME OF USE: A MACHINE LEARNING APPROACH

Abstract ID: 618
Individual Paper Submission

JIAO, Junfeng [University of Texas at Austin] jjiao@austin.utexas.edu, presenting author
BAI, Shunhua [The University of Texas at Austin] shunhua@utexas.edu, primary author

For a long time, traditional four-step modeling dominates transportation forecasting. Generally, the four-step model predicts the travel purposes by travelers' personal information gathered from community surveys and regional economic characters and then assigns the expected traffic volume to different modes based on assumptions (McNally, 2000). However, due to the rapid development of micro-mobility in the current years, such as electric scooter-share, transportation planners and engineers have found it troublesome in applying the traditional technique to exercise the same procedure in practice. There are two significant barriers to this problem. For one, micro-mobility trips are much shorter than the trips fulfilled by automobiles or transit. At a smaller geographic scale, the diversity of land use and economic status fail to indicate the travel demand. For another, given the fact that there hasn't been much personal information collected from extensive user surveys to establish trip purpose baselines, the issue of generating a possible distribution of traffic origins and destinations based on trip purposes is still unsolved. The lack of credible traffic forecasting methods in the micro-mobility prevents transportation planners, city administrators, and the private vendors of micro-mobility service from managing and adjusting the operation in the local market.

Many researchers in the smart city field have proposed to use concepts and techniques in data-rich studies as (part of) a solution to urban problems(Lim et al., 2018). In transportation, machine learning algorithms such as support vector machine (SVM) classification and artificial neural network (ANN) generation have been primarily used in predicting automobile traffic density or transit passenger ridership (Çetiner et al., 2010; Wang et al., 2018). The critical datasets used in these simulation studies are location and time of use, which have been proved to be directly associated with travel behaviors regardless of modes (Pendyala & Goulias, 2002). Unfortunately, short-distance travel modes in micro-mobility like bike-share and scooter-share are ignored continuously. To fill the research blank, this study first selects scooter trips generated between July and December in 2018 in Austin as the sample dataset. Then, we configure a recurrent neural network (RNN) model to predict the scooter-share traffic flow between origins and destinations of interest based on their location information and the time use. Finally, this study complements other datasets such as weather and special events to improve model performance. Results show that RNN is a valid computationally-efficient model to predict scooter-share travels with an average precision rate of over 75%. The study contributes to the current transportation planning by proposing a tangible travel demand management methodology during the operationalization of micro-mobility in cities. The method can be used in practice, such as controlling the fleet size or optimizing redistribution strategy when the survey-based forecast is inapplicable.

THE PROSPECTS FOR ARTIFICIAL INTELLIGENCE IN URBAN PLANNING
Abstract ID: 621
Individual Paper Submission

SANCHEZ, Thomas [Virginia Polytechnic Institute and State University] sanchezt@vt.edu, presenting author

Since the late 1960s, urban planning has encountered a variety of advanced analysis methods with greater and lesser degrees of adoption. Geographic Information Systems (GIS) is probably the most notable, with others such as database management systems (DBMS), decision support systems (DSS), planning support systems (PSS) and expert systems (ES), having mixed levels of recognition and acceptance (Han and Kim, 1989; Pettit et al, 2018). The adoption of GIS, some will argue, has been primarily related to its cartographic capabilities and less so for sophisticated spatial analysis techniques. More recently there has been a re-emergence of artificial intelligence (AI) related methods. Applications of AI have been rapidly increasing, especially with respect to consumer goods and services. Amazon, Netflix, Google, and other companies have invested significant sums in these technologies to gain insights on consumer characteristics as well as improve supply chains and distribution.

This paper reviews the literature (1960s to current) on AI-related methods to assess how language and perspectives have changed over time relative urban planning applications. Several interviews with urban planning methods experts were also conducted to add further nuance to the discussion and identification of the primary challenges involved. Increased data availability, increased processing speeds, and increased accessibility to AI methods have the potential to reconnect with urban planning processes and decision-making. But will it be different this time? The paper also draws on Lee's assessment of large-scale models from 1973 as a lens for evaluation. While it is only possible to speculate about the prospects of AI in urban planning, familiar cautions remain alongside optimism for new opportunities and possibilities.

PREDICTING HEALTH OUTCOMES AND HEALTH BEHAVIORS FOR FOUR MAJOR CITIES IN TEXAS: A MACHINE-LEARNING APPROACH
Abstract ID: 647
Individual Paper Submission

FENG, Chen [The University of Texas at Austin] cfeng.gatech@gmail.com, presenting author
JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, co-author

Promoting urban health has been a core mission of urban planning since the birth of the profession more than a century ago. In the scholarly field of city planning, many studies have been conducted to analyze the impact of the built environment on health. There has been increasing evidence that the built environment can influence people's lifestyle and level of physical activity which can lead to poor health outcomes such as obesity, cardiovascular disease, and diabetes (Ewing & Cervero, 2010; Schulz, Romppel, & Grande, 2016; Villanueva et al., 2013). Existing research, however, mostly focuses on the relationship between features of the built environment and a narrow set of physical activity behaviors or related health outcomes based on traditional, inferential statistics methodologies, with few studying the issue with novel AI technologies such as machine learning which can accurately predict a broad range of health outcomes and health behaviors based on the increasingly available large-scale urban datasets.

In this study, we use machine learning techniques to predict a wide range of health outcomes and health behaviors at the census tract level for four major cities in Texas—including Austin, Dallas, Houston, and San Antonio—based on a broad set of features that characterize different social, physical, and perceived neighborhood environments. The outcome variables include not only the common physical health outcomes but also variables indicating mental health and unhealthy behaviors such as smoking and binge drinking. In acknowledging the possibility that, in addition to the physical and social environments, the perceived neighborhood environment could also have played a role in affecting the different health outcomes and behaviors, we used the relative frequencies of 311 service requests of different issue types aggregated at the census tract level to capture important features of the perceived neighborhood environments. Eight different machine-learning algorithms are compared based on their predicting accuracy with their defaulting setting of hyperparameters, including ridge regression, lasso regression, elastic net, support vector machine, decision tree, random forest, extra trees, and gradient boosting. We further fine-tuned the lasso regression models for predicting the health outcomes and behaviors and show the important features selected by the lasso regression models. Lasso regression was used for understanding the potential factors affecting the health outcomes and behaviors because: (a) in our study, after the lasso models are fine-tuned, their performance is often boosted to a great extent, sometimes even outperforming the more sophisticated models such as random forest and gradient boosting; (b) the results of the lasso models, presented as standardized coefficients, are easier to interpret than the more sophisticated non-parametric and ensemble-learning models.

Our findings suggest that the socioeconomic variables are the most important predictors for many health outcomes and behaviors, followed by the built environment variables. In some cases, the relative frequencies of 311 service requests of certain types have also significant predictive power, although the reasons for such connections are not always clear. We map and compare the predicted and the true prevalence of obesity in Austin for the census tracts included in the test set to show the potential of our models to be used as a robust tool for evaluating health risks for existing and future developments. The predictive models can be implemented as interactive tools for government officials and the public to understand how changes of certain factors can increase or decrease health risks and help the planners evaluate and improve the potential health outcomes through planning.

REGIONAL LAND SET-ASIDES FOR FORESTATION, AND THEIR EFFECT ON REGIONAL EMPLOYMENT LOCATION: A DYNAMIC MODEL FOR EXPLORING SCENARIOS

Abstract ID: 662
Individual Paper Submission

KAUFMAN, Sanda [Cleveland State University] s.kaufman@csuohio.edu, presenting author
SALLING, Mark [Cleveland State University] m.salling@csuohio.edu, co-author
KAUFMAN, Miron [Cleveland State University] adnasnorim@gmail.com, co-author

We plan for complex social-ecological systems which change constantly, whether or not we intervene. Along with governmental agencies, numerous individual and organizational actors make self-interested, unilateral decisions in the regional space (Alberti 2005). Some of the outcomes are unexpected and undesirable. Actions in any sector are intertwined, with system consequences—some unanticipated—in other sectors. Planners prefer to be forewarned, to prevent or mitigate some of the unintended consequences. However, the joint outcomes of unilateral and planning decisions are often difficult, if not impossible to predict with the accuracy necessary for action. To avoid costly or irreversible mistakes, planners need to explore region-wide consequences of plans both on targeted and non-targeted system components. Increasingly, scenarios are used to anticipate ranges of some of the system-wide responses to ranges of specific planning interventions.

Adaptive and mitigating responses to climate change exemplify both the complexity of social-ecological systems, and the difficulties planners encounter in anticipating results of plans and in avoiding negative surprises. We focus here on regional land set-asides for forestation, which may affect the number of jobs at locations losing development space. Forestation mitigates climate change in the long run by sequestering carbon, while in the short run sustaining and enhancing ecosystems' diversity, and providing other desirable ecosystem services and recreation. However, forestation for climate change and ecosystem services requires specific locations (Matthews et al. 2014). For instance, new trees at the edge of existing forests grow faster (Briber et al. 2015) and counter fragmentation, contributing to ecosystem health (Reinmann & Huitra 2017).

We propose to use a dynamic model we devised for generating anticipated numbers of jobs in time in a region's municipalities (Kaufman et al. 2018). Based on the number and location of jobs in a regional space in two initial years, the model yields the regional spatial configuration of jobs, with only four nonlinearly estimated parameters, using publicly accessible data. We have applied this model to Northeast Ohio (NEO) and Dallas-Fort Worth (DWF) data (2001-2015). We compared actual and predicted municipal proportions of the total number of jobs in each region. By 2015, we obtained actual-predicted correlations of .98 (NEO) and .99 (DWF). We generated scenarios for policies directly targeting the number of jobs in selected municipalities and discovered the consequences for proportion of jobs in other municipalities in the two regions.

Here we consider a regional forestation plan expected to indirectly affect the number of jobs at different locations in Northeast Ohio. We have found the existing forests in NEO, to which the plan would add forest in adjacent places that would enhance the likelihood of generating healthy, sustainable and diverse ecosystems. We also identified forest-adjacent clusters of vacant commercial and industrial land (2013 data, the most recent available) that could be set aside for forestation. In the absence of a set-aside plan, these areas would likely be redeveloped with similar uses, which would provide employment. We have explored the NEO relationship between percent commercial and industrial area and respective percent jobs in a locality. We have found that—in a first approximation—it is safe to assume that they are similar.

We generate a non-intervention regional jobs scenario, and two scenarios with various levels of set-asides for forestation. We estimate model parameters with data from 2012 and 2013. Beginning in 2014, we set aside the vacant commercial and industrial land available in each municipality, to explore at two levels the effect on jobs location in the region for 2014-2040, including 2015-2018 for which we have actual data. Our results can inform regional plans and help communicate with regional stakeholders.

REIMAGINING TRAFFIC SAFETY DISCOURSE: CIVIC TECHNOLOGY AND VISION ZERO
Abstract ID: 683
Individual Paper Submission

STILES, Jonathan [The Ohio State University] jonathan.stiles@rutgers.edu, presenting author
GOLDSTEIN, Shoshana [Cornell University] srg258@cornell.edu, co-author

Over the past decade, smart city planning discourse has been accompanied by a counter thread: civic technology (Wilson and Chakraborty 2019). Civic technologies engage communities. For communicative planners, civic technology can mean using new participatory approaches such as crowdsourcing and local open data platforms (Seltzer and Mahmoudi 2013; Schweitzer and Afzalan 2017). Yet the "civic hackers" who engage with these processes may also be activists who reveal "the hidden workings of abstract systems" (Schrock 2016) in relation to or even in opposition to the efforts of planners (Maharawal and McElroy 2018). In this article, we build upon recent explorations of civic technology by considering its role as a network of citizen knowledge production in service of a particular public good. In short we ask: can civic technology actually move the needle on government decisions within a particular policy area? And in doing so through the involvement of the public, in what ways does civic tech present a counter to the dominant smart cities paradigm as suggested by Wilson and Chakraborty (2019)? What are the implications of this for planning practice?

To explore these questions we conduct a case study of the role of civic technologies in the traffic safety discourse surrounding the implementation and assessment of Vision Zero in New York City. The Vision Zero approach was originally developed in Sweden in the late 1990s. Its ambition to achieve zero fatalities in a transportation system demands a strategy that goes beyond top-down analysis and provision. In 2014, New York City's mayor released a Vision Zero Action Plan in partnership with the City Council, varied city agencies and private sector organizations. In subsequent years the program has seen a reduction in speed limits, increases in bike lanes, street design changes, and new legislation. While overall traffic fatalities have declined for most years, pedestrian and cyclist deaths have experienced increases. Meanwhile, an expanding community of activists and media actors have engaged with the language, policies, and politics of Vision Zero in NYC through civic technologies that enable users to report and share their experiences, as well as conduct analyses and assemble their own evidence of progress or failure in traffic safety. The civic technologies our case study considers include How's My Driving NY, Reported NYC, On the Bike Lane, Crashmapper, and Vision Zero View among others, most of which emerged out of New York City's civic tech ecosystem or that depend on its open data platform, NYC Open Data.

Our findings, based on discourse and document analysis, demonstrate how civic technologies have supported new forms of safety activism, albeit alongside problematic forms of everyday surveillance. They have also contributed to policy decisions, such as the passing by the New York City Council of the 2020 Dangerous Vehicle Abatement Law requiring drivers to take a safety course based on their number of traffic violations. On the other hand, the prevalence of fatalities in recent years indicates there are basic infrastructural and institutional challenges for which local activism cannot fully compensate. This is where local government--including the nature and quality of the interaction between planners and civic technologies--becomes important. A comparison between an advocacy online mapping tool and a government-developed tool is central to our analysis. We contend that in the smart city, planners need activists, and activists need planners to collectively produce knowledge towards confronting urban problems. We conclude by considering the broader theoretical implications of this case for other applications of civic technology in planning practice.

ESTIMATING THE CAUSAL EFFECT OF UBER & LYFT CARPOOLING ON PARKING VIOLATION IN NYC
Abstract ID: 748
Individual Paper Submission

GUO, Zhan [New York University] zg11@nyu.edu, presenting author
CAI, Junjie [New York University] jc9033@nyu.edu, primary author

Introduction

Carpooling is supposed to reduce parking demand as many more auto trips will not require vehicle parking at the trip end. This argument is one of the major social benefits of Transportation Network Companies [1]. However, it has not been well proved. This paper aims at exploring Uber & Lyft carpooling impact on parking violations in New York City. It leverages the power of machine learning and statistics to proves the causal effect. The most effective way of establishing causality is controlled study [2]. In this paper, it is estimated by Difference in Differences (DID) within a natural experiment [3], and cross k-means clustering was implemented to pair up homogeneous taxi zones as control groups and treatment groups respectively. The results show a negative causal effect between the number of Uber & Lyft carpooling trips and parking tickets, indicating that Uber & Lyft help reduce parking violations and likely parking demand in NYC. Given the controversial issues around carpooling services, this paper sheds light on the impact of Uber & Lyft, offers policy insight to the NYC Taxi and Limousine Commission regulation, and provides a proxy to understand parking demand [4].

Methodology

Difference in Differences (DID) is conducted to explain the causal effect of Uber & Lyft Carpooling on parking violations. A natural experiment was studied using observational data from 2014 to 2018, taking the treatment of Uber & Lyft starting carpooling in NYC in December 2014. Homogeneous taxi zones are cross-paired to be 'treatment groups' and 'control groups' mutually, using cross k-means clustering in terms of demography, economy, transportation, parking, etc. The intervention effect is calculated by comparing the change over 4 years in parking violation for the control and treatment the groups. And Pearson correlation analysis between the intervention value and intervention effect is applied to measure the strength of causality.

To check whether the result is concrete and not sensitive to method selection and model parameter, Fixed Effect Model (FEM) is built, and different k-means model parameters of n_clusters and random_state are tested. If the estimated effect is changeless with different methods and different parameters, the result will be solid and reliable.

Results

As a result of DID, Uber & Lyft Carpooling rides significantly reduced parking violations in Manhattan from 2015 to 2018. The average estimate of causal intensity for Manhattan is -0.037, which indicates that every increase of 27 Uber & Lyft Carpooling trips causes a decrease of 1 parking ticket. As a validation, Fixed Effect Model (FEM) results show that the average effect Uber & Lyft carpooling has on parking violation is 0.0264, with a confidence interval of (-0.029 to -0.024) and a p-value under the statistical significance level. This significant result is consistent with that of DID. In addition, the parameter robustness test shows that the causal effect is stable. In conclusion, at least in Manhattan, the result that Uber & Lyft carpooling has a negative causal effect on parking violation is reliable with an average effect intensity of approximately 0.03.

Conclusions and Discussion

This paper demonstrates that Uber & Lyft Carpooling can reduce parking violation in NYC. It serves as an example to combine causal inference and machine learning methods to prove unnoticed potential effects of ride-share services. Reducing parking violation can be regarded as a positive impact, and also have the following effects such as the reduction of parking enforcement pressure for the city. In this aspect, Uber & Lyft could be beneficial to NYC, and potentially to other major cities in the world.

UNVEILING URBAN STRESS USING TWEETS: MODELLING THE IMPACT OF BUILT ENVIRONMENT STRESSORS ON MENTAL WELLBEING
Abstract ID: 765
Individual Paper Submission

DUTT, Florina [Georgia Institute of Technology] florina.design@gatech.edu, presenting author

GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

Nearly one in five adults experience some form of mental health issues, and one in 24 has severe mental illness in the United States (APA, n.d.). World Health Organization (WHO) have pointed out that globally slightly more than one in ten people live with mental health disorders (Ritchie & Roser, 2018). The suicide rates in the United States have increased to 24% between 1999 and 2014 (Curtin, Warner, & Hedegaard, 2016). The rise in mental wellbeing is more often than not attributed to Urban Living that comes with opportunities like access to better jobs, health care facilities, education, etc. However, rising inequalities, lack of affordable housing, lack of restorative environment, and rampant crimes, have raised the risk factor of psychopathologies in the cities. As the burden of mental health disorder continues to rise, it becomes pertinent for urban planners to understand how the built environment impacts the mental –wellbeing of its residents. Early detection of stress, and understanding its relationship to the built environment can allow planners and policymakers to take necessary steps. Vulnerable residents can be helped through placemaking strategies or by innovative community organizing campaigns, making them aware of their stress, and various stress mitigation strategies. With the constant progress in the public discourse online, more public health officials and stakeholders are inclined to use new mediums to assess mental health (De Choudhury, Gamon, Counts, & Horvitz, 2013). Online medium allows early detection of stress or mental wellbeing of residents across larger geographies, and cultures, e.g., Twitter is one such online medium where people can share their experiences and tie them with locations (geo-tags).

This research explores the association between people's mental wellbeing and the built environment of communities where they live, work, and play. Machine learning techniques are used to identify the stressed and de-stressing tweets of individuals. The built environment surrounding the locations of the tweets is assessed by the streetscape, land use diversity, points of interest, access to parks and green spaces, access to public transportation, and accessibility by biking and walking. Finally, through spatial clustering techniques, we identify the set of built environment variables that are associated with stressed and de-stressing Tweets (Chu, Thorne, & Guite, 2004).

Through this research, we intend to widen the scope of mental wellbeing and urban planning research from the scale of isolated urban developments and neighborhoods to cities (Halpern, 1995). As the factors affecting the mental wellbeing of people often vary across cultures and geography, the stress threshold varies for people living in different cultures. Integrating the use of big crowdsourced data will not only expand the research horizon but also allow researchers to unveil the complex relationship between mental wellbeing and the built - environment(Plunz et al., 2019).

A QUANTITATIVE PERFORMANCE EVALUATION OF URBAN REGENERATION PROJECTS USING BIG DATA IN KOREA: CASE STUDY OF 13 URBAN REGENERATION FLAGSHIP PROJECTS
Abstract ID: 768
Individual Paper Submission

BYUN, Hyunsik [Kangwon National University] arch_angels@naver.com, presenting author
LEE, Jae-Su [Kangwon National University] nowwater@gmail.com, primary author
LEE, Sam-Su [Land and Housing Institute] l3water@lh.or.kr, co-author

Since the 1960s, Korea has seen a steady influx of large population into cities due to rapid industrialization and urbanization. To renew a number of housing complexes built during the period, numerous urban renewal projects including redevelopment and reconstruction projects, have been implemented. Large-scale renewal projects, however, caused many social problems such as the collapse of community and the discrimination of housing welfare among income brackets. With criticism of renewal projects lasting more than 50 years, new paradigm of urban regeneration emerged. Since the enactment of the regeneration act in 2013, the central government has implemented 13 urban regeneration flagship projects in 2014 and 33 regeneration projects in 2016. After setting urban regeneration as one of the national agendas. the present government has been pushing for 100 urban regeneration New Deal projects every year.

In terms of assessing the achievements of the projects, a set of performance indicators and measures is presented when a local government establishes a regeneration action plan. When the local government submits an annual performance report, the authority conducts a comprehensive evaluation. The evaluation of most projects makes the objectives of the projects feasible by monitoring the performance indicators and feedback the results to the management entities. However, studies are insufficient of the performance assessment of urban regeneration projects in terms of the composition and measurement of the indicators and evaluation method. Ho (1999) argued that the performance evaluations of the urban regeneration projects in the UK were neither objective nor valid because they did not consider the outcomes of various relevant studies. Also, it was claimed that the assessment of the urban regeneration projects completed in Western Europe has not been fully made although they were critical for enhancing the vitality and viability of cities (Guimarães, 2017).

Recent studies offer new ideas on how to evaluate and monitor urban regeneration projects. The concept of sustainable urban regeneration, establishment of the set of indicators, hierarchical model and multicriteria analysis has been proposed (Hemphill et al., 2002). It is suggested that selecting and measuring relevant performance indicators, evaluation models and analysis methods are important to ensure sustainable urban regeneration projects (Hemphill et al., 2004a, 2004b). In order to monitor and evaluate their performances, it is important to use instant and quantitative data, such as big data and real-time data, along with a set of measures (Marsal-Llacuna et al., 2015; Jung et al., 2017).

We first set up the indicators to measure the performance of urban regeneration projects by utilizing big data such as mobile communications and credit card data. This study aims to analyze the temporal changing patterns of the urban regeneration flagship projects from 2013 to 2019 in terms of performance evaluation. A set of indicators is compared between the project area and the municipalities on a monthly basis. It is also examined if the cross correlation and granger causality are significant between them. Based on the concept of urban regeneration and sustainability, the indicators are divided into social, economic and physical and environmental sectors. The social sector considers the indicators of settled population and moving population using mobile phone data. The economic sector consists of the measures of credit card sales, newly established companies and small businesses. Also, the physical and environmental sector encompasses the measure of building permits.

In the preliminary results, despite the implementation of the projects, the number of settled population continues to decrease in the project areas, and credit card spending also decrease in small and medium-

sized cities. In addition, credit card spending decreases although the number of moving population increases.

PLANNING AND THE CHALLENGE OF SPATIAL DATA PRIVACY
Abstract ID: 779
Individual Paper Submission

SUN, Feiyang [University of Washington] fs377@uw.edu, presenting author
WHITTINGTON, Jan [University of Washington Seattle] janwhit@uw.edu, co-author
SHI, Xiao [University of Washington] xiaoshi@uw.edu, co-author

The emergence of new data sources and analytical techniques enables the collection, recording, and analysis of unprecedented amounts of information, both online and offline, by planners and other city administrators. As cities attempt to capitalize on these new developments in pursuit of smarter urban governance and socio-economic progress, they encounter growing data privacy challenges, which can impede data sharing, cause economic harm, and exacerbate social inequity (Whittington et al., 2015). In particular, recent research and prominent court cases highlight the ease with which spatial trace data can be used to identify individuals (Carpenter v. United States, 2018). While such challenges are prominent in law and information science and pervasive in city administration, they are still quite foreign to the field of urban planning. This paper introduces the challenge using the theoretical frame of transaction cost economics, and demonstrates the empirical measurement of privacy risk from spatial traces of people in the built environment, as in mobility data.

As a form of government intervention, planning often finds its intellectual support in the argument of market failure and transaction costs. Planning research and practice have primarily relied on theories and empirical studies of land and infrastructure, though the same theories are applicable to information and the study of privacy (e.g., Whittington and Hoofnagle, 2012). From a transaction cost perspective, people are increasingly exchanging information with public and private organizations, presumably to benefit from improvements in services. However, without governance structures to protect their interests, people may never know the extent to which the data is used to harm them, or benefit others at their expense. Such vulnerability can be estimated by the asset specificity of the transaction, or in other words, how unique a consumer's information is when compared with other users. Planners are already keenly aware of the aggregation and disaggregation of people, but may be less aware of the implications for the privacy.

Studies have showed that anonymized spatial traces remain uniquely distinguishable due to the high

dimensionality of spatial data, created by the tuple of coordinates and time stamps (De Montjoye et al. 2013; Sweeney, 2002). This paper demonstrates how variation in the built environment heightens privacy risk, and highlights the tradeoffs between data utility in urban planning and the use of privacy-preserving algorithms. Utilizing a GPS mobility dataset, this paper measures the risk of re-identifying individuals from anonymized datasets with common privacy measurements, such as k-anonymity, and investigates associations between measured privacy risks and built environment characteristics, including urban density, property value, and walkability. The paper also applies Shannon entropy, and estimates the tradeoffs between privacy risk and information loss at spatial and temporal aggregation levels common to planning.

The results demonstrate that, due to differences in consumers' accumulated location traces, privacy vulnerability is heterogeneous across built environments. Furthermore, with an understanding of how privacy risk can vary, planners can play a proactive role in the design of privacy policy and location choice of sensors and location-based services, with direct impacts on privacy.

LISTENING TWEETS OF GROWING AND DECLINING CITIES: AN EVIDENCE FROM DENVER AND DETROIT
Abstract ID: 796
Individual Paper Submission

PARK, Yunmi [Ewha Womans University] ymp@ewha.ac.kr, presenting author

The level of subjective well-being—often called as happiness— has long been measured by expressed preference (e.g., survey or interview) in the previous studies (Park 2017, De Jong et al. 2012). These measures are useful, while there are several barriers to collect the data such as small sample size, return rate, survey types, time, and budget. To compromise these obstacles, there has been an increasing interest in using big data, particularly data retrieved from social network service (SNS) as a form of social listening. Even though there are several downsides of using SNS data including biased age groups, inconsistency in data collection, or privacy issues, SNS can be useful data resource to identify the level of subjective well-being, in particular emotions. With the intrinsic limitation of using SNS data in mind, this study attempts to identify the association between sentiments as a surrogate of happiness and the neighborhood conditions including demographic, socio-economic status and built environment using Twitter posts. This research also highlights the sentiments of people in declining cities where the vitality of the whole city has constantly declined. It is not always true that people in declining city would be less happier than those in growing cities, but declining, depopulating, or shrinking often implies unhealthy, undesirable, or unhappy (Hollander 2010). In order to explore this assumption, this study examined whether the patterns of positive and negative sentiments were consistent in both types of cities with the comparison between Detroit, MI and Denver, CO in the U.S.

This research collected the sentiment data—only geo-coded—from Twitter posts for 14 months from January of 2016 to December of 2017. Username, text, longitude and latitude of each mention were

retrieved using the Twitter developers' APIs. The tweet posts from Bots that share automated messages were filtered out using the complete automation probability (CAP) score. 31% of the original data whose CAP scores with 0.5 or greater that generally implies the Bot accounts (Levente et al, 2019) were removed. The final size of tweets was 123,144 for Detroit and 171,126 for Denver. The sentiment analysis was done by using AFINN lexicon dictionary developed by Hansen et al. (2011){Hansen, 2011 #24}{Hansen, 2011 #24}, which is able to classify positive, negative, and neutral words. Since their dictionary has been used in several studies (Lowe et al. 2011, Koto and Adriani 2015, Markovikj et al. 2013), authors assumed that AFINN lexicon was already validated for the academic research. Cluster and hot spot analysis were done to identify the spatial patterns of sentiments by using the geo-coded point data. Python 3.7.0 and ArcMap 10.4 software were used for Twitter data collection and mapping. The Ordinary Least Square Regression (OLS) models were ran to identify the association between neighborhood conditions and sentiments.

The preliminary outcome of this study indicated that 1) the proportion of positive and negative tweets was higher in Denver (positive: 34.5% and 32.0%, negative: 12.5% and 11.3%), but not substantially high; Most tweets were concentrated around downtown; 3) neighborhoods with more people of higher education and less minority were likely to be happier; and 4) people in neighborhoods located closer to the CBD in both Detroit and Denver. Interestingly, neighborhoods with higher unemployment rate in Detroit tend to be happier. The outcomes are expected to contribute to the usage of big data in planning field and also being a basis for the improvement of social and physical conditions of unhappy spots and push those neighborhoods in a priority, if aids are necessary.

DELINEATING FINE-SCALE URBAN FUNCTIONAL USE FROM POINTS OF INTEREST DATA WITH WORD EMBEDDING MODEL
Abstract ID: 804
Individual Paper Submission

NIU, Haifeng [University of Cambridge] haifeng.niu@outlook.com, presenting author
SILVA, Elisabete [University of Cambridge] es424@cam.ac.uk, primary author

Urban function has been studied in both urban planning and geographic information science for decades. Understanding urban functional use not only provides a geospatial feature for urban modelling but also helps to detect urban problems, evaluate planning strategies and support policy-making especially in highly urbanised and densely populated metropolitan areas (Batty, 2012; Arsanjani et al., 2013). Different from the traditional studies focusing on physical environment with remote sensing data such as land use classification and land use boundary detection, studies now focus on socio- economic characteristics of land/building functional use with detailed and fine-scaled crowdsourced data, i.e. social media data, points of interests and other open-source and volunteered datasets (Crooks et al., 2015; Frias-Martinez

and Frias-Martinez, 2014; Zhi et al., 2016). Among these sources, points of interest (POIs) are popularly applied in understanding urban functional use (Niu and Silva, 2019). POIs refer to point-based locations such as commercial property, public spaces, transportation facilities, etc. associated with detail including location, name, postcode, address, and so on. The distribution of POIs and combination between POIs varies in different urban areas. This variation reflects the preference of urban activities and indicates the pattern of urban functional use at a larger scale. Moreover, POIs are highly disaggregated data with precise location and can be applied at a variety of scales. However, previous work neither frequency-based approach nor neural word embedding such as Word2Vec considered the spatial relationship between POIs in the context of the first law of geography. In this paper, we recognised the capabilities of neural word embedding in delineating urban functional use from POIs and introduce neural network model (Doc2Vec) with sentence/paragraph feature input in the context of geographic space.

This paper chooses the metropolitan area of London as the study area. This paper employs POIs from Ordnance Survey, which is the national mapping services in for Great Britain. This taxonomy is three levels, including nine groups and 52 categories and 582 classes. For each item in this POI dataset, it contains information such as Identified code, name, coordinates, address, postcode, telephone number, brand, and so on. Specifically, the dataset used in this case study is updated in March 2019 with 420,559 POIs throughout the London metropolitan area. Since this paper recognised the advantage of Doc2Vec model in term of presenting the relationship between POI categories with considering the spatial heterogeneity, we apply the model to POIs data by conducting nearest neighbour query of POIs based on London road network (40,000 random points), POIs sequences construction with local tags, vectorisation for POI categories by cosine distance, evaluation of Doc2Vec and clustering urban functional areas with K-means. The contribution of this paper is to introduce a new data source and a new tool for understanding the dynamics of urban functional use from bottom-up and provide a tool to predict and monitor the impact of urban dynamics.

PLANNING SUPPORT SCIENCE: BEYOND PLANNING SUPPORT SYSTEMS (PSS)
Abstract ID: 825
Individual Paper Submission

GEERTMAN, Stan [Utrecht University] s.c.m.geertman@uu.nl, presenting author
STILLWELL, John [University of Leeds] j.c.h.stillwell@leeds.ac.uk, co-author

Never has there been a more important time for communities, planners and policymakers to work together with researchers more closely and to make use of Information and Communication Technologies (ICT) to address the pressing issues facing the cities in which we choose to live in increasing numbers. We are faced with major challenges such as increasing number of people living in slums or conditions of multiple deprivation, increases in extreme climatic events, and global health crises. These major global challenges sit alongside the more routine requirements to produce solutions to physical, economic, social problems associated with urban and regional development and the drive towards more sustainable environments.

Yet several encouraging signs have emerged in this current age of digitization, big data and smart cities indicating that new ICT and data driven approaches (data science and informatics) may be brought to bear to support researchers, planners and policy-makers in confronting some of the grand challenges as well as the routine tasks, many of which might be undertaken more effectively. Planning Support Systems (PSS) are computer-based tools which can assist planners to more effectively undertake their day to day planning-specific activities.

PSS came into being in the late 1980s as described by Harris and Batty (1993). They arose through a convergence of efforts being undertaken in the areas of GIS, large-scale urban models and decision support systems (DSS). In the 1990s, a number of PSS were developed which enabled planners to interact and use these tools themselves through graphical user interfaces (GUIs). Early PSS included systems for modelling land use such as What if? and UrbanSim, systems for measuring conditions and change such as INDEX, and systems for encouraging community participation such as CommunityViz (Brail 2008). Several of these PSS, and others, have stood the test of time and, in their various incarnations, are still used in planning practice 20 years on.

However, as Vonk et al. (2005) and others have noted, the implementation of PSS has not been without its challenges with the adoption in practice not being as widespread as the PSS developer community might have hoped for (Geertman and Stillwell 2003). Yet with the emergence of the smart city, digitisation, big data and the opening of government data repositories, there are new opportunities for PSS to embrace this shift towards the digital paradigm and increase its visibility and uptake as a geo-information toolkit which can support a number of urban planning tasks. It is due to this much widened perspective on PSS that we prefer to speak of an upcoming scientific field of 'Planning Support Science' with an emphasis on the goal of support instead of focusing just on the system-side of PSS (Geertman 2013).

For their acceptance in planning practice, PSS developed in the 'computer laboratory' need to be adapted to the specifics of planning practice, to the intended application, and to the context of that application. This adaptation, its needs and its associated methodology have become a field of research in its own right. In addition, the upcoming concept of smart city has blurred the distinctions between systems, tools, instruments, apps, social media, big data, et cetera, that by itself can fulfil an ICT-based supporting role in planning practice. It is for these reasons too that we prefer now to use the term Planning Support Science. The intersection of Planning Support Science, city or urban science and data science is offering exciting new possibilities in data driven approaches to city planning.

In this contribution we will elaborate on the transformation of PSS into PSScience, its preconditions, consequences, and recent applications (Geertman and Stillwell 2020).

CLIMATE'S SILENT KILLER? EAST BOSTON EXTREME HEAT MAPPING PROJECT
Abstract ID: 835
Individual Paper Submission

KANDEL, Sajani [University of Massachusetts Boston] kandelsajani@gmail.com, presenting author
BUTLER, Debra [University of Massachusetts Boston] debra.butler001@umb.edu, co-author

Central theme/Research Hypothesis

In large dense cities, unshaded roads and buildings absorb heat during the day, then at night, radiate back into the surrounding air creating "urban heat islands" .With Climate change and increasing global temperature, local temperatures are increasing in both frequency and intensity. On the days when local temperature is high, additional heat emitted by paved and concrete structures can produce dangerously hot areas within specific city neighborhoods. In addition, building without adequate cooling systems have the potential to retain heat, even during non-extreme events. Heat held inside infrastructure like buildings may be higher than outside temperatures for up to 72 hours.

Mainstream planning strategies have relied on open spaces, parks, green infrastructures, waterfronts, cooling stations or emergency shelters to combat urban heat. However, not all resident has equitable access to these interventions nor can afford air conditioning People living in densely populated residential housing, those who lack mobility, reliable transportation, or are disabled, medically ill, the old and very young, are dis-proportionally impacted by the lack of realistic or accessible remedies.

This collaborative, participatory pilot research is an attempt to bridge science and community activism through a simple data collection and analysis system which identifies critical threats to well-being and climate resilience. Our research seeks to understand: How can transdisciplinary approaches and methodologies "place" data to develop just, equitable and humane approaches to climate adaptation? How might the residents of East Boston neighborhoods' leverage the process of narrative and geospatial mapping to promote holistic understanding that includes all people for whom the city is "home".

Research Approach

This pilot project synthesizes people-of-place narratives and stories with participatory GIS using mobile phone applications to create "story maps". Story maps create new forms of data (which communities own and control), a pathway toward deeper understanding the layered challenges of "lived experiences". Story maps might be used as a political capital for climate activism, agency, advocacy and adaptation. Neighborhood residents create their own maps, elevating voice to local needs and priorities, and political projects of resilience and resistance.

Findings

The research contributes to both technology-mediated citizen involvement and urban planning participation methods to advance inclusive planning with readiness to incorporate unfamiliar areas, its understanding and ways to effective management for climate change. This pilot also evaluates space and relevance of different age group participation for the effective data collection, interpretation, data ownership and advocacy of community need to inform planning/policy for mitigation of extreme heat.

Relevance

This research is a step towards problem solving by integrating communities, science and policy during the time when climate change is becoming new "normal" and communities need to come together in combating it. The research builds on a foundation that every urban resident brings a unique objective, perspective, history, and set of needs determining the identity and location of the high concern areas that would have missed from traditional approaches.

SMART CITY AS PLATFORM, SMART CITY AS INFRASTRUCTURE, SMART CITY AS CONVENOR: A COMPARISON OF HOW SMART CITY TECHNOLOGY POSITIONS 'THE CITIZEN'

Abstract ID: 870
Individual Paper Submission

ROBINSON, Pamela [Ryerson University] pamela.robinson@ryerson.ca, presenting author
JOHNSON, Peter [Waterloo] peter.johnson@uwaterloo.ca, co-author

On trade show floors and city halls worldwide, vendors pitch their smart city technology with promises of more efficient, inclusive, sustainable, and accountable cities. While it is still relatively early days in terms of smart city activity, many jurisdictions are moving ahead with developing plans and policies. Vendors are selling, governments are buying, decisions are being made and the built form is being shaped all under the rhetoric of deploying technology to help local governments and their cities become more efficient, transparent, accountable, and inclusive.

Ultimately, the decision to use this technology has real implications for the role(s) of citizens in local governance (Greene, 2019; Johnson, Robinson and Philpot, 2020). There are concerns about citizens being unitized as data points, monetized as data sets, their citizenship being reduced to the role of a consumer and/or units of economic or data production, and their actual agency being erased by the platformization of city hall (Robinson and Biggar, forthcoming). At this pivotal point in the planning of cities using new technologies, before technology is deployed at a large scale, this paper examines early stage smart city platform deployment to evaluate how these platforms position citizens in relation to traditional democratic actions of city hall.

This paper presents findings from an evaluation of nine urban technology platforms that are being used in North American cities. These platforms provide services and gather data related to municipal infrastructure problems, active transportation, multimodal mobility, waste management, street furniture and public wifi, last mile mobility, and citizen engagement. For each platform we consider how the vendor is positioning its role in quality of life improvement for urban residents; who the user groups are of each platform; and the mechanics of how the platform operates and what kinds of data it requires or gathers. Using these inputs we then deploy Johnson et. al's type, tap, tweet, pass framework for evaluating citizen roles in smart cities to evaluate which kinds of citizen-platform interactions are intended to serve which goals and what are the implications of these actions citizens and governments.

The results of this evaluation are used to answer the following questions: Is there 'citizenwashing' taking place where vendors make claims of transformational change, but in reality they are selling a transactional product? To what extent do these technologies empower/marginalize citizens or even empower or marginalize government? And how is the introduction of these technologies impacting citizen-government interactions? Ultimately, this research will provide practicing planners with feedback about the deployment of these platforms might influence their work with community members (Desouza et. al, 2014) while also making a contribution to planning scholarship about smart cities and citizen engagement

and participation efforts (Arnstein, 1969).

BIG DATA FOR CITIES IS NOT NEW
Abstract ID: 903
Individual Paper Submission

WILLIAMS, Sarah [Massachusetts Institute of Technology] sew@mit.edu, presenting author

Data is a medium to construct and convey ideas, just as a collection of words makes a story or an artist who uses paint to provide an image of the world. Data analytics and the resulting insights communicated through visualizations have done tremendous good in the world, from easing and stopping disease to exposing exploitation and human rights violations. At the same time, data analytics and algorithms all too often exclude women, the poor, and ethnic groups. How do we reconcile the potential of data to marginalize people and reinforce racism with its ability to end disease and expose inhuman practices? These two realities remind us that the same data in the hands of different people can produce wildly different outcomes for society. That is what is at once so exciting and alarming about using data to change the world. For many city planners, their relationship with technology, data, and its use in communities is an uneasy one for just this reason.

"Big Data for Cities is Not New," positions the reader within this larger narrative, providing examples of the ways those in power have used data to shape our cities. How they have reinforced structural racism, and how data has helped enforce the marginalization of various populations. However, at the same time, the article illustrates the many benefits analyzing data has afforded societies, such as the provision of social services and stopping the spread of disease. The juxtaposition of these two outcomes reminds the reader that the use of data is defined by the person analyzing it.

This article reminds as that data is as old as civilization itself. The earliest forms of data collection recorded property rights, land production, assets—largely to determine taxation. During the Victorian era society's increased fascination with using scientific methods to understand social processes launched what might be considered the first open data movement. The excitement of these early statisticians helped to promote the release of census data, vital statistics, and the development of maps and data analysis. Their work helped to create the field of public health and epidemiology. Early activists, such as W.E.B Dubois', used data visualizations to explain the African American experience at the turn to the 20th century. St. Louis' first Director of Planning in 1917, Harland Bartholomew, used data analytics to segregate, and his early work helped lay the groundwork for the development of the Home Owners Loan Company (HOLC) redlining maps. Postwar America was fascinated with applying data analytics developed during the war

towards urban planning, and the results often led to the marginalization of the poor. These experiments among other examples provided in the book caused data to fall out of fashion with urban planners. However, the popularity of big data and civic technology have created a renewed interest. Learning from these historical successes and failures will equip us to apply data towards policy development more ethically and responsibly.

REDEFINING 'CIVIC MEDIA' THROUGH THE LENS OF AN URBAN PLANNER
Abstract ID: 935
Individual Paper Submission

THOMAS, Louis [University of Chicago] lou_t@alum.mit.edu, presenting author
MEHTA, Aditi [University of Toronto] aditi.mehta@utoronto.ca, co-author

Information communication technologies have transformed over the last thirty years, including the invention and commercialization of the Internet, the creation of interactive social media, the rapid spread of mobile phones, digital imaging and instant audio making (Allen and Light, 2015). These innovations have allowed individuals to easily increase their stock of knowledge, as well as share their perspectives on various political, social, and economic issues leading to the rise of "civic media." Civic media is the practice of designing, building, implementing or using digital tools to intervene or participate in the public sphere, and the umbrella term encompasses mediated activities initiated by those in power and by non-state actors (Gordon and Mihailidis, 2016).

Existing research explores how planners use social and mass media (Flyvbjerg, 2012; Schweitzer and Stephenson, 2015), how new media is changing users perceptions of cities (Park and Evans, 2018), and how planners use new media tools for public participation (Goodspeed, 2008). Thus, as a field and profession that prioritizes community engagement, participation and collaboration, Civic Media should be at the forefront of contemporary planning practice. This research asks how can planners utilize the tools of Civic Media toward that end.

To answer our question, through content analysis we examine multiple case studies concerning the nexus of Civic Media and planning practice found across academic literature, journalism, and Civic Media itself. Civic Media as currently defined is used to describe disparate practices, from 311-type interfaces to report pot-holes and other minor civic-maintenance and quality of life issues, to coordinating regional relief efforts such as occurred after superstorm Sandy in New York, to national movements such as #MeToo and #BlackLivesMatter, to internationally engaged movements such as the Zapatista uprising and the Arab Spring. While these all represent innovative civic uses of technology that planners should be fluent in, the breadth of the practices is so wide that it endangers the term Civic Media of becoming another empty signifier.

We find that Civic Media, rather than conceived as a general term, is more productively understood when considered from three distinct lenses: one, the primary scale of its use--Local, Regional, National, or

International; two, its power-position (place along a top-down vs. bottom-up continuum); and three, its position along a spatial-virtual continuum. This taxonomy of the specific qualities Civic Media manifests will help planners as they navigate how to best integrate these new technologies into their practice and research. We analyze the potentials and pitfalls of Civic Media use for planners along each category of our taxonomy. The broad cases we examine provide new categories for future planning research.

As an effective strategy to develop healthy cities, improving urban air quality is often highlighted by urban planners and environmental scientists (Northridge et al., 2003). Developing air pollution models is commonly used to assess human exposure to air pollutants at locations without air pollution measurements (Jerrett et al., 2005). Among them, land use regression (LUR) models effectively characterize neighboring geospatial features and enable predicting air pollution concentrations nationwide (Hoek et al., 2008). However, existing national LURs are often trained with limited and expensive ground-level regulatory monitors (e.g., Environmental Protection Agency Air Quality System [EPA AQS]) and may fail to capture within-city spatial variability (Kim et al., 2020). Emerging big and open data from community-based air quality monitors allows for opportunities to improve existing model development and supplement locations where regulatory monitors are not available (Kaufman et al., 2017).

PurpleAir is a low-cost sensor network that offers publicly available real-time and historic air pollution data worldwide (e.g., $PM_{2.5}$: particulate matter with a diameter of less than 2.5 micrometers). This open data source provides more community-level air monitors with increased spatial resolutions as compared to traditionally limited number of regulatory monitors. In particular, it measures $PM_{2.5}$ concentrations in different microenvironments including traffic segments, university facilities, and suburban environments. While this dense network has been deployed, few studies have integrated it into LUR models to help estimate national-scale exposures. In this study, we use the PurpleAir sensor network to develop national LUR models for $PM_{2.5}$ in the US with the goal of assessing whether such community-based open data could improve model performance and inform community health.

We retrieved and calibrated the annual average $PM_{2.5}$ concentrations from the low-cost sensors (i.e., PurpleAir sensors) from 6 urban areas (i.e., core-based statistical areas) in the US where at least 7 EPA and PurpleAir sensors were available. Our independent variables included 11 categories (n = 339) of geographic features (e.g., traffic, population, land use, and satellite air pollution measurements). We developed both low-cost sensor-based LUR models (using only the PurpleAir sensors) and hybrid LUR models (using both the regulatory and low-cost monitors) for predicting annual average $PM_{2.5}$ concentrations; we applied a partial least squares-universal kriging approach. Finally, we compared the long-term concentration estimates derived from exposure assessment of different LUR-derived population-weighted predictions.

Our results showed that LUR models using only the PurpleAir sensors showed reasonable performance: 10-fold CV $R^2 = 0.66$, mean absolute error [MAE] = 2.01 µg/m^3. However, the external evaluation using the EPA monitors suggested that the PurpleAir-only LUR models may consistently over-predict $PM_{2.5}$ concentrations. We observed that the hybrid LUR models performed better as compared to the PurpleAir-only LUR (R^2: 0.85, MAE: 1.02 µg/m^3) indicating that regulatory monitors and low-cost sensors could be integrated to refine LUR models. We also noticed that both the hybrid LUR and PurpleAir-only LUR were spatially correlated with the regulatory-based LUR (e.g., Los Angeles: R^2: 0.82, MAE: 0.77 µg/m^3). Likewise, the LUR-derived population-weighted predictions suggested that integrating low-cost sensors into LUR may help catch hot spots of higher $PM_{2.5}$ concentrations.

We found that LUR model development using low-cost sensor network is feasible to capture spatial variability that maybe missed by the regulatory monitors and obtain promising performance where regulatory monitors are unavailable. Our study uses the 6 urban areas to explore the integration of community-based open data into urban air quality modeling. As such, national-scale low-cost sensor-based LUR models could be developed to track exposures more accurately and inform planning policies towards health-promoting communities.

DATA FEMINISM: IMPLICATIONS FOR PLANNING
Abstract ID: 979
Individual Paper Submission

D'IGNAZIO, Catherine [Massachusetts Institute of Technology] dignazio@mit.edu, presenting author
KLEIN, Lauren [Emory University] lauren.klein@emory.edu, co-author

As data are increasingly mobilized in the service of cities, governments and corporations, their unequal conditions of production, their asymmetrical methods of application, and their unequal effects on both individuals and groups have become increasingly difficult for data scientists--and others who rely on data in their work--to ignore. But it is precisely this power that makes it worth asking: "Data science by whom? Data science for whom? Data science with whose interests in mind? These are some of the questions that emerge from what we call data feminism, a way of thinking about data science and its communication that is informed by the past several decades of intersectional feminist activism and critical thought. Illustrating data feminism in action, this talk will show how challenges to the male/female binary can help to challenge other hierarchical (and empirically wrong) classification systems; it will explain how an understanding of emotion can expand our ideas about effective data visualization; how the concept of invisible labor can expose the significant human efforts required by our automated systems; and why the data never, ever "speak for themselves." The goal of this talk is to introduce the data feminism framework, along with its implications for planning, urban science, and smart cities.

ASSEMBLING URBAN CONSERVATION IN THE COLD SEASON OF TEHRAN
Abstract ID: 990
Individual Paper Submission

YADOLLAHI, Solmaz [BTU Cottbus-Senftenberg] solmaz.yadollahi@b-tu.de, presenting author

Economic and political crises have, in many cases, contributed to the opening of space for more participation in planning. However, crises can have different scales and dimensions, and participation as a planning strategy can work differently within different social, geographical, and temporal contexts. Therefore, neither crisis nor participation is used as a general term in this paper. My aim is to look at the particularities of participation in urban conservation during the recent critical months in Tehran. In the last two decades, the traditionally rigid and centralized planning apparatus in Iran has shown a slow but growing tendency to cooperate with private investors and civil activists. Together with other challenges, economic sanctions have put unprecedentedly enormous pressure on Iran. This pressure has reached a peak between November 2019 and March 2020. I map the state of urban conservation assemblage in Tehran with an eye on the multiple challenges that rose during the recent months. I observe the interplay of planning instruments and concepts, organizations, human actors, and internet-based social media in the presence of the economic sanctions, the possibility of war, and the coronavirus. Research material for this paper is mainly collected through the ethnographic observation of online social media, academic publications, public events, as well as personal interviews. The findings show how the current circumstances have led to the formation of a tamed, territorialized space of social involvement on the periphery of the official conservation planning assemblage.

ALL THE WAY FROM MACRO TO MICRO: DO MICROSCALE FACTORS OF STREETSCAPES MATTER FOR WALKING?

Abstract ID: 1012
Individual Paper Submission

KOO, Bon Woo [Georgia Institute of Technology] bkoo34@gatech.edu, presenting author
ZHANG, Ge [Georgia Institute of Technology] ge.zhang@coa.gatech.edu, co-author
BOTCHWEY, Nisha [Georgia Institute of Technology] nisha.botchwey@design.gatech.edu, co-author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

The built environment characteristics that influence walkability range from macro-scale urban forms to micro-scale design details (Harvey and Aultman-Hall 2016), but much of the literature focused on macro-scale factors. In our previous studies, we showed the effectiveness of using computer vision and street view images for measuring meso-scale (i.e., a mid-scale between macro and micro, which relates to the overall size and scale of streetscapes) walkable streetscapes and the potential generalizability of the findings. To expand the scope of measurements all the way from macro- to micro-scale, this study turns to micro-scale walkability factors, the most fine-grained features of streetscapes pertaining to the presence and the quality of pedestrian-related physical features such as street furniture, streetlights and traffic signals, crossings, and sidewalks. Despite their potential influence on walking behavior in the empirical and theoretical literature (Alfonzo 2005; Cain et al. 2014), measuring such features is a resource-intensive task as there have been few options other than manually measuring them using, for example, walkability audits.

In this study, we use computer vision and street view images to automate a pre-validated walkability audit tool designed to measure micro-scale pedestrian environment. We combine this measurement with macro- and meso-scale walkability features to construct a comprehensive measurements of the built environment for Atlanta, GA. We first examine the correlations among various scales of measurements. Next, we use a travel survey data to evaluate the standalone, relative, and interactive contributions of various walkability features measured in different scales on walking behavior after controlling for demographic characteristics. We demonstrate the relative importance of measurements in various scales on explaining walking behavior. We show that the image-based measures can capture not only the presence and configuration of the physical features of the built environment but also the perceived quality of the features, offering an opportunity to expand the scope of data-driven research substantially.

IMPROVING SMALL-AREA POPULATION AND HOUSING ESTIMATES USING ADMINISTRATIVE AND SPATIAL DATA
Abstract ID: 1029
Individual Paper Submission

RUTHER, Matt [University of Louisville] matthew.ruther@louisville.edu, presenting author

Neighborhood-level population and housing forecasts are useful in a variety of settings in demography, public policy, and planning. Although forecasts for large geographies – such as counties – are carried out using complex demographic models, small-area (i.e., neighborhood) forecasts typically rely on a simpler modeling framework. For sub-county projections, the Hamilton-Perry model has been established as a reliable forecast model that requires minimal data inputs. The only information required for the Hamilton-Perry method is the age distributions in the two preceding time periods. However, regardless of the technique used to carry out the population and housing forecasts, small-area projections still suffer from some notable limitations, including the instability arising from the incorporation of small numbers, the unboundedness of the forecasts, and a lack of spatial cohesion.

In this paper, we examine several modifications to the existing Hamilton-Perry method to improve the accuracy of small-area forecasts. In particular, we consider the propensity for any single parcel of land to develop, the maximum density that might be supported within a given neighborhood, and the spatial autocorrelation in the forecasts in computing our small-area projections. To test how the incorporation of these additional data sources affects the accuracy of the method, we generate 10-year forecasts using census tract-level data from the 1990 and 2000 Decennial Censuses. These forecasts are then compared to the actual 2010 Decennial Census counts to produce several measures of numerical and distributional accuracy.

In carrying out our forecasts, we utilize ancillary information available in land parcel databases, infrastructure networks, and other publicly available local data sources. This paper thus contributes to an existing research literature that explores the utility of administrative data in complementing or supplementing population and housing data from other sources, such as the U.S. Census Bureau. The forecasting methods that we derive are important to planners at the local and regional levels, as accurate population and housing projections are necessary in modeling future transportation and housing needs, the implementation and location of community service facilities, and in emergency and disaster planning.

UNDERSTANDING LONG-TERM LAND VALUE PROSPECTS IN PLANNED NEW URBAN CENTRES
Abstract ID: 1057
Individual Paper Submission

YANG, Tianren [University of Cambridge] tianren.yang@hotmail.com, presenting author
JIN, Ying [University of Cambridge] yj242@cam.ac.uk, co-author

Land value capture (LVC) is a prevalent approach enabling local communities to recover and reinvest public-induced land value increment, especially in relation to large-scale urban development. However, the state of the art in LVC is considered fairly restricted to the short-term prospects and existing centres of high land values. This leads to many missed opportunities – for instance, planned new centres if successful may well have good prospects of long-term land value uplift (LVU), but such opportunities are off the radar for existing methodologies.

This research aims to develop a new method to measure, model and predict the long-term, comprehensive land value effects and related socio-economic benefits/costs pertaining to new urban sub-centres. Specifically, three research questions are addressed: (1) What is the relationship between investments in housing, jobs and transport infrastructure in creating land value uplift (LVU)? (2) How to create higher LVU in new sub-centres in order to better perform LVC over the long run? and (3) What are the trade-offs between LVU and socio-economic benefits/costs?

To answer these policy-cogent questions, a novel analytical model has been developed, which is able to pinpoint the causes and effects in terms of land values and their implications for value capture and urban growth. This combines spatial equilibrium modelling of business and resident activities with recursive dynamics of land use and transport supply. The key inputs of the model are the changes in the macro economy, demography, technology, infrastructure and land provision. The key outputs are where businesses and people locate, building and land rents, wages and prices of goods and services. The spatial equilibrium and dynamic models interact over decade-long periods for 15 years in the past (i.e. from 2000, for model calibration and validation) and another 20 years into the future (for predictions up to 2035).

Greater Shanghai has been chosen as a fair representative case for sub-centre development for its long tradition in planned polycentricity and large-scale urban investments induced by rapid urbanisation. Despite the paucity of reliable and disaggregated data therein, this research has made systematic use of multi-source urban data (i.e. official statistics, novel online data and proprietary big data) to calibrate and validate the models. Three scenario sets (i.e. trend growth, spatial mismatch and coordinated polycentric derivations) have been tested to explore the possible ranges in potential outcomes regarding future sub-centre development.

As opportunities for LVC are fundamentally market-driven, this research reveals that coordination between different types of development (i.e. jobs, housing and transport) is essential in generating positive externalities that are realised and capitalised in land rents. Following the trend growth, the balance between jobs and housing provision appears to be lost, which will dampen the long-term prospects of LVC in the sub-centres; they are insufficient job opportunities rather than any lack of housing development that will lead to the loss of this balance. In addition, trade-offs between LVC and capitalisation of other socio-economic benefits/costs do exist. The localised circumstances are crucial in determining the location of newly planned developments in order to maximise the potential economic gains (from more value uplift to capture) and socioeconomic benefits (indicated by higher consumer surplus).

The model findings provide new insights for city leaders, developers and other stakeholders in a quantified range of market impacts that are induced by investments in infrastructure and public services. Such an approach would materially improve local governments' abilities to explore LVC options, not only as a financing instrument within current property hotspots, but also as part of a wider policy toolkit that can be utilised to promote social equity, environmental sustainability and business productivity.

LANDSCAPE SHAPE ADJUSTED COMPACTNESS INDEX FOR URBAN AREAS
Abstract ID: 1078
Individual Paper Submission

KAZA, Nikhil [University of North Carolina at Chapel Hill] kaza.nikhil@gmail.com, presenting author

It is of significant interest to characterize urban form and its change for various cities (e.g. Schnieder and Woodcock, 2008; Seto et al., 2011) and to study their effect, among other things, on air qual- ity, transportation behaviour and relationships with environment (e.g. Kaza 2020; Stone et al., 2007; Jones and Kammen, 2014). One dimension of urban sprawl is the compactness of the urban area as measured by dispersed fragmentation. In this paper, I illustrate some challenges associated with measurement of this compact urban form especially when using raster datasets and landscape metrics.

Conventionally compactness is defined for a single shape and there are number of metrics that have been proposed over the years. (For reviews see, Maceachren, 1985; Gustafson, 1998; Angel, Parent and Civco, 2010). Angel et al. (2010) extend these concepts to characterize different notions of compactness of a shape by looking other aspects such as dispersion, girth and range. All these metrics are susceptible to issues of resolution and accuracy of the perimeter and area as well proper treatment of holes and other non-simple features that are often found in urban areas. In particular, many of these metrics are designed for a single polygonal or contigu- ous/connected shapes. However, urban areas are often polynucleated and characterized by fragmentation especially at the edges. Similarly, urban growth is often characterized by simultaneous processes of dispersion, coalescence and infill. Shape compactness metrics are local compactness metrics and for urban form we need meso level compactness metrics that take into account multiple distinct and discontinuous shapes at different distances. Li.et. al (2013) proposed ratios of area moment of inertia (MI) as a measure of compactness. Two features of this measure makes it particularly attractive. 1) MI is decomposable individual parts 2) Parallel Axis Theorem. While IMI_u is a good metric for measuring compactness, it has some problems associated with the landscape boundary and urban suitability. I propose an adjustment to this compactness index.

In this paper, I demonstrate that identifying compactness of urban area is complicated by landscape shape and other restrictions. Using 2016 land cover data, at the county level, I demonstrate the effect of these adjustments. Only 14% of the counties see their IMI go up by more than 0.1 and 2% see changes that are more than 0.2. Most of these counties are located in the heavily urbanized North eastern corridor, in the hilly regions of Appalachia, Bayous in the Gulf coast of Louisiana. In the Pacific coast where compactness score is improved, it is due to mountainous and irregularly shaped counties. Another distinct cluster can be observed in counties along the Rocky mountains in Idaho and Colorado. Coastal counties that are con- strained in their development patterns by water in South Carolina and Florida also experience modest changes.

BEHAVIORAL INTERVENTIONS TO ENSURE EQUITY IN SHARED MOBILITY FOR LOW-INCOME COMMUNITIES
Abstract ID: 1096
Individual Paper Submission

PAN, Alexandra [University of California, Berkeley] alexpan33@berkeley.edu, presenting author

East Oakland, California has been the victim of racially motivated government policies that identified majority non-white neighborhoods as risky investments, thereby depriving them of essential resources such as housing and transportation infrastructure. Innovations in shared mobility that have given users short-term, on-demand access to cars, bicycles, or scooters have emerged as a possible strategy to alleviate the transportation problems facing these neighborhoods today, such as poor public transit accessibility and lack of vehicle ownership [1].

Despite the potential for shared mobility to address transportation barriers, the demographics of users are not entirely inclusive. Just 8-24% of bikesharing users are non-white, while 29-39% earn a household income greater than $100,000 per year [2]. In a survey of seven U.S. cities, researchers found that college-educated and affluent individuals adopted Uber and Lyft at twice the rate of less-educated and lower-income individuals [3].

While some companies, notably Ithaca Carshare and Indego Bikeshare, have made strides to address these barriers [4], in a review of these efforts to increase equity in shared mobility, I have identified two major shortcomings: few projects conducted a needs assessment to understand what target populations actually wanted, and the majority failed to follow up with participants to determine whether sustained behavioral change occurred. As a result, initiatives to increase equity often fall short of stated goals.

My research targets this gap in the literature by posing two research questions:

1. How can shared mobility meet the specific transportation needs of low-income residents of East Oakland?
2. What are the most effective strategies that can facilitate the access, awareness, and usage of shared mobility by low-income groups?

To explore these research questions, I will conduct a 9-month long pilot project starting in April 2020 with 60 low-income households in East Oakland. I designed the pilot using input from expert interviews (n=9) with local planners, policy directors, and program managers at non-profit agencies. I also completed three focus groups (n=24) with low-income East Oakland residents. Data from focus groups indicated high levels of interest towards shared modes but hesitance towards assuming financial risk for the shared vehicles. Focus group participants also identified potential use cases for shared mobility, in particular as a back-up option for when a personal vehicle was unavailable or for connections to public transit. Data from focus groups were also used to determine which behavioral interventions to explore further in the pilot project.

I will randomly place pilot participants in either a control group or one of three treatment tracks. Treated participants will receive some combination of the following interventions:

1. One-on-one travel training

2. One month-long free trial for micromobility
3. Discounts on trips taken with shared mobility

I will measure the behavioral change of all participants by combining quantitative activity data (miles driven, trips taken on public transit or shared modes) with qualitative responses from before and after surveys and in-depth interviews. I will compare changes across treatment and control groups to identify the impact of behavioral interventions on use of shared mobility.

THE AGING POPULATION'S PERCEPTION OF AND ATTITUDE TOWARD SMART CITY INITIATIVES
Abstract ID: 1103
Individual Paper Submission

KIM, Jongwoong [West Chester University] jkim@wcupa.edu, presenting author

This research project explores the aging population's perception of, and attitude toward, a range of exemplary smart city initiatives, primarily weighing on: (1) their perception of the initiatives likely in helping them age in community; and (2) their willingness vs. reluctance to accept those initiatives as actual policies. By surveying older Americans age 55 and older in the Northeast region, this project intends to provide practical implications for planners and city officials who contemplate proposing the smart city initiatives in the near future for their municipalities. Our population is rapidly aging, primarily driven by the aging baby boomer cohort, and it is imperative that our cities and communities need to help them age in community since it is their dominant preference (American Planning Association 2014). Although smart home technologies have generally been regarded as beneficial for older adults to age in place (Peek, et al. 2014), there is a lack of studies whether smart city initiatives, with much larger scale and probably bigger impact, could possibly help the older adults age in community. While there is no simple definition of a smart city, the exemplary smart city initiatives can be characterized as actively utilizing ICT, IoT, Sensors, GIS, A.I., and blockchain technology to promote efficiency and sustainability of city- or community-wide systems, ultimately to enhance the quality of resident's life in general. However, there is no shortage of concerns about the potential abuse of the pervasive technologies (Peek, et al. 2014; Demiris, et al. 2008), namely the possibility of invading privacy with the "omnidirectional" personal data collection. Population aging is a reality, and there has been a significant number of policies and movements to facilitate aging in place/community throughout the U.S. (American Planning Association 2014; Scharlach 2012). The smart city has not only been a buzzword at this critical juncture of the 3rd and the 4th industrial revolutions but also been an actual policy goal, particularly in the West Coast cities with high-tech industry bases. This study, by shedding a light on the aging population's perception of and attitude toward a range of smart city initiatives, aims to support our cities and communities to take one of the early steps toward a smarter future, especially for our aging population.

DIVERSIFICATION IN THE CITY SCIENCE BASE: EXPLORING THE CONNECTIONS BETWEEN KNOWLEDGE LEADERSHIP AND DIVERSITY IN CITY SCIENTIFIC EFFORT
Abstract ID: 1146
Individual Paper Submission

POWERS, John [Singapore University of Technology and Design] john_powers@sutd.edu.sg, presenting author
NATALI, Felicia [Singapore University of Technology and Design] felicia_natali@sutd.edu.sg, co-author

As cities and the larger regions of which they are a part, are increasingly central to innovation, the important question about how much specialization and how much diversity is good for their growth prospects must be pursued in new ways. The characterization of a trade-off between what was regarded as efficient and valuable specialization and inefficient and impractical diversity in the economic functions of the city, was famously made by Jacobs (1969: chapter 3 in particular). There is ample historical evidence to demonstrate that cities with dominant industries have experienced prolonged stagnation and decline as a result of economic restructuring, including technological change, affecting that industry (Bluestone and Harrison, 1982), including in financial and advanced producer services (Sassen, 2012).

The present paper is rooted in the reciprocal relationship between science and its links to growth and innovation, on the one hand, and in arguments about the long-term merits of capitalizing upon urban-centered diversity, on the other. Diversity in this context is taken to mean primarily the nature of scientific activity, its link to the renewal of technological opportunity and to broad-based economic growth and development. The set of questions that guide this effort are of two sorts. First, in what ways can we say diversity is connected to city scientific leadership? Second, given the growing significance of global scientific collaboration, how may it contribute to a city's structure of diversity in scientific activity?

Our data collection and analysis is centered on highly cited scientific publications from the Web of Science database covering the period 2014 through 2018.[1] From this global data set we focus our analysis on the top 200 cities in terms of volume of highly cited scientific publications. This is consistent with scholarly work seeking to examine what the structure and content of scientific output in cities across the globe (Matthiesen et al., 2009; Grossetti et al., 2013) looks like, how it is changing, creating new centers of scientific knowledge production, and leading to innovative capability development.

Fractional counting methods and using the Google API have been combined to achieve a high degree of consistency of author addresses and institutional affiliations and in turn to apportion scientific publications to particular cities owing to substantial national and international collaboration. We have condensed the data of over a hundred scientific fields into 15 'macro-disciplines' in order to aggregate fields into more manageable categories that still provide enough granularity to indicate city specialization in a particular area. The Herfindahl-Hirschman Index is used as a high-level measure of diversity across

the range of a city's scientific output while statistical pattern analysis is used to examine other key facets of diversity in the science base of cities and how these differ across different regions of the world. We make an attempt to provide a diversity-based categorization of these top 200 cities in the global system of city scientific production. We conclude by discussing what our analysis implies in terms of optimal pathways toward scientific diversity and its meaning for planning at the city level in terms of the cohesiveness and relatedness of local innovation systems.

---

RESOR, Elizabeth [University of California, Berkeley] elresor@berkeley.edu, co-author

One of the biggest issues for many rapidly developing cities is road safety. Solving the problem has become so vital to urban environments; it has been included in the 2030 Sustainable Development Goals. In Kenya, road-related accidents account for more deaths than heart attacks. Road traffic crashes (RTCs) in much of the global south are the primary cause of death among children and young adults. Data on the spatial location of accidents and their cause is often extremely hard to obtain. This makes it challenging to determine planning policies that could be developed to address safety issues. This research project sought to test whether Twitter data could be used to determine the location of RTCs in data-poor environments. In order to test our hypothesis, 850,000 tweets were scraped from Twitter accounts discussing traffic-related issues in Nairobi, Kenya. A machine-learning algorithm was applied to the data to geolocate RTCs using reverse geocoding and semantic analysis. Motorcycle drivers were dispatched in real-time to the site of the presumed accidents to verify the validity of the geolocated Twitter data. This ground-truthing process allowed us to determine the performance of the algorithm, which identified the unique location of 72% of the data points. These results show that it is possible to use Twitter to identify safety issues in cities that do not already collect this data. A spatial clustering algorithm was applied to the data to highlight areas where accidents were significantly clustered. Analysis of these clusters often highlighted poor road design, with a lack of sidewalks or proper bus stops, among other issues. The results can be used to prioritize the redesign of these areas to improve their safety. Ultimately, the research shows that

Twitter is a viable data source for identifying RTC in data-poor environments, such as Nairobi Kenya. The methods laid out here can be applied to other cities that lack RTC data, giving these cities the means to make important policy decisions to improve street safety.

THE APPLICATION OF NIGHT-TIME LIGHT IMAGERIES TO IMPROVE THE EVALUATION OF URBAN AND RURAL RESILIENCE
Abstract ID: 1202
Individual Paper Submission

RAN, Jing [Hunan University] jing_ran@foxmail.com, presenting author
XU, Yiqing [Hunan University] xyqplan@hnu.edu.cn, co-author

The resilience of cities and villages in relation to climate change and natural hazards has gained increasing attention in planning policy and practice. The level of resilience even become an important element to evaluate government performance. Hence, several well developed matrices and indexes are proposed, such as Social Vulnerability Index (SoVI) (Cutter et al.'s 2003) and Disaster Resilience of Place model (DROP) (Cutter et al.'s 2008), to guide and support urban and rural planning. However, when those index and models are applied to remote and rural areas, especially in low- and middle-income countries, the availability and accuracy of datasets are constraining the accuracy of resilience evaluation, and thus hindering the application of such results in informing planning decision and policy making in urban and rural space.

In this case, we found that high resolution night-time light imageries are a useful tool to fix this problem of data missing and low accuracy. Many researchers have tested the correlation between intensity of night-time light and population density, as well as the level of economic development and urbanisation (Chen et al., 2019, Duque et al., 2019, Stokes and Seto, 2019). Therefore, we believe, such datasets could be used to generate variables and enhance the metrics of resilience. In our specific methodology, we will first apply Cutter et al.'s (2008) DROP model to measure the resilience of all the cities, towns, and villages in Hunan province, China. Then, we calculate the intensity of light in each city and town, and village with Luojia-1 night-time light imageries. With the light images, we will also extract the roads that are active during night and calculate the density of active roads in each city, town, and village. Third, evaluate the resilience again with enhanced DROP model with light intensity and density of active roads at night. At last, compare the resilience measured by DROP model and DROP enhanced by night-time light imageries.

With the new technology and datasets, will not only improve the technology in disaster studies, but also helps to could get a better and broader picture of the region in terms of their level of resilience to climate change and natural hazards. The findings hight the most vulnerable areas, which are omitted because of

missing datasets, and draw attention to decision makers in such areas and guide planning for more resilient rural and urban system.

USE OF DEEP LEARNING TECHNIQUES TO ASSESS STREETSCAPE CONTRIBUTORS TO PEDESTRIAN SATISFACTION
Abstract ID: 1235
Individual Paper Submission

WON, Jaewoong [Kyung Hee University] jwon@khu.ac.kr, presenting author
KIM, Yurianna [Kyung Hee University] kyran0255@khu.ac.kr, co-author

Background: A body of literature has identified various environmental factors contributing to pedestrian activities. While studies have generally suggested that high dense, well-connected, and diverse neighborhood environments are significant for promoting pedestrian activities such as walking, studies have been required to examine micro-scale features of streetscape, which might directly affect a pedestrian's perception (Ewing et al., 2016). Previously, studies have attempted to audit street environments using Google Street View (Rzotkiewicz et al., 2018), but rapid advances in computer vision technology to detect, classify, and segment image data enable efficiently to transform street view images into learning datasets. A recent research is applying such a machine learning approach to assess street environments and examine their associations with social and health outcome variables (e.g. Wang et al., 2019; Yin & Wang, 2016; Naik et al., 2017). Yet, there has been little research examining the associations that the various streetscape features assessed by deep learning models may have with pedestrian satisfaction.

Methods: This study used the survey data administered in 2016 by the Seoul city government, which includes the 5-Likert scale item measuring pedestrians' satisfaction at 1,000 random locations in Seoul, South Korea. The survey data also provided personal factors such as gender and age. Using the geographic information systems (GIS), initial heading values of view at the 1,000 locations were identified, and then using Google Street View application programming interface, streetscape images from four angels (0, 90, 180, and 270) were extracted. Two trained assistants annotated the street view images for building training datasets. After a series of testing, YOLOv3 and HRNetV2 were selected as the deep learning models to detect the objects and segment the images. Various features of streetscape were assessed including illegal parking, fence, speed bump, street sign, pedestrian priority sign, crosswalk, braille block, bus stop, street tree, street furniture, traffic light, stop sign, bicycle lane, bus lane, pedestrian, car, wide sidewalk, broken curb, etc. After controlling for personal factors, pedestrian satisfaction was regressed on a list of streetscape features. Statistical significance was determined at

p<0.1.

Findings: Preliminary results showed that the presence of wide sidewalk, crosswalk, obstacles, and fence was significant for pedestrian satisfaction with street environments. Findings from this study highlighted the potential of deep learning approach to assess streetscape contributors to pedestrian activities and further discussion on policy guidelines will be promised for promoting pedestrian activities.

ANALYZING THE EFFECTS OF GREEN VIEW INDEX OF NEIGHBORHOOD STREETS ON WALKING TIME USING GOOGLE STREET VIEW AND DEEP LEARNING
Abstract ID: 1279
Individual Paper Submission

KI, Donghwan [Hanyang University] orient1477@naver.com, presenting author
LEE, Sugie [Hanyang University] sugielee@hanyang.ac.kr, co-author

Previous research has reported that green is an important factor in walking activities, with greenery existing in various forms, including trees, gardens, green walls, and other examples. However, traditional methods of measuring urban greenness involve limitations in coverage of various forms of green and do not reflect the actual degree of exposure to pedestrians. The relationship between green and walking activity can depend on how these green areas are measured, individual characteristics, and purpose of walking. Accordingly, this study examined the street Green View Index (GVI) and its associations with walking time by different income groups using the survey data on walking behaviors in 2,350 residents in Seoul, Korea.

To examined this research question, this study utilized Google Street View (GSV) and semantic segmentation as one of the deep learning technique to calculate the GVI, referring to greenness from the visual perspective of pedestrians. To make a model suitable for segmentation, a deep learning model was trained using a 'Cityscape' dataset containing a urban street view. The study also controlled self-selection to clarify the relationship between the neighborhood environment and walking behaviors. Correlation analyses between traditional green variables and GVI were conducted to examine differences, and multiple regression models were applied to identify the relationships between walking time and green variables from multiple angles.

The results of this study show differences between traditional green variables (green area, the number of

street trees) and GVI, even in the same neighborhood, in terms of including specific green forms and perspectives. Specifically, GVI was found to be able to consider vitality of green, small green forms, private green located along a street that traditional green calculation methods cannot consider. As hypothesized, GVI was more closely associated with walking time than the traditional green variables. However, the relationship between green and walking activities had changed according to the purpose of walking. Also, this study found that the low-income residents generally lived in low GVI neighborhood, but their utilitarian walking time was more sensitive to GVI compared to the high-income group. These results were because GVI represents the actual green exposure to pedestrians, and there was a difference between income groups in the degree of vehicle usage in daily life. The results of this study indicate that, when analyzing the relationship between urban greenness and walking behavior, it is necessary to examine the relationship from multiple angles and to investigate the importance of eye-level street greenery. Our findings provide useful insights for public policies to promote pedestrian walking environments.

ENCODING ACCOUNTABILITY: THE TRANSPARENCY ASPIRATIONS OF OPEN GOVERNMENT
Abstract ID: 1309
Individual Paper Submission

CRAFT, Andrea [University of Illinois at Chicago] acraft2@uic.edu, presenting author

Transparency in government is a fundamental prerequisite for accountability, or the obligation of public officials to answer to the public and be responsible for how they perform their duties in relation to those they represent. Transparency has long been a democratic political ideal, and in the U.S. has taken the form of legalistic rights and freedoms, such as the freedom of information laws born out of campaigns for a free press in the post-war period (Fenster, 2012), and later a normative goal that is expected to be implemented voluntarily in governmental agencies and non-governmental organizations. Transparency is now at the core of a global open government movement, and the rapid growth of open government reforms may foreshadow transparency as the next major paradigm in public management (Piotrowski, 2017).

City governments are now investing heavily in data transparency initiatives that they say will promote accountability of government to the public. These initiatives take the form of online disclosure of budgeting and planning documents, data portals publishing information about government operations and

expenditures, and web platforms that aggregate and visualize open government datasets. My research asks "how is data transparency enrolled in the politics and management of public expenditures, and what are its implications for governmental accountability?", and focuses on the changing practices of transparency as mediated by technology and operationalized through data sharing and circulation. This research improves on existing studies of governmental transparency by extending the focus to open data policies and citizen engagement processes, and will assess how new transparency policies, practices, and products are transforming the capacity for government accountability to taxpayers. This research is a well-timed contribution to local governments that are adapting traditional methods of economic development and fiscal management to the opportunities and challenges of big data and new transparency standards.

Different motives for transparency – such as political goals of openness and democracy as well as entrepreneurial goals of efficiency and monetizing public data – influence what policies cities adopt and products they create, complicating the assumed link between transparency and accountability. There are also internal debates over the role of government in furthering transparency – should cities primarily invest in proper data management practices to enable analysis, mining, and application development by researchers and civic hackers? Or should they also do the work of interpreting data for non-technical users?

City government employees and civic tech activists are actively constructing transparency policy and open data infrastructure in Chicago, IL. Public data producers grapple with these competing visions of what transparency means. As a result, they take different approaches to constructing data, transforming and publishing datasets, and building and managing platforms. They operationalize assumptions about data users, and encode expectations about how data will be used, which ultimately shape and limit what forms of accountability are possible.

WHEN NEIGHBORHOODS OVERLAP: SEEING LIKE A FLICKRER
Abstract ID: 1317
Individual Paper Submission

SOLEIMANI, Babak [University of Michigan] babaks@umich.edu, presenting author
HWANG, Christine [University of Michigan] ckhwang@umich.edu, co-author

How do you see your neighborhood? Administrative and institutional entities, such as planning departments and census bureaus, often define neighborhoods in line with street grids and census blocks. Regarding planning processes, these methods of defining neighborhood allow for easy demographic and site analyses. However, these neighborhood boundaries may not necessarily capture the nuances of how residents perceive space. Acknowledging the utility of using administrative and institutional data to collect data, we also want to propose that the easiest way to represent, abstract, and partition space, a methodology with roots, as James C. Scott cites in Seeing Like a State, in real estate practices, may not actually produce the best planning units to think about community identity and cohesion. With no universal method of defining neighborhood, and a number of scholars arguing that neighborhood boundaries should vary by local context, the method by which to define neighborhood remains ambiguous. Rather than beginning with resident-generated boundaries, planners often rely on pre-defined

boundaries from planning departments and the U.S. Census. Given that neighborhoods, however ambiguous, are important to planning processes and policy decisions, should there be a more user-generated and experiential way of defining neighborhood to complement existing knowledge? We want to propose a new methodology that asks how on-the-ground occupants of a city might define neighborhood boundaries.

Inspired by the studies in geography and computer science, this study presents a workflow for utilizing user-generated datasets to identify the perceived neighborhood boundaries. In specific, textual and geographic coordination tags and geotagged photos from a publicly-available Flickr dataset were utilized to map neighborhood boundaries in the borough of Manhattan. As an initial step, we gathered a list of neighborhood names in Manhattan from conventional sources such as the New York City Department of City Planning (NYC DCP) and curated online real estate guides to Manhattan neighborhoods. Next, we mined the dataset to find photos tagged with the neighborhood names that were located inside the boundaries of Manhattan and mapped their geographical location. A density-based clustering algorithm (DBSCAN) was then utilized to remove the geo-tagged points located outside the high-density cores of the neighborhood. Finally, we drew a bounding polygon around the clusters of points to generate new neighborhood boundaries.

In this study, we mapped neighborhood boundaries using the geo-tagged Flickr photos in order to draw user-generated neighborhood boundaries. We found these user-generated boundaries challenge the traditional, administratively-defined neighborhood boundaries. While boundaries defined by the New York City Department of City Planning present a neat, gridded map of neighborhoods, boundaries generated by Flickr data created messier, overlapping boundaries. Using user-generated data to complement existing methodologies, this study proposes multiple neighborhood typologies that counters flattening data across place in the unwieldy attempt to generalize neighborhoods in a one-size-fits-all model. More broadly, we push planners and architects to do the following: First, to expand how they might use existing and available bottom-up forms of data to create more nuanced and localized representations of space. Second, to acknowledge the imperfect nature of user-generated datasets, including biases and gaps, and determine how to both develop measures to counter and openly use the data's imperfections as in the overall narration of a place.

LEE, In Je [University of Florida] injelee@ufl.edu, presenting author
NOH, Soowoong [University of Florida] nswscott@ufl.edu, co-author
ZHAI, Liang [University of Florida] lzhai@ufl.edu, co-author
YAN, Xiang [University of Florida] xiangyan@ufl.edu, co-author
BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

Background:

Mobility of people has always been the issue in transportation planning since transportation dependents (TD) tend to rely more on public transportation. Especially in the U.S, where people highly dependent on personal cars than other countries cause more problems in mobility. Inequality in the spatial distribution of transportation services found among different socio-economic status. Not only the service provision such as frequency and headways of public transportation affect the whole travel time. Therefore identify the spatial gap considering the temporal dimension throughout the day is needed. However, the general methods to measure accessibility were mostly static measurement, which assumes that the accessibility remains the same throughout the day. This research presents changes in the spatial disparity between need and supply, considering the temporal component.

Study Design:

This study develops a modular geospatial model to identify transit accessibility by different times of the day. The model is consists of three modules: transit need, public transportation supply, and gap. The transit needs modular account for multiple socio-demographic variables to estimate the need. The demand calculation is based on the attributes from census blockgroup. The supply modular creates a layer of accessibility for different travel time: peak and off-peak hours. The calculation involves a gravity model, an Origin-Destination (OD) matrix, and network analysis using travel time based on the GTFS (General Transit Feed Specification) data. Finally, two layers are combined into a gap layer that represents the spatial disparity of transportation accessibility. The study applied to Alachua County in Florida, where the below the poverty population has been growing steadily.

Expected Results:

These results will help identify the area where the gap between need and supply and is significant during different times. This research will contribute to transportation planning by suggesting options such as on-demand or supplementary public transit that operating only at a particular time based on the result. These results will eventually improve the mobility for TD population and reduce the disparity throughout the time and space

Conclusion/Contribution:

The findings demonstrate that the model was successful in determining areas that lack accessibility. The contribution of this research is twofold: 1) methodological – identify the spatial disparity considers various socio-demography and 2) The model can be used as a tool to assist planners and policymakers in their efforts to reduce spatial gaps in transportation services, especially for populations unable to travel by private automobile.

ANALYZING SPACE-TIME DYNAMICS OF AN URBAN SYSTEM TO SUPPORT PLANNING APPLICATIONS: A CYBERGIS-BASED APPROACH
Abstract ID: 1327
Individual Paper Submission

KASHEM, Shakil [University of Illinois at Urbana-Champaign] kashem1@illinois.edu, presenting author

Despite wider availability of urban big data, thanks to rapidly advancing sensor networks and mobile technologies, urban planning practices are still highly dependent on census-based authoritative data. By relying on such static demographic data for dynamic urban systems, our planning and zoning regulations inherently ignore the uncertain geographic context problem (UGCoP) (Kwan, 2012). While the growth of big data is shifting our focus from long-term strategic planning to short-term thinking about how cities function (Batty, 2013), it can also help gain urban insights that might be absent from the authoritative static data. Big data can be used to visualize and analyze urban systems across multiple spatial and temporal scales. Such analysis of space-time dynamics of cities can help to better evaluate the efficacy of different planning and zoning regulations. But there is yet to have enough study exploring how to harness urban big data for such planning applications and what additional insights can be gained by this approach for evaluating social equity compared to census-based data. For gaining insights on patterns and dynamics of an urban system, data should be archived over time, enabling multi-scale and longitudinal spatio-temporal analytics (Thakuriah et al., 2017). CyberGIS is conceptually well positioned to enable such analytics through high-performance, distributed, and collaborative computing approaches (Wang, 2010). In this paper, we propose a novel CyberGIS framework for analyzing space-time dynamics of urban systems by integrating data from multiple sources (e.g., urban sensors, social media, Google map, transit data, etc.). The framework also synthesizes authoritative socio-economic and land use data for plan evaluation and formulation. We took the city of Chicago as a case study to apply this CyberGIS framework and demonstrate how multi-scale space-time analytics can be incorporated into several planning applications of the city.

Urban land-cover change exaggerates the threats of climate change through loss of natural habitat and increases in carbon emission. However, little is known about future patterns and rates of urban expansion. Deep learning (DL) algorithms have emerged as a promising tool for large-scale urban land-cover change predictions. Among the variants of deep learning algorithms, Convolutional Neural Networks (CNN) and Recurrent Neural Networks (RNN) are particularly advantageous for geographical information extraction and change prediction because of their superior capacity to recognize patterns across space and over time. Combining the advantages of CNN and RNN, a convolutional LSTM (ConvLSTM) was proposed for capturing spatiotemporal correlation (Xingjian et al., 2015). Given the path-dependent nature of land-cover change, ConvLSTM presents an opportunity to improve the performance of land-cover change prediction.

In this study, we aim to 1) compare the performance of three spatial-temporal models in urban expansion prediction and 2) optimize the performance of ConvLSTM by leveraging ancillary data (including socioeconomic data, institutional contexts, and cultural structures) and geospatial constraints, which also serves for scenario planning. We choose Mckinney, TX as our study site, which is among the nation's fastest-growing cities from 2000 to 2010. A series of urban maps for the year 2001, 2003, 2006, 2008, 2011 will be used to train the DL models and test their performance in predicting an urban map in 2016. All the urban maps will be reclassified from NLCD. Candidate models for the comparison include a traditional CA-Markov model, fully connected LSTM (FC-LSTM), and ConvLSTM. We expect to identify the best-performed models and offer guidelines for deep learning algorithms application in urban expansion predictions. By unlocking the potential of ancillary data and innovating on deep learning algorithms, the proposed research will contribute to the study of urban land-cover change by not only predicting future urban development but also constructing potential scenarios under different policy interventions.

This paper proposed two approaches to extract typical pedestrian routes from consumers' multi-stop spatial behavior, which is quite complex but undoubtedly essential for urban design of commercial space. The first approach is to conduct a cluster analysis for individual routes. The degree of similarity of each pair of routes is measured by Levenstein ratio, and affinity propagation algorithm is applied to the similarity matrix to generate exemplars as typical routes, from which different patterns of spatial behavior could be revealed. The second approach is to simulate a route with the maximum probability. For this purpose, two models, namely convolutional neural network (CNN) and discrete choice model (DCM), are adopted to predict the probability that a consumer will choose a specific place as the next destination. Based on that, a typical route is simulated step by step using beam search. These two approaches are applied on a dataset consist of 323 individual routes observed in a commercial complex in Shanghai, China. For the first approach, six typical routes are derived to represent different patterns, such as task shopping, fashion-oriented shopping, and so on. For the second approach, three sets of explanatory variables, namely functional attractiveness, spatial impedance, and go-home indicators, are used for both CNN and DCM. It is found that CNN performs slightly better than classical DCM in terms of cross-validation accuracy, but it is much more prone to overfitting and could hardly provide intuitive understandings of spatial behavioral mechanisms. By contrast, the results of DCM are easy to interpret and provide satisfactory accuracy. The typical route simulated by beam search suggests that consumers are mainly focusing on anchor stores, while smaller stores will also be patronized in the link between anchor stores.

A DEEP LEARNING APPROACH TO URBAN MODEL ADAPTABILITY AND REPLICABILITY: THE CASE OF LAST MILE ACCESSIBILITY
Abstract ID: 1409
Individual Paper Submission

CHEN, Si [University of Illinois at Urbana-Champaign] sichen12@illinois.edu, presenting author
DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, co-author

End-chain accessibility in public transit, generally called the 'last mile', refers to the final leg of a journey from a public transit stop. The last mile problem can play an important role in determining how transit systems are perceived and subsequently used (Zellner et.al., 2016). Prior urban modeling work in this area has focused on walking, biking, or feeder bus strategies for improving the last mile experience (Tight et.al., 2016) – although these approaches are typically of neighborhood scale and highly contextual. Standardized approaches that can be replicated, applied to multiple places at a regional scale, and that implicate strategic or design interventions are fewer. Such regionally scaled models that operate at a fine spatial resolution however, are generally very computationally expensive – in this case, due to complicated travel behavior simulation processes. In addition, not all cities have sufficient open-source data for these types of models, making replication and multiple applications difficult. Decreased run times and improved computational efficiencies would open these types of urban models to many different user groups and applications.

Machine learning techniques that can 'train' a model and model data holds promise for addressing scale, replicability, multiple application, and data collection problems in large scale urban models. Deep transfer

learning is one form of machine learning. It refers to the process of storing knowledge gained while solving one problem and applying it to a different but related problem (Tan et al., 2018). Similar to analog knowledge transfer techniques, the transfer learning process addresses efficiency and data problems by assuming the training data is not independent nor identically distributed (Tan et al., 2018).

In this paper we explore the role of deep transfer learning techniques in developing a regional, fine scaled urban model that is easily replicable and computationally efficient in different urban settings. We first explore the role of various urban form and socio-economic factors in predicting last mile scores - the relative value of how well an area performs given specific variable attributes. We test and 'train' the model in Chicago, IL considering several machine learning methods in the process: Bayes, Support Vector Machine, and Random Forest. We then test the replicability of the trained model with an application to Stockholm, SE using transfer learning techniques. We evaluate the application using 2 main criteria: i) an ability to predict last mile scores, and ii) interpret last mile performance using a small local sample.

More specifically, a map-based deep transfer learning method will be used to map the training data from Chicago and Stockholm to a new data space (typically a reproduced kernel Hilbert space) for a deep transfer learning process. A joint maximum mean discrepancy, measuring the joint data distribution, will be used to adjust the data to the new domain (Long et al., 2017). This will help increase model accuracy.

This approach can improve regionally scaled models, help evaluate model performance in data poor environments, and improve computational efficiency for wider user interactions. This research also generally represents an approach for improving the replicability and adaptability of other large-scale urban models. We suggest the process is important for numerous planning support system applications.

REFINING MEASUREMENT OF METROPOLITAN SYSTEMS USING NLCD DATA
Abstract ID: 27
Poster

RICHTER, Steven [The University of Texas at Austin] steven.richter@utexas.edu, presenting author

Consistent, conformable land cover data is a relatively new tool for planners. Such data is needed to accurately measure the physical growth of cities since political boundaries introduce a wide array of biases (Landis, 2017). Fulton et al (2001) was an early national study that used land cover data. Their study used metro regions as a unit-of-analysis to assess changes in density derived from developed land

instead of census-derived areal measures. Their approach has been replicated by others (e.g. Landis, 2017), though current scholars typically use the National Land Cover Database (NLCD)(Yang et al, 2018). Unlike earlier data, the NLCD is not aggregated to counties, instead it is available as 30m raster data. In theory, this allows metrics to be calculated across a wide range of units-of-analysis; however, few studies leverage NLCD to conduct national studies of urban form built on units-of-analysis below the metro or county scale. To fill this gap, this poster asks the following question: how can NLCD be leveraged at the census block scale to better understand urban growth of all US metros from 2001 to 2016?

Though NLCD is widely used, it is rarely leveraged systematically at finer scales. McDonald et al (2010) provide an important precedent. The authors calculate developed land by census block, leveraging it to calculate land consumption (the inverse of density). This data allowed the authors to analyze the distribution of urban land patterns within metro regions, synthesizing their findings into a Gini index measuring the inequality of land consumption across metro regions. While innovative, their approach yielded a single synthetic metric for a single time period. This study leverages the 2001, 2006, 2011, and 2016 iterations of NLCD to calculate several metrics. These include land inequality (McDonald et al, 2010) and density gradient slopes and intercepts (Landis, 2017). In addition to metrics built using developed acreage, NLCD also contains data on imperviousness and tree canopy. Hence, this study also leverages these NLCD layers, calculating inequality and gradient metrics for each. These metrics are examined longitudinally, and by geographic region and metro size.

Early findings from this analysis yield a diverse set of findings. Land inequality showed a similar distribution as McDonald et al (2010), though longitudinal change shows that inequality tends to be widening in most metros. Analysis of density slope gradients show some evidence for systematic recentralization, especially after 2010. This aligns with the findings of Landis (2017), as well as the tendency for US metros to consume less land in general, as identified by Richter (2019). Imperviousness and tree canopy inequality and gradients show more varied patterns that perhaps are driven by metro specific regional geography or land use regulations.

Accurate measurement of urban phenomena is crucial to effective planning. Landis (2017) demonstrates how inaccurate metro population densities are when calculated using census areal measures. The anomaly between census and land cover-derived metrics likely diminishes as the unit-of-analysis shrinks; however, by how much is uncertain. Therefore, the first contribution this poser makes is to provide clarity regarding biases of census block level densities. Second, this poster leverages synthetic metrics built from census blocks to better understand the physical structure of metropolitan regions. That this study does so longitudinally provides valuable data on urban growth. Finally, the use of NLCD imperviousness and tree canopy layers provides significant refinement in the physical measurement of metro regions. Analyzing land as "developed" or not is a false binary that this poster begins to eliminate.

HISTORIC RESOURCES SURVEY USING DEEP CONVOLUTIONAL NEURAL NETWORK
Abstract ID: 418
Poster

MYUNG, Junyoung [University of Illinois at Urbana-Champaign] jymbright@gmail.com, presenting author
YI, Yun Kyu [University of Illinois at Urbana-Champaign] ykyi@illinois.edu, primary author

The classification and evaluation of the images are essential tasks in a historic resources survey. These are very time-consuming tasks since a large number of images usually require sorting. The availability to use automatic techniques to facilitate these tasks would play an important role in the digital documentation of historic resources survey. The purpose of this study is the application of deep learning techniques, especially Convolutional Neural Network (CNN or ConvNet), for the classification and evaluation of architectural housing styles in the United States when establishing a local historic district. Correct classification and evaluation of the images in historic resources survey will allow researchers to find out if a particular structure or feature of a single house retains the historic character and significance, and identify all contributing properties and non-contributing properties as a part of the nomination process for designating a historic district.

The work related to the classification of architectural styles can be mostly found in the computer science field and few studies have examined the application of automatic architectural housing style identification in neighborhood planning and historic preservation. Zhao et al. [1] described using a feature extraction module based on Deformable Part-based Models (DPM) to classify the architectural style. Xu et al. [2] used a Multinomial Latent Logistic Regression method that also adapts DPM methods for classification. Zhang et al. [3] proposed a hierarchical sparse coding of blocks to recognize architectural styles. Obeso, et al. [4] proposed a CNN to classify Mexican buildings according to the architectural styles. Llamas, J., et al [5] also applied deep learning techniques to the classification of architectural heritage images. However, some of these works lacked character-defining features of architectural styles. In most cases, the samples did not identify the typology of buildings or differentiate types of buildings that were mixed-use under the same style. Without clearly distinguishing the relationship between architectural styles, any advanced methods or algorithms will comparatively reduce the robustness of the classification. Thus, it is important to choose carefully which images should be used to represent an architectural style and acknowledge the role of architects or historians in order to identify building types more accurately and show there is a clear relationship between styles.

In this study, we chose one of the local historic districts designated as the Los Angeles Historic Preservation Overlay Zone (HPOZ), which helps protect the authentic and unique character of a neighborhood. In designating a neighborhood as a local historic district, it is important to determine which building retains its original design features as contributing structures and what percent of the properties are contributors in the neighborhoods. In this respect, we first focused on identifying architectural styles to avoid redundancy as we were interested in concentrating on a single house as an architecture type. Seventeen styles of single house architecture were identified and categorized in this study to reduce the complexity and to find a clearly distinguishable difference between styles. We compiled two new datasets: one was collected data from the web without organizing by a proposed house style definition and the other was an organized image dataset based on the proposed house style definition. The two image datasets were passed through image processing to filter and edit into the same format, that then could be used for the prediction model using Deep Convolutional Neural Network. This study is the first of our attempts to utilize image recognition algorithms to predict house style in neighborhood planning and historic preservation. Furthermore, this study still demonstrates the usefulness of the deep learning techniques for historic resources survey in designating a neighborhood as a local historic district.

A STUDY ON SPATIAL DISTRIBUTION OF MUNICIPAL WASTE COLLECTION POINTS AND SOURCE SEGREGATION STRATEGY FOR DHAKA
Abstract ID: 777

A city's sustainability in terms of health, environmental, aesthetic, land-use, resource, and economic aspects may be posed with serious threat if the solid waste generated cannot be handled in a systematic and technically sound manner (Ghani et al., 2013; UN-Habitat, 2010). Dhaka, one of the biggest cities in global south, is faced with serious problems with its solid waste management because of the rapid city growth in terms of population and spatial extent and the resulting huge volume of wastes that remain unmanaged and untreated.

The waste flow chain in Dhaka is a complex one involving various phases and stakeholders. The system of solid waste collection in Dhaka is usually secondary waste collection point (SCP) based and the primary waste collection from home to these SCPs is mainly operated by NGOs or community-based organizations or private sectors. The secondary waste collection from these SCPs to landfill sites are handled by Dhaka North City Corporation and Dhaka South City Corporation (Matter et al., 2013).

However, there are many flaws associated within these waste transfer chain. Constraints of institutional capacity, financial resources, NIMBYism and efficient technologies create severe gap between the demand and supply between SCPs. The result is the overflow of SCPs and dumping on open streets causing environmental degradation, susceptibility of health hazard and contamination of the land and water bodies (Shuvo et al., 2013). Another problem is the absence of source separation of wastes, the key activity to successful 3R initiative. The conventional trend is giving the collectors the commingled waste. Sorting and cleaning of commingled and deteriorated waste entails substantial time in subsequent phases and low-grade product and less price is obtained thereby (Matter et al., 2013). In absence of source separation practice in Bangladesh, a considerable portion of waste goes unused now, at least 80% of which can be recycled (DoE, 2010).

This research examines these flaws of waste management system of Dhaka from generation point to disposal at SCPs by assessing the capacity and spatial location of SCPs and the existing scenario and perspective of different stakeholders about source separation.

In order to evaluate the optimality of spatial distribution of SCPs, the Indian standards for spatial location of dustbins is used given the similarity of dustbin-based collection system with Bangladesh. The location and capacity of the 292 SCPs are collected from all the 10 municipal zone offices and their position is

demarcated using ArcGIS. Results show that only 30% of the total area of Dhaka is conveniently served considering a walkable distance, 70.5% of the area can be served by waste van conveniently and the only 24% of the total area of Dhaka city is served by the capacity of the SCPs in Dhaka.

For understanding the existing practice of waste separation and the view of stakeholders involved in the primary waste collection phase, questionnaire survey of 384 households and focus group discussion with waste collectors, scavengers and housing societies in eight areas of Dhaka and interview with experts in concerned field are conducted. The findings indicate that nearly 50% households do not possess any knowledge regarding source separation. Waste collectors and scavengers who need to be trained and incentivized for proper handling and transporting of segregated waste to SCPs, are lagging behind in government's strategies.

Based on the findings and review of policy documents, the research finally provides recommendations on spatial standards and location of SCPs and some policy guidelines for an integrative chain for source separation and recycling. We believe that the findings and recommendations would be helpful for planning practitioners in developing countries who are facing similar challenges as Dhaka.

UNTANGLING THE DIGITAL PUBLIC DISCOURSE IN SOCIAL MEDIA: EXAMINING THE ROLE OF CROWDCULTURE TO ADVANCE THE RIGHT TO THE CITY IN DALLAS, TX
Abstract ID: 875
Poster

BONAKDAR, Ahmad [University of Texas, Arlington] ahmad.bonakdar@mavs.uta.edu, presenting author
GRANPAYEHVAGHEI, Tahereh [University of Texas at Arlington] tahereh.granpayehvaghei@mavs.uta.edu, co-author
AUDIRAC, Ivonne [University of Texas, Arlington] audirac@uta.edu, co-author

The growing role of social media in the digital public sphere has led to the formation of crowdculture (Holt, 2016) and the emergence of mass-self communication. Being a powerful vehicle for social change, social media shapes the urban experience and could be a potential tool for participatory democracy (Fuchs, 2017). Aided by the Internet and social media, cities may bask in their positive images as promoted through place brands or endure negative territorial stigmas associated with their past or most vulnerable distressed places (Audirac, 2018).

This research uses tweeted data to decipher how the City of Dallas is projected in the social media and the way crowdculture has shaped the digital public discourse of the city. To accomplish this, the authors draw

on the classification and sentiment analysis of tweeted hashtag data collected from the city's official Twitter outlets during two time periods—March 5 to April 30 and September 23 to December 3, 2019. Dallas is particularly an interesting case since, during the past two decades, the city has promoted a world-class image of itself that is business-friendly to create a "geography of buzz" (Currid & Williams, 2010). However, preliminary findings suggest that what manifests in tweeted data by crowdculture has challenged this image and somewhat presents an opposite thesis according to which the city is dealing with racial tension, poverty, and violence.

This research contributes to planning scholarship in two ways: First, following Schweitzer (2014), social media has the ability to influence decision making in planning processes and offers policymakers and planners an innovative methodological approach to reach out to the public and identify critical issues facing communities. Second, this research inspires community-based actions because social media opens the possibility of forming new digitally produced public spheres wherein communities and grassroots can reinforce their identity and claim their rights.

A CONCEPTUAL FRAMEWORK FOR THE INTEGRATION OF ENVIRONMENTAL SIMULATION MODELING AND STAKEHOLDERS' KNOWLEDGE TO IMPROVE ADAPTIVE CAPACITY TO HEAT STRESS
Abstract ID: 902

KIANMEHR, Ayda [Virginia Polytechnic Institute and State University] akianmehr@vt.edu, presenting author
LIM, Theodore [Virginia Polytechnic Institute and State University] tclim@vt.edu, co-author
SCHENK, Todd [Virginia Polytechnic Institute and State University] tschenk@vt.edu, primary author

Severe heat stress resulting from exposure to the urban heat island effect exacerbated by extreme heat waves can cause intolerable thermal conditions for residents. Many physical, social and economic factors modify the magnitude, frequency and severity of such events. In order to address such a multidimensional problem and increase the adaptive capacity of crowded cities that face extreme heat events, participatory approaches that nourish both technical and societal knowledge are needed. The purpose of this study is to explore how (1) physical environmental simulation conducted through global sensitivity analysis and (2) stakeholder modeling processes conducted through fuzzy cognitive mapping can be effectively integrated. The purpose of this integration is to identify effective solutions for heat stress risk reduction that are co-produced with communities, and therefore more likely to be effective.

Global sensitivity analysis (GSA) explores how the variability of input factors in numerical models can cause variation in output factors (Pianosi et al., 2016). The GSA process examines both parameter uncertainty and scenario variability by examining a multitude of scenarios. In this study, GSA will help us to answer the following questions: which physical factors cause the largest variation in thermal conditions (e.g.: building aspect ratio, vegetation density, surface albedo, etc); what are the magnitudes of variation associated with various parameters and combinations of parameters; and which factors interact

with other factors to minimize or maximize the variability of thermal conditions. We show how, by capturing the physical variation of urban environments, GSA can help improve understanding of extreme heat exposure risks.

However, GSA is useful only within the narrow context of the physical parameters being modeled. Comprehensively identifying community risks from heat stress and the appropriate responses requires understanding of physical and social determinants of risk and policy efficacy. Fuzzy cognitive mapping (FCM) can be a helpful tool for deriving socio-economic scenarios and adaptive strategies grounded in stakeholders' knowledge. For example, community responses to heat exposure risk may include subsidizing air conditioners, building cooling shelters, identifying socially isolated people, or street watering (Olazabel, 2018). All of these options have all been shown to be effective under some circumstances but would be completely excluded in physically based heat-transfer models. FCM may be used to quantify residents' perceptions of the efficacy of such interventions. The FCM process can be useful not only for researchers seeking better understanding of community perceptions of risk and risk reduction; the process itself facilitates social learning (Henly-Shepard et al., 2015). The application of FCM in our proposed framework can augment the raw modeling results of GSA processes.

The co-production of knowledge through integrated GSA and FCM processes can better link the often separated worlds of modeling and perception. Therefore, our study will answer the following questions:

- What are the outcomes of GSA and FCM models, and how can those results be categorized and merged to build a structured framework?

- In what ways is the integration of data from these models useful in support of the adaptive actions communities may take?

Addressing these questions will allow us to form a stratified two layer yet interrelated framework that can leverage the results of modeling and deep knowledge from the public. In our proposed framework, all the casual relationships derived from both CFM and GSA processes would be reflected on an integrated map. This map would allow decision makers to project the tradeoffs of various heat exposure adaptation strategies for minimizing physical and social vulnerabilities. This approach can also make the decision-making process more transparent, enhance social learning, and improve the legitimacy and acceptance level of adaptation strategies (Korfmacher, 2001; Voinov et al., 2018).

DOES CHOICE OF DAY-TO-DAY ACTIVITY LOCATION IMPACT MENTAL WELLBEING? MAPPING PEOPLE'S ACTIVITIES AND ASSOCIATED STRESS LEVELS FORM TWEETS
Abstract ID: 909
Poster

DUTT, Florina [Georgia Institute of Technology] florina.design@gatech.edu, presenting author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

There is a rising burden of urban mental health disorders that are attributed to urban living (Peen, Schoevers, Beekman, & Dekker, 2010). Apart from economic inequality, noise, and pollution in cities, studies have shown that increased urban density (often measured by population density) and crowding may have an adverse impact on mental wellbeing. Lack of control over one's environment in dense urban areas and lack of social contact in high-rise residents are some of the causes of stress in dense urban areas (Chu, Thorne, & Guite, 2004). Mental health surveys have often shown conflicting results on the impact of density and crowding.

Urban theorists on the other hand have encouraged density. William White, in his book 'The Social Life of Small Urban Spaces, mentioned: "For the foreseeable future, the opportunities in the center city are going to be for small spaces (p101)" (H.Whyte, 1980). He emphasized on the inclusion of small spaces and spaces marked by a high population density in urban spaces. His theories are backed by the naturalistic observation in New York City in 1969, and the early 1970s. Jacobs further reinforced his views. She highlighted the importance of smaller blocks and diversity of uses. She states, "wherever lively and popular parts of cities are found, small much outnumber the large p.147 (Jacobs, 1961)."

 The contradiction in theories surfaces when the concepts of crowding and density are muddled. Crowding is defined as the lack of personal space, associated with an increased sense of confusion, aggression, sense of vulnerability in people who inhabit those spaces. A design fallacy can cause crowding. While crowding is often measured by population density, a more appropriate description of crowding would be a condition where demand for space exceeds supply, and there is a lack of control on one's privacy. Thus, the sense of voluntary control over one's surrounding impact perception of crowding and the stress tied to this perception. Also, an individual's perception of space is critical in determining the level of stress from crowding. The same person may feel stressed when he has to space in the lift with strangers while he may feel relaxed in the same proximity with people while watching a musical performance.

A desirable urban density that urban theorists have described is complemented by land-use diversity and the diversity of points of interest. Urban areas with dense building footprint without adequate diversity of land use may appear dead, and result in social isolation for people. Also, inhabiting such areas would increase travel time and cost to access any 'escape facilities' for relaxation or engage in any social activity. However, dense urban areas with adequate diversity give people a chance to socialize and engage in constructive social activity. Our hypothesis is, easily accessible, and dense urban areas with diverse uses encourage relaxation (de-stressing). In this research, we identify people's stress levels in their day to day de-stressing activity from Twitter microblogs (Abbasi, Rashidi, Maghrebi, & Waller, 2015). We evaluate the built environment density and diversity of people's home and work location as well as the shortest distance (cost) to their activity locations. We aim to find a relationship between people's choice of activity locations and their stress levels. Further, we aim to show if the choice of activity location varies by people's demographic attributes, such as length of residency (resident or tourist), socio-economic status, and gender.

SMART CITIES AND DIGITAL INCLUSION: A CASE STUDY OF MACON-BIBB COUNTY'S SMART NEIGHBORHOODS PROJECT
Abstract ID: 1044
Poster

RAO, Arthi [Georgia Institute of Technology] arthir@gatech.edu, presenting author
ROSS, Catherine [Georgia Institute of Technology] catherine.ross@design.gatech.edu, co-author

Digital inclusion is a key criterion to ensure that Smart cities will be able to live up to their full potential in addressing equitable and sustainable communities. Successful Smart city projects will need all individuals to have access to the Internet, be able to use the Internet and be digitally literate to consume digital information (Brooks and Schrubbe, 2016; National Digital Inclusion Alliance). There is a wide spectrum of methods by which different places implement digitally inclusive processes. Equally varied are the inclusivity of programming and integration of digital inclusion within the local regulatory environment. This paper presents a case study of one communities' effort to improve digital inclusion for their most vulnerable populations.

Macon-Bibb is a consolidated city-county in middle Georgia with an estimated population of approximately 155,000 and is the fourth largest city in the state of Georgia. The US Census Bureau estimates that one in three households in Macon-Bibb County currently have no access to broadband internet. Additionally, one in five households have no access to a computer or smart device. Smart Neighborhoods MBC, a Macon-Bibb County (MBC) Government Smart City Initiative will extend existing efforts to inform and engage the community through integrative technology, information solutions and stakeholder engagement community involvement to engage the public in new ways as well as bridge the digital divide for underserved populations. Smart Neighborhoods MBC was one of four projects to win the 2019 Georgia Tech Georgia Smart Challenge, a competitive program that helps local governments implement Smart City ideas by providing grant funding and access to research partners.

The projects' primary goal is to promote digital equity by deploying a Smart Kiosk system in underserved and at-risk areas of Macon-Bibb County. A key component of the Smart Neighborhoods MBC project is to develop a collaborative platform with a digital applications interface and broadband access for citizens and government to collectively address community challenges around education, health, employment, etc. and develop innovative models of reciprocal data-sharing to nurture civic engagement.

The research component of the project seeks to answer the following questions: 1) What are the optimal locations for the kiosks? 2) How do we design stakeholder engagement for underserved neighborhoods around Smart City initiatives? 3) What types of technology interfaces and applications are best suited for the needs of the community? 4) What metrics are appropriate to evaluate the short-term and long-term outcomes of these types of Smart City projects? The presentation will provide an overview of the project planning and development phase in year one. Additionally,
the research components, including the development of the "smart location" index to inform kiosk locations, stakeholder engagement strategies, analysis of usage data from the kiosk prototype and design

of the evaluation plan will be discussed. This will include an overview of methodological instruments and techniques including spatial analytics, surveys, logic models and development of key performance indicators. Collectively, the aim is to create an evidence-based roadmap for phase 2 of the project, namely, deployment of an extended network of kiosks and evaluation of long-term changes in community disparities.

EXPLORING MULTI-SOURCE NIGHT-TIME LIGHT DATA TO EXAMINE SCALING LAWS IN SOUTH KOREA
Abstract ID: 1090
Poster

JUNG, Meen Chel [University of Washington, Seattle] jmc129@uw.edu, presenting author
KANG, Mingyu [University of Seoul] mingyu23@uos.ac.kr, primary author

Emergence of night-time light data provides opportunities for researchers to investigate various types of urban dynamics (Mellander et al., 2015). Given the sources of night-time lights, the data were primarily used as a proxy for regional economic activity (Doll et al., 2006). The increased application of night-time light in urban planning required more accurate data, which led to the development of post-processing techniques. Three types of datasets are publicly accessible: (1) Uncalibrated Defense Meteorological Satellite Program Optical Linescan System (DMSP-OLS), (2) Calibrated DMSP-OLS, and (3) Visible Infrared Imaging Radiometer Suite (VIIRS). The objective of this study was to compare the effectiveness of night-time light datasets to test urban scaling laws by investigating the relationship between population, urban development patterns, and night-time light in South Korea. Although economic activity has been proven to correlate with the urban development in the literature, only a few studies have been conducted to investigate the relationship between night-time light and urban development patterns based on urban scaling laws (Kang and Jung, 2019).

A pre-processing protocol was developed to integrate three types of night-time light data, land cover data, population data, and urban area boundary data. Since the extents, resolutions, and formats of these spatial data were different, grid cells located within the boundary of urban area were set as the unit of analysis. The population size was computed to test the urban scaling relationship. In addition to the demographic factor, physical urban development patterns were identified by introducing four landscape metrics: percentage of landscape (PLAND), aggregation index (AI), fractal dimension index (FRAC), and Shannon's diversity index (SHDI). Thus, a grid cell with corresponding three night-time light values, four landscape metrics, and population size was used to estimate the relationship between them. Since all grid cells were clustered within cities, we applied random intercept mixed-effects models to account for the correlation between grid cells in the same city.

A stepwise approach was applied to compare the relationship between night-time light, population, and landscape metrics. Twelve single landscape metrics models and twelve combination models were selected as final outcomes. The population was included in all models to test the urban scaling relationship. Each night-time light data (uncalibrated DMSP-OLS, calibrated DMSP-OLS, and VIIRS) has four single landscape metrics models. The population coefficients were positively related to all night-time light

datasets, but the values were higher in calibrated DMSP-OLS and VIIRS models. Similarly, all landscape metrics were positively related to night-time lights and uncalibrated DMSP-OLS models had the lowest coefficient values. The combination models included multiple landscape metrics to test the relationship between complex landscape characteristics and night-time light. In calibrated DMSP-OLS combination models, the population coefficients were similar to the coefficients in the single landscape metrics models, but some landscape metrics were not statistically related to the night-time light. In the VIIRS combination models, most of the landscape metrics were positively related to night-time light except for the AI.

Urban development and night-time light had similar relationship patterns regardless of data sources, but the magnitudes were varied across datasets. This result has some implications. First, sub-linear urban scaling relationships were observed in all models, which indicated diminishing returns to scale. We concluded that the economic activity level does not catch up with the population size in finer-grained regions. Second, positively related landscape metrics indicated that the composition and configuration of physical land attributes have effects on regional economic activity. Lastly, the different magnitudes of coefficients mean that selecting a proper night-time light dataset is needed when estimating regional economic activity. The effectiveness of datasets that we tested in this study could provide valuable insights for further studies.

TRACK 2 - COMMUNITY DEVELOPMENT

TRACK 2 – PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

RADICAL PLANNING 1: PRACTICE IN SHIFTING NARRATIVES
Pre-Organized Session 16 - Summary
Session Includes 436, 437, 438, 439

GELBARD, Sarah [McGill University] sarah@gelbard.ca, organizer

While planning offers hope for better cities, decades of radical scholars and planners have exposed a troubled history of the complicity of planning in perpetuating spatialized injustice and domination. Frequently overlooked or silenced are the traditions and emerging actions of communities caught in these spaces of struggle, along with their capacities to imagine and to enact spaces of difference, spaces of resistance, and spaces of refusal. As part of the collective ongoing Spaces of Struggle project, these sessions help us to radically rethink what constitutes planning and who has the power and expertise to engage in city-making. By challenging dominant narratives, introducing alternative perspectives, sharing difficult and untold stories, and making space for stories to transform, scholars in the "Practice in Shifting Narratives" session show how the struggles of planning is partially based in who controls the narrative.

Objectives:

- Lessons from scholarly traditions in radical planning for contemporary movements in equity and social justice planning
- Lessons on how to bring theoretical insights from other disciplines, specifically those that have a much longer history of engaging with communities
- Lessons on how to bring practical insights from communities actively engaging in transformative and insurgent collective placemaking practices

LESSONS FROM A CARISHINA: CYCLING INFRASTRUCTURAL IMAGINATIONS FROM QUITO, ECUADOR
Abstract ID: 436
Abstract within Pre-Organized Session 16

GAMBLE, Julie [Trinity College] julie.gamble@trincoll.edu, presenting author

Sustainable transport policies that favor the bicycle have traveled around the world, pushing cities to adopt cycling measures in an attempt to a low carbon emissions. Global policy actors and trans-national policy networks have facilitated how the 'best practices' associated with cycling plans, programs and infrastructure mobilize (Montero, 2017). In particular, a sustainable mobility paradigm establishes a global imagination of who benefits from cycling and how cities who are pro-bicycle are usually also democratic. These global processes often embrace certain achievements, leaving aside the work of local actors whose voices often do not get translated into global planning circles(Miraftab, 2009). In 2019 at the World Urban Bike Forum in Quito, Ecuador, these tensions between translation and reality became evident. Local groups and event leaders embraced a feminist agenda through a series of solidarity actions like weaving in public space and calls to end sexual violence which are subjects that go unaddressed in

bike policy planning circles. The Forum itself ended with the ratification of new operating bylaws that promote actions against machismo, a dominant form of sexist masculinity. Such actions were deeply influenced by the work of Quito's women's bicycle collective, Carishina en Bici (CEB), which translates ironically from Quechua as "Bad Housewives that Cycle". This group establishes a cycling agenda that does not make it into global planning circles—spaces still dominated by scientific rational approaches that leave out situated knowledge (Haraway, 1988). CEB is a cycling collective that promotes an agenda to end violence in public spaces of the city while also pushing the limits of what feminist interventions in public space can look like (Gamble, 2019). This paper draws on ethnographic evidence collected between 2012-2019 in Quito, Ecuador that focuses on the events and efforts of CEB. It demonstrates how feminist cycling actors leverage activist and educational events to envision a future, non-sexist city(Hayden, 1980).

DISASTER COLONIALISM: HOW COLONIALITY OPERATES THROUGH DISASTER IN PUERTO RICO
Abstract ID: 437
Abstract within Pre-Organized Session 16

RIVERA, Danielle [University of Colorado Boulder] danielle.rivera@colorado.edu, presenting author

Disasters are often viewed as singularities, without consideration for the impacts of continuously-poor and incomplete post-disaster reconstruction. However, disaster studies scholars in sociology have identified the concept of procedural vulnerability to explain the weaponization of planning procedures that support structural erasure (Veland, Howitt, Dominey-Howes, Thomalla, & Houston, 2013; Woods, 2017), generally by leveraging relational injustices (Hsu, Howitt, & Miller, 2015). These practices represent "deep colonizing" (Rose, 1996), whereby institutional structures are used to entrench colonization, even when the processes are intended to decolonize. From this, the term disaster colonialism (colonialismo desastre) describes the leveraging of procedural vulnerability to deepen coloniality (Rivera, Forthcoming).

Recentering this work in the United States, this paper illustrates the mechanisms through which disaster colonialism thrives in post-disaster Puerto Rico. Using the disaster events from the first twenty years of the 21st-century, specific planning mechanisms (particularly from the Federal Emergency Management Agency (FEMA)) are examined to demonstrate how disaster colonialism is occurring in Puerto Rico. Additionally, these mechanisms are discussed in the context of U.S. post-disaster reconstruction more broadly, identifying how they operate across multiple communities of color (Rivera, 2019, Lincoln Institute of Land Policy report). Ultimately, the paper points to a growing movement in the U.S. to address procedural vulnerabilities and relational injustices such as disaster colonialism.

50 YEARS OF PRIDE: QUEER ORGANIZING AS RADICAL URBAN PLANNING
Abstract ID: 438
Abstract within Pre-Organized Session 16

CRISMAN, Jonathan Jae-an [University of Arizona] crisman@email.arizona.edu, presenting author
TURESKY, Marisa [University of Southern California] turesky@usc.edu, co-author

Parades have long been a vibrant yet often overlooked practice for consolidating and expressing grassroots power in public space (Davis, 1988). This paper argues that the historical struggle to develop pride parades have been a key site of radical planning which intervene in the urban imaginary to create space for queer bodies to exist in the city.

This year, Los Angeles celebrates the 50th anniversary of its pride parade yet the narrative around pride has shifted from a struggle for recognition and existence to a space of commodified celebration. We examine and analyze archival data from the ONE National Gay & Lesbian Archive and other related archives to identify the planning processes used in early LA Pride events compared to today, focusing especially on how these historical forms of community organizing have been especially powerful in reducing social isolation among queer people who may not have felt able to exist in public space.

Planning scholars have discussed the historic role of planning in repressing queer people (Frisch, 2002) as well as the importance of understanding the history and experiences individuals in the LGBTQ community to encourage dialogue (Forsyth, 2011), but our study goes beyond "inclusion" to demonstrate the sophistication of the queer planning at work in the development of pride. Through the lens of insurgent planning (Miraftab, 2009), we analyze the historical planning of LA Pride as a grassroots means for community organizing, building social capital and connection, and creating queer urban space—illuminating a powerful set of tactics for planners seeking spatial justice.

We thus ask the following research questions: How did the historical planning of LA pride demonstrate a queer planning praxis in comparison to standard planning practices of the time? And how did this planning praxis interface with concerns around social isolation among queer individuals? Critically, given how white, gay male narratives have often dominated LGBTQ histories, we focus on unearthing and analyzing materials that center women and people of color as an act of "archival justice" (Rawson, 2015). These narratives point toward the potential for a queer planning praxis as one which can create space for people who have historically been excluded from urban planning. These narratives can also reclaim the possibility of pride as a space of radical planning in contrast to the corporate-sponsored celebrations that they are often critiqued as having become.

PUNKING THE COMMON URBAN NARRATIVES
Abstract ID: 439
Abstract within Pre-Organized Session 16

GELBARD, Sarah [McGill University] sarah@gelbard.ca, presenting author

Planning participates in a kind of storytelling that "is not simply persuasive. It is also constitutive" (Throgmorton 2003). The capacity of planning to persuade and to constitute through stories, depends upon the socio-political structures that privilege the stories it has to tell and the futures it envisions. The stories planning tells work to shape both material outcomes but also ways of being, ways of knowing, and ways of evaluating. In order to radically rethink planning praxis, we need to consider and value stories not only as accounts of past events. We must critically position stories as reflections of the present, and evaluate the power they reproduce into the future. When we understand planning documents and planning processes as social narratives, we must also consider how they participate in the dominant narratives of that society, who they benefit, and who they continue to burden and exclude even in the stories that tell us otherwise. For Sandercock (2003), not only does planning learn from stories, "planning is performed through story." In this paper, I invert the statement to also call attention to which stories are performed through planning. I adapt performative narrative analysis (Reissman, 1993) to the analysis of three case stories of marginalized and alternative group placemaking events in Ottawa, Canada. These are the designation of Le/The Village, the construction of the Charlie Bowins Skateboard Park, and the production of the Ottawa Music Strategy. Each notably contribute to guiding principles of the Ottawa 2020 Official Plan towards being "a caring and inclusive city," "a creative city rich in heritage and unique in identity," and "a city of distinct and liveable communities." A key finding of this research is how each of the three case stories and the Official Plan draw upon and participate in "common urban narratives" (Finnegan, 1998). I identify three such narratives: the dangerous city in decline; the city as site of opportunity; and the city as site of injustice. Performative analysis considers not only the content of the narrative but also the role of the authors, characters, and audience. This method invites us to interrogate how these stories implicate each participant in "doing their identities" (Reissman, 1993). These case stories of the struggle to renew, build, access, legitimate and present a more desirable city each notably present the city as in need of a protagonist. I argue that these narratives allow the different participants to perform and conform to their respective foundational stories in order to reinforce identity, belonging, and morality. Ottawa as capital form, planning for the public, and grassroots DIY-ethos, are each heroically performed through the planning process. With an overarching desire to present democratic, progressive, and community-oriented city-building, these three case stories manage to reconcile the roles of its three protagonists, resolve conflict, and improve the "City for All." They tell us a good story. They tell us a story we want to hear. That is, except for those popularly represented as the antagonists of the city, those who interfere with the noble pursuit for the good city. Through critical autoethnography of punk placemaking in the city, I hope to disrupt the performance of good city-building through common urban narratives. I present an alternative urban narrative with punk as neither antagonist or protagonist, adopting instead an agonistic position and perspective to placemaking.

PROMOTING THE SUSTAINABLE DEVELOPMENT GOALS IN NORTH AMERICAN CITIES: CASE STUDIES & BEST PRACTICES IN THE SCIENCE OF SUSTAINABILITY INDICATORS
Pre-Organized Session 41 - Summary
Session Includes 148, 149, 151, 460

IYER, Seema [University of Baltimore] siyer@ubalt.edu, organizer

In September 2015, the member countries of the United Nations adopted the Sustainable Development Goals (SDGs), which form a cohesive and integrated package of global aspirations with a clear set of quantifiable targets. The intention was for individual countries to commit to achieving the SDGs by 2030. However, since 2015, several North American cities have embarked on localization processes. In this session authors will present case studies from cities in the US and Canada on common themes for future adoption: 1. The ability to tailor the localization approach is a hallmark feature of the SDGs. When localization has occurred, the impetus has predominantly come from and with bottom-up efforts. 2. The SDGs represent a new way to communicate the comprehensive themes in urban development. Local jurisdictions are strategically implementing SDGs to further adoption and implementation of long-sought policies. 3. Tracking progress during localization has been able to leverage existing local data and indicator systems as well as identify data gaps. 4. Low awareness about the SDGs and lack of leadership in cities will hamper future attempts to localize them.

Objectives:

- Understand successful elements of localizing the SDGs in urban areas
- Learn about tracking systems and frameworks for measuring city-level progress towards sustainable goals

LOCALIZING THE SGDS IN BALTIMORE: CHALLENGES AND OPPORTUNITIES OF THE USA SUSTAINABLE CITIES INITIATIVE
Abstract ID: 148
Abstract within Pre-Organized Session 41

IYER, Seema [University of Baltimore] siyer@ubalt.edu, presenting author

In 2015, when member countries of the United Nations adopted the Sustainable Development Goals (SDGs), many cities in the US like Baltimore were in the grips of civil and racial unrest at a level not seen in urban America since 1968. So when the UN Sustainable Development Solutions Network (SDSN) selected Baltimore as one of the first cities in the US to localize the SDGs for the USA Sustainable Cities Initiative (SCI), the city had many challenges to overcome to potentially take advantage of a set of yet-unknown benefits. Given this backdrop of significant local upheaval, the SCI-Baltimore process focused on engaging multi-sector stakeholders to connect existing local, quantifiable targets and goals to the

global framework as well as using the SDGs to identify and coalesce around data gaps that might prevent continuation of business-as-usual and stave urban unrest in the future. This paper assesses these engagement techniques used for 'mapping' local data and priorities to the global goals, in terms of both technical considerations as well as translating grassroots efforts to the global framework. This translation between local and global became critical for ensuring Baltimore saw the localization effort to fruition instead of abandoning the process. Three main methods were used in Baltimore to make linkages with governmental plans and projects, local data repositories, and advocates and nonprofits. The first method involved the review of a broad range of plans and policies to assess whether existing strategies and goals were already aligned with the SDGs. This stocktaking effort identified: a) partner organizations that could share tacit knowledge about sustainable development in Baltimore; b) natural allies who would (and resistors who would not) collaborate on the SDG localization effort, and (c) indicators and measurement data for SDG target tracking. The second method drew on open data resources in Baltimore to identify a preliminary set of 56 indicators across the 17 SDGs. Participatory methods engaged a broad community to rank, add and remove indicators for final selection. Lastly, given the particular timing of the SCI-Baltimore initiative after the period of unrest, review of the SDGs revealed the glaring lack of locally available quantitative measures to track progress towards a more just city. The SDG localization process galvanized the collection of common data to track legal awareness among the public, equal access to justice, and fair outcomes for all who encounter the civil justice system. Over the course of a year, the SCI-Baltimore effort yielded insights for urban leaders and planners to use the SDG localization process to furthering inclusive, coordinated sustainable development efforts for cities. Key lessons include the need for leadership at all levels of government to value and promote the value to linking local priorities to shared global goals, for raising awareness in the US about the benefits of SDG-localization among local civil society stakeholders engaged in sustainability efforts, and the value of local data integration to track progress towards the global goals. From this paper, planners will better understand how connecting local efforts to global goals can help build broad coalitions around common data to ultimately help implement long-standing priorities.

HOW LOCAL COMMUNITIES CAN ALIGN WITH THE UN SUSTAINABLE DEVELOPMENT GOALS: A SANTA CRUZ COUNTY CASE STUDY
Abstract ID: 149
Abstract within Pre-Organized Session 41

BRUTSCHY, Susan [Applied Survey Research] susan@appliedsurveyresearch.org, presenting author

For 25 years, Santa Cruz County (Calif.) has progressed toward its goal of achieving well-being and equity for everyone. More recently, the County has cultivated the conditions to successfully localize the United Nations' Sustainable Development Goals (SDGs) established in September 2015.

In this presentation, Susan Brutschy, president of Applied Survey Research (ASR), a California-based social research organization, explains how other local entities can cultivate those conditions in their communities. From there, she will demonstrate how Santa Cruz County leveraged those conditions and the SDGs to produce biennial reports that reflect current quality-of-life issues throughout the county and to provide the means that helped various entities set improvement goals in each category.[1] She also will include examples of those improvements.

The goal is to help communities around the globe understand how they can leverage the UN's mission to address root causes of inequities so they can be mitigated more fully and more directly. These include issues related to poverty, inequality, climate change, environmental degradation, prosperity, and peace and justice—all of which interconnect and apply to everyone.

At the foundation is a determined quest for health justice—the basic right of every person to have a healthy quality of life. It's a concept that everyone can stand behind. However, if communities truly are serious about achieving that goal, they must start at the local level and interconnect their efforts with communities in every nation. Only then can they deliver health justice for everyone.

The presentation will include community conditions necessary for applying the UN's SDGs:

- Commitment to wellbeing for all
- Individual and population measures of wellbeing via social connectedness
- Alignment and ability to coordinate and leverage action It also will hold up Santa Cruz County as a specific example of success, citing the biennial Community Assessment Project report[2], which tracks the county's progress vis-à-vis several measures of wellbeing, especially as they relate to the SDGs that are most relevant to the local communities.

And finally, the presentation will include recommendations for other communities wishing to adapt these goals for their own needs. Some of those recommendations include:

- Establish the conditions necessary for community involvement;
- Align the community's work within the framework of the SDGs by selecting those that are most relevant to your situations or that are most manageable and attainable;
- Select an organization that will fill the role as the "backbone" for the project;
- Conduct statistically valid, professionally administered surveys to provide the necessary data for a snapshot of current quality-of-life conditions and—with each successive survey—a comparison with past conditions;
- Provide a summary report, available to everyone, that will inspire individuals and organizations to make necessary improvements, ideally through collaboration;
- Finally, track progress toward meeting their chosen SDG goals, and make adjustments as necessary. By following the United Nations' SDGs, more communities, more nations, and ultimately the entire globe can enjoy true equity and health justice, along with the benefits of economic stability, quality education, improved health and health care, more livable communities, and a cleaner and more sustainable environment.

HOW THE YOUTH SOCIAL ENTERPRISE (YSE) MODEL SUPPORTS THE IMPLEMENTATION OF THE SUSTAINABLE DEVELOPMENT GOAL #8 ECONOMIC GROWTH AND DECENT WORK IN THE TWIN CITIES
Abstract ID: 151
Abstract within Pre-Organized Session 41

THOMAS, Peg [Sundance Family Foundation] peg@sundancefamilyfoundation.org, presenting author
VALOROSE, Jennifer [Wilder Research] Jennifer.Valorose@wilder.org, co-author
SCHAUBEN, Laura [Wilder Research] Laura.Schauben@wilder.org, co-author
JACOBS, Nancy [Sundance Family Foundation] nancy@sundancefamilyfoundation.org, co-author

The United Nations Sustainable Development Goal #8 promotes inclusive and sustainable economic growth, full and productive employment, and decent work for all. Strategy 8.b.1 focuses on building a specific youth workforce system. This includes reducing the proportion of youth not in employment, education, or training, along with strategies to identify and provide support to opportunity youth[11]. The average unemployment rate for Minnesota is between 3.2-3.6%. Yet, the disaggregated rate for youth, predominantly youth of color, living in low-income areas is between 18-23%. To address this need, the Sundance Family Foundation of St. Paul, MN launched a grant initiative to promote Youth Social Entrepreneurship (YSE) and test its effectiveness as a model in strengthening a specific workforce development system with youth in 11 nonprofits from low-income areas in the Twin Cities. The YSE is a multi-indicator/ multi-structured model for providing equitable economic opportunities for individual youth and their communities. The model integrates 1) practices of positive youth development to strengthen personal agency 2) community/cultural engagement to increase social capital, and 3) workforce skills development. The YSE model also tracks the emotional impacts and socio-cultural disposition of youth in settings that might be challenging. Rather than focusing only on job acquisition, as do informal economy building or classic workforce skills training programs, the YSE model seeks to address several overlapping layers of complexity of the issue.

Nationally, lessons from this study may inform how replication of the YSE model could assist with the implementation of a common set of workforce indicators such as the SDGs by nonprofits serving low-income opportunity youth and youth from communities of color. Further it explores lessons learned when grassroots nonprofits with limited infrastructures and no financial incentives work together to adopt common indicators. While evidence-based challenges can and did arise during implementation of the YSE model, common indicators aggregated across these nonprofit organizations demonstrated increases in the development of personal agency and social capital. Youth were also exploring exciting careers and were encouraged to seek training options.

Minnesota set a goal in 2016 of 70% certificate or degree holders age 25-44 by 2025. One of the most educated states in the country, across all age groups, in 2016 58% of Minnesotans, age 25 to 44, had completed a postsecondary certificate or degree placing Minnesota third highest in the country. (Fergus et al, 2016). To achieve the 2025 educational attainment goal of 70% across all ethnic groups, an additional 121,425 postsecondary credentials (certificates and beyond) are needed. Of those, 37,397 must be attained by Latinx people, 34,428 from Whites, 33,462 from Blacks, 6,572 from American Indians, 5,524 from Asian Americans, and 3,546 from multiracial people (Hermida, 2018). For perspective, 71% of all future postsecondary credentials must come from racial and ethnic minorities, otherwise Minnesota will not reach the 70% educational attainment goal equally across groups (Hermida, 2018).

Demographic trends in the greater Minneapolis/Saint Paul metropolitan area demonstrate that youth of color, and youth from low income areas, are facing an assemblage of consequences as the result of structural inequality and how structural inequality is operationalized by statistically significant lower grades, standardized test scores, course selection, dropout rates, college completion rates for students of color and/or of low-income backgrounds. These finding are typical of other American Cities (Garcia, et.al, 2017; Raj Chetty et.al, 2017). This paper focuses the importance of a youth centered design, recommendations for the implementation of the SDG common indicators, and recommendations for how these indicators can contribute to continuous program improvement and public policy.

MAKING THE SDGS RELEVANT FOR CITIES: USING THE COMMUNITY CAPITAL TOOL IN BRITISH COLUMBIA
Abstract ID: 460
Abstract within Pre-Organized Session 41

SPILIOTOPOULOU, Maria [Simon Fraser University] maspil@yahoo.com, presenting author
ROSELAND, Mark [Arizona State University] mark.roseland@asu.edu, co-author

The success of the UN Sustainable Development Goals (SDGs) is conditional on creating and implementing monitorable and transferable sustainability policies and practices in communities. In pursuit of sustainability, however, communities are challenged by the complexities of goal-setting, addressing multiple objectives and interests, meaningfully engaging citizens, and monitoring progress. One way to address these challenges is by adopting sustainability frameworks and tools. Despite the abundance of such tools, not all of them promote a whole-systems approach or assist in effective planning, implementation, and monitoring. The objective of our research was to support municipalities in achieving their long-term visions by providing effective and locally relevant sustainability tools that would also connect them to the broader context of the SDGs.

We engaged a mixed-methods, information-oriented approach within case study research, integrating quantitative and qualitative data collection and analysis. We worked with two communities in the Lower Mainland of British Columbia: the City of Maple Ridge (CMR) and the District of North Vancouver (DNV). The research foundation in these case studies is the Community Capital Framework and Tool (CCF and CCT). Its purpose is to support decision-making not only as a planning toolkit but also as a performance and progress assessment instrument.

In these case studies, we conducted a complex SDG-CCT-Local Goals matching and mapping exercise,

modeled on the work done within the USA Sustainable Cities Initiative under the guidance of the Sustainable Development Solutions Network. This mapping extended along three levels of decision-making within three frameworks: goals, targets and indicators of the SDGs, the CCT, and the case studies. We also collected data from various sources such as: related literature; current arena of sustainability frameworks, tools, and best practices; current socio-economic, environmental, political, and cultural context in CMR and DNV; their official community plans and other policy and strategy documents; interviews with elected and appointed officials; meetings with expert staff; and workshops with community members.

The mapping exercise revealed significant gaps in policies and objectives in both case studies: low consideration of wider national or global context, fragmented prioritization in policy-making and implementation, and little attention to whole-systems thinking. Although at the goals level there was partial alignment between local goals and SDGs, at the target level we found very few actionable, measurable targets in municipal policy documents. Similarly, at the indicators level we identified an overlap ranging from 25-32%, meaning that, even after excluding SDG indicators that are not locally relevant, municipal indicators still covered few of the remaining SDG indicators.

The interview data offered similarly important insights, particularly into the perceptions of local elected and appointed officials about global-level goals and international commitments. What seems as a simultaneously interconnected and distanced relationship between the multiple levels of government in B.C. provides a telling argument for the lack of interest or comprehension of the UN global agenda.

Our research findings highlight the imperative to educate local governments and citizens about the SDGs which, thanks to their versatile structure, can equip communities with a broad and holistic framework for decision-making processes, from identifying core values and planning to forming partnerships for inclusive implementation. Our recommendations to both municipalities focused on a customized framework with forward-looking and holistic-thinking indicators informed by the CCT and the SDGs.

Canadian cities that incorporate such tools into their regular practice can contribute to and become leaders in the achievement of Canada's Federal Sustainable Development Strategy which reflects Canada's commitment to the SDGs. We have every reason to expect that tools and approaches such as the CCT could work as well in other countries and we encourage sustainability researchers and planning practitioners to collaborate to this end.

RADICAL PLANNING 2: STORIES OF CHANGING PRACTICE
Pre-Organized Session 71 - Summary
Session Includes 334, 441, 442, 443

VASUDEVAN, Raksha [The University of Texas at Austin] rakshav@utexas.edu, organizer

While planning offers hope for better cities, decades of radical scholars and planners have exposed a troubled history of the complicity of planning in perpetuating spatialized injustice and domination. Frequently overlooked or silenced are the traditions and emerging actions of communities caught in these spaces of struggle, along with their capacities to imagine and to enact spaces of difference, spaces of resistance, and spaces of refusal. As part of the collective ongoing Spaces of Struggle project, these sessions help us to radically rethink what constitutes planning and who has the power and expertise to engage in city-making. Scholars in the "Stories of Changing Practice" session bridge social movement-building with community action through storytelling, knowledge co-production, and reflective practice.

Objectives:

- Lessons from scholarly traditions in radical planning for contemporary movements in equity and social justice planning
- Lessons on how to bring theoretical insights from other disciplines, specifically those that have a much longer history of engaging with communities
- Lessons on how to bring practical insights from communities actively engaging in transformative and insurgent collective placemaking practices

PERFORMANCES IN COMMUNITY DEVELOPMENT: TRACING THE WORK OF NON-PROFIT ORGANIZATIONAL NETWORKS IN EMPOWERING LOW-INCOME HOMEOWNERS
Abstract ID: 334
Abstract within Pre-Organized Session 71

BALACHANDRAN, Sowmya [University of Illinois at Urbana Champaign] sowmyab2@illinois.edu, presenting author

The housing and foreclosure crisis of 2008 brought considerable attention to the vulnerabilities of homeowners, particularly of low-income and minority households (Faber 2018, Hyra, et al. 2013, Massey, et al. 2016). Following the deluge of community organizing and class action suits against the widespread dispossession brought forth by the crisis, reparative funding provided to state and local governments along with the Dodd Frank Act (2010) found their way to local housing non-profits, amongst others, in the form of resources and a strong mandate for consumer protection.

In this research I study the scope and extent of service provision these housing non-profits engage in to assess how they intervene in the experience of buying as well as sustaining homeownership for low-income and minority households. I study three housing non-profits, their institutional and community networks, and daily practices in 4 case study sites in the Chicago region, using qualitative methods including in-depth interviews and participant observation. These housing non-profits assume multiple roles as they enable households to access government grants and subsidies, deliver counseling support at various stages of ownership, negotiate with financial institutions, and hedge against fraudulent market practices. These are, nonetheless, anticipated functions given the sources of their funding. However, my fieldwork also reveals that, these community actors go well beyond the dictates of state policy and stretch available resources to support low-income homeowners in their everyday lives. From providing 'financial self-defense' classes as one housing counselor calls it, to hand-holding customers through destabilizing life events like foreclosures and job loss, these actors successfully bridge the knowledge divide between episteme and metis or scientific knowledge and experiential knowledge (Tironi 2015), or in this case the bureaucratic procedures associated with policy implementation and legislation on the one side, and intimate knowledge of communities in need on the other. By training themselves to implement government policies and utilizing overt and covert identities they nuance their practices based on the needs of different members of these communities and speak to the specific nature of vulnerabilities and risks posed by intersectionality of class, race, age and family composition in navigating the housing terrain, thereby delivering 'a thousand tiny empowerments' (Sandercock 1998).

The dominant view in both policy and scholarship in the post 2008 context, has been that homeownership is not for everyone (Faber 2018, Hyra, et al. 2013, Massey, et al. 2016). This view, however, exacerbates class and race-based divides, by further legitimizing the already discriminatory tendencies of the current housing policy regime that promotes property ownership and agency for the affluent, and primarily tenancy and dispossession for the poor (Schuetz 2018). At stake for the black single mother household is not only claims to finance, state resources and real estate markets, but also to the full 'economic citizenship' (Reid 2014) that only property ownership brings in the United States. However, through my research I tease out the specific ways in which the housing non-profits use their networks and practices in subverting the view that homeownership is not for everyone. While they do not take the form of grand, confrontational practices, these institutions assume the role of double agents (Roy 2010) and work to enhance political consciousness and a sense of self-agency in the households and communities they work. Thus, these agents undertake the work of incremental social transformation (Beard 2003).

GRASSROOTS PLANNING AS A RESILIENT STRATEGY: LESSONS FROM LA CAMPANA
Abstract ID: 441
Abstract within Pre-Organized Session 71

STAINES-DIAZ, Leon [The University of Texas at Austin] leon_staines@msn.com, presenting author

Hypothesis: The community processes in the informal settlement of La Campana qualifies as Subaltern Urbanism (Roy, 2011), and is of utmost relevance for community self-organizing to resist the real estate capital and "formal" planning by the state.

Context: For La Campana, an informal settlement in Monterrey, Mexico, a new way to relate to the public space had its origins as a result of a traumatic event originated due to the violence nested in this community during the Mexican War on Drugs initiated in 2007. La Campana is a consolidated informal settlement located in a vibrant urban area in Monterrey. The community settled in the decade of 1950-1960 in what once was a lonely hill surrounded by agricultural land. It borders with San Pedro, which is one of the wealthiest municipalities in Latin America, and with "Distrito Tec", a district with significant real estate interests due to a mega-urban project. La Campana was, for many decades, a forgotten place by the local authorities, only remembered before every election. That changed after a period of severe violence (2009-2013) as a result of the war on drugs. The drug dealers took advantage of the inaccessibility of La Campana due to the hill's topography; they established there using the community as a hiding place. Aggressive police operatives freed La Campana of most of the cartel presence (although they are still there in a more discrete way), leaving behind deep scars in the territory and in the way

people relate to each other.

Methodology: Using Participatory Action Research (Wilson, 2019), and unstructured interviews from fieldwork in 2019, we were able to research the trauma that the clash Cartel/Community originated in the settlers: a new way to interact with the public space. To overcome the shock of the curfew imposed by organized crime, a group of female neighbors created an NGO that initially focused on the modification of the public built environment to transform it into pocket parks for the kids. The NGO gets funds by donations to buy the materials, and community members contributes with their time and skills. The benefits in the community have been notable, and have brought attention from the local authorities, which paradoxically could menace the community's planning practices and identity.

Findings: The government and the private sector designed a partial comprehensive Plan for La Campana area and its surroundings. We argue that this Plan is evidence not only of profound oblivion to the community but a way to conquer the power spaces the community has won for the last five years of planning their community with limited but very imaginative resources.

Relevance: The theoretical framework for this project draws on various streams within the planning theory (PAR, empowerment, and decolonizing theories). For Sandercock (2000, 2004), the incorporation of actors that usually do not have a voice is crucial for the Planning challenges of the 21st century. Nevertheless, caution about participatory processes has its origin since Arnstein's A ladder of citizen participation (1969), more recently, Bayat and Biekart (2009), warn of the public participation of the society in the neoliberal era. For them, concepts such as decentralization, citizen participation, and the drive against corruption are the vehicles used by imperialist domination (Bayat & Biekart, 2009: 819). This argument aligns with Miraftab (2009: 33) discussion of citizen participation as a way to legitimize neoliberal goals through the perception of inclusion to achieve hegemonic power.

This paper argues that without a different approach from the city's authorities, the community organization is at risk of diluting, dismantling the community momentum, and leaving it vulnerable to the several real estate interests currently in the area.

TRANSNATIONAL NETWORKS OF INSURGENT PLANNING FOR POST-DISASTER RECOVERY
Abstract ID: 442
Abstract within Pre-Organized Session 71

TORRES CORDERO, Ariam [University of Illinois at Urbana-Champaign] ariamlt2@illinois.edu, presenting author

Post-disaster recovery is a complex, long-term process where communities must continuously assert their needs and priorities in government-led planning processes. In both research and practice, planners have

acknowledged that standard disaster recovery models are not adequately designed to accommodate bottom-up streams of local knowledge about needs, vulnerabilities, and priorities (McDonnell et al. 2019). Further, more often than not, these recovery models aggravate pre-existing spatial injustices and social vulnerabilities (Jacobs 2019). In response, grassroots organizations across different geographies have needed to assert their claims for a just recovery by creating spaces of active citizenship, engaging in counter-hegemonic practices, and connecting to transnational networks. My study will present a case where insurgent planning practices have been mobilized to advance a just recovery after Hurricane María struck Puerto Rico in 2017. My focus will be on how and to what extend Puerto Rican diasporic communities mobilize these practices from afar to support post-disaster recovery on the ground.

Conceptually and methodologically, this research is rooted in postcolonial thinking, drawing on a background of colonial relations of domination and what Huq (2020) calls: "context-specific political societies with embedded relations of internalized oppressions and exclusionary politics." Drawing on qualitative interviews, participant observation, and archival research in both Puerto Rico and Chicago between 2018 and 2020, I illustrate how diasporic communities and grassroots organizations in the island connect and develop a transnational network for post-disaster recovery. My work will illustrate that there have been significant gains and advances through these transnational networks filling important recovery gaps and asserting collective rights in a post-disaster recovery environment. Preliminary results suggest that, despite constrained democratic spaces for community participation in hazard mitigation and disaster recovery action planning, being in this case what Miraftab and Wills (2005) call "invited spaces", grassroots organizations in the diaspora have "invented spaces" of engagement for a just recovery in Puerto Rico.

TALES OF PUERTO RICAN PLANNING INSURGENCIES: THE CASE OF VESPRA, THE JOINT ACTION COMMITTEE OF POOR COMMUNITIES OF PUERTO RICO AND THE COMITÉ ACCIÓN POBRES DEL CAÑO
Abstract ID: 443
Abstract within Pre-Organized Session 71

ENCARNACION BURGOS, Angeliz [The University of Texas at Austin]
encarnacion.angeliz@gmail.com, presenting author

Following Sandercock (2003), this presentation aims to foreground the marginalized stories of community organizers and community members that orchestrated an Avant-guard coalition to navigate, negotiate resist, and (re)imagine Puerto Rico's institutional planning/development ensemble in the 1960s. Different from other Community Action Programs (CAPs) across the US, VESPRA's actions were far

from political patronage or partisan politics or paternalism (89 Cong. Rec. Senate, 6732, 1966). On the contrary, VESPRA program equipped communities to claim their rights within the official colonial spaces, invited spaces (Miraftab, 2004), and to invent their own spaces when official access was denied. One of the most notorious collective action was the first meeting of the Joint Action Committee of Poor Communities of Puerto Rico; titled The Poor People Convention. Around 3,000 residents from communities across the Island participated in the gathering, attendees debated and passed eleven resolutions demanding active participation of residents of poor communities in government Boards, in the elaboration and implementation of plans, programs and public services activities such as transportation, development strategies, public housing, urban renewal initiatives. This action marked the beginning of many other mobilizations and concerted actions of communities across Puerto Rico; such as the case of the Comité Acción Pobres del Caño's efforts. By telling these stories, this work intends to contribute to extending planning praxis. In doing so, the stories were gathered using an uncommon research design in the planning field (Pinel, 2015), historical ethnography, which illuminates the pivotal relationships between political struggles and development/planning ideologies, and the spatial implications of these struggles as reflected in Puerto Rico today.

RADICAL PLANNING 3: REIMAGINING PLANNING PRAXIS
Pre-Organized Session 72 - Summary
Session Includes 444, 445, 446, 646

GELBARD, Sarah [McGill University] sarah@gelbard.ca, organizer

While planning offers hope for better cities, decades of radical scholars and planners have exposed a troubled history of the complicity of planning in perpetuating spatialized injustice and domination. Frequently overlooked or silenced are the traditions and emerging actions of communities caught in these spaces of struggle, along with their capacities to imagine and to enact spaces of difference, spaces of resistance, and spaces of refusal. As part of the collective ongoing Spaces of Struggle project, these sessions help us to radically rethink what constitutes planning and who has the power and expertise to engage in city-making. By enabling us to rethink who we learn from, what we are open to learning, and how we learn, scholars in "Reimagining Planning Praxis" propose a basis for envisioning an ethical and imaginative socially transformative planning praxis.

Objectives:

- Lessons from scholarly traditions in radical planning for contemporary movements in equity and social justice planning
- Lessons on how to bring theoretical insights from other disciplines, specifically those that have a much longer history of engaging with communities
- Lessons on how to bring practical insights from communities actively engaging in transformative and insurgent collective placemaking practices

IMAGINING A SOUTHERN PLANNING PRAXIS FOR COMMUNITY DEVELOPMENT

VASUDEVAN, Raksha [The University of Texas at Austin] rakshav@utexas.edu, presenting author
NOVOA, Magdalena [The University of Texas at Austin] mpnovoa@gmail.com, co-author

A 2019 ACSP conference roundtable entitled, "Radical and Insurgent Planning: Reflecting on Concepts, Stories, Geographies, and Futures" featured panelists (including the authors of this paper) who spoke to the adequacy of present-day planning theories to not only address urban problems in 'Global South' contexts but also to address contemporary crises in Western democracies (De Satgé and Watson 2018, Miraftab 2017, Roy 2009). In both contexts, racialized and impoverished subjects cannot access the same basic expectations for city services, design, participation, and governance (Fanon 1967, Holston 2008). Reflecting on this 'southern turn' in planning, Faranak Miraftab reflected that as a profession, "we have not recognized how planning has been complicit in the colonial project," and Leonie Sandercock stated that "social transformation moves at the pace of trust."

This paper revisits the theoretical, methodological, and community contributions of radical, insurgent, and critical planning to imagine a southern planning praxis for community development (Vasudevan and Nova, forthcoming). We develop a 'southern praxis' to bridge practice and theory, dismantling the idea of a hegemonic planning theory that is something apart from the lived realities of communities. By 'southern' we are not referring to a geographic location, but rather a re-centering of peoples and stories that have been left out of planning.

Our findings suggest that the future of an ethical and imaginative southern planning praxis lies in what some scholars are already doing, namely bringing theoretical insights from other disciplines, specifically those that have a long history of engaging with communities, in order to break from the rationalist foundations of planning and the profession's continued complicity in facilitating inequity. Additionally, many of these same scholars engage in long-term relationships with the people they are working in their research. Given the recent upsurge in global political demonstrations, including in the Dominican Republic and Chile, where the authors conduct community-engaged ethnographic work, we propose a reimagined southern planning praxis that is founded on co-theorizing, co-working, and co-advocating with community organizations and residents. Recognizing that planning is not acting in a silo, the interdisciplinary bend of 'southern scholarship' enables greater opportunities for dialogue, a more rounded and nuanced understanding of the cultural, political and historical specifics of a community's necessities, and the opportunity to develop relevant theories of the city based on people's historical experiences and future visions.

INDIGENOUS FUTURITY: RECOGNIZING THE UNACTIVATED POSSIBILITIES OF OUR ANCESTORS

HARJO, Laura [University of New Mexico] harjo@unm.edu, presenting author

Indigenous futurity considers the unactivated possibilities of ancestors, creating community in a present temporality, and building worlds for future relatives. The Indigenous community is (re)centered within a futurity praxis, and does not work solely towards tactical ends to meet normative planning needs. However, a futurity praxis functions to perform other work such as building kinship and relationality or producing and sharing knowledge, all of which can operate as community caretaking. Community caretaking is vital to community futurity, and it does not require the assistance of formal planning entities, or planners as experts to carry out this work. In this paper, I will share examples of local Indigenous youth functioning as community caretakers.

Indigenous futurity methodologies are guided by theories drawn from community knowledge. Further, Indigenous community knowledge is embodied, lived, and felt. (Million, 2009; Simpson, 2014; Sweet & Ortiz Escalante, 2015) Because it is embodied, community members might feel secure with sharing their embodied knowledge with someone they think might dismiss or not fully comprehend it. Maori scholar Linda Tuhiwai Smith (2013) argues that the legacy of Western research has disrespected Indigenous communities and their knowledges. Therefore in community planning, it necessary for community to access culturally appropriate methodological tools to carry out community-led processes of knowledge production and caretaking. This type of community planning seeks community kinship and not necessarily justice from the state—in particular with *Missing and Murdered Indigenous Women* carceral approaches do not examine and extinguish root causes that are bound up with resource extraction that render Indigenous land and bodies as expendable. Further, it seems that it is not possible to create decolonial worlds from a carceral approach that fails to recognize the devaluing of Indigenous lands and bodies and instead offers laws and policies to address symptoms. Futurity methodologies provide means for local communities to enact and create other possible worlds with the resources they embody. Indigenous communities do not have to wait on permission from anyone and an Indigenous futurity praxis enables them to begin conceiving of and enacting their futures they wish for in a present temporality.

"PLANNING ISN'T READY FOR A PERSON LIKE ME": WOMEN OF COLOR AND COMMUNITY-BASED KNOWLEDGE PRODUCTION IN THE PLANNING ACADEMY

GAUGER, Bri [University of Michigan] bgauger@umich.edu, presenting author

Despite significant institutional gains for women in planning over the last fifty years, many challenges remain for female scholars of color, who face compounded barriers due to institutional racism, sexism, and xenophobia in academia. A backlash against the politically-engaged planning of the late 1960s

emerged in the 1990s, just as women of color were entering the planning academy in greater numbers than ever before. These women, most of whom focused on community-based equity research throughout their academic careers, faced insidious discrimination and persistent precarity as waves of tenure denials disproportionately affected scholars of color.

Nonetheless, women carved out discursive space for planning research addressing the intersections of gender, race, ethnicity, and sexuality at the community scale, and refocused planning epistemologies and historiographies around principles drawn from feminisms of color and decolonial and indigenous feminisms. By repeatedly questioning who has the expertise and power to engage in planning, women of color built on a long tradition of interventions in the debate over how planning is defined. In a field that values bridging practice and theory, academic women have historically been discouraged from and even penalized for doing community-based work, and scholars who take the radical position of knowledge co-production and community self-determination have been marginalized.

How did women of color challenge dominant structures of academic knowledge production and value in the academy, and at what individual and collective costs? This paper examines how the boundaries of academic planning have been enforced upon and renegotiated by women of color. Alongside archival documents and intersectional planning scholarship, I analyzed ten interviews with women of color who became planning scholars in the 1990s and 2000s. Through these accounts, I examine the ways in which female and non-binary scholars of color embody the tensions at the core of planning's history, present, and future, and explore how intersectional feminist praxis can be used to reinvigorate activism in the academy.

PÒSALI CASE STUDY: AN INSURGENT PLANNING HERSTORIOGRAPHY
Abstract ID: 646
Abstract within Pre-Organized Session 72

JOSEPH, Sophonie Milande [Columbia University] smj2140@columbia.edu, presenting author

This study examines how pre-disaster sustainable planning practice informs durability in post-disaster shelter outcomes. I employ insurgent planning herstoriography, a mixed-method approach to storytelling, in order to understand Haitian women vendors and residents' post-2016 Hurricane Matthew experiences. The methodological design is conceptually framed by a Black feminist lens as a radical, progressive and transformative act of research practice and a contribution to the planning discipline. By combining quantitative statistical analysis of survey data and qualitative methodologies including field-notes, interviews, and content analysis, I analyze how Haitian women imagine new tourism spaces and environmental justice in Pòsali, Ayiti. Acknowledging that just sustainabilities are limited in a post-natural disaster context by parallel human disaster factors, I suggest planning and policy

recommendations to advance the sustainability planning triangle's contributions to resolving development conflicts in the face of ongoing environmental injustice.

RESEARCHING ACCESS AND EQUITY IN A STATE OF CONTRADICTIONS
Pre-Organized Session 144 - Summary
Session Includes 958, 959, 960

MELENDEZ, Jose [University of Oregon] jmelende@uoregon.edu, organizer

The state of Oregon is a place of extreme contradictions. For example, in 1857, Oregon, by popular vote, added exclusionary language against African Americans to its constitution, which would not be repealed until 2000. Yet, since the 1960s, Oregon's progressive politics have often placed the state at the forefront of prominent national social issues, such as land use policies, environmental protection, and sanctuary state, amongst others. This dichotomy has resulted in an increasing divide within the state between rural and urban residents, namely the rural areas east of the Cascadia Mountains and the urban centers of what is commonly referred to as the "Emerald Valley," along the I-5 corridor. It is within this state of contradictions that the scholars in the Access and Equity research group at the School of Planning, Public Policy, and Management at the University of Oregon are investigating the nexus of theory and practice regarding issues of access, equity, social justice, representation, and power for underrepresented and underserved communities. The intention for this panel is to highlight access and equity research in a "state" of contradictions.

Objectives:

- Participants will be able to compare and contrast different forms of influencing decision-making by immigrant communities at the state, regional, county, and city levels.
- Participants will be able to describe how immigrant communities are transforming communities in Oregon.
- Participants will be able to explain how immigrants' challenges to access can generate innovative solutions.

DOCUMENTING THE TERRAIN OF DECISION-MAKING BODIES ACROSS THE STATE OF OREGON
Abstract ID: 958
Abstract within Pre-Organized Session 144

MELENDEZ, Jose [University of Oregon] jmelende@uoregon.edu, presenting author

Including the public in decision-making processes is often required by statutes at the national, state, county, and municipal levels (Bryson, Quick, Slotterback, & Crosby, 2013; Fung, 2015; Quick & Feldman, 2011). However, inviting members of the public into decision-making is more commonly used as a strategy to secure public buy-in on decisions that impact communities directly (Ibid), even when public involvement is not required by law. Regardless of initial motivation, the actual number of bodies that exist across the state of Oregon at the different jurisdictional scales is unknown. Additionally, many factors about these bodies are indefinite, including who sits on these boards; their demographic make-up; and, any efforts that have, are, or will be used to diversify them to reflect the growing diversity of communities across the state. Together, these factors create a black box of related unknowns.

The research presented in this paper was specifically conducted to shed light on the unknowns related to a common government practice and mechanism that impacts communities across the state of Oregon, especially those from under-represented groups, such as immigrants. Since under-served communities usually lack meaningful representation at all levels of government bureaucracies, be they at the state, county, or city (Riccucci, & Van Ryzin, 2017; Bradbury, & Kellough, 2011), their involvement in decision-making processes can be seen as an alternate way to have them influence policy and outcomes (Hafer, & Ran, 2016; Quick & Feldman, 2011). Therefore, in phase one of this study, we focused on access to civic engagement through decision-making bodies by conducting a cross sectional study of both the different engagement bodies available for decision-making across the state and their demographic composition. The research questions that drove this phase of the study were: What were the different levels of decision-making available across the state (i.e. from appointed and elected boards to other spaces); and, to what extent were immigrants represented at these different levels? For these research questions, the levels of decision-making were identified using online research of the government agencies who manage these boards. Once the boards were identified, additional online research, surveys, and network outreach were conducted to determine the demographic composition of the various boards.

Having collected the baseline data, the study turned to phase two: investigating the level of engagement by immigrants on said boards. The following subset research questions drove this phase two of the study: What challenges prevent or discourage immigrants from engaging in the different levels of decision making; and, what features have supported the incorporation of immigrants in more successful instances? To answer these questions, we conducted semi-structured interviews of immigrant leaders who sit on these decision-making bodies from across the state.

Preliminary findings of the study reveal that of the 515 jurisdictions inventoried, only 7.6% have immigrant representation, either first or second generation regardless of country of origin. Besides presenting the methodology of the study for replication in other states, the paper will describe in greater detail what the numbers look like across different jurisdictional scales that include: statewide, county, city, and special districts/regional. Additionally, interviews from over 50 immigrants who sat on a variety of the inventoried bodies reveal multiple variables at play that either support or hinder their access to join said boards or their abilities to serve effectively once they join. The paper will connect particular variables to either policy or administrative changes at different jurisdictional scales that can make a difference for diversifying representation on decision-making bodies.

ARTS, CULTURE, AND IMMIGRATION: CREATING AN INCLUSIVE OREGON
Abstract ID: 959
Abstract within Pre-Organized Session 144

ARROYO, John [University of Oregon] arroyojc@mit.edu, presenting author

Changing demographics in Oregon reflect a growing "newcomer" population of immigrants, refugees, and asylees. Nevertheless, change is not always easy for these newcomers, the communities they settle in, and long-term residents. The immigration sector is in search of new strategies to organize and develop basic resources to support immigrant, refugee, and asylee constituents and the significant contributions they make to the economies, civic infrastructure, and social life of their local communities. Artists and arts organizations have an opportunity to support these vulnerable populations as well as to celebrate the common threads that bind us together. The arts and cultural sector can serve as a platform to help immigration policy expand beyond "arts for arts sake" programming to one that embraces a broader mission of inclusive economic development, community cohesion, and equitable communities in which all people can thrive.

The purpose of this paper is to identify current and future ways in which arts and culture can drive local, place-based outcomes for the immigration sector across a statewide level (Oregon). Research findings identified three key immigration sector goals and the salient arts and cultural strategies that support them. Key immigration sector goals for Oregon-based organizations included expanding services to non-urban areas, new forms of targeted support related to newcomer's immigrant experience, and developing local and statement welcoming policies. Some immigration sector organizations in Oregon are already employing arts and cultural strategies in their work. Some arts and cultural projects across Oregon are already aligned with organizations in the immigration sector network. This study highlights critical lessons to sustain current or catalyze future collaborations between both fields. The fact that many cases already exist is a strong sign of their potential to collaborate on common goals.

Data are drawn from 25 semi-structured interviews with immigration advocates, government officials, social service providers, artists, and arts organizations; over 50 case studies; and content analysis of local policies. Transcripts were coded on MaxQDA computer-assisted qualitative data analysis software (CAQDAS) through a grounded theory approach. Research findings highlight the ways artists and cultural organizations can act as integrated community development allies in local, place-based immigration sector work, helping to bridge newcomers and longer-term residents and working together to create multivalent spaces that signal belonging in Oregon.

The union of the immigration and arts and culture fields provides a window into state-level needs at multiple scales of service provision. Furthermore, a seemingly polarizing debate about immigration policy in the U.S. exemplifies the importance of understanding changing ethnic demographics as a value to U.S. society. The nature of the migration experience has more to teach about unity and support and common bonds than about difference and division. Creating bridges across the immigration sector goals and arts and culture strategies featured in this research illustrates the importance of local-level planning work as the vanguard for testing immigrant and refugee incorporation strategies between new and extant populations. Lessons from this research create a foundation for scaling this work across the regional, ethnic, and political domains in similar less-urbanized and more rural-oriented states.

RANCHITOS: IMMIGRANT INTEGRATION VIA LATINO SUSTAINABLE AGRICULTURE
Abstract ID: 960
Abstract within Pre-Organized Session 144

SANDOVAL, Gerardo [University of Oregon] gsando@uoregon.edu, presenting author

This paper investigates the relationships between immigrant integration and agricultural, environmental sustainability in Oregon. We provide evidence that ranchitos (Mexican-immigrant owned small rural ranches) serve as an important mechanism for immigrant integration as they regenerate place and belonging via their sustainable agricultural practices. Hence, understanding ranchitos' roles in rural communities provides an essential contribution to rural community planning (Flora 2000; Hibbard 2011) as ranchitos highlight important relationships among ethnic cultural practices, environmental sustainability, and immigrant integration.

The research method included a revelatory case study method based on 30 in-depth interviews of ranchito business owners, local economic development professionals, and city officials. We answered the following research question: Are Latino immigrant in Eastern Oregon involved in Sustainable Agricultural Practices? If so, how?

Our findings point to ranchitos reshaping immigrant integration efforts via community economic development, by producing alternative foods and through their placemaking efforts.
Latino ranchito owners are creating local added economic value, keeping wealth in the community, encompassing an environmental ethic, and supporting community/cultural assets. Ranchitos' support roles make this organic and generative immigrant integration possible by supplementing their formal incomes and supporting the buy local movement, providing safe and healthy food, and recreating a Mexican rural lifestyle.

TRACK 2 - ROUNDTABLES

CARRYING TWO BUCKETS: RECONCILING THE FRAGMENTED LIVES OF COMMUNITY-ENGAGED PLANNING SCHOLARS
Abstract ID: 86
Roundtable

IDZIOREK, Katherine [University of Washington] kidzi@uw.edu, participant
NGUYEN, Lan T. [University of Washington] lan8@uw.edu, moderator
CAMPBELL, Heather [University of British Columbia] heather.campbell@ubc.ca, participant
HENDRICKS, Marccus [University of Maryland] mdh1@umd.edu, participant
MINNER, Jennifer [Cornell University] j.minner@cornell.edu, participant
UMEMOTO, Karen [University of California Los Angeles] kumemoto@ucla.edu, participant
YERENA, Anaid [University of Washington Tacoma] yerena@uw.edu, participant

Recognizing that approaches to engaged scholarship range from participatory planning activities to Participatory Action Research (PAR) to Community Based Participatory Research (CBPR), this roundtable session addresses community-engaged research broadly. Our specific focus is to facilitate a dialogue about the challenges of a system in which community-engaged scholars feel they must "carry two buckets." One bucket comprises a research program that centers community knowledge while simultaneously creating community change and enhancing scholarship. The other is tailored more specifically to satisfying the requirements of the academic institution.

Community-engaged research is widely recognized as an approach that has the potential to co-create knowledge for action to address social equity, build community capacity, and empower marginalized populations. However, the challenges to simultaneously meeting the expectations of academia ("publish or perish") and satisfying the principles underlying community-engaged research (Israel et al. 2017) - such as sharing power with community stakeholders in terms of research design and authorship (Gaillard & Peek 2019) and directly addressing community-defined problems (Campbell 2012) - are substantial.

The perception that community-engaged research is not valued in promotion and tenure processes can dissuade researchers from pursuing this kind of work (Stanton 2008), particularly early career researchers (Raynor 2019). Additional challenges include uncertainty around outcomes, the requirements of human subjects review, and the potential for mismatched project timelines in co-learning processes that need to incorporate relationship-building and trust development.

This roundtable session focuses on understanding the strategies researchers have used to successfully navigate challenges that arise as a result of this "two-bucket" system. The key discussion questions for the panel focus on the themes of navigating ethical dilemmas, providing guidance for researchers who wish to pursue community-engaged research, and enacting structural change:

1. What key ethical principle guides your research process? How has adhering to this principle helped you to maintain your commitment to community-engaged research?

2. Drawing upon your own experiences of "carrying two buckets," what advice would you give to planning academics who are interested in pursuing community-engaged research?

3. Looking forward, what structural changes are needed to support community-engaged planning academics so they can more fully engage in community partnerships that balance academic and community benefit? What steps need to be taken now to move us toward the goal of being able to carry a single bucket?

PLANNING ON THE EDGE: VANCOUVER AND CHALLENGES OF RECONCILIATION, SOCIAL JUSTICE AND SUSTAINABLE DEVELOPMENT
Abstract ID: 417
Roundtable

GURSTEIN, Penny [University of British Columbia] penny.gurstein@ubc.ca, participant
SANDERCOCK, Leonie [University of British Columbia] leonies@mail.ubc.ca, participant
HONEY-ROSES, Jordi [University of British Columbia] jhoney@mail.ubc.ca, participant
ANGELES, Leonora [University of British Columbia] nora.angeles@ubc.ca, participant
CAMPBELL, Heather [University of British Columbia] heather.campbell@ubc.ca, moderator

While Vancouver is heralded around the world as a model for city building, Vancouver and its region is experiencing challenges in addressing Indigenous reconciliation, the influx of global capital, economic shifts, growing polarization, and environmental concerns. This roundtable explores the reality behind the rhetoric of Vancouver's reputation as a sustainable city, and how to reorient Vancouver and its region's development trajectory along a more environmentally sound and equitable path. The recently released book, Planning on the Edge: Vancouver and Challenges of Reconciliation, Social Justice and Sustainable Development, authored by planning scholars and practitioners, and indigenous leaders, forms the basis of the discussion.

Panelists are:

Leonora Angeles, Associate Professor, SCARP, UBC. Nora will discuss the challenges of immigrant integration and civic capacity building in Metro Vancouver in an era of strong neo-liberal influences in the immigrant settlement sector, and what concerned stakeholders can do about them.

Penny Gurstein, Professor, SCARP, UBC. Penny focuses on what has led to Vancouver becoming one of the most unaffordable cities in the world, with the consequent socio-economic impacts, and the housing innovations that are occurring to address these impacts.

Jordi Honey-Roses, Associate Professor, SCARP, UBC. Jordi will discuss Vancouver's ambitious goal to be the greenest city in the world with a particular look at how water flows in the city. In many respects, Vancouver has an admirable water network, but there is still a sustainability gap in how water is managed, in large part because few households have water meters and water use is higher than comparable cities with similar climates.

Leonie Sandercock, Professor, SCARP, UBC. Leonie will discuss what 'planning for co-existence' might mean from an Indigenous perspective, given that the Metro region is home to eleven First Nations who have been here since 'time immemorial' as well as a significant urban Indigenous population comprising people from many different First nations across Canada as well as Metis and Inuit peoples.

Moderator: Heather Campbell, Professor and Director, SCARP, UBC

Economic development has long been situated on the margins of Planning theory and practice (Rankin 2020), despite the fact that economic factors are critical in shaping the nature and location of activities (e.g. employment, public services). And within economic development, community economic development - which places communities at the center of these fateful choices – is even more remote. Yet, in light of the 2008 financial crisis, the precarious nature of work and heightened environmental degradation, there has been a renewed interest in promoting alternative models that can ensure more holistic approaches to how we plan our sources of livelihoods and shared wealth. Community economic development, which moves beyond the conventional economic development frame of 'creating more jobs and income' to attend to the quality of jobs and distribution of wealth via participatory means, is at the center of sustainable development approaches today. Thus, a key objective of our roundtable is to reclaim CED as a critical field of Planning by showcasing initiatives in the area of labour market intermediation and what they mean for how we conceptualize Planning.

The city has long been a magnet for smart talent. Top cities in the world are constantly being ranked by political, economic, environmental, personal safety, health, education, transportation and other public service factors, as cities compete with each other for investment. Impacts of neoliberalization and the extension of urbanization processes globally demand reconsideration and a strategic pivot of the role of 'the new urban' universities (Addie, 2017). Universities are important partners in city growth and city ranking as they attract talent; first as university students migrate to cities to study and then live as professionals (Addie, 2017). Further, universities are becoming actors in the governance of regional economic development through activities to support economic and entrepreneurship development in their regions (Pugh, Hamilton, Jack, & Gibbons, 2016). While universities continue to be major centres for innovation, due to globalization and neoliberal policies that enable markets, universities are increasingly reliant on powerful private markets and institutions (Bose, 2015). Combined with a shift of power from governments to private institutions, urban development actors in globally ranked cities have changed (Busquets, 2006). Universities in these successful cities also face pressures that are created by the success itself through the facets of contemporary urbanism – gentrification, studentification, and youthification (Moos, Revington, Wilkin & Andrey, 2019). This in turn affects universities themselves in regards such as cost of housing, the ability for universities to attract and retain professors and students, and transportation planning for this large and typically unstudied population.

Thinking beyond the problematic tendencies of university-city connections and the university as a monolithic rational agent (Addie, 2017) this session will explore the questions: What are innovative ways that universities have been leading through urban development partnerships for institutional growth, for building strong faculty and student bodies, and city competitiveness? What are the opportunities and potential challenges of these activities and partnerships? The round table shed light on universities' activities using various case studies of how universities are involved in urban development and regional economic governance, including the initiatives of the four Toronto university presidents as they influence the agenda of city development – StudentMoveTO and StudentDwellTO. These partnerships raise questions for planners concerned with housing and transportation provision for students and how universities are changing communities and their role in the greater city.

TRACK 2 – INDIVIDUAL PAPERS

URBAN PLANNING FOR SOCIALLY MIXED COMMUNITIES: URBAN PLANNERS' APPROACH TO DISADVANTAGED SOCIAL HOUSING ESTATE TRANSFORMATION.
Abstract ID: 57
Individual Paper Submission

KJELDSEN, Lasse [Aalborg Universitet] lakj@sbi.aau.dk, presenting author

The overall theme of the paper is social mixing strategies in urban planning in the case of redevelopment of disadvantaged social housing estates in Denmark. Social mixing I define as housing strategies aimed at attaining a socio-economically mixed resident base within a given neighborhood.

The paper poses the questions: How do urban planners perceive and address the issue of social mixing in disadvantaged social housing transformation? And in particular: How do urban planners consider and approach community building, and what bearing does it have on the planning process?

The paper is based on an empirical analysis of urban planners' response to the Danish so-called Parallel Society Agreement (PSA) of 2018. The PSA requires municipalities and social housing organizations to put forward plans to fundamentally change the housing tenure composition in 15 severely disadvantaged estates.

The main objective behind the PSA was to obtain a more socio-economically mixed resident base. The key instruments stipulated were demolition or sale of social housing units combined with infill dwellings (market rate rental or owner occupied) as well as improved connectedness to the surrounding cityscape. By forcing through demolitions and tenure mixing, the PSA marked a radical shift in the approach to disadvantaged social housing estates; from an approach based on welfare interventions towards a strategic physical redevelopment approach.

The paper is based on 25 in-depth qualitative interviews with urban planners involved in plans for transformation in four different estates following the PSA. Informants in each case cover 1) municipality and housing organization senior staff leading the overall urban development and planning; 2) urban planning practitioners; 3); external consultants to the building owner, e.g. architects or landscape architects; 4) private developers, and; 5) community building organization executives.

There is plenty of evidence that social mixing does not automatically make for well-integrated and well-functioning communities. On the contrary, estates that have been redeveloped to enhance social mixing,

have often been shown to be marked by significant inter-group social distance and tensions. Consequently, building cohesive communities cutting across cultural and socio-economic divides in transformed social housing estates is often hampered by disputes over territory, access to amenities, entitlements, recognition, prejudice, and community norms. Cultural displacement and social control experienced by minority and socially disadvantaged residents are among the important factors challenging inclusive community building.

In this paper I see the urban design and transformation planning processes as the starting point of community transformation and community building. Following a Bourdieuian perspective on planning I perceive the planning process as a power struggle between actors with different leverage in terms of economic, social and cultural capital. Socio-economically deprived as well as ethnic minority residents are by default disadvantaged in the planning process.

The paper finds that (1) while stakeholders are concerned with building inclusive communities, they remain hesitant and uncertain as to how to address the task, particularly in terms of how urban design and planning may promote inclusive community building. (2) Resorting to well-known procedures such as community hearings is favored out of familiarity, though often not providing new insights. (3) Innovative urban design processes, that could address community building issues, are hampered by the absence of an organizational framework underpinning cross-cutting and multidisciplinary learning processes. (5) The challenge of attracting investments as well as socioeconomically advantaged newcomers is overshadowing the task of promoting community building, thus diminishing management focus on the need for innovation and organizational learning.

The paper points to the need of exploring and developing new tools and methods for designing and planning disadvantaged social housing estate transformations, both in academia and practice.

BUILDING IMAGINARIES: CREATIVE PRACTICES TO IGNITE PUBLIC IMAGINATION AND COMMUNITY PRESERVATION
Abstract ID: 75
Individual Paper Submission

MINNER, Jennifer [Cornell University] jm2359@cornell.edu, presenting author

Art and creative place-making shape experiences of the public realm in communities (Zitcer, 2019); they also help us collectively assemble and tend to public memory (Minner, 2019). The methods employed to visualize the city and its pasts and possible futures such as art, media, science fiction, and other forms of storytelling can inspire creative thinking, awareness, and action (Dobraszczyk, 2017). Artistic media can

render visible the many layers of identities and meanings in cities. They may also strengthen attachments to place and the built environment. Creative media can shape ideas or imaginaries of the city whether this is through public art in the landscape or artworks held anywhere that can inspire new awareness of cities.

Creative place-making has many similarities in objective to historic preservation. When done well, they strengthen connections to place and community. While certain elements of preservation's ability to tell stories is obvious -- such as with historic plaques -- much of preservation's power remains largely invisible to many members of a community. Preservation may remain intentionally invisible, so as not to disrupt the continuous experience of a place. Preservation and adaptation of existing, ordinary building stock is essential to efforts to conserve flows of material and energy through city systems in order to address mitigation of greenhouse gases. However, many of these preservation and adaptation efforts – along with their positive effects – remain invisible along with so many other forms of maintenance, care and repair and its associated labor (Denis and Pontille, 2019).

This paper represents faculty-student-community partner research undertaken to begin to address these connections. An initial research question guided this search: "What are creative means of raising consciousness and instilling curiosity and consciousness about the built environment, social histories, cultural landscapes, and collective identities that can translate into greater care and stewardship for place and socially just cities?" Two cohorts of students in classes about art, preservation, and the just city at Cornell University participated in this research. Students in the classes ranged from undergraduate, master's and PhD students. While many were in planning and preservation programs, students came from a variety of programs across the university. The classes were inspired by initial and ongoing research conducted with artists and on the artistic practices of artists and filmmakers (e.g., Minner 2019; Abbott and Minner, 2019). This research represents a step toward identifying creative means of community preservation – in particular, the potential role of 'socially-engaged,' creative place-making and other creative practices to repair, maintain, celebrate, defend, remember, reinterpret, adapt, and preserve places and communities.

As detailed above, the first two aspects of this research bring together exploration of: 1) 'socially engaged' art and creative place-making that can render ideas and histories visible and 2) preservation as a form of care for the built environment. A third and equally important dimension of this research is on the visualization of the 'just city.' Preservation efforts struggle to respond to issues of equity in the flow of resources in a community. Urban neighborhoods are either threatened by an overabundance of outside investment (spurring gentrification and displacement) or by disinvestment (and subsequent abandonment and vacancy). Furthermore, the needs of marginalized communities, may not find aid from tools such as landmarks or historic district designations (Ryberg-Webster, 2016). There is a need to creatively engage in imagining additional forms of community preservation methods. Thus, this research attempts to bring three distinct domains in focus – art and creative-place-making; community preservation; and equity. An outcome of this research is a prototype educational kit, developed by students, to ignite public imagination around sensing and caring for cities and the built environment.

FIGHTING FIRES AND CHASING DEADLINES: MAIN STREET REVITALIZATION ORGANIZATIONS AND THEIR INSTITUTIONAL ENVIRONMENT
Abstract ID: 81
Individual Paper Submission

VAN LEUVEN, Andrew [The Ohio State University] vanleuven.3@osu.edu, presenting author

Downtown revitalization has become a nearly ubiquitous undertaking throughout the municipal landscape of the United States. In the hope of curtailing the effects of twentieth-century downtown disinvestment, suburbanization, and deindustrialization, local coalitions of public and private stakeholders have decided to reverse these trends and restore the vitality and character of their historic business districts. However, this process looks very different across communities of various sizes, state governments, and commercial legacies. In this paper, I use survey data from a universe of over 1800 communities participating in the Main Street Program (MSP). My analysis examines how a local MSP's organizational environment influences various components of program performance. I particularly focus on the "administrative home" of state-level MSP coordinating organizations, which vary widely across the country, ranging from various departments within state government (North Carolina, Colorado), to the state economic development authority (Iowa, Michigan), or as an independent non-profit organization (Ohio, Wisconsin). I test whether heterogeneity within the organizational environment influences the performance and economic outcomes of local MSPs.

"WHAT DO WE WANT? HOUSING! WHEN DO WE WANT IT? NOW!": THE RISE AND SUCCESS OF KC TENANTS ORGANIZING IN KANSAS CITY
Abstract ID: 95
Individual Paper Submission

IRAZABAL, Clara [University of Missouri-Kansas City] irazabalzuritac@umkc.edu, presenting author
SMIRNOVA, Michelle [University of Missouri-Kansas City] smirnovam@umkc.edu, co-author
AYALA, Jordan [University of Missouri-Kansas City] jksy8c@mail.umkc.edu, co-author

Since the 2008 housing crash, many Kansas City homes have been foreclosed, forcing families onto the streets. These effects continue to impact residents today. As a result of both gentrification and slumification, landlords file on average 42 evictions per business day in Kansas City, MO (KC Eviction Project, 2017). Race is the biggest predictor of whether or not a person will be evicted in Kansas City, even with income held constant. Increasingly, those evictions are filed on the basis of nonpayment of rent. A whopping 48 percent of Kansas City households rent their homes, and half of those renters are cost burdened, spending over 30 percent of their income on rent (KC Eviction Project, 2017; Desmond 2016). Like many other American cities, Kansas City is haunted by a history of racial segregation, restrictive

covenants, redlining, predatory lending, and disinvestment (Gotham, 2014; Wagner, 2003).

However, in the lead up to the 2019 Kansas City Mayoral and City Council elections, a new grassroots organization emerged with a mission to fight for more equitable housing in the Kansas City metro. Kansas City Tenants (KCT) was founded with the mission of organizing on behalf of all those experiencing housing insecurity to ensure that everyone has a safe, healthy, accessible, and affordable home in KC. Led by a multiracial, gender-inclusive, and multigenerational base, KCT has been successful in mobilizing and effecting policy change. They have accomplished this by building coalitions among poor and working class tenants and through innovative organizing strategies that brought housing to the attention of key stakeholders in Kansas City. Presently, 85% of the KCT's base lives below the Federal Poverty Level and over 75% of its base is uninsured or on Medicaid/Medicare. Kansas City is about 60% White, 29% Black, and 11% other races; whereas KC Tenants' base is 40% white, 40% Black, 15% Latinx, 3% Asian, and 2% Native American. KCT's base allowed the organization to stage direct actions, write a People's Housing Platform, make housing a focal point of the 2019 mayoral and city council elections, and successfully advocate for the adoption of its Tenants Bill of Rights. Their work has been featured in local and national news stories, contributing towards a campaign for a national Homes Guarantee proposal (Ayala and Irazábal, forthcoming) adopted by several presidential candidates.

Our research project analyzes how KCT was able to develop such a robust base so rapidly, with traction among city, state, and national government officials, but also identifies where the organization has yet to make inroads, tracing these challenges to historical and current racial and class policies and politics that may hinder efforts of grassroots movements to bridge such divides. Engaging in a historical analysis of housing insecurity in Kansas City and the US, we identify the political, economic, and socio-spatial factors that have contributed to the emergence, rapid growth, and significant success of this organization. Using GIS mapping and spatial statistical analysis, we detect communities that have been skipped over by the movement so far and to what extent to understand where future outreach and engagement efforts might be more effective at bridging across race, ethnicity, and class. Using in-depth qualitative interviews and quantitative survey data from those with active involvement to no involvement, we identify the factors contributing to (non)participation among different community groups.

This research foregrounds the experiences and the power of the most marginalized, those suffering from housing insecurity, experiencing or risking homelessness or eviction. Based on the analysis, the study offers recommendations for KCT to sustain their momentum and lessons to similar social movements, organizations, and planners striving for socio-spatial equity in Kansas City and beyond.

UNDERSTANDING HOW NEIGHBORHOOD CONTEXT AFFECTS IMMIGRANT INTEGRATION
Abstract ID: 142
Individual Paper Submission

NEMETH, Jeremy [University of Colorado Denver] jeremy.nemeth@ucdenver.edu, presenting author
RIGOLON, Alessandro [University of Utah] alessandro.rigolon@utah.edu, primary author
BURCIAGA, Edelina [University of Colorado Denver] edelina.burciaga@ucdenver.edu, co-author

In this study, we investigate the role urban planners can play in building pathways for immigrant integration, or the dynamic, two-way process in which immigrants and their receiving society work together to create secure, vibrant, and cohesive communities. Current research in this area suffers from two major gaps. First, integration is typically measured rather narrowly and relies solely on objective variables such as economic incorporation, language acquisition, or educational attainment (Portes and Rumbaut, 2014). Second, the field has not seriously considered the role of neighborhood context (i.e., "place") in creating a sense of belonging for immigrants. Drawing on 356 surveys of immigrants administered in neighborhoods throughout the Denver Metro Area, we first examine how neighborhood types (urban, urban edge, and suburban) shape immigrant integration. We then determine whether the relationship between neighborhood type and integration level varies between immigrants with and without legal status. Examining variation across legal status is important because undocumented immigrants are often more restricted in urban mobility, are more likely to be residentially segregated, and are more vulnerable to exclusionary policies and practices (Burciaga & Martinez, 2017).

To measure immigrant integration, we use a well-established framework developed by Ager and Strang (2008) that captures 10 dimensions of integration. To assess the impact of neighborhood context, each respondent is sorted into one of three categories established in the Denver Zoning Code: urban neighborhood, urban edge neighborhood, or suburban neighborhood. Classifications are based on street patterns, building placement and height, land uses diversity and intensity, and mobility options. For areas outside the City of Denver, two independent coders used Denver's form-based code descriptions to assign neighborhood contexts to respondents' locations, with 99% agreement. We then use multivariate regressions to assess associations between respondents' experiences of integration (dependent variables) and the three neighborhood contexts (independent variables). Models also include interaction terms between neighborhood context and legal status to assess whether legal status modifies the relationship between place and integration. We control for potentially confounding variables such as education levels, immigration status, and duration of stay in the U.S.

We hypothesized that place should matter in shaping integration outcomes for immigrants, and that documentation status modifies this impact significantly. Our initial findings indicate that, among other outcomes, immigrants living in suburban neighborhoods feel more integrated into their communities than those in urban areas, with residents of urban edge neighborhoods falling somewhere in between. The findings are similar for documented and undocumented immigrants. This might suggest that immigrants tend to feel more "at home" when they live in suburban neighborhoods that represent a vision of the American Dream rather than in traditional urban ethnic enclaves. In addition, discussions with immigrant-serving organizations in the region suggest that residents of urban neighborhoods in the fast-growing Denver region tend to feel less rooted and less integrated into mainstream society because of fears they will soon be displaced due to gentrification pressures facing many inner-ring neighborhoods.

This study contributes to an emerging body of literature and policy in a number of ways. First, it introduces a key spatial-analytical construct for immigration scholars that can help tease out the relationship between the built environment and immigrant integration (Németh, 2019). Second, it recognizes the important role that planners and designers can play in building more inclusive and integrative spaces for underserved populations. Third, it helps nonprofits, policymakers, and other state actors advocate for built environment improvements in existing and potential arrival neighborhoods. And finally, it can benefit the daily lives of immigrants in the Denver metro area and beyond by showing the powerful ways that "place matters" for immigrant integration.

THE ROLE OF RACE IN AMERICAN COMMUNITY DEVELOPMENT PLANNING: RETHINKING STATE VS. MARKET
Abstract ID: 152
Individual Paper Submission

IMBROSCIO, David [University of Louisville] imbroscio@louisville.edu, presenting author

Much of the best urban analysis on the planning and development of large American cities sees, rightfully, the central role played by race and racism in shaping spatial patterns and aggregate outcomes. Most well known is the effect of redlining, that explicitly targeted African Americans and the neighborhoods they occupied. A dominant theme running though these accounts is the central role played by the U.S. state (i.e., federal, state, and local governments) in carrying out these racist actions. This paper seeks to challenge this account.

Its central research question interrogates the issue of how to best understand the proper role played by state actions and market forces in creating and perpetuating racialized harms, especially the racial wealth gap, in contemporary U.S. urban planning and community development. The paper uses conceptual and historical analysis to answer this research question, marshaling a wide range of data and other empirical evidence to develop its central thesis. It finds that, while contemporary urban research purports to take race seriously in its account of the planning and community development of large American cities, in turns out that, ironically, careful analysis rooted in an array of rich data sources demonstrates that it does not take race seriously enough. That is, it does not do full justice to the myriad ways that race plays a role in shaping urban outcomes (spatially and socially) – outcomes that stem from processes that are at once both deeply structural and systematic. This is especially the case in accounts of the current racial wealth gap. One particularly notable finding is that we need to understand American community development as driven more by the dynamics of racial capitalism, rather than merely as a case of state-inflicted racial discrimination.

There has been an explosion in interest by community development planners in the development of large American cities and the role played by race. Community development planning needs to understand this phenomena, both for its own sake, but – more crucially – in order to better understand how the field can contribute to more racially just practices that ameliorate and even counteract the most serious negative impacts on people of color. Of particular importance is the effort to understand and rectify the racial wealth gap in the United States, where white wealth and resources far outstrip that of African Americans, something that helps exacerbate and perpetuate racialized inequalities and deprivations, as well as ongoing dispossessions. The paper concludes with an analysis of community-based strategies, drawing on case examples in community development planning to illustrate salient possibilities, that challenge racialized inequalities in US cities and further the goals of social and racial justice.

NORTH-SOUTH DIALOGUES: DESIGN AND ENVIRONMENTAL JUSTICE IN THE CITIES OF LOS ANGELES AND SÃO PAULO
Abstract ID: 175
Individual Paper Submission

SAKURAI, Tatiana [University of São Paulo] tsakurai@usp.br, presenting author

Sustainable development has become the benchmark economic model of the world's leading nations with the aim of ensuring that future generations have the secure right to have their needs met. However, socially disadvantaged people and communities have been excluded from the process of institutionalizing sustainable development. Acselrad (2009) draws attention to the fact that environmental degradation, as well as its perception and mitigation, is not democratic, thus causing an unequal distribution of environmental risks.

Environmental justice can be a democratic and inclusive tool to foster real transformation and decisions that can take place in an equal and fair manner for all. The construction of this new scenario must be participatory, scalable, transparent and multidisciplinary, which demands the articulation of many social and political actors in the long run. Although recent, the concept of environmental justice has been consolidated in its theoretical bases in the areas of Environmental Law, Health, Environmental Management and Public Policy, Social Sciences and Geography. But what about in the field of practice?

The main objective of this research is to survey, classify and analyze actions and projects in the fields of urban planning, architecture and design undertaken with communities and social groups in the two major cities of Los Angeles, in the US, and São Paulo, in Brazil, in light of environmental justice (EJ) concepts and the UN's Sustainable Development Goals (SDGs). This work's intention is to understand the constraints (conceptual, social, environmental, political and material) articulated in the chosen sites, together with the relationships between the actors and design tools that have been used.

The two cities selected as sites of analysis differ in many respects but are similar in other ways, such as the presence of social inequality, and the need for public policies and interventions that promote social justice for affected people and communities. For the analysis of the macro context of São Paulo, the research takes several academic works as references that deal with multiple bases and data visualizations. Theoretical discussion will take place with the works of Acselrad (2009, 2010, 2015). In the case of Los Angeles, resources include the Urban Displacement Project coordinated by UC Berkeley in partnership with other universities and research centers, including CNK, the Environmental Justice Organizations, Liabilities and Trade (EJOLT), and the Environmental Justice Screening and Mapping Tool (EJSCREEN). The main theoretical discussion will take place with Ong (1988, 1995, 2012, 2016, 2018, 2019).

This research methodology is primarily located in the broad field of Applied Social Sciences, emphasizing Urban Planning, Architecture and Design, and is characterized by a qualitative approach. The theoretical foundation, and the extraction, manipulation and reading of data adopts tools and

sometimes transposed methods originating in other disciplines and areas of knowledge in an interdisciplinary relationship. The adopted methodology is Grounded Theory, following the constructivist perspective of the American sociologist Kathy Charmaz (2018, 2017, 2016, 2014).

It is understood that this research is committed to the three dimensions of knowledge construction described by Severino (2016). According to the author, these constitute education in the sphere of higher education, especially in universities: the epistemological dimension in a perspective of knowledge (research); the pedagogical dimension and its relation to learning (teaching) and the social dimension linked to the perspective of extension (extension). But it is also, and mainly, a two-way education in its dialogue between, "scientific or humanistic knowledge", produced by the university and, "lay, popular, traditional, urban, peasant knowledge coming from non-Western cultures ... that circulate in society," defined within the concept of an 'ecology of knowledge' as described by Professor Boaventura de Souza Santos (2011).

GROWTH OR EQUITY: MEDIA NARRATIVES OF THE FUTURE IN POST-KATRINA EAST BILOXI
Abstract ID: 181
Individual Paper Submission

DAVISON, Mark [University of Florida] davison.mark@ufl.edu, presenting author

The study of media narratives offers an avenue for understanding the public framing of both the prospect for, and policies of, planning. Local media narratives construct a version of reality and are viewed as trusted chronicles of daily life (Wilson & Mueller, 2004). Local media has the power to form a contextualized language and an imagined cohesion in the creation of community identity (Anderson, 1983). News reports work as tools in which individuals may incorporate their own ideas through forced frames of reference driven by media narrative. The rhetorical frame drives the narrative in the act of policy setting (Schön, 1979). By laying out the story of a proposed future through a compelling perspective, a cast of characters, and plot development, the media provides a narrative that the public then interprets.

The power of the media to disseminate stories that marshal support for differing sides of debate holds strong influence over the planning process. The now-famous axiom that the news media directs which ideas the populace thinks about, is true, and even truer is that the news media directs the way the populace thinks about those ideas (McCombs & Shaw, 2003).

The east side of Biloxi contains the most diverse neighborhoods in Mississippi. A spit of land between the Bay of Biloxi and the Gulf of Mexico, it is a place where AME churches, Buddhist temples, and Catholic cathedrals all lie within blocks of one another. It is a neighborhood where shotgun houses, new casino resorts, and "starchitect" designed museums stand alongside decades-old seafood processing plants.

Historically a poor neighborhood with a rich cultural heritage, East Biloxi has a poverty rate of more than 34% and an economic and cultural history strongly attached to the sea. Springing from French colonial roots, East Biloxi was home to the city's first African American community, followed by Yugoslav immigrants, and later Vietnamese, all working in the seafood and maritime industries. Today, the area is touted by both elected officials and local media as a site of intense tourism and casino development.

This program of research is focused on the problematic disconnect between the reported future and the drive towards increased social and economic equity. The media's role becomes problematic for free and open debate because local news is often less of a "watchdog" and more a source of boosterism (Shumow & Gutsche, 2015). Local elites and officials harness the power of the media to reinforce established power structures by using specialized language and through the reporting of specific events or ideas (Vincent, 2000).

Linking equity with narrative inquiry is a novel approach to understanding how diverse groups imagine their shared future. Findings come from the print newspaper Sun Herald and the broadcast television station WLOX between the 2009 adoption of the current comprehensive plan and 2019.

Through this narrative analysis, this project specifically answers the following questions:

1. How do media reports narrate future development in East Biloxi?

2. How do media reports narrate equity in East Biloxi?

3. How do media reports narrate the cultural heritage and identity of East Biloxi?

4. What is the overall level of discourse surrounding planning, growth, and equity in East Biloxi?

5. How do these reports combine to communicate a narrative of planning in East Biloxi?

The narrative analysis of these media reports uncovers the prevailing narratives and frames of reference concerning equity and the future in racially diverse and economically stressed neighborhoods.

Local media can offer a unified frame of reference. Through the study of media narratives, researchers and practitioners can more artfully craft future policy and planning narratives to provide the greatest general benefit.

(MIS)TRUSTING THE PROCESS: HOW COMPLICATIONS IN THE BUYOUT PROCESSES CAN DEGRADE PUBLIC TRUST

SCHWALLER, Nora [University of North Carolina at Chapel Hill] nschwall@live.unc.edu, presenting author
NGUYEN, Mai [University of North Carolina at Chapel Hill] mai@unc.edu, primary author
CAMPBELL, Leah [University of North Carolina at Chapel Hill] lc401@live.unc.edu, co-author

The increasing intensity of weather events and geographic reach of disasters in the US in modern times has sparked interest in relocating households out of risky areas, a strategy known as "managed retreat." Historically, this has been facilitated by the federal government through "buyout" programs, the largest and oldest of which is FEMA's Hazard Mitigation Grant Program (HMGP). This program provides funding to local governments for purchasing significantly damaged homes in the aftermath of disaster declarations from voluntary homeowner participants. Through this program, FEMA has helped fund the buyouts of close to 40,000 properties over the last three decades (Mach et al. 2019). While largely considered a successful hazard mitigation tool for the federal government, households are often wary of participating because the buyout process can be lengthy and bureaucratically cumbersome, and often lacks transparency (Greer and Brokopp Binder 2017).

Local governments play a crucial role in the implementation of the buyout program. They are responsible for representing the interests and needs of their constituents and facilitating the administration of the buyout program. In doing this, they act as a crucial link between the people they serve and both the state and federal governments. This places them in a precarious situation where the successes and failures of the other levels of government, that are often outside of local control, affects their relationships with their own constituents (Olshansky, Hopkins, and Johnson 2012).

Scholars and practitioners understand that trust between households and buyout administrators is a key ingredient to willing participation and retention, making it an essential aspect of overall program success (Vries and Fraser 2012). However, there is scant research on understanding how trust is gained or lost in the buyout process. This study employs interview data from 18 local administrators of the HMGP in North Carolina after Hurricane Matthew in 2016, and more than 300 North Carolina-based newspaper articles related to post-Matthew buyouts. Fifty of North Carolina's one-hundred counties were included in the presidentially declared disaster following Hurricane Matthew. While there was substantial need for government assistance in disaster recovery, available funding only allowed the State of North Carolina to approve 800 buyouts. At the time of this study, over three years after Hurricane Matthew made landfall, none of these projects have been completed.

Our preliminary findings suggest that the time that it has taken to implement the program, the miscommunication of details from the federal government to residents as it is filtered through state representatives and then local administrators, and a lack of clearly articulated guidelines on program requirements has led to an erosion of trust in the buyout process. On the flip side, there was a lot of goodwill and trust at the beginning of the buyout process due to community members' memories of previous successful buyout programs. For example, in the program following Hurricane Floyd (1999), over 2,000 homes were bought out in a period of months. Our findings suggest that this base of goodwill has largely been squandered, implying that future buyouts will face increasing difficulties. By elucidating the specific and nuanced ways in which trust is built or eroded, we suggest policy recommendations for improving communication and public participation to increase the likelihood of success in future buyouts. This research fills a gap in research studies about local implementation of HMGP and offers recommendations for improving trust in the HMGP process to lead to improved outcomes in future programs (Greer and Brokopp Binder 2017; Sipe and Vella 2014).

EARLY LESSONS FROM DETROIT'S COMMUNITY BENEFITS ORDINANCE
Abstract ID: 233
Individual Paper Submission

BERGLUND, Lisa [Dalhousie University] lisa.berglund@dal.ca, presenting author

In 2016, Detroit voters passed a community benefits ordinance (CBO) making it the first city in the country to mandate that developers arrive at an agreement with local residents to provide benefits from development projects. This ordinance draws from the creation of community benefits agreements (CBAs) that have been implemented across the country since the 90s; these agreements have won benefits like jobs, affordable housing and amenities for local communities. In light of the renewed investment interest in gentrifying inner cities, CBAs between community coalitions and developers have aimed to address concerns that development carried out with public subsidies might bypass responsibilities to longstanding communities. However, there are often challenges in terms of developer follow through and difficulties in establishing community coalitions that wield the power to negotiate with developers directly. In response to these factors that jeopardize the effectiveness of CBAs, Detroit codified the strategy into law through its CBO. Detroit's ordinance is pioneering in that it uses policy to create the conditions for communities to negotiate with developers for benefits, and mandates that they arrive at an agreement. This ordinance applies to projects that are $75 million in value or more, or that are receiving $1 million or more in public financial incentives. The negotiations are overseen by the Planning and Development Department, and take place between the developer and a nine-member Neighborhood Advisory Committee (NAC) of residents living in the project impact area.

The literature on CBAs has done a thorough job of outlining key aspects of agreements for well-known cases and the challenges in leveraging negotiating power for communities (Leavitt 2006). Literature on CBAs has also theorized on the ideal role of local governments in negotiations (Wolf-Powers 2010). Relatedly, some scholars have claimed that the obvious next step in strengthening CBAs is to codify them into law (Gross, LeRoy, and Janis-Aparicio 2002). However, with few examples of how this can be done (Belongie and Silverman 2018; Vance 2017), ways of formalizing unpredictable and ad hoc CBAs into consistently used policies are absent from the literature. The case of Detroit's unique community benefits ordinance provides an opportunity to explore this gap in the literature further. This paper answers the questions: 1) what have been the successes and challenges of Detroit's approach to securing community benefits? And 2) how is the process being refined to improve outcomes for communities in the future?

This case study research draws from the qualitative analysis of development documents, policies and interviews with key stakeholders. Stakeholders interviewed include developers, city planning staff, NAC members and activists responsible for proposing the ordinance and advocating for amendments to it. This research shows that the ordinance is successful in its establishment of agreements for more than ten projects where NACs have secured over 170 distinct benefits for their communities, including affordable housing, jobs, streetscape improvements, and public transit among many others. However, this research

also indicates that there are several shortcomings that threaten the potential for communities to have their voices heard in development, including a lack of transparency regarding public financial incentives and uneven access to key development and policy knowledge. Further, since the renewed development interest in Detroit is centered in neighborhoods with strong real estate markets, and NAC members must reside in the project impact area, representation on NACs is biased towards more affluent residents. This paper considers these findings and the experiences of local communities in light of the city's ongoing attempts to amend the ordinance, making suggestions for how it could be modified to shift power dynamics that have historically disenfranchised Detroiters from the benefits of development.

THE EVOLUTION AND RETROFITTING OF WORK-UNIT COMMUNITIES UNDER A SELF-ORGANIZING LOGIC: A CASE STUDY OF XIANLU NEW VILLAGE COMMUNITY IN NANJING, P. R. CHINA
Abstract ID: 234
Individual Paper Submission

LIU, Jingping [Harvard Graduate School of Design] jingpingliu@gsd.harvard.edu, presenting author

Throughout the planned economy era in P. R. China (1949-1978) and the following two decades, the work-unit system, a special organization system that gathers urban populations around different working places and with the common welfare system as its most distinct characteristic, has played a significant role in the country. However, as the domestic and international environment changed around the 1980s, the national government deemed the system an impediment to the country's modernization and began to slowly abandon it. Nonetheless, the built form was not so easily erased. Today, forty years have passed since the 1978 economic reform. While many working quarters have been regenerated, relocated or demolished, most work-unit communities (living quarters) have been left behind. However, under the new economic and political backgrounds, the future development of most Chinese cities will focus on the existing housing stock, and so the retrofit of these work-unit communities will become a priority and thus contribute to the revival planning of Chinese cities.

This paper aims to explore reasonable and applicable retrofitting strategies that would follow the inner self-organizing logic of the work-unit community. This will be done by studying both the administrative and morphological evolution process of a typical enterprise work-unit community in Nanjing as a starting point, with the self-organization theory as a supporting theory and the typo-morphology approach as the primary physically-oriented methodology. In doing so, this research will offer a much-needed study of

Chinese work-unit communities, provide innovative research ideas and methodologies for the field, provide strategic support for the national existing stock-based development policy, and enrich the research on work-units in the second-tier cities of the country.

It is expected that the official end of the housing reform in 1998 and the geographic relocation of working quarters are two important turning points in the evolution process of the work-unit community, of which the latter often occurs a bit later, and has more influence on the administrative and morphological changes of the community. Generally speaking, before the two turning points, the factory or the work-unit acts as the sole management role for both the working and the living quarter. After that, multiple role players are involving in the process, such as the residents' committee, the developer, the property management company, the volunteers, and perhaps the factory too. The morphological evolution is analyzed through the spatial and social changes in this paper. The spatial morphological evolution of the work-unit community, is to some extent the opposite to the administrative one, a process from diversity to paucity. While there are relatively many spatial morphological changes before the two turning points, such as the continuous building constructions, extensions and reinforcement, the spatial morphological changes are quite limited afterwards. But the social morphology changes, taking the population composition and property rights as two evaluation indicators in this paper, tend to be complicated after the two turning points. It is anticipated that, in both phases, before and after the two turning points, there exists an either strong or weak self-organizing process within one work-unit community, and in principle, its borders have been dissolving and gradually merging into the surrounding urban environment. At last, it is expected that the pros and cons of the process differ between communities. Using an enterprise work-unit community in Nanjing as a starting point in this paper, other types of work-unit communities could be further selected and studied. From this and future analysis, practical retrofitting strategies can be refined, all of which would follow the inner self-organizing logic of the work-unit community, only to promote, maintain or perfect the process with certain interventions, such as policy, technical and financial support.

RESILIENCE CONVERSATIONS WITH HURRICANE HARVEY RESIDENTS IN RECOVERY
Abstract ID: 255
Individual Paper Submission

POWERS, Liza [Texas Southern University] l.powers4800@student.tsu.edu, presenting author
PUN THAPA, Jiwan [Texas Southern University] j.thapa4313@student.tsu.edu, co-author
OLALEYE, Olaniyi [Texas Southern University] olaniyi.olaleye@tsu.edu, co-author

Two years after Hurricane Harvey, researchers and practitioners are still trying to understand how resilience and recovery manifest in different communities. The vulnerability literature finds that communities recover from extreme climate events, such as Hurricane Harvey, when social vulnerability is reduced (Adger, 2006). Cutter, Boruff, and Shirley (2003) conclude that limited or no access to information can put communities at greater risk of disasters and make them less resilient. Aldrich and

Meyer (2014) and Lalone (2012) argue that developing strong social networks enables vulnerable populations to have more access to resources during disasters, thereby increasing their resilience. Meaningful change and increased equity also occur when vulnerable population groups participate to raise concerns about the status quote of inequity (Benner & Pastor, 2015).

Our research elicited lay perspectives and local knowledge about resilience and recovery in the nine counties most impacted by Hurricane Harvey flooding (Harris, Galveston, Fort Bend, Jefferson, Liberty, Montgomery, Waller, Brazoria and Chambers, Texas). Our research question was: how did vulnerable residents view equity and resilience in the recovery? We held focus groups and community meetings with vulnerable residents in each county. Each meeting was designed for residents to discuss their concerns to the whole group, in break-out sessions, and in one-on-one interviews. Participants were a convenience sample provided to us from our partnership with a non profit advocacy organization, the Coalition for Environment, Equity and Resilience (CEER).

At each community meeting, we provided an interactive base map on which residents could provide their local knowledge of flooding and other hazards. Residents were also given new information about the hazards they face by way of GIS maps showing flood zones, social vulnerability, food access, environmental hazards, and population demographics. Residents walked from map to map and discussed their concerns one-on-one with a professor or graduate student stationed at each map. This interaction at the mapping stations cultivated new realizations and concerns of health risks to environmental hazards and the coorelation between lack of food access in areas with a high concentration of people of color. The interviews revealed that most residents believed social capital and access to technology, expressed in a variety of ways, was the most valuable recovery resource available to them.

In conclusion, with citizen driven dialogue and carefully designed meeting formats and communication tools, our research explored local knowledge on equity and resiliency in a region where extreme flooding events have occurred and are certain to occur again. Our research shows that collaborating with vulnerable populations will provide a better understanding of equity in disaster recovery and in the operationalization of resilience.

NEIGHBORHOOD CHARACTERISTICS, HOUSING CONDITIONS, AND LIFE SATISFACTION IN THE TWIN CITIES, U.S. AND GUANGZHOU, CHINA
Abstract ID: 303
Individual Paper Submission

WU, Xinyi [University of Minnesota] wuxx1088@umn.edu, presenting author
CHANG, Jiang [Michigan State University] jc@msu.edu, co-author
FAN, Yingling [University of Minnesota] yingling@umn.edu, co-author
XIE, Dixiang [Guangdong University of Technology] xiedixiang@126.com, co-author

People's living environments, including the condition of neighborhood and housing, could have substantial impacts on their satisfaction with life. For example, the pleasantness and safety of open spaces and parks in a neighborhood are associated with residents' life satisfaction (Sugiyama et al., 2009, Parra et al., 2010). Homeownership and house sizes are also correlated with life satisfaction and mental health (Zhang et al., 2018; Pevalin et al., 2017). Although many studies have explored the association between living environments and life satisfaction, few of them investigate how this association differs across regions and cultures.

To approach this topic from a more comprehensive perspective, this study examines housing and neighborhood conditions using household-level survey data collected in two distinctive metro areas: the Twin Cities, located in the Midwestern United States, and Guangzhou, located in South China. We employed the Gradient Boosting Decision Tree (GBDT), a machine-learning algorithm, to examine the explanatory power of each living environment variable on life satisfaction. The study identified four major aspects of the living environment in both surveys: housing conditions, neighborhood characteristics, accessibilities (to other destinations), and sense of communities. After confirming the internal consistency, we calculated the mean of the individual variables in each category and created four new variables. We then put the variables from each survey into two GBDT models for the two metro areas and control for age, household size, education, gender, income level, and years living in the neighborhood in both models.

Table 1 shows the modeling results. Collectively, living environment variables have much greater contributions to residents' life satisfaction in Guangzhou (62%) than in the Twin Cities (32%). The sense of community has a similar level of association with life satisfaction in both metro areas. Nevertheless, the variable housing conditions has a significantly larger association with life satisfaction in Guangzhou than in the Twin Cities. We could potentially interpret this result from three perspectives: economical, cultural, and psychological. Economically, compared with Twin Cities, Guangzhou's housing is much less affordable. The lack of affordability makes housing conditions a higher priority for Guangzhou residents than for Twin Cities residents. Due to a larger wealth gap, Guangzhou residents' housing conditions also have greater disparities than the condition in the Twin Cities. According to the social comparison theory, larger disparity prompts more attitudes in comparison with each other, which further leads to a greater influence of housing conditions (Suls & Wills, 1991). Culturally, Chinese people have the tradition to view fixed assets, including housing, as status symbols. Therefore, housing conditions have greater value to Chinese than to U.S. residents. Finally, as a city in a developing country, the average income of Guangzhou residents is still lower than the average income of Twin Cities residents. So psychologically, the lower income puts Guangzhou residents on a lower level of the Maslow hierarchy of human needs, rendering them more focused on physical comforts such as housing conditions.

This study conducts a comparison between two distinctive urban areas in the U.S. and China. We believe that the results of this research provide valuable insights into the understanding of the connection between urban living environments and life satisfaction, which further helps create happier and more livable houses and neighborhoods.

Table 1 Modeling Results

	Variables	Association with Life Satisfaction	
		Twin Cities	Guangzhou
Living Environment	Housing Conditions	14%	36%
	Sense of Community	10%	11%
	Neighborhood Characteristics	5%	7%

	Accessibility	3%	8%
	Total	32%	62%
Demographics and Socio-Economics	Income	32%	10%
	Education	12%	2%
	Age	11%	10%
	Household Size	6%	2%
	Years Living in the Neighborhood	6%	8%
	Gender	0%	6%
	Total	67%	38%

HISTORIC PRESERVATION IN SHRINKING CITY COMPREHENSIVE PLANS
Abstract ID: 345
Individual Paper Submission

KINAHAN, Kelly [University of Louisville] kelly.kinahan@louisville.edu, presenting author
RYBERG-WEBSTER, Stephanie [Cleveland State University] s.ryberg@csuohio.edu, primary author

This paper focuses on the ways in which recent comprehensive planning efforts in shrinking cities have addressed issues of historic preservation. In shrinking cities, sustained population loss and economic decline have left a landscape of vacancy, abandonment, and property decline (Mallach, 2011). Local comprehensive plans provide a guide for the future of cities, including their built environments. As such, exploring the incorporation (or lack thereof) of historic preservation within shrinking city comprehensive plans illuminates how, why, and to what extent planners value the historic built environment. In recent years, demolition has risen as a top strategic priority in many shrinking cities (Heim LaFrombois, Park, and Yurcaba, 2019). Our analysis of comprehensive plans explores if and how planners navigate the tensions between demolition and preservation. This qualitative study asks: How do legacy city comprehensive plans address historic preservation and the historic built environment? How do planners across shrinking cities balance the competing interests of preservation and demolition? The research

offers insights into the current relationship between preservation and city planning, particularly within the context of shrinking cities (Birch and Roby, 1984).

The research is based on an archival analysis of fifteen recent comprehensive plans in shrinking cities. We use Ganning and Tighe's (2018) universe of eighty shrinking cities, of which fifty-eight have comprehensive plans. We then limit the study to the fifteen shrinking cities with comprehensive plans and a population greater than 150,000. Using the comprehensive plans as archival sources, we conduct textual analysis to explore how each of the plans addresses historic preservation. The findings confirm existing research that suggests historic preservation has grown into an integral component of city planning efforts (Yeater, 2011). Across the board, the comprehensive plans demonstrate that cities place a high value on their history, built environments, and historic resources. While some cities emphasize preservation on its own, others embed preservation within their focus on housing, neighborhood revitalization, and/or downtown development.

Overall, the comprehensive plans suggest that planners view preservation as a key asset that underpins community character, architectural heritage, and sense of place. While demolition, particularly of over-supplied and vacant housing, has played a prominent role in shrinking cities recently, none of the cities emphasize demolition within their comprehensive plans. Thus, the analysis suggests that, despite recent practice, preservation remains a more palatable strategy than widespread demolition. Finally, the analysis highlights fundamental questions about who should be responsible for neighborhood preservation shedding light on the complexity of this task for community-based organizations, which have limited financial means and operate within a complex political system.

RELIGIOUS AND ETHNIC SEGREGATION PATTERNS IN SYDNEY, AUSTRALIA
Abstract ID: 371
Individual Paper Submission

ALLEN, Ryan [University of Minnesota] allen650@umn.edu, presenting author

As immigration to the U.S., Canada, Western Europe, and Australia renders metropolitan areas in these regions ever more diverse, scholars have begun to turn their attention to religious identity as a measure of diversity with practical and theoretical importance to urban planning. For practicing planners religious identity has played a role in understanding local discourses on immigration, concerns over land use decisions (e.g., the siting of religious institutions like mosques and temples), and a deeper understanding of engagement and outreach strategies in planning processes (Gale, 2008; Bugg, 2013). As a part of the larger social science canon on spatial segregation, scholars have also considered the relationship between religious identity and the formation of ethnic enclaves and ghettos (Brimicombe, 2007; Gale, 2013). However, measuring the degree of spatial segregation by religious identity has proven elusive in most contexts due to data limitations.

This article focuses on religious identity as a potential explanatory factor for observed spatial segregation patterns. In doing so it responds to the following research question: What is the relationship between religious identity and the degree of spatial segregation for residents of a metropolitan area? To answer this research question I use data from the 2011 Australian Census and a typology that quantifies the degree to which multiple religious or ethnic groups share neighborhood space in the Sydney metropolitan area of New South Wales, Australia (Brimicombe, 2007). As one of the very few countries that collects religious identity data for its residents and a major receiving context for immigrants in recent decades, Australia is an appropriate site for this research. I analyze data at the SA1 level, a small spatial unit used by the Australian Census that typically consists of about 400 people. Such a small level of aggregation provides a nuanced sense of patterns of "micro-segregation" that might be present in Sydney neighborhoods. In contrast to popular measures of spatial segregation that only compare the spatial patterns of two groups, such as the dissimilarity index, the typology that I use is able to distinguish between neighborhoods dominated by a single religious group and neighborhoods where multiple religious groups share space.

Preliminary results indicate that religious enclaves, defined by the predominance of a single non-Christian religion, are exceptions, not the rule in Sydney. While there are substantial concentrations of Muslims, Hindus and Buddhists clustered in the Western and Southern suburbs of Sydney, the neighborhoods in these suburbs are most typically characterized by a mix of religious identities, where no one religious identity dominates. On the occasions when a non-Christian religion did dominate a neighborhood, the residential composition was often multi-ethnic. Rather than neighborhoods defined by a religion or ethnicity, the neighborhoods in these suburbs are perhaps best characterized as immigrant neighborhoods. The availability of affordable housing and economic opportunities that are attractive to recently arrived immigrants may explain the observed settlement patterns in the Western and Southern Sydney suburbs, though religious discrimination in the rental housing market may also play an important role (MacDonald et al., 2016).

The preliminary findings from this research point toward structural factors such as economic opportunities and affordable housing as having influence on immigrant settlement patterns, creating multi-religious, multi-ethnic neighborhoods as a result. Practically, this suggests that planners should assume multiple religious and ethnic groups in immigrant neighborhoods to help inform the creation of engagement and outreach strategies for planning processes in these locations. Further, planners should examine and respond to challenges in the employment and housing markets as they seek to understand immigrant settlement patterns and assist immigrant integration.

BRIDGES DON'T MAKE THEMSELVES: USING COMMUNITY-BASED THEATER TO RESHAPE RELATIONSHIPS RETHINKING THE IDEA OF ABUNDANCE IN ABCD
Abstract ID: 380

Individual Paper Submission

LANGE, Zechariah [Florida State University] zjl13@my.fsu.edu, presenting author

Community-based theater (CBT) has a variety of manifestations, and the plurality with which these manifestations are occurring is increasing. As such, the diversity and complexity derived from these socio-cultural sites of public engagement requires further understanding. This article is based upon a multi-case study of two community-based theaters; one in Middle Appalachia (Appalachian Theater), and the other on the Gulf Coast of Florida (Sitting in the Shade Together Theater). Together these sites of performative expression are acting as social interventions for differing reasons within their respective contexts. The examination of these endeavors was an intensive effort to understand more fully the work required to catalyze social relationships as well as activate new forms of interpersonal being within socio-cultural domains. Meaning, how can 'abundance,' as part of the theoretical frameworks of asset-based community development, be activated and implemented through CBT? The purpose of which, was in part, to ground the conception of 'abundance' (Block, & McKnight, 2011), and to also further our current understandings of socially derived asset-based community development as implemented through these two community-based theaters.

 Through the use of constructivist embodiment and semi-structured interviews it became clear that the work of theater making within each community was intentionally driven. The personalized narratives that are actively created, and performed, aim to shift the manner in which local citizens experience themselves with each other. These cultivated lived experiences change awareness of participants from stranger, to acquaintance, to neighbor, all in an endeavor to recalibrate the lived experience of 'community.' Meaning, Appalachian Theater endeavors engage citizens through a performative relationality that simultaneously honored past abuses caused by oppression, but to also cultivate social relationships that activated new forms of being between strangers. The point being for such newly formed relationships was to assist in the creation of new opportunities where there previously was none for self/collective expression, connection, empowerment, and social change. Further, Sitting in the Shade Together Theater purposefully uses CBT to alter cultural landscapes through their own form of performative relationality for the empowerment of vulnerable and oppressed populations of color in a color divided county. Each of these cases are situated in the rural South where structural race/class inequities are entrenched within low resource contexts.

The space of the theaters, as a material technical function, served as a pallet for creative imagining to bring stories to life through shared/divergent interpretations of the lifeworlds of the performed stories. The role of the theater as organization in each case was to facilitate this process by supporting active agency between participants to sculpt, craft, practice, and ultimately perform a story that local audiences could connect with as an imaginary conjuring (a conjuring that is not detached from local life/society). The performances acted and participated in by the author in both cases were complex augmentations of personal boundaries between participants and audiences, but as well as the boundaries between local life and the narratives of the performances. Acting as sites of cultural renewal and change (Barad, 2003), the drama of the performances narratively created a deeper social ontological heterogeneity to serve dialogic functions assisting in the creation of understandings between people (Gumbrecht, 2011). The broken open spaces within the theaters served as an opportunity for social relationality/collaboration/dialogue beyond the confines of the theaters. In other words, strangers were now in conversation with each other. This complex set of mechanisms deepened relationships between citizens in both counties; Appalachian Theater deepened relationships between people and non-profits to aid in survival and renewal, and; Sitting in the Shade Together Theater deepened relationships between people to millimetrically – but nevertheless crucially – adjust face-to-face race and class relationships.

DRAWING YOUR NEIGHBORHOOD: COGNITIVE MAPPING IN MOMENTS OF CRISIS AND CHANGE
Abstract ID: 381
Individual Paper Submission

HWANG, Christine [University of Michigan] ckhwang@umich.edu, presenting author
ETIENNE, Harley [University of Michigan] hfe@umich.edu, primary author

Over the last decade, the drastic amount of crisis and change in Detroit, including the city's re-emergence from the nation's largest municipal bankruptcy, has led us to consider the following: how do residents of various identities, including race and ethnicity, housing tenure status, age, and gender, define their neighborhoods? In a city with loosely defined and varied notions of neighborhoods, including residents who claim that the city lacks neighborhoods altogether, competing perceptions of neighborhood as a unit of residential space have implications about the future of equitable and just urban planning, particularly related to issues of combating gentrification and the spatial distribution of schools and other community institutions, resources, and amenities. This study determines how Detroit residents conceptualize neighborhood boundaries and landmarks amidst drastic social and economic change.

During the course of our research, we conducted 46 semi-structured interviews that included asking residents to describe where they live, including their reactions to any changes they have observed, and a cognitive mapping exercise to examine how residents perceived neighborhood boundaries and landmarks. Our study area was located in an expansive radius around an administratively-defined neighborhood in Detroit that has experienced dramatic change including multiple school closings and gentrification in the last few years. We found that many long-time and African American residents did not associate their residential area with defined boundaries and used very general and broad terms that refer to expansive portions of the city. Additionally, residents had greatly varied perceptions of whether their residential area had sufficient resources and amenities that also often correlated with race and tenure. Lastly, homeowners across racial backgrounds affiliated with block clubs and homeowners' associations as well as newer white renters living in recent construction and rehabilitated real estate developments have strongly defined notions of neighborhood boundaries and names that can both create a sense of community cohesion and exclusion.[1]

Ultimately, our study brings into question the utility of planners using a singular and stagnant definition of neighborhood as a unit of analysis. Given discrepancies in whether a neighborhood has necessarily resources and amenities, the implications of planning based on neighborhood boundaries has tangible implications that privilege certain identities over others and affect livelihood particularly as cities experience crisis and change. This paper expands upon Jackelyn Hwang's study (2016) of conflicting and shifting understandings of neighborhood boundaries in a gentrifying area of central Philadelphia by using similar cognitive mapping methodologies.[2] While we corroborated Hwang's findings of drastically different notions of neighborhood across demographics, we also found that competing notions of residential space in Detroit brought into question the concept of the neighborhood altogether. Recent work, such as Emily Talen's Neighborhood (2019) and George Galster's Making Our Neighborhoods, Making Our Selves (2019) anthologize historical and contemporary concepts of the neighborhood and propose recommendations for the future of the neighborhood.[3] Our study expands on these works by

both interrogating the concept of the neighborhood and highlighting the flaws of operating within a generalized and abstracted definition of neighborhood perilously accepted as neutral.

CLEVELAND HEIGHTS: FROM SEGREGATION TO INTEGRATION TO DIVERSITY
Abstract ID: 409
Individual Paper Submission

KEATING, W. Dennis [Cleveland State University] w.keating@csuohio.edu, presenting author

Cleveland Heights, Ohio is a bedroom suburb of Cleveland. Booming in the 1920s and advancing from a rural village to a streetcar suburb, Cleveland Heights became the home of a predominantly White, Protestant and Professional class of residents. Then, in the 1960s and 1970s, like the adjacent suburbs of East Cleveland and Shaker Heights, Cleveland Heights saw the arrival of African-Americans moving from Cleveland. Initially, there were some violent incidents protesting their arrival. However, many residents rallied in support of racial integration.

In the 1970s, residents organized to fight realtors engaged in racial steering and blockbusting. The Heights Community Congress formed to organize neighborhoods to welcome racial integration of housing. In 1976, the city officially adopted pro-integration policies, making it a model of suburban integration along with a few other suburbs like Shaker Heights and Oak Park, Illinois. A non-profit was established to promote the choice of racially mixed neighborhoods by new prospective White homebuyers.

In subsequent years, the African-American population grew rapidly. This led to controversy about the composition of the public school system, including the racial identity of the faculty. At the same time, the population of the city declined with some of more affluent residents leaving for the exurbs and many families, including Orthodox Jews, choosing to send their children to private rather than the public schools.

In the 21st century, race-related issues around housing and education receded. Instead, Cleveland Heights

joined with other inner ring suburbs to attempt to compete with newer suburbs for residents and business. Cleveland Heights saw its once prosperous Severance Mall (also the site of City Hall) fall into decline, with its foreclosure and auction as major anchors departed. Some of its commercial strips have also experienced decline. The city also experienced a significant increase in housing foreclosures and abandonment.

By 2017, the population had declined to 44,373 (from @ 60,000 in 1960). The demographics were: White (49.20%), African-American (41.84%), Asian (5.24%), two or more races (2.82%). In contrast to the general population profile, 71% of the students enrolled in the public school system (shared with neighboring University Heights) were African-American versus 17% White (and 4% Hispanic, 2% Asian, and 5% multi-racial). With one on the highest property tax rates in the state of Ohio and very poor ratings of overall student academic performance in the state of Ohio rankings, the city and school system have found it increasingly difficult to win financial support for the schools and with a declining population several school buildings have been closed. Despite these problems, in 2016 the voters approved an increase in the city income tax. Another troubling sign has been the increase in poverty households: 18.66% (11.58% White, 25.70% African-American). In 2020, the public schools are once again seeking voter support for a property tax increase in the face of drastic prospective budget cuts caused by state policy on funding private school vouchers.

In 2020, Cleveland Heights describes itself as a "diverse" community, not as a racially integrated city. It no longer has pro-integrative housing programs. Throughout the city, despite its overall racial profile, most neighborhoods are either predominantly White or African-American. Politically, only one of its 7-member City Council has been African-American, although its representatives in the U.S. Congress, Ohio General Assembly, and Cuyahoga County Council are all African-Americans.

So, Cleveland Heights presents the unusual case of a bi-racial bedroom suburb struggling to survive despite its economic and social problems. Its present status and alternative future prospects will be analyzed.

OLDER ADULT VULNERABILITY IN AUSTRALIA'S "BLACK SUMMER"
Abstract ID: 416
Individual Paper Submission

HARTT, Maxwell [Cardiff University] harttm1@cardiff.ac.uk, presenting author

Growing old in a suburban environment can be difficult. As we age, we are increasingly likely to experience some kind of physical or cognitive impairment. Simultaneously, the likelihood that we do not, or cannot, drive an automobile grows. As a result, our life spaces shrink. Without reliable transit, easy access to services, family and friends, older adults in suburban neighbourhoods may face

loneliness, depression, and other health risks. These risks are amplified in times of crisis. From June 2019 until March 2020 bushfires raged across one of the most suburban, and quickly aging, countries in the world - Australia. Over two thirds of Australians live in suburban environments and the Australian "baby boom" generation is, proportionally, one of the largest in the world. Therefore, when the bushfires resulted in air quality levels more than twenty-three times higher than the "hazardous" level in some of Australia's suburban communities, there was serious cause for concern. Across the world, policymakers must consider whether residents will be able to maintain a high level of wellbeing while aging-in-place in suburban communities. In Australia and other regions with climate-related risks, the question must be more fundamental: is aging-in-place even a viable option for the majority of older adults? As the impacts of climate change continue to grow in frequency and severity, planners and policymakers must reflect on and plan for a trinity of risk: individual, (built) environmental, and climate.

A two-part approach is taken to assess the risk, opportunities, and challenges of aging in suburban Australian communities. First, the paper presents results from a quantitative neighbourhood-by-neighbourhood analysis of Australia's 27 metropolitan regions to determine the trinity of risk that many older adults live with – the potential of being disadvantaged by social determinants of health (being older, living alone, on low income), by living in a non-supportive built environment, and by climate-related disasters (hazardous air quality from bushfires). Secondly, the opportunities and challenges of suburban aging-in-place are assessed through the analysis of semi-structured interviews with fifteen local, state, and federal policymakers and stakeholders. The results show that the majority of vulnerable older Australians are living in unsupportive built environments that were impacted by air quality issues due to the bushfires. The geography of vulnerability is presented and the spatial variance within the 27 regions analyzed highlights the need for targeted age-friendly policy. Specifically, the policymakers and stakeholders highlight the need for more, and better, public transportation and additional social infrastructure to support the physical and social connectivity of older adults.

DOES PLACE MATTER? REFUGEE OUTCOMES IN A SHRINKING CITY
Abstract ID: 447
Individual Paper Submission

JUDELSOHN, Alexandra [University of Michigan] alexjud@umich.edu, presenting author

Nearly three million refugees have permanently resettled in the United States since 1980 (Krogstad and Radford 2017). The federal Office of Refugee Resettlement determines where refugees will be resettled based on local resettlement agency capacity and family ties. Historically, refugees were resettled in large cities such as Chicago and Los Angeles, but in the past decade there has been an effort to resettle refugees in historically shrinking cities, such as Buffalo, New York. Opportunities and constraints that may affect the ability of refugees to thrive in their new community are not considered in placement (Calamur 2019),

and factors such as prior job and educational experience are not taken into account. Yet multiple variables impact resettlement outcomes: state and local level policy as well as the local political climate towards refugees, institutions that exist, social capital, and their prior migration experience (Colic-Peisker and Walker 2003; Pittaway, Bartolomei, and Doney 2016; Allen 2009). Still, it is unclear whether different types of cities impact resettlement experiences.

Buffalo, once one of the most populous cities in the country, experienced a huge population loss: In 1950 over 580,000 people called Buffalo home, but by 2015 only 260,000 people did (U.S. Census Bureau, 2015). In recent years, Buffalo's population has stabilized and even increased somewhat, in part due to the influx of refugees. Between 2002 and 2019, 16,346 refugees were resettled to Buffalo (Department of State 2020). While refugees face similar challenges related to housing, transportation, and lack of English-language skills in both large and small cities (Miraftab 2000; Judelsohn et al. 2017), smaller cities may come with additional opportunities and challenges.

I explore the experiences of refugees from Myanmar in Buffalo as a lens to understand how shrinking cities may pose particular opportunities and challenges in resettlement. Based on open-ended interviews (n=15) with refugees originating from Myanmar, local government officials, and representatives from civil society groups, results suggest that neighborhood environments - including low-quality housing and ample vacant land - pose opportunities for newly arrived refugees. Additionally, while the local government is supportive of the incoming refugee population, they do not actively address the needs of this population, placing most of the burden on civil society groups. Implications include an understanding of what challenges and opportunities exist for refugees in a shrinking city, and how local governments can better support their refugee residents.

WHERE WOULD YOU RELOCATE IN LATER TIME AND WHY? EVIDENCE FROM 2017 AMERICAN HOUSING SURVEY
Abstract ID: 458
Individual Paper Submission

HU, Wanyang [The University of Macau] huwanyang@gmail.com, presenting author
LI, Shengxiao (Alex) [University of Pennsylvania] lsx@design.upenn.edu, co-author
GUO, Fuyu [Peking University] guofy@pku.edu.cn, co-author

With a rapidly aging population, older people (65 years and older) are expected to outnumber those under 18 for the first time in US history in 2035 based on a projection by the US Census Bureau. Given the

dominance of older adults in the future decades, it is critical to understand their residential trajectories and to inform planning policies to better fit their residential needs.

Most existing planning policies for the aging population in the U.S. focus on "aging in place" that aims to encourage older adults to live in their original homes and communities. Aging in place is not only more affordable than other alternatives, such as nursing homes (Molinsky, Herbert, and Forsyth, 2019), but is also preferred by many seniors as it helps them to maintain social ties in their original communities (HUD, 2017).

However, recent studies show that the residential patterns of older adults are very complex and increasingly diverse (Kwon et al., 2015). Older adults not only remain in their original homes and neighborhoods, they may also relocate to new neighborhoods or to institutional care facilities (HUD, 2017). At least three reasons could explain why relocation is a good option for some older adults than "aging in place": first, many features in existing housing stock and communities may fail to accommodate the needs of seniors in terms of accessibility, such as the lack of wheelchair-friendly entry and extra-wide doorways (Chan & Ellen, 2017). Second, many communities are also inadequate in necessary aging-friendly infrastructures or transit options that allow older adults to access health services and other community amenities (HUD, 2017). Finally, affordability is another challenge for many older adults given their declining income and increasing needs for health expenditure and the necessary accessibility modification at home (HUD, 2017).

Given these challenges, many older adults choose to relocate to shop for the housing or communities that could better serve their needs (Chan & Ellen, 2017; HUD, 2017). However, existing studies offer limited knowledge on the relocation decisions of older adults in the U.S.

To fill this gap, this study uses the sample of households in which at least one person is above 60 years old in 2017 American Housing Survey to topologize the residential patterns among older adults in the U.S. and attempt to explain the underlying reasons why older adults make different residential decisions.

Using cluster analysis, we identify three major types of elder movers beyond 60 years old. The first mover group is "the winner in all aspects": they move in short distance for better and aging-friendly neighborhood with good public transit access. The second mover group is "loser in several aspects": they move for long distance but end up in neighborhoods with worse living quality and public transit access. Their only gain is that the destination community has more older adults. The last mover group is at intermediate level that they move in short distance to a non-aging neighborhood with similar quality of living, but worse public transit access. We then use multinomial logistic regression to explain the underlying factors that shape their diverse residential patterns. Our results help to inform urban planners of the various residential patterns of older adults in the U.S. based on their socio-demographic characteristics, and the possible planning solutions to better serve the heterogeneous housing needs of older adults.

EXPERIENCES OF THE RELOCATED SMALL INDUSTRIAL BUSINESSES: WHAT WE CAN LEARN FROM CHEONGGYE STREAM MERCHANTS?
Abstract ID: 464
Individual Paper Submission

YANG, Hee Jin [Incheon National University] hjyang@inu.ac.kr, presenting author
KIM, Yoon-jung [Seoul National University] art-de-vivre@hanmail.net, primary author

Cities have sought to improve physical urban environment in order to harness competitive advantages for economic growth and global investment. Urban redevelopment or regeneration has long been a key response to economic restructuring and improving residents' quality of life. Urban governments(?) replace low-value businesses by higher value or more competitive businesses, or geographically visualize places to make them more desirable and attractive. While there is euphoria of positive effects of regeneration efforts on cities, however, the inevitable displacement of the existing community has also long been an issue of concern (Ferm, 2016; Raco and Tunney, 2010).

Public sector-led initiatives on transforming and revitalizing industrial sites have brought concerns about displacements of existing small businesses that geographically concentrate as clusters. Because business advantages at current location are almost impossible to replicate elsewhere (Curran, 2007), it has been argued that any disruption in spatial concentration or forced relocation results in negative consequence to business competitiveness (Curran, 2007; Kim and Kim, 2015; Park, 1996; Park and Kwone, 2004). In existing literatures dealing with agglomeration theory, modern industrial district theory, and inter-firm networks, interdependencies and interpersonal relations are considered critical factors for the formation and functioning of industrial clusters (Granovetter 1985; Harrison, 1992; Park, 1996; Park and Kwone, 2004).

Past studies have often taken an aggregate approach of bracketing the experiences as "bad", while the experiences of displacement have focused on the threats that it poses to the ecosystem of small industrial businesses and to the unique characteristics of the place (Ferm, 2016; Kim and Kim, 2015; Raco and Tunney, 2010). Although a few have acknowledged different groups of firms might respond differently in coping and adapting to the relocated area (xx), [L1] many empirical studies have tended to examine impacts of immediate post-relocation and merchants' satisfaction. This study aims to fill this gap in current literature by examining long-term experiences of those firms which have been forced to relocate in the process of urban regeneration. The underlying argument [L2] is that because inter-firm interdependencies and relational network may differ across firms, relocation may result in variable business trajectories.

The Cheonggye Stream Restoration Project (CSRP) in Seoul, South Korea is a public sector-led initiative, internationally acclaimed for its success in urban regeneration (Ryu and Kwon, 2016; Yoon, 2018). While the project entailed removal of the elevated highway and concretes that covered the 5.8 km historic stream, it brought about oppositions from industrial businesses that clustered around the area. They had feared profit loss from traffic congestion and gentrification that would result from the project (Lim et al., 2013). In dealing with such oppositions, the local government has provided a space located at 21 km southeast from the Cheonggye area for firms to relocate. Today, almost 10 years have passed since 6,100 firms have moved to the new place, and it has been reported that only some hundreds remain and continue business operations.

This study examines the long-term experience of small industrial firms which have relocated in the process of CSRP implementation. By conducting in-depth interviews with relocated firms and property managers of the new place, the study intends to explore the following. One, the types of business that continue to operate at the relocated area. Two, the implication of relocation on the firm's business competitiveness. Three, the transitional experience of interdependencies and interpersonal relations with other firms after relocation. Snowballing sampling is employed to select interviewees. More specifically,

the authors have visited the site and randomly selected a firm to ask for an interview. Then, the authors have requested the first participant to recommend potential participants who can answer our questions.

ALTERNATE PERSPECTIVES ON PLACE-BASED POVERTY REDUCTION: RETHINKING IMPLEMENTATION AND EVALUATION FRAMEWORKS
Abstract ID: 504
Individual Paper Submission

CONWAY, Megan [Carleton University] megan.conway@lycos.com, presenting author

The design and implementation of third-sector managed place-based poverty reduction programs has emerged in response to the state's absence in effectively mitigating the negative impacts of neighbourhood effects. This research examines the central research question of how to evaluate a place-based poverty reduction program across different geographic sites and scales through a case study of a specific third-sector designed and implemented place-based poverty reduction program in Canada. Specifically, this research explores this question through the lens(es) of urban youth participants in the poverty reduction program, Pathways to Education. Connected to this broad research question, I explore other inter-connected questions including:

-What are effective place-based poverty reduction implementation and evaluation frameworks, especially those that target youth?

-Do neighbourhoods matter to children and youth and if so, in what ways?

-How might ethical and methodological tensions be resolved to hear youth perspectives on neighbourhoods, youth, evaluation and poverty more clearly?

To answer this question, I craft a theoretical framework linking the concept of the right to the city as presented by Lefebvre (1996) to Uri Bronfenbrenner's (1977, 1979, 1995) understanding of the micro, macro, and meso systems in which children and youth operate. I then present a literature review that unpacks and analyzes the current dominant literature on neighbourhood effects, children and youth and evaluation. This research proposes alternate narratives on the themes of neighbourhood, evaluation, poverty and, ultimately, success, by challenging dominant urban planning constructs as to what it means to be both youth and poor. Utilizing a community-based participatory research approach, this research presents an evaluation framework that might be considered in examining place-based approaches to poverty reduction. It presents a counter-narrative to the dominant frame that all neighbourhoods that are poor require interventions and, ultimately, saving. It examines some of the associated ethical dilemmas of how best to mitigate neighbourhood effects, especially in some of Canada's poorest neighbourhoods where educational and health outcomes remain lower than middle-class or more affluent neighbourhoods. I present findings from data collected through interviews with national experts in the areas of evaluation, children and youth and neighbourhoods as well as data collected through focus groups and surveys with program staff, and through traditional focus groups and arts-based methods with youth. This research presents a critical analysis to place-based poverty-reduction programs and proposes

a framework to incorporate diverse stakeholder's perspectives, specifically marginalized youth voice(s), into place-based program planning and evaluation. It lastly provides concrete recommendations for planning, implementing and evaluating place-based policies and programs, especially those that target lower-income neighbourhoods.

THE MISSING INSTITUTIONAL LINKAGES IN CREATING SLUM INSECURITY: EXCLUSION, POLICING, AND SLUM UPGRADING IN INDIA
Abstract ID: 519
Individual Paper Submission

LI, Ziming [University of Florida] liziming@ufl.edu, presenting author
ALAKSHENDRA, Abhinav [University of Florida] alakshendra@dcp.ufl.edu, co-author

This paper seeks to address the gap in current knowledge about institutional linkages partly responsible for both the formation of neighborhood insecurity in slums and exclusion originating from the bias towards slums and the unclearness of policies generated by administrative agencies in India. Bihar is one of the underdeveloped states in India. Its capital, Patna, was selected as a model city of the Smart Cities Mission. As per the guidelines, model cities are required to provide citizens with "core infrastructure," including basic public facilities, affordable housing, good governance, and public security. However, due to the incomplete institutional design of city redevelopment at the national level, the local goals and execution of urban governance have led to uncertainties in policing and community governance at the neighborhood level.

Patna, Bihar is one of the dense cities in India with a very large presence of informal settlements. Regular conflicts in informal settlements are quite common. However, at present, it is unknown whether neighborhood conflicts in slums could escalate into violence or diminish, and how slum dwellers' perception of neighborhood insecurity has formed. In order to fill this knowledge gap, this paper utilized multistage stratified random sampling to select 224 low-income families in sixteen slums in Patna for household surveys between 2016 and 2017. Based on IV-probit models and treatment effect models, this paper finds that government actions toward slums—including eviction threats, relocation attempts, and regularizations—are associated with the "identity of living in slums" and that the informality in slum housing and land tenure influenced police patrolling and gave rise to police harassment in the slums. This transmission mechanism from top to bottom through policing is the primary reason for slum dwellers' violent resolutions toward neighborhood conflicts and their perception of insecurity at the neighborhood level. Through individual interviews and focus group discussions, this paper reveals the role of community and the importance of slum dwellers' perception of slum upgrading policies. It finds that slum dwellers' opinions about slum upgrading policies and their perceptions of their roles in urban planning and community design are essential. These results reveal that when it comes to more inclusive slum upgrading and more effective redevelopment, the key is to mitigate distrust between the local government

and slum dwellers and maintain neighborhood security.

RE-EXAMINING THE ACCULTURATION ISSUE AND COMMUNITY DEVELOPMENT OF RELOCATED FARMERS: AN EMPIRICAL EVIDENCE OF SUZHOU, CHINA
Abstract ID: 532
Individual Paper Submission

PENG, Rui [Tongji University] pray1212@163.com, presenting author
ZHANG, Shangwu [Tongji University] zhshangwu@tongji.edu.cn, co-author

It is widely accepted that one of the challenges facing China's rapid urbanization is land urbanization is faster than population urbanization. During the process of land urbanization, there are a large number of rural areas have been converted into urban land use for urban construction, which has resulted in a large number of landless farmers. Thus, the government tried to solve the problem of resettlement of land-lost farmers by building concentrated residential communities (CRC) in rural areas, and this housing policy has become the key spatial strategy for urban-rural integration development. However, the various number of farmers lived in the CRC facing many new situations and dilemmas, and insufficient resettlement policies and spatial planning caused many problems of economic, social, and psychological. Specifically, some landless farmers are facing the change of identity from rural farmers to urban citizens. Furthermore, the transfer of living space from scattered village fields to new residential communities, and the lifestyle change from a self-sufficient rural life to a comprehensive and diversified urban life. Both local government and scholars also suspected the mode of large-scale centralized resettlement is appropriated. From the perspective of cultural anthropology, the process of passive urbanization of farmers caused by such land expropriation is essentially the process of farmers as urban migrants adapting to the new environment. In this sense, this research would employ a case of Suzhou, since there are 1.1 million farmers in Suzhou are transformed into citizens in resettlement policies. The acculturation occurs when a newcomer adopts the cultural behaviors common in the host country, which may lead to changes in diet, physical activity level, and environmental exposures. The motivation of this study is to examine the traditional cultural distance hypothesis, that is, increasing cultural distance between urban and rural makes it more difficult for farmers to achieve local integration, in terms of the living styles, lifestyles, production style, and the traditional unidimensional model, also known as liner or bi-polar model indicates that the increasing adoption of one culture leads to the reduction of the other. Thus, we did a survey for 26 relocated farmers' communities with 1200 samples, and we would construct a multidimensional (in terms of components of acculturation such as practices, values, and identifications) and bicultural acculturation framework to understand adaptation by these relocated famers. Furthermore, we also interested how the built environment features (e.g. green space, or facilities) in community could mediate the negative effects of concentrated residential communities on the process of cultural adaptation. The expected results have very strong policy implications, for instance, whether these housing policies made new barriers for farmers' life. whether we need to re-think the size of communities and how to implement a housing mix strategy for farmer relocation. In the planning process, we must pay attention to

not only the construction of material elements, but also the construction of non-material elements. To improve farmers' employment rate and sustainable livelihood capabilities, expand social networks between farmers and citizens, strengthen farmers' community participation, and guide farmers to improve their lifestyles, thereby increasing their sense of identity and belonging to new communities.

THE RELATIONSHIP BETWEEN SPATIAL INCLUSION AND SOCIAL INCLUSION: EVIDENCE FROM SOUTH KOREAN CITIES AND REGIONS
Abstract ID: 567
Individual Paper Submission

PARK, In Kwon [Seoul National University] parkik@snu.ac.kr, presenting author

Modern cities are increasingly diverse, with people from different socio-economic and cultural backgrounds coexisting. However, social integration among the people in the city is hardly achieved, and social exclusion is a serious social problem along with economic inequality and polarization. In terms of urban space, problems such as spatial segregation, gated communities, and lack of affordable housing have excluded the socially underprivileged, such as the poor, the disabled, and racial and ethnic minorities, from various socio-economic opportunities. There has been some discussion about the positive/negative socio-economic effects on the excluded people of spatial factors such as spatial segregation and transport accessibility (Galster and Killen, 1995; Musterd, 2005; Bolt et al, 1998; Kenyon et al., 2002). Housing affordability is also important to the well-being of the underprivileged and it mediates the generation of segregation and the effect of transport accessibility. We conceptualize 'spatial inclusion' as the spatial dimension of inclusion that promotes the availability of space and mobility for the underprivileged, and physical proximity of different social groups. One may expect that spatial inclusion leads to social inclusion, though the relationship between the two has yet to be empirically established.

The purpose of this study is to identify the key components of spatial inclusion that contribute to improving social inclusion by examining the relationship between inclusive spatial arrangements and social inclusion in South Korean cities and regions. For this purpose, I analyze the Korean Community Health Survey data, a micro-dataset on personal health and social life, along with other data released to the public, such as the Census data. In this study, social inclusion is composed of two dimensions, interdependence and participation, following Gerometta et al. (2005). And those two dimensions are in turn measured by the degree of social network of the socially underprivileged such as the poor, the disabled, the youth, and women and the degree of their participation in social activities. On the other hand, the components of spatial inclusion include space availability for all, mobility for all, and physical proximity between different social groups. The first component is measured as the ratio of 20th percentile housing price to 20th percentile income and the fraction of public housing stock; the second is measured by access to public transportation; and the third is measured by an index of dissimilarity for the poor and ethnic minorities. The relationship between spatial inclusion and social inclusion is then analyzed by

constructing a multi-level model that regress the degree of social participation and network on both personal characteristics and regional characteristics, including the spatial inclusion components.

The expected results are as follows: Overall, increased spatial inclusion leads to increased density of social networks and increased participation in social activities. However, the effects of each component of spatial inclusion may be distinct or less pronounced. In addition, depending on the personal characteristics of the individual, the effects on social inclusion of the inclusive spatial arrangements may be weakened or strengthened. The findings of this study will provide important implications for drawing up the tasks of urban planning to promote social inclusion in cities and regions.

HOW DOES SCHOOL CHOICE IMPACT COMMUNITY SOCIAL SUSTAINABILITY?
Abstract ID: 581
Individual Paper Submission

CONROY, Maria [The Ohio State University] conroy.36@osu.edu, presenting author

Communities across the United States have adopted school choice programs which provide educational alternatives beyond the public neighborhood school. These alternatives are varied and ostensibly form a market-based system where schools compete for students, enhancing the quality of their services. While the educational merits of these programs are hotly debated, there have been few investigations into the impacts of such options (as distinct from school closures) on the social sustainability of surrounding neighborhoods. The planning literature has addressed schools as a destination in an urban design and/or transportation mode choice context. Good (2019) and others have considered the impact of school closures on community development and revitalization. Schools as a location for community gardens, and as a contributor to social capital more generally, has also been discussed in the literature. However, there has been little investigation into the question of how school choice systems affect measures of community social sustainability.

Social sustainability as an element of the broader sustainable development concept is considered by many to be the most nebulous of the three sustainability pillars. Even so, Shirazi and Keivani's (2017) meta-analysis of the social sustainability literature highlights a coalescing around seven defining principles among which are "social networking and interaction" and "livelihood and sense of place." These principles form the basis in this work for measuring social connectivity between schools and their surrounding neighborhood. Schools have held key positions in community engagement through athletics and arts performances, supporting a sense of place and providing opportunities for broad community interactions. These enhancements to social sustainability may provide lasting impacts with respect to school fundraising and levy support, as well as increased social capital supporting student achievement (Warren 2017). Additionally, heightened engagement and identity may increase broader sustainability

efforts related to, for example, school-based community gardens benefiting the surrounding neighborhood.

This study uses the city of Columbus and its School District (CCS), the largest school district in the state of Ohio, as the focus of inquiry. Columbus and CCS provide a somewhat unique opportunity to explore a variety of school choice alternatives. While traditional neighborhood schools remain in the CCS repertoire, the district also includes lottery admission (up to 100% of school enrollment) in traditional, alternative, and specialty schools. Lottery based schools, therefore, may have few if any students from the immediate surrounding community. Moreover, the state of Ohio has school choice where taxpayer-funded assistance (scholarship, voucher) means district students can attend private schools. There are twenty public and nine private high schools within the CCS district boundary.

This paper represents the first phase of a two-phase effort exploring the relationship of high schools within the CCS district boundary with their associated neighborhood. In this phase, site visit and survey data are used to measure the community's identity and connections with the school, as well as the school's identity and connections with the surrounding community. Using an existing GIS-based school location map, all restaurant and retail businesses within a 2-mile radius of the 29 high schools are mapped. On-site visits to these establishments provide the number and type of school-based paraphernalia (e.g., sports team photos/schedules, school pennants, school event fliers) present. Next, a survey of business owners gives insight regarding the role of the school in the community's identity and social interactions. Finally, a similar survey provided to the 29 high school principals assesses their sense of the role the school plays in the surrounding community. Results of this work provide insight regarding how school choice influences social sustainability principals related to sense of place and social interactions, and suggest fundamental issues of communication and trust provide policy directions moving forward.

EVALUATING VACANCY DYNAMICS IN POPULATING AND DEPOPULATING METROPOLITAN STATISTICAL AREAS
Abstract ID: 624
Individual Paper Submission

BAE, Jinhyun [Texas A&M University] jinhyun2009@tamu.edu, presenting author
NEWMAN, Galen [Texas A&M University] gnewman@arch.tamu.edu, co-author

Despite projected increases in global urban populations, many cities worldwide still suffer from severe depopulation (or shrinkage). More than 35 percent of US cities with at least 10,000 residents are

considered shrinking cities. While the U.S. Rustbelt is typically considered the area comprising most US shrinking cities, massively depopulating cities are located broadly in the US and can also include areas in California and the Sunbelt (Hartt, M., 2019). Because of the reduction of residents in these areas, depopulating cities are also characterized by increases in vacant land and abandonment. Negative externalities from these conditions can include a growing crime rate (Branas et al., 2018) and reductions in neighborhood property values (Han 2014). The relationship between depopulation and vacancy has not been well studied at the macro-scale, with most studies examining only singular cities or neighborhoods. The spatial dynamics of vacant land are highly impacted by growth at the national and local scales and hare highly related to regional population migrations (Newman, Bowman, Jung Lee, & Kim, 2016).

To identify the spatial inequalities in the distribution of vacant urban land, this research examines vacant address changes at the Metropolitan Statistical Area (MSA) scale, assessing urban and suburban alterations in vacant land and linking these changes to different socioeconomic conditions. To achieve this, we evaluate 1) vacant address amounts in both populating and depopulating US MSAs from 2008 to 2018, and 2) local scaled of socioeconomic conditions in massively depopulating neighborhoods characterized by excessive vacant addresses. The vacancy was measured at the census tract scales using the Department of Housing and Urban Development's vacant address data. These data derive from the United States Postal Service information, which designates addresses as vacant once their mail has not been picked up for 90 days. The data is measured quarterly from 2006 to current. At the local scale, we compare vacancy dynamics across a growing MSA and a shrinking MSA, using Detroit, MI, and Cleveland, OH, as case examples. Detroit lost nearly 30 percent of its population from 1990 to 2010, while its MSA gained grew by more than 1 percent during the same time frame. However, Cleveland's MSA lost more than 1 percent of its people, while the city itself lost 20 percent of its population during the same period.

Results show that, when using US census data from 1990 to 2010, thirteen out of sixty-nine cities with a population of over 250,000 are shrinking. Simultaneously, eight out of thirteen of the MSAs surrounding each depopulating city are increasing in population in the same time frame. Similarly, vacancy patterns also show different and dynamic changes at the city scale compared to the MSA scale. While many shrinking cities are increasing in vacant addresses as their populations decline, their MSAs tend to be characterized by small and medium-sized cities that are growing in population and reporting the minimal amount of vacant addresses. Vacant addresses also tend to increase in lower socioeconomic neighborhoods. Our findings can be used to improve urban regeneration plans, and help identify areas suffering from spatial inequalities and vacant land issues.

THE IMPACT OF ABSENTEE-OWNED SINGLE-FAMILY HOMES ON NEIGHBORHOOD CHANGE AND SUCCESSION
Abstract ID: 753
Individual Paper Submission

LI, Yanmei [Florida Atlantic University] yli22@fau.edu, presenting author

Homeownership has a myriad of benefits to individuals, families, and neighborhoods. It offers a safe haven and shelter to the occupants and owner, and helps promote a sense of belonging to their neighborhood. Therefore, vested interests of homeowners to their neighborhoods may help enhance neighborhood stability (Coulson, Hwang, & Imai, 2002, 2003).

The recession from 2007 to 2009 sent millions of homeowners into the crisis of foreclosure, either due to negative home equity, loss of employment, or other irremediable factors. Based on CoreLogic, a property database, the peak years for foreclosures were from 2010 to 2012 across the U.S. The deep discount of foreclosed homes in the market prompted investors, particularly small to medium-sized investors, and homebuyers to venture into purchasing foreclosed properties and converting them into rental or vacation housing (Immergluck, 2012). In the meanwhile, many, including foreign buyers, use real estate to diversify investment risks in financial markets. The influx of absentee-owned properties in the housing market may impact neighborhoods in various ways. Neighborhoods with a high percentage of absentee-owned properties tend to be low-income minority neighborhoods, consistent with the concentration of foreclosed properties. The housing conditions in neighborhoods with a higher homeownership rate and a lower rate of absentee-owned properties fair better than neighborhoods with a higher rate of absentee-owned properties. A high percentage of absentee-owned single-family homes also tends to have tax liens, compared with owner-occupied single-family homes (Mallach, 2014). In the meanwhile, absentee-owned properties might worsen affordable housing crisis in certain markets (Graham & Redmond, 2015).

None of the extant studies have specifically focused on how changes in absentee-owned properties impact neighborhoods. This study uses the property parcel and tax data from 2010-2018 in three Florida counties, Palm Beach, Broward, and Miami-Dade counties, to explore and answer the following questions:

1. Have absentee-owned single-family homes increased over the years? What are the characteristics of these homes?
2. What is the spatial pattern of these homes? What is the spatial pattern of percentage absentee-owned single-family homes among all housing units at the census block group level? Is there a concentration of those properties? If so, in which kinds of neighborhoods?
3. How did the change in percentage absentee-owned single-family homes among all housing units at the census block group level from 2010-2014 relates to the change in neighborhood characteristics, e.g. median household income, percentage minority households, property values, rents, homeownership rates, etc. in 2014-2018?

American Community Survey 2010-2014 and 2014-2018 five-year estimate data are used to measure neighborhood attributes and change variables. The absentee-owned properties are those with a mismatched property and mailing address, although the property status, whether it is rental, vacant, or vacation homes, is unknown. The reason to use these counties in Florida is that the state of Florida was one of the states with the highest foreclosure rates during and after the recession. Foreclosures peaked in Florida in December, 2010, and the tri-county south Florida region suffered the most from the foreclosure crisis. This region is also a prime destination for retirees and real estate investors due to its climate and close proximity to Latin American countries.

This study sheds light on the magnitude of the issue of absentee-owned single-family homes and how they might impact neighborhood change and succession. Negative impact from a large concentration of these homes may be alleviated through policy interventions such as vacancy tax, rental permits, and code enforcement, etc. However, added tax burdens might discourage the owners of these properties to rent to lower income households, due to added financial liabilities to make these houses affordable.

INSURGENT KNOWLEDGE IN PLANNING: A COMMUNITY-BASED APPROACH TO CHANGE
Abstract ID: 754
Individual Paper Submission

LASKEY, Allison [Wayne State University] ablaskey@wayne.edu, presenting author
TAYLOR, Tristan [Charlevoix Village Association] tristan.taylor@ueaa.net, co-author
SILVERSTEIN, Brian [Charlevoix Village Association] bsilverstein@gmail.com, co-author

Local knowledge of poor and working class people of color is systematically shut out of institutional participatory processes. In response, some residents collectivize to pursue justice and structural transformation beyond the participatory paradigm. In doing so they become insurgent planners who, among other things, revalue local knowledge that institutional planning devalues. We define the knowledge revalued through insurgent planning as insurgent knowledge.

This paper explores the character and role of insurgent knowledge in planning. We highlight a Detroit resident association's intervention in their neighborhood's revitalization that limited public funding for neighborhood development. The results cover three years of community-based participatory action research with Detroit's Charlevoix Village Association (CVA), in which insurgent knowledge changed the course of institutional planning and development. Authors of this paper include three volunteers with CVA: a planning scholar (an ethnographer and postdoctoral fellow); a grassroots organizer (a life-long working class black Detroiter); and a new resident in CVA's area (a professional neuroscientist).

Insurgent planning employs local knowledge and analyses to shift planning processes. In CVA, long-term residents' interpretation of information provided grounded meaning to technical analyses and kept experts accountable to the needs and wants of grassroots leaders. Revaluing the local knowledge of grassroots Detroiters allowed insurgents to throw a wrench in status quo planning, opening new space to pursue justice in planning. CVA's insurgent planners collectively produced an independent body of knowledge that formed the backbone for resident mobilization. The process of knowledge production was accountable to working class black residents and thus acts in service of their interests.

CVA's insurgent planning process is exemplified by its response to a redevelopment project on Field Street in Detroit, MI. In challenging the recommendations of city officials to award public funding for the Field St redevelopment, CVA's research uncovered that the developer had accumulated a large number of city code violations on their other local properties. CVA's insurgent knowledge brought forward information that even City Council was not aware of, prompting council members to call for a more thorough background check on developers that include whether they have property in good standing or in violation of city code. The revelation that this developer owed more than $50,000 in fines forced the developer to withdraw their request for funding and enter into a consent agreement with the Mayor's office to address the violations. To be effective, this knowledge had to do more than simply exist -- insurgent residents had to push the information past several gatekeepers, including the Mayor's office, the planning department, and quasi-public planning entities to make their knowledge appear within and shift the planning process.

In the neoliberal era, many cities operate under policies of austerity, impacting what official planning sees as essential and realistic. In alignment with neoliberal goals, the planning establishment devalues the expressed needs of residents in deference to the "wisdom" of market forces. City officials make a choice between listening to community voices or appeasing developers, who promise potential revenue through their real estate projects. As insurgent planners, CVA exposed the disconnect between what was important and of value to residents versus the interests of profit that swayed institutional planners.

MEASURING COMMUNITY DISASTER RESILIENCE FOCUSING ON SOCIAL CAPITAL INDICATORS

Abstract ID: 772
Individual Paper Submission

JANG, Seonju [Texas A&M University] s.jang@tamu.edu, presenting author
NEWMAN, Galen [Texas A&M University] gnewman@arch.tamu.edu, co-author
KIM, You Joung [Texas A&M University] kyj0244k@tamu.edu, co-author

Community disaster resilience can be defined as the capacity of a community to mitigate, prepare for, respond to, and recover from disasters (Burton 2015, Cutter et al. 2008). The ability to measure community disaster resilience is important, not only for implementing disaster management strategies in planning practice, but also for increasing knowledge about how communities perform throughout disaster event and recovery processes (Burton 2015, Cutter et al. 2008, Cutter 2016, Yoon, Kang, and Brody 2016). Community disaster resilience levels, however, are best understood when social attributes are incorporated and considered interconnected components including natural and built environments.

This study develops a community disaster resilience index which integrates social capital indicators, and highlights the importance of completeness in covering social capital for measuring community disaster resilience. Social capital can be defined as features of social organizations and trust that facilitate coordination and cooperation for mutual benefit (Aldrich and Meyer 2014). The role of Social capital during and after disasters has been discussed, at length, in the current literature. Findings typically show that a community with strong social networks tends to get less severe damages and more quickly recover from a disaster event (Aldrich and Meyer 2014). Social capital is one of the most significant factors related to community resilience levels, yet it is inadequately considered in many existing indices. (Cutter et al. 2008, Cutter 2016). To address this gap, this study answers, what types of social capital have been addressing in existing social capital indices and how do they contribute to explaining community disaster resilience?

To answer these questions, the study compiles a list of all social capital indicators that have been proposed in current indices and performs a frequency analysis. These indicators are categorized into three types of social capital based on the "attributes of ties": bonding, bridging, and linking social capital. This

categorization allows for the identification of the typologies of social capital that have been both covered and overlooked in community disaster resilience indices. Then, we examine the internal consistencies among the indicators categorized in each type of social capital by using Cronbach's alpha. Each indicator that is confirmed as consistent is then aggregated to create a combined index. Lastly, we conduct a nested regression analysis to determine if the set of social capital indicators contribute to increasing explanatory power for community disaster resilience. Flood loss data is used as a proxy variable for the level of community disaster resilience in the regression model. It is based on the main assumption underlying disaster resilience concept that a resilient community is less vulnerable to disasters as a result of a high level of capacity to mitigate and response to disaster consequences (Burton 2015, Cutter et al. 2008, Yoon, Kang, and Brody 2016).

Results suggest that the social capital indicators proposed in community disaster resilience literature are limited. The incompleteness in current indices may result in the undervaluation of the roles of social capital in terms of disaster resilience. Future research should be undertaken to employ more diverse indicators which better capture social capital in more innovative ways. Methods such as utilizing geotagged Social Networking Service data to infer social network patterns are expected to be useful. The study contributes to understanding the significant roles of social capital in terms of community disaster resilience.

ANDREW, Simon [University of North Texas] simon.andrew@unt.edu, presenting author
CRAW, Michael [The Evergreen State College] crawm@evergreen.edu, primary author
FISCHER, Lauren [University of North Texas] lauren.fischer@unt.edu, co-author

A significant challenge in mitigating urban inequality is the search for ways to reinforce the physical condition of housing and infrastructure in urban neighborhoods. While many neighborhoods experience significant decay and disinvestment over time, others experience new investment and owner maintenance activities that refresh the housing stock. We argue that neighborhood organizations, such as homeowner associations and voluntary neighborhood associations, play a significant role in mediating the physical condition of urban neighborhoods. Physical deterioration poses significant collective action dilemmas within urban neighborhoods. As a result, neighborhoods with greater institutional capital, i.e. organizations and social relationships that reduce transaction costs to cooperation and collective action, experience fewer instances of physical disorder and greater degrees of homeowner maintenance and

improvement than do neighborhoods with less institutional capital. To evaluate these hypotheses, we analyze code violations and building permits for single-family home renovations and additions from 2014 through 2019 for the cities of Dallas and Fort Worth, Texas. We compare these findings to prior analysis finding support for these hypotheses for Little Rock, Arkansas.

YOUTH, EXCLUSION AND COMMUNITY DEVELOPMENT: THE MECHANICS AND VALUE OF ENGAGING MARGINALIZED YOUNG PEOPLE IN PLANNING AND POLICYMAKING
Abstract ID: 841
Individual Paper Submission

KOCSIS, Joanna [University of Toronto] joanna.kocsis@utoronto.ca, presenting author

In Latin America, a complex history of exploitation and institutionalized violence is now compounded by poverty, unequal access to education and employment, inadequate state security and the increasingly strong global criminal economy of drugs and weapons, which drive alarming numbers of individuals to engage in delinquency. In 2012, the average national homicide rate in Latin America was over four times the global average and young men from the Americas accounted for 15% of all homicide victims worldwide. Young people have become the focus of official reports about increased public insecurity, being forced to bear the weight of negative representations of their generation in the media, and the official discourse. As a result, youth-specific social violence (such as street delinquency and gang violence) is increasingly being perceived as a major barrier to community development. In Latin America, the popular and official attribution of most crimes to youth reproduces the pervasive image of the 'anomic adolescent other' and perpetuates their exclusion from formal processes of planning and policymaking.

While in recent years, traditional punitive responses to delinquency exercised through the criminal justice system have been increasingly complemented by a public health approach that seeks to prevent violence through risk reduction and protection mechanisms (Moser & MacIlwaine, 2005), planners and policymakers have integrated this stigmatization of youth into their decision-making, developing and resourcing social interventions that target "at-risk" youth in the region rather than working with young people. Such programs seldom address the structural factors related to youth-specific social violence, focussing instead on controlling bad behaviour, developing positive personal attributes and filling unproductive time with structured, adult-supervised activities (Coalter 2013). There has been little research on the impact of such strategies, and only a few scholars (ex. Darnell 2014) are questioning how programs that depoliticize youth delinquency, like these, might perpetuate the disempowerment or disenfranchisement of target beneficiaries both through the categorization of "youth" as a problematic life-stage and through the entrenchment of their position in the global system as needy recipients of expert guidance.

This paper examines the mechanics and value (Kraftl, 2013) of engaging racially and territorially

stigmatized young people in planning and policymaking, using data from a 4-year ethnographic study in Old Havana, Cuba. This study explores the lived experiences of youth in a rapidly gentrifying, economically unstable neighbourhood, with a severe housing shortage and increasingly 'tourist-friendly' public spaces, during a period of national political and economic transition. Using affect-focussed arts-based research (Hickey-Moody, 2013), this research found that urban structural conditions such as housing, public space and gentrification affect young peoples' meaning-making and identity formation processes, impacting their perceived options for their futures and influencing their behaviour choices. This action research project supported the creation of a community-based theatre group, Joven Habana, that used works of theatre and film to advocate for policies that problematize, rather than reify the marginalization of stigmatized youth, and to empower locally-led advocacy efforts that challenge the structural barriers to community development.

"IT'S LIKE YOU'RE INVITED TO A BANQUET, BUT CAN'T EAT ANY OF THE FOOD:" LIVED EXPERIENCES OF DISPLACEMENT ALONG WATERLOO REGION'S LRT CORRIDOR
Abstract ID: 889
Individual Paper Submission

DIWAN, Faryal [Social Development Centre Waterloo Region] fdiwan@uwaterloo.ca, presenting author
DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, primary author

In 2019, Waterloo Region in Southern Ontario opened its new light rail transit (LRT) system; it is the smallest community in North America to operate a full LRT. Its planning rationale has less to do with moving people and more to do with managing growth in Canada's fastest growing urban region. The LRT works in conjunction with an urban growth boundary (the Countryside Line) to curb sprawl on the urban fringes and encourage development within the core. The results have been impressive; more than C$3 billion was invested along the LRT corridor before the line opened and new investment, largely in the form of condominium developments continues apace.

While this has largely been praised within the region and by outsiders, this approach to growth management is not without its consequences. Gentrification is rapidly reshaping many neighbourhoods along the LRT line, including downtown Kitchener, which houses many of the region's low-income residents, as well as social services that cater to them. The Region of Waterloo has been monitoring change along the LRT corridor; while its analysis (primarily using census data) has concluded that gentrification is taking place in several areas, it has found little statistical evidence of displacement occurring (Region of Waterloo, 2019). Recent scholarship has highlighted the shortcomings of trying to quantify displacement in this way (Easton et al., 2020). There is also a growing understanding that displacement has moved beyond purely economic factors outlined by Marcuse (1985), towards more experiential and social forms of displacement that may not necessarily result in physical outmigration (Elliott-Cooper et al., 2019).

Therefore, there is a need to go beyond statistics to better understand the complex and often intersectional meanings of displacement from the perspectives of those living through it. We do this through an analysis of two dozen interviews conducted with persons with lived experiences of poverty who live, or lived, along the LRT corridor, primarily in and around downtown Kitchener. This research represents a partnership between the University of Waterloo and the Social Development Centre Waterloo Region (SDC), a charitable non-profit, social planning and community development organization that focuses on advancing social justice and documenting the lived experiences of poverty and homelessness. These types of partnerships combine the theoretical and methodological grounding of academic research with the on-the-ground connections that organisations such as the SDC have with affected communities. In this way, they have the potential to both generate new knowledge about gentrification and displacement and elevate social justice issues within mainstream planning debates (see Maharawal and McElroy, 2018).

Our interviews consisted of both sit down conversations and walk along interviews. We find evidence of systemic displacement that involves financial pressures, harassment from landlords and a loss of community, services and 'homeless-friendly' spaces. Additionally, these interviews reveal new sources of knowledge about urban space from the perspectives of residents who have spent much of their lives within a very small geographic area. This information about how buildings, streets and neighbourhoods have changed offer intimate and detailed knowledge that counterbalances top-down, or statistical accounts of change. This combination of knowledge has also allowed us to begin to map the spatial locations and types of direct, indirect and experiential displacement that go beyond an individual's own experience. This is highly relevant to planning theory and practice, as affordable housing has shot up the political priority list in recent years. As this research is a collaboration between academic and non-academic partners, we also discuss the challenges and opportunities of this type of partnership, as well as offer suggestions for academic researchers on how to partner meaningfully with non-profits within their own communities.

BEYOND HOUSING: COMMUNITY LAND TRUSTS AND EFFORTS FOR COMMUNITY-CONTROLLED DEVELOPMENT
Abstract ID: 898
Individual Paper Submission

DEFILIPPIS, James [Rutgers, The State University of New Jersey] jdefilip@rutgers.edu, presenting author
LARSON, Scott [Queens College] Scott.Larson@qc.cuny.edu, co-author

Since the emergence of the first community land trust (CLT) in 1969, the CLT has become overwhelmingly a tool to provide permanently affordable housing for low-income people (Davis, 2010). While CLTs are useful tools to build and maintain affordable housing, many communities around the country are looking at the CLT form of ownership – in which the land is owned by a non-profit organization and removed from the market – as a way to do many other things and serve many other community needs and interests (Curtis, 2018; Rosenberg and Yuen, 2012; Sorce, 2012). These needs and interests include, among others, retaining small businesses facing the threats of displacement by significant rent increases when their current leases are up, trying to preserve manufacturing land in places losing space for manufacturing, trying to construct and maintain spaces for not-for-profits and other community service providers, etc. Unfortunately, the public sector and non-profit sectors' organizational frameworks and subsidy programs are overwhelmingly geared towards housing production and maintenance. CLTs that do pursue other ends therefore usually do so without the public or non-profit support they need; support that is often present (if certainly significantly under-funded) when the goal is for affordable housing. That forces these CLTs to not only do the community organizing to build support for these efforts, but also to try to build the frameworks that allow CLTs to pursue these ends. This has the effect of making these efforts especially difficult and cumbersome.

In this paper we will use our experiences as part of the steering committee of the newly formed Western Queens Community Land Trust (WQCLT), as well as interviews and conversations with CLT practitioners elsewhere in New York City and around North America. We will analyze the difficulties and problems that CLTs confront when they go "beyond housing;" and how the CLTs have dealt with these difficulties and problems. We will do so both to provide intellectual support for these efforts around the country, and to think more broadly about the potential of CLTs to be tools for real community control – and how the CLT form cannot lose sight of the "community" that should be at the heart of it (DeFilippis, et al., 2017; Lowe and Thaden, 2016).

COMMUNITY-DRIVEN PROGRAMMING: HOW NEIGHBORHOODS SHAPE IMMIGRANT RESOURCES
Abstract ID: 899
Individual Paper Submission

DELGADO, Laura [Massachusetts Institute of Technology] ldelgado@mit.edu, presenting author

Across communities, public library branches offer one of the few free, trusted, and safe spaces that are open to all. More than just safe spaces, they provide a range of traditional and nontraditional resources for immigrants, from job search assistance to bilingual story times to English as a Second Language classes. Even within one library system, the offerings in any given library branch are as unique as the neighborhood in which the branch is located. Through a mixed-method study of neighborhood library

branches in Boston, this research asks how neighborhoods—through expressed needs, community volunteerism, cultural sharing, and partnerships with local organizations—shape neighborhood library branches and the services they offer to immigrants.

The findings reveal that, despite operating within bureaucratic institutions, neighborhood library branches are uniquely responsive to community needs and reflective of community assets, as evidenced by the programs and services they offer. Individuals, groups, and local organizations often bring programs that engage immigrant communities to neighborhood library branches through an informal, organic process. This results in a diverse and valuable set of programs across branches; however, the community-driven nature of the programming benefits some neighborhoods more than others.

Whereas scholarship on the distribution of resources across local organizations has tended to focus on the strong role of institutions, this research highlights the influence of neighborhoods on local organizations, even those that operate within a large, public institution. Furthermore, it speaks to some of the challenges that public-private partnerships and reliance on volunteers pose for the equitable distribution of resources.

MAJOR LEAGUE SPORTS VENUES: ANCHORS IN URBAN DEVELOPMENT AND NEIGHBOURHOOD REVITALIZATION
Abstract ID: 980
Individual Paper Submission

GRAHAM, Rylan [University of Calgary] rylan.graham@ucalgary.ca, presenting author
HAN, Albert [The University of Texas at San Antonio] albert.han@utsa.edu, co-author
DEWALD, Jim [University of Calgary] jim.dewald@haskayne.ucalgary.ca, co-author

Cities are increasingly using sport as a catalyst for economic and cultural development (Trendafilova et al., 2012). Chapin (2004) notes that for decades, construction of new sports facilities was rationalized based on its perceived economic impacts, however, come the 1980s a major shift towards the impact of sports facilities emerged. Specifically, the development of sports venues has been rationalized on the basis that they are central anchors and catalysts for district redevelopment (Chapin, 2004; Spirou, 2010). Despite the persisting narratives on the effectiveness of major league sports venues on neighborhood revitalization, there is little research to confirm this position.

Through a mixed-methods approach, this research seeks to better understand the perceptions towards and realized impacts of major league sports venues on neighborhood revitalization. Perceptions towards major league sports venues as effective catalysts for urban change are collected through the dissemination of a web-based survey to planning, real estate development, and economic development experts located in 67 North American cities (those municipalities with a major league sports facilities developed for franchises

of the NFL, MLB, NBA, NHL, and/or MLS in Canada and the USA). This component of the research is complemented through an analysis of census tract data to determine the relationship or impacts between major league sports venues and neighborhood revitalization. Specifically, from 2000 to 2016, our analysis focuses on changes in 1) population 2) dwelling counts 3) population density 4) land-used mix and 5) median dwelling value in census tracts located near the local major league sports venue.

The findings of this research fill a gap in providing empirical evidence regarding the relationship between major league sports venues and neighborhood revitalization. As major league sports venues have emerged as a common strategy for neighborhood revitalization, this research provides critical findings regarding actual outcomes and thus its effectiveness in achieving revitalization objectives.

CIVIC ENGAGEMENT IN CHINA'S LAND EXPROPRIATION-INDUCED RESETTLEMENT NEIGHBORHOODS: A SHANGHAI CASE STUDY
Abstract ID: 1048
Individual Paper Submission

ZHANG, Shuping [University of Waterloo] shuping.zhang@uwaterloo.ca, presenting author
QIAN, Zhu [University of Waterloo] z3qian@uwaterloo.ca, co-author

Civic engagement is a composite of associational life and voluntary interaction that develops knowledge, skills, values, and motivations to promote the quality of life in a community. Since the late 1990s, increases in community-based individual voluntarism, organizational membership, electoral participation, and activity involvement have provided strong evidence for the proliferation of civic engagements in China's grassroots society. However, as China's urban neighborhoods have become more diverse in location, size, function, resident composition, and other aspects, it is inappropriate to generalize China's base-level civic engagements without referring to specific neighborhood contexts. Through a Shanghai case study, this research unravels the conditions and features of the civic engagements in China's land expropriation-induced resettlement (LEIR) neighborhoods. LEIR refers to the state-led rural-to-urban resettlement arrangements for land-expropriated villagers. For affected rural dwellers, LEIR practice has transformed their life patterns from a horizontal and self-sufficient style in spacious village houses to a vertical one depending on market goods and paid services in compact urban neighborhoods. Villagers' uneasy post-resettlement life transformation has largely affected their civic engagements in LEIR neighborhoods. Although institutional and infrastructural platforms have been set up for conditioning villagers' associational life, the overall civic engagements in LEIR neighborhoods are neither adequate nor effective. This is largely due to the lack of meaningful citizen participation aiming at addressing public issues and engaging residents in decision-making processes. Meanwhile, civic engagements in LEIR neighborhoods are not equally available or attractive to resettled villagers. Finally, the involuntary nature of the resettlement and multifaceted urban integration challenges have combined to discourage villagers in participating civic activities in their neighborhoods. Villagers' civic engagements in LEIR neighborhoods require continuous institutional guidance and support. This study advocates for the establishment of robust and responsive policies to create for resettled villagers with a larger institutional

space for interest representation and resource access.

THE TROUBLE MAKERS AS CITY MAKERS? PARTICIPATION OF EXPERIENCED CITIZENS IN URBAN PLANNING PROCESSES
Abstract ID: 1079
Individual Paper Submission

COHEN-BLANKSHTAIN, Galit [The Hebrew University] g.c.b@mail.huji.ac.il, presenting author
GOFEN, Anat [The Hebrew University] anatgo@mscc.huji.ac.il, co-author

Privileging access to decision making that draws on the local lived experience of local people is at the heart contemporary planning discourse. Nonetheless, public participation faces multiple encounters including a major challenge of recruiting the individual participants, engaging them in the process and providing the public with meaningful tools while distributing it in a fair and inclusive way. In accordance, representation, inclusion, outreach and empowerment are extensively discussed both when examining and when promoting public participation. The unorganized, unpaid and unprofessional public are considered as lacking power, and often approached as idiosyncratic, one-time participant in a specific process (Powell and Colin 2009; Tauxe, 1995). However, there are empirical evidence of "natural joiners," (Lowndes et al, 2001), who engage in more than one voluntary participation process, or the "usual suspects" (May, 2007) that engaged repeatedly in public participation processes, but they are understudied.

This study focuses on the small, overlooked, distinct category of the public, who persistently and proactively get involved in city-making. It will not only uncover the role and the influence of experienced participators, but also calls for a more nuanced examination of public participation patterns as an underdeveloped dimension in current public participation literature, discussing both its positive contributions and negative implications.

data is drawn on 12 in-depth interviews with individuals who took part in at least three participation processes in the city of Jerusalem. Two additional relevant sources were interviewed: two city officials from the Jerusalem planning department and two NGO representatives, who are involved in city planning in Jerusalem.

Preliminary findings suggest that all informants identified the small but acknowledged group of experienced participators. Common to all experienced participators was high civil awareness that manifested in knowledge and definite opinions about contemporary public debates, and beliefs that the public should stand up for things that matter. Their participation in multiple participation processes does not stem from a strong sense of efficacy, most of them are critical of the participation processes and frustrated by their narrowness and one-sidedness. But as experienced participators they developed several strategies to enhance civic voice in urban policies: (1) Suggesting or initiating additional activities or methods during the participation process; (2) sharpening their ability to navigate the professional jargon, which enabled them to criticize policy proposals as well as to submit their own alternatives; (3) A few frustrated experienced participants realized that they would have greater effect if they joined their Neighborhood Self-Management Organizations and steered the participation process from a more

established position; (4) pushing for processes that are led by non-governmental actors that can gain trust from both sides; and (5) although acting at the neighborhood scale, some of them established a larger urban network, encouraging joint action at the city level.

On the other side, the repeated, experienced participators were portrayed by the city officials in less compelling ways: as oppositionists, representing none but themselves, pushing aside the 'real' local community, and bringing negative atmosphere. However, the officials acknowledged their achievements as well, such as pushing the authorities to confront issues that they tended to ignore and taking into consideration criteria that were not included in the initial analysis and plan. The NGO representative had a positive view of them, but thought they could be more effective if they join existing community organizations or NGOs.

COMPLICATING PERCEPTIONS OF ARTISTS' ROLES IN RACIALIZED COMMUNITY DEVELOPMENT
Abstract ID: 1085
Individual Paper Submission

SLOANE, David [University of Southern California] dsloane@usc.edu, presenting author
SHANNON, Brettany [California State University at Northridge] brettany.shannon@csun.edu, co-author

Problem Statement

In much of the literature around gentrification and community development, artists' presence is linked to the arrival of art galleries and related commercial enterprises to poor and minority neighborhoods, creating creative beachheads to promote growth and "diversity," yet largely understood as attracting a wealthier population to the neighborhood. Critics have even coined a term, "artwashing," during which capital forces use artists as pioneers in their efforts to erase neighborhoods (Deutsche & Ryan 1984; Ley 2003; Ocejo 2015; Smith 1996; Zukin 2010; Pritchard, 2017).

Our paper reverses this depiction by presenting a case study of two Los Angeles-based social practice artist collectives. Slanguage and Public Matters self-consciously engage and collaborate with young residents of Wilmington and East Los Angeles to proclaim their identities, embrace their neighborhoods and local histories, and – perhaps above all – resist efforts to erase them; examples of what we term equitable creative placekeeping. These artists move our analysis of gentrification beyond Brown-Saracino's (2010) helpful categories because instead of being pioneers or even social preservationists, Slanguage and Public Matters are supportive placekeepers attempting to help develop a community's voice in response to environmental injustices, social and political erasure, and racism (Bedoya, 2014).

We study these two collectives because they share common principles, yet position themselves and their

practices differently. Slanguage are Latinx, and work in the same neighborhood where one of them was born and raised. Conversely, Public Matters is not residents of East Los Angeles, and are not Latinx. Slanguage simply opened its storefront and assumed a provisional approach to teaching neighborhood youth how to make art and voice their emotions and concerns. Public Matters teaches through the institutional link of the East Los Angeles Renaissance Academy (ELARA), one of the nation's three high schools with a focus on urban planning.

However, they both adopt socially engaged art (SEA) practice as their mode. Socially engaged art emphasizes collaborative authorship, discourse, place, and social context, and a "critically self-reflexive dialogue with an engaged community" (Helguera, 2011, p. 12). They reject efforts to bind their activities to familiar art-based community development that favors capital over community.

Methods

This qualitative study utilizes two in-depth interviews with four socially-engaged artists in the Los Angeles region. Wilmington and East Los Angeles are both communities with a very high Latinx population and very poor. Both communities confront environmental injustices. Wilmington lies in the shadow of the LA Port, while four freeways crisscross ELA. Information on the communities was researched through local archives and newspapers, as well as ephemera provided by the artists.

The artist and collaborator Anne Bray conducted the two interviews that ran between 6 and 8 hours. Shannon transcribed and coded them using Atlas.ti. Both authors contributed to the conceptualization and writing. The codes were used to categorize the artists' backgrounds, approaches to art, relevant projects, networks and relationships, styles of engagement, and their efforts to use their art as equitable creative placekeeping.

Results

The artists are not shaping neighborhood culture, but rather offering a set of skills so the community's younger generation can build self-consciousness and generate its own identity. Public Matters conducted projects with ELARA's staff and students created 3-dimensional maps of key arterials around the high school where students highlighted dangerous intersections and offered planning solutions.

Slanguage's open door through which local youth pour creates a different set of outcomes. Wilmington is the kind of oppressed Latinx community where art is not supported, and art outside the mainstream galleries is not art. Slanguage reverses such understanding by offering space for youthful graffiti artists, graphic designers, skaters, and others to advance their skills, creating art everywhere.

GREEN AND BLUE SPACE JUSTICE INITIATIVES: THE EXPANSION OF NONPROFIT MODELS IN CALIFORNIA.

GIBSON, Stephen [Pepperdine University] stephen.c.gibson@pepperdine.edu, presenting author
RIGOLON, Alessandro [University of Utah] alessandro.rigolon@utah.edu, co-author

Collaborations among park-based nonprofits and public agencies in environmental justice (EJ) initiatives are on the rise. These initiatives are aimed at increasing access and use of Green and Blue Spaces (GBS) by underserved individuals and groups. The increasing involvement of nonprofits stems from a gradual reduction in public spending due to neoliberal approaches to governance and more recently, through heightened advocacy toward EJ goals (Anguelovski, 2015; Rigolon, 2019). Previous research has shown advancement of EJ pursuits for GBS, including efforts to engage marginalized groups in decision making (procedural justice) and recreation programs to ensure these groups can visit GBS and feel welcome in those settings (interactional justice; Loukaitou-Sideris & Mukhija, 2019; Rigolon, 2019). Yet there is limited research to date investigating the influence of externalities (unexpected external influences - positive or negative - on the roles and strategies of the GBS nonprofit, for example, coalition membership or change in park policies or funding measures) on these advancements.

Building on our previous work (Gibson, Loukaitou-Sideris, & Mukhija, 2018; Rigolon, 2019; Rigolon & Gibson, 2019), in this project we explore the interactional and procedural justice roles and strategies of GBS nonprofits in California, a progressive state known for various EJ victories in recent years (Rigolon, 2019). We seek to answer the following questions: 1) How have GBS-supporting nonprofits evolved in their justice pursuits since their inception? And 2) How have GBS-supporting nonprofits experienced externalities during this evolution and how have they responded to them?

To determine catalysts in GBS nonprofit roles and strategies, we conducted interviews with staff members of GBS nonprofits working to increase interactional and procedural justice among underprivileged communities in California. First, we conducted semi-structured interviews with 22 individuals representing 17 nonprofit organizations to determine the scope of work, perceived roles, and strategies used toward achieving justice outcomes. Second, we revisited (3-5 years later) GBS nonprofits previously interviewed to investigate if roles and strategies had changed since the first interviews or since the inception of the GBS nonprofit.

Interviews revealed that fundraising and sponsorship is a common struggle that nearly all nonprofits engage in as they amalgamate funding and supplies from various individual and corporate sources and public agencies. Further, nonprofits working to foster procedural justice for GBS through advocacy use several complex strategies to influence public policy change and generate funds for GBS. Those strategies include forming coalitions for specific campaigns, completing demonstration projects that can be scaled up to many other sites, and conducting and reporting research on GBS-related issues that are pertinent to public policy and urban planning.

Additionally, we found that impactful procedural justice efforts can be achieved with limited funds, which enables small neighborhood organizations to be important actors in local and statewide conversations on policy change and park funding. Also, public agencies provide small nonprofits with the funding to conduct community outreach work for the design and planning of GBS.

Our findings suggest that public agencies that collaborate with nonprofits generate a supportive, inclusive, and cohesive community environment in support of GBS. These community outreach efforts also contribute to parks and open space that reflect the cultures of marginalized communities, or that "fit" with the needs and histories of those communities (Gibson et al., 2018). Thus, procedural justice efforts that empower marginalized groups to build parks also contribute to advancing interactional justice by creating places where such groups can feel welcome and recognized. Public sector planners must recognize the potential of collaborating with EJ-focused nonprofits to achieve equity goals for GBS and beyond. And other states could consider following California's lead in providing these nonprofits with the necessary support to build more equitable communities.

THE CHANGING FACE OF KOREATOWN, LOS ANGELES: AN ANALYSIS OF COMMERCIAL GENTRIFICATION WITH AN EQUITY LENS
Abstract ID: 1108
Individual Paper Submission

SUNG, Seyoung [Portland State University] seyoung@pdx.edu, presenting author

Koreatown is one of the most well-established immigrant communities in Los Angeles. Besides its proximity to downtown, easy access to transit, and relatively affordable rents compared to close neighborhoods, this multiracial and multi-class community boasts its authentic and vibrant commercial strips enough to become a playground for hipsters and paradise for foodies. Once Koreatown was a haven for immigrants, now it has become the most populated and desirable neighborhood in LA along with the increased risk of gentrification and displacement. The overwhelming development boom for upscaling the housing and retail in Koreatown exacerbate the vulnerability of the very marginalized groups in the community.

Vibrant retail corridor with local small businesses such as mom-and-pop stores certainly contributes to defining the cultural and social identity of a community, especially an immigrant community (Gandhi and Minner, 2017). Further, immigrant communities have long served a hotbed of small businesses of immigrant entrepreneurship, as those have been the frequent employers of immigrants (Rankin and McLean, 2015). If gentrification happens in the immigrant communities of color, it may hit the communities harder than others by disrupting the cultural and social identity of the communities (Rankin, 2008).

However, a limited amount of previous research examined the gentrification in Koreatown focusing on socioeconomic and housing shifts. In order to better understand gentrification dynamics in Koreatown, this research aims to delve into the trajectory of commercial activity in order to better address the particular vulnerability and precariousness of marginalized groups to gentrification and displacement. Applying a mixed-method research approach, this research asks the question: what are the trends and patterns of commercial activity changes in Koreatown under the gentrification and displacement risks?

First, the study explores the trends and patterns of small businesses and commercial development in Koreatown from 2010 to 2019 by utilizing NETS and ReferenceUSA data. Focusing on the small businesses for the retail and food industry, the data analysis finds whether small businesses have become more precarious under the gentrification and displacement risks. Next, the research deploys the field observation as a ground-truthing exercise to capture a detail showing the signs of gentrification and

displacement in Koreatown at the street and block level. Through the field observation, the study will examine the commercial gentrification in more detail by identifying the changes in services and goods of retails.

The findings of this case study will highlight the importance of incorporating commercial and retail activity along with the housing market activity for neighborhood change analysis, especially when examining the Asian immigrant communities. In addition, the study will demonstrate how a ground-truthing exercise can improve the gentrification analysis with regards to better capturing and predictability for the Asian immigrant communities.

ENCOURAGING PRESERVATION ACTIVITIES IN LOCAL HISTORIC DISTRICTS: AN ANALYSIS OF INCENTIVE PROGRAMS IN US CITIES
Abstract ID: 1155
Individual Paper Submission

CHOI, Sunho [University of Washington] sunhoch@uw.edu, presenting author

Historic district is a representative preservation tool to maintain a neighborhood's overall charcteristics, called *tout ensemble*. According to its main agent, historic district is divided into the National Register and locally designated historic district, which have some differences in its roles (Hamer, 1998). The National Register historic district is an honorary designation accompanied by protections from federal projects and eligibility for historic tax credits. On the other hand, as "the first line of defense at the local level" (Stipe, 2003), local historic districts impose regulations on properties and request design review processes managed by a local preservation board. These stringent regulations and bureaucratic processes over local historic districts arouse widespread resistance to district designation from residents (Shipley et al., 2011). The adoption of incentive programs is a way to divert this opposition as well as to promote rehabilitation or restoration of historic properties (Tyler, 2000). Yet, there is little research about preservation incentives, especially about their features and impacts at the local level (Ryberg-Webster, 2017). To fill this gap, this study investigates how incentive programs in twenty-five US large cities encourage preservation activities in local historic districts.

Exploring local preservation ordinances, zoning codes, and other administrative data on incentive programs for locally designated historic districts, this research focus on two aspects: general features of incentive programs and their contributions to preservation activities. First, I categorize each municipality's programs into financial incentives (easement, fee exemptions, grants, and tax credits/abatements) and planning ones (code relief, incentive zoning, and transfer development rights). This categorization allows me to compare how each municipal government's programs are different in features such as rewards, eligible works, and qualifications. Second, this study examines the overall

characteristics of preservation projects in local historic districts, supported by municipalities' incentive programs for the last ten years (2010-19). The analysis of these projects evinces incentive program's contributions to management and improvement of historic properties in the districts.

Preliminary findings show that most of the municipalities don't adopt sufficient incentive programs to mitigate the opposition against local district designations and to facilitate preservation activities. They generally administer one or two incentive programs, which are mostly tax credits/abatements in financial incentives and code reliefs in planning ones. Although only a few local governments develop grant programs for rehabilitation, restoration, and maintenance of historic properties in local districts, eligible works or qualifications to receive rewards are very limited. This study also finds that financial incentives contribute more to encouraging preservation activities than planning ones. These findings provide insight into policy implications for the management of local historic districts and the development of local preservation ordinance.

COMMUNITY BENEFITS AGREEMENTS (AND DISAGREEMENTS) IN THE ANTI-DISPLACEMENT TOOLBOX
Abstract ID: 1161
Individual Paper Submission

GOLDMAN, Laurie [Tufts University] laurie.goldman@tufts.edu, presenting author

Community benefits agreements (CBAs) are gaining in popularity as a tool for ensuring that transit-oriented and other large-scale development projects yield lasting benefits for residents and small business owners who are vulnerable to displacement. These binding contracts between private sector developers and community groups can result in affordable housing, job opportunities, small business supports, green and open space, sustainable building, and other benefits (e.g., Basamusa 2008). Moreover, they have mobilized broad coalitions around a common anti-displacement agenda (Belongie and Silverman 2009; Jansenn-Jansen and van der Veen 2017).

Yet CBAs are notoriously difficult to negotiate and enforce (Marantz 20015). Contract terms may deliver only small gains over what can be achieved through zoning and local ordinances (Marantz 2015). Groups ostensibly representing the entire community may be coopted by self-serving interests and they depend on local government support which may or may not be forthcoming (Wolf-Powers 2010; Rosen and Schweitzer 2018).

This paper addresses the potential and limitations of CBAs in the context of a 15 acre transit-oriented development project in Somerville, MA, a working-class city of immigrants already undergoing rapid gentrification and displacement. The case study analyzes six years of community organizing and

advocacy leading up to the negotiation and ratification of a CBA that promises to deliver approximately $20 million of affordable housing, job training resources, small business supports, green and open spaces, and public art investments as well as commitments to local hiring, labor-friendly construction contracts, and sustainable building designs. While these gains are substantial, they represent significant compromises and questions remain about its long-term enforceability and the momentum of the anti-displacement movement.

Analysis of documents from the elected neighborhood council, a grassroots coalition, resident and labor groups, and city-appointed advisory committees as well as testimony from hearings, local media coverage, and interviews with key stakeholders supplement participation observation throughout the campaign.

This account is distinctive because it illuminates how concurrent advocacy to enact city-wide inclusionary zoning and affordable housing and job training linkage fees along with organizing to elect progressive city officials can influence the CBA negotiation process and the terms of the contract.

Findings also affirm the significance of local government in both enabling and constraining CBA negotiation and implementation.

Involvement of multiple types of community groups over the course of the CBA campaign affords analysis of dynamics of legitimacy and power and tensions between inclusion and marginalization among stakeholders with diverse backgrounds, experience, and expertise.

The case study also underscores the importance of organizational capacity to sustain community engagement, access legal and other expert advice, and provide facilitation and coordination supports for over-extended volunteers.

Together, these insights contribute to the emerging discourse on CBAs and they provide useful guidance for community activists and local planners considering adding CBAs to their anti-displacement toolbox.

URBAN SCHOOL DISTRICTS AND NEIGHBORHOOD DEVELOPMENT: COLLISIONS, CONSEQUENCES, AND OPPORTUNITIES FOR COORDINATION
Abstract ID: 1167
Individual Paper Submission

MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, presenting author

This study explored neighborhood change in relation to school changes in two U.S. cities, Oakland, CA and Denver, CO. The goal was to identify the direction and timing of these interactions and the subsequent effects on families and schools in order to pinpoint potential policy adjustments to school district's choice systems, school budget allocations, and facilities plans, and city policies for development approvals, neighborhood planning, and affordable housing.

The study used detailed longitudinal spatial and statistical data on schools and neighborhoods (census tracts), as well as interviews with parents, school staff, and neighborhood organizations to test and explain the relationships among changes to neighborhoods, including total population, household types, racial and ethnic composition, housing units, and housing tenure, and changes to schools, including quality rankings, enrollment, opening, closure, and reconstitution. Both cities saw rapid school development sparked by open enrollment and charter school policies at the same time many of their neighborhoods were experiencing gentrification and displacement. While the cities have somewhat different demographics, as well as different regional and state contexts for education funding, the statistical relationships between neighborhood changes and school changes were similar. Schools in neighborhoods with increases in total population, family households, housing units (both rental and owner units), and percent white residents increased their ranking. Schools in neighborhoods with increases in Hispanic residents and families with low incomes, saw declines in their rankings. Neighborhoods with increases in white households without significant increases in rental and ownership housing eventually had school rank increases but lost black residents and students in the interim. Neighborhoods with high levels of development also had more charter school openings, which sometimes threatened the existing schools' enrollment and funding levels. Neighborhoods with high percentages of black residents saw little new development and little to no change in school rank. Qualitative data reveal that displaced families, largely families of color, attempted to remain in their former neighborhood schools until the travel from their new neighborhood was too burdensome, the school was closed, or the student body changed.

The data reveal nuanced and temporal interactions between the number and type of new residents and housing units in a neighborhood and the change in the neighborhood school's enrollment, demographics, quality rankings, classroom resources, and "branding". When neighborhood demographics change, without sufficient increases in families with children and the number of housing units, or city policies to prevent displacement and school policies to support existing students at risk of displacement, families and students are at first displaced from the neighborhood and then from their school. Neighborhoods with little new development and high shares of minority residents often experienced declines in their school's enrollment, since students can go elsewhere, and seemingly less investment from the school district or charter schools. The study suggests policies for city planners, community development organizations, and school districts to manage the constant and rapidly changing landscape of school choice, housing markets, and neighborhood gentrification. Before approving new traditional or charter schools or making major changes to existing schools, school districts should study the housing situation of their at-risk families and run scenario analyses on the effects of their changes on school and district resources, both in gentrifying neighborhoods and neighborhoods with little change. City planners should study how changes to the zoning code and comprehensive or subarea plans will affect the housing stock and the incomes of families with school-aged population. The two entities also should compare and coordinate results in order to avoid and mitigate negative impacts on urban families and public school resources.

IMMIGRANTS' ATTITUDES TOWARDS NEIGHBOURHOOD AMENITIES THAT SUPPORT SOCIAL PARTICIPATION: A QUANTITATIVE EVALUATION OF PREFERENCES IN METRO VANCOUVER
Abstract ID: 1185
Individual Paper Submission

EBNESHAHIDI, Marjanossadat [University of British Columbia] marjan.ebneshahidi@gmail.com, presenting author
SENBEL, Maged [University of British Columbia] maged.senbel@ubc.ca, co-author
FOROUZANDEH, Peyvand [University of British Columbia] peyvand@alumni.ubc.ca, co-author

Background: Recent critical theories pertaining to cultural diversity and immigrant experiences have focused on spatial, ethno-racial and social inequality experienced by ethnic groups and immigrants, and acknowledged that the immigrant population might have some barriers and challenges to community engagement and cultivating social activities and networks in the host countries (Couton & Gaudet, 2008; Kazemipur, 2012; Hurtado-de-Mendoza. Et al, 2014). In addressing these challenges planners may seek to better understand the needs of immigrants and explore how immigrants experience social isolation in residential neighbourhoods, what social supports they need, in what social activities they are involved, and how they can be integrated into new communities (Ajrouch, 2008; Guo & Guo, 2016). This study sought to address the question of how socio-demographic factors and preferences for neighbourhood amenities are associated with social participation of immigrants and examined the strength of relationship between those variables, sense of belonging and social connections, and their engagement in social activities.

Materials and methods: We conducted an online survey in Metro Vancouver region from January 2019 to October 2019. Our sample was comprised of 164 recent and long-time immigrants living in different neighbourhoods. In this study, social participation measured by the frequency of 4 activities at the neighbourhood-level, including art, music, literature or hobbies, sports or recreational, religious, and neighbourhood or community activities. To find differences in social participation and preferences for neighbourhood amenities (recreation or community centers, libraries, places of worship, and public spaces for gather) between male and female immigrants, we used a Mann-Whitney U test. A Spearman's rank correlation coefficient helped us discover the relationship between social participation, preferences for neighbourhood amenities, and age, length of stay, education level, and English proficiency. Additionally, a binary logistic regression model was used to determine the effect of sense of belonging, the importance of proximity to public services, and having social connections with neighbours on the likelihood of immigrants' social participation after adjusting for selected demographic variables.

Results and contribution: A basic descriptive analysis shows that the highest proportion of immigrants were engaged in neighbourhood or community activities. In general, our findings highlight the relative importance of socio-demographic factors for social engagement of immigrants and their preferences for some neighbourhood amenities. Besides, the results indicate that social participation is correlated with the preference for some social spaces in residential neighbourhoods. The logistic regression also illustrates that although neighbourhood amenities can support social activities of immigrants, some personal and social factors such as gender, social connections with neighbours and a sense of belonging are stronger predictors for immigrants' social participation. Clearly, the results of this study will be of interest to (1) scholars who study immigrant social engagement (2) social and physical planners (3) policy makers at municipal and provincial levels who set policy about community support services. These results help planners identify the barriers to immigrant engagement and promote social inclusion of immigrant communities, and design welcoming neighbourhoods for them.

BUILDING SPATIO-TEMPORAL COMPARISONS: GENTRIFICATION AND HEALTH FROM THE NATIONAL TO THE NEIGHBORHOOD LEVEL
Abstract ID: 1193
Individual Paper Submission

SPURLOCK, Danielle [University of North Carolina at Chapel Hill] dspurloc@email.unc.edu, presenting author

A substantial body of literature links neighborhood conditions to health outcomes (Diez Roux & Mair, 2010; Kawachi et al., 2009), but the relationships among gentrification, displacement and health remain unclear. This uncertainty stems, in part, from challenges to measurement: the definition and presence of gentrification, geographic scale, and time (Tulier, Reid, Mujahid, & Allen, 2019). The dynamic nature of gentrification complicates its definition although considerable scholarship exists using existing data sources (Ding, Hwang, & Divringi, 2016; Freeman, 2005). Data availability shapes the geographic scale at which many studies occur, which can present a modifiable areal unit problem. The uneven progression of gentrification and displacement confounds the linkage between exposure and health outcomes measured at the individual level. In short, despite the central roles gentrification, displacement, and health disparities play in urban policy discussions, we need considerable research to clarify relationships among these topics. In this study, we explore datasets linking gentrification and health at the national, state, city, and neighborhood level over time.

We will integrate an existing dataset with national, state, and city data with local findings on gentrification and health. Our previous work created a database linking gentrification indices at the census tract to the CDC's 500 Cities: Local Data for Better Health, and the U.S. Small-area Life Expectancy Estimates Project–USALEEP. We operationalized gentrification using approaches developed by Freeman (2005) and Ding, Hwang, and Divringi (2016). CDC's 500 Cities dataset contains data for 27 measures of chronic disease related to health behaviors, health outcomes, and use of preventive services and the USALEEP dataset (also known as the Neighborhood Life Expectancy Project) provides life expectancy at birth for most U.S. Census tracts for the period of 2010-2015.

In collaboration with Communities in Partnership, a nonprofit based in Old East Durham, and community residents, we will conduct a second round of a door-to-door household survey stratified by type of housing tenure (i.e., tenancy versus owner-occupied) using community based participatory methods in April 2020. The previous survey of 120 household (~12% of the neighborhood) in April 2018 will allow us a second point in time. Both surveys include questions on housing affordability, attitudes, and beliefs

about displacement and/or the threat of displacement, and self-reported health status and behaviors.

By utilizing two similar but different definitions of gentrification, exploring multiple geographic scales including a sub-census tract neighborhood, and measuring health outcomes at multiple points, we hope to build on the literature linking gentrification and displacement to health and continue the dialogue between community stakeholders and decision makers on the topics on disinvestment, gentrification, and displacement and the social determinants of health

COMMUNITY AND WORKER EXPERIENCES IN THE AMERICAN SOUTH'S GROWING MANUFACTURING INDUSTRY
Abstract ID: 1205
Individual Paper Submission

ERICKSON, Emily [Alabama A&M University] Emilyerickson@gmail.com, presenting author

Planners and economic development officers across the American South have spent recent years smokestack chasing, offering billions of public dollars incentives for manufacturers to open plants in the region. Companies are drawn by these incentives, the region's business-friendly policy environment, access to local markets, and weak environmental and worker protections. Despite decades of literature questioning the effectiveness of business attraction policies (Logan and Molotch, 2007; Chapple, 2012; Boothroyd and Davis, 1993, Rubin 1988, and Perry 1989), the promise of job creation remains politically popular in a region with some of the nation's highest poverty rates and continued legacies of racial inequality. There has been a substantial level of success in attracting manufacturing firms to the region. Last year Alabama was the largest single recipient of foreign direct investment – mostly in transportation-related manufacturing, and manufacturing employs fourteen percent of the population (Alabama and Mississippi). Aside from broad measures of poverty and unemployment rates (both of which remain high), there are few studies of manufacturing workers and communities in the American South.

This paper addresses this gap, presenting new data from the Southern Manufacturing Study, which surveyed community members and manufacturing workers at sites across Alabama and Mississippi. The paper addresses three broad questions (1) how are workers faring in these manufacturing plants, (2) what are the tradeoffs for local communities hosting manufacturing plants, and (3) are the opportunities and costs equitably distributed across racial and ethnic groups? Answers to these questions will provide valuable insight for planners, policymakers, and communities seeking to ensure equitable community economic development. The paper concludes with a discussion of the potential of job-quality and economic justice related community economic development strategies to ensure equitable distribution of

opportunity for southern workers and communities in an industrial South.

NEIGHBORHOOD SOCIAL TIES, SOCIAL CAPITAL AND SELF-RATED MENTAL HEALTH: COMPARING MIGRANTS AND LOCAL RESIDENTS IN BEIJING
Abstract ID: 1232
Individual Paper Submission

WANG, Xiaomeng [Tsinghua University] wangxm18@mails.tsinghua.edu.cn, presenting author
ZHOU, Peiling [Harbin Institute of Technology (Shenzhen)] lindaplzhou@gmail.com, primary author
LIU, Zhilin [Tsinghua University] zhilinliu@tsinghua.edu.cn, co-author

The mental health effects of neighborhood social capital has been widely recognized by both public health and community development scholars (DeFilippis, 2001; Kawachi & Berkman, 2001). Social ties developed within the neighborhood, along with the resources and leverage embedded in the network, provide critical social support for disadvantaged populations, leading to various mental health outcomes (Carpiano, 2006). In the meantime, Strong neighborhood ties may also create a perception of strong neighborhood social cohesion (e.g. trust, common values, norms of reciprocity) that affects mental health. Nevertheless, community development literature also widely documented potential negative effects on the upward mobility and well-beings of disadvantaged populations such as the urban poor and immigrants, suggesting a potential negative mental health effect of neighborhood social capital. Recent studies of the mental health of rural-to-urban migrants in Chinese cities also suggested that neighborhood environment – including social environment – may pose different mental health effects on local residents and migrants (Wen, Fan, Jin, & Wang, 2010).

Using data from a large-scale questionnaire survey conducted in 26 neighborhoods in Beijing, this study examines the mental health outcomes of neighborhood social capital in urban China. In particular, we investigate the extent to which different forms of neighborhood social capital (cognitive neighborhood social cohesion, neighborhood social support, informal control, and neighborhood participation) may predict the self-rated mental health of residents, and how such effects may differ migrants and local residents. Preliminary findings indicate that whereas cognitive neighborhood social cohesion and neighborly social support may promote mental health for both local and migrant residents, neighborhood social ties may only possess social capital and promote mental health status for local residents.

This research contributes to the ongoing debate on the effects of neighborhood-level social capital on mental health for different social groups. Also, this research highlights the importance of neighborhood social capital in maintaining residents' mental well-being.

TRANSFORMATIVE STRATEGIES FOR COMMUNITY LAND: PARTICIPATORY COMPREHENSIVE PLANNING, INSIDE/OUTSIDE PARTNERSHIPS, AND COMMUNITY FINANCE
Abstract ID: 1240
Individual Paper Submission

SHATAN, Nicholas [Massachusetts Institute of Technology] nshatan@mit.edu, presenting author
WILLIAMS, Olivia [Independent scholar] oliviareneewilliams@gmail.com, co-author

Community land trusts (CLTs) are an increasingly common response to a racialized gap in ownership of land and wealth, a lack of democratic control over what happens on urban land, and an increase in the power of extractive finance to determine development patterns. While there is a traditional CLT model based in tripartite board governance, ground leases that insulate land from the speculative market, and permanent housing affordability, there is increasing variation in their actual practices as the number of CLTs rises rapidly, with over 280 across North America. This swift growth and mainstream acceptance can come at a cost. CLT organizations that become increasingly focused on professionalized housing development have tended to lose some of the original intentions of the model, including community control and decommodification of land. The CLT model, on its own, is not inherently transformative (DeFilippis et al. 2019).

This paper uses this framework of transformative politics, defined as those that aim to subvert and dismantle the existing power structure, to understand community land organizations emerging at this inflection point for the CLT movement. This paper asks: what common understandings, strategies, and practices are organizations developing and implementing to advance transformative community control of land? We also address select corollary thematic questions: Following a thread of solidarity economy research, how can organizations scale without losing their democracy? How can CLTs overcome reliance on external funding that can compromise their values? What role does participatory planning play for CLTs that either continue to focus on housing or are expanding beyond housing? To answer these questions, we interviewed practitioners and activists in newer community land organizations oriented towards political transformation, racial justice, and economic democracy around North America, and reviewed the documented visions and practices of dozens more such organizations. We also triangulated these sources with our own in-depth participation in the launch of a new CLT in the Bronx, New York.

 This paper finds that the recurrent practices and strategies of transformative community land organizations fall into three categories: participatory comprehensive planning and site visioning, strong partnerships both inside and outside the traditional power structure, and community equity and cooperative finance models. We also find that their community engagement practices often center intergenerational political education on the CLT model and its relationship to solidarity economy and housing movements. Participatory comprehensive plans and site visioning exercises emerge as one potential practice to maintain democratic accountability on the path to scale. These findings are relevant for planners and educators who are invested in the transformative potential of the CLT model and are seeking emerging examples to learn from and to adapt. We hope this work informs further investigations and initiatives that integrate economic democracy and racial justice into community development and land use planning.

ASSESSING EQUITY IN THE ACCESS TO CULTURAL OPPORTUNITIES IN SEATTLE'S MUNICIPAL AREA
Abstract ID: 1256
Individual Paper Submission

TOBEY, Michael [University of Washington] mbtobey@gmail.com, presenting author
COSTA, Ana [University of Washington Seattle] anacosta@uw.edu, co-author

Equitable access to urban places is a key issue in planning and often examined using jobs, homes, parks, food outlets, and care facilities as destinations. However, cities are also engines of culture and places of community, requiring a broader perspective on accessibility to spatially scarce resources such as museums, libraries, and creative spaces. Our paper analyzes how Seattle's public and private cultural facilities (assets) are spatially distributed. Specifically, we investigate whether proximity and access to cultural facilities significantly differed between different socioeconomic groups. Our hypothesis is that such difference exists and that the spatial distribution of cultural facilities is not equitable, favoring those most historically privileged in American cities: the White and middle- to high-income sectors of the population. We looked at cultural facilities located in the city of Seattle both as a whole and via their dominant use categories. Five dominant uses (education, entertainment, art, identity & advocacy, and other) were considered. Accessibility to each location was assessed using two modes of transit, bicycling and walking, tied to the transportation network using GIS network analysis. Census tract and block group level data by race and income were integrated with the network analysis to identify which socioeconomic groups were most correlated with proximity to cultural facilities. Accessibility scores were calculated as the deviations of each asset's catchment area's income and racial distribution from the overall income and racial distribution of Seattle. We found that there was a relationship between the location of cultural assets and the socioeconomic characteristics of residents living within walkable and bikeable distances, but not most strongly with White and middle- to high-incomes. When income is examined alone, we found across all metrics, modes, and distances that households with income lower than $10,000 were consistently overrepresented, with the lowest accessibility scores amongst the wealthiest groups. When extremes were not considered, distance scores tended towards a more homogeneous distribution, with values close to Seattle's overall distribution. When assessing accessibility by race at the block group level, people who self-identified as White alone had the lowest walkability scores for short distances. However, for biking and longer walking distances, this group frequently had the best scores. For short walking distances Asians typically had the highest scores. Blacks consistently had the worst scores across all distances. Combining race and income revealed additional insights. While Blacks had predominantly the highest accessibility at the lowest income level, they had the worst accessibility scores across other low- to mid-income categories. This shows an equity gap for Blacks, to whom cultural assets are not as accessible as for other racial groups. Identity & advocacy assets showed the most heterogeneous distribution across the different groups of household income by race. Positive scores significantly higher than Seattle's distribution were found for every racial group at low- and mid-income levels. This may show that identity and advocacy institutions tend to intentionally place themselves in proximity to a variety of socioeconomic groups that need access to resources and services. While the past decades have

broadened what is included in the analysis of resource accessibility in urban areas, there is still a dearth of studies on how cultural assets are distributed across different income and racial groups. Our study seeks to contribute to this debate and inform policy discussions regarding equity in cities by expanding accessibility considerations through the inclusion of cultural and community focused elements. Future research will investigate how the distribution of cultural facilities pertains to the demographic and socioeconomic patterns that emerge from the real estate market.

COMMUNITIES LEFT BEHIND? EXAMINING THE SCOPE OF, AND DECISION-MAKING PROCESSES UNDERLYING, PUBLIC SCHOOL CLOSURES IN ONTARIO, CANADA
Abstract ID: 1273
Individual Paper Submission

COLLINS, Patricia [Queen's University] patricia.collins@queensu.ca, presenting author
IRWIN, Bill [Huron University College] birwin6@uwo.ca, co-author

Public schools are more than educational institutions; they are public assets that are essential to healthy, sustainable, and complete communities [1-3]. Yet, public schools are being permanently closed across Canada, particularly within the province of Ontario, owing to declining student enrolments, aging school infrastructure, and reduced government funding. For over a decade, school closure decisions in Ontario have been directed by the provincial government's pupil accommodation review model [4]. This model has been roundly criticized for prioritizing economic efficiency to the benefit of school boards, while failing to consider the broader impacts of school closures on the households and communities served by these schools. In turn, school closure decision-making processes have led to atmospheres of conflict and resentment, and feelings of powerlessness within affected communities [5].

Despite the turmoil that school closure decisions often generate, little is known about the characteristics of communities in which school closures tend to occur, or of complexities and dynamics that underlie these challenging decisions for school boards. This study aimed to address these knowledge gaps through two objectives: 1) to evaluate the scope of public school closures in Ontario, and the nature of the communities in which these closures have occurred; 2) to explore the dynamics of school review processes as employed by two selected public school boards in Ontario. Using GIS, the first objective involved a socio-spatial analysis of the socio-economic and geographic profiles of communities in which school closures have occurred in Ontario since 2010. The second objective was addressed through roughly 25 semi-structured key informant interviews with school board trustees, city councillors, municipal staff members, former teachers, and school advocates, from two school board districts in Ontario.

Our study found that, since 2010, 354 public schools in Ontario were permanently closed. When compared with the locations of open schools, closed schools were more commonly located in small- to

mid-sized cities, as well as rural communities. Closed schools were also more commonly located in communities with high levels of material and social deprivation, relative to the characteristics of communities in which schools remained open. These findings have important equity-related implications for the communities left behind, since their limited resource base and high concentrations of vulnerable populations pose even greater challenges for residents dealing with the loss of these critical public assets. Analyses of the current use of these closed school properties, which is underway, will offer additional context regarding the extent to which these former school sites are serving residents in meaningful ways, as the public schools on these sites once did.

Our key informant interviews revealed a range of complex and competing priorities and interests that underlie the decision-making processes surrounding school closures. Emergent themes from the interviews included a lack of transparency in the boards' decision-making process; an over-reliance on flawed and highly technocratic analyses by external consultants; and a lack of long-term planning in coordination with municipal planning departments. Intensive analyses of these interviews are underway, and the findings will highlight opportunities for enhancement in the school closure decision-making process for public school boards in Ontario.

It is well established within the field of planning that public schools are essential elements of complete and sustainable communities. Thus, the ability of public school boards to unilaterally decide on the fate of these public assets undermines the goals of community planning. More collaborative decision-making processes that meaningfully engage with municipal planners, residents, and other local stakeholders are urgently needed to ensure that complete and sustainable communities are prioritized and protected, in Ontario and elsewhere.

#THEHOODISNOTFORSALE: COLLECTIVE IDENTITY AND HOOD SOLIDARITY IN THE GENTRIFICATION DEBATE IN BOYLE HEIGHTS AND BEYOND
Abstract ID: 1348
Individual Paper Submission

HERNANDEZ, Ashley [University of California, Irvine] ashleych@uci.edu, presenting author

The Boyle Heights neighborhood of Los Angeles has become a battleground of intense anti-gentrification activism and resistance against displacement carried out by neighborhood organizations. One group of neighborhood organizations is made up of self-proclaimed radical grassroots organizations who forcefully engage in the gentrification debate with insurgent planning (Miraftab 2009) and high-risk direct action to push their anti-gentrification politics and target gentrifiers (e.g. coffee shops, galleries) online and offline. Their goals lie outside traditional channels of local politics and market driven urban development as they demand direct democracy in urban planning. The insurgent groups even target non-profit neighborhood organizations, claiming that they promote gentrification.

Organizations and activists that engage in high-risk activism and rely primarily on the support of a marginalized grassroots base are typically thought of as being less centralized and struggle for resources compared to their non-profit counterparts who often depend on traditional political structures and elite donors. Such conditions can lead to greater instability, barriers in achieving sustained mobilization, and cause group fragmentation over time. Yet, the ongoing anti-gentrification activism coming from radical grassroots organizations suggests otherwise. They continue to mobilize and foster unity with other like-minded groups within and outside of Boyle Heights around a collective political identity rooted in hood solidarity. This research focuses on the discursive mechanisms used by autonomous grassroots organizations in Boyle Heights to develop a collective identity and strategy against gentrification and the hostile conditions it creates for working-class residents in the city. As demonstrated through this case, symbolic boundaries and frames are used together to articulate a global sense of place for working-class residents (Massey, 1991) and a larger call to action against capitalist urban development that distinctly separates them from others in the neighborhood.

Using Facebook and interview data collected from local activists, this research focuses on the iterative framing processes in developing a collective identity. Such processes help activists interpret the threat of gentrification, construct meaning around threat through networks, and maintain a sharply defined identity. As demonstrated through this case, framing and identity formation occur through activist interactions both online and offline.

PREDICTING BLACK OUTMIGRATION IN THE AMERICAN METROPOLIS
Abstract ID: 1373
Individual Paper Submission

SNIDAL, Michael [Columbia University] mjs2267@caa.columbia.edu, presenting author
HAUPERT, Tyler [Columbia University] th2675@columbia.edu, co-author
MAAOUI, Magda [Columbia University] mm4964@columbia.edu, co-author

Scholarly research on municipal population decline has traditionally focused on white flight and its explanations. However, municipal population decline in the US is now explained almost exclusively by a Black population exodus to the suburbs and to the South. While this shift began as early as the 1970s, the press began covering this "great reverse migration" with the release of the 2010 decennial census. Nowhere has this coverage and conversation been more salient than in Chicago, an epicenter of Black population decline. In Chicago, competing "push" explanations have been put forth to explain Black outmigration: cost of living, lack of employment opportunities, crime, schools, and segregation. However, there has been no scholarly attempt to test these explanations; to estimate the causal effect of each of these variables and understand why this exodus is occurring.

This paper seeks to answer the research question: which neighborhood and demographic characteristics are predictive of Black outmigration in Chicago? The paper explores relationships between Black outmigration in Chicago and metrics that include housing market characteristics, small business investment, crime levels, and indicators of segregation and neighborhood change. A series of multivariate regressions are run for the years 2010 to 2015, at the census-tract level, based on the hypothesis that there is a relationship between Black outmigration and these variables. Anticipated findings: based on the

broader literature investigating factors associated with neighborhood change, this study hypothesizes that housing related indicators such as per-capita foreclosure filings, residential segregation levels, and the occurrence of gentrification will most effectively predict going through Black population decline.

Understanding the causes of Black outmigration has intellectual and practical implications. It contributes to our understanding of the motivating factors of migration; and it can inform policy recommendations to jurisdictions experiencing Black population decline.

The study of collective capabilities shows the extent to which communities, with their specific cultural, political, economic and social systems contribute to freedom expansion or reduction. However the connection between community capabilities and the ecosystems they depend on has attracted less attention from the research community.

This paper describes how different contingencies (e.g. personal heterogeneity or the environment) impact the "territorial capabilities" of communities. Indeed, from a human development perspective, community well-being depends upon expanding capabilities, which depend upon Socio-Ecological Systems (SES) and their contingencies.

Over the 2017-2019 period, participatory action research was carried out in three hilltop villages in the circus of Mafate, in the mountainous heart of La Réunion Island's National Park. Village communities were observed, as well as public and private actors in charge of water appropriation and distribution in the setup of water management projects. In contrast to common practice, these projects recognized the inhabitants as experts and authorizers of the management of the resource.

In situ observations were analysed through the lenses of an SES framework based on Ostrom's institutional arrangements. The results show various phases in the adaptative management cycle of the resource by the stakeholders, which explain the process of continuous change of communities in order to adapt and exist within their SES.

Results show that community territorial capabilities are systematically related to local institutional arrangement processes. The possibilities for reorganization are linked to a "bundle of capabilities" which can translate into operating modes that respond to emergencies and local problems such as resource depletion.

Therefore, the expansion of territorial capabilities is linked to changing institutional arrangements, which

depend upon the appropriation of resources within the SES. In this sense, territorial capabilities correspond to a bundle of collective capabilities that are location-specific and defined by the milieu (SES) in which communities exist.

The combination of two theoretical approaches (capabilities and institutional arrangements) into a single analytical framework offers an integrated vision of human development, including an understanding of how living well and protecting SES equilibria are complementary.

In conclusion, analyzing the "territorial anchoring" of capabilities shows the importance of freedom with respect to environmental policies, the role of communities in the political apparatus, and the impact of cultural rights on the functioning of Socio-Ecological Systems.

LATINX INSURGENCIES: RESILIENCE THINKING AND PLANNING IN THE CITY OF CHELSEA (MA)
Abstract ID: 1393
Individual Paper Submission

RACITI, Antonio [University of Massachusetts, Boston] antonio.raciti@umb.edu, presenting author

The City of Chelsea (MA) is one of three cities in the Boston Metro Region (alongside with Lawrence and Holyoke) that are minority-majority occupied as 65.9% of the population is of Latinx heritage, primarily Salvadorian, Honduran and Puerto Rican. In the early 90s, the city went through a phase of high corruptions of public offices leading to the total bankruptcy, a major event coeval with increasing social tensions due to ethnic conflicts, street crime, and demoralized police (Chelsea 2000). This major economic and social upheaval definitely marked the urban history of Chelsea in 1991 when the state of Massachusetts legislature placed the City of Chelsea into receivership. Such a major event prompted the City and its community to engage in a process of re-imagining their future while addressing pervasive conflicts "from below" (at the community level) and "from above" (at the city level). A major milestone was the achievement of the City Charter in 1993 after a long process characterized by an exacerbated ethnic and social conflict, but also unique mediation skills used to reconcile forces from "above" and "below" (Forester 2013, Chapter 8). Lessons learned from this turning moment – still very recent in Chelsea history – are still at the basis of a public city life where non-profit organizations, citizens, and city departments try to maintain a constructive dialectical relationship to address citywide issues.

Today, increased immigration phenomena and the rise of housing prices due to the thriving of the Boston housing market are causing a new wave of upheavals: while the City and local organizations keep trying to work together, residents are struggling to have access to basic essential human needs such as food. In 2018 the Chelsea Hunger Network (CHN) Coalition established a capacity building community/university partnership (Reardon 2006) with the Urban Planning and Community Development (UPCD) Program at UMass Boston. The CHN/UPCD Partnership was born to carry out an action research project designed to generate a community food assessment as background study for the development of a community food security strategy. This research project aimed at answering the following questions: What are the structural causes of food insecurity in Chelsea? What collective efforts are currently under way to address these causes? How community-based planning can acknowledge, support, and expand those existing efforts? Findings show how the community's demand for food security in Chelsea is strictly intertwined

with current formal planning and policy decisions affecting local space, culture, economy, and governance. More specifically, findings are unveiling the more complex struggles faced by the Latinx Community to cope with uncertainty and what practices are currently undertaken to counteract its disruption.

Reflecting on those findings, this paper contributes to two main areas of planning scholarship: (1) resiliency planning (Davoudi and Porter 2012) and (2) Latinx place identity (Irazábal and Farhat 2008). In particular, it conceptualizes a form of resilience "from below" through the exploration of Latinx collective efforts trying to re-orient Chelsea's planning and policy dimensions. The paper concludes with some more general reflections on how contingent upheavals shape community reactions and how these can substantially inform resiliency-planning practices.

RURAL PHILANTHROPY: A CASE STUDY OF RURAL ENGOS AND CHARITIES IN NEWFOUNDLAND AND LABRADOR
Abstract ID: 1399
Individual Paper Submission

DEACON, Leith [University of Guelph] leith.deacon@uoguelph.ca, presenting author
IVANY, Miranda [University of Guelph] mivany@uoguelph.ca, primary author

Philanthropy in rural regions is often considered core social norm, seen in the propensity of individuals and communities to help those who are struggling (Gibson et al., 2014; Barrett & Gibson, 2013; Lorinc, 2019). While the role of philanthropic organizations within community development has been examined within the Canadian context (Gibson et al., 2014; Harrow & Jung, 2016; Jackson, 2004), little research has examined the role of 'charity' as a form of philanthropy, as well as the impacts it can have as a vehicle to address socioeconomic and environmental issues, in rural Atlantic Canada and within Newfoundland and Labrador (NL) more specifically. NL's economy has been, and remains largely reliant on natural resource extraction and the associated boom/bust cycles reduces organizations' and communities' ability to provide services or expand the scope of their social and environmental justice work (Gamble, 2014; Tomblin, 2002). Furthermore, NL has the highest charitable donor rate, and highest sense of belonging to their province and local community in Canada (Turcotte, 2015; Statistics Canada, 2015), and NL offers opportunities for philanthropic growth (Barrett & Gibson, 2013). The goal of this research paper is to contribute to the discourse on philanthropy in rural Canada and will be addressed in four objectives: (1) to map existing patterns within the landscape of philanthropy in NL; (2) to examine the nascent nature of philanthropy in the environmental sectors of NL and Atlantic Canada; (3) to examine the suitability of obtaining charitable designations for small, rural (E)NGOs.

This project, informed by grounded theory and a qualitative research approach, will explore its research objectives through: (1) a literature review and jurisdictional scan of Canadian philanthropy/rural philanthropy and; (2) a review and analysis of secondary data from the Canada Revenue Agency to measure who gives/receives within NL and Atlantic Canada.

Findings from this study may increase the presence, scope and impact of social and environmental charities in NL, enhancing relationships between governments, communities and grant-making organizations and their ability to influence the creation of good public policy and environmental stewardship in NL and Atlantic Canada.

SO LONG CHARITY! PHILANTHROPIC LENDING TO CDCS REBUILDING HISTORICALLY BLACK NEIGHBORHOODS POST-DISASTERS
Abstract ID: 1405
Individual Paper Submission

AIDOO, Fallon [University of New Orleans] samuelsaidoo@gmail.com, presenting author

After Hurricane Katrina hit the Gulf Coast in August 2005, philanthropic capital and capacity flooded the region, reshaping not only the Charity Hospital campus and Daughters of Charity medical system but also the investment practices of community foundations and public trusts that previously supported residential stabilization and commercial revitalization. Yet, planning scholarship on disaster-affected places has yet to analyze how philanthropy--from individual gifts and institutional grants to impact investing and lending--affects the rebuilding of neighborhoods and redevelopment of commercial corridors. This paper, which draws from the author's mixed-methods, multi-case study of foundations' grantmaking and lending after disasters, reveals the rebuilding of New Orleans's historically Black neighborhoods depended on construction loan guarantees from community foundations as much as government land grants.

This case study of precarity and privilege among neighborhood preservationists builds on community development literature concerned with philanthropic power over neighborhood preservation capacity (BondGraham 2011; Harrow, Jung and Phillips 2016; Lowe 2004) but is modeled after studies of historic tax credits in economically depressed commercial areas (Ryberg-Webster and Kinahan 2014; Kinahan

2019). The latter, which assess the geographical and social equity of federal rehabilitation tax credits, demonstrate this financial instrument of historic preservation and commercial revitalization presumes developers of depressed Main Streets accumulate tax-liability. Yet, tax-exempt nonprofit developers such as CDCs and local redevelopment authorities are often the only agents of commercial revitalization in disinvested corridors and communities, especially after a disaster (Johnson 2011). Similarly, the author argues philanthropic program officers' low-interest loans to CDCs —one of several market strategies by which these grantmakers generate revenue from their grantees—can discount and even double-down on distrust in local Black stewardship of public land and private capital. Assessing development finance and outcomes via interviews, document reviews, and participant observation with Pontchartrain Park CDC and its underwriters, the paper illuminates lending foundations have become not only fixes for acute destruction of New Orleans's built environment but also fixtures of chronic disinvestment in historically Black communities of urban America.

REBUILDING THE LOST PUBLICITY: THREE CASE STUDIES OF URBAN REGENERATION IN SHANGHAI
Abstract ID: 1408
Individual Paper Submission

ZHENG, Luqiao [Tongji University] Luqiao.zheng1012@gmail.com, presenting author

In recent years, Shanghai has entered an era of stocking regeneration. Shanghai Master Plan 2017-2035 plans to achieve a negative growth of construction land in the future. In the era of the stock economy, community development has begun to pay more attention to the coexistence of cultural diversity, spatial inequality, and lack of justice and publicity brought about by social stratification. Besides capital and power, a third force known as non-governmental initiating, a kind of grassroots power, has started to participate in urban space production and create inclusive space by community place making. Applying the methods and approaches of architecture, urban planning, sociology and anthropology, this paper selects three urban practice cases we participated in to illustrate NPO in China trying to achieve sharing of public space, realize equity and justice of social space and rebuilding of urban publicity by breaking boundaries and enhancing social cohesion with multi-participation.

Firstly, KIC garden, operated by Clover Nature School (NPO), integrated community residents of different incomes, household registration, birth places, occupations, education and living conditions to realize the connection of space，eliminate inequality among groups and promote social integration by breaking the walls between old and new communities with multi-participation of the government, local citizens, academic and social powers.

Secondly, the gatehouse of Xinfeng village, full of private express packages, was supposed to be the public space and community information transmission. In 2019, a micro-neighborhood-space, revitalized from the former gatehouse by Big Fish (local NPO), broke the former boundaries between public and private areas, rebuilt publicity and justice of community space and enabled citizens to regain community identity while strengthening a sense of unity by holding photo exhibitions and reconnecting community history.

Thirdly, at the beginning of 2019, Daxue Road in Shanghai experienced a mandatory fire prevention rectification led by the government, which has led to mass retreat of the creative merchants and the gradual disappearing of vitality. The reason for the fire prevention rectification was that the upstairs merchants changed the original function of living and office to commercial, causing the original residents' complaints to local government. Happening Store on Daxue road, an open, inclusive, and non-profit Third Space operated by local KOL, cooperated by media, invested by developer, realized a connection of society by breaking boundaries between commercial space and residential area and encouraging local merchants, residents, staff and students to initiate activities spontaneously to redefine the authenticity of the mixed block and promote equity and justice of public space.

In conclusion, there was no absolutely grassroots-power-led urban space practice in Shanghai. The model, initiated by social organizations, empowered by local government, and cooperated by multi-stakeholders, is helpful for the flexible allocation of social resources and the growth of humanized urban space. People's inner connection takes much longer time to achieve than physical connection. It requires breaking the boundaries of disciplines, promoting an awakening of public consciousness, encouraging a multi-connection based on local NPO/ NGO, and establishing a sustainable local empowerment system.

Boston Chinatown is reshaped by the influx of luxury residential developments, institutional expansions, and short-term vacation rental models such as Airbnb. Not only does the increasing rent burden the low-

income immigrant residents, but it also gentrifies the local retails, restaurants, and grocery stores, which dilutes the identity of Chinatown as a cultural harbor for its community. This research introduces and reviews the work done by our Boston-based research initiative, Rentify Chinatown, which leverages the joint power of digital tools, data analytics, and in-depth interviews to document and explain place-based identity for the low-income community of Boston Chinatown.

As part of this research, the Rentify Chinatown research team created a shared database of quantitative and qualitative data for Boston Chinatown community organizations, including Chinatown Community Land Trust (CCLT), Chinatown Progressive Association (CPA), and Alliance of Downtown Community Organization (ADCO). Combining the big data including housing price, inventory of ongoing development, change of building ownership, local demographic with micro-data featuring granular, individual inputs of local narratives through online and offline engagement, we present a conflict between a culturally rich local community with the ongoing trend of development. Our work complements the current Boston Chinatown master planning schemes from the perspective of individual experience and highlight the importance of maintaining local culture as it contributes to the overall diversity of Boston Downtown districts. With the construction of an organized database and an engaged documenting process, Rentify Chinatown devotes the efforts in paving an avenue for future work that will further strengthen the sense of belonging for vulnerable communities.

THE INSTITUTIONAL DILEMMA OF URBAN REGENERATION IN CHINA: A CASE STUDY OF THE URBAN REDEVELOPMENT PROJECTS IN SHANGHAI OLD TOWN
Abstract ID: 1025
Poster

ZHANG, Hao [Tongji University] zhanghao1054@tongji.edu.cn, presenting author

In recent years, planning scholars in China have been advocating for new urban regeneration approaches. However, existing urban regeneration practices that generated from the country's social and institutional context still dominate most Chinese cities. Urban regeneration is traditionally implemented in two ways, the first is "demolition-reconstruction", by tearing down old houses to make room for new development. This approach achieves stated urban renewal goals at the expense of the loss of historical areas and the gentrification of the community. The second is "frozen protection", namely, designating no-growth areas around certain historical sites and neighborhoods. This approach has the potential to retain the recognized cultural values of specific urban areas, but has also deprived the communities of the opportunity of upgrading their facilities and improving their deteriorating built environment. This study selects the Shanghai Old Town as a case to discuss the institutional factors of urban regeneration dilemmas in Shanghai.

Shanghai Old Town (Lao Chengxiang) used to be the city center of Shanghai, and is now one of the city's

municipal-level historic and cultural areas in downtown. The city government has been attempting to promote regeneration projects in this area. Residents are also eager to improve their living environment. However, the two types of regeneration methods (phenomenon) mentioned above have been implemented repeatedly in this area for a long time, resulting in a fragmented and collaged built environment. Social organizations and scholars have engaged in the discussions of developing new urban regeneration approaches in this area that achieves both objectives of historic preservation and urban renovation. This study attempts to analyze the causes of the traditional urban regeneration approaches from the perspective of the institutional context. Specifically, this study explores two research questions: what are the institutional factors that have determined and sustained the traditional regeneration methods? What institutional factors prevent the new regeneration approaches from being implemented?

This study argues that urban regeneration is a collective social activity. It adopts sociological institutionalist methods to analyze regeneration activities from the dimensions of the institutional framework, main actors, dynamic structures, and mechanisms. We builds our analytical framework on the empirical evidence of the redevelopment projects in Shanghai Old Town, and conducts a theoretical analysis surrounding the two research questions. Our research suggests that path dependence significantly influences Shanghai's urban regeneration process. Existing land management methods, urban development models, plan-making and implementation mechanisms, and social governance models determine and shape the urban regeneration dilemmas. The successful transformation of urban regeneration strategies in China requires both institutional and technical innovation.

This study attempts to propose a new analytical framework for understanding the urban regeneration in Shanghai, and provided new evidence on the institutional dilemma of urban regeneration in Chinese cities. At the same time, this study contributes to urban regeneration theory through the discussions on the dominant discourse, technical instruments, and the interaction of actors in urban regeneration and the transformation of urban generation strategies.

CREATING AN ADAPTIVE REUSE PLAN FOR THE HISTORIC STEPWELLS OF HYDERABAD, INDIA
Abstract ID: 1061
Poster

MYANA, Rajiv Kumar [Pratt Institute] myanarajiv@gmail.com, presenting author

Stepwells are subterranean rock-cut structures used to supply communities with water in all seasons. They have a unique architectural style that is found only in India and they are the traditional means for harvesting water. These wells first came into use in the early sixth century, and were two to nine stories deep, with pavilions, chambers, and corridors connecting them. Indian royal families would typically commission the construction of the well monuments to serve the community. Women significantly used

stepwells to fetch the water for household purposes. Due to modernization, hand pumps and taps replaced stepwells to supply water. Out of thousands of stepwells in existence, only a handful have been adequately preserved and many have been filled in or left abandoned since the primary utility of these architectural monuments was no longer needed.

The history of stepwells is not well documented in India. There are very few resources or books about them. Most stepwells have pre-colonial history, and they still have significant value to the people who resided in areas around them. They were built for patrons and patronesses to serve as asylums, gathering places, and spiritual centers. Some of the stepwells were also used to serve the community and provide a counterbalance to the extreme famine conditions by serving the harvested rainwater and ground water for irrigation purposes. Stepwells were sited in neighborhoods as well as along important trade routes, available for use by the whole community and by traders a place for rest.

The literature review for this research details the history of stepwells in India, as well as its style, function, and characteristics. Historical research about stepwells and their function was synthesized through the literature review of the books: Steps to Water by Morna Livingston, The Stepwells of Gujarat by Jutta Jain, Her Space Her Story by Purnima Bhatt and Vanishing Stepwells of India by Victoria Lautman.

This study aims to aid the preservation of these stepwells by identifying community-based, adaptive reuse options to revitalize these astonishing structures. Alternative use options with some interventions are submitted for two stepwells selected based upon their historical significance. Precedents like Stepwell Square in Jodhpur and a local level comparative study of five Global Heritage Fund restoration projects in Rajasthan are identified to discern common threads. These stepwells were restored with help from the local community and came to be reused as civic spaces, providing community facilities and public health utilities. Examining these precedents helps to shed light on the appropriate preservation approach for the stepwells. Finally, recommendations were developed using a values-based preservation approach. In terms of Social Value, the stepwells contribute to the authenticity of the place, which is important to the community's connection to it.

Traditional rituals and routine household chores linked women intimately with the stepwell. Stepwells were often referred to as women spaces as they not only provided water yearlong but also served as a gathering place for the women. The stepwell was the place where women could socialize in the same way men used village squares to socialize (Chowk). In some villages and the countryside in India, it is still common for women to gather at water sources.

Restoring stepwells as historical monuments is essential for the conservation of India's heritage. Providing them with new uses has the potential to reinvigorate the social and economic life of the communities. In general, to develop stepwells across India, place-making strategies can be adopted. Instead of creating a new place for the public, these sites can be used as plazas or public squares. Stepwells can be transformed into "Indian Piazzas."

PLANNING AND RESIDENTIAL GROWTH PATTERNS IN THE MID-SIZE CANADIAN CITY
Abstract ID: 1165
Poster

TSENKOVA, Sasha [University of Calgary] tsenkova@ucalgary.ca, presenting author
GRAHAM, Rylan [University of Calgary] rylan.graham@ucalgary.ca, co-author

Smart Growth is a well-established planning policy framework to facilitate more sustainable development in Canadian cities. One of the core principles of the movement is the call for greater levels of intensification to direct development towards existing urbanized areas, while reducing development pressures on open space at the periphery and urban sprawl. Planning for more compact communities has become the normative approach advocated by planning professionals and scholars, however the status quo of low-density development on the periphery continues to perpetuate (Curic and Bunting, 2006, 206; Brewer and Grant, 2015). These patterns of growth are typical of the mid- size Canadian city which is noted for its low-density, high rates of dispersion/decentralization, auto-dependency, poor transit service, and stagnant growth in the core (Filion et al., 2004; Bunting et al., 2007).

In the context of eight mid-size Canadian cities, this research explores the shift to intensification as a Smart Growth strategy reflected in municipal policies and plans and long-term plans (Filion et al., 2015). The research develops a conceptual framework, which draws on the political market model and the public choice model to explain adoption of certain policies by municipalities emphasizing the impact of institutional factors on planning policy outcomes (Levesque, 2017). An important component of the conceptual framework is content analysis of municipal plans with a focus on intensification strategies, targets, monitoring & evaluation instruments. Our findings from the comparative analysis of eight conceptually appropriate case studies suggest that the commitment to intensification depends on fiscal resources, the capacity of planners, their responsiveness to development interests and the commitment to growth management by provincial governments. We argue that there is a significant gap in the implementation process.

This research contributes to the limited empirical evidence on planning and growth management strategies in mid-sized Canadian cities.

PATEL, Purvangi [OCAD University] purvangi02@gmail.com, co-author

Low-lying Pacific Atoll nations like the Republic of the Marshall Islands (RMI), face increased vulnerability to climate change risks, such as flooding, drought, and typhoons. These environmental risks are compounded by broader social issues, such as lack of access to education and expertise, which are needed to increase civic capacity and climate resilience. Environmental risks and social issues are compounded in the built environment, where development often ignores them, and is built without input from community stakeholders. These develop processes also disregard input from Indigenous knowledge. Continental American mindsets have privileged western notions of development in the Marshall Islands – further inducing settler-colonial structures. As new development is built, resilience strategies must be integrated during the design process. Two known methods for utilization are: (1) Community-Based Disaster Risk Reduction (CBDRR) -- providing a method for assessing risk, building capacity, and assisting in climate change adaptation -- and (2) Participatory Design -- which brings the community into the design process. While these methods are known, examples combining CBDRR and Participatory Design are few. In Pacific Atolls, where action is imperative, there are fewer.

This project aims to leverage the real-world design of a K-12 school to provide a case study in the integration of CBDRR and Participatory Design that will help build a framework for other such projects in communities facing similar challenges across the globe. Through the participatory process the aim is to include Indigenous methods within the design and development process and prioritize Indigenous knowledge within the frameworks developed. Indigenous community members will be assisting within the research methodology. Integration of CBDRR into school design is uncommon, yet the school (located in Laura, RMI and about to begin design), provides an unusually ideal medium for this research, since its components (educational platform, community-hub, and use as a disaster shelter) provide traits central to CBDRR's success. This project, as alluded to, allows for the centering of indigenous frameworks within the design and development of resilience hubs in the Marshall Islands.

Our main research questions are: (1) How can Community-Based Disaster Risk Management be integrated within the master planning and design of a K-12 school? (2) How can Community-Based, Participatory-Design processes improve community agency in Disaster Risk Reduction? (3) How can a partnership between private enterprise (architect, planner), academic institution, and community organizations (school, municipality, non-profit) work together to accomplish these goals?

The exploration and analysis will build a framework to (1) assist community stakeholders to develop sustainable and resilient land use strategies; (2) illustrate community based best practices for development; (3) promote the applications of sustainable local resources and local knowledge, more specifically local Indigenous knowledge, in building design and development. These approaches will be applicable to the specific community of Laura, Majuro, RMI; and more broadly, to vulnerable coastal communities facing similar issues, such as the Northern Inuit communities of Canada.

ACCESSIBILITY TO GREENWAYS AMONG DIFFERENT RACIAL GROUPS
Abstract ID: 1330
Poster

YANG, Shan [The Ohio State University] yang.3828@buckeyemail.osu.edu, presenting author

Urban greenways are part of the green spaces in urban areas for peoples' physical and mental health. In order to study the racial equity of accessing greenways in urban areas, this study addresses the issue of whether the areas per person within the effective influence range of greenways are equal among difference races and therefore create an equal accessibility for people with different ethnicities. The effective influence range is defined as the 10-minite walk buffer of the greenway, which is one kilometer. In this study, the results not only include the general areas per person within the effective influence range of greenways for people with different ethnicities, but also include the areas per person within the effective influence range of prime greenways which have broader paths and bigger vegetation areas than average greenways or of those where are waterfront.

In this study, a case study in the city Columbus, OH was used to investigate the research question. Columbus has 54.3% white people, 29% black people and 6.13% Asian people. Geographic Information System (GIS) was utilized at the 2010 census block groups and the greenway trails for calculating the aforementioned areas. One-kilometer buffers were created first and the number of residents of one block was calculated by multiplying the whole number of people of a specific race and its ratio which is the proportion of areas covered by the effective influence range of greenways to the areas of this block. In addition, the prime greenways were selected out to conduct the calculation further.

This study is still in progress since the greenways in the city are designed differently according to the design guidelines. However, according to the previous studies, I assume that there would be a difference among different races on the areas per person within the effective influence range of greenways.

The implications of my work to planning practice would provide urban planners and policy makers a notice to pay attention to the equal accessibility to urban greenways among different racial groups when it comes to designing new greenways and managing the existing greenway systems.

TRACK 3 – ECONOMIC DEVELOPMENT

TRACK 3 - PRE-ORGANIZED SESSION SUMMARY & ABSTRACTS FOR THE SESSION

NEW DIRECTIONS IN WORKFORCE DEVELOPMENT AND THE FUTURE OF WORK
Pre-Organized Session 62 - Summary
Session Includes 346, 347, 348, 349, 350

RENSKI, Henry [University of Massachusetts Amherst] hrenski@larp.umass.edu, organizer

This session includes a variety of papers exploring the connections between skills and innovation, technology and work, new models for training and talent development, community and economic development and workforce opportunity, and climate and work – among other topics.

Objectives:

- Workforce development strategies
- Technological trends and its impact on labor demand and skills

HOW MANY TRUCK DRIVING JOBS WILL AUTONOMOUS VEHICLE ELIMINATE? AND ARE WE PREPARED?
Abstract ID: 346
Abstract within Pre-Organized Session 62

FANG, Kerry [Florida State University] lfang3@fsu.edu, presenting author

Research Question: This paper will answer two questions: 1) How many truck driving jobs will be eliminated by the adoption of autonomous vehicles (AVs) in the United States, and how much variation is there across geography? 2) How well prepared are planners for this upcoming change in the labor market?

Background: The wide-spread adoption of AVs appears inevitable in the near future, yet our understanding of their influence on the labor market is limited. Most prior research has focused on AV technology and the impact of AV on traffic flows (Childress et al., 2015), but ignored its impact on job displacement. A few recent reports have estimated the total number of trucking jobs subject to elimination at the national level (Groshen et al., 2018), while the geographical variations have not been fully explored. However, different regions vary in their pace of adoption, concentration of trucking jobs, and level of policy preparedness. These differences are unlikely to be uniformly absorbed across (regional) labor markets, and workers in certain regions will experience employment hardship more than others. Thus, this paper aims to differentiate the degree to which regions will be impacted by AV, and how well prepared planners are to combat the upcoming change in their labor markets.

Methodology: This paper contains two parts. The first predicts the number of trucking jobs subject to elimination across metropolitan areas. Building on Groshen et al. (2018), I developed a series of AV adoption scenarios and allowed the pace of adoption to vary across geography. These scenarios were then applied to CBSAs combined with the spatial distribution of trucking jobs to predict the magnitudes of job

elimination induced by AV.

The second part analyzes the policy preparation for AV across geography. I collected long-range transportation plans (LRTPs) in metropolitan planning organizations (MPOs) and comprehensive economic development strategies (CEDSes) in economic development districts (EDDs). Following the methodology of Freemark et al. (2019), I searched for keywords and contents related to AV and automation, and conducted a content analysis to examine what AV-related issues have been discussed in these plans.

Putting the two parts together, a spatial analysis is conducted to explore whether the regions expected to be more seriously impacted are also better prepared. A list of "best practices" will be formulated based on the existing plans to help guide regions forward.

Findings: Preliminary results show that the adoption of AV threatens 1.2 to 1.4 million truck driving jobs by 2035, and 1.8 to 2 million by 2050 in the United States. The most affected metropolitan areas are Atlanta-Sandy Springs-Roswell, GA, Charlotte-Concord-Gastonia, NC-SC and Riverside-San Bernardino-Ontario, CA. Only one-third MPOs have mentioned AV in their LRTPs, and about 20% of EDDs mentioned AV or automation in CEDSes. The spatial correlation between policy preparation and expected job loss is minimal: none existent for CEDSes, and correlated with a 0.1 correlation coefficient for LRTPs. This is an alarming sign of under-preparation for the upcoming change; planners have a lot to do in order to prepare US workers for an automated future.

Relevance: The adoption of AV is expected to exhibit significant impacts on the future of human labor. This paper estimates the magnitudes of such impacts on trucking drivers, and how these impacts unfold across geography. The estimated magnitudes can be used to target the most impacted regions and pace the formulation of AI-related regulations and policies. In addition, this paper also identifies a list of "best practices" in existing plans, which can serve as a starting point for planners to move forward in their preparation for AV.

UNDERSTANDING STATE VARIATIONS IN NON-DEGREE PROFESSIONAL CREDENTIALS
Abstract ID: 347
Abstract within Pre-Organized Session 62

RENSKI, Henry [University of Massachusetts Amherst] hrenski@larp.umass.edu, presenting author
FORBES, Allison [Center for Regional Economic Competitiveness] aforbes@crec.net, co-author

Non-degree credentials, such as professional certifications, have garnered considerable interest in recent years as an alternative pathway to demonstrate job-ready skills, especially among those with lower levels of formal education. Non-degree credentials can be less expensive, quicker to obtain, and more effective at imparting specific skill sets than traditional degree programs. Many see this as a particularly attractive

option for an anticipated future of rapidly changing workplace technologies and contingent work arrangements. Attainment of non-degree credentials is also associated with positive employment outcomes and higher earnings, and often act as a compliment to more traditional forms of higher educational attainment.

We use newly added measures of professional certifications in the Current Population Survey (CPS) to examine why some states have higher certification rates and related wage premiums than others. We use multi-level modeling techniques to a document the influence of occupation/industry mix, individual endowments, and metropolitan size as possible sources of cross-state variation. By examining differences across states in attainment rates and premiums, we hope to inform strategies aimed at expanding coverage and employer confidence in professional certifications as valid credentials.

UNEVEN ROBOTICS DIFFUSION: IMPLICATIONS FOR SMALL/MEDIUM MANUFACTURERS AND FEMALE AND MINORITY WORKERS
Abstract ID: 348
Abstract within Pre-Organized Session 62

LEIGH, Nancey Green [Georgia Institute of Technology] ngleigh@design.gatech.edu, presenting author
LEE, Heon [Georgia Institute of Technology] leehy@gatech.edu, co-author
KRAFT, Benjamin [Georgia Institute of Technology] bkraft70@gmail.com, co-author

While the development of robotics and AI technology is rapidly progressing, the diffusion of these technologies has been uneven and relatively slow. Robotics adoption has been greatest in manufacturing, concentrated in the automotive sector, and almost exclusively of traditional industrial robots. Small and medium size manufacturers have been much slower to adopt robots. The development of collaborative robots (co-robots) holds the promise of much higher levels of adoption across the manufacturing sector, and in particular, small- and medium-sized manufacturers (SMMs). Manufacturing is an important source of jobs for women (30% of workers) and minorities (34% of workers). However, they are concentrated in lower paying occupations that are less likely to require STEM skills, and vulnerable to displacement from automation and robotics. The introduction of collaborative robots shifts traditional manufacturing into the advanced manufacturing category, generally defined as using innovative technology to improve products or processes. This paper explores the potential for up-skilling and moving into middle skill and wage jobs without having college level STEM skills when women and minority workers use collaborative robots in their manufacturing firms.

RECOVERY FUNDING, BUSINESS RELOCATION, AND THE IMPACT ON FUTURE EMPLOYMENT ACCESS
Abstract ID: 349
Abstract within Pre-Organized Session 62

WATSON, Maria [Texas A&M University] mwatson1@arch.tamu.edu, presenting author
YU, Siyu [Texas A&M University] yusiyu_1989@tamu.edu, co-author

The economic effects of a disaster are not uniform across space, therefore the ability for businesses to adapt to changing populations, demands, and labor pools after a disaster may make the difference in their survival. However, encouraging businesses to move as an adaptation strategy may have consequences for future employment access, particularly for socially vulnerable populations in hazardous areas that may not have the means to be as mobile. To complicate this issue, Federal disaster spending has been increasing in the last several decades due to more frequent hazard events and an increase in the federal share as outlined by the Stafford Act; because disaster assistance often takes the form of loans, it is possible that the disbursement of these funds impacts residential and business mobility decisions either through additional debt burden or supplemental financing streams.

This research, therefore, seeks to understand the relationship between federal disaster assistance, business and residential adaptive strategies, and its consequence for future employment access. Using parcel data and data from Freedom of Information Act requests to the U.S. Small Business Administration, we explore the relationship between recovery funding and the mobility decisions of businesses and residents after Hurricanes Ike and Harvey in Galveston County, Texas. We investigate whether federal recovery funds serve as hindrance or catalyst to post-disaster adaptation in the form of moving out of hazardous areas. We explore if businesses and households differ in this regard, as well; although businesses may see moving as a strategic decision, household decisions may be complicated by other factors outside of market indicators. We discuss the consequences of this research on long-term development patterns, namely the distribution of businesses in relation to households and economic opportunity considering social, economic and physical vulnerability.

OPEN KNOWLEDGE NETWORK FOR SPATIAL DECISION SUPPORT TOWARDS URBAN SUSTAINABILITY

Abstract ID: 350
Abstract within Pre-Organized Session 62

YE, Xinyue [New Jersey Institute of Technology] xinyue.ye@gmail.com, presenting author

The proliferation of online data and mapping technologies has greatly increased access to and utility of spatial decision support (SDS) systems in a wide range of application domains in urban sustainability (Gorsevski et al., 2013). SDS combine data, tools, models, and maps within a user interface to help people, often representing diverse stakeholder groups, make scientifically-based, data-informed decisions (Ye, 2010).

Despite these successful applications, SDS contributions are limited by challenges in integrating information across complex organizational networks and across an array of tools developed for narrow (often disciplinary) applications (Nyerges et al., 2014). A basic challenge is that SDS researchers and professionals lack structured ways to locate and interrelate existing data, models, visualization tools, and workflows. This need is becoming ever more challenging as the volume, velocity, and variety of available data and tools increases substantially. A second challenge is with the ability to share and co-develop the more fundamental building blocks of these data and tools, including conceptual, methodological and applied data objects. Third, decision support activities must involve diverse knowledge perspectives broadly, deeply, and flexibly, but participatory mechanisms for decision support remain immature.

In order to lay the groundwork for broader open knowledge network (OKN) development, we will focus on building the semantic structures and tools needed to support Open knowledge network (OKN) development focusing on SDS (OKN-SDS) for urban sustainability. OKN development relies heavily on creating ontological structures to enable machine reading and reasoning of networked information, and we will test the effectiveness of participatory and machine learning approaches to assembling these ontologies, using wildland fire, water quality, and biodiversity conservation as the case studies.

Three domain-specific case studies will build on participatory GIS and ontology development work through engagement of problem-focused stakeholder networks. At the same time, the utility of automated tools for resource discovery, ontology development, and social network analysis will be tested in these real-world problem environments for urban sustainability. Through integration and comparison of these techniques, we will deliver insights into efficient and effective methods for OKN development.

SDS-OKN will address each of those three challenges using a multi- and cross-disciplinary approach. There are three advantages of using OKN-SDS as a seed for contributing to the broader OKN development: 1) it embraces geographic space as a natural integrator between disciplines, 2) it is use-inspired and action-oriented towards supporting important societal decisions, and 3) SDSS are already designed to operate at the human-computer interface. Hence, SDS-OKN will dramatically enhance organizational opportunities for developing use-inspired and knowledge-based spatial decision support applications towards urban sustainability. For example, diverse stakeholder will be able to address challenges with managing wildfire and forest fuels, such as those conditions which led to the Camp Fire in California, the deadliest and most destructive wildfire in California history. The Puget Sound Partnership, composed of 750+ organizations working on the monitoring, cleanup, and recovery of Puget Sound ecosystem, will have access to digital resources that could reduce some of the costs, which in 2017 were estimated at $500+ billion over the coming decades. Scholars and policy makers on biodiversity conservation will advance planning techniques needed to maintain services that healthy ecosystems provide humans, such as food, clean water, and cultural services. Synthesizing outcomes from these examples will demonstrate how combining different disciplines and aspects of an overarching problem in urban sustainability can be accomplished through OKN technologies.

TRACK 3 - ROUNDTABLES

CLIMATE CHANGE AND THE FUTURE OF WORK
Abstract ID: 155
Roundtable

PARKS, Virginia [University of California Irvine] vparks@uci.edu, participant
CHA, Mijin [Occidental College] mcha@oxy.edu, participant
ISKANDER, Natasha [New York University] natasha.iskander@nyu.edu, moderator
TEWARI, Meenu [University of North Carolina at Chapel Hill] mtewari@unc.edu, participant
LOWE, Nichola [University of North Carolina at Chapel Hill] nlowe@unc.edu, participant

Climate warming is the fundamental challenge of our time, not only because it will radically transform our natural environment, but also because it will redefine jobs and livelihoods. This roundtable discussion will bring together labor and urban planning scholars who are critically exploring the intersection of climate change and the future of work. Panelists will focus their comments on a set of questions that reflect on uncertain employment future in our rapidly changing environment.

The goal of this session is to move beyond overly stylized, hopeful narratives of 'green' job creation to consider the multifaceted challenges that workers and their employing industries will face due to climate change pressures. The panel will explore what climate threats to livelihood and economic stability will mean for policy coordination and advocacy, at both the local and global levels.

Panelists will address the following questions:

- What do we really know about green jobs? Are they the antidote to inequality, or sources of inequality themselves?
- What are the obligations of a "just transition"? To what extent must fossil fuel dependent workers and communities be made whole?
- In what way do climate change pressures shape conditions for workers at the worksite, either directly or indirectly, by influencing the ways that industries have moved to restructure their systems of production in response to global warming?
- How are firms' efforts to respond to the effects of a changing climate (rising temperatures, precipitation) on firm productivity and performance touching down on differently situated workers within the firm's supply chain? How are they reshaping work processes and work environments and how are workers' responses, in turn, foregrounding the connections between sites of production and sites of social reproduction in coping with the pressures of climate change.
- With climate change exacerbating inequities, should we limit our focus to work and employment?

URBAN DATA SCIENCE IN ECONOMIC DEVELOPMENT RESEARCH AND TEACHING
Abstract ID: 242
Roundtable

FANG, Kerry [Florida State University] lfang3@fsu.edu, organizer, moderator
GREEN, Jamaal [University of Pennsylvania] jamaal.Green@gmail.com, participant
YE, Xinyue [New Jersey Institute of Technology] xinyue.ye@gmail.com, participant
SEYMOUR, Eric [Rutgers, The State University of New Jersey] eric.seymour@rutgers.edu, participant
SHI, Wei [Portland State University] ShiWei@pdx.edu, participant

With the rapid advancement of data science methods, the use of urban data science in planning research has been on the rise (Schweitzer, 2014; Zook, & Graham, 2007). Economic development researchers are relatively slow adopters of these new techniques compared to planning's other subdisciplines, particularly transportation. This roundtable invites scholars with experiences of using data science in economic development research and/or teaching to share their perspectives on what advancements data science has brought, and can bring, into the field of economic development, and what challenges exist in using data science to address economic development issues.

Additionally, panelists will reflect on how they have taught data science in their economic development classes, what challenges they have to overcome, and how we can effectively equip students with the increasingly necessary data science skills both public and private employers demand.

Specifically, in the spirit of the theme of this year's conference, the panelists will discuss distinctive challenges for female scholars (Cheryan, Master, Meltzoff, 2015), African American scholars (Rankin, Thomas, Brown, & Hatley, 2013) and other minorities to develop coding skills and enter the field of data science. The female and African American scholars on the panel will share their stories, and the panel will discuss ways to overcome stereotype and create equal opportunities for all.

COVID-19 AND NATIONAL, STATE AND LOCAL RESPONSES TO HELP VULNERABLE POPULATION, INDUSTRY, AND REGIONS
Abstract ID: 515
Roundtable

JUNG, Namji [Seoul National University] namji.jung@gmail.com, organizer, moderator
MOTOYAMA, Yasuyuki [The Ohio State University] motoyama.1@osu.edu, participant
KIM, Karl [University of Hawaii] karlk@hawaii.edu, participant
SANTIAGO-BARTOLOMEI, Raul [University of Puerto Rico] raul@grupocne.org, participant
NAMIN, Sima [Medical College of Wisconsin] sima12898@yahoo.com, participant

COVID-19 has spread rapidly from mobile populations to local communities throughout the world. With a delayed development of the vaccine and the less known routes of contagion, this highly contagious virus slips through the crack of cutting-edge science, technology, big data, and medical systems. Many countries have imposed social distancing and lock-down orders to prevent further spread of the virus. While these measures seem to work slowly, it is uncertain how long they should continue and how it will affect the local, national, and global economy. In the midst, it is evident that the situation will continue to affect vulnerable population, industry, and regions, and it will take years to unfold.

Although many local and national governments around the world keep on fighting to get ahead of the epidemic and provide stimulus packages, these efforts seem to have limited impact. Unless the epidemic dies out, it will be like a water tank with a sinkhole in it. As such, due to the complexity and variability of the economic impact of COVID-19, the response to mitigate the local economic downturn has to be a more systematic organization of resources instead of solely relying on compartmentalized economic development strategies.

This round table will shed light on the different cases and models of the systemic organization of local resources such as science, technology, data, public services, and industry. We will provide a comparative perspective with cases from South Korea, Puerto Rico, Hawaii, Ohio, and Wisconsin. We will primarily discuss 1) what policy measures were employed to reduce the socio-economic consequences of the disease and how they worked; and 2) what need to be done to prepare better systematic ways of local-level response to unknown 'manufactured risks' to come in the future.

TRACK 3 INDIVIDUAL ABSTRACTS

THE ONLINE MARKETPLACE: A ZERO-ORDER CITY?
Abstract ID: 72
Individual Paper Submission

GANNING, Joanna [Cleveland State University] j.ganning@csuohio.edu, presenting author
GREEN, Timothy [Clemson University] tgreen8@clemson.edu, co-author

Past studies on the drivers of online shopping have focused predominantly on demographic variables like age, race, and ethnicity (Zhou and Wang 2014). Other studies have attempted to quantify the utility gains to consumers (if any) from shopping online. Dolfen et al. (2019) drew upon both approaches, and transaction-level credit card data, to estimate the utility gains distinctly provided by online shopping, and in so doing produced the first national county-level estimates of online purchases as a percentage of consumer expenditures.

This paper integrates this prior research on the demographic and economic drivers of online shopping with classical retail location theories to understand how the forces of income and geography interact to motivate engagement in the online marketplace. Using the language of Central Place Theory, online retail might function as a zero-order city: one that carries the most diverse assortment of goods and that can be visited from virtually anywhere. By this logic, rural households would engage most zealously with the online market, due to the larger variety gains possible for those consumers. This effect, however, is hypothesized to be variable, because although transportation costs are ubiquitous, they are realized differently (in time versus money) depending upon both location and income. By parsing the roles of income and remoteness, the paper develops a spatial retail development theory for the online marketplace.

The model includes four groups of independent variables: controls, income variables, measures of remoteness, and the marginal utility of a dollar with respect to time (a ratio of the shipping cost per mile for goods, by income quantile). The results show income and remoteness relating to online shopping in the expected ways, but the interaction effects were surprising. In our model, lower-income counties have the smallest elasticity between propensity to shop online and the cost per mile of shipping charges, while higher-income counties have the largest elasticity. We hypothesized the opposite: that households in lower-income counties would be more likely to "spend" time by driving to brick and mortar stores given higher shipping charges, while households in higher income counties would value the time savings of online shopping with less regard to the cost of shipping. We hypothesize that our findings may result principally from geography. Low-income areas were almost entirely remote, perhaps shying away from online shopping due to the relatively larger sunk costs of travel necessary for other shopping, whereas even remote areas of higher income areas were relatively closer to brick and mortar stores, making online and in-person shopping substitutions more sensitive to price changes.

We conclude that the online marketplace is not a zero-order city. Instead, it appears to largely re-institute the rules of spatial markets. Planners can use these results to anticipate where brick and mortar retail development will shift to online, thus lowering the demand for floor space. Future research should focus on the interactions of luxury goods' price elasticity and online shopping, and the mechanisms at play in counties with household incomes modally near the national median.

ARE INNOVATION DISTRICTS AN EFFECTIVE STRATEGY FOR COMMUNITY ECONOMIC DEVELOPMENT?
Abstract ID: 94
Individual Paper Submission

DRUCKER, Joshua [University of Illinois at Chicago] jdruck@uic.edu, presenting author
KAYANAN, Carla Maria [University College Dublin] carla.kayanan@ucd.ie, primary author
RENSKI, Henry [University of Massachusetts Amherst] hrenski@umass.edu, co-author

Urban planners and policy makers promote innovation districts as benefitting surrounding communities by creating jobs for a wide range of skill sets, from service-oriented to high-skilled professions (Katz and Wagner 2014). They also champion innovation districts for their potential to create or revitalize communities within their borders, producing desirable neighborhoods with housing and amenities in close proximity to work (March and Ribera-Fumaz 2016; Wagner et al. 2019). Both of these goals, however, are mismatched with the application of innovation districts.

We analyze the progression of four, varied innovation districts in the United States (in Boston, Detroit, St. Louis, and San Diego) in relation to community economic development goals. Our empirical information is drawn primarily from interviews with innovation district creators and implementers, entrepreneurs, and representatives of local business and community organizations. We also collected and reviewed primary documents and media reports, diagrammed and toured each innovation district and its environs, and in a couple of cases attended selected local events relating to innovation district development.

We demonstrate how the direction and pace of innovation district development determines whether community goals are realized (Drucker et al. 2019). Promoting innovation involves prioritizing the needs of high-skilled workers, who may not live close to the district or may not share the preferences of other local residents. If real estate development takes center stage, market demands become the focus. The construction of hotels, high-end condominiums, and boutique amenities may leave affordable housing options for lower-income workers and the provision of public services as secondary considerations, if they are included at all (Lawrence et al. 2019). As is true with other economic development tools, the achievement of robust, rapid development may undercut community aims. Surging real estate prices within and around an innovation district hold the potential to push out longstanding residents and services, further negating the innovation district as a space for a diversity of people, ages, resources, and amenities.

IN THE SHADOW OF AMAZON'S HQ2: UNDERSTANDING THE ENTREPRENEURIAL ECOSYSTEM NEAR NATIONAL LANDING
Abstract ID: 97
Individual Paper Submission

COWELL, Margaret [Virginia Polytechnic Institute and State University] mmcowell@vt.edu, presenting author

The development of the new Amazon HQ2 and Virginia Tech Innovation Campus at National Landing (hereafter called 'National Landing') in Arlington County and the City of Alexandria, Virginia offers unprecedented research and engagement opportunities for scholars and practitioners interested in entrepreneurship and economic development. This paper focuses on the existing entrepreneurial ecosystem (Mack and Mayer, 2016) in the neighborhoods most likely to be impacted by the Amazon HQ2 and Innovation Campus developments. It does so by asking what opportunities exist to leverage assets and build capacity to ensure local small businesses and entrepreneurs participate in economic opportunities related to developments at National Landing? The goal in answering this research question is to better understand these entrepreneurs and small businesses, identify their unique challenges, and effectively communicate these findings using data visualization tools that allow us to see and understand the threats and opportunities presented by extraordinary levels of investment (Mason and Brown, 2013). At the time of the National Landing announcements, the commercial corridors within these targeted communities make up some of the most diverse in all of Northern Virginia.

When dealing with investments as sizable and as potentially disruptive as those that are planned for National Landing, moving quickly to establish baseline data is essential. The paper utilizes data collected through in-person interviews and focus groups with small businesses, entrepreneurs, and resource providers in the neighborhoods surrounding the National Landing developments. Thereafter, a social network analysis and visualization of the ecosystem is conducted using the preliminary ecosystem map, as well as data from identified Twitter feeds. The network analysis maps the region's assets, communities and connections (nodes and edges) and analyzes relationships between different nodes, or in this case, relationships among organizations, small businesses, and entrepreneurs in the ecosystem (Cowell, et al 2019). The mapping aids in the identification of: actors with a strong presence in the ecosystem; sub-communities, resource providers, individuals, or small businesses that may have disproportionate or noticeable influence in the ecosystem; and potential bridges between sub-communities, which can be key to gaining entrée or effecting change in underrepresented communities (Engbers, et al 2017).

Preliminary findings suggest that the entrepreneurial communities in the neighborhoods surrounding National Landing are not monolithic. Degree of specialization, connectedness, and financial health vary greatly across business types and neighborhoods. Additionally, the degree to which the business community in each neighborhood is willing to connect with traditional economic development and small business assistance programs varies greatly across business types. ethnicity of the proprietor, and other dimensions. Nevertheless, common challenges and potential opportunities to connect with the developments at National Landing were identified. For planners and economic developers, the results of this study can help us understand how the National Landing developments are affecting the surrounding small business ecosystem. Moreover, the results will help us to identify the physical and programmatic approaches or strategies most appropriate for maintaining a locally-embedded entrepreneurial ecosystem as these developments take shape over the next decade.

SPATIO-TEMPORAL ANALYSIS OF THE ROLE OF NEIGHBORHOOD ECONOMIC DIVERSITY ON SHRINKING REGIONS

Abstract ID: 108
Individual Paper Submission

LYM, Youngbin [The Ohio State University] lym.3@osu.edu, presenting author

The influence of economic diversity and agglomeration economies on regional growth and stability has been gaining broad attention and many economists, regional scientists, and urban planning researchers have focused on clarifying its impact. In the context of regional growth and stability, both strains have proven to have good explanatory power for the success of cities. Although a plethora of studies has attempted to clarify the role of specialized (Marshallian) and diversified (Jacobian) economies in the regional economic growth context, the role of these two strains in shrinking cities is yet to be explored. An exception is Murdoch (2018), whose study examines how these Marshallian and Jacobian economic theories help to explain the variation in growth and decline within shrinking cities at the neighborhood (census tracts) level and concludes that there is some evidence of economic specialization for shrinkage reduction.

From a different perspective, Hartt (2019) attempts to identify the existence of prosperous shrinking cities, their locations, and influential factors for their economic prosperity in the U.S. However, he did not take economic structure (i.e. either Marshallian or Jacobian) into consideration in his study. Building upon and further expanding Murdoch (2018) and Hartt (2019), the present study investigates the role of neighborhood-level economic diversity within shrinking regions. We hypothesize that some census tracts would reveal economic prosperity while others would not, and this disparity can be explained by the diversification of their economies.

In particular, this study examines the role of space, time, and economic diversity on the economic performance (e.g. employment growth or per capita income growth) of each census tract in a shrinking region. Unlike previous studies, we attempt to incorporate temporal dependency along with spatial influence, which further allows us to identify the dynamic changes in economic performance over space and time at a small-area level as well as to capture its variation within the region. This contributes to expanding the body of existing knowledge in terms of shrinking cities.

We select the Cleveland-Elyria Metropolitan Statistical Area (MSA), which consists of 635 census tracts, as the study region. In order to capture the shifts in economic diversity for each census tract over the 2002-2017 period, an economic diversity measure (i.e. an entropy index) is calculated for six temporal spans (every three years) using the Longitudinal Employer-Household Dynamics (LEHD) data. We adopt a flexible space-time Bayesian hierarchical approach (Knorr-Held, 2000) and the penalized complexity (PC) priors (Simpson et al., 2017) as our analytic framework.

The outcomes suggest that 1) accounting for space, time, and space-time interaction contributes to a significant increase of explanatory power for the model; 2) diversification of economies leads to employment growth within shrinking regions; 3) we can identify census tracts experiencing prosperity in terms of economic performance as well as their unique characteristics including economic diversity, proportion of skilled workers, labor force participation rates, and size of the units; 4) dynamic influences of economic diversity within shrinking regions are clarified.

These findings allow us to advise planners and decision-makers on where and how they should concentrate their efforts in order to improve the economic conditions of specific neighborhoods within shrinking regions. Planners can also consider revising current economic development strategies to be economically diversified (i.e. more localized) or how to maximize the benefits of pre-existing economic conditions by encouraging multiple industries.

INCORPORATING POLICY LEARNING IN TORONTO TO KEEP CREATIVITY DOWNTOWN
Abstract ID: 126
Individual Paper Submission

GOLDBERG-MILLER, Shoshanah [The Ohio State University] goldberg-miller.1@osu.edu, presenting author

I examine the City of Toronto's interest in the process of policy learning regarding possible solutions to development pressure in its downtown though understanding extant cultural policies from San Francisco, Seattle, and Vancouver. I foreground Toronto's efforts to mitigate the increasingly frenetic development pressure in its central city through creative economy policy learning and lesson drawing, with the policy transfer inquiries focusing on related efforts in three other North American cities. I also explore how the return to urban living and the creative cities movement challenge city centers in preserving creative and cultural businesses and organizations.

I investigate Toronto's interest in the policy learning process regarding possible solutions to development pressure downtown though understanding policies from these cities. Grounded by the analysis of creative city interventions and incorporating a theoretical framework of policy adaptation, the research is informed by interviews with 51 multi-sector stakeholders, historical and archival materials, and policy documents. Emergent data themes include: (1) research and strategic planning; (2) stakeholder partnerships; and (3) economic development incorporating economic benefit and social good.

Toronto's urban core is where a number of creative businesses, nonprofit arts organizations, and arts producers are located, and while Toronto's city boosters, politicians, and cultural institutions remain interested in bringing the creative economy to the city, they want to leverage their city's institutions and established private sectors for organized district development. Here, I examine the interventions and smart practices municipal actors undertook in three similarly sized North American cities, recognizing the political will underlying Toronto's desire to explore policy options from other urban centers.

Municipal as well as regional actors have focused on finding ways to bring talent into cities and regions through policies that offer opportunities to interact with like-minded individuals, in addition to economic factors. Return to urban living and the creative cities movement challenge city centers in preserving creative and cultural businesses and organizations. Municipal actors often use central city district development to attract creative economy talent into their cities, promising that targeted policies, such as cluster formation, repurposing city-owned properties, and tax incentives will revitalize their city. However, many cities are facing challenges regarding the over-popularity and hyperactive developer agenda within downtown areas, due to the increased interest in city centers for both residential and commercial purposes.

Municipal actors often use central city district development to attract creative economy talent into their

cities, promising that targeted policies, such as cluster formation, repurposing city-owned properties, and tax incentives will revitalize their city. Municipal as well as regional actors have focused on finding ways to bring talent into cities and regions through policies that offer opportunities to interact with like- minded individuals, in addition to economic factors. However, many cities are facing challenges regarding the over-popularity and hyperactive developer agenda within downtown areas, due to the increased interest in city centers for both residential and commercial purposes.

Toronto's willingness to leverage this kind of policy learning in the trajectory towards making policy change shows that the city continues to be one that is open to innovation in municipal strategies. An important factor to consider is the role not only of placing this policy learning on the city agenda, but that of the implementation and subsequent evaluation of policy interventions. It is only through the careful rolling out and monitoring of any policy that the results of strategies for dealing with development pressure in center cities may be gleaned. This will lead to new knowledge for academics and practitioners alike and could prove to be of great value in the ever-evolving cycle of study, adaption, implementation, and evaluation in the field of urban policy today.

REGIONAL INDUSTRY EMERGENCE AND THE DIFFERENTIAL ROLE OF FINANCING
Abstract ID: 245
Individual Paper Submission

CLAYTON, Paige [University of North Carolina at Chapel Hill] clayton3@live.unc.edu, presenting author
FELDMAN, Maryann [University of North Carolina at Chapel Hill] maryann_feldman@kenan-flagler.unc.edu, co-author
MONTMARTIN, Benjamin [Skema Business School] benjamin.montmartin@skema.edu, co-author

Within any emerging technology, a few locations are able to establish an agglomeration of entrepreneurial firms. Firms in these locations benefit from the higher productivity associated with agglomeration economies. While places around the globe search for the appropriate recipe to create firm agglomerations there is increasingly a realization that an underlying spatial-temporal dynamic may be at work (Lévesque & Stephan 2019). This is a dynamic process as a region passes through a series of punctuated stages of emergence as an agglomeration of entrepreneurial firms forms. Understanding how industries take hold and transform regional economies is critical for public and private investment and for entrepreneurs who build their companies in places.

Regional industrial emergence, most simply, is a function of the entry and survival of startups (Spigel 2017). Organizational ecology provides a conceptual framework to study a population of firms, with a geographic region forming an appropriate boundary (Aldrich 1990; Sorenson 2017). Startup formation is

a response to collective patterns of activity in the environment, with prior entrepreneurial entry encouraging subsequent entry (Agrawal & Tripsas 2008; Carroll & Hannan 2000). An increase in the density of new firms indicates legitimacy, attracting resources that make it easier to establish firms (Baum & Singh 1994; Carroll & Khessina 2005). Finance is one of the most important resources for startups. It serves a direct role in development but also an indirect role crowding in other investment at the community level.

Prior work suggests the population focus of organizational ecology may be integrated with a micro level analysis of new firm financing to explain regional industrial emergence. Of course, this process is endogenous; individual regional contexts are highly differentiated and establishing causality is elusive. This paper puts forward a complementary theoretical framework that can provide new insights into the growth of regions. We change the focus from the individual entrepreneur and firm to consider conditions that shape the community in which the entrepreneur operates. Rather than comparing regions which contain heterogeneous resources and differing institutional contexts, we focus on emergence in one region over time, holding the external environment constant.

Organizational ecology suggests we should be able to discern temporal patterns as a regional industry emerges. Karniouchina et al. (2013) argues that the elements that determine firm performance will reconfigure as the industry lifecycle shifts from one stage to another and notes that the literature that examines performance variance has failed to account for the potential effects of lifecycle stage changes. We plot the density of firms over time in an emerging technology region, using a new method, threshold regression, to find inflection points where the radiant growth changed. Next we seek to understand how the reliance on different financing niches changes over the regional industry lifecycle using a dynamic random effects probit model with regime-switching analysis. We then estimate the relationship between the different sources of funding and firm survival within different stages using discrete event history analysis and regime-switching.

To develop this synthetic approach and explain industry emergence, we study the development of the life sciences industry in North Carolina's Research Triangle Region from 1980 to 2016 – an unlikely region to develop a successful agglomeration that provides a more realistic model than well studied highly successful archetypes. The novelty of this paper is the use of a unique, detailed database that links firm entry over time to different funding sources. We find that public and private funding sources are complementary but exhibit different signaling relationships and impacts on firm survival during different industry stages. Results have implications for startups seeking funding and for economic development policymaking and planning trying to encourage industry emergence.

SUBURBAN YOUTHIFICATION, IMMERSIVE ART EXPERIENCES, AND HOW THEY ARE ALTERING THE PROVINCIAL FABRICS SURROUNDING DENVER, COLUMBUS, AND SANTA FE
Abstract ID: 329

Individual Paper Submission

KEMPER, Rebecca [Center of Science and Industry] rkemper@cosi.org, presenting author
MEYER, Justin [Center of Science and Industry] justinmeyer553@gmail.com, co-author

Much has been written about the youthification of cities, whereby increases in urban millennial residents are driving amenities that appeal to them (Florida, 2015). Youthification has been posited as another way to understand the changes to inner-city neighborhoods that may appear to be gentrification, but are driven by large increases in younger residents following knowledge economy jobs (Moos, 2016; Moos et al, 2019). However, with increasing inner-city real estate costs inhibiting entry of youth into these areas, we may expect to find evidence of youthification within outer-ring suburbs, where real estate costs are dropping (Hanlon, 2010). We present a case study investigation of three U.S. cities experiencing youthification of their outer-ring suburban areas in the form of immersive art institutions locating there. These nontraditional institutions have been identified as part of the millennial pallet for arts & cultural institutions and leisure activities, in general (Owens, 2018). This comparative case study analysis (1) uses quantitative methods to present how each of the cities' urban cores have experienced changes with respect to inner-city real estate prices and an influx of younger residents to the general metropolitan area, driving opportunity for immersive art institutions to locate within the cities' suburban areas, and (2) provides a qualitative analysis of resident reactions to the development of outer-suburban immersive art institutions within these three contexts. Findings suggest that there are differences in perceived value to these immersive art galleries that relate to socio-economic status -- as it relates to inclusions within the knowledge economy -- as well as that of age. This study furthers the literature on the role arts and cultural institutions play in the change of neighborhoods that they locate in, as well as furthering an understanding of how suburbs may change in the 21st century (Hanlon, 2010; Kemper, 2019; Meyer, 2020).

THE EFFECTS OF DRIVERLESS CAR ADOPTION ON EMPLOYMENT IN THE US ECONOMY
Abstract ID: 374
Individual Paper Submission

SIMONS, Robert [Cleveland State University] r.simons@csuohio.edu, presenting author

The advent of driverless vehicles (DV) is expected to be highly disruptive to travel modes in US metropolitan areas. Adoption is expected to accelerate from testing pilot programs during the early 2020s, and reach a substantial (but not preponderant) market share within the next 20 years. By 2050, the majority of US metro travel is expected to be in app-driven shared or solo DVs (Simons, 2020, chapter 9). There will be certainly be job displacement, as taxi drivers get scaled back, but some job sectors would grow, such as tech support. Other job sectors would see indirect changes, like car insurance.

This study seeks to translate the DV adoption phenomenon into economic impacts, measured by changes

in employment. Some initial work on this has already been accomplished, looking at existing sectors that could be affected, and at potential first-order effects, e.g., before economic multipliers (Simons 2020, Chapters 5 and 17). This approach posited three strata of affected jobs attributable to DV adoption. Primary jobs (taxi driver, bus driver, truck driver and similar direct transportation services, car dealerships), are directly affected. Secondary jobs are more indirect, (insurance claims, auto body shops, EMTs, organ donor networks, police) since they may rely heavily on private vehicle activity. The tertiary sector (power plants to serve electric cars, junior colleges to retrain, engineering and tech firms, data centers computer mapping) supports the general economy in places where DV and job retraining could occur, and many sectors here could expand rather than contract. We will begin with this base research, and expect to use IMPLAN or a comparable economic development software package to estimate national changes, and relative changes in 3 US states, over the next 20 years, under a range of DV adoption scenarios. Policy implications for Planners and economic development professionals would be set forth.

PLACE-BASED COLLEGE SCHOLARSHIP PROGRAMS, LOCAL ECONOMIC DEVELOPMENT, AND RACIAL DISPARITIES: PROSPECTS AND PITFALLS OF THE BIRMINGHAM PROMISE
Abstract ID: 453
Individual Paper Submission

YIN, Jordan [Alabama A&M University] jordan.yin@aamu.edu, presenting author

This paper examines the potential prospects and pitfalls for the newly established Birmingham Promise (Alabama), a place-based college scholarship program providing universal last-dollar full-tuition college scholarships to in-state public post-secondary institutions for graduates of the Birmingham City Schools starting with the graduating class of 2020. The program is based on the Kalamazoo Promise program and other subsequently established place-based scholarship programs that have the dual objective of promoting academic success in secondary and post-secondary education, as well as contributing to local economic development (Miller-Adams, 2015; Miller 2018). The Birmingham Promise represents a novel application of a place-based scholarship program to address racial disparities in local economic development as the school district's students are roughly 90 percent African-American and more than half of the school district's college-bound graduates typically go on to attend Historically Black College and Universities (HBCUs).

The Birmingham Promise contrasts with existing place-based scholarship programs in locations such as Kalamazoo, Pittsburgh, and Buffalo in terms of the underlying the demographic, institutional, and economic factors that may impact the potential success of the program (Bifulco et al., 2019; Page et al.,

2019; Perna & Leigh, 2018). Five specific issues will be examined and contrasted to existing "promise" programs and their locations, including: (1) the demographic composition and academic performance of the Birmingham City School (BCS); (2) the preference of BCS graduates to attend HBCUs; (3) the public-private partnership funding and operational model of the program; (4) the inclusion of the scholarship program within a suite of related local economic development programs, and (5) the relevance of Birmingham's city and metropolitan economic structure.

Examination of these structural issues serves as the context for evaluating the strengths and weaknesses of the Birmingham Promise as it begins to pursue its stated objectives, including: (1) promoting economic development, (2) enhancing human capital, (3) stimulating urban revitalization, and (4) addressing racial disparities (www.birminghampromise.com). The concrete findings of this work will be used to establish benchmarks for the success of the program, as well as to deliver operational recommendations for the on-going program that can be implemented by post-secondary institutions receiving Birmingham Promise students, as well as stakeholders in the local public-private partnership for local economic development.

WHO BENEFITS FROM URBAN INNOVATION? ASSESSING PUBLIC GOODS CLAIMS IN URBAN INNOVATION INITIATIVES
Abstract ID: 469
Individual Paper Submission

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, presenting author
MILLER, Thaddeus [Arizona State University] Thad.Miller@asu.edu, co-author
KIM, Mina [Portland State University] kimmin@pdx.edu, co-author

Cities around the U.S. and the world are undertaking initiatives that are intended to promote "urban innovation." The goals and approaches taken in these initiatives vary, but generally revolve around two broad types of strategies: "smart city" approaches that seek to prototype and deploy new technologies for gathering, processing and disseminating data in the urban context, especially those that relate to public services or planning interventions (Miller 2019; Clark 2020). The other approach is "innovation districts," which seek to catalyze research and commercialization activities on the part of institutions, existing firms and new entrepreneurial ventures through efforts to promote spatial proximity and functional synergies (Katz and Wagner 2014; Drucker, Kayanan and Renski 2019). Increasingly, such projects claim to yield broad public benefits beyond economic development, from environmental sustainability to social and racial equity. Yet these claims remain largely unexamined, leaving considerable room for skepticism about the credibility of such claims, especially in light of the demonstrable private benefits accruing to technology firms and real estate interests through these initiatives (Clark 2020; Schrock and Wolf-Powers 2019).

In this paper we undertake an inventory of publicly-initiated or supported urban innovation efforts in North American cities in the past two decades. We define "urban innovation" broadly to include the two primary categories mentioned above, but also related planning efforts, such as creative placemaking, that frame their objectives in terms of "innovation." Second, we conduct content analysis to catalog the claims to public goods and benefits made by project officials through published reports and project websites. We define "public goods" as social benefits providing use value to individuals through collective provision, or as an external benefit of private actions. We categorize the public goods claimed in terms of economic, environmental, and social benefits. Finally, and most importantly, we assess the quality and credibility of these public goods claims. Using a qualitative coding methodology, we assign a quality score to each initiative-public good combination, based on the following factors: theoretical plausibility, resources allocated to achieving outcome, measurement of relevant outcomes, and inclusion of impacted communities in planning efforts. We find, not surprisingly, that economic benefits like entrepreneurship are the "highest quality" claims of urban innovation initiatives, while social benefits such as racial equity are the least clearly specified and demonstrated.

The goals of this research are both scholarly and practice-oriented. We fill a knowledge gap among scholars studying urban innovation, "smart cities," and related efforts regarding the broader public benefits of those initiatives, especially in relation to social and racial equity. In that regard, our findings – descriptive in its current form – contribute toward a body of scholarship that has been largely critical of the political economy of urban innovation strategies (Clark 2020). However, by identifying conditions and practices that would be more likely to yield inclusive public benefits, we also seek to inform planning practice in progressive ways, so that urban innovation efforts can indeed benefit more than just technology companies and real estate interests.

PRIVATIZATION AND INTER-MUNICIPAL COOPERATION IN US LOCAL GOVERNMENT SERVICES: BALANCING FISCAL STRESS, NEED, AND POLITICAL INTERESTS
Abstract ID: 513
Individual Paper Submission

KIM, Yunji [Seoul National University] yunjik@snu.ac.kr, presenting author
WARNER, Mildred [Cornell University] mew15@cornell.edu, primary author
ALDAG, Austin [Cornell University] ama296@cornell.edu, co-author

The 2007-2008 Global Financial Crisis (GFC) motivated calls for public sector reforms in a highly politicized context. At the center of this context is the 'austerity narrative' (Blyth 2013) that views cuts to public spending and taxes as necessary for recovery, and unions as an obstacle to reforms. With this emphasis on lower costs, the ideas and tools of New Public Management (NPM), such as delivering

services through for-profit contracts ('privatization'), are back in the spotlight. The 'austerity narrative' (Blyth 2013) shows a level of 'discursive convergence' (Pollitt 2002, 477) toward NPM ideas after the GFC that has raised concerns about its impacts, especially in communities with greater need. Do we see convergence on an austerity response (Blyth 2013) reflected in US local government actions or do we see a more balanced approach, as we look across a national sample of local governments (Kim and Warner 2016)?

With high levels of service responsibilities and fiscal autonomy, US local governments are key actors that can push back against austerity or implement it through service cuts and privatization. The two most common service delivery reforms among US local governments are inter-municipal cooperation (contracting with other local governments) and privatization. The use of cooperation is particularly meaningful in the debate of whether NPM tools are compatible with public values (Jorgensen and Bozeman 2002), because previous research finds inter-municipal cooperation, in addition to seeking lower costs, also is motivated by broader goals, such as higher service quality and better service coordination across the metropolitan region (Aldag and Warner 2018). Broader equity and quality goals may limit the cost savings potential of cooperation but may help ensure broader public objectives are met.

We conducted a national survey of US local governments in 2017 to explore which factors differentiate their use of privatization and cooperation in service delivery. In the highly politicized context of more than a decade after the GFC, do local governments prefer the use of NPM tools such as privatization? Or, do they continue to balance fiscal stress and service needs with a broader approach (e.g. inter-municipal cooperation)? Using data on 2,109 US local governments, we build regression models of privatization and cooperation as a function of fiscal stress, capacity, need, place characteristics, political interests, and managerial factors. We find inter-municipal cooperation is responsive to both fiscal stress and community need, while privatization is more responsive to wealth. As US local governments manage the various political and fiscal pressures with service needs, cooperation appears to be the service delivery alternative more closely related to a broader set of public values.

The findings of this study will have practical implications for city planners searching for reforms that balance community needs with shrinking fiscal resources. Moreover, the findings will allow us to test previously established characteristics of privatization and cooperation in a context of long-term fiscal stress.

RECONSIDERING "BUT-FOR" ANALYSIS IN PLACE-BASED ECONOMIC DEVELOPMENT POLICIES: A NOVEL METHODOLOGY FOR EVALUATING OPPORTUNITY ZONES
Abstract ID: 628
Individual Paper Submission

LESTER, Bill [University of North Carolina, Chapel Hill] twlester@unc.edu, presenting author
WILSON, Matthew [University of North Carolina, Chapel Hill] mwilson2@live.unc.edu, co-author

With the passage of the 2017 Tax Cuts and Jobs Act, Congress created Opportunity Zones—the first new economic development tool aimed at assisting low-income neighborhoods in decades. Opportunity Zones (OZ) aim to redirect private investment flows into real-estate projects or local businesses in certain designated census tracts by offering significant tax breaks to wealthy investors. While certain aspects of the OZ law are new, this policy builds on a legacy of federal, state and local place-based policies, including Empowerment Zones, Enterprise Communities, and Tax Increment Financing that seek to leverage private capital to improve economic outcomes and alter the physical landscape in distressed neighborhoods. What makes the OZ program unique is that it is being offered at a time when many central cities are undergoing profound economic change marked by the reversal of decades disinvestment, growing population, and an improved competitive position (Hartley, Kaza, & Lester, 2016 2016). Critics of OZs—and other place-based policies—worry that such policies will end up subsidizing gentrification in that they will encourage investment in areas that are already primed from private sector development (Jacoby, 2019).The critical factor in assessing the effectiveness of place-based policies like OZs is the so-called 'but-for' test, or, asking if the investment outcomes observed would have happened anyway without a public subsidy.   Most place-based policies include some kind of selection criteria to select the geographic areas targeted for public assistance. These criteria typically involve a threshold poverty or unemployment rate, or some kind of "blight test" based on physical deterioration or devalorization.

A critical problem with these selection criteria is that they focus only on the values in targeted census tracts or blocks, and do not consider the levels of distress or market attractiveness in surrounding areas. Thus, a given census tract may qualify as an OZ, based on its poverty rate, but may be located in or adjacent to a rapidly gentrifying area. In this case, the but-for test would fail, and public subsidies may end up accelerating displacement. Alternatively, an OZ located within a much larger disinvested neighborhood, which has seen little or no private investment would closer align with the program's stated goals of providing subsidies needed to stimulate private investments.

In this paper we present a new methodology for answering the 'but-for' test that accounts for the spatial context of potentially targeted tracts and assigns a likeliness score to each tract based on the economic characteristics and investment trends in surrounding areas. We begin with a descriptive case study of the problems with ignoring spatial context when designating the boundaries of place-based subsidy programs. Specifically, we use case of the Lincoln Yards TIF (involving over $1 billion in public funds) in Chicago to motivate this issue. Next, we demonstrate how a spatially-weighted regression model can be used to assess the likelihood of development for each potentially targeted zone. Finally, we compare our spatially contextualized model results to the existing OZ designations in Chicago to evaluate the potential for the OZ program to pass the 'but-for' test in the City. Finally, we conclude by offering recommendations to planners and local officials on how they can better incorporate spatial trends into their own evaluations of local subsidies and capital investment decisions in OZ targeted areas.

SHRINKING CITIES IN URBANIZED CHINA: DIVERGENT DEVELOPMENT PATHS UNDER STATE RESCALING

Abstract ID: 717
Individual Paper Submission

XU, Yuanshuo [Cornell University] yx246@cornell.edu, presenting author

Shrinking cities are now considered one of the most critical challenges in urban planning. However, the issue of urban shrinkage has not been explored much in the developing world, especially in rapidly urbanizing China. The "developing" character tends to divert the research focus to the growing and mega cities, masking the paralleled uneven development and the problem of shrinkage in other cities. In fact, the massive state-led urbanization in China has created different development trajectories for cities.

To fill the gap of shrinking cities in developing contexts, this paper contributes to the study of urban shrinkage in China both methodologically and theoretically. Instead of choosing two time points and calculate urban changes, this paper utilizes an innovative technique, Dynamic Time Warping (DTW) algorithms, to conduct time-series clustering analysis on urban growth and shrinkage. It groups all 290 prefecture cities in China into different urban trajectories from 2006 to 2015, such as continuous growth, recent growth, stabilized shrinking, recent decline etc. The typologies are further created based on the trend of time-series clustering results of urban population and economy dimensions.

Then, the paper further explores the factors that may affect urban shrinkage in China using a multinomial logistic regression. The impacts of state spatial selectivity, local responses to state rescaling, core-periphery neighboring effects and economic restructuring are examined across different urban trajectory typologies. In general, cities in the northern China, especially in the Middle Yellow River region and the Northeast suffer from population loss and economic decline due to not being privileged by the state for development, higher local economic share in resource-based sectors, lower natural growth rate, less competitiveness and attractiveness to the market and developers. In contrast, shrinking cities in the south-central China, especially in the southeastern coast and Middle Yangtze River, can be attributed to their proximity to state-selected high-level large cities that have a gravitational pull of people and economic activities. Since these middle and smaller cities are not favored by the state policies, they are likely to rely on debts to sustain local economic growth.

FOUNDATION COALITIONS AT CROSSROADS: TRACING THE RELATIONSHIP BETWEEN DISCOURSES BY NATIONAL PHILANTHROPIC COALITIONS AND FOUNDATION PRACTICES IN LOCAL ECONOMIC DEVELOPMENT

OH, Jeeson [The Ohio State University] oh.483@osu.edu, presenting author

While philanthropic foundations have long played a role as a partnership builder in American cities, foundations have been increasingly collaborating with each other across larger geographies in the past two decades. In particular, a number of prominent philanthropic foundations have formed national coalitions to collaborate on a specific set of issues across multiple cities. Simultaneously, in cities such as Detroit and Cleveland, national and local foundations have worked closely together to take on leadership roles in forming and implementing local economic development agendas. By analyzing discourses and supported projects channeled by two prominent national foundation coalitions, this paper investigates: How do national philanthropic coalitions and their discourses relate to foundation practices at the local level?

Recent planning scholarship has identified emerging roles for foundations at the local level. In Detroit, high-profile foundations, such as the Kresge Foundation and the Ford Foundation, planning professionals, and private developers have been a driving force in many of Detroit's revitalization initiatives in the past decade (Thomson 2019; Berglund 2020). Berglund (2020) points to the profoundly influential role and decision-making authority these foundation-led partnerships wielded. The foundation-led partnerships, she argues, produced outcomes that exacerbated existing economic disparity in the city. A highly nuanced comparative analysis of the roles local foundations played in urban revitalization across multiple jurisdictions uncovers tremendously complex and highly contextual dynamics of foundation practices in cities (Rocco, 2016).

The findings of this recent planning scholarship highlight potential tension in foundation practices at the local level. While the findings point to potential risks associated with emergent roles of foundations in urban revitalization as observed in Detroit, they also suggest complexities and contextuality of such dynamics. As national foundations often actively engage in local economic development efforts, research on how national philanthropic coalitions and their discursive practices relate to local foundation activities will shed light on the workings of foundations in cities.

This paper investigates this tension at the local level by analyzing the discourses and associated practices of two national foundation coalitions and their selection of local interventions. It presents systematic comparison across different "discourse-coalitions" (Hajer, 1995). The selected national coalitions focus on urban development and include Living Cities and the Funders' Network for Smart Growth and Livable Communities. Living Cities (formerly Comprehensive Community Development Initiative), a coalition between large foundations (12) and financial institutions (6), aims to improve the economic prospect for low-income citizens in over 40 cities in the United States. The Funders' Network for Smart Growth and Livable Communities is a coalition of 175 foundations that support equitable as well as sustainable economic development in regions and communities.

In order to investigate the relationship between national discourses and local activities, this paper uses mixed methods: discourse analysis and grantmaking analysis. It first examines discourses taking place at the national level coalitions. This paper then systematically compares those discourses to descriptions, narratives, and justifications of local economic development initiatives funded or even created by these national coalitions to determine whether meaningful differences or even tensions exist between national discourses and actual foundation practices in local economic development. Interviews with relevant participants provide more nuanced understanding of how foundations may rely on different frames of reference and how meanings may be interpreted differently (Healey, 1996).

This paper finds that discourses at the national level do not always linearly translate into practices taking place at the local level. In particular, key themes such as 'innovation' (which means 'taking risks' in the national discourses) are often in tension with projects those foundations support in urban development, indicating many foundations' knowledge of innovation may not be advanced or transformed through

national discourses.

UNDERSTANDING THE FACTORS INFLUENCING EQUITY WITHIN ENTREPRENEURIAL ECOSYSTEMS: EXAMINING THE ROLE OF DIVERSITY, INCLUSION, AND ACCESSIBILITY
Abstract ID: 769
Individual Paper Submission

HARPER-ANDERSON, Elsie [Virginia Commonwealth University] elharperande@vcu.edu, presenting author

The entrepreneurial ecosystem framework has been widely embraced by economic development practitioners, scholars and policymakers as a key strategy for building strong economies. The aim is to create a network of organizations and key stakeholders who each play a role in creating, nurturing and growing new businesses in hopes that they will mature and contribute to the area's economy. The key is the connectivity which enables knowledge, information, and resources to be disseminated efficiently. The specific patterns of resource-flow through the system have implications for which entrepreneurs, organizations, and communities participate and prosper from a particular ecosystem. Entrepreneurial support organizations (ESO) play a critical role in entrepreneurial ecosystems by acting as the conduit through which individual entrepreneurs receive a great portion of their resources and information. However, not all entrepreneurs have benefitted equally from this process.

Inequality in entrepreneurship has been well documented, particularly among minorities and women. Historically, minority firms have higher closure rates, lower sales, fewer employees and lower profits than white-owned firms (US Census Bureau 2006; Fairlie and Robb 2008; Harper-Anderson 2018). Inclusion and accessibility are two of the primary barriers to minority entrepreneurs accessing critical resources and information through the ecosystem. Prior research suggests that a combination of geographic, industry and network factors help to shape the minority entrepreneur's experience in their ecosystem.

The purpose of this study is to determine which internal and external factors influence the level of equity (diversity, inclusion, and accessibility) for minority entrepreneurs within each ecosystem. More specifically, the study will assess the influence of ESO organizational characteristics, services, policies, and practices as well as external economic and policy factors on equity levels for minority entrepreneurs within the ecosystem in four U.S. entrepreneurial ecosystems (Detroit, New Orleans, Pittsburgh, Atlanta). While most other research on entrepreneurs uses the entrepreneur as the unit of analysis, this focuses on ESOs.

This research takes a multi-method approach employing both quantitative empirical data and qualitative

case studies to examine entrepreneurial ecosystems. An online survey is employed to collect data from ESOs in each study region. Survey data is combined with regional demographic and economic data to control for environmental factors external to the ESO. Regression analysis will be used to assess the impact of each factor on overall equity levels. Interviews provide context around the culture, policy environment, and leadership within each ecosystem. By understanding the influence of internal and external factors on ecosystem equity levels, policies and strategies can be derived to promote and increase diversity, inclusion and accessibility to critical resources, networks and information for minority entrepreneurs and thus improve their chances of starting and running successful businesses within their evolving ecosystems.

RESEARCH UNIVERSITIES AS GATEWAYS: FOREIGN-BORN POPULATION GROWTH IN UNIVERSITY CITIES AND COLLEGE TOWNS
Abstract ID: 793
Individual Paper Submission

OSUTEI, Nene [University of California, Irvine] nosutei@uci.edu, presenting author

In 2017 the foreign-born population of the United States reached its highest share since the turn of the last century. In contrast to previous periods of peak immigration, new arrivals are frequently skilled workers, pursuing advance degrees, or moving to states with relatively low historical immigrant populations. While many studies have pointed to the importance of large research universities as critical to the economic development functions of learning, innovation, and knowledge production, the mechanisms underlying the potential role of universities in the attraction and retention of ethnically and culturally diverse populations to city-regions has received less attention. This study aims to extend the literature concerning the role of universities in economic development by examining their potential to serve as gateways for foreign-born populations and contributors to diversity. More specifically, it examines whether differences in the share of foreign-born residents in US counties with and without research universities can be observed following 1990 amendments to the US Immigration and Naturalization Act. The Act created further pathways to permanent residency for skilled professionals and international students who acquired degrees at US higher education institutions. Using a sample of 258 US counties (distinguished between those containing research universities and those without such institutions), it analyzes the relationship between foreign-born population growth and two experimental indicators of university presence before and after 1990. Results suggest that while a significant share of foreign-born population growth in counties within small and medium-sized cities is attributable to the presence of highly educated residents, counties with a research university exhibited significantly larger foreign-born population growth in the study period than counties without such institutions.

HOUSING THE NEW ECONOMY: AN ANALYSIS OF ECONOMIC DEVELOPMENT AND HOUSING PLANS IN US AND CANADIAN CITIES

Abstract ID: 816
Individual Paper Submission

VINODRAI, Tara [University of Toronto] tara.vinodrai@utoronto.ca, presenting author
MOOS, Markus [University of Waterloo] mmoos@uwaterloo.ca, co-author
IGNATOVICH, Eleonora [University of Waterloo] e2ignatovich@uwaterloo.ca, co-author

Cities have embraced talent attraction as a core element of their economic development strategies (Florida 2018). While the critiques of this approach are well-rehearsed amongst scholars of planning and allied fields, it continues to be a mainstay practice amongst city builders and planners. Urban governments are commonly engaged in place promotion to attract young, highly skilled workers. Relatedly, there is growing concern that housing in major North American cities is becoming unaffordable. While large cities have always been relatively more expensive, there is now concern that there is a growing share of young adults experiencing affordability concerns, and that high housing costs could become a barrier to attracting young, skilled workers (Moos et al. 2018). This has become of particular concern in new economy cities that rely heavily on tech-oriented activity and the service sector for economic growth.

In this paper, we explore whether housing is considered in economic development strategies, and whether housing and economic strategies are linked in metropolitan regions. Neo-liberalization, globalization and financialization have contributed to increasingly market oriented housing provision and land value appreciation in many large North American metropolitan areas. There is growing concern that major cities that are 'successful' in the new economy have become less affordable for, and inclusive of, a broader spectrum of people (Lee 2018; Zukin 2019). Although housing affordability issues should arguably be recognized as social issues in their own right, in the contemporary neo-liberal city, unaffordable housing is increasingly positioned as a potential concern that impacts economic competitiveness by limiting labour flows, especially highly skilled workers seen as central in the new economy.

We conduct detailed content analysis of 131 local economic development plans and 119 housing strategies across 59 metropolitan regions in Canada and the United States with populations greater than 1 million. Drawing on methods used by Filion and Kramer (2011), we code these documents to derive 13 variables capturing the local economic development and housing policy context. We analyze these data to find out if the economic development plans in these metropolitan regions identified talent attraction as a key element of their strategies, whether there was a specific youth or young adult focus related to talent attraction, and if housing and housing affordability issues were considered. Similarly, we assessed housing strategies within these same jurisdictions to determine whether there was a bias toward young, skilled workers. Finally, we assemble socio-economic data from the 2016 US American Community Survey (ACS) and the 2016 Canadian Census for these jurisdictions. We conduct an exploratory quantitative analysis using these socio-economic and policy variables to establish the types of relationships that exist between concentrations of a young, skilled workforce, housing affordability and the local economic development and housing policy context.

We find that most strategies tout the presumed value of 'talent attraction', particularly young workers, as well as the importance of housing. Yet, in most cases, housing and economic development strategies are not explicitly linked, especially when it comes to actionable items. We empirically evaluate whether

lower income households receive less attention in housing strategies, as affordability has become a middle- and upper-class concern. We find that most housing strategies consider low-income and marginalized populations, especially in the US due in part to federal requirements. We also find that young adults entering the housing market for the first time receive little explicit attention in housing strategies. We conclude that these two domains of planning remain largely disconnected in practice and argue that economic development planners must actively consider housing market dynamics and affordability. Moreover, planning scholars have a role in drawing closer attention to the relationship between these domains.

THE IMPORTANCE OF TECH-FIRMS IN LEASING AND DEVELOPMENT MARKETS: ITS IMPACT ON MARKET PRACTICE AND EMERGENCE OF NEW SUBMARKETS IN CHICAGO
Abstract ID: 923
Individual Paper Submission

KIM, Youngjun [University of Illinois at Chicago] youngjunkim84@gmail.com, presenting author

Over the last decade, growing interest in tech firms as anchor institutions and ecosystem for knowledge-intensive firms have shifted the focus of many cities to accommodate firms and jobs in tech-sector as a driver of economic development. From the perspective of economic development, tech-sector is viewed as a provider of public benefits: providing high-quality jobs and growing rapidly, which continues to trigger real estate development in the locality. After the recent global financial crisis (GFC), the local government and media emphasized the role of tech-firm and startup in the local economy and its growth as a key indicator of the local economic achievement in the same way as many other metropolitan areas.

However, according to the County Business Patterns data, Chicago has shown 11 percent of employment growth in tech-sector while broader geographies such as Cook County (8.6%) and Chicago MSA (16.2%) have lost a significant number of IT jobs. Even though the overall CBD submarkets in Chicago has shown growing a trajectory in this particular economic sector, the only gains are drawn by emerging submarkets such as River North and West Loop and the rest of existing CBD submarkets have lost IT employments during the recovery period from the GFC. The recent submarket creation in Chicago is driven by the overall economic growth of the city to some extent, but it may be linked to the outcome of the interplay between the new urban redevelopment politics and changing market practices in the GFC period.

While we have witnessed the uneven development in office market development since the post-crisis, there is a gap in the literature that investigates the role of urban politics and their practices in the marketplace of how these submarkets are formed and its implications on urban space. This study views the emergence of new inner-city submarkets in the post-2008 period as 'a co-constructed process' of urban development that facilitated by both public and private sector to focus on identifying the micro-dynamics of rising submarkets and unfolding abstraction of market in boom and recovery period (Weber 2015). The study asks about: what is the role of urban politics in this particular urban transformation and how new development politics and networks have engaged in this process in relation to the growing tech

and startups in marketplaces. This research employs a mixed-method approach: interviews with local stakeholders in the development of emerging submarkets; extensive archival research at two submarkets; and analysis of the consolidated database from zoning, planning instrument, development project profile, transaction and financing of project.

The study identifies new politics and networks (i.e., real estate developer, institutional investor, local government, technology company, and hospitality group) have emerged and intensified throughout the post-GFC period that control and manage a wide range of the portfolio within a submarket. The study rethinks a portfolio not simply as a form of asset management but as a way of practice in which provides both spatial and temporal control that allows to internalize and capitalize the aggressive expansion and growth of rising blue-chip tenants within a short period of time. The local economic development institutions also engaged with the creation of the new submarkets and development vehicle by providing incentives and adopting private sector approach, which shifted local office demand from one place to other and promoting old industrial space to global investors. These findings problematize the assumption that naturalizes the direct relationship between macroeconomy condition and the inner-city revitalization in the current era; and revisits the role of local government and planning in local marketplace during the period of boom cycle that typically undermines the significance of planning and public sector.

GRANPAYEHVAGHEI, Tahereh [University of Texas at Arlington]
tahereh.granpayehvaghei@mavs.uta.edu, presenting author

Following the evolution of a global, service-oriented economy in which arts, culture, and creative clusters are economic assets that help regenerate and revitalize particular places, cultural and creative policies aim at enhancing local communities. Creative clusters are thought to be catalysts for sustainable economic development; they provided 29.5 million jobs globally, and with a global revenue of 2,250 billion $US, the industry exceeded Telecom services revenues, and surpassed India's GDP (EY 2015).

With all the competitive advantages of the inner city for industry clustering (Porter 1998) in general, these advantages are especially present for the creative industries dependent on "the salient features of the innovative milieu of the 21st-century inner city" (Hutton 2006, 1822). Creative clusters, in general, are expected to be more centralized than other industries, partly as a result of their need for proximity to better facilitate information flows vital to these industries.

This research investigates whether and to what extent specialized creative clusters contribute to the firm

productivity in their local community. The relationship and effects of creative clusters on firm productivity and local and regional economic development is a relatively understudied and assumed part of the creative economy. In most extant empirical studies about the benefits of clusters for creative firms, the subject of research is limited to either the creative cluster as a whole, one or few industries in particular, or the number of artists or creative workers, and not the relationships within the different creative clusters of various types.

This study seeks to address these gaps by investigating creative firms' productivity in specialized creative clusters, drawing upon a typology of creative clusters based on a comprehensive list of the NAICS codes (Markusen et al. 2008). This is one of the first national studies that uses disaggregated address-level employment size and sales volume for all firms within 20 metropolitan areas in the US to measure and compare the benefits of creative clusters for the creative firms. The author categorizes the creative industries into eight separate groups of 1) performing arts, 2) visual arts and photography, 3) film, radio, and television, 4) design and publishing, 5) educational services, 6) software publishing and gaming, 7) crafts and jewelry, and 8) museums and collections. Using cluster analysis to find specialization among creative clusters, this research compares two methodologies for investigating the relationship between firm productivity and the location of creative firms.

The results of regression analysis and propensity score matching methodologies demonstrate a positive and statistically significant relationship between the creative clusters and firm productivity for most of these clusters, as supported by the literature. The sales volume for both creative and non-creative firms within the clusters is significantly higher as compared to non-cluster areas, for some of the specific sectors such as gaming and software publishing as well as media. This approach offers a systematic and comparative analysis across the country, by studying the creative clusters in terms of their relationship with firm productivity.

Planners and policy makers can benefit from the findings of this study as it measures to what extent creative firms may benefit from clustering patterns in cities, while also providing a basis for assessment of cities' success for creative and cultural policies and strategies in the studied metropolitan areas. Instead of anticatalysts epitomizing inequality and gentrification, a thorough understanding of where the specialized or diverse creative clusters locate and to what extent they benefit the firms can enable policymakers to utilize the benefits of these clusters as effective catalysts for urban and rural revitalization.

BUILDING OPPORTUNITY: HOW ECONOMIC DEVELOPMENT PRACTITIONERS LINK OPPORTUNITY ZONES TO PRE-EXISTING PROGRAMS

DONEGAN, Mary [University of Connecticut] mkdonegan@gmail.com, presenting author
GREEN, Jamaal [University of Pennsylvania] jamaal.green@gmail.com, co-author
KIM, Minjee [Florida State University] m.kim@fsu.edu, co-author

Opportunity Zones (OZs) are the latest in a long line of urban programs meant to spur economic development in low-income neighborhoods. Considerable research suggests that similar incentive programs—including place-based programs, such as Empowerment Zones, and programs that target individual firms, such as those used during Amazon's HQ2 search—are not a panacea for urban problems. Still, after decades of practice and research, local practitioners have also learned how to make these programs work better for communities, for example by requiring Community Benefits Agreements or targeting distinct industries. As one of the largest federal programs to be rolled out in recent years, OZs thus provide an opportunity to ask: have local government applied lessons learned from these previous programs in their responses to and strategies for OZ development?

Opportunity Zones remain relatively new. Their designation was included in the Tax Cuts and Jobs Act of 2017, and allowed states to declare up to 25% of low-income tracts to be Opportunity Zones; private investors, in turn, can defer capital gains invested into the zones, and even waive them altogether if the investment is held for ten years. OZs are thus a novel approach to marshalling private dollars into neglected communities.

Yet local policymaking is an iterative process, with practitioners reconciling new institutional realities against existing institutional structures and logics. How practitioners frame new programs (like OZs) against established practices and approaches to economic development thus has implications for the responses they choose to undertake—and the impact newer programs have. For example, cities that identify similarities between OZs and more traditional firm-based incentive programs might respond by layering complementary programs together to achieve previously-determined community goals, by ensuring community groups have meaningful participation at critical junctures throughout the development process, or by prioritizing brownfield redevelopment and historic preservation, etc. Alternatively, cities may instead frame Opportunity Zones as a unique federal program that leaves little room for community input or involvement may choose to not develop such find-tuned responses.

We therefore ask three questions: First, how do practitioners frame OZs and theorize differences and similarities between OZs and established incentive programs? Second, what lessons have planners learned from past programs and initiatives—and to what extent and how have they applied these lessons to OZs? Third, what examples or lessons can we draw from studying heterogenous responses to OZs that we can apply to future programs?

We focus on the case of Connecticut to address these questions. Connecticut has 72 Opportunity Zones, drawn from 27 urban, rural, and suburban municipalities. Our data includes marketing materials produced by the state and all of these municipalities, media coverage and archival documents, and interviews with municipal and state officials (both elected and appointed).

We find substantial heterogeneity in responses to OZs. While practioner framing impacts prioritized projects and strategies, so, too, do pre-existing resources. We conclude with thoughts on how future economic development programs could include instructive efforts to help planners draw connections between newer and existing or former programs, but also on what role state government could play to help "level the playing field" between diverse municipalities so as to not reinforce pre-existing inequalities.

FIRM NETWORKS, GLOBALIZATION, AND INTER-REGIONAL DIVERGENCE: A RELATIONAL PERSPECTIVE ON UNEVEN ECONOMIC DEVELOPMENT
Abstract ID: 1060
Individual Paper Submission

BUCHHOLZ, Maximilian [University of Toronto] max.buchholz@mail.utoronto.ca, presenting author
BATHELT, Harald [University of Toronto] harald.bathelt@utoronto.ca, co-author

Average income levels of U.S. urban regions have been diverging since about 1980. The cause of varying degrees of economic development across city-regions is typically argued to be a function of differing levels of human and physical capital at the urban-regional level. And yet, it could also be argued that these factor endowments may not be the causes of regional economic development, but instead are the outcome of even deeper processes that shape economic disparities across city-regions.

This paper argues that urban income levels and development are not just dependent on local factor endowments but are instead dependent upon a larger fabric of actors' economic relations at the local, national and international levels. Focusing on CBSAs (core-based statistical areas) in the United States, this paper identifies the patterns of firms' ownership networks between cities that form a basic architecture through which crucial knowledge flows and transaction relations unfold. We argue that it is through these channels that innovation processes are stimulated and growth impulses transferred which impact urban income development. For the period from 1993 through 2017, we use a large-N database of firms' ownership networks to first trace how changes in these networks are related to qualitative understandings of inter-regional inequality and divergence. We then propose an alternative approach to conventional models of regional economic development that centers on the impact of local, national and international connectivity on urban income levels. Using a combination of social network analysis and longitudinal regression models, we find that our relational model of regional economic development strongly predicts differences in average income levels across U.S. CBSAs. In particular, we find that both local connectivity and urban scale stimulate economic development, as well as the degree of national and international connectivity of firms within a city-region. The results are consistent with a number of case studies that highlight the need to foster increased linkages between actors within and across city-regions in order to stimulate regional economic development.

WHEN STATE ECONOMIC DEVELOPMENT PLANNING SUBVERTS LOCAL PLANNING: THE CASE OF EMPIRE STATE DEVELOPMENT CORPORATION IN EAST GREENBUSH, NEW YORK
Abstract ID: 1116
Individual Paper Submission

MARCELLO, Elizabeth [Columbia University] elizabeth.marcello@columbia.edu, presenting author

The Empire State Development Corporation (ESDC), New York State's chief economic development agency, is a powerful public authority that can condemn property, issue tax-exempt bonds, and override local zoning ordinances. The ESDC plays a critical role in shaping local planning and policy outcomes through its use of loans, grants, tax credits, marketing, and other forms of assistance primarily brokered "behind the scenes" and sometimes at the expense of local public planning. Using existing literature on the politics of planning (Forester, 1989), the role of public authorities (Doig, 1983; Radford, 2013), and intergovernmental relations (Sbragia, 1996), this paper seeks to better understand how this state entity acts in (and on) localities by using the case of ESDC grants to Regeneron Pharmaceuticals, Inc. in East Greenbush, New York.

Regeneron Pharmaceuticals, Inc. is an internationally renowned biotechnology company. In September 2018, the company announced it would invest $800 million and hire an additional 1,500 employees in East Greenbush, where the company already operated a manufacturing facility. At the same time, Empire State Development Corporation (ESDC) announced $70 million in capital grants to Regeneron for the expansion. Loretta Beine, the director of industry and life sciences at ESDC, told ESDC's board of directors in a meeting that the company would have expanded to Ireland without the incentives.

As of early 2020, the company's expansion is progressing thanks in part to the support of Empire State Development Corporation and steps the authority has taken to expand the biotechnology sector in the region. In East Greenbush, existing roadways and sewage facilities are insufficient to accommodate Regeneron's expansion. Further, the Town Board says it does not have adequate amenities that would motivate Regeneron employees to live in the town and spend money locally. While plans are underway to upgrade necessary infrastructure and the town is receiving development proposals for luxury apartments and other amenities suited for Regeneron employees, the town finds itself in a precarious situation. East Greenbush is a recipient of Regeneron development and expansion, rather than an active player in shaping its own future. Regeneron is changing the fabric of the East Greenbush community while the Town Board struggles to keep pace with the changes.

Through interviews, site visits, and media and document analysis, this paper explores the East Greenbush case in detail. This paper concludes that, first, while statewide public authorities can facilitate planning by providing financial, administrative, or other resources that may be lacking locally, they can also interfere with local planning efforts by imposing their own goals on local government. Second, a public authority brings a level of opacity to the local development process both in terms of its lack of transparency to local officials and residents and in terms of its ability to ignore local planning regulations and regulations regarding resident participation in the planning process.

RACIAL SEGREGATION AND SPATIAL INEQUALITY OF OPPORTUNITY
Abstract ID: 1120
Individual Paper Submission

EOM, Hyunjoo [University of Maryland, College Park] hjeom15@gmail.com, presenting author

Given recent structural changes in urban geography that are largely characterized by expansion to suburbs, this research investigates the spatial inequality of opportunities within metropolitan areas relating to the suburbanization of blacks and the locational patterns of jobs. Based on studies that argue the spatial disconnection between blacks and job opportunities continue in racially segregated suburbs and blacks have no choice but to sort into "unattractive" suburbs (Johnson, 2014; Moretti, 2012; Theys et al., 2019), it is argued that such patterns created spatial inequality between neighborhoods well beyond the boundaries of the inner city. Moreover, studies have shown that job growth most often occurred nearest concentrations of affluent, native-born whites and away from concentrated minority populations. To examine whether such trends have created spatial disparity within American cities, the spatial divergence in the locational distribution of black concentration and job opportunities are examined separately for neighborhood subareas (the inner-city, the inner-suburb, and the outer-suburb) using the decomposition of inequality measures. This provides an indication of whether urban structural changes in recent decades have shifted the "inner-city problem" of the SMH to other parts of metropolitan areas, and how these contributed to the spatial disparities within MSAs. The findings reveals that compared to existing notion that suburbs are homogeneous entities, the spatial distribution of blacks and jobs in the outer suburbs are greatly diverged and the inequality of opportunity across neighborhoods are greater in the outer suburbs than in the inner city depending on the development patterns of metropolitan areas. In metropolitan areas with suburban expansion in the Southern region – Atlanta, and Dallas – much of the inequalities are derived from the outer suburb, suggesting growing inequality between opportunity-rich neighborhoods and opportunity-deprived neighborhoods within the outer suburbs. This suggests that urban structural changes involving suburban expansion in metropolitan areas increased inequality in the suburbs, requiring more attention paid to more balanced suburban growth as much as the redevelopment projects in the inner city for achieving spatial equality in American cities.

AN INPUT-OUTPUT ANALYSIS ON ECONOMIC DEVELOPMENT AND GENDER EMPLOYMENT GAP IN CHINA
Abstract ID: 1197
Individual Paper Submission

YAO, Ye [Rutgers, The State University of New Jersey] ye.yao@rutgers.edu, presenting author
LAHR, Michael [Rutgers, The State University of New Jersey] lahr@rutgers.edu, co-author

Economic development and structural change have different impacts on labor force participation in terms of different gender and sectors. In recent decades, the growing female labor force participation rate has reduced the gender employment gap. By the end of 2017, employed females accounted for 43.5% of the total employed population, which have already exceeded the 40% target set by the China Women's Development Program (2011-2020) for 2020. However, the gender gap in the labor market still existing regarding different occupations and sectors. In this context, this paper evaluates the impact of economic growth and structural change patterns on the evolution of gender employment gaps in China. We explore the influence of consumption, investment, trade, technology improvement, and employment intensity on employment changing in the combination of time, gender, sectorial, and education level aspects. As an empirical study, we use the multisectoral input-output model to analyses structural, intersectoral and technological changes, as well as their impacts on Chinese gender employment gaps from 2002 to 2017. Our results show that economic structural change contributed to reducing the gender employment gap in China. More specifically, we observed a structural change steering China towards more female employment per unit of total output, and a shift toward a more service-oriented economy. The increase in final demand (scale effect) in terms of urban consumption and investment is also an important driver of employment growth. This paper has a contribution to revealing the relationship between economic development and gender equality in the Chinese labor market. In addition, our work is a first step in the study of female employment and gender gaps for China with Input-output model.

GROWTH BEGETS GROWTH? THE DECENTRALIZATION OF THE BUSINESS PROCESS OUTSOURCING INDUSTRY IN THE PHILIPPINES
Abstract ID: 1208
Individual Paper Submission

STERN, Justin [Yale-NUS College] justindstern@gmail.com, presenting author

The Philippines is a major global hub for the business process outsourcing (BPO) industry, through which operations such as customer service work, back-office accounting, digital animation, and human

resources management are subcontracted to third parties. As the country's second-largest source of dollar income, BPO directly employed about 1.3 million people across the Philippines in 2018. Scholarly questions are increasingly surfacing in an interdisciplinary context about the impact of the BPO sector, and "offshoring" more generally, on economic growth and urban development in metropolitan regions across the Global South.

This paper focuses on the decentralization of the BPO industry in the Philippines. In the Philippines, the vast majority of BPO offices are concentrated in Metro Manila. Over the previous decade, national and regional government agencies and private trade and industry associations alike have worked to propel the BPO industry into a handful of midsized cities. This paper documents these strategies and, in doing so, asks the following questions: What are the unique challenges faced by midsized cities in the Philippines as they attempt to capture inward investment from the BPO industry? How do midsized cities market themselves as BPO hubs? Is the expansion of the BPO industry in midsized cities, including the urban development projects it has triggered, distinct from those in Metro Manila? And, finally, what are the "urban futures" of the BPO industry in midsized cities, given rapid economic and technological change?

To answer these questions, the paper draws on three months of field research conducted in the Philippines. I focus in particular on the experience of two mid-sized cities, Bacolod and Iloilo, which are located in the Visayas region of the country. I adopt a mixed methods approach, which includes spatial analysis, observational analysis, industry analysis and semi-structured interviews with business leaders, politicians, urban planners and BPO office workers.

Through this analysis, I draw attention to the different strategies that are being taken in the Philippines to decentralize what is currently the country's fastest-growing industry. I argue that the decentralization of the BPO industry is placing significant pressure on midsized cities to invest in electricity and telecommunications infrastructure, office space, technical training schools, and other initiatives so as to attract multinational corporations in the outsourcing sector. Such investments represent a significant reallocation of resources for metropolitan and provincial governments, and, in some cases, have resulted in the construction of excessive office space, unnecessary infrastructure, or a combination of the two. The paper concludes with a more generalizable discussion of how automation in the BPO sector undermines much of the economic development policy currently being implemented in the country.

EVERGREEN: THE PERSISTENCE OF GREEN INDUSTRY GROWTH AND LOCAL ECONOMIC DEVELOPMENT PROSPECTS
Abstract ID: 1229
Individual Paper Submission

ODEN, Michael [University of Texas at Austin] oden@mail.utexas.edu, presenting author
LIU, Haijing [University of Texas at Austin] hjliu@utexas.edu, co-author

"Green" industries had a brief stint on the center stage of local economic development planning. But among many practitioners and analysts, the green industry road show has definitely moved on due to the failure to expand regulatory initiatives (particularly related to climate change) and the boom in domestic oil and gas resources leading to quiescent energy and materials prices. In recent years many local economic development practitioners have downgraded green industry development as a strategic focus, yet other entities in many cities have continued to promote green industry growth (e.g. sustainability offices, climate action planning offices, local utilities, etc.) The aim of this paper is twofold. First, we will conduct a careful assessment of the size, composition and growth of green industry employment, detailing shifting growth patterns in green industry segments. Using two scenarios we will estimate green industry employment growth (2010-2018) and projected growth (2018-2028). Second, we will examine the current status of green industry development strategies in broader urban development processes and institutions highlighting especially import-substituting "green" activities promoted through local sustainability initiatives.

This paper aims to evaluate recent "green" industry development activities through several angles. We will analyze national industry data to estimate aggregate growth in green industries (2010-2018) and patterns of growth and decline among specific industries (at the NAICS 3 digit subsector level). We hypothesize that aggregate employment growth in green industries has been higher than aggregate national employment growth through 2018. This will be supplemented by using BLS industry growth projections through 2028 to estimate potential future green employment growth. If green industry growth is robust under the current policy and regulatory set up, a more supportive set of national policies could transform environmental industries into a significant future driver of national and regional economic growth.

We will utilize the Bureau of Labor Statistics Green Goods and Services Survey (2012) to estimate green industry shares (as of 2011). These BLS share estimates will be applied to 2018 national QCEW industry employment estimates to estimate green job growth between 2011 and 2018 and to the BLS employment projections through 2028. This simple exercise will provide a baseline estimate of the size, composition, growth and projected growth of green industry employment over the periods. We will then draw upon academic and industry studies to develop an alternative scenario based upon adjusting the green shares of industry employment detailed in the 2011 BLS estimates. This will produce high and a baseline estimates of aggregate and industry specific green job growth.

Finally, we will relate recent performance of environmental industries to an earlier hypothesis put forward by the author(s) that in conditions of weak regulatory action and stable and relatively low energy prices a select set of import substituting, conservation-related industries and activities have constituted the most promising targets of local economic development planning (Oden and Young, 2014). This claim will specifically evaluated by the authors by more in-depth case studies from two case regions: Austin Texas and Buffalo, New York. The cases are selected based upon and earlier emphasis on import substituting green industry development (Austin) and export promoting green activity (Buffalo).

THE ROLE OF SUB-CENTERS IN U.S. CITIES
Abstract ID: 1253
Individual Paper Submission

OSMAN, Taner [University of California Los Angeles] tanerosman@ucla.edu, presenting author

Despite signs of reversal in some cities, the great majority of employment in U.S. metropolitan regions is located outside of central areas. For the most part, employment decentralization is measured in a binary way, whereby the share of employment in central business districts is compared to the share of employment in the rest of regional economies. This approach provides few insights into the nature and form of employment decentralization, such as whether employment decentralization is diffuse and random in nature or concentrated into numerous centers of relatively dense activity. A notable exception in this regard is work on sub-centers, where, using a variety of different methods, researchers identify multiple agglomerations of activity within cities. Due to both data and computational limitations, the detection of sub-centers is mostly limited to the analysis of single regions. No study has attempted to measure the extent and importance of sub-centers to regional economies as part of a comprehensive, multi-regional analysis.

While, in U.S. cities, employment has mostly decentralized from CBDs since World War Two, limited evidence shows that a small number of sub-centers throughout a region can account for as much as 48% of all metro region employment (Cervero and Wu 1997). This study seeks to measure the presence of sub-centers across the largest 100 metropolitan regions in the U.S. The research is motivated by three primary research questions. First, what percentage of employment is found within sub-centers across cities, and does this vary by city size and region? Second, what is the nature of employment activity within sub-centers and which industries tend to locate in sub-centers? Third, has employment within sub-centers become more or less pronounced over time?

The Census Bureau's Longitudinal Employer-Household Dynamic (LEHD) program will be the primary dataset employed in this analysis. LEHD provides employment counts by 2-digit NAICS category for census block groups over the period 2002-2017. For the largest 100 combined statistical areas (CBSAs), sub-centers will be identified following the approach of Redfearn et al. (2012), who employ locally weighted regressions to detect local peaks of employment density within regions.

This research is guided by the idea that employment decentralization in U.S. cities is more nuanced than may be widely perceived. The primary hypothesis of this research is that significant economic activity, while not found in a single CBD, is found in multiple sub-centers of dense activity throughout cities, which approximate many of the benefits of central business districts.

BROKEN DEVELOPMENTAL PROMISES? HOW THE GOVERNMENT IMPEDED LOCAL ECONOMIC DEVELOPMENT ANCHORED ON FDIS IN THE CASE OF SONGDO, SOUTH KOREA

Abstract ID: 1255
Individual Paper Submission

JUNG, Namji [Seoul National University] namji.jung@gmail.com, presenting author

Foreign Direct Investment (FDI) through multinational enterprises (MNEs) has become an important source of local economic development. More countries are adopting policies to attract FDIs with industrial targeting and special economic zones. However, evidence that MNE (FDI) has delivered continued and sustainable economic development to localities is surprisingly scarce. Even where zones have successfully generated investment, the benefits to the hosting locality have often been hard to detect.

Songdo, a free economic zone in the City of Incheon in Korea, is not an exception. On January 14, 2002 the Korean government designated Songdo as a site of the new Hub city to induce new FDIs, accommodating a Techno Park and Knowledge and Information Industrial Complex. Songdo meticulously followed FDI-led economic development strategies to forge regional assets to fit MENs' needs. After ten years of the program, however, Songdo continues to lag.

Existing studies account for such cases by placing the emphasis on the lack of MNE-local linkage development. Taking this approach one step further, this article delves into what lies behind the lack of the MNE-local linkage development from the perspective of the role of the government. I do it by building on the structure-agency approach. I found that, while Songdo succeeded in hosting FDI, the synergic effects of industry clustering have not materialized mainly because diffused supports and constant interventions from the national government that have disrupted locally specific strategies, such as industry targeting. Although the national government empowered localities to implement their own Free Economic Zones, it also directly and indirectly imposed its own interests through the legal systems and upper level national plans: for instance, the Korean government directed local FEZs to undertake national industrial policy goals. Songdo was thus required to target MNEs in biotechnology and IT, even though it did not have an existing technological, human resources, or industrial base able to benefit from MNEs in such sectors.

A telling piece of evidence is that, while Songdo struggled, other MNEs in Incheon (outside of Songdo) with more connections to the area's existing industry, such as the electronics and auto industries, show active collaboration with local firms. SMEs in these sectors, not only benefit financially from collaboration with MNEs, they also receive active knowledge and technology transfer and workforce training. This strongly suggests that the trouble lies with the national directive steering local economic development policies in Songdo toward firms it would have had difficulty attracting and away from using its existing resources and advantages.

EMPLOYMENT IMPACTS OF BUILDING ALTERNATIVE FOOD SYSTEMS

Abstract ID: 1270
Individual Paper Submission

KELMENSON, Sophie [University of North Carolina at Chapel Hill] soph@live.unc.edu, presenting author

The local food literature analyzes systems of production and distribution of local foods as an opportunity for sustainable economic development that combats the barrage of negative impacts on human health and the environment, loss of small farms and food businesses, and the increasingly reliance on inequitable labor practices that are associated with industrial agriculture. Local food and environmental advocates encourage an understanding of local food that connects ecological sustainability with social and economic justice, so that the development of alternative food systems (AFS) offers an interdisciplinary opportunity to bring about sustainable development on several levels (Feenstra, 1997; Born and Purcell, 2006; Donald, 2008).

Intermediated supply chains and larger-scaled systems have become potential assets to shift our food system to more equitable and sustainable practices, where researchers have called for the return of the medium sized farm that relies on wholesale markets and the sales of value-added goods, instead of focusing solely on selling directly to consumers in places like the farmers market. This presentation unpacks a crucial element of this recipe – labor beyond the farm. There is very little research analyzes labor across AFS, and specifically there is little understanding of the work involved in creating the food systems that will meaningfully shift food production and consumption away from industrial agriculture. From frequently small, "grassroots"-esque beginnings, how is work to develop alternative supply chains stimulated? What types of work are necessary to establish and expand sustainable food systems supply chains? What are the spatial patterns for labor demand in this industry? How do these jobs fit into the sustainability paradigm with respect to equity, quality, and environmental protection?

This study empirically estimates the effects of the Local Food Promotion Program on job stimulation from 2014 to 2017. Specifically, it unpacks the influence of this grant program on job creation beyond the job stimulus reported in final grant deliverables, instead examining the county level trends, in order to better understand broader supply chain and industry growth dynamics. Second, it examines the role of existing local food infrastructure and policy as foundational to extending intermediated supply chains for local food, finding that, while efforts to "go beyond local" are important, they may also serve as a critical foundation. Third, it connects this job growth with the first assessment of job quality, equity and inclusion outcomes, as well as spatial patterns of work and supply chain geographies within the industry by relying on a novel dataset document alternative food system jobs over the last decade.

EXPLAINING PROPERTY TAX COLLECTION DISPARITIES IN MEXICAN MUNICIPALITIES
Abstract ID: 1363
Individual Paper Submission

ECHAVARRIA, Aurora [University of California Los Angeles] aechavarria@g.ucla.edu, presenting author

Property taxes are one of the most important sources of income for Mexican municipalities. However, collection rates in the country are very low (0.3% of GDP), even in comparison to other countries in Latin America. Insufficient local revenues mean cities under-invest in important urban services and infrastructure, such as waste collection, transit networks, and additionally, limit their planning capacities. Achieving a better understanding of the factors that limit property tax collection can be instrumental in improving quality of life, health, and environmental resilience amongst the population in Mexican cities. This study asks why some cities have greater revenues from property taxes. To answer this question, I first analyze the differences between cadaster values and market property values in a number of Mexican municipalities, as a proxy for potential missed revenue for the years 2012-2017. I then analyze the differences in tax revenue collection amongst different municipalities, and assess the role of municipal debt, the presence and involvement of planning institutes, the date of last update of cadaster system and land use plans, as well as urban form variables. The analysis will contribute to the growing body of research on local government performance in Mexico, and present new insight into the factors that influence and interact with increasing revenue streams in Mexican local governments.

DOES LARGE-SCALE ANNEXATION OR CITY-COUNTY INTEGRATION POSITIVELY AFFECT LOW-INCOME RESIDENTS?
Abstract ID: 1384
Individual Paper Submission

HILL, Ned [The Ohio State University] hill.1973@osu.edu, presenting author

Large scale municipal annexation is a public policy that has received support from planners and urban political scientists as a tool to both provide revenue elasticity for central cities and opportunity for low-income residents. In this research we superimpose pre-annexation boundaries on the small number of municipalities that experienced large-scale annexation or county-city integration. We then examine the socio-economic conditions of residents who live within the original city limits and compare them to

residents of central cities that did not annex aggressively. We will restrict our universe to annexations or integrations that took place after the Second World War.

The literature on annexation will be reviewed; examples see Planning Advisory Service Bulletin 114 (1958), David Rusk's work for the Brookings Institution: Inside Game/Outside Game (1999) and Annexation and the Fiscal Fate of Cities (2006), Carr and Richard Feiock (Political Science Quarterly 2001), Mary Edwards (Journal of Planning Literature 2008), and Smith (Southeastern Geographer (2011). However, our quick scan of the literature indicates that it focuses on the motivations for cities to annex, not on the outcomes from the annexation or integration on residents and the fiscal condition of the annexing municipality. Here the Wikipedia page on Consolidated City-County is helpful.

Our research strategy is to first find the beginning of the annexation or integration and then identify a municipality that is a match before annexation takes place. There are three components to the analysis. First, we identify the motivation for the annexation. The we examine the integration of municipal services, especially public safety and schools, and the fiscal condition of the municipality compared to its match. This will be done by examining the Consolidated Annual Financial Reports (CAFR) and school district data. Students, crime, and fiscal outcomes (including bond ratings) will be compared. Third, we examine differences in socio-economic outcomes for people who live inside the original city limits.

The number of observations may not allow for the use of econometric techniques, such as difference-indifference regression models. Central Cities that have undergone large scale annexation include Columbus (Ohio), Indianapolis (In), Lexington (Ky), Jacksonville (FL), Kansas City (KS), Louisville (Ky), Miami (FL), and Nashville (TN). We also need to recognize that public schooling is often a county function in southern states and a municipal function in northern states.

Pre-war annexations took place in Atlanta (GA), Baltimore (MD), Denver (CO), New Orleans (LA), New York (NY), Philadelphia (PA), and San Francisco (CA). In these cases, the merged city-county is now hemmed in by municipalities and can no longer expand. Georgia has two smaller city-county integrated governments, Athens and Macon.

PROGRAMMATIC INNOVATIONS ON POST-DISASTER SMALL BUSINESS RECOVERY PROGRAMS.
Abstract ID: 76
Poster

KIM, SUA [University of Utah] sua.kim@utah.edu, presenting author

Small businesses are critical stakeholders in local economic recovery after disasters. And their resilience against disasters can affect that of the economic development as a whole. But rarely do they receive the same level of attention or aid as their neighboring households. Unlike large and medium-sized businesses, small businesses are particularly vulnerable to disaster recovery. Small businesses tend to have fewer

financial resources, less access to political capital, take fewer mitigative actions against disasters and generally are less prepared for disasters. Small businesses not only have fewer programmatic options to aid them in their post-disaster recovery, but these programs often require significant and tedious paperwork that acts as a barrier to business participation. For instance, the U.S. Small Business Administration (SBA) requires small businesses to show Credit Requirements (e.g. credit history, repayment, and collateral) to receive a disaster recovery loan, which some small businesses cannot easily provide. Furthermore, existing small business recovery aid programs underutilize the recovery moment as an opportunity to promote long-range mitigation and resilience actions such as business continuity plans. Also, small businesses are less likely to adopt disaster mitigation and resilience-based strategies. It is unclear as to whether small business recovery programs, sparse as they are, provide an opportunity to take mitigative actions against the next disaster. This missed opportunity is rendered even more significant in light of the fact that businesses are more likely to do mitigation and resilience planning immediately after a disaster, rather than before it occurs.

While research on indicators of disaster resilience has grown significantly in the last few years, much less is known about programmatic dimensions of resilience-building. Insights from disaster planning and environmental management literature suggest that programs that focus on mitigation and resilience-thinking generally share a set of specific characteristics. They encourage long-range planning, including mitigation planning; encourage adaptive thinking in the face of uncertainty, such as through circumventing red tape; promote the use of creative funding mechanisms, to work around resource constraints; increase engagement with nonprofits to improve resource availability; and promote networking and collaboration between various stakeholders to better identify local needs and improve response.

This paper uses this resilience-focused framework to examine whether small business recovery programs are utilizing the opportunity presented by disaster recovery to promote mitigation and resilience-thinking. We review business recovery plans, grant programs, loan programs and other economic recovery schemes in six disaster-affected cities, namely New York City, NY and Hoboken, NJ (2012 Hurricane Sandy); Charleston SC and Hilton Head SC (2016 Hurricane Matthew), and Port Aransas TX and Houston TX (2017 Hurricane Harvey) to identify program aspects such as implementing agencies (federal, state or local), scale of implementation (state or local), primary funding source, and programmatic innovations. These include creative financing mechanisms, incorporation of mitigation or resilience-focused actions(e.g. promoting use of insurance, business continuity plans, structural upgrades, and etc), and other innovations such as involvement of nonprofits in program design or implementation, efforts to reduce red-tape. We expected that some programs are more likely to mitigate for the next disaster, others programs only focus on recovery right after disaster despite of the fact that they name the mitigation.

This study fills many gaps in the literature. It sheds light on small business recovery after disasters, its relationship with disaster recovery policy, and the ways in which the post-disaster recovery moment can be used as an impetus to promote resilience-based thinking in the long-run.

EVALUATION OF ECONOMIC RESILIENCE IN THE GUANZHONG PLAIN URBAN AGGLOMERATION（CHINA）FROM AN EVOLUTIONARY PERSPECTIVE
Abstract ID: 597

Poster

YE, Shanshan [University of Waterloo] 402880740@qq.com, presenting author
QIAN, Zhu [University of Waterloo] z3qian@uwaterloo.ca, co-author

Cities probably suffer from huge shock due to natural disasters, climate change, epidemic diseases, terrorist attacks and so on. In the social-ecological system, cities are extremely vulnerable ascribed to their complexity and independence. The Guanzhong plain urban agglomeration is located in northwest China, a relatively less developed region in China's economic landscape. How to make the region respond effectively to cumulative risks from the economic, social, and environmental changes, and actively adjust itself to reduce the uncertainty and vulnerability, improve resilience to prevent risk have become an agenda for local organizations, governments, and the academic community.

The growing emphasis on the study of regional and economic resilience lies in an increasing external risk and domestic vulnerability in economic disturbances(Christopherson et al., 2010). In recent years, research works focus on analyzing resilience from "factors" and "domains" from the "engineering" and "ecological" perspective. There is a tendency in the literature that the concept of resilience resonates with the growing importance of an evolutionary perspective within economic geography(Simmie & Martin, 2010; Martin, 2012; Boschma, 2015).

This study aims to answer the questions as follow: (1) How to apply an appropriate method to assess the economic resilience from an evolutionary perspective? (2) Wha are the assessment results of economic resilience in the Guanzhong urban agglomeration and its spatio-temporal characteristics. (3) What optimal measures should be taken to improve the local economic resilience? To respond to these questions, this study discusses the theoretical evolution process of economic resilience. A gravity model is introduced to construct the economic network structure, and then the network structure analysis is used to assess the economic resilience in the Guanzhong urban agglomeration from 2008 to 2019. Using the GIS and Ucinet network analyses, this article analyzes three features of network: hierarchy, assortativity and clustering, then the variation characteristics of economic resilience in different periods are illustrated. Suggestions for optimizing the economic resilience are put forward in the conclusion.

AN EXAMINATION OF MUNICIPAL EFFORTS TO MANAGE BROWNFIELDS REDEVELOPMENT IN ONTARIO, CANADA
Abstract ID: 613
Poster

DE SOUSA, Christopher [Ryerson University] chris.desousa@ryerson.ca, presenting author
RIDSDALE, Reanne [Ryerson University] dridsdale@ryerson.ca, co-author

Since the 1990's, the reuse of brownfield sites for urban intensification has emerged as a core strategy in government efforts aimed at remediating pollution and prioritizing renewal, regeneration, and retrofitting. While upper levels of government in Canada engaged in early efforts to devise policies,

programs, and funding strategies to support redevelopment, the job of overseeing it has largely fallen to local government. This research project investigates the role of municipalities in Ontario, Canada's most populous and industrialized province, in managing and facilitating brownfields redevelopment via a so-called Community Improvement Planning (CIP) approach. Online surveys of municipal brownfield specialists, site visitations, and data provided by the province are used to answer the following questions:

- What role are Ontario municipalities playing in managing and facilitating brownfields assessment, remediation, and redevelopment activity in regulatory, financial, technical, and other relevant terms?
- What barriers continue to inhibit the redevelopment of brownfields?
- What redevelopment outcomes and impacts have been evidenced by municipalities?
- What is the municipal relationship with other public, private, and nonprofit sector stakeholders?

Results reveal that there has been moderate growth in the number of municipalities of different sizes using CIPs and offering incentives to support brownfield redevelopment throughout the province. The CIP approach also helps standardize how municipalities perceive their role and the role of brownfields in planning for growth and urban economic development. But, while objectives and perceived roles may be common, the research reveals that municipal capacity to deliver on those objectives and roles is extremely diverse. Indeed, three groups of municipalities have emerged, with one group very experienced in how to apply a CIP and the financial tools therein, another group muddling through as opportunities and interests arise, and a group with brownfields goals and plans but little capacity to move them forward. As such, the development barriers that continue to inhibit brownfields redevelopment in Ontario are not only related to development costs, risks, and complex procedures, but are further complicated by the need to maintain and improve municipal capacity to engage in and support brownfield activities and partnerships.

Overall, the province's hope of empowering municipalities with the ability to both plan and facilitate brownfields redevelopment locally via the CIP approach seems to support a common vision, but realities are fragmented on the ground. While this may be fine for some, it doesn't provide hope for those keen on seeing brownfields achieve more to advance renewal, regeneration, and retrofitting. The research is of relevance to urban planners and policy makers interested in this domain of urban revitalization and redevelopment, as well as the strong cohort of planning scholars who have made significant contributions to this field of research over the last two decades.

DOES TRAVEL BEHAVIOR AFFECT INNOVATION?
Abstract ID: 668
Poster

LIU, Haijing [The University of Texas at Austin] hjliu@utexas.edu, presenting author

Are physical spaces important to innovation? If so, are there particular elements of the physical space that matters? While research has been done on financial, political and institutional factors, I'm more interested in discovering the role of the built environment in economic performance. Scholars such as Edward Glaeser and Richard Florida have argued that the built environment could attract high-skilled talents so as to improve a place's productivity. This argument has been criticized by many as it's excluding a large share of the population to be considered in the policy actions and put an emphasis on place-making as a policy tool without an understanding of the exact causal mechanism behind. I'm less concerned about how would public amenities attract talents to the city, but how does the built environment improves its current situation, and thus bring more economic opportunities to the local community. One argument is that the physical environment could increase the frequencies of face-to-face interactions, which are important because of its facilitation knowledge spillover, and also build relationships and trust.

There has been little empirical evidence to prove the link between the built environment and the level of innovation through face-to-face interactions. In a recent study by Rosen(2019), she argues that the physical layout of a neighborhood makes a significant contribution to innovation capability through street connectivity. Another channel that could explain how the built environment affects innovation is through travel behavior. My hypothesis is cities that have a higher proportion of non-motorized commuting behavior and use of public transit yield a higher level of innovation. Why? Entrepreneurs value time at higher value than average workers because they're under intensive competitions. Therefore, time spent on commuting especially congestion on a daily basis will be a waste for entrepreneurs. As planners, we should advocate for more investment in public transit to increase its usage and have a positive impact on innovation and productivity.

The empirical framework of this analysis is as follows: first, use patent data to measure the level of innovation, identify innovation clusters in each MSA. Second, use Longitudinal Employer-Household Dynamics (LEHD) data to match residential locations of innovation clusters, then calculate average travel time (minimum travel time by auto, public transit and walk) for the identified work-home location for each city. The dependent variable is the number of patents in the innovation clusters in each city. The key independent variable is the average travel time, ration between public transit, non-motorized travels and auto travel along with other control variables.

COORDINATING PLANS TO REDUCE RISKS TO HAZARDS AND CLIMATE CHANGE: NEW PERSPECTIVES ON NETWORKS OF PLANS AND PEOPLE
Pre-Organized Session 29 - Summary
Session Includes 110, 111, 112, 113

WOODRUFF, Sierra [Texas A&M University] swoodruff@tamu.edu, organizer

By 2050, global flood damages are projected to increase to more than $60 billion per year. Costs continue to rise in part due to the isolation of hazard mitigation planning from land use and other planning processes. In many communities, lack of coordination across these types of plans allows development to continue in risky locations. But there are examples of where coordinated planning has been leveraged to reduce risks and advance multiple community goals. These lessons indicate that plans should not be treated in isolation. Rather, to understand the effectiveness of plans – particularly hazard mitigation, climate adaptation, and resilience plans – we must take a "network of plans" approach. This session examines current perspectives on networks of plans: What do we learn by examining network of plans and interdependencies compared to looking at plans in isolation? What are the different methodological approaches to studying networks of plans? What drives coordination and conflict among plans? What are the outcomes of coordinated planning? What are the implications for the future of hazard mitigation, climate adaptation, and resilience planning?

Objectives:

- Describe methodological approaches to study networks of plans and people.
- Illustrate how communities have coordinated plans for reducing risk to hazards and climate change.
- Identify how coordinated planning results in changes to local understanding of risks, strength of partnerships among stakeholders, and risk to different population groups and the built environment.

APPROACHES TO UNDERSTAND NETWORK OF PLANS
Abstract ID: 110

ROY, Malini [Texas A&M University] mr956@tamu.edu, co-author

Communities adopt many plans including comprehensive, hazard mitigation, transportation, open space, climate change adaptation, and resilience plans. Together, these multiple plans create a "network of plans" that collectively guide development in a community. It is increasingly recognized that the field of planning must move away from analyzing plans in isolation and towards a more holistic view of "network of plans." Studying multiple plans together can improve our understanding of how plans drive development and address policy issues. While a network of plans approach to understand planning is valuable, methodological approaches to analyze multiple plans and their relationships have been underdeveloped. In this presentation, I will introduce different methodological approaches to study networks of plans, demonstrate how they can be applied using a case study, and discuss the implications of these different views of a network of plans. The four approaches that I will focus on are: (1) plan quality evaluation, (2) cross referencing, (3) social network analysis, and (4) plan integration for resilience scorecard.

Applying plan quality evaluation techniques to a network of plans in a single community highlights how multiple plans address a single policy issue. For example, do plans in a community consistently address issues of climate change and sea level rise? Do they include goals, information, and policies to address climate change? In Boston, evaluating 17 plans found that 70% of plans discuss sea level rise and 60% include sea level rise projections. Infrastructure plans such as transportation, housing, and capital improvement plans tend to be weakest in this component, suggesting they may inadvertently increase vulnerability to sea level rise. Applying plan evaluation techniques can help identify specific strengths and weakness of plans regarding a policy issue within a community.

Cross referencing, refers to plans explicitly citing or drawing on other community plans. For example, in Seattle, the 2016 comprehensive plan references 7 of the 18 other plans included in the analysis suggesting it is building on existing planning efforts. In contrast, the 2015 hazard mitigation plan only references two other plans suggesting relative isolation from other planning efforts. This type of approach can help identify the importance of specific plans in driving the overall planning agenda, by identifying those that are most central and well connected.

Social network analysis moves from considering plan content to considering the organizations involved in developing and implementing plans. Applying this type of approach can help identify central actors and boundary spanners in planning efforts. It can further help identify which organizations may be excluded from planning.

Lastly, the plan integration for resilience scorecard (PIRS) spatially analyzes plan policies. PIRS was developed by Berke and colleagues in 2015. Researchers identify policies in each plan that may affect physical vulnerability to flooding, score policies on whether they would likely increase or decrease vulnerability, and then spatially map each policy. This approach can help identify specific areas in a community where plan policies may increase vulnerability as well as inconsistencies across plans. In Baltimore, for example, the 2018 Hazard Mitigation and Climate Adaptation Plan has on average 21 policies per a district in the city to reduce vulnerability. In contrast, the 2012 Climate Action Plan tends to increase vulnerability across the city by encouraging denser and mixed use development in risky locations.

As greater emphasis is put on examining networks of plans, there is a need to review the methodological approaches to studying multiple plans and their relationships. The approaches presented here can help advance our understanding of network of plans and develop recommendations to increase consistency and coordination across plans.

RILEY, Rachel [University of Oklahoma] rriley@mesonet.org, co-author

Since the onset of settler colonialism in the United States, the widespread failure to develop communities in sustainable and resilient ways stems from deeply engrained conceptions of land as an economic resource to be exploited, often with little to no regard to timelines beyond a few years or decades. Research often falls prey to a similar dynamic, with scholars often overwhelmingly focusing attention on the most obvious material relationships amenable to study by 'hard' science and exploitation for economic gain. Meanwhile while ignoring the nuance and messiness of the relationships between people

Millions of research dollars and government studies have examined the relationships between hydrological systems, infrastructure systems, financing systems, and weather systems. For all their benefits, which are certainly non-trivial, these efforts are vulnerable to the trap of focusing of scientific and material conceptions of systems (i.e. rivers, concrete, money, and rain) and losing sight that the systems are run by and meant to serve people. Markedly less attention has been given to the relationships between the people, plans, and policies that shape how land development patterns influence flood risks. We aim to address this gap by investigating local-level flood risk reduction planning and implementation, with particular attention to two questions:

- Do the people involved in local flood risk reduction efforts function as integrated and mutually supporting networks or as isolated individuals?
- Do local flood-related plans and policies function as integrated and mutually supporting networks or as isolated, stand-alone, and even contradictory efforts?

To answer these questions, we apply concepts and analytical approaches from network science, which have gained increase attention and traction in planning in recent years (Albrechts and Mandlebaum 2007, Innes and Booher 2010, Dempwolf and Lyles 2013, Lyles 2015, Berke et al. 2019). Our research design involved selecting six localities in a region of the country highly vulnerable to flood risks: the southern plains. The localities were chosen to offer multiple layers of comparison: within and between states (AR, OK, and TX), within and between population sizes, and within and between participation in the most prominent incentive-based federal program for flood risk reduction: the Community Rating System run by the Federal Emergency Management Agency. For each locale, we systematically applied content analysis approaches to the flood-related plans, focusing on land use policies, cross-referencing of other relevant plans, and stakeholder engagement in the plans. We also conducted semi-structured interviews with key stakeholders, including emergency managers and planners, paying particular attention to the 'soft skills' like emotional and social intelligence that too often are ignored when investigating planning relationships. Our analytical approach consisted of comparative case studies that identify the structure and quality of the relationships that make up the networks of plans, policies, and people.

Our findings identify important commonalities across the cases, notably underwhelming levels of

relationships among the plan documents and land use policies with each community. They also point to important variations as well, though, including some provocative dynamics responsible the remarkable success in flood risk reduction over a multi-decadal time period of one locale in particular, Tulsa. Our findings reinforce and extend previous research that has shown fragmented and disconnected local risk-reduction networks and point to problems when planners play secondary roles to emergency managers in the realm of hazard mitigation (c.f. Lyles 2015). The scope of implications of this study extend from local planner behavior to federal policy, especially when considered in the context of the last two decades' research on hazard mitigation and the growing attention to climate change.

A "NETWORK OF PLANS" ANALYSIS OF SUPERSTORM SANDY RECOVERY PLANS IN NEW YORK CITY
Abstract ID: 112
Abstract within Pre-Organized Session 29

FINN, Donovan [Stony Brook University] donovan.finn@stonybrook.edu, presenting author
COLETTA, Matthew [Stony Brook University] matthew.coletta@stonybrook.edu, co-author

The aftermath of a major disaster is a time of urgency. Planning activity reaches a fever pitch as many plans are made to address many different issues due to an atypical need for analysis and decisions. A lot of planning is happening, many issues must be addressed, and coordination is difficult, and this period has sometimes been likened to the "fog of war" (Olshansky and Johnson 2010). But while we know WHY so many plans are created in the aftermath of a disaster, we do not necessarily understand the utility of creating multiple plans or how we might harness their existence in more effective ways. This project analyzes post-disaster plan-making activity in New York City after Superstorm Sandy to unpack the benefits and challenges created by the existence of this network of overlapping, though not necessarily coordinated, plans.

Superstorm Sandy struck the east coast of the US on October 29th 2012, devastating parts of New York City. While it has many spatial and policy plans and produces more every year, it is notable that the city, does not, and has never had, a comprehensive plan. Indeed, in 2019 the city's Charter Revision Commission chose not to include a potential question on the November 2019 ballot that would have required the city to create a regularly updated comprehensive plan if approved by voters.

The city, state and civic actors created dozens of new plans – some citywide and some neighborhood-focused – in the aftermath of Sandy (Finn et al. 2019). Most of these plans address not just short-term

recovery but also long-term resiliency and many other issues from economic development to housing policy and social services. Thus, while existence of these multiple plans may represent redundancy and conflict, they may illustrate potential opportunities for coordination, gap analysis and other beneficial actions that would harness the somewhat paradoxical window of opportunity for action presented by a catastrophic disaster. Especially in the case of a city like New York with no over-arching comprehensive planning strategy, the aggregated importance of these many smaller plans is of great importance.

Taking as a given that plans always exist in systems or networks (Finn, Hopkins and Wempe 2007) and not in isolation, we analyze these post-Sandy recovery/resilience plans using a variety of spatial and content analysis techniques (e.g. Berke, Smith and Lyles 2012; Woodruff 2018) to ask a series of questions including: What are the specific types of issues that these plans address? To what degree do these nominally "recovery"-focused plans overlap with content typically expected to be found in other plans? What are the notable spatial gaps in plan coverage? To what degree do the plans share, acknowledge, complement, support or contradict the projects and policies found in other plans? In short, we seek to better understand the utility of using post-disaster recovery plans as a tool for addressing comprehensive resilience and other municipal goals more broadly. Findings from this analysis will help us better understand the role of disaster recovery plans as they relate to broader community development goals and create a more nuanced knowledge base for how the recovery planning process can be refined for future disaster events to be more effective as both a recovery activity as well as helping build long-term resiliency.

Planning to reduce risks from hazards is often isolated from other planning initiatives governing land use and development in hazardous areas. Arguably, the disconnect is one of the major causes of the exponential rise in losses to disasters for much of the past five decades, losses likely to increase due to climate change. To address this concern, organizations representing science (National Research Council 2014) and planning practice (American Planning Association 2018) recommend development of a new tools and practices that enable communities to improve integration of risk reduction policies across plans adopted by different agencies.

In the is paper, we chronicle and critically examine engagement experiences of three pilot communities at risk to floods and sea level rise – Nashua, NH; Norfolk, VA; and Rockport, TX – that tested application of a Plan Integration for Resilience Scorecard™ (PIRS), first introduced by Berke and colleagues (Berke et al. 2015). The scorecard allows local planners and staff of agencies responsible for planning (emergency management, housing, infrastructure) to determine whether the goals of local plans conflict and actually increase risk to floods and sea level rise; and, the degree to which local plans recognize or respond to the physical and social vulnerability in different geographic areas and populations.

Our objectives are to determine the degree to which the Resilience Scorecard process:

1. Produces changes in local capacity to plan for reducing the destructive effects of hazards. Indicators of capacity include use of new technologies to better incorporate scientific information and local experiential knowledge into planning, improvement in cross agency communication and coordination, and greater stakeholder support for their communities to be more equitable, resilient and adaptive; and
2. Generates outcomes that are expected to achieve the intended effects of the scorecard. Indicators of outcomes include improved integration of risk reduction policies across plans, stronger development regulations and expanded public investments, and reduction in levels of vulnerability to structures and populations at the neighborhood scale.

The project was undertaken by the authors of this report that consisted of a partnership between researchers at the University of North Carolina and Texas A&M, and community engagement planners at Texas Target Communities, a community development organization at Texas A&M. We use a participatory action research (PAR) methodology throughout the Resilience Scorecard process by working with each pilot community in conducting training workshop and advising in revisions of plans and implementation actions. We supplemented PAR with interviews of local teams of plan evaluators, crowdsourcing information linked to community experience with hazards, email notifications of public events, and electronic communication platforms that display relevant reports and revisions of planning documents.

The pilot community experiences indicate that communities can use the scorecard to learn about the degree of coordination among policies of different local plans and the impacts of the network of local plans on risk. The scorecard provided valuable insight on the policies and goals that unintentionally raise the risk of certain areas and populations, especially in the poorest and most socially vulnerable neighborhoods. This gave planners from different agencies the ability to ask crucial policy questions about goals and priorities and how to improve the integration of multiple local plans. The process also gave local leaders a chance to take ownership of scorecard results. As a consequence, the process succeeded in raising understanding and support for resilience planning and adaptation, and in the adoption of better integrated policies and implementation actions.

PLANNING RESEARCH AND PRACTICE FOR EXTREME HEAT

Pre-Organized Session 30 - Summary
Session Includes 127, 128, 129, 130, 131

KEITH, Ladd [University of Arizona] ladd@email.arizona.edu, organizer

Extreme heat is an increasing climate risk for cities across the world due to both the urban heat island (UHI) effect and climate change. While other climate events may often garner more media attention, extreme heat is the deadliest of all climate risks, particularly to vulnerable populations such as children, elderly, and those with lower income. Other impacts include a decline in quality of life, an increase in mental health and behavioral disorders, declines in economic productivity, an increase in stress to urban ecology, an increase in water and energy usage, and additional strain on urban infrastructure. Phoenix Mayor Stanton called extreme heat "…a public health crisis," and Los Angeles Mayor Garcetti framed shade as "an equity issue." Only recently has research focused more on how planners approach extreme heat, which has implications for practice. An assessment of over 3,500 climate adaptation resources in the U.S. found that only 4 percent specifically focused on extreme heat (Nordgren, Stults, & Meerow, 2016). This session will explore diverse perspectives in the current state and innovations in planning research and practice for extreme heat.

Objectives:

- Attendees will learn the current state and innovations in planning for extreme heat.
- Attendees will gain insight from diverse disciplinary perspectives on extreme heat, including public policy, public health, and climate services.
- Future directions for extreme heat research will be identified and discussed.

PLANNING FOR EXTREME HEAT: A NATIONAL SURVEY OF U.S. PLANNERS

Abstract ID: 127
Abstract within Pre-Organized Session 30

MEEROW, Sara [Arizona State University] sara.meerow@asu.edu, presenting author
KEITH, Ladd [University of Arizona] ladd@email.arizona.edu, co-author

Extreme heat is already the deadliest climate risk in the United States and negatively impacting communities around the world. The combination of climate change and the urban heat island effect is increasing the number of dangerously hot days in cities and the need for them to mitigate and plan for resilience to extreme heat. Given this increased focus and urgency, a better understanding of the current state of heat planning research and practice is needed. We conducted a systematic literature review of the peer-reviewed literature on heat planning. This showed that most of the literature focuses on heat island mapping and modeling, while few studies delve into extreme heat planning and governance processes. We therefore surveyed planning professionals to examine how heat risk perceptions, current planning activities, and barriers to action vary across the county. The same survey was conducted on two different samples: 1) a stratified random sample of planners working for U.S. cities from different regions and of different population sizes (n=69); and 2) a convenience sample of planners who are members of relevant professional networks (n=114). The survey was co-produced with input from planners, designers, and climate service providers to establish important baseline information for a growing area of planning practice and scholarship. Survey results reveal how different cities and sectors are impacted by extreme heat, the planning and design strategies that communities have pursued to mitigate those impacts, barriers to advancing heat planning efforts, and heat information sources and needs. We also look at how different individual characteristics, such as planning specialization and employer type, are related to planners' perceptions of heat risks.

HOW ARE CITIES PLANNING FOR HEAT? A NATIONAL ASSESSMENT MUNICIPAL PLANS
Abstract ID: 128
Abstract within Pre-Organized Session 30

TURNER, Kelly [University of California Los Angeles] vkturner@ucla.edu, presenting author

Heat is a central environmental, public health, and social justice concern in cities. Urban regions are already hotter than surrounding undeveloped areas due to the Urban Heat Island (UHI), extreme heat events are predicted to increase with climate change, and heat impacts disproportionately affect disadvantaged communities. In response, some cities have begun to incorporate cooling strategies into official planning documents as part of broader climate planning efforts. Outdoor cooling through urban design interventions like urban greening and cool surfaces is of central interest due to several potential co-benefits. These include mitigating UHI, improving pedestrian thermal comfort to encourage active transportation, and reducing indoor energy demand. Yet, heat is a multifaceted concept and the effectiveness of outdoor cooling strategies are scale, context, and regionally dependent (Georgescu 2014, Martilli 2020). Lack of nuance in heat policy could promote "panaceas": strategies that are likely to fail because they assume too much similarity in context (Ostrom 2007).

Through a content analysis of 228 municipal planning documents spanning 70 cities across the United States, this study addresses three interrelated questions: (1) Which heat related problems are cities incorporating into planning documents? (2) Which hard (e.g., green infrastructure) and soft strategies (e.g., education, studies) are cities planning to implement to address those challenges? (3) How does problem framing and strategy selection vary by climate region (National Climate Assessment), plan type (Hazard Mitigation, Climate Action, Sustainability, Resilience, Infrastructure, General Plans, Other), and membership in national/international networks (Urban Sustainability Directors Network, Rockefeller 100 Resilience Cities, and Cities Climate Leadership Group, C40)?, and (4) To what extent do the strategies suggested actually address the problems invoked according to urban climate science? We hypothesize that strategies will conflate multiple dimensions of heat—land, air, and surface temperature—which operate differently across scales, leading to claims of co-benefits across heat related goals that are not scientifically supported. Moreover, we hypothesize that regional differences in urban heat dynamics will not be considered.

We found that more than half of the municipal planning documents analyzed (59%, n=134) contain at least one statement mentioning heat. The most pervasive goal statements pertained to adapting to extreme heat events or mitigating urban heat island. Soft interventions like education and outreach were more pervasive than infrastructure interventions, but many statements contained no soft or infrastructure intervention was prescribed at all. This reflects the fact that addressing urban heat was most frequently

mentioned as a co-benefit of broader efforts to vegetate the city. Many documents addressed vulnerability, variously defined, but mostly focused on exposure as opposed to sensitivity or adaptive capacity, and mentions of equity were infrequent. Finally, while explicit misinterpretations of urban climate science were rare, vague generalizations were pervasive and could potentially lead to misinterpretations in translation to policy.

EVALUATING THE USE OF URBAN HEAT ISLAND MAPS FOR EXTREME HEAT PLANNING
Abstract ID: 129
Abstract within Pre-Organized Session 30

KEITH, Ladd [University of Arizona] ladd@email.arizona.edu, presenting author
MCMAHAN, Ben [University of Arizona] bmcmahan@email.arizona.edu, co-author
WAGNER, Tess [University of Arizona] tesswagner@email.arizona.edu, co-author

The impacts of extreme heat to cities and urban systems are well documented, including an increase in mortality, a decrease in quality of life, additional stresses on urban infrastructure and ecology, reductions to economic productivity, and increased energy and water usage. A growing number of cities concerned about the increasing risk of extreme heat, due to climate change and the urban heat island (UHI) effect (Oke, 1995), seek to increase extreme heat resilience through strategies such as increasing urban forestry canopies, reducing paved surfaces, and increasing shade. Despite the current interest in these strategies, there is a lack of resources and information available for planners related to extreme heat. One assessment of 3,500 climate adaptation resources in the U.S. found only 4 percent specifically referred to extreme heat (Nordgren et al., 2016). UHI maps are one of the best-known tools for planners for extreme heat, but the maps are diverse in their development methodology and in what and how they display information (Mirzaei, 2015). There are also legitimate questions about the usefulness of UHI intensity for decision-making (Martilli et al., 2020). As planners weigh these extreme heat-related policies and strategies, a better understanding of the uses and limitations of UHI maps for planners is needed.

We utilized an exploratory multi-case study approach to document the current use of UHI maps by planners in Arizona and New Mexico and evaluate challenges and opportunities related to their usability. Out of 44 communities in the two states with populations above 20,000 included in the initial scoping, we identified four cities with UHI map use, including Albuquerque, NM, Las Cruces, NM, Phoenix, AZ, and Tucson, AZ. We systematically collected information on map development, map users, and policies and strategies created with referral to the maps. We also worked iteratively with four additional pilot communities in the coproduction of new UHI maps as an additional way to explore UHI map development and use.

This study provides several important findings related to UHI map development and use for planning researchers and practitioners. Several challenges with UHI maps included concerns over their appropriate use, accuracy, and reliability for planning purposes. The maps were not updated once created and did not reflect changes in the built environment or vegetation over time. There was also inconsistent buy-in across the departments in the case studies, although the public availability of Tucson's UHI map allowed

it to referred to by external groups such as non-profits. Finally, the UHI maps had a wide range of displays which limited the ability of the communities to learn from their peers. Despite these challenges, we documented the use of UHI maps as a boundary object (Wenger, 2000) in the case study communities, where they served an important role in bringing diverse stakeholders together to discuss and plan for extreme heat. During the creation of new UHI maps for the four pilot communities, the maps also provided an opportunity to increase stakeholder awareness and understanding of extreme heat risk and interdisciplinary strategies to increase resilience. More research on the use and limitations of tools, such as UHI maps, that planners have available to inform decision-making is critical as cities seek to increase resilience to climate impacts such as extreme heat.

SYNTHESIS OF CLIMATE-ADAPTIVE DESIGN IN OUTDOOR PHYSICAL ACTIVITY SPACES FOR HEALTH EQUITY
Abstract ID: 130
Abstract within Pre-Organized Session 30

IROZ-ELARDO, Nicole [University of Arizona] irozelardo@email.arizona.edu, presenting author
LADD, Keith [University of Arizona] ladd@email.arizona.edu, co-author

Active living research has repeatedly demonstrated the importance of built environments in supporting healthy habits. Two public outdoor physical activity spaces are particularly important: active transportation is an essential source of physical activity while parks and schools are critical outdoor recreation spaces. Avoiding outdoor spaces during prolonged extreme heat to manage health risks may result in less physical activity for long periods and thus increase chronic disease risk. This urgent paradox has been inadequately studied despite considerable health equity implications. Communities of color and low-income communities are at higher risk of chronic disease and premature mortality (World Health Organization, 2008). Further, children and older adults have a higher heat health risk (Mayrhuber et al., 2018). These groups are more likely to be dependent on public, outdoor physical activity spaces; more likely to live in urban heat islands (Mayrhuber et al., 2018); and generally have reduced access to active transportation (Adkins et al., 2017) and public, outdoor recreation (Jennings et al., 2019) facilities.

Objectives/Methods: This paper reviews the state of the literature for the intersection of physical activity with climate science. Particular attention is paid to understanding the state of the science for managing heat health through climate-adaptive design in public physical activity spaces. Understanding this multidisciplinary space required reviewing several distinct fields (urban planning, public health, climate science, and landscape architecture) and literatures including but not limited to: active living and active transportation; urban heat islands and heat health; and microscale design and thermal comfort. Using a flexible and snowball keyword approach, this paper reports on several literature searches performed over the past year to define this emerging field. For example, to understand the implications of climate science on pedestrian spaces, variations of ((health OR climate) AND (physical activity OR utilization) AND

(pedestrian)) were used in a literature search of PubMed and WebofScience. Similar searches were also employed for playgrounds and for greening along active transportation and/or park facilities.

Results: Heat-health is an important consideration for active living, public health, planning, and climate researchers and professionals. Heat-health is often mentioned as the rationale for examining design features of outdoor public spaces when attention is paid to thermal comfort. However, the vast majority of the literature stops short of linking neighborhood or microscale design features to physical activity or health outcomes. The topical literature can be organized by design features: shade and vegetation; surface materials; and presence of water in public recreation spaces. The science indicates that each design feature influences both temperature and thermal comfort and thus likely impacts physical activity levels. Research on shade, in general, and vegetative shade, in particular, appears to be the most developed. Heat risk on playgrounds for children is also growing but does not explicitly examine physical activity levels. Indeed, there is almost no literature examining temperature or thermal comfort and resulting utilization and physical activity of public physical activity spaces. A conceptual map helps delineate these links and organize future research and practice needs.

Conclusions: While some literature examined design features and influence on temperatures or thermal comfort in public physical activity space, very little explicitly links design to physical activity. Research about how best to support public active transportation and recreation in extreme heat situations is needed. With climate change increasing risks, practitioners will need guidance in designing outdoor, public physical activity spaces with extreme heat and heatwaves in mind to maximize healthy habits.

HEAT EQUITY AND INTER-SECTORAL MANAGEMENT OF THE THERMAL ENVIRONMENT
Abstract ID: 131
Abstract within Pre-Organized Session 30

HAMSTEAD, Zoe [University at Buffalo, The State University of New York] zoehamst@buffalo.edu, presenting author

Climate change has its roots in economic change – the industrialization and carbonization of our economic processes, with concomitant development of cities. Due to their biophysical landscape, it is those cities which are now particularly susceptible to heat islands, intense flooding, sea level rise and other forms of extreme weather. But which cities are able to harness resources to aid in recovery and to which social groups within cities those resources get directed is a matter of politics, power and exclusionary practices. Examining how social separateness that forms unequal climate burden is embedded in planning, policy and economic practices across sectors is crucial for transforming those institutions to design adaptation strategies that protect vulnerable communities from extreme weather.

Here, I explore the role of social separateness in producing spatial heat injustice and heat inequity. In the

United States, extreme heat is a leading weather-related killer, contributes to thousands of emergency department visits and hospitalizations, and adversely impacts many people's quality of life. And yet, heat impact is not typically addressed proactively—among the list of factors that an environmental impact statement must consider, for instance. Nor do we have an adequate understanding of the pathways through which heat inequity is produced and reproduced. Nonetheless, in support of efforts to protect people against heat, heat vulnerability scholarship in fields of urban planning, public health, geography, urban ecology and related disciplines has focused on describing geographic and temporal patterns of heat vulnerability and outcome distribution, as well as social correlates of those patterns. I argue that more full integration of environmental justice theory into this vulnerability scholarship holds potential to produce more equitable outcomes in climate, and particularly heat justice.

CLIMATE JUST CITIES & REGIONS
Pre-Organized Session 66 - Summary
Session Includes 326, 327, 328, 687, 727

FITZGERALD, Joan [Northeastern University] jo.fitzgerald@neu.edu, organizer

Urban climate action cannot be undertaken in isolation from the interconnected issues of poverty, racial division, and gentrification evident in so many cities. While many mayors say they are committed to reducing poverty and income inequality and to climate action, few city leaders are connecting the two issues. This panel examines aspects of climate action and social justice: how do we measure and evaluate equity as a goal of climate action? What is the relationship between climate investments and displacement pressures? How does urban climate action framed as a green new deal differ?

Objectives:

- understand linkages between climate action and social equity
- understand how climate action can lead to gentrification
- understand how "green new deal" approaches changes urban climate action

DOUBLE JEOPARDY: THE UNINTENDED EFFECTS OF CLIMATE CHANGE MITIGATION
Abstract ID: 326
Abstract within Pre-Organized Session 66

CHAPPLE, Karen [University of California Berkeley] chapple@berkeley.edu, presenting author

California leads the nation in legislation, programming, investments and research to reduce greenhouse gas emissions and mitigate the negative effects of climate change. From coordinated land use and transportation planning, to climate investments made possible by the Cap and Trade program, California is investing in a wide range of housing, active transportation, complete streets, and transit in low-income and vulnerable communities. While climate investments have the potential to transform these neighborhoods towards more sustainable land use and transportation patterns, they also may have impacts on displacement, creating a double jeopardy situation. If vulnerable residents are displaced due to climate

investments, mitigation strategies may not just further disadvantage already disadvantaged populations, but also endanger climate goals if displacement shifts residents to lower resourced neighborhoods with relatively poor accessibility. Furthermore, the potential impacts of different types of investments still remain unclear. To the extent that they provide new amenities, climate investments may raise local land values, which could then impact local rent levels and destabilize communities.

Previous studies have attempted to examine investment-related displacement, but with limitations, and thus inconclusive results. Studies of the relationship between transit station proximity and change in low-income households found mixed effects depending on station location within the region (Boarnet et al. 2017, Chapple et al. 2017); these studies were both limited to rail transit and did not examine other types of investments, whether market-rate or public sector. Thus, studies to date have not been able to examine the impact of investments on housing stability in many of the disadvantaged communities, raising questions that then may contribute to political conflict and impede the passage of legislation.

This study estimates the relationship between climate investments and displacement pressures. Three research questions will be addressed. First, what features of climate mitigation investments are associated with declines in housing affordability in surrounding neighborhoods? Second, what features of climate mitigation investments are associated with displacement of low credit-score households? Third, how can our understanding of the impact of mitigation investments be incorporated into a predictive model? Focusing on three regions, the Bay area, Los Angeles County, and Fresno County, we characterize representative investment projects, and generate a typology of climate investments related to infill housing and sustainable community investments. Relying on Zillow data and subsidized housing data from the California Housing Partnership Corporation (CHPC), we develop block-level data of housing developments to explore the unintended affordability impacts of investments. These data sets are then merged with the Infogroup data which allow us to examine residential mobility patterns associated with climate investments. Exploring the role of a variety of investments, across diverse geographies with use of fine-grained data on investments, housing, and households, we expect to effectively predict and mitigate the displacement impacts of future investments.

HOW NEW IS THE GREEN NEW DEAL? TRACING THE CONSTRAINTS OF 'SUSTAINABLE DEVELOPMENT' THROUGH A NEW ERA OF ENVIRONMENTAL PLANNING"
Abstract ID: 327
Abstract within Pre-Organized Session 66

POLLANS, Lily [Hunter College, City University of New York] lily.pollans@hunter.cuny.edu, presenting author
RIDER, Abigail [Hunter College, City University of New York] abigail.rider12@myhunter.cuny.edu, co-author

In 1996, Scott Campbell influentially argued, via his conceptualization of the planner's triangle, that the emerging framework of sustainable development contained inherent conflicts; the economic, environmental, and equity pillars of sustainability could not easily be advanced simultaneously. In the decades since, Campbell's observations have been echoed and amplified by theorists and empirical researchers. Researchers evaluating environmental plans from sustainability to climate adaptation have argued that the three components do not have equal power or legitimacy in policy-making: development interests dominate, usually subjugating environmental and social justice goals (Anguelovski et al. 2016; Berke and Conroy 2000). Ecological economists argue that infinite economic growth exacts increasing costs on a finite planet, and thus cannot resolve environmental crisis or social inequality (Daly 2002). Critical geographers argue the project of capitalism necessarily depends on the exploitation of bodies (especially non-white bodies) and nature, making economic growth under capitalism inherently incompatible with environmental protection or social justice (Pulido 2017).

The green new deal promises a way out of the intractable contradictions of sustainability. But can it be operationalized? Can the conceptual framing of the green new deal provide planners with a path towards equitable mitigation of the climate catastrophe and associated environmental crises?

To determine the extent to which the Green New Deal offers something substantively different from a prior generation of sustainability planning, we have undertaken a deep read of recently adopted Green New Deal legislation and plans from Los Angeles, New York City, and Seattle. We employ a grounded theory approach in our analysis as a way to identify driving interests, priorities, and potential conflicts within the plans.

Early evidence suggests that by centering social equity and climate mitigation and reframing economic growth as green jobs, the plans short circuit some of the conflicts that Scott identified in 1996. However, some key conflicts remain, and the plans also appear likely to get caught in a new set of intractable tensions.

JUST DECARBONIZATION TO COMBAT DEEP-SEATED REGIONAL POVERTY: THE REGIONAL CASE
Abstract ID: 328
Abstract within Pre-Organized Session 66

GLASMEIER, Amy [Massachusetts Institute of Technology] amyglas@mit.edu, presenting author

Defeating Two Birds with One Stone: Can Decarbonization Polices Counter Decades of Economic Malaise

Decarbonization calls for a radical reshaping of the U.S. energy system. To circumvent intensifying damage accompanying climate change requires fossil fuel producing regions to abandon their long-held means of livelihood generation. On the surface, shifting out of resource extractive industries offers the potential to unshackle rural areas from the grip of environmentally compromising sectors. Perhaps even more beneficial, abandoning fossil resource production could lead the way toward a new social system unhindered by the effects of the "resource curse." Beyond environmental problems with few exceptions, resource extractive industries of the 20th-century have embodied a form of economic development that benefits the few, the wealthy, and the powerful. Left in its wake are high levels of poverty, stunted economies, and compromised institutions undergirding norms and practices. And yet, for decades and even centuries, resource extraction represents well-worn ways of life for generations of rural families. Shifting from carbon-intensive activities to alternatives will be difficult and costly. Conventional development regimes can shed light on the recalcitrance of deep-seated poverty in these regions. Far more challenging and less well-tested are development tools that address the transformation of the underlying social structures accompanying extractive industries. Efforts to transform dependent territories leave little doubt that ill-considered gestures serve only to reinforce rather than redirect local economies toward more sustainable pathways. With more than 60 years of experience, the case of Appalachia serves as a reminder of the necessity to maintain realistic expectations as well as to embrace the necessary patience to support the formation of institutions and practices capable of overcoming decades of malaise. Reviewing more than a half-century of well-documented research can offer insights into practices that lead not only to impartial adjustment but, more importantly, the just transformation of the fabric of oppression that otherwise accompanies resource development.

COORDINATING LOCAL PATHWAYS TOWARDS DEEP DECARBONIZATION THROUGHOUT THE UNITED STATES
Abstract ID: 687
Abstract within Pre-Organized Session 66

HSU, David [Massachusetts Institute of Technology] ydh@mit.edu, presenting author
ULAMA, Darryle [Massachusetts Institute of Technology] darryle@mit.edu, co-author

Multiple, recent studies of pathways to eliminate the carbon emissions of the United States – a goal known as deep decarbonization – find that the U.S. must reduce approximately half of its future energy

consumption with increased efficiency and use, and replace the remaining half with decarbonized electricity and other fuels from clean resources. Pursuing any of these pathways will require three things: first, the dismantling or repurposing of fossil fuel infrastructure; second, the building of new renewable resources and efficient systems of use; and, third, any new systems must be climate-resilient. Places differ in their existing level of investment in fossil fuels, renewable potential, and climate risk, but coordinating both efforts and energy between cities, regions, and states will be faster, more efficient, and probably more equitable.

This paper therefore combines these criteria with existing data sources to analyze the potential of different cities, regions, and states to contribute to any economy- or nation-wide effort towards eliminating carbon emissions. We analyze fossil fuel data from the U.S. Energy Information Administration, renewable potential information from the National Renewable Energy Laboratory, employment and industry data from the Bureau of Labor Statistics, and climate risk data from the firm 472mt, in addition to data about populations and growth from the U.S. Census. We then use data clustering methods and mapping overlays to identify diverse but complementary strategies for different localities, and then discuss how the approach of representative cities, regions, and states in order to illustrate the possibilities for local climate actions to be coordinated at a national scale. Identifying representative cities, regions and states can help other similar localities to decide how to contribute best to a national effort towards deep decarbonization.

The paper concludes by arguing that planners should be leading efforts to think through some of the local land-use implications of building new renewable energy resources, dismantling or repurposing fossil fuel infrastructure, and planning for future climate risks to the energy system. Furthermore, given recent discussion of the National Environmental Policy Act (NEPA) and an upcoming Supreme Court decision over pipeline siting, coordinating local actions with national strategies has become an increasingly important and contentious issue. The paper concludes by discussing some of the federal legislation and national-level efforts necessary to enable these local actions.

MEASURING THE CLIMATE-EQUITY LINK
Abstract ID: 727
Abstract within Pre-Organized Session 66

FITZGERALD, Joan [Northeastern University] jo.fitzgerald@northeastern.edu, presenting author

What is a Climate Just City?

Climate justice is a framework that focuses on how the effects of climate change are unevenly distributed

within cities. Building on Susan Fainstein's The Just City, which examines how principles of equity, diversity and democracy can underpin urban planning, an emerging climate-just cities framework calls for integrating considerations of social, environmental and ecological justice into urban climate action planning (Steele et al, 2020). While the focus often is on climate adaptation, climate justice is also a concern with respect to mitigation. For example, the energy democracy movement calls for integrative policies that link social justice and economic equity with renewable energy transitions (Burke and Stephens, 2017). Yet equity is a relatively low priority of most U.S. climate action and related plans and there are few attempts to measure the extent to which equity is integrated into climate action. We attempt to fill that gap by developing an instrument to assess the extent to which urban climate mitigation and adaptation are planned and applying it to Boston's climate action planning. The goal of our exercise is to create a self-assessment tool for cities as part of a broader project that identifies leading practices for making equity a priority of urban climate action. This study builds on a slim literature on how cities incorporate environmental justice concerns in climate planning.

Finn and McCormick's (2011) examination of the climate plans of the three largest U.S. cities concludes that environmental justice is not a focus. They measured this by investigating the historical and political contexts surrounding plan development and adoption then analyzing the plans to determine how many times they explicitly or strongly implicitly. The analysis was done by examining the inclusion of local knowledge and agency and their relationship to social equity by counting the number of times each term is mentioned. Bulkeley and Castán Brato's (2013) international survey of more than 100 cities implementing climate change experiments found that about one fourth included environmental justice concerns. They counted explicit mentions of procedural, individual, and collective justice relating to environmental concerns as illustrating environmental justice. Schrock, Bassett and Green (2015) concluded that equity was a relatively low priority of the 28 U.S. cities they examined. Raters counted instances of equity in the plans and whether it was a problem, goal or action item. Plans were then assigned a score based on the rater's evaluation of the quantity and quality of the equity concerns and actions. Following Bullard (1994), equity was defined in three ways: procedural (public participation), geographic (across neighborhoods), and social (race, ethnicity, income) (Schrock, Bassett, and Green, 2015: 286).

Building on Schrock et al., Waud (2018) examines whether social justice, defined by keywords, is identified as a problem, goal, or action, in the climate action plans of 19 Carbon Neutral Cities Alliance global member cities. She differentiates three categories of inclusion: absent, isolated, or integrated. The isolated category refers to plans in which equity considerations are contained in a separate section, with little or no integration with action items, while integrated plans have equity as a key principle integrated into all components of the plan and its action steps. Waud found that only six of the nine U.S. city plans she reviewed had a fully integrated equity agenda. These six U.S. cities were rated by highlighting sections of the plan that included mentions of social justice or climate equity. The sections were then evaluated by determining if the sections on equity included multiple themes. These themes included sustainability, social development, economic inclusion, and health equity. If the plan mentioned more than one theme of equity, it was placed in the "integrated category." The author mentions that this work is the first step toward examining equity in climate change mitigation/adaptation planning research. A shortcoming of these studies is that they only measure whether equity and social justice are mentioned. Second, they only analyze the climate action plan, so mentions of equity or social justice in related plans is overlooked. Boston, for example, has 10 climate-related plans in addition to its Climate Action Plan. A third shortcoming is that they don't require that the city measure its progress on equity goals. A fourth shortcoming is that they don't examine the role of participation of low-income communities in developing the plan and determining priorities and goals for their communities. Despite these shortcomings, these studies are the first step in analyzing how justice/equity is incorporated, but require studies of implementation to determine the outcomes achieved. This Boston case study analyzes implementation to identify the effectiveness of climate action that attempts to address equity concerns of residents.

TRACK 4 - ROUNDTABLES

COMMUNITY ENERGY PLANNING: FROM CONCEPT TO IMPLEMENTATION
Abstract ID: 215
Roundtable

WINFIELD, Mark [York University] marksw@yorku.ca, participant
CALVERT, Kirby [University of Guelph] calvertk@uoguelph.ca, moderator
FARBRIDGE, Karen [Karen Farbridge and Associate] karen@karenfarbridge.ca, participant
ERGUN, Deniz [Town of Oakville] deniz.ergun@oakville.ca, participant
MCVEY, Ian [Region of Durham] ian.mcvey@durham.ca, participant

Community energy planning, alternatively referred to as local or municipal energy planning, represents "a process to develop strategic vision documents that outline the energy goals of a local context" and is a growing trend internationally and in Canada. As a common component or extension of local climate change mitigation and adaptation planning, Community Energy Plans (CEPs) have gained importance as local governments move to address the impacts of climate change and reduce greenhouse gas (GHG) emissions. CEPs offer a structure to integrate considerations around urban form, transportation, energy sources, buildings, and climate change mitigation and adaptation into coherent and integrated community-level strategies. As such CEPs offer substantial potential to advance community and energy sustainability.

CEPs involve complex interactions between local and senior levels of government, publicly and privately-owned utilities, developers, building owners and operators, transportation service providers, community organizations and individual residents. They may engage with federal and provincial policy frameworks around climate change, energy and land-use in varying ways. These policy frameworks have themselves traditionally been relatively disconnected, particularly around the linkages between energy and land-use planning and urban form. The divided and territorialised energy systems that operate across different levels of government in Canada can impede CEP development and implementation.

The round table flows from the work of the Community Energy Knowledge and Action Partnership, or CEKAP. CEKAP is a SSHRC-funded partnership that has been established to facilitate collaboration between researchers, practitioners and community groups across Canada in the area of community energy planning.Core partners include five universities (Guelph, York, Western Ontario, Simon Fraser and Dalhousie) and seven municipalities across three Canadian provinces (Ontario, BC and Nova Scotia), QUEST Canada, a number of government and non-government knowledge mobilizers, policy & governance partners, and community partners. Together, the goal is to leverage techniques in community-based research and community engaged scholarship in order to identify pathways to improve the design and delivery of community energy plans across Canada. A special edition of the Canadian Planning and Policy Journal is under development, based on the key research findings from the CEKAP project.

The round table will feature speakers who have been involved in the CEKAP project and the development and implementation of community energy plans. Three of the participants (Ergun, McVey and Farbridge), have been directly involved in CEP development and implementation at the local level in Canada. The representative of QUEST will provide a national perspective on CEP development across Canada. The

academic participants (Winfield, Calvert) will provide insights on CEP as an exercise in multi-level, polycentric governance and on the role of municipal, academic and civil society partnerships in CEP development and implementation.

Devastated by Hurricane Maria in 2017, Puerto Rico has embarked on what could be the largest community relocation effort in U.S. history. The Repair, Reconstruction, or Relocation Program (R3) program, title notwithstanding, disallows in-situ elevation of structures, which de facto promotes relocation over reconstruction or repair. But how well is the program likely to perform? What are the factors that hinder or enable effective, sustainable, and just community relocation? This roundtable seeks to inform the R3 program by looking into the successes, failures and complexities of disaster relocation programs both domestically and abroad.

Post-disaster community relocation has long-lasting consequences for future settlement patterns, land use, economy, social structure, and local politics. Relocation planning in Puerto Rico however, faces many governance challenges. The commonwealth has a tense history with the mainland U.S. and the current White House administration. It was in the process of implementing a widely unpopular federally-driven austerity plan when Hurricane Maria hit. The commonwealth's central government is mired in corruption and largely opaque to its municipalities and citizens. In addition, the island has significant amounts of

informal construction, inadequate property deeds and titling, and has seen renewed seismic activity. More positively, the island has high levels of community and nonprofit activism, especially from diaspora organizations, and has seen a rise in insurgent planning.

This roundtable brings together experts with significant experience in disaster recovery studies across the world, including Japan, Philippines, India, Nepal, Indonesia, Turkey, New Zealand, Haiti, Ecuador, and the various parts of the U.S. to weigh in on the R3 Program. After an introduction to the problem, roundtable participants will consider the following questions:

1. What are important governance aspects for post-disaster community relocation programs?
2. What lessons have we learned from other cases about the processes and outcomes of disaster-induced relocation?
3. What are considered effective, sustainable, and just practices in relocation planning? and,
4. How might these practices be integrated into the R3 Program, its design and its implementation?

Panelists and moderators for the roundtable are as follows:

- Divya Chandrasekhar (organizer): Assistant Professor, Department of City & Metropolitan Planning, University of Utah.
- Robert B. Olshansky (moderator): Professor Emeritus of Urban and Regional Planning, University of Illinois at Urbana-Champaign.
- N. Emel Ganapati: Associate Professor in Public Policy and Administration at Florida International University
- Donovan Finn: Assistant Professor, School of Marine and Atmospheric Sciences, Stony Brook University
- Kanako Iuchi: Associate Professor, International Research Institute of Disaster Science (IRIDeS), Tohoku University.
- Ariam Torres: Doctoral Candidate, Urban and Regional Planning, University of Illinois at Urbana-Champaign.
  Bala Balachandran: Doctoral Candidate, Urban and Regional Planning, University of Illinois at Urbana-Champaign.
- Elyse Zavar: Assistant Professor, Department of Emergency Management and Disaster Science, University North Texas.

TRACK 4 – INDIVIDUAL ABSTRACTS

VOLUNTARY PUBLIC CAMPAIGNS TO BENEFIT THE ENVIRONMENT: ASSESSING THE EFFECTIVENESS OF THE THERE IS NO POOP FAIRY CAMPAIGN
Abstract ID: 31
Individual Paper Submission

SCRUGGS, Caroline [University of New Mexico] cscruggs@unm.edu, presenting author
LOZOYA, Sergio [University of New Mexico] slozo@unm.edu, co-author
RUMSEY, Kellin [University of New Mexico] knrumsey@unm.edu, co-author
BRONSON, Kali [Bernalillo County Natural Resource Services] kbronson@bernco.gov, co-author
CHAVEZ, Patrick [Albuquerque Metropolitan Arroyo Flood Control Authority] pchavez@amafca.org, co-author

In the arid southwestern United States (US), drought and maintenance of adequate water quality and quantity for human and ecosystem needs are ongoing concerns. The City of Albuquerque, in Bernalillo County, New Mexico, relies on the Rio Grande as a major water source for drinking, agriculture, business, industry, and recreation. As a strategy for keeping it clean and healthy, in 2014 Bernalillo County joined a growing number of communities in initiating the There Is No Poop Fairy campaign. Bernalillo County's goal with the voluntary campaign was to inform dog owners about the impact of their dogs' waste on the environment, specifically that uncollected dog waste can be transported by storm water into the Rio Grande where it causes water contamination and subsequent transmission of bacteria and disease. Historically, concentrations of the bacterium Escherichia coli (E.coli) in the Rio Grande have been high, but recent monitoring found a significant decrease in the E.coli concentration in the middle Rio Grande that runs through Albuquerque, allowing E.coli to be removed as an impairment. These findings led county officials to ask whether the There Is No Poop Fairy campaign contributed to improvements in water quality.

The effectiveness of policy used to govern pets and their owners is rarely studied, and scholars have not examined the effectiveness of the There Is No Poop Fairy campaign in motivating residents to clean up after their dogs. We conducted a community survey (*n*=502) in 2018-19 to better understand the effectiveness of the campaign in Bernalillo County and its influence on dog owner behavior. The survey also examined dog ownership practices, dog owners' feelings of responsibility for picking up their dogs' waste, and related topics. We used convenience and purposive sampling techniques and administered the survey at various sites throughout Bernalillo County. Excel was used to record the data and the open-source statistical software "R" was used to create all figures and tables and in testing for relationships between dog waste pick up frequency and a variety of demographic variables.

Despite our study's limitations, the data suggest that the There Is No Poop Fairy campaign was successful based on its reach (almost 70% of respondents had seen the sign), its influence on behavior (50% of dog owners reported increased pick up frequency after seeing the sign), and improved water quality in the Rio Grande. Increased age and education were associated with higher pick up frequencies. Pick up frequency also increased with the number of dog walks per week; a high number of weekly dog walks could lead to feelings of connectedness to the community, and it is possible that walking frequency could be seen as a surrogate for social connectedness or social capital. There was a clear association between increased environmental concern and pick up frequency, and those who believed that dog waste had a negative effect on water quality had the highest pick up frequencies. Our study may be one of the first to examine pick up frequency of waste from others' dogs, and our findings on this topic reinforce the idea of dog ownership as a driver of social capital. Though the short and simple message used by the campaign may have contributed to its success, we identify important aspects of the message that are being lost in the aim for simplicity and provide recommendations to improve the campaign's success. This research will contribute to the literatures related to dog ownership and policy in public spaces. The results will be of particular interest to planners in other communities who are interested in the There Is No Poop

Fairy campaign, which is gaining traction across the US.

DISASTER HITS INEQUALITIES IN HOUSING RECOVERY: THE CASE OF GYEONGJU EARTHQUAKE IN SOUTH KOREA
Abstract ID: 47
Individual Paper Submission

YEOM, Jaeweon [Pusan National University] jaywo7@naver.com, presenting author
KANG, Seungwon [Pusan National University] allan92@naver.com, co-author
JUNG, Juchul [Pusan National University] jcjung@pusan.ac.kr, co-author

[Problems] This paper aims to analyze the impact of the earthquake on inequalities in housing recovery, because disasters can redress the preexisting inequality problems of low-income housing by affecting housing prices. Housing loss is central to understanding the impact of disasters on residents' ability to recover after the event. In particular, South Korea has shown that social inequality and polarization problems centered on land and housing are greater than other socio-economic factors due to the characteristics of high-population density. Low-income housing refers to housing that generates differential social vulnerabilities to cope and recover from natural disasters. In addition, as natural disasters indiscriminately affect communities, it is necessary to consider low-income housing loss in order not to exacerbate preexisting inequalities after disasters.

Previous studies have analyzed the relationship between natural disasters and residential property prices. Most studies have shown that natural disasters have a negative effect on these prices. However, some studies have shown that natural disasters have a positive effect on them. These conflicting analyses are a result from the lack of consideration given to the frequency of natural disasters at the analysis site. That is, in order to analyze the impact of natural disasters on inequalities in housing recovery, analyses must be carried out in areas that have not suffered natural disasters for many years or where there has been no damage previously (Tobin&Montz, 1994).

Research has shown how housing in lower-income areas suffers more damage and lags behind in the recovery process (Peacock et al, 2014). However, since social factors have different effects in different settings, there is a need to analyze the impact of disasters on housing equalities in areas that have been recognized as safe from disasters.

[Research Methodology] The geographical range of this paper covers Gyeongju in South Korea, which

has been recognized as safe from earthquakes in the past. The timescale of the analysis covers the 42 months before and after a 5.8 magnitude earthquake in September 2016. We report on empirical analysis in the South Korean case using longitudinal-multilevel modeling.

[Findings] The results of the analysis show that the earthquake has led to a decrease apartment prices in hazardous areas, and, after the earthquake prices have risen over time. In addition, longitudinal-multilevel analysis showed that low-income housing is more likely to suffer a greater loss and take a longer time to recover to pre-disaster conditions. That is, an earthquake's impact on housing loss is uneven for different types of housing.

[Policy Implications] As developments in hazardous areas continue, the potential for damage from disasters is growing (Berke, 1998). In addition, previous studies have shown that planning policies reduce losses from disasters by affecting land use in urban areas (Burby, 1999). In order not to exacerbate the inequalities that already exist in housing prices, planners must consider social vulnerability before integrating hazard mitigation plans into urban planning. In addition, as there is no system to disclose disaster-history information on residential real estate in South Korea, institutional improvements are required in order not to exacerbate inequalities.

GROWING DENSER AND GREENER: THE TALE OF THE "EMERALD CITY"
Abstract ID: 65
Individual Paper Submission

WEI, Hanxue [Cornell University] hw652@cornell.edu, presenting author
CARRUTHERS, John [Cornell University] jc3474@cornell.edu, co-author

Seattle, Washington—the Emerald City, so-called for its distinct color and stunning natural beauty—has spent the past 25 years growing denser and taller in response to the state's 1992 Growth Management Act, or GMA (DeGrove 2005). The city lies at the heart of the Puget Sound and is at the epicenter of the region's state-mandated urban growth boundary, whose basic purpose it is to contain development by pushing it inward and upward. Despite the pressure of this urbanization policy, amplified by a massive tech-based agglomeration economy, Seattle has emerged as beautiful as ever: U.S. News and World Report ranks it in the top 10 cities nationwide, a score that is supported by scientific research on urban amenities (see Albouy 2008; Albouy and Lue 2015).

This paper argues that Seattle has achieved its high status, even while living up to the demands of the GMA, though careful attention to the intersection of urban and environmental planning. In particular, even as the city has pursued an intense strategy of urbanization, it has also pursued an innovative forestry program aimed at greening its density—across multifamily residential, commercial, mixed, and other land uses—that it has created. Just a casual glance at data redevelopment and tree plantings shows that the two activities correspond across both space and time. Yet, as a matter of policy, it remains unclear that these activities are functionally linked, raising several questions: (i) to what extent has Seattle consciously pursued urban forestry in parallel with its land use planning activities; (ii) how have tree planning and

related activities enabled the success of the city's innovative Urban Villages plan; (iii) what is the estimate social value (Wachter and Wong 2008) of the linkage; and (iv) what are the lessons for urban and environmental planners in other cities, working toward the goal of simultaneously promoting density and quality of life?

This paper responds to these questions via an analysis of redevelopment within Seattle since 1995. It begins by introducing the terms of the GMA, which have demanded much of the city, and explains the situation through the lens of theory on the consumer city (Glaeser et al 2001) and urban agglomeration (Glaeser 2008) economics. It then systematically explores the spatial and temporal correspondence of urban and forestry planning in Seattle in order to establish the connection, whether formal or happenstance, between the two. Finally, the paper implements a two-equation econometric model of the city's land market, designed to test the joint hypotheses that (i) urban and environmental planning are mutually-reinforcing, interdependent activities; and (ii) that substantive social value has been accumulated via their interplay. A set of generalized policy implications—keyed to cities, regions, and states—and directions for future research follow from the results.

LONG-TERM COMMUNITY RELOCATION AFTER TYPHOON HAIYAN – RESIDENTS' ADAPTIVE AND TRANSFORMATIVE DECISIONS
Abstract ID: 70
Individual Paper Submission

IUCHI, Kanako [Tohoku University] iuchi@irides.tohoku.ac.jp, presenting author

Internationally, community relocation is increasingly considered after large-scale coastal disasters (Nalau & Handmer, 2018; UNHCR, 2014). When calamities struck, affected governments – both central and local – often support the idea of relocation in rebuilding to secure residents from future risk. Post-disaster relocation is increasingly studied, for instance, to understand how affected governments and communities make decisions whether to rebuild in-situ or relocate (Bukvic, A., Owen, G, 2017; Cong, Nejat, Liang, Pei, & Javid, 2018; Henry, 2013). These studies help governments understand when to adopt relocation post-disaster. However, post-disaster relocation aiming for future risk reduction has not been particularly successful.

This paper aims to understand how disaster-affected coastal residents targeted for relocation make and change their decisions regarding their permanent residence over time. The goal of this longitudinal study is to understand the decision-making mechanism of post-disaster relocation at the community level. After the 2013 typhoon Haiyan (local name Yolanda) devastated the coast, about 14,000 families who originally resided in the newly-defined no-dwelling zone in Tacloban City were targeted to relocate to an underutilized area in the City's north. Under the national socialized housing program (Republic Act 7279 of 1992), relocating residents were eligible to receive new affordable housing units in exchange for their previous informal residence. At the completion of the relocation project, the original, informal residences

along the coast was planned to be cleared as new residences will be provided inland, thus, reducing future coastal risk. However, six years of post-typhoon houses are still found in the no-dwelling zone, even though permanent houses are nearing completion.

This study focuses on the experiences of residents who originally lived along the coast before Haiyan and were targeted for relocation. Interviews were semi-structured and open-ended, with questions related to: i) resettlement process and outlook, ii) livelihood and housing changes before and after Haiyan, and iii) level of residential satisfaction at the time of each interview. On-site interviews were conducted twice a year – once in the coastal area and the other in the relocating area – totaling forty residents each time. To reduce the bias of community members' responses, as well as to interview in the local language warai, local university students were trained to interview together in the field. Interviews were repeated for five years before all the planned permanent housing was completed.

Analysis suggests that community relocation is not a linear development, but an organic, adaptive, and responsive process, as a result of residents seeking a sustainable living. In an earlier phase of relocation, residents strongly desired to distance themselves from the coast to avoid future hazard risk. Therefore, residents being relocated from the coastal areas to other sites were more satisfied compared to those waiting for their turn in the original coastal areas. Over time, residents' satisfaction levels began to correlate with the availability of daily life activities as opposed to mitigating future risk, and thus contentment increased in the original coastal sites. Towards the end of the study, residents in some relocation sites had finally begun to experience normal lives. As a result, their level of satisfaction slowly increased. Longitudinal observation also identified that the original sites were both a gateway for life activities and a financial burden due to the increase in commuting needs between the original and relocation sites.

WHY AND HOW DO CITIES PLAN FOR EXTREME HEAT?
Abstract ID: 83
Individual Paper Submission

GABBE, Charles [Santa Clara University] cgabbe@scu.edu, presenting author
PIERCE, Gregory [University of California, Los Angeles] gpierce@luskin.ucla.edu, co-author

California, like most places, is facing a future with more extreme heat days and waves. There is some evidence about why and how U.S. cities engage in climate adaptation planning. Municipalities planning for climate adaptation have higher municipal expenditures per capita, greater exposure to local climate impacts, and more committed local officials (Shi et al., 2015). Cities plan for adaptation in specialized plans and comprehensive plans, with those taking a narrower focus on specific risks proving more

effective (Lyles et al., 2018). We know little, however, about why and how cities specifically plan for extreme heat.

Moreover, while scholars and practitioners have presented best practices for managing extreme heat, there is limited evidence about how cities apply these practices. These practices include lighter colored "cool" roofing and paving materials, urban greening, tree planting, building envelope design, cooling centers, early warning systems, and heat response plans (Stone et al., 2019; Stults & Woodruff, 2017).

In this paper, we answer two questions about adaptation planning for extreme heat in California. What are the characteristics of California municipalities that adopt policies and plans for extreme heat? What extreme heat policies do California municipalities most commonly adopt to plan for high temperatures?

The first part of the paper employs regression analysis of the factors associated with municipal adaptation of urban heat island policies and climate adaptation. We specify three sets of logistic regression models. Our binary outcome variables – from the state's 2018 Annual Planning Survey – are (1) city has adopted urban heat island policies, (2) city addresses climate adaptation in its General Plan, and (3) city has adopted climate adaptation plans and strategies. We control for planning staff capacity, population and population density, residents' socio-demographic characteristics, voting in the 2016 election, and projected extreme heat days in the 2040s.

We find that 41% of Californian cities responding to the statewide survey have adopted urban heat island policies and 40% have climate adaptation in their General Plan, whereas 62% have some climate adaptation plans and strategies. Preliminary results show several factors to be statistically associated with climate adaptation. Cities with larger planning staffs, larger shares of Democratic voters, and more projected extreme heat days are more likely to adopt urban heat island policies. Cities with higher shares of black residents are more likely to have climate adaptation in their General Plan. Cities with more college graduates and Democratic voters are more likely to adopt climate adaptation plans and strategies. Our subsequent analysis of these data will focus on how climate hazards are associated with planning interventions, with an intent to shape future state guidelines.

The second part of our paper is a content analysis of adopted policies related to extreme heat. We developed an inventory of best practices based on the literature and professional publications. We selected a stratified sample of cities in California by size and climate zone. Two trained students are working in parallel to review cities' general plans, climate adaptation plans, and other relevant documents to assess the degree to which cities have adopted best practices in the inventory.

INCORPORATING STORM WATER MANAGERS' KNOWLEDGE AND PERCEPTIONS INTO AN AGENT-BASED MODEL: SIMULATION OF INSTITUTIONAL DECISION-MAKING IN GREEN INFRASTRUCTURE PLANNING

Abstract ID: 107
Individual Paper Submission

BANERJEE, Debolina [University of Utah] banerjee15d@gmail.com, presenting author
BREWER, Simon [University of Utah] simon.brewer@geog.utah.edu, co-author
JACKSON-SMITH, Douglas [The Ohio State University] jackson-smith.1@osu.edu, co-author
HINNERS, Sarah [University of Utah] sarah.hinners@utah.edu, co-author

In the age of climate change, there is an increased interest in urban stormwater management to combat problems related to excessive flooding and pollution of water bodies. Green infrastructure [GI] tries to simulate natural hydrologic systems to address such issues. The advent of GI as a significant piece of urban stormwater and wastewater management reflects the concerted efforts to build an eco-friendlier urban system. Urban areas are, in fact, complex socio-ecological systems [SES] which involve human and natural resources in a multifaceted multi-scalar manner [Gunderson & Holling 2002]. According to Innes and Booher [2010], the logical way to plan for a complex urban system is through collaborative rationality. A popular method of collaborative planning is participatory modeling, which is the process of incorporating stakeholders into an otherwise purely analytic modeling process [Voinov & Gaddis 2008].

Although GI for stormwater management is on the rise; there is little research that has examined the role of stakeholder perception and decision making in the planning process [Montalto et al., 2013]. Additionally, most GI implementation plans are based on deterministic physical models that fail to account for variability in perception. Agent-based models [ABMs] provide a tool to simulate and study human decision making. ABMs comprise agents who mimic real-world rules and interactions, can incorporate dynamics of the social and physical environment, and quantify complex interactions [Railsback & Grimm, 2011].

The purpose of this paper is to present results of an ABM designed to explore dynamics of institutional decisions about green infrastructure implementation in Utah. The model is built to capture impact of stormwater managers' existing experience and knowledge in implementing green infrastructure. The specific research question is how the incorporation of stakeholder perception in an otherwise deterministic model changes the overall GI implementation rate and achievement of corresponding benefits, and how this may lead to sub-optimal outcomes.

Based on 31 key informant interviews and 67 stormwater program manager surveys on GI perception, we formulated the agent knowledge base for an ABM developed in NetLogo to simulate GI implementation in Salt Lake County, Utah, under two different scenarios. Agents in the model are stormwater managers making final decisions on GI types and locations in both scenarios. In the first scenario, we assume perfect, objective knowledge on the part of the stormwater managers, leading to an optimal solution for the distribution of GI. This model then uses deterministic variables used to assess suitability and overall cost and benefit accrued after implementation [in terms of flood reduction, pollutant removals, etc.], i.e., based on benefit maximization. In the second scenario, implementation decisions are weighted using insights from stakeholders concerning the awareness of GI types and effectiveness of various GI types in flood control, nutrient reduction, with the resulting implementation representing a suboptimal solution defined by preconceptions about GI. We then extend this second model to study how knowledge transfer through direct experience of GI efficacy, contact with other agents, and policy incentives can be used to counter these preconceptions and encourage optimal implementation.

Our findings demonstrate the importance of knowledge transfer as both a top-down and bottom-up process plays a role in designing GI for flood control, pollution reduction, and local infiltration. In particular, the results illustrate the role of innovation spread [Hagerstrand, 1952], through dialogue and interaction between agents. The primary relevance of this study is in bridging the gap between a purely objective choice model for GI and more qualitative information on stakeholders' preconceptions and preferences. Although a simplistic model, this produces realistic simulations that can be used to explore the role of education and information in guiding choices.

Buying flood-prone properties and returning the land to open space is an important strategy used by government agencies to mitigate flood hazards (FEMA, 2018). A recent nationwide study found that buyouts tend to target low-income diverse zip codes within whiter, wealthier, and denser counties, leading to the question of whether buyout practices are equitable (Mach et al, 2019). A second nationwide study, also in 2019, found that buyouts are disproportionately offered to white zip codes and that federal disaster aid disproportionately benefits whites (Benincasa, 2019). A third nationwide study (Elliott et al, 2020) found that buyouts disproportionately target whiter counties and neighborhoods, especially in more urbanized areas. However, neighborhoods of color in these areas have been historically more likely to accept buyouts in greater numbers (except in New York and New Jersey area after Hurricane Sandy). These three pioneering studies are the first of their kind, but their results appear to contradict each other and they fail to clarify the problem. This problem includes, for example, the belief expressed by low income people of color in Houston that buyouts are tantamount to a land grab (Nance and Johnson, forthcoming), which would explain relatively low interest in the buyout program among racial minorities. Also unaddressed in the emerging literature is the preponderance of people of color in flood zones due to historical factors, which should increase their eligibility for buyouts. To address these gaps we selected Greater Houston as a case study to examine buyout program inequity at a more manageable scale. We had two research questions: who is getting bought out and is the buyout program equitable? Through the Freedom of Information Act we were able to obtain address-level data for 1,399 buyouts in the Greater Houston area from 1997-2017. We combined this buyout data with Census data and buyout program information from the local flood agency to analyze the equity implications of past buyout decisions in terms of race, income, property value, and flood risk. We used GIS mapping and statistics for the first phase of the analysis. For the second phase we interviewed buyout program participants to understand the range of reasons why historically excluded groups would either volunteer for or avoid a buyout. Our overall finding for the Houston region is that the local flood agency does in fact target people of color for buyouts because they tend to be at higher risk of flooding. We also find that these groups are generally not interested in participating in the program because of the lack of affordable housing and the predatory nature of the local housing market. Our case-based results provide additional knowledge that supplements the emerging literature. These results also offer constructive guidance to planning practitioners who are trying to develop equitable buyout programs.

DISASTER INEQUITY AND THE CHALLENGES IN RURAL AND EX-URBAN COMMUNITIES
Abstract ID: 166
Individual Paper Submission

MILLER, Shaleen [The University of North Carolina- Chapel Hill] sam15s@my.fsu.edu, presenting author
GARCIA ZAMBRANA, Ivis [University of Utah] ivis.garcia@utah.edu, co-author
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author
MEYER, Michelle [Texas A&M University] mmeyer@arch.tamu.edu, co-author

Disasters are often accounted for in terms of numbers—numbers of people, structure, dollars of damage. This means that when natural hazards, such as hurricanes, affect larger cities the statistics can be escalating and alarming. Yet these statistics hide the intensity of damage to rural and ex-urban areas where population and the built environment is less dense but vulnerability also high. In rural areas, non-structural damage is often more of a concern, causing stress and economic problems that are not well well-supported by current hazard mitigation planning (Whitman et al., 2013). In areas outside of the US, this has been a major driver in rural-urban migrations (Ishtiaque & Nazem, 2017).

Rural and ex-urban communities face unique vulnerabilities. On one hand, they often have more dependence on natural resource livelihoods that can be affected by natural hazards (Jurjonas & Seekamp, 2018). However, some studies have shown that despite this dependence, the built-up social capital and civic engagement may help residents to respond to challenges of hazards (Jedd et al., 2018). These different sources of challenges and resources affect the disaster profile of these communities in a way that statistics often fail to account for.

Rural areas in the US have been understudied, particularly in hazard research. Most rural hazard research pertains to developing countries, where larger portions of the population still live. This paper addresses and brings to light many of the challenges of disaster preparation, recovery, and adaptation based on three case studies post-hurricane. The case study analysis highlights the initial vulnerabilities that exacerbate problems and the way statistics and the media reduce the available resources to the area to recover.

THE LOCAL INFLUENCE OF A GLOBAL CITY: A CASE STUDY OF EMBODIED EMISSIONS POLICY FOR URBAN CLIMATE ACTION
Abstract ID: 173
Individual Paper Submission

TEICHER, Hannah [Pacific Institute for Climate Solutions] hannah.teicher@gmail.com, presenting author

Since at least the early 2000s, the City of Vancouver has been a self-proclaimed and widely-recognized leader in urban sustainability. In 2010, the city announced a bold vision to become the "greenest city in the world." Over the past decade, it has been an active member of all of the high-profile transnational urban climate networks, including C40 and the Carbon Neutral Cities Alliance. Recently, those networks have adopted a focus on embodied carbon as one of the crucial frontiers of urban climate action. In dialogue with them, decision-makers in the City of Vancouver have played a critical role in developing this policy area for the building sector, actively testing and proposing strategies.

The carbon footprint of goods imported into a city is particularly significant for the built environment. Globally, new construction continues so rapidly that a popular metric suggests the equivalent of New York City will be built every month for the next 40 years. As operational emissions decline with increased energy efficiency and electrification, the embodied emissions of building materials become an increasingly large part of the building footprint. Reducing embodied emissions presents an opportunity to take immediate action to meet Paris commitments.

The City of Vancouver is primarily addressing embodied carbon in relation to peer cities such as Seattle, San Francisco, Copenhagen and Oslo, but this initiative is also occurring within a supportive provincial context. In BC, the provincial government and the private sector have been supporting mass timber construction to reduce embodied carbon and foster local economic development.

Cities are increasingly seen as the last, best hope for meaningful climate action, and global cities are the clear champions in this arena. However, urban climate action cannot depend solely on those elite cities, but must also be taken up among cities with less capacity that are less "plugged-in" to global networks. This raises the question, given favorable conditions from higher levels of government, to what extent do global cities serve as a catalyst for further local climate action? Specifically, how does City of Vancouver and forestry sector leadership translate to uptake of embodied carbon policy in other local governments and public sector organizations in British Columbia? Do decision-makers choose to pursue embodied carbon policies? If so, how and what are the main barriers and enablers?

In this case study of embodied emissions policy uptake in BC, methods include interviews with key decision-makers in multiple levels of government, focus groups in the public and private sectors, and content analysis of policy documents and green rating systems. Preliminary findings indicate that even with Vancouver leading the way and the province providing some supportive conditions, public sector

organizations face significant barriers to considering embodied carbon policy, let alone adopting it. Barriers range from a lack of capacity and authority to the limitations of territorial emissions accounting. Local governments tend to fold embodied emissions into circular economy approaches, such as reusing buildings and materials, which may have a minimal emissions impact. In early evaluation, embodied emissions policy seems to present critical trade-offs in areas including affordable housing and adaptation.

The City of Vancouver does act as a regional leader and engenders some limited upscaling in the arena of embodied emissions policy, but the stratification of urban climate action between this global city and other local governments persists. This points to the need to identify more explicit, viable mechanisms for leveraging the influence of a global city within a regional and subnational context, an approach which will be essential to fulfilling the promise of local governments as climate champions.

LEVERAGING PEER INFLUENCES TO MOTIVATE ENERGY EFFICIENCY RETROFITS
Abstract ID: 174
Individual Paper Submission

BORIA, Eric [University of Illinois at Chicago] eboria2@uic.edu, presenting author

Planning for energy efficiency in multi-unit residential buildings implores examining the assumptions underlying conventional approaches and implementing more robust strategies that account for the potential of negative, unexpected reactions.

Interview findings from this research revealed that people could respond to programs and policies in ways that undermine their intended outcomes. For example, in response to information on a building's energy efficiency level and options to retrofit and lower consumption, some types of building owners perceive that message differently and can instead react by disinvesting in that building – the opposite of the intended outcome.

The reason these types of reactions are unexpected is due to faulty assumptions underlying how building owners are thought to make decisions. Conventional planning and policy approaches assume that building owners are rational actors. The rational actor framework values information that is knowable, accessible, and quantifiable. Both municipalities and non-governmental organizations (NGOs) apply this framework by quantifying the benefits and costs of energy-related investments in financial terms and sharing this information with building owners with the assumption that they will be motivated accordingly.

These assumptions need to be tested, but many municipalities lack the capacity and resources to assess fully the performances of planning and policy approaches. Without feedback on which efforts are effective with different types of building owners, efforts to motivate those who didn't respond to conventional approaches often resort to doing more of the same: education, outreach, and financial incentives.

While in other contexts, emotional, sociological, and other non-rational factors have been recognized to influence consumer behavior significantly, these factors have not been widely applied to motivating

energy retrofits in buildings. The challenges to motivating multi-unit residential building owners include large numbers of owners to motivate, different types of management strategies, and the problem of split incentives between those who incur the retrofit costs and those who receive the benefits.

Planning for energy efficiency among multi-unit residential buildings can serve as a test case to uncover and verify new approaches that will prove effective in motivating diverse types of building owners to retrofit.

This study combines methods of qualitative research with agent-based modeling. Qualitative methods include semi-structured interviews exploring how municipalities and non-governmental organizations (NGOs) in Cleveland, Detroit, and Grand Rapids encourage energy efficiency and leverage social incentives among multi-unit residential buildings. The 22 interviewees included building owners, municipal and NGO decision-makers. Building owners were interviewed to understand how they make energy retrofit decisions.

The interview findings were used to build the Neighbor-Influenced Energy Retrofit (NIER) agent-based model that explored the effect of neighbor and network peer influences upon energy retrofit decisions within a population of building owners. It explores scenarios in planning and policy interventions.

Interviewees reported lacking the capacity, resources, and information feedback to properly evaluate the performance of their efforts, which may contribute to limited or converse results from owners who are not receptive to those approaches.

However, an emerging approach employing a spatial strategy to engage building owners is being implemented. This approach magnifies neighborhood and network peer influences and conveys information from respected peers, which building owners have reported that they factor into their retrofit decision-making.

These dynamics are represented in the NIER model that produced the following insights: Large peer groups can achieve quick energy efficiency gains but abandon reluctant owners. Small peer groups successfully motivate all types of building owners but takes time and requires large financial incentives. A combined approach with bringing buildings up to code at the point of sale improves retrofit outcomes.

This research contributes to more robust energy efficiency planning that can motivate reluctant building owners with effects beyond the initial intervention.

SUBSTANTIAL WIND POWER PROJECTS IMPROVED THE COMMUNITY SERVICES ON RURAL AREAS IN THE UNITED STATES
Abstract ID: 198
Individual Paper Submission

SHOEIB, Eman [University of Massachusetts Amherst] eshoeib@umass.edu, presenting author

Wind power development has rapidly expanded in rural areas in the United States. Numerous studies addressing the impacts of wind development on rural communities focusing on economic, environmental, and social effects, none of these studies investigate the impacts on community services. This research addresses the impacts of substantial wind development on community services and the standard of living. It used a mixed-methods approach to investigate the effect of wind power development on the eleven rural counties which hosted substantial wind farms over 1000 MW. This approach consists of three components: descriptive analysis, semi-structured interviews, and government documents and newspapers analysis. The descriptive analysis is performed to document changes in the population size, employment, and poverty rate of eleven rural counties before and after hosting substantial wind projects. The interviews and documents are analysed to identify the effect of wind development on public services and standard of living, based both on empirical outcomes and respondents' experiences. The results show that wind development increased the tax revenue of the rural community without any noticeable increases in required public services or increases in the population size of the rural communities. Counties received substantial tax revenues and showed an improvement on public services. Wind development provides an additional source of income to rural communities without any changes to the rural nature. This research suggests that wind development is a suitable economic source for rural economy's diversification.

DO DOLLARS AND CENTS EQUAL IMPORTANCE: AN ADAPTED METHOD TO ALIGN ECOSYSTEM SERVICE VALUATION TO SPATIAL PLANNING
Abstract ID: 205
Individual Paper Submission

PECK, Megan [University of Waterloo] mlpeck@uwaterloo.ca, presenting author
KHIRFAN, Luna [University of Waterloo] luna.khirfan@uwaterloo.ca, co-author

In the words of Baba Dioum, "In the end we will conserve only what we love; we will love only what we understand; and we will understand only what we are taught". Since the onset of the twenty-first century, the ecosystem service concept has gained increased attention for its ability to highlight human's dependency on nature. This concept has the potential to be used by spatial planners, urban designers, and landscape architects to transform urban patterns to integrate ecosystems, hence, support their provision of needed services. However, there is a dearth in empirical studies that use ecosystem valuation (i.e., obtaining the public's value of nature to better inform policy and management decisions) in a way that is compatible with the idiosyncrasies of urban planning, particularly the discipline's diverse information sources and competing stakeholder opinions (Galler et al., 2016). The current literature is predominated by valuation studies based on neoclassical economics that aggregate individuals' monetary conception of value (Gómez-Baggethun et al., 2014; Chan et al., 2012). However, these approaches continue to face unresolved difficulties, including the commodification of incommensurable values and isolating value framing from its social construction (Chan et al., 2012). Yet, alternative, non-monetary valuation approaches, which are often deliberative, have been criticized for lacking structured and replicable procedures, leading to loosely defined management ideals that do not "address implementation issues where conflicts occur and trade-offs are necessary" (Kallis et al., 2007).

Accordingly, this paper addresses two research questions: (1) How can ecosystem service valuation be adapted into a pragmatic framework suitable for use within urban planning? and (2) How can we empirically apply this adapted framework?

To answer these questions, the paper looks to the literature to identify three critical themes across valuation approaches, including: (1) deliberation; (2) local ecological knowledge; and (3) explicit trade-offs. These themes guided the creation of a pragmatic valuation framework, operationalized by combining two interactive public engagement methods (Q-method and focus groups) to create a robust heuristic planning tool. This preference ranking method, dubbed "deliberative Q-method", combines objective data outputs, derived from a rule-guided statistical analysis, with deliberative narratives to holistically understand participant values. In doing so, this method allows for a more inclusive, transparent participation process by drawing on local knowledge and allowing for explicit tradeoffs to be made across ecosystem services. This enables stakeholders to share in the creation of management guidelines, and highlights the importance of mutual learning and value creation's socio-contextual determinants. This combined method was empirically tested in Amman, Jordan by analyzing how experts value urban water features amid severe water scarcity. Specifically, we investigate how and why experts in Amman, Jordan value stream ecosystems, and how these values can inform future planning and management decisions.

Our findings revealed two juxtaposing opinions about the value of Amman's urban surface waters. The predominant perspective is sustainably minded, valuing urban water features for their sociocultural benefits and for their support in creating nature-based solutions. The second perspective is technically minded, valuing hardscape protections against ecosystem disservices and unsustainable water management practices.

The relevancy and implications of this work is twofold, first concerning planning scholarship and second, regarding planning practice. The combined method bridges the quintessential gap between theory and practice, building theoretical and empirical frameworks believed to be valuable to planners, policymakers and scholars alike. This work highlights two important considerations: (1) valuation methods should be fit for the purpose of the process, and (2) practitioners should question the status quo by applying new methods to reconcile competing policy agendas and citizen values. This method produces results that are easily interpreted by decision-makers amid complex urban realities such as climate change.

Planning for climate change requires the initiation and implementation of policy at the local and national levels. Public support and buy-in are crucial to the introduction, passage and eventual success of these policies (Drews & Bergh, 2016). Climate policies typically support either mitigation (the reduction of greenhouse gas emissions) or adaptation (preparation for and responses to the impacts of climate change). While many studies have measured support for climate-mitigation policies, fewer have explored support for adaptation-focused policies. Further, some scholars and policymakers have expressed concern that focusing on adaptation might reduce support for mitigation measures, although existing evidence does not support this claim (Carrico et al., 2015). This research explores three central questions: 1) what variables are associated with support for mitigation and adaptation policies, and do they differ? 2) do these variables change from the local scale to the federal scale for each set of policies? and 3) are private, self-reported pro-environmental behaviors associated with support for climate policy?

As part of a National Science Foundation funded multi-university, inter-disciplinary project designed to test intervention messaging to encourage resource conservation at the household level, we will survey 300 households in Lake County, Illinois about their environmental beliefs, knowledge, and behaviors. These issues should be relevant for residents as multiple municipalities in Lake County have experienced flooding as a result of increased frequency and severity of precipitation events. Efforts to adapt to the impacts of climate change are underway at both the county and municipal levels.

We will measure support for four types of policies: federal mitigation, federal adaptation, local mitigation, and local adaptation. Independent variables measured in the survey include belief in climate change, perceived risk from climate change, perception of local climate impacts, direct hazard experience, political affiliation, and self-reported pro-environmental behaviors. To analyze the impacts of independent variables on dependent variables, we will use a series of ordinal regression models (DVs are measured using a 5 or 7-point Likert-type scale).

Following other recent studies, we hypothesize that past hazard experience will influence support for

adaptation policy, particularly at the local level (Albright & Crow, 2019; Demski et al., 2017). We predict that knowledge of and belief in climate change will predict more variance in mitigation policies than adaptation policies, following Toole et al.'s (2016) observation that belief in or knowledge about the causes of climate change is not necessarily a prerequisite for building household adaptive capacity. As a large body of research finds strong association between support for climate policy and political orientation, we predict that it will be a significant variable in our models, but hypothesize that political orientation will predict more variance in support for federal policy than local policy, as federal policies are often more politicized. Finally, we predict a positive association between engaging in household pro-environmental behavior (individual behavior) and overall support for climate policy (collective action). Understanding these distinct dimensions of support for climate policy can inform efforts to implement policy at multiple scales.

READING THE SILENCES: HOW URBAN CLIMATE ADAPTION PLANS ADDRESS INCOME AND RACIAL INEQUALITIES
Abstract ID: 214
Individual Paper Submission

ZOLL, Deidre [The University of Texas at Austin] deidrezoll@utexas.edu, presenting author

U.S. cities are experiencing climate change impacts ranging from sea level rise and flooding to increased heat waves and wildfires. These ecological changes have extensive and varied social consequences, and many of these risks will disproportionately affect people already experiencing forms of social inequality. In response to these challenges, cities are creating climate adaptation plans and associated projects. Within these plans, if and how cities address issues of social inequality vary widely, raising concerns that adaptation interventions may continue patterns of disparate risk or create new forms of environmental injustice especially for low-income communities of color (Shi et al., 2016). This study contributes to this body of research by deploying content analysis and plan evaluation techniques to answer two questions: 1) How do cities acknowledge issues of racial and income inequality in their climate adaptation plans? 2) What is the relationship between plan attention to social inequalities and measures of racial and economic disparities?

To answer these questions I examine how 25 U.S. cities address racial and income inequality in their climate adaptation plans. I use manifest content techniques to code internal plan elements including: issue identification, goals, strategies, attention to uneven climate risks, and consideration of racial and class inequalities (Berke & Godschalk, 2009, Bulkeley, et al., 2013; Schrock, Bassett, & Green, 2015). I contrast plan attention to racial and economic injustices with measures of current income inequality,

racial segregation, and historical redlining processes to understand how planners contend with uneven socio-economic conditions in the face of climate change.

Initial results indicate that a majority of plans focus on vulnerable and/or low-income residents in assessing unequal climate risks and in targeting their adaptation actions. Less than half of the plans acknowledge racial inequalities and fewer than a quarter target communities of color in their adaptation strategies. While a majority of plans acknowledge some level of unequal risks from climate change, few unpack the urban processes and structures that create(d) those disparities. Using Stuart Hall's discussion of silences as a process of racialization and Charles Mill's work on silence as a form of collective denial that maintains what he calls "white ignorance", I argue that the lack of attention to racial inequality creates a collective silence on urban climate injustices that may exacerbate racial inequalities (Hall, 1992; Mills, 2007). In contrast to these silences, I offer examples of climate adaptation plans with explicit anti-racism rhetoric and discuss how those approaches influence issue identification, goals, and strategies. These findings contribute to our understanding of how emerging urban planning responses to climate change may continue or attempt to disrupt racialized planning practices and climate injustices (Anguelovski et al., 2016; Hardy, Milligan, & Heynen, 2017).

MANAGING URBAN GROWTH IN THE WAKE OF CLIMATE CHANGE: REVISITING THE GREENBELT POLICY IN THE US
Abstract ID: 243
Individual Paper Submission

HAN, Albert [The University of Texas at San Antonio] albert.han@utsa.edu, presenting author
DANIELS, Thomas [University of Pennsylvania] thomasld@design.upenn.edu, co-author
KIM, Chaeri [University of Pennsylvania] chaeri@design.upenn.edu, co-author

Greenbelts are one of the oldest land use policies. Since the mid-20th century, they have gained in popularity as a way to preserve land from development and to contain urban growth. Originating from Sir Ebenezer Howard's Garden City concept, greenbelt policy was first adopted in the United Kingdom and later in Canada, Australia, the United States, and South Korea. The success and failure of modern greenbelt programs depend on how the political support, public preference, and planning priorities reconcile two contradictory policy objectives – land preservation and development (Han and Go 2019). Criticism against greenbelts has focused on: 1) the effectiveness of greenbelts in mitigating the costs of sprawl; 2) the impacts housing affordability by restricting land supply and development activities; and 3) the resulting land use patterns, which may include, leapfrog development and related high commuting costs (Hack 2012; Amati and Taylor 2010; Amati 2008; Morrison 2010). Despite the heated debates on the effectiveness of greenbelts, their primary function of land preservation remains intact in countries like

the UK, Canada, and some parts in the US, despite escalating development pressures (Ontario Ministry of Municipal Affairs 2017; Daniels 2010; Amati and Yokohari 2007).

While the costs of maintaining greenbelts are being weighed against their benefits, the intensifying impacts of climate change shed new light on an overlooked benefit of greenbelts. According to the Land Trust Alliance, forests, prairies, farmland, and natural habitats absorb about 15% of America's carbon dioxide emissions (Land Trust Alliance 2017). Tomalty (2012) reported that the forestland, wetland, and agricultural land in Ontario's Greenbelt can annually store 86.6 million tons of carbon and sequester 200,000 tons of carbon. He estimated the economic value of the greenbelt as a carbon sink was around $10.7 billion per year. Thus, studying the effects of greenbelts as carbon sinks will make an important contribution to research on climate change. For example, the spatial distribution of development was an important element missing from the Green New Deal and its goal to eliminate greenhouse gas emissions by 2030.

In the U.S., several metropolitan counties including Lancaster County in Pennsylvania, Sonoma and Marin Counties in California, Baltimore County in Maryland, Boulder County in Colorado, Lexington County in Kentucky have instituted greenbelt policies based on agriculture zoning, urban growth boundaries, and market-based land preservation tools (e.g., Fee simple purchase, Transfer of Development Rights, Purchase of Development Rights, and land trust acquisition of conservation easements) to preserve lands. Daniels (2010) finds that the modern greenbelt programs attuned to the American land use planning system have contributed to increasing agricultural outputs in the studied counties. Following up on this study, we seek to estimate the effects of the greenbelt programs on sinking carbon by comparing the land conversion in the six counties to neighboring counties without greenbelt policies. Using the longitudinal National Land Cover Datasets from the year 2001 to 2016, we conduct a series of raster analyses and land fragmentation analysis to analyze the growth containment, land preservation, and carbon sink effects of greenbelt. Based on the empirical findings, we conclude our paper with planning policy implications that could help better shape future climate action plans and policies.

Larger, more severe forest fires in the Western United States are a result of climate change, fire exclusion, and lack of active resource management (Littell, McKenzie, Peterson, & Westerling, 2009; Abatzoglou & Williams, 2016). Over 1.25 million acres burned in Washington State from 2014 to 2015. Unusually hot temperatures, 4 to 9 degrees F above average in June (OWSC, 2015), triggered the fires. Communities struggled to recover from the fire as well as subsequent flooding and mudslide events.

Our research examined how to reduce risks from fire and flooding given long-term expected changes. We examined the wildland-urban interface in Plain, Washington using scenario planning coupled with appreciative inquiry and storytelling to develop four alternative futures over 60 years. This method blends scientific probabilistic modelling of scenarios with the local knowledge and community values to create stories about the community's future that address socio-ecological problems. Considering multiple scenarios allows communities to incorporate uncertainty into planning, test different mitigation strategies, identify risk reduction approaches common to all scenarios, and recognize path dependencies that limit future options for ecosystem services and planning.

"Scenario planning is a systematic method for thinking creatively about possible complex and uncertain futures" (Peterson, Cumming, & Carpenter, 2003, p.359) while improving the usefulness and efficacy of plans (Chakraborty, Kaza, Knaap, & Deal, 2011). We created four scenarios using the most important and uncertain community-identified drivers of change: fire, flooding, and population. Fire risks were calculated using a statistical model that included regional historical fires (1984-2010) and climate change predictions for temperature and precipitation. Flooding estimates and building damage were calculated using HAZUS. The population growth rate calculated for 2000 to 2010 was used to develop population bust and boom ranges. Four alternative futures were developed for years 2040 and 2080:

- Local Renewal: Plain will depend on local experimentation and innovation to rebuild and protect the community after fire, flooding, and population decline occur.
- Community Transformation: Plain adapts to extreme events and transforms into an urban community after fire, flooding, and population growth occur.
- Local Reorganization: Plain will depend on local knowledge to protect and utilize natural resources to stabilize the community when population decreases and no fire and flooding occur.
- Reactive Management: Plain focuses on growth and makes incremental steps towards a resilient community when population increases and no fire and floods occur.

We find that institutionalizing proactive and sustainable ecosystem management practices is critical for preserving healthy forests. Land management agencies can employ a myriad of risk reduction measures to preserve the health of the forest and enhance the safety of life and property in the wildland-urban interface. Community members can enhance Fire Adaptive Communities initiatives to protect their properties. This will allow fire suppression to focus on protecting forest resources, which in turn will protect the ecosystem long-term. In scenarios where population increases, the community must assess path dependencies that increase fire and flooding risks. In scenarios where fire and flooding occur, the community must consider post-event practices that inhibit forest regeneration and avoid path dependencies that limit future adaptive capacity and increase risks. We recommend adopting strategies that address several scenarios.

Comprehensive plans articulate a community's land use goals and aspirations based on growth. Hazard Mitigation Plans are aligned with comprehensive plans and focus on reducing natural hazard risks to communities. Both types of plans currently focus on the short term and follow a linear planning process that fails to account for uncertainty and surprises. In contrast, our research demonstrates how scenario planning, appreciative inquiry and storytelling methods can blend scientific and local knowledge to examine long-term risk reduction strategies and path dependencies over multiple alternative futures.

SEEKING URBAN CLIMATE JUSTICE: ASSESSING HOW COMMUNITIES INCORPORATE EQUITY GOALS IN LOCAL CLIMATE CHANGE PLANNING
Abstract ID: 252
Individual Paper Submission

FRENCH, Emma [University of California Los Angeles] emma.mehlig.french@gmail.com, presenting author

Anthropogenic climate change is no longer a threat looming on the horizon; it is upon us. As major contributors to, and victims of, climate change, cities have taken the lead in mitigating the impacts of global climate change while addressing local impacts on the ground through adaptation. The impacts of climate change fall unevenly both among and within cities around the world, with historically marginalized communities often bearing the brunt of the burden due in part to pre-existing vulnerabilities. Early scholarly, advocacy, and policy discussions around climate justice focused on the uneven impacts of climate change at the international scale, emphasizing the responsibility of the wealthiest nations to support mitigation and adaptation efforts. As attention has shifted from national to local actors, the discourse around climate justice has also shifted to the city scale, raising new queries about the meaning of equity in the face of climate change. Urban climate justice scholars consider not only the uneven impacts of climate change, but also the uneven impacts of local efforts to mitigate and adapt to climate change (Bulkeley et al. 2013). While the existing empirical work in this field highlights the uneven impacts of climate change and local efforts to mitigate and adapt to it, no research has focused on how cities are grappling with these tensions on the ground. This study intends to fill this gap in the literature by exploring the intricate ways in which cities are attempting to balance conflicting goals and impacts that surface in the process of planning for climate change.

This study examines the equity implications of the design and early implementation of California's Transformative Climate Communities (TCC) program. TCC was adopted by the California State legislature in 2016 and is funded with proceeds from the State's landmark Cap-and-Trade program. TCC provides funding to some of California's most polluted and economically disadvantaged with the aim of empowering them to develop and realize neighborhood-scale projects (e.g. urban greening, building retrofits, transit expansion, and electrification) to reduce greenhouse gas (GHG) emissions and mitigate impacts (e.g. rising temperatures). While TCC's primary goal is to reduce local carbon emissions to help the State reach its goal of carbon neutrality by 2045, the program also aims to address historic environmental disparities and prevent local displacement through the expansion of affordable housing, community engagement, and workforce development. This equity-centered approach to climate change planning could serve as a model for how state and federal governments can support equitable local climate action. However, more information is needed about the design and early implementation of TCC in order to understand its potential to achieve equitable outcomes in local climate change planning.

Now a year into implementation of TCC, this study seeks to examine the equity-related goals and impacts

of the strategies supported by the program, highlighting both the successes and challenges facing local governments as they seek to mitigate and adapt to climate change. Drawing on document analysis, participant observation at a series of TCC meetings and public events, and semi-structured interviews with activists, government officials, and other actors, this study analyzes 1) how equity is defined in local climate change planning, (2) how, if at all, equity is considered in the adoption and implementation of local adaptation and mitigation strategies, and (3) how local governments are grappling with the uneven impacts of both climate change and strategies to address it. This study highlights differing conceptions of climate justice within theoretical and practice-based discussions and contributes to debates in critical environmental justice (CEJ) scholarship on the role of the state in addressing historic and ongoing environmental and climate injustices.

APPLICATION OF URBAN ANALYTICS IN FOOD RECOVERY PROGRAMS: AN EXPLORATORY STUDY IN CHICAGO
Abstract ID: 289
Individual Paper Submission

ZHENG, Junjun [University of Illinois at Chicago] jzheng25@uic.edu, presenting author
AI, Ning [University of Illinois at Chicago] ain@uic.edu, co-author

Food recovery programs (FRPs) present dual benefits of waste reduction and hunger relief; however, FRP implementation has been limited in the U.S. Currently one-third of food produced for human consumption ends up in landfills; only 1% of wasted food is recovered for human consumption (US EPA, 2019). Notably, if just 30% of wasted food was recovered, it would be enough to supply the entire diet of all food insecure Americans (Leib et al., 2017). In urban areas particularly, there are clear spatial mismatches between surplus food (e.g., from commercial and institutional sites) and potential users (e.g., food banks, pantries, and community kitchens) (Ai & Zheng, 2019). Continuing the current practice of food wastage leads to economic inefficiencies, environmental pollutions, and social inequities associated with food system planning (Pothukuchi, 2009). There is a need to rethink the roles and functionalities of planning and public agencies in promoting FRPs and empowering local sustainability actions.

This study investigates how urban analytics may help promote FRPs. Advanced data analytics, such as ubiquitous computing, open data, and artificial intelligence, are already in widespread use for business decision making (Batty, 2019). Yet, many pragmatic modeling approaches are exclusively focused on economic analyses or operations research. Little attention is paid to societal and community implications of data analytics (Marcus & Koch, 2017), especially those for waste management.

This study employs cluster analysis and machine learning analytics to better connect the excess food with local demand (Kaufman & Rousseeuw 2009). Developed as a local solution, the planning framework and models also aim to identify appropriate zonal scales and areas that could operate FPRs effectively, efficiently, and sustainably. The zone delineation is anticipated to be particularly helpful for community-based infrastructure and capacity building for FRPs, given the heterogeneities of urban communities (e.g., spatial patterns, land uses, and urban density). Scenarios are developed by a varying number of clusters,

modeling parameters (e.g., by distance, by volume, by the density of donors and users), and machine learning algorithms (i.e., by the partitional or hierarchical clustering). Furthermore, this study evaluates the effectiveness of zone delineation options under different program objectives, including minimizing operating costs, optimizing environmental benefits, or reducing social inequities. The modeling framework illustrates an integrated way of interpreting and communicating urban complexities, as well as emphasizes the importance of inclusive approaches to solving interdisciplinary urban issues.

When implemented in Chicago, the modeling results suggest that simply including as many variables as possible into the computational model does not yield valid results. Different program objectives (with economic, environmental, or social orientations) do not always lead to the same solution. Moreover, the characteristics of heterogeneous communities (e.g., in terms of land use mix and demographics) lead to diverse options of local FRPs. Given the scattered distribution of surplus food suppliers across cities and limited edible surplus food at each site, economies of scale in operation would necessitate the potential collaboration among various sectors in each community. This study suggests a critical role for planning in engaging broader community stakeholders. The proposed planning framework is anticipated to inform the planning and design of such inclusive FRPs.

INTEGRATING SEDIMENT TRANSPORT SCIENCE INTO LAND USE LAW AND POLICY: INSIGHTS FROM THE NORTHEASTERN UNITED STATES
Abstract ID: 372
Individual Paper Submission

DUFF, John [University of Massachusetts, Boston] john.duff@umb.edu, presenting author

Today, the east coast of the United States is dominated by megalopolis stretching from southern Maine to northern Virginia. With over 45 million people living in this region, two significant forces shape the shoreline: human society and nature. Much is known about the socio-economic growth and development of the region including its built environment, less so about the natural process of sediment transport and littoral dynamics that shape the shoreline. Recently, scientists have begun to investigating how alongshore processes work with an eye toward better informing land use law, policy and management.

For the last several years, researchers have examined both the natural processes and manmade changes to the region's littoral dynamics (Jackson & Nordstrom, 2019). The state of understanding of littoral cell dynamics continues to grow as research efforts increase and new modeling, mapping, and monitoring technologies are advanced (Anderson, et al., 2018a). This includes knowledge about areas of the northeastern states, such as the studies of longshore sediment transport done for Cape Cod in Massachusetts. While sediment budgets are known for some parts of the northeast, much remains

unknown.

In addition to remaining data gaps, the science of coastal sediment processes has yet to be fully integrated into policy. Management decisions are typically responses to site-based problems using localized solutions, without consideration of the system as a whole (Cooper & Ponte, 2006). As scientific understanding of littoral cell dynamics grows, many stakeholders have made calls to better integrate this understanding into laws and policies. In the United States, governing bodies at the state level have recognized the importance of littoral systems as the basis for effective shoreline management and coastal protection, including in several Northeastern states.

As coastal populations continue to increase and sea level rise exacerbates threats from erosion and coastal storms, it is more important than ever that lawmakers and coastal managers make fully informed decisions that are based on the best available science (Anderson, et al., 2018b). This paper examines whether and how the seven northeastern States (Maine, New Hampshire, Massachusetts, Rhode Island, Connecticut, New York, and New Jersey) have gathered and articulated knowledge about their littoral cell dynamics. It scrutinizes the degree to which the states have integrated that information into coastal law, policy, and management. Because all of the states fall short of fully integrating littoral cell-based management into policy, this paper then looks beyond the study area to examples in California and the United Kingdom to determine whether their more comprehensive science-informed management practices might help inform coastal managers in the northeastern United States. Finally, this paper reflects on where littoral cell-based theories of management have been utilized by the federal government as a potential path toward an integrated policy for the coastal zone.

A PARCEL-SCALE ANALYSIS OF MUNICIPAL FLOODPLAIN MANAGEMENT IN NORTH CAROLINA
Abstract ID: 379

In the face of escalating climate change, effectively managing the population and assets exposed to climate hazards is critical to limiting damages (Brody & Highfield, 2013; IPCC, 2014). Recognizing the benefits of moving out of harm's way, the US government has already spent billions of dollars removing over 40,000 households from flood-prone areas (Mach et al., 2019). However, without simultaneous efforts to limit new development in hazardous places, the population and infrastructure exposed to floods may continue to grow. Some municipalities may strategically grow by channeling new construction away from floodplains and buying out existing flood-prone houses, while others may ignore floodplains altogether in their decision-making. Yet, with little data available on how development in floodplains has changed over time, our understanding of which municipalities have effectively managed their floodplains – and how – remains limited.

Here, we construct a novel parcel-level dataset to measure changes in floodplain development over time, allowing us to identify which municipalities have successfully grown while limiting flood risk. Researchers have sought to measure floodplain development since at least 1936, using aerial photographs and surveys of local officials to estimate the number of floodplain structures (Montz & Gruntfest, 1986; White et al., 1958). We apply today's powerful remote sensing and data science tools to take a more comprehensive and systematic approach to answering this question.

We combine property buyout records, real estate databases, and land cover data to measure the area of floodplain developed and the change in number of housing units in the floodplain since 1997 across the State of North Carolina. We compare these metrics against the number of property buyouts in the municipality to identify where the benefits of retreat have been offset by new construction. Then, we assess municipality performance by accounting for differences in how much land in the municipality is exposed to flooding, how much growth has taken place overall, and how much land is available for development. These additional steps ensure that we do not confuse municipalities with no floodplain or with no growth with municipalities that have grown strategically.

Initial results indicate that many municipalities use property buyout programs to remove flood-prone housing while simultaneously permitting extensive new construction in floodplains. Since 1997, over 7,000 flood-prone properties have been bought out across North Carolina. However, during that same time period, over 50,000 new buildings have been constructed in the 100-year floodplain, and an additional 16k have been built in 500-year floodplains. In four counties, over half of the new builds have taken place in the floodplain, but results vary by municipality.

Our findings indicate a substantial need to harmonize federal- and state-level buyout efforts with local policies aimed at minimizing floodplain development. Reductions in floodplain development are unlikely to be achieved through buyouts alone. This parcel-level analysis creates an empirical foundation for identifying municipalities that have grown while minimizing exposure to flooding. This foundation enables further investigation of policy tools and governance approaches employed to achieve these floodplain management outcomes.

MUNICIPAL TRACKING OF CLIMATE MITIGATION GOALS: APPLYING AN ATTRIBUTES FRAMEWORK TO BRITISH COLUMBIA'S FOUR LARGEST CITIES
Abstract ID: 408
Individual Paper Submission

SENBEL, Maged [University of British Columbia] maged.senbel@ubc.ca, presenting author
ZAMAN, Sunya [University of British Columbia] zamansunya@gmail.com, co-author

This work sets out to assess the mechanisms cities are using to track their progress towards GHG emissions reduction targets. Numerous cities around the world are participating in networks that showcase their commitments and plans for emissions reductions. Over 1,400 local governments have declared climate emergencies. Cities are even touted as leaders in climate change action (Rosenzweig et al, 2010) However city-level efforts to mitigate the effects of climate change through policies, plans, projects, programs and actions are hindered by lack of monitoring mechanisms. Cities are generally under resourced in devising robust plans and developing implementation strategies. Methods and metrics are not standardized, or are unavailable or inaccessible (Klopp and Petretta, 2017). Goals are often described elusively and without implementation timelines or specific outcomes, so they are difficult to measure (Carmona and Sieh, 2008). Without specificity and measurement and without iterative updating of goals and actions goal achievement decreases (Singh and Vieweg, 2015). Are cities' climate change plans sufficiently robust to allow them to meet their targets? Will cities know if they are meeting their targets or the extent to which specific development decisions help or hinder?

We explored climate mitigation plans in British Columbia's four largest cities. We began by reviewing the literature on current issues in progress measurement, processes and frameworks in climate mitigation planning, as well as general goal setting and implementation from diverse literatures. We used this review to developed a framework of necessary attributes for successful target setting and implementation. We called it Effective Climate Goal Attributes (ECGA). Goal setting and implementation standards vary but generally include recurring characteristics derived from two widely recognized concepts used in climate mitigation contexts; (1) Measurable, Reportable and Verifiable (MRV) and within broader contexts, (2) Specific, Measurable, Appropriate, Realistic, Timely (SMART). While some attributes, such as 'Transparency', arguably serve as 'by-products' of MRV, we include them as independent attributes to emphasize their importance. Our ECGA framework includes precision, measurability, reportability, verifiability, and transparency as well as several other requisite characteristics for setting targets, choosing indicators, and developing monitoring and evaluation strategies.

We applied our ECGA framework to Vancouver, Surrey, Burnaby and Richmonds' climate mitigation-related plans. We additionally applied the monitoring and evaluation components of the framework to the City of Vancouver's CDP (formerly the Carbon Disclosure Project) reporting platform. The majority of city climate networks, including ICLEI, C40 Cities and the Global Covenant of Mayors for Climate and Energy, have adopted the CDP Cities questionnaire to collect data on climate initiatives done by their members. We also analyzed the degree to which the CDP Cities questionnaire makes cities accountable for their climate change commitments.

We found CDP monitoring to be consistent with our ECGA framework and a marked improvement over other and previous reporting networks. Most plans lacked quantified greenhouse gas emissions at any scale smaller than city level sectors. There were unclear linkages between plans, targets, indicators and

actions. Most plans did not include any monitoring and evaluation sections and those that did were general and lacked sufficient detail to be actionable. On the whole cities are not well equipped to measure their own progress towards their targets and lack the kind of precision and specificity needed to have their actions accurately measured by indicators linked to their plans. We identify critical gaps in the implementation of climate change mitigation plans and make numerous recommendations to address those gaps.

A LANDSCAPE-BASED ANALYSIS OF ENVIRONMENTAL (IN) JUSTICE AND PHYSICAL ACTIVITY: PATTERN, THEORY, AND ACTION
Abstract ID: 424
Individual Paper Submission

NAMIN, Sima [Medical College of Wisconsin] sima12898@yahoo.com, presenting author
ZHOU, Yuhong [Medical College of Wisconsin] yuzhou@mcw.edu, co-author
BEYER, Kirsten [Medical College of Wisconsin] kbeyer@mcw.edu, co-author

For decades, landscape approaches have been used to categorize and translate ecological data into useful information to visualize the spatial patterns and processes of landscapes, and ultimately quantify the ecological conditions of each landscape in order to understand interactions between ecological characteristics and human health. In Environmental Justice (EJ) research, however, the strong emphasis on distributive justice has maintained the focus of EJ work primarily on applied and methodological studies to analyze and represent the proximity of populations to environmental hazards and the burden of human health effects among affected communities. In this article, we draw on the most discussed critiques of EJ to argue that a landscape approach to EJ questions could broaden and deepen our understanding of the complex structures of environmental in-justice(s) in urban contexts. First, we argue that complex EJ theories are not adequately reflected in most methodological approaches to EJ research. We then make the case that landscape-based approaches would better reflect this complexity and offer new opportunities for understanding complex urban structures and their myriad health effects. We illustrate this argument with an examination of the structure of green and the patterns of physical activity and obesity in Milwaukee, WI. We conclude that utilizing landscape metrics can improve our understanding of the complex ecological structures of cities and the impacts of these structures on patterns of health and related behavioral factors, ultimately leading to urban planning and public health interventions to create health promoting urban environments and address health inequities.

LOCAL LAND USE POLICIES FOR ENVIRONMENTAL JUSTICE
Abstract ID: 434
Individual Paper Submission

BAPTISTA, Ana Isabel [The New School] baptista@newschool.edu, presenting author

Historically, zoning codes and land use practices have had the effect of hardening disparities and expressing forms of institutional racism evident in the built environment. These processes continue to jeopardize the health and safety of communities of color and low-income communities throughout the country, also known as environmental justice communities. Zoning and land use policies can also be harnessed affirmatively to redress these impacts. Indeed, looking to zoning and land use policies to remedy local environmental injustices is critical, as state and federal environmental laws and regulations are limited in their ability to address the siting decisions that concentrate cumulative pollution burdens. Nor do these environmental laws directly speak to the socio-demographic characteristics of communities impacted by multiple pollution sources or the development process that can drive siting decisions locally.

A variety of planning and zoning tools are available to municipalities for the purpose of addressing environmental justice, including comprehensive planning, eliminating nonconforming uses, using environmental reviews or impact analysis, and making change through local boards and commissions. Cities can also strengthen public health and building codes, augment public review and notification processes, impose development fees, implement overlay zones or special zone designations, or simply tighten existing zoning codes to make them more protective in communities of color and low-income communities. The right balance of approaches for any given place will depend on local conditions and priorities, along with state law regarding the powers of local governments vis-à-vis land use and environmental regulation.

This study explores how environmental justice advocates advanced policies that affirmatively use land use planning and zoning tools to address environmental injustices at the local scale.

A nationwide review of existing municipal, county and local government initiatives was conducted to identify policies that explicitly address environmental justice through local land use planning, zoning, or policy tools. It also includes an in depth analysis of the community led processes that resulted in the adoption of environmental justice legislation in the cities of Newark, New Jersey and Los Angeles, California. The methodology utilized for this study included multiple case studies (Newark and Los Angeles) using semi-structured interviews, document analysis and a qualitative summary review of online sources employing key word searches. The study was conducted in collaboration with several environmental justice organizations in Chicago, including Little Village Environmental Justice Organization (LVEJO) and the Natural Resources Defense Council using participatory action research methods.

The national review of policies identified 40 local policies focused on addressing environmental injustices

across 23 cities, three counties and two public utilities. The policies were categorized according to six typologies: (1) Bans, (2) Broad EJ policies, (3) Environmental Reviews, (4) Proactive Planning, (5) Targeted Land Use Measures, and (6) Public Health Codes. The case studies of Newark, NJ and Los Angeles, CA further detail the community led processes by which the respective policies in each city were adopted. In both communities, a clear articulation and understanding of cumulative impacts, leadership of community based environmental justice groups, strong local planning and zoning tools and a receptive political environment, led to the successful adoption of policies. The distinct approaches of each city, environmental review in Newark and proactive planning in LA, also reveal key catalysts for policy formulation and the challenges that can be anticipated in the development and implementation of these policies.

USING A RESILIENCE FRAMEWORK TO UNDERSTAND WATERSHED ENVIRONMENTAL HISTORY
Abstract ID: 462
Individual Paper Submission

KELLOGG, Wendy [Cleveland State University] w.kellogg@csuohio.edu, presenting author

This research extends prior work based in resilience theory to understand the evolution of governance of a watershed as a social-ecological system (SES) (Kellogg and Samanta 2017). The current work developed an environmental history of the Chagrin River watershed in NE Ohio, extending the period of change backward to the creation of the Connecticut Western Reserve in in 1795. Research objectives were 1) to understand how changes in landscape over 200 years impacted water quality and quantity in the river and altered its broader biophysical status; and 2) to understand the resilience of the social – ecological system to disturbances, disruptions, and thresholds (Folke 2006) through different time periods of natural history, socio-economic change, and perceptual (political/ideological) shifts (Hughes 2008). How did management, planning and governance systems change through several major historic periods in the social-ecological system to reflect changing perceptions of actors (DuPlessis 2009)? Can incorporation of resilience theory with environmental history more effectively identify the evolutionary change (the adaptive cycle) of a watershed, including the attributes of nested and cross scale interactions and of multiple equilibria which relate directly to the variations in biophysical conditions in sub-watersheds?

Primary and secondary sources were used to identify historic change to landscape from settlement, resource extraction and political institutions (e.g., surveyor notes from 1796, land sales maps, tax records, Sanborn maps, and state and county aerial photos). Data for changes to the river (e.g., water quality, changes to stream morphology, and water quantity) were obtained from 19th and 20th century newspaper accounts, and local, state and federal agency testing databases. Timelines of disruptions and trends for these attributes knit data from disparate times, scales, and sources together and were compared to

discover key social or biophysical thresholds and ecological regime changes indicating evolution of the system across scale and time.

The timelines indicate critical disruptions to the SES, some internal and periodic (such as flooding) and some external (e.g. opening of the Erie Canal in NY state), interspersed with longer term landscape change. Settlers and entrepreneurs shifted their subsistence and economic exchange behavior to substitute for declining ecosystem services, which in turn often initiated a secondary round of landscape change, causing further degradation of ecosystem services over two hundred years. A counter trend to restore ecosystem services began in the late 19th century and accelerated after passage of the CWA, resulting in a new governance structure, one explicitly focused on restoration. Sub-watersheds experienced different drivers and changes to landscape and ecosystem services across differing time scales, and adaptation in these watersheds reflected the perceptions of actors who dominate governance in these smaller geographies.

Relevance of this approach stems from planning as primarily a place-based enterprise. One of the outcomes of developing the environmental history was a deeper appreciation of the value of the Chagrin River to its residents and leaders that was discovered in earlier studies. The history of the place frames decision making up to this day as actors seek to address changing climate conditions. A resilience framework combined with an understanding of historic disruptions and trends provides a deeper foundation for decision making.

RESOURCE MANAGEMENT AND THE CULTURE OF RURAL PLANNING
Abstract ID: 479
Individual Paper Submission

FRANK, Kathryn [University of Florida] kifrank@ufl.edu, presenting author
HIBBARD, Michael [University of Oregon] mhibbard@uoregon.edu, primary author

Rural places are vital not only to their residents but to the world at large, as sites of such critical resource management issues as climate change, biodiversity loss, food and resource production, and ecological preservation and restoration. Yet planning in rural places, as currently practiced, is often ineffective and conflict laden. This is in part the result of a mismatch between rural culture and the urban bias of planning. The implications of the urban bias and the concomitant neglect of the rural have been insufficiently problematized. As a result, opportunities for improved rural planning processes, policies, and outcomes, and in particular, more effective resource management, are missed (Alkon and Traugot 2008).

The recent interest in planning cultures provides a vehicle through which to examine the urban bias and the benefits for resource management of a more rural-centric planning culture. Friedmann (2005, 184) defined the culture of planning as "the ways, both formal and informal, that…planning in a given multi-national region, country or city is conceived, institutionalized, and enacted." The growing literature on the culture of planning (e.g., Sanyal 2016) rejects the modernist notion that planning, as a field of professional activity, is more or less the same regardless of where it is practiced. Instead, planning is embedded in the political culture of a place and, as such, is always historically grounded. Building upon this insight, scholars have identified diverse planning cultures and alternative perspectives, such as feminist/LGBT, children and youth, race and immigrants, and Indigenous and post-colonial.

Comparable scholarship is needed to explore the urban bias in planning and the implications for a culture of rural planning. Toward this end, the paper begins with a review of the planning culture literature to explain our premise of an urban bias and how it is manifest in the planning field's issues of concern, institutions, conventions, values, and so on. We then support that premise through analyses of published definitions of planning in key books and leading planning journals across a range of substantive/sectoral planning topics, including resource management. As Porter (2010) has observed, seeing planning as a cultural practice makes it specific to particular peoples, life views, times, and places. In that spirit, we then ask how particular views of "the rural" shape rural planning. To illuminate rural culture(s), we define rurality through the literature of rural studies, cultural geography, social theory, and other relevant fields. Last, we build upon our previous work (e.g., Frank and Hibbard 2017) to present the emerging culture(s) of rural planning and its application to resource management.

Analyzing rural planning through the lens of culture gives new insights into why urban-biased planning has not succeeded in rural contexts, the kinds of missed opportunities for local and global sustainability in resource management, and how planning may be improved in these places. Furthermore, this paper shows that the culture of planning should explicitly diversify along substantive dimensions, especially to include the rural perspective. These lessons should be incorporated into planning education and best practices, similar to the field's responses to other alternative perspectives.

DIFFUSING ENERGY TRANSITION: THE CASE OF COMMUNITY LEAGUES IN EDMONTON, CANADA
Abstract ID: 520
Individual Paper Submission

JOSHI, Neelakshi [University of Alberta] joshi2@ualberta.ca, presenting author
AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author
KAPLINSKY, Eran [University of Alberta] eran.kaplinsky@ualberta.ca

Niches occupy an important place in the socio-technical energy transition of our society. Community-led grassroots activity plays a significant role in this regard (Seyfang and Smith 2007; Boyer 2015). Current scientific discussion on energy transitions are largely dominated by the creation, strengthening and diffusion of niches (Wolfram and Frantzeskaki 2016; Köhler et al. 2019). However, niches can also be found in well-established grassroots structures that re-orient themselves to address the challenge of energy transition. Such well-established niches are better insulated against the changes in regime and have the potential to sustain the transition processes. Furthermore, it is within these niches that socio-technical transitions can gain large scale visibility and social acceptance.

Community Leagues in Edmonton, Canada are presented as a case in point. Community Leagues are a unique form of grassroots community-centred and volunteer driven organization that have existed in Edmonton since 1917 (Kuban 2005). Currently there are a network of 160 neighbourhood organization working towards enhancing the quality of life in their neighbourhood. Following an interest in the community towards energy transition in 2012, Community Leagues have worked towards diffusing the idea through solar panel installations and energy audits of the community halls. This has been done with the aim of making solar energy tangible in the neighbourhood as well as encourage homes and local institutions to do the same. In doing so, they have taken a leading role in achieving last mile of energy transitions.

Based on the transition and diffusion experiences of 21 Community Leagues, this research establishes how niches were created within the well-established Community Leagues structure to foster and diffuse energy transitions. This is done through a review of Community League documents, interviews with transition leaders and an online survey of residents in each neighbourhood.

Results indicate that grassroots organization like Community Leagues are well suited to take up the task of diffusing the ideas and practices of energy transition. They build on existing access to the community as well as trust of members and regime institutions at local and regional level. However, taking up new responsibilities regarding energy transitions require an expansion of existing network as well as recruiting self-motivated individuals to take up the task.

The results address city governments, energy advocacy groups as well as renewable energy companies to understand the advantages and challenges of partnering with organizations like Community Leagues to achieve large scale diffusion of energy transition.

MOVING GOODS SUSTAINABLY: HOW DO PRACTITIONERS CONSIDER SCIENCE ACROSS NETWORKS OF PLANS?
Abstract ID: 572
Individual Paper Submission

CAMPO, Matthew [Rutgers, The State University of New Jersey] mcampo@ejb.rutgers.edu, presenting author

Campbell's (2016) sustainability planning framework presents a system of governing relationships between social, environmental, and economic risks through on-going planning processes. The on-going nature of sustainable planning is, in part, a result of both individual and institutional capabilities to incorporate uncertain and continuously evolving scientific evidence into the environmental governance of conflict between economic development and environmental protection (Campbell, 2016; Renn et al., 2011). This paper uses three cases to demonstrate how networks of plans in the Northeast United States manage this on-going resource conflict relationship in the context of planning for freight-related land uses.

The tension between economic development and environmental protection is particularly salient for freight-related land uses. Warehouses, fulfillment centers, and other freight-related land uses are sprawling in urban areas, exhibiting both the environmental nuisance characteristics of locally unwanted land uses (LULUs) and the job gains sought after by economic development officials (Yuan, 2019). Planning practitioners and public officials use 'networks' of plans to balance future employment gains with concerns about climate resilience, job quality, transportation emissions, and other risks unevenly distributed by growing logistics-related land use (Berke et al., 2019). I propose that both individual attributes and institutional level governance structures influence practitioners' choices for incorporating environmental sciences within networks of plans (Renn and Rohrmann, 2000). In this paper, I study how these individual and institutional influences can serve as barriers or enablers for including scientific information that allows practitioners to observe and act upon perceived environmental risk.

I used semi-structured interviews and archival document review to understand how institutional settings and personal values influence participants' perceptions of economic, social, and environmental risks related to freight-related land uses, and the participants' uses of environmental science to analyze their perceived risks. First, I conducted a content analysis of past planning documents using existing risk management and sustainability theory to develop an initial coding scheme related to the management of trade-offs in economic, social, and environmental risk. Then, I conducted hour-long semi-structured in-person or telephone-based interviews, followed by focus groups convened among the regional participants to reflect on the participation in the networked planning processes. Study participants include local and regional planners, engineers, public health officials, emergency managers, and other participants in the 'networks of plans' that include long-range transportation, comprehensive land-use, and hazard mitigation planning processes (Berke et al., 2019). I use the interviews and focus groups build on themes reflecting participants' thoughts on institutional arrangements, personal values, available reference knowledge, and other correlates of risk perception outcomes.

I find evidence that participants' capabilities to take action on environmental science in planning decisions vary based on both institutional and individual capacities and frameworks for incorporating scientific information into planning decisions. In particular, participants discussed trade-offs between short-term and long-term planning horizons and inconsistent methods for dealing with presenting and managing the inherent uncertainty in environmental sciences (Renn et al., 2011). Incorporating climate change science consistently across networks of plans was especially challenging across all cases. For planners, these findings demonstrate the continued importance of understanding how and where concepts of uncertainty play a role in planning decisions, and the implications for incorporating evolving science into a complex set of social, environmental, and economic risks during planning processes. Moreover, engaging in participatory co-production strategies between scientific disciplines and planning institutions can play a significant role in developing trust and encouraging a more robust scientific fact base for planning decisions.

PROPOSING AN ENERGY URBAN PLANNER ROLE TO INTEGRATE ENERGY CONSUMPTION DECISION-MAKING
Abstract ID: 584
Individual Paper Submission

ROZHKOV, Anton [University of Illinois at Chicago] arozhk2@uic.edu, presenting author
BORIA, Eric [University of Illinois at Chicago] eboria2@uic.edu, co-author
SEYRFAR, Abolfazl [University of Illinois at Chicago] aseyrf2@uic.edu, co-author

Municipalities could benefit from more intentional integration between energy efficiency planning and urban planning. Municipal Energy and Sustainability Managers often have limited information with which to assess their city's building stocks and design the most effective approaches to achieve energy efficiency goals. Further, energy-related information is too often requested at the end of the development process. For example, when utilities are contacted about energy capacity and energy infrastructure needs after a planned development has already been approved and is slated for construction, it stifles any potential for integrated planning or a systematic approach to development.

Integrated planning efforts can be especially beneficial for reducing energy consumption in the multifamily residential building sector. This sector poses unique challenges that reduce the effectiveness of traditional energy efficiency approaches. Significant differences across metropolitan regions, building owner types, and urban forms, are not fully addressed by the current state of energy and urban planning. This paper employs qualitative interviews with key energy efficiency decision-makers, and a data quality and spatial analysis of 2017 Chicago Energy Benchmarking data to identify urban planning-related factors that can address these limitations.

Additionally, the role of an Energy Urban Planner (EUP) is proposed to resolve the identified gaps in data and energy efficiency implementation issues. The objective of an EUP role is to intentionally integrate the de facto energy planning that has been carried out in parallel by municipalities, non-governmental organizations (NGOs), and utility companies. An EUP role that more intentionally plans the reduction of energy consumption can bolster energy efficiency efforts with other urban planning decisions that have energy implications, thus coordinating various aspects of urban planning that have historically been distinct. For example, an EUP would coordinate both the energy savings from retrofit incentives with urban development plans to ensure that progress towards sustainability goals in one area would not be countered by energy intensive development projects in another area.

The paper concludes with a discussion of the potential implications of an EUP role for both urban planning more broadly and specific approaches to reduce energy consumption. We found that there are three main components of an EUP role starting from identifying the energy needs of a municipality, or region, and aligning goals; continuing with the identification, collection, and analysis of relevant data to

make data-informed decisions; and lastly applying insights from data and urban planning theory to design, implement and evaluate the collaboratively chosen approach. Finally, a very important stage summarizing all three previous steps is the information feedback. This feedback from evaluating the implementation of different energy efficiency strategies to inform the decision-makers at the goal setting stage could provide insights for the planning field and it is crucial for learning, adapting, and generating planning and policy recommendations.

INCORPORATION OF STORMWATER MANAGEMENT INTO URBAN PLANNING IN THE UNITED STATES
Abstract ID: 594
Individual Paper Submission

KIM, Chaeri [University of Pennsylvania] chaeri@upenn.edu, presenting author

Urban stormwater runoff is a leading cause of water pollution and quality degradation in the United States. Local governments have historically held responsibility for the management of stormwater issues (Holloway, Strickland, Gerrard, & Firger, 2014). A municipality's public works or utility department has typically overseen the drafting, approval seeking, and implementation of a stormwater management plan (Cesanek, Elmer, & Graeff, 2017). However, their work scope has been often limited to a traditional stormwater management measure that involves collecting and conveying stormwater through sewer systems in order to protect public health and safety, as well as prevent property damage that could result from flooding.

A more recent stormwater management approach, specifically green stormwater infrastructure, has expanded the roles and impact of stormwater management in the field of urban planning. For example, while the conventional stormwater management approach has a single purpose (i.e., stormwater removal), green stormwater infrastructure offers various secondary roles. A growing number of studies demonstrate that green stormwater infrastructure not only contributes to the reduction of stormwater runoff, but it also provides various benefits, such as alleviating urban heat island effects, improving air quality, creating jobs, increasing property values and enhancing community cohesion (Heckert & Rosan, 2015). Unlike the traditional approaches that generally only require public infrastructure development, green stormwater infrastructure necessitates the involvement of both public and private stakeholders, and sometimes requires balancing the competing environmental, economic and social values at stake. Thus, linking stormwater planning with other city-wide planning and policy has become a crucial means of achieving desired outcomes in urban planning.

This research attempts to understand how the 50 most populous United States cities have incorporated stormwater management into their city-wide plans, including comprehensive plans, sustainability plans and/or climate action plans. Based on previous studies concerning stormwater management components

in local plans (e.g., Berke et al., 2003; Kim & Li, 2017), this study uses content analysis to examine the integration of stormwater management considerations with the concerns of city-wide plans. By addressing the issues from a national perspective and exploring the status quo of stormwater management in urban planning, this paper provides planning and policy implications regarding 1) how to avoid limiting the roles and impact of stormwater management strategies within the field of stormwater planning and 2) how to incorporate stormwater management considerations into the city-wide plans to facilitate better outcomes.

CRITICAL CARTOGRAPHY FOR URBAN ENVIRONMENTAL PLANNING: EXPLORING THE ROLE OF PARTICIPATORY MAPPING IN THE QUEST FOR ENVIRONMENTALLY JUST CITIES
Abstract ID: 599
Individual Paper Submission

WALKER, Rebecca [University of Minnesota] walk1134@umn.edu, presenting author

Environmental "big data" and remotely-sensed data sets are increasingly used to guide environmental planning.[1] This regime of decision-making relies on GIS, using spatial overlays to embed the environmental landscape with values that can be compared, ranked, and prioritized for investment in conservation or environmental infrastructure. This reliance on quantitative, abstracted data divorces environmental planning from its economic, cultural, and political context, excluding non-experts from decision-making. As a result, control over the environmental future of spaces, and the communities to which those spaces are home, becomes increasingly technocratic, raising concerns over who benefits and who is harmed by these decisions.

These concerns are particularly salient in the context of urban environmental planning. Here, a reliance on corporate- and state-produced environmental quality data and regulatory compliance standards serves to justify the siting and operation of toxic facilities in poorer, communities of color,[2] while narratives of sustainability and the "added value" of urban green space are used to justify urban redevelopment, gentrification, and displacement via a process known as "green gentrification."[3] This form of spatial decision-making mirrors the "rational urban planning" model that justified devastating urban renewal policies of the second half of the 20thC, in which data-driven "expert" decision-making paved the way for the destruction of neighborhoods of color.

Critical GIS challenges the technocratic spatial urban regime, using digital mapping to interrogate spatial inequalities and expose geographies of class, race, gender, and environmental injustice. One example of the power of critical GIS projects in the context of urban planning comes from the Anti-Eviction Mapping

Project, which utilizes digital maps, oral history, and community art to mobilize resistance to gentrification and displacement in San Francisco.[4] Critical GIS methodologies have also promoted urban environmental justice, such as the success of the "596acres" Project, which mapped vacant lots in New York City in order to encourage residents to convert them to community gardens. Critical GIS and counter mapping produce ontologies of hope, providing a tool for visualizing alternative, progressive futures and for collaborative, artistic, and community-based place-making.

Scholarship in radical urban planning provides a framework for how we might use critical GIS to reimagine urban environmental decision-making. While planning has historically served to reinforce and reify hegemonic power structures in physical space, radical planning challenges neoliberal capitalist ideologies, decentralizing power without dictating destination, and centering epistemologies of marginalized groups.[5] The bedrock of radical planning is co-production, in which power over space shifts from the individual planner to a decentralized, democratic distribution of authority, framing justice not merely as distributive outcomes but as a process of enablement and empowerment.

Drawing on radical urban planning theory and critical cartography, I present the results of participatory-mapping experiment in environmental justice planning in Minneapolis, MN. This project aims to incorporate human-scale experiences of the urban environment into environmental decision-making process. By allowing residents to create their own data layers, based on perceptions of environmental quality, housing affordability and displacement pressure, and community-safety, this project embraces tenants of radical planning by shifting the production of knowledge and decision-making to communities. In doing so, it seeks to promote environmental justice and combat green gentrification. In an urbanizing world, developing frameworks for compassionate and humanistic environmental decision-making is essential to elevating movements for spatial justice.

CONVENING REGIONAL CLIMATE COLLABORATIVES: A CROSS-COMPARISON OF US CASES
Abstract ID: 607
Individual Paper Submission

MARGERUM, Richard [University of Oregon] rdm@uoregon.edu, presenting author
ADAMS, Steve [Institute for Sustainable Communities] sadams@iscvt.org, co-author
CURTIS, Thomas [University of Oregon] cthoma17@uoregon.edu, co-author

Collaboration has been increasingly used to address complex regional problems that cross political boundaries and jurisdictions. The roles, approaches and implementation issues associated with collaboration strategies and networks have been widely discussed in the research literature (Forester,

2013; Healey, 1997; Innes & Booher, 2009; Koppenjan, 2008; Margerum, 2011). There has been less analysis of the approaches and deliberations associated with convening collaborative efforts (Vella et al., 2016). Some researchers have identified common processes and issues associated with convening (Carlson, 1999; Margerum, 2011), but have not explored in detail the process of gathering diverse stakeholders prior to the formal launch of a collaboration effort. This paper explores the issues, dialogue and framing of collaborative efforts before the formal launch of a stakeholder-based collaboration effort. We analyze this issue through a cross case comparison of over twenty climate change mitigation and adaption actions plans. These action plans were initiated by local governments across the United States, due to the absence of state and federal leadership. However, the cases include a range of political settings, contexts, and resilience issues. Based on document review, survey data, and stakeholder interviews, we compare and contrast the history of backroom deliberations and framing debates that eventually resulted in a collaborative effort. In particular, we focus on the (1) key terminology and concepts that allowed participants to convene a collaborative effort; (2) the role of intermediaries and leaders in gathering participants; and (3) the key qualities of the forum that enticed leaders to participate. The research findings help address a gap in the research literature about the dynamics of convening and provide specific strategies for how local governments can convene politically difficult issues such as climate change adaptation.

A CARBONSHED PLANNING FRAMEWORK TO CAPTURE THE BENEFITS OF SECOND GENERATION BIOENERGY CROPS FOR RURAL COMMUNITIES IN THE CONTEXT OF GLOBAL CLIMATE CHANGE
Abstract ID: 612
Individual Paper Submission

LIM, Theodore [Virginia Polytechnic Institute and State University] tclim@vt.edu, presenting author

"Biofuel" refers to liquid, solid, or gaseous fuels derived from non-fossilized organic material. Burning wood for heat is the oldest example of human-harnessed bioenergy, but modern forms of bioenergy include the combustion of wood pellets, bioethanol, and methane gas from solid waste digestors. Compared to fossil fuels, which are extracted from deep in the ground, the premise that biofuels are more sustainable is based on assumptions that (1) bioenergy is produced and transported in a way that releases fewer greenhouse gas emissions into the atmosphere, and that (2) bioenergy production can revitalize local rural communities economically by creating demand for bioenergy crops. However, the "productivist rationale" underlying the first generation of biofuels (bioethanol made from corn grain) (Frank and Hibbard, 2017; Daniels et al., 2013) has proven to be of greater benefit to global agricultural interests than it has been to rural communities or the environment.

There are many lessons to learn from the shortcomings of first generation biofuels, and these lessons are critical because of two coming socio-technical conditions that will be relevant for rural communities.

First, technological advancements will eventually make the so-called "second generation" biofuels, which use lignocellulosic crops such as switchgrass as feedstocks, economically viable. Second, the longer global efforts to reduce carbon emissions are delayed, the more pressure there will be to implement so-called negative emissions technologies (NETs) to keep the planet within the recommended 1.5'C warming targets. Implementation of NETs are estimated to require the cultivation of vast areas of dedicated bioenergy crops. By one estimate, an area one to two times the size of India would be required (Smith et al., 2016). Such a transformation would have large environmental and social implications: land devoted to bioenergy crop production can impact food security, biodiversity, water resources, as well as local autonomy. Both socio-technical conditions described above will result in increased demands for second generation bioenergy crops that will impact local economies and environmental quality, as well as the cultural and aesthetic value of rural land (Buck, 2018).

In this paper, I suggest how rural communities might use integrated planning to respond to these future pressures in a way that retains benefits locally. First, I present the case of the "ethanol decade" in the US to illustrate a missed planning opportunity. I use the idea of local sovereignty as a way to understand an alternative to this model. Second, I suggest carbonshed planning, modeled after foodshed planning, as a suite of coordinated infrastructure, land, water, and economic planning activities that can help rural communities retain local energy, food, water, land, and infrastructure sovereignty (Horst and Gaolach, 2015). Third, I present a case study of the first district heating plant fueled by > 90% switchgrass in Southwest Virginia to illustrate rural community benefits and coordination activities. Lastly, I discuss how second generation bioenergy crops are likely to become increasingly significant in the context of global climate change mitigation, how this may present both opportunities and challenges for rural communities, and what options may be available for adaptive infrastructure planning.

DIFFUSION OF PHOTOVOLTAIC SOLAR PANELS IN RESIDENTIAL BUILDINGS
Abstract ID: 616
Individual Paper Submission

KOCAKUSAK, Diren [Rutgers, the State University of New Jersey] diren.kocakusak@gmail.com, presenting author

Climate change is one of the biggest threats to humankind and can also be framed as an energy problem. Ever-growing energy demand since the Industrial Revolution is likely to continue over the next decades, and the change in our energy production methods is slow. Solar energy is one of the most important sources of renewable energy. It can be exploited through photovoltaic (PV) solar systems for various

applications, and better understanding of the factors in adopting it is needed (Solagni, Islam, Saidur, Rahim, & Fayaz, 2011). As the photovoltaic solar system industry grew globally since the beginning of this century, the cost of installing these systems has decreased significantly.

The adoption of photovoltaic solar systems has the potential to add up to a significant change in the United States, considering the ubiquitousness of solar irradiation and the prevalence of low-density urban development. The objective of this study is to better understand the photovoltaic solar systems' adoption process for residential users. I use the diffusion of innovations literature as the main framework since the adoption characteristics of new technologies proposed by Rogers (1962) are also applicable to photovoltaic solar systems. In this regard, I address following research questions: (a) what affects the photovoltaic solar system adoption rate?, (b) does the adoption of the photovoltaic solar system in residential buildings follow the diffusion of innovations theory?, (c) which policies are effective in promoting photovoltaic solar systems to residential users?, and (d) how does the solar industry adapt to the changes in solar policies and attitudes of residential users?

I carry out this research in two different stages, in which I apply different research methods. In the first stage of the research, I carry out a quantitative analysis by using secondary data and building statistical models to understand the impact of socio-economic, geographical, or technical factors on the photovoltaic solar panel adoption rate in residential buildings. I use two publicly available datasets that contain the records of photovoltaic solar system installations in the United States: The Open PV Project and the Tracking the Sun report. I aggregated the records on photovoltaic solar panel installation at the ZIP code level, which allowed me to calculate the adoption rate and add socio-economic, geographical, and solar insolation variables that are used as the independent variables.

In the second stage, I will conduct semi-structured interviews with key actors from the solar industry in New Jersey with the aim of understanding how the solar industry adapts to the changes in solar policies and attitudes of residential users. I will follow content analysis methods that will allow me to systematically classify and maintain crucial data while reducing the volume of qualitative data to a manageable level. Moreover, by identifying the similarities and patterns in each interview, I will be able to interpret the content of the data and the context to produce meaning beyond merely summarizing the data.

Initial findings reveal that states that have environmentally innovative policies argued by Greenberg and Schneider (2020) have more policies on renewable energy and energy efficiency and higher adoption rates. This finding underlines the importance of state-wide policies implemented to increase the degree of the relative advantage of photovoltaic solar systems for potential adopters. No existing empirical research approaches photovoltaic solar panel adoption at the national level in the United States from this perspective and compares state-wide policies. Since it is important for planners to envision and articulate the future of energy supplies and technological advances (Felder, Andrews, & Hulkover, 2011), an important implication of this study is to investigate how policy-makers can intervene effectively to promote photovoltaic solar system installation in residential buildings.

ESTIMATION OF EXPOSURE TO URBAN PM2.5 IN FINE SPATIOTEMPORAL RESOLUTION: A LOS ANGELES CASE STUDY
Abstract ID: 637
Individual Paper Submission

LU, Yougeng [University of Southern California] yougengl@usc.edu, presenting author

Fine particulate matter (PM2.5) has large impacts on human morbidity and mortality. Even though concerns regarding dispersion models in the distribution of PM2.5 have led to a considerable amount of academic research during the last two decades, little is known about how PM2.5 distributes in a finer spatial and temporal resolution (i.e., local v. regional, hourly v. annual). The limited number of regulatory air quality monitors that most research used significantly restricts the prediction accuracy and spatiotemporal resolution of the generated concentration pattern. To solve this limit, we present an approach to analyzing urban fine particulate matter (PM2.5) data from a network of low-cost air sensors to obtain a finely resolved concentration map.

In this study, the PM2.5 was measured with the low-cost air sensors PurpleAir PA-II and PA-II-SD on an hourly time-base at more than 250 locations spreading over urban areas in Los Angeles County, California for 2018 and 2019. The measurements show that hourly concentrations vary not only between different locations, but also over the day. Being proved as a statistical and reliable technique used to determine exposure to air pollutants in epidemiological studies, land use regression (LUR) models for PM2.5 are developed using different strategies: by means of dummy variables, with dynamic dependent variables and with dynamic and static independent variables (e.g. temporal variables, land use variables, traffic variables, and meteorological variables).

A global and 48 hourly LUR models were developed — weekday hours and weekend hours, respectively. Results show that a single global regression model is not able to capture either temporal or spatial variance of urban PM2.5 concentrations when compared to hourly LUR models. The model results show that weekend hourly LUR models perform better than weekday hourly LUR models, where R^2 values for weekend models are mostly higher than those of weekday models (range from 0.44 to 0.63 against range from 0.34 to 0.51). Between 3 p.m. and 7 p.m. on weekdays, the R^2 values approximate the most significant levels, whereas on weekends, the LUR models perform best in the early morning between 3 a.m. and 6 a.m. and at late night between 9 p.m. and 1 a.m. Although models of consecutive hours are developed independently, similar variables turn out to be significant all the time. Traffic and meteorological predictors were found to be significantly affecting the hourly LUR models, while land use variables were also important factors but vary by hours. Using the low-cost air sensor network and hourly LUR models, we are able to generate PM2.5 dispersion map in much finer spatial and temporal resolution. Time-activity diaries can be combined with LUR models, enabling detailed exposure estimation and limiting exposure misclassification, both in shorter and longer time lags.

VACANT LAND, FLOOD RISK, AND URBANIZATION: EXAMINING LAND COVER CHANGE IN THE DALLAS-FORT WORTH METRO AREA
Abstract ID: 667
Individual Paper Submission

LEE, Ryun Jung [Texas A&M University] ryunjunglee@gmail.com, presenting author

The Dallas-Fort Worth (DFW) metropolitan area is one of the fastest growing areas in the U.S. As the urbanization process continues in DFW, existing greenfields are being developed and more developments appear near floodplains. This research examines the relationships between existing vacant land, flood risk, and the urbanization process by analyzing the land cover change between 2011 and 2016 in and around current floodplains and vacant properties in the DFW metro area. The major focus lies in the questions: 1) Are floodable neighborhoods more vulnerable to new development activities? 2) Is existing vacant land a catalyst for new development activities? and 3) Are the effects of vacant land different by neighborhood socioeconomic status and by the level of flood risk?

To answer these questions, this study operationally identifies development activities using the USGS land cover information and compares with existing flood risk and vacant properties. The first model examined if neighborhoods with a high flood risk are more likely to have new developments and if existing vacant land is a catalyst for these developments (Model 1). Then, three subgroups by different income levels were separately examined to compare the effects in low, middle, and high-income neighborhoods (Model 2). Finally, subgroups by different flood risks (low, moderate, and high risk) were compared to examine if vacant land is a catalyst only in neighborhoods with certain flood risks (Model 3).

The results suggest that, in the DFW area, floodable areas are experiencing more development. Specifically, the odds of having large development activities are increased by 103% in high flood risk areas. Also, existing vacancies are a trigger for new development only when vacancies are not clustered and when the flood risk is low. In fact, significant clusters of vacancies decrease the odds of having a large-scale development by 60.5%, and small-scale development by 61.2%. A heterogeneous pattern across different neighborhood profiles was found as well. For low-income neighborhoods, the odds of inviting large-scale development significantly increases by 281% in high flood risk areas while the effect in middle-income neighborhoods is marginal. Finally, there was no sign of dramatic neighborhood change or gentrification caused by the rapid urbanization process.

This study encourages city planners to pay attention to citywide vacant properties as they could either predict or detour potential developments. While existing vacant land can catalyze both large- and small-scale developments, clustered vacancies would not. This implies the importance of collecting a citywide vacant land inventory and proactively guiding potential development patterns through regulations if necessary. At the same time, where the flood risk is high, more attention is required for the neighborhood socioeconomic status than existing vacant land uses.

REVISITING THE KATES/PIJAWKA MODEL FOR DISASTER RECOVERY IN THE AGE RESILIENCY
Abstract ID: 682
Individual Paper Submission

SOBHAN, Saida [Clemson University] ssobhan@g.clemson.edu, presenting author
BUCKMAN, Stephen [Clemson University] stbuckm@clemson.edu, co-author
PIJAWKA, David [Arizona State University] Pijawka@asu.edu, co-author

Over 40 years ago the Kates Pijawka Model for Disaster Recovery was introduced in the book chapter From Rubble to Monument: The Pace of Reconstruction (Kates & Pijawka, 1977). Since its publication in the 1977 the model has been used and cited hundreds of times to describe and explain the process of how cities go through reconstruction post disaster, such as New Orleans post Katrina (Kates etal 2006) and New York post Sandy (Jahan, 2015) to name a couple examples. The model looks at four key stages or periods in the recovery process: 1. Emergency; 2. Restoration; 3. Replacement Reconstruction; and 4. Commemorative, Better and Development Reconstruction. Beyond simple descriptions of each phase the model showed how each phase operated in different disasters (earthquakes, floods, hurricanes, etc.), the timing of each phase, and the costs associated with each phase. While this model and its four stages have been used many times to explain the post disaster recovery of urban areas the question prevails whether in the face of rapid urbanization and climate change over the decades since first being used does the model still hold true or has it reached its shelf life? Furthermore, what can be done to update it for the third decade of 21st century?

Through an in-depth view of the literature and an examination of how it has been used throughout the years this paper will look to answer the question of its usefulness and shelf life. Additionally, the paper will suggest how changes can be made to the model. Upon deciding on those changes, they will be put to the test using the case study of Hurricane Maria in Puerto Rico which made landfall September of 2017 and devastated the island. The aim of the paper will be to create an updated version of the model which can be used by academics and policy makers to assess recovery success and for planners to be better design and implement more resilient urban forms that can adapt and absorb to future shocks to the systems as well as alter their physical design to be more prepared in a more unstable climatic world. Moreover the paper will look to update the model particularly in regard to issues of social and economic equity which is one of the backbones of resiliency and was not deeply touched on in the original model.

TOWARD A FRAMEWORK FOR CO-BENEFITS OF CLIMATE ADAPTATION: COMPARING THE CO-BENEFITS APPROACH WITH PRINCIPLES OF SPATIAL PLANNING

Abstract ID: 730
Individual Paper Submission

KUIPER, Jacobien F. [University of Massachusetts Amherst] jdevrieskuip@umass.edu, presenting author
HAMIN INFIELD, Elisabeth M. [University of Massachusetts Amherst] emhamin@larp.umass.edu, co-author

Cities in the United States use the concept of co-benefits in their climate plans to describe additional benefits of mitigation and adaptation strategies. The cities' use of the concept is in line with the development of the academic literature and official policy documents. Both emphasize the potential of co-benefits in the context of climate change (Mayrhofer and Gupta 2016). The potential of co-benefits lies within the concept's resemblance of a win-win strategy. Climate change and other goals can be addressed with a single measure. The key idea behind the co-benefits approach is that environmental and developmental goals can be reconciled. Responding to climate change does not have to halt and can even stimulate economic or social development.

Strategies with co-benefits are actively promoted for climate change planning practice (Meerow and Woodruff 2020). However, it remains unclear how a co-benefits approach should be implemented to create effective climate actions. Therefore, this paper questions how the full potential of co-benefits for climate adaptation planning can be reached.

This paper takes a two-step approach. First, we perform a content analysis of current climate plans of US cities (e.g. San Antonio, San Diego, and Philadelphia) to describe the use of the co-benefits approach in practice. In addition, we review the academic literature and official policy documents to assess current knowledge on co-benefits of climate adaptation. Second, we compare key characteristics of the co-benefits approach to principles of sustainable spatial planning (Godschalk and Rouse 2015).

This paper shows that large gaps exist in and between the theory and practice of the co-benefits approach in planning. The academic debate acknowledges limitations of the co-benefits approach but fails to propose a framework that matches the current theory and practice of climate change planning. Co-benefits are mostly discussed in relation to climate change mitigation, from a mono-disciplinary perspective. Different interpretations and applications of the term in current climate plans hinder the evaluation of empirical data necessary to assess the actual realization of co-benefits of climate action.

It is therefore surprising that the planning discipline is not more extensively engaged with the co-benefits of climate adaptation. Spatial planning is critical for climate adaptation and accustomed to a multidisciplinary approach. As such, the discipline of spatial planning is well-equipped to spur the development of a framework for understanding and application of co-benefits for climate adaptation.

We propose a framework that combines insights from the co-benefits approach and principles of sustainable, spatial planning. With a focus on place-based synergies, planning provides a co-benefits approach with a stronger sense of place. At the same time, the co-benefits approach realigns temporal differences between future adaptation and immediate benefits of climate action, adding a stronger sense of time.

This paper fills a current void in planning theory and practice, by connecting the co-benefits approach to principles of spatial planning. Insights from this paper serve as a foundation for future research on the actual realization of co-benefits of climate adaptation. The proposed framework functions as a guide for application of the co-benefits approach in future planning for climate adaptation.

COMMUNITY PERCEPTIONS AND CHALLENGES OF GREEN STORMWATER INFRASTRUCTURE PLANNING IN URBAN NEIGHBORHOODS
Abstract ID: 738
Individual Paper Submission

MEENAR, Mahbubur [Rowan University] meenar@rowan.edu, presenting author
HOWELL, Jordan [Rowan University] howellj@rowan.edu, co-author
MOULTON, Devon [Rowan University] moultond2@students.rowan.edu, co-author
WALSH, Shane [NJ DEP] shanecanyonwalsh@gmail.com, co-author

Green stormwater infrastructure (GSI) has the potential to mitigate a considerable amount of runoff from storms and flooding, while also improving the aesthetic and ecological performance of an urban built environment. Prior research has documented environmental and economic benefits of GSI projects including, but not limited to, increased water quality, increased air quality, reduced energy consumption, and increased property values. Literature on the social benefits of GSI, however, is insubstantial. While GSI projects such as rain gardens, bioswales, stormwater bumpouts, and tree trenches are considered an attractive approach to managing stormwater, it is not without its challenges. In particular, there is a lack of understanding on whether urban residents view GSI as an asset to their neighborhood or as projects that will attract a new set of social and environmental problems. The aim of our paper is to understand the social contributions of GSI and how people become (or do not become) connected to these projects. We examine neighborhood and user perceptions of GSI projects in two adjacent cities: Philadelphia (Pennsylvania) and Camden (New Jersey), located directly across the Delaware River from each other. Two-thirds of Philadelphia is within a combined sewer system (CSS), and Camden in its entirely is a CSS. Both cities face frequent flooding and stormwater issues, often leading to combined sewer overflows (CSO) that pollute nearby rivers and waterways, as well as city streets. Philadelphia has recently committed to prioritizing GSI features throughout its stormwater management system as one strategy for meeting federal requirements and improving urban infrastructure. These cities have collectively installed hundreds of GSI projects, which are expected to become socio-economic and environmental assets to their encompassed communities, including those burdened by environmental injustices, so long as these installations meet the needs of the community and are understood by the receiving neighborhood's residents. In order to understand the appearance, performance, and obstacles of these GSI projects, we conducted extensive field observations of GSI projects in Philadelphia (n=183) and Camden (n=55) and collected data on social aspects such as project setting, surrounding environment, social use and interaction, appearance and recreational appeal. We also conducted semi-structured interviews of 20 residents from these cities, discussing various social aspects and perceptions of GSI. After reviewing and analyzing field observation data, we identified several major themes including the following: (i) Lack of signage leads to lack of understanding, and can cause an increased amount of misuse; (ii) Interactions with GSI can increase if implemented in a suitable location; and (iii) Conditions are indicative of improper maintenance/lack of routine maintenance. Additionally, qualitative content analysis of interview transcripts helped us evaluate residents' understanding and perception of GSI design and maintenance, as well the concept of GSI as an infrastructure. Lack of knowledge and community support for GSI can result in the rejection of these projects, which can facilitate improper use, maintenance and function, and ultimately fail to mitigate the detrimental effects of a CSS. We have identified what community-based aspects of these projects can affect their ability to reach their full potential and formulated recommendations to ensure their longevity and productivity. It appears as though one pathway for overcoming the problem of resident and stakeholder education is through a careful

design of decision-making and maintenance-planning processes prior to actually undertaking GSI installations. Consistent with prior research, we speak to the importance of participatory planning processes in improving community acceptance, and interest in, GSI installations.

ARE SMART GROWTH STRATEGIES EFFECTIVE TO ADDRESS URBAN HEAT ISLAND EFFECTS?
Abstract ID: 747
Individual Paper Submission

WON, Jongho [University of California Irvine] jonghw1@uci.edu, presenting author
JUNG, Meen Chel [University of Washington] jmc129@uw.edu, co-author

This research explores the relationship between urban form—which exhibits smart growth principles such as mixed land use, high density, increasing access to public transit, and enhancing the walkable environment—and urban land surface temperature (LST) in Los Angeles County. Currently, the rising LST aggravated by urban sprawl is a critical problem associated with climate change and its related environmental threats. Scholars have demonstrated that urbanized areas have a higher level of LST, indicating the adverse consequences of urban sprawl. In response to these negative consequences of urban sprawl, the discourse on compact urban form has received significant growing momentum. Smart growth is one of the comprehensive planning frameworks that promotes compact urban form by incorporating land use, transportation, environment, urban design, economic development, and housing. The advocates of smart growth believe that compact development combined with smart growth strategies can enhance quality of life, protect the natural environment, and develop economically vibrant communities. Therefore, it is timely to assess whether smart growth strategies are effective for lowering the elevated LST in urbanized areas. Previous studies mostly have focused on the role of land cover compositions on LST. Therefore, this research contributes to the literature by incorporating diverse features of urban built environments, such as residential and job density, street connectivity, open green space, and transportation system, in the analysis. This research utilizes multiple datasets, such as the smart location database distributed by the Environmental Protection Agency, U.S. Census data, the National Land Cover Database produced by the U.S. Geological Survey, and the Landsat level 2 surface temperature data provided by the U.S. Geological Survey. By employing Geographically Weighted Regression models, this study reveals that the presence of walkable environments and green spaces is vital for lowering the elevated LST, particularly in more urbanized areas in Los Angeles area. The locally varied relationships between smart growth factors and LST across the region indicates the importance of localized approach for accommodating future urban growth and addressing high LST in urbanized areas.

GREEN PROGRESS OR GREEN PARADOX: IDENTIFYING GREEN SPACE ASSOCIATED GENTRIFICATION IN BEIJING
Abstract ID: 755
Individual Paper Submission

WU, Longfeng [Harvard University] lwu@gsd.harvard.edu, presenting author
ROWE, Peter [Harvard University] prowe@gsd.harvard.edu, co-author

In the past three decades, the Chinese government has made tremendous progress to increase the volume of green space to mitigate multiple negative impacts of urbanization. However, such effort prioritizes the quantity over other dimensions of urban green space planning including quality, spatial distribution, as well as varying socio-economic factors. While green space provides multiple benefits for urban residents, it often triggers gentrification in neighboring areas and thus tends to dislocate marginal people who can no longer afford to live in such areas due to the increased living cost. By using Beijing as a case study, this paper focuses on such concerns and aims to identify whether the extensive afforestation projects in the past decade results in gentrification. If such a trend is observed, the "green progress" aiming to benefiting more residents finally serves advantaged groups who constitute a small spectrum of total population of the city—a paradoxical result concerned by many scholars.

Relying on multiple open source data and Hedonic Pricing Model with a Difference-in-Difference indicator, the estimation results show that adding new green spaces can trigger gentrification by increasing the housing prices in the neighboring communities in Beijing. However, the capitalization scale of green spaces depends based on a variety of features. Distance to a property, area, vegetation quality, presence of water features, and types of green space all play different roles in affecting the housing price and thus have divergent capacities of triggering gentrification in the neighboring communities. The empirical results can be used as a reference to gauge the dislocation effect due to potential gentrification outcomes from urban green spaces, based on which the decision makers and planners can propose inclusive policies or planning schemes to avoid turning a "green progress" into a "green paradox" in the future afforestation efforts.

SCENARIO-BASED GREEN INFRASTRUCTURE PERFORMANCE ASSESSMENT FOR BUILDING URBAN RESILIENCE
Abstract ID: 757
Individual Paper Submission

FU, Xin [Northwest A&F University] fuxinuc@outlook.com, presenting author
WANG, Xinhao [University of Cincinnati] wangxo@ucmail.uc.edu, co-author

With an increase in the number of hazards and recognition of climate change, the importance of resilience has been gradually getting more attractions of both practitioners and researchers in urban planning (Fu & Wang, 2018; Meerow & Newell, 2017). Green infrastructure (GI) is an important strategy of urban planning aimed at enhancing urban resilience by providing stormwater runoff attenuation, social and ecological services, and green employment (Fu, et al., 2019). It is necessary to understand and compare various GI types for their individual and combined contributions to urban resilience. However, it is lacking in the current literature a comprehensive assessment framework combining quantitative and qualitative measurements to assess GI performance in promoting a social-ecological system resilience. We propose to develop a Scenario-Based Planning Support System (SB-PSS) to facilitate the assessment process by building a robust indicator set incorporates quantitative and qualitative indicators using the fuzzy comprehensive evaluation (FCE). Quantitative indicators are modeled, whereas qualitative indicators are surveyed; both types of data are used in the assessment of urban resilience. FCE is an effective means to transform original measurements (quantitative or qualitative) into defined fuzzy membership degrees (Gharibi, et al., 2012; Pislaru, et al., 2019). GI Urban Resilience Capacity Index (GIURCI) is conducted to support decision-making for GI planning through scenario comparisons.

Five scenarios were developed in Congress Run sub-watershed (within Mill Creek watershed, Ohio, USA) to test popular types of GI (rain barrels, rain gardens, detention basins, porous pavement, and open space). By our definition, open space provides temporary storage of stormwater runoff and publicly-accessible recreation areas (e.g., picnic shelters, playground, etc.). GIURCI was conducted based on GI performance in ecological, economic, and social resilience indicators. The results show open space scenario achieves the overall highest performance (GIURCI=4.27/5). To implement the open space scenario, the public or stakeholders need reclaim or purchase suitable vacant lots and convert them to forest land, detention basins, and facilities. This study helps planners acquire scientific and practical knowledge of GI in building urban resilience. The benefit of SB-PSS is it allows public participation in the assessment process and incorporates users' preferences and concerns in scenario generation. We propose a customizable SB-PSS and use widely-accepted indicators of resilience from the literature, making the methodology easy to duplicate, customize, and apply to other locations to assess environmental, economic, and social influence on urban resilience capacity for several types of GI.

APPLICABILITY OF TRANSITION MANAGEMENT APPROACHES TO THE JAPANESE PLANNING CONTEXT
Abstract ID: 773
Individual Paper Submission

MATSUURA, Masahiro [Meiji University] mmatsuura@meiji.ac.jp, presenting author
YAMANAKA, Hideo [Tokushima University] yamanaka@ce.tokushima-u.ac.jp, co-author
MAKIO, Kaho [Tokushima University] c611601384@tokushima-u.ac.jp, co-author

Sustainability transition has become a major challenge to the cities around the world particularly after the decade of frustrating experience with mitigating global warming (Loorbach, Frantzeskaki and Avelino 2017). The multi-level perspective (Geels and Schot 2007) suggests that managed transitions at the socio-technical "regime"--which is the dominant order in a societal system including policy, technology, culture--is needed for dealing with the global challenges. For example, energy transition advocates call for an abandonment of fossil-fuel based energy and replacement by renewable ones. In order to scale-up grassroots movements, such as the ones of tactical urbanism (Lydon and Garcia 2015), they must be steered and coordinated so that they would collectively push for a systemic transition of the regime. In response, European cities, particularly those in the Netherlands, have experimented with transition management approaches to urban governance for more than a decade (Loorbach 2010).

The approach, however, has rarely been experimented in the urban planning context outside Europe. Differences in institutional structures and meta-governance might preclude its use outside Europe. Transfers of such governance approaches beyond different contexts require their adaptation to the local context (Matsuura 2006). Particularly in Asia, the influence of power distance, which represents a tendency of deferring to authorities, is substantiated in the studies of cross-cultural communication (Meyer 2014). This predisposition to authority can be a barrier to introducing the transition management approach to Asian cities because the idea of challenging the current regime does not fit with the context of power distance in Asia.

Our research question, therefore, is the applicability of transition management approaches to the Asian urban planning context. Our working hypothesis is that the approaches do not operate well in the Asian context because of citizen's reluctance to challenge the regime and explore the opportunities for transition.

In order to explore this question, the authors experimented with transition management approaches, as practiced in the Netherlands as such, in Japan. One of the experiments is organized in a newly-developed suburb of Urawa-Misono neighborhood. The neighborhood, whose land use is primarily residential and commercial, is developed on a former wetland with a planned population of thirty two thousand. Due to

its suburban characters, the neighborhood has many sustainability problems, including dependence on private automobiles, lack of daytime population, and weak resilience against unforeseen climate change impacts. One of the authors organized multiple workshop meetings, involving local frontrunners, for exploring its sustainability transition strategies for 2050. Another experiment is a series of workshop meetings for promoting bicycle usage in Kanazawa City. Although the city is the pioneer among Japanese cities in implementing bicycle-friendly streets, the number of riders remains the same. By involving local activists, the authors organized three workshop meetings for exploring strategies for accelerating the transition to a more bicycle-oriented city.

These experimental workshops have demonstrated the possibility of adopting transition management approaches in Japan, even though these processes explicitly addressed the need of challenging the conventional regimes and accelerating a systemic change. In our analysis, the proposed actions produced at the Urawa Misono workshops all have the expected outcomes of transition management processes, which are a sense of direction, an impulse for local change, and collective empowerment (Roorda et al 2014). Time-series survey of the participants in Kanazawa experiment also indicates an increase in the perceived ability of making a systemic change in the society. These evidence indicates the possibility of adopting transition management approaches in the Japanese planning context.

The research is limited in that the strategies produced in the workshops are yet implemented. The research, however, demonstrated the possibility of taking the initial step of managed transition in a different context.

PROTOTYPICAL RESILIENCE PROJECTS FOR POST-DISASTER RECOVERY PLANNING
Abstract ID: 826
Individual Paper Submission

ZHAI, Wei [University of Florida] wei.zhai@ufl.edu, presenting author

Gaps and research questions

Even though the debate on urban resilience is continuing, many countries have initiated plans and implemented programs to guide local communities towards achieving it (Weichselgartner and Kelman, 2015). Despite the theoretical attractiveness of resilience, however, not knowing how to approach the concept by actionable and tangible projects makes it challenging for resilience practitioners to rehearse integrated urban resilience concepts. In addition, when decision makers and planners are building resilience in the recovery phase, they would question what projects can be adopted. Even though Meerow & Newell (2019) employed a typical resilience strategy- green infrastructure- as an example to answer these questions, it is challenging to generalize the findings to other resilience strategies. Moreover, few studies examined the actionable pathway to achieve resilience in practice, such as developing implementable resilience projects for the recovery planning (Mabon, 2019). Therefore, understanding what resilience projects can be employed is an urgent endeavor for post-disaster recovery planning

(PDRP) practitioners and planners.

Collectively, we ask the following research questions:

1. What are the prototypical resilience projects for enhancing resilience after the natural disaster?
2. From a top-down perspective, who is responsible for implementing the resilience projects for PDRP? What are the economic and environmental benefits of the resilience projects?
3. From a bottom-up perspective, to what extent, the public support and community coordination could be involved in implementing the resilience projects?

Methods and Data

To answer the first research question, we applied the text mining and clustering methods to extract prototypes from 940 resilience projects that were documented in the Hurricane Matthew Resilient Redevelopment Plans. The project title and project summary are employed to represent the semantic similarity between pairwise projects. More specifically, 50 counties are involved in the Hurricane Matthew Resilient Redevelopment Plans. Participating counties must draft a redevelopment that specifies resilience projects for the areas of economic development, environment, housing, and infrastructure.

To answer the second and third question, we developed a code scheme of 20 variables covering a range of goal, time schedule, economic impacts, environmental impacts and implementation characteristics from the project documents. Our interest is in the distinctive characteristics of each prototypical project in terms of building resilience, which can assist practitioners in formulating resilience projects that are responsive to these distinctions.

Results and policy recommendation

Our analysis of resilience projects reveals the following findings:

(1) Based on the projects from Hurricane Matthew Resilient Redevelopment Plans, we identified four prototypical housing projects, five prototypical economic development projects, seven prototypical infrastructure projects and four prototypical infrastructure projects.

(2) Prototypical projects in the infrastructure group more rely on local government compared to other groups whereas two prototypical projects in the economic group more rely on regional government. Overall, economic projects are the most cost-effective. Project designers show the least confidence in obtaining environmental benefits and return of investment of housing projects.

(3) 87.5% of all projects do not require coordination with other communities and counties. Particularly, 92.9% of housing projects are supposed to be implemented dependently by the local county. Many project designers are not sure about the level of public support (27.8%), particularly for the economic projects (34.6%).

According to our results, we have the following recommendations for future post-disaster recovery plan:(1)Develop resilience projects as tangible actions to realize resilience goal; (2) Design and encourage projects that can achieve multiple benefits; (3) Encourage robust community coordination and public engagement during project design; (4) Foster more flexibility for disaster recovery funding.

MARKET-LIKE NUTRIENT CONTROL POLICY AND RURAL-URBAN DYNAMICS: A WISCONSIN CASE STUDY
Abstract ID: 850
Individual Paper Submission

WU, Zhixuan [University of Wisconsin Madison] zwu223@wisc.edu, presenting author
GENSKOW, Kenneth [University of Wisconsin-Madison] kgenskow@wisc.edu, co-author

Market-like environmental policies enable transfer of pollution reduction credits among dischargers and are perceived as a cost-effective approach to pollution control. However, such programs for water quality face a particularly complex situation when the goal is to engage both regulated point sources (PS) and unregulated nonpoint sources (NPS). Much attention has been paid to design, implementation, and evaluation of these programs, while their social context – the relationship between rural and urban communities in the watersheds – is understudied. We argue that the transfer of pollution credits from NPS (farms) to PS (e.g. municipal wastewater treatment facilities), despite its transactional feature, is built on the existing rural-urban social network and in return reshapes the relationship. We explore how the PS-NPS water quality market programs interact with the urban-rural dynamic in a watershed. In particular, we are interested in the mechanisms for buyers and sellers to connect with each other, as well as the implications of the transaction to the local community.

Wisconsin's Adaptive Management (AM) program for phosphorus control provides a good opportunity to answer these questions. Enabled by statewide numeric phosphorus standards established in 2010, this program allows all the polluters in the same watershed to coordinate efforts to meet an ambient water quality standard instead of individual effluent standards at outfalls. The AM program relies on PS-funded phosphorus reduction by implementation of agriculture Best Management Practices (BMPs). Among Wisconsin's 16 cases proposed as of 2019, we concentrate on the very first one, Oconomowoc Watershed Protection Program (OWPP) led by municipal wastewater treatment plant of City of Oconomowoc. OWPP formed an extended partnership network connecting local NGOs, farmer-led groups, regional planning commission, consultant, and adjacent towns and cities. It also obtained support from federal, state, and local governments. As a result, though still in its early phase, OWPP is providing a model through successful implementation of BMPs, empowerment of farm-led group, and its visibility in the community. This case study includes interview of key stakeholders in this network and analysis of archival data.

Our case study draws from the theory of social network analysis with a special focus on brokering and bridging social capital. Based on the case of OWPP, we first explore the factors that brought urban partners and farmers together. Critical structural elements emerge such as existing social capital between rural and urban communities, resource gap that creates demand and supply, and organizational infrastructure that facilitate discourse. Besides, a process-based analysis expands the inquiry to individuals who are instrumental in the collaboration and the patterns of their quasi-brokering activities. Combining structure and process perspectives, the role of network in this PS-NPS water quality market is discussed. We then analyze the implication of OWPP to the rural-urban relationship. Three types of outcomes are identified: create new network, rearrange existing network, and connect multiple networks. We conclude that, besides influence on water pollution compliance, successful implementation of PS-NPS market-like program can bring about more profound social relationship adjustments on watershed level and open the window for co-learning and further actions. As AM cases accumulate, comparative studies will be used to enrich the details of this framework in the future.

This study will interest planning scholars as it applies social network theory to examine the market-like water quality programs via the lens of rural-urban relationship. It broadens the scope of survey on benefits

and consequences of environmental markets. For practitioners at local government's conservation departments, university extension divisions, and NGOs, this informative case study introduces the lessons learned from one promising case. Gaps in the network are also identified and opportunities for participation in similar markets are revealed.

WATERFRONT EVOLUTION AND ADAPTATION IN BOSTON: THE ROLE OF TIDELANDS LAW AND POLICY IN PLANNING
Abstract ID: 852
Individual Paper Submission

HUMPHRIES, Courtney [University of Massachusetts Boston] c.humphries001@umb.edu, presenting author

The interface between land and sea is an ecologically rich habitat and has long been a focus of human settlement and economic activity. It is also increasingly a site of risk for coastal cities. Climate adaptation planning is often presented as a novel endeavor rather than a process embedded in existing social-ecological relationships with long histories (Bassett and Fogelman, 2013). This paper will explore the urban-tidal interface as an often-overlooked, dynamic zone that has shaped coastal urban evolution and now plays a vital role in its planning decisions as coastal cities adapt to climate change.

 In the past, many coastal cities in the United States hardened their shorelines with built infrastructure and expanded them in order to create new land. However, this practice declined by the late 20th century due to the implementation of environmental laws and other waterfront regulations designed to preserve the integrity of coastal waters (Archer, 1994). Addressing the threats of 21st century sea level rise and increasing flood risks in dense urban coastal areas, however, brings renewed interest in retrofitting of urban shorelines, which may include filling areas of the shoreline to create new land—both horizontally extending the shoreline as well as raising its height—as a cost-effective way to protect existing neighborhoods and municipal infrastructure. As such, the need to physically alter waterfronts is likely to move again to the forefront of urban infrastructure planning (Nordenson et al., 2018).

This paper bridges urban history and contemporary urban planning through a qualitative case study of Boston, Massachusetts. The city provides a notable example of shoreline evolution; Boston gained about 5,250 acres of constructed land, much of which is projected to be at a high risk of flooding with sea level rise. While this change has been documented in previous planning histories, less explored is the legal, regulatory, and administrative structures governing the intertidal space, and how those structures shaped Boston's expansion.

This paper first traces the evolution of the laws and policies governing Boston's extensive tidelands. Drawing upon government reports, legislation and case law, maps, newspaper articles, and secondary sources, I focus on time points of major shifts in governance, beginning with the creation of the Colonial Ordinances of 1641-7, which established private property to the low tide line while also preserving public usage rights. Legal disputes along a waterfront dominated by private development gradually led to state regulatory control in the 19th century. The notion of a public trust in tidelands that was first codified in colonial days was reconfigured in the 20 century when emerging waterfront development interests, new federal coastal management policies, and a landmark 1979 court case prompted state legislation and regulations.

Drawing on published documents and interviews, I then explore how this historical regulatory regime impacts the 'adaptability' of the shoreline as public and private actors explore potential climate adaptation solutions involving fill as part of protective coastal infrastructure. I consider where and how climate adaptation aligns or conflicts with existing laws and policies, focusing on solutions that have been designed or proposed by government, professional experts, and academic groups. The findings contribute to a growing body of research that contextualizes urban risk and adaptation under climate change within a larger history of urban planning decisions.

As disaster trends continue to rise, communities across the globe are increasingly concerned with the aftermath of disaster impacts (Cutter, 2008; Berg, 2010). These concerns are not without merit; the United Nations Office for Disaster Risk Reduction (UNDRR) concluded that future "communities will have to adapt even more to these stressful environmental conditions, through disaster risk reduction and resilience building measures" to withstand multiple disasters and recover following disaster impact (UNDRR, 2015).Historically, disaster recovery was defined as the restoration to a previous state of wellbeing, in which people experience 'closure' and communities, economies and infrastructure return to pre-disaster levels (Winkeworth, 2007). However, simply rebuilding or restoring may not meet the standards needed to combat increasing and intensifying storms, and thus researchers have refined the definition to include the "intensity of impacts and the combined social, economic, and physical processes by which an area regains normal life and adapts to new circumstances" (ibidem). By this definition, a recovering

community moves from a state of reaching normalcy to a state of adaptation for future events.

Hazard mitigation planning enables communities to effectively pursue actions that help reduce or eliminate risks to life and property from natural hazards. Planners can play a key role in guiding communities through the complexities of recovery management, post-disaster decision-making, and long-term risk reduction by educating stakeholders and engaging them around holistic consideration of disparate variables like land use and development patterns, infrastructure, density, and vulnerability.

This study investigates the planner's role in the disaster recovery process. We designed and administered a 51-question online survey, targeting American Planning Association members, to assess planning practitioners' understanding of disaster recovery perspectives, experiences, and the needs of the broader planning community and answer the following research questions:

(1) What are planners' perceptions of the disaster recovery process and their roles in community recovery?

(2) What do planners need to know about disaster recovery to better support their communities?

Survey results indicate that many respondents (43.43%) felt they played a key role in the recovery efforts (33.33% reported feeling neutral, while the remainder felt they did not play a key role). Based on the survey, the majority of respondents would like to learn disaster recovery planning through a workshop, seminar, or conference. We recommend conducting training that best fits with this strong respondent preference. Very few respondents actually participated in pre- or post-disaster recovery planning, suggesting a need for increased planning efforts in these areas. A large number of respondents indicated that they used no planning tools in the pre-disaster recovery plan. This result highlights a prime opportunity for increased guidance and training.

This study identifies the role of planners in the disaster recovery process, and what planners need to know about disaster recovery to better support their communities. This study provides scholars and planning practitioners witha framework for collecting information from recovery planners and disaster specialists regarding their concerns, perceptions and best practices regarding community recovery.

CHANGES IN THE WATER: THE IMPACT OF NATURAL HAZARDS VULNERABILITY AND EXPOSURE ON POPULATION CHANGE
Abstract ID: 885
Individual Paper Submission

BRANHAM, Jordan [University of North Carolina at Chapel Hill] jbranham@live.unc.edu, presenting author

SCHWALLER, Nora [University of North Carolina at Chapel Hill] nschwall@live.unc.edu, co-author

The effects of sea level rise and an increased propensity for major storms due to climate change are expected to drive a dramatic reduction in the availability of habitable coastal land and induce retreat from particularly vulnerable areas (Allen et al. 2018; Hino et al. 2017). However, there is little understanding of how existing flood vulnerability and hazard exposure influences population changes or the thresholds at which these impacts are realized (Black et al. 2011; Bardsley and Hugo 2010). In this paper, we seek to understand how different aspects of environmental risk induce changes in the demographics of vulnerable areas. More specifically, we ask, how does physical vulnerability to flooding and exposure to major storm events interact to influence population change over time.

Using a geospatial dataset of building locations along with FEMA's flood hazard maps, we quantify the proportion of buildings within a census tract that are located in a floodplain and use federal disaster declarations are used to quantify major storm events for each census tract. We control for a number of mediating variables, including demographics, economic indicators, geography, and population trajectories. We measure census-tract level population change over a study area that encompasses the Southeast United States – Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina, and Texas – from 1990 to 2018. Our analysis employs multilevel regression, allowing us to assess the effect of our key explanatory variables at different geographic scales.

Our findings suggest that populations have differential responses to environmental risks based on geographic location, which are compounded when physical vulnerability is accompanied by hazard exposure. More specifically, while coastal communities have experienced significant population growth despite high levels of flood vulnerability, those subareas that are exposed to multiple disasters possess a negative relationship with population growth, suggesting that hazard quantity may be an important determinant of retreat from coastal areas. Comparatively, areas subjected to riverine-based flood vulnerability are inclined to population loss in reaction to moderate risk, but less reactive to major events.

Our initial analysis suggests that major storm events play a focusing role in raising awareness of geographic vulnerability and flood risk, which may induce population shifts away from vulnerable areas following repeat storm events. We expect that these risk-responses will become more pronounced in an era of climate change as the severity and frequency of natural disasters increases and awareness of vulnerability heightens. As population loss leads to reduced community resilience, municipalities subjected to disaster-related impacts may also need to contend with a decreased ability to support its remaining residents' livelihoods (McLeman and Smit 2006). The policy-relevant findings from this study can be used to help understand environmental determinants of population shifts, as well as inform post-disaster recovery and identify future areas for targeted managed retreat programs.

THE MAKING OF A SUSTAINABLE CITY: THE FORMULATION OF URBAN SUSTAINABILITY POLICY IN TEL AVIV-JAFFO (2000-2020)
Abstract ID: 911
Individual Paper Submission

BAR-NER, Hila [School of Sustainability, Interdisciplinary Center (IDC) Herzliya]

MAROM, Nathan [School of Sustainability, Interdisciplinary Center (IDC) Herzliya]
natmarom@gmail.com, co-author

Recent years have brought intensive scholarly attention to the framework of urban sustainability, and how it shapes urban policy and planning in the age of rapid urbanization, environmental pressures and climate change. There are numerous contributions on how urban sustainability, as a theoretical framework and as a prescriptive concept, should be applied to urban planning, as well as many surveys and comparative analyses of urban sustainability plans around the world (e.g. Wachsmuth & Angelo, 2018). Less attention has been directed to the question of how urban sustainability is conceived and adapted locally, through the interactions of local and international actors, as well as the myriad of projects and plans that are put in place (Hughes, 2016). A better understanding of the practice of policy formation could shed light on the way it affects the meaning, scope, and success of urban sustainability policy (e.g. Campbell 2016).

This paper addresses the process of urban sustainability policy formulation – as one that is highly localized, reiterative, and at times experimental and contradictory. It does so by outlining how urban sustainability, emerges and changes over the recent two decades in the city of Tel Aviv-Jaffa (TLV), the economic and cultural center of Israel. Since the early 2000s, TLV has undergone a gradual policy shift influenced by local and international factors, resulting in a series of high-profile environmentally driven plans dealing with sustainability, urban nature, resilience and climate change.

We focus on three main questions in order to analyze the process of urban sustainable policy formulation: (a) What are the key drivers of the urban sustainability policy framework? Following Joss (2015), we map environmental and socio-economic pressures, economic development goals, cultural branding, and international cooperation. (b) Who are the main actors shaping the policy development? We address top-down, bottom-up and middle-out processes, looking at stakeholders and the ways in which policy ideas and implementations "flow" between them (c) Where are the main sustainability interventions planned in the city and who benefits from them most? Following approaches that highlight links between sustainability and environmental justice (e.g. Agyeman 2005), we review the way the city's sustainable policy distributes benefits and risks across geographical and social divides.

We trace the formulations of Tel Aviv's urban sustainability policy by focusing on three key domains: (a) incorporating sustainability into the city's first Strategic Plan (2005) and its comprehensive revision a decade later (2017); (b) setting up a municipal program for a local network to explore sustainability at the community level (since 2012); and (c) addressing the ecological dimensions of sustainability through the siting and planning of "urban nature" (since 2015). We use an interlinked case study approach, following the evolution of each of these plans and projects, as well as their interactions over the years. Our research is based on collection and critical analysis of policy documents and interviews with key actors and stakeholders.

Our findings highlight the prominent role of the "activist clerks", middle-out agents who translate and transmit urban sustainability ideas between policy and practice, municipality and grassroots. We also find that the scale of the neighborhood, and the interplay between social development and environmental activism becomes an important platform for policy development and interlinking different sustainable plans and agendas. Focusing on the neighborhood level also reveals implications for equity and environmental justice, since community-focused sustainability prioritizes established and resilient communities over other, sometimes more vulnerable urban areas.

Connecting the theoretical and substantive knowledge of sustainable policy formation serves to both enrich scholarly understanding of the contemporary development and implementation of urban environmental policy as well as to inspire practitioners searching for innovative tools for social and environmental change.

THE ETHICS OF TRANSFORMING INCINERATORS INTO COMMUNITY ASSETS: NEIGHBORS' PERCEPTIONS AND ACCEPTANCE IN SEOUL, SOUTH KOREA
Abstract ID: 917
Individual Paper Submission

LAURIAN, Lucie [University of Iowa] lucie-laurian@uiowa.edu, presenting author
GO, MinHee [Ewha Womans University] minheego@ewha.ac.kr, primary author
HAN, Albert [The University of Texas at San Antonio] albert.han@utsa.edu, co-author

Incineration is a primary municipal waste disposal method in many countries including Japan, Taiwan, South Korea, Denmark and the Netherlands. Some countries incorporate community amenities to incinerator (observatory decks, recreation centers, gyms, parks) to mitigate their negative socioeconomic impacts on surrounding communities. Using the case of the Seoul Metropolitan Area of South Korea, Han, Laurian, and Go (2019) found that these amenity features significantly mitigate incinerartors' impacts on property values, compared to incinerators without similar amenities. This findings, however, leaves important social and ethical questions open: Can adding public "goods" make up for environmental "bads" and redress environmental injustices?

Studying the social and ethical implications of compensating environmental bads with public goods requires an in-depth understanding of public perceptions of the amenities provided by waste incinerators, and of the citizen oversight and compensation programs instituted to assuage public disputes. This paper presents findings from field research in South Korea, including site visits, interviews with facility managers and local public officials, and interviews and surveys with residents who live in proximity to the incinerators. The interviews and surveys answer the following questions: 1) To what extent do residents in communities hosting waste incinerators with amenity features perceive those as a community assets and/or liabilities? 2) To what extent do they find the citizen oversight and financial compensations satisfactory? 3) How do they understand and perceive incinerators' potential health impacts?, 4) Does participation in decisions related to the incinerator siting or in the citizen oversight groups that monitor incinerator operations impact perceptions and acceptance? and 5) Overall, how do residents understand, perceive, and to what extent do they accept, the tradeoffs between environmental impacts and community amenity? We examine the responses of residents who live near incinerators with and without amenities.

The implications from this research will provide theoretical and practical insights into the ethical

dilemmas involved mitigating environmental impacts (and potentially injustices) with social goods.

USING COMMUNITY MAPPING TO CREATE OPPORTUNITIES FOR LEARNING AND CHANGE SELF-PERCEPTION OF RISKS ASSOCIATED WITH CLIMATE CHANGE
Abstract ID: 929
Individual Paper Submission

BARCHERS, Camille [University of Massachusetts Amherst] camille.v.barchers@gmail.com, presenting author

Emerging public engagement scholarship has examined the importance of creating opportunities for social learning among participants and the ability of experimental research to generate insights on the design of public engagement activities to support learning. This paper includes the results of experimental research conducted in Springfield, MA. This research examines the potential of community mapping exercises to create opportunities for learning and enhance participants' perception of short-term and medium-term risks from climate change. Prior research on climate resiliency suggests that community members do not understand personal risks of climate change and fail to participate in long-range planning activities or change behavior because they lack information and do not perceive themselves as part of "at risk" populations (Pongiglione, 2011).

Based on prior research on public engagement, it has been suggested that interactive, small-group, collaborative activities have the potential to create opportunities for social-learning. As planners we work in small, interdisciplinary groups, to complete the tasks most commonly associated with our field: preparation of plans, community meetings, negotiation, goal formation, and review of documents (Shalinsky & Norris, 1981). We also frequently ask citizens to engage with small groups through focus groups and advisory boards. The popular and regional scale goal setting approach espoused by the Urban Land Institute, Reality Check, brings hundreds of invited stakeholders together and asks them to play a board game in small groups of 5-7 ("Reality Check - Urban Land Institute," n.d.) . In other examples, we ask citizens to develop ideas in groups, review models in groups, and develop visioning maps in groups (Desouza & Bhagwatwar, 2014; Frewer & Rowe, 2005; Kleinhans, Van Ham, & Evans-Cowley, 2015; Zellner et al., 2012).

Often an unstated, implicit goal of these activities is to create opportunities for learning. We suppose that these engaging and participatory small-group exercises can lay the groundwork for supporting social learning and promote better planning outcomes (Goodspeed, 2016). We also suppose that this type of activity might also lead to a community of active planning participants (Barchers, in preparation). Use of experimental research design in planning has emerged as one such way to test claims about the efficacy of activities within a public engagement process (Honey-Roses and Stevens, 2017). To address the extent to which small group activities can generate opportunities for social learning in public engagement

processes, and the extent to which learning can lead to enhanced perception of risk, we conducted an experimental public engagement study in Springfield, MA. This study used community-based mapping as a small group meeting activity and used pre and post surveys to test whether and to what degree participation in the activity generated social learning and greater understanding of risks from climate change. The work provides new insights on how experimental research design can increase knowledge in the planning domain and how self-perception of risk influences likelihood of continued participation in planning activities among participants. Results from this work demonstrate how specific design choices in public engagement activities can lead to enhanced long-term participation of community members and increase social learning among participants.

URBAN FORM AND FLOOD RESILIENCE: A MICRO-SCALE STUDY IN MACAU
Abstract ID: 938
Individual Paper Submission

LI, Chaosu [City University of Macau] csli@cityu.mo, presenting author

The Intergovernmental Panel on Climate Change (IPCC) Fourth Report stresses the need for a fundamental transition in the structure and functioning of built environments to simultaneously adapt to the effects of climate change. Meanwhile, more frequent urban flooding events brought about by climate change has been posing great threats to urban communities in recent decades. Yet, less is known about the relationship between urban form and flood resilience in the literature. The purpose of this paper is to advance the empirical understanding of how urban form, particularly urban design features at the micro-scale, influences urban flood resilience. We use the real-time data from the 32 water level monitoring sites in Macau to model the duration of urban flooding in different urban built environments during all the urban flood events in 2018 and 2019. Using the fixed effect model, our initial results indicate that floor area ratio, vegetation intensity, and form-based urban parameters such as urban porosity and building characteristics are associated flood resilience. This paper lies at the intersection of urban form and climate change adaptation, which is one of the major thematic issues of resilience science. The results of this paper can also enable planners to think more deeply about flood resilient urban form and formulate comprehensive policies to improve urban resilience.

NETWORK ANALYSIS IN PLANNING EVALUATION (NAPE) TO EVALUATE GOVERNANCE CAPABILITIES IN THE FACE OF MULTI-JURISDICTIONAL & MULTI-DIMENSIONAL PROBLEMS: A NOVEL APPROACH WITH WATERSHED PLANNING FOR FLOODING HAZARDS IN LOUISIANA
Abstract ID: 941
Individual Paper Submission

DOUTHAT, Thomas [Louisiana State University] tdouthat1@lsu.edu, presenting author
REAMS, Margaret [Louisiana State University] mreams@lsu.edu, co-author
IRVING, Jennifer [Louisiana State University] jirvin6@lsu.edu, co-author
LAMANA, Lindsey [Louisiana State University] llaman2@lsu.edu, co-author

Regional planners frequently address issues surrounding housing markets, transportation, land use, and the environment. These issues manifest themselves cumulatively as the result of the actions of a diverse set of actors, separated by both jurisdictional boundaries and areas of expertise. The mismatch between the scale of the problems and the jurisdiction of decision-making bodies means that plans developed by individual governments often fail to address complex regional issues effectively. In the planning realm, the capacity for planners and policymakers to create and implement effective regional solutions is much studied. Many planning processes begin with a diagnosis of existing planning documents, and academically, plan evaluation literature has traditionally focused on evaluating plans or network of plans based on their discrete attributes. From within planning and within allied literature on socio-ecological networks and policy, there has been a growing attention to the problem of how to assess networks of planning governance over space and areas of expertise.

This is especially in the case of water planning and ecosystems. Here, we aim to fill the gap left by the lack of widely adopted tools and methodologies to assess how individual plans interact across jurisdictions or within diverse types of plans (e.g, comprehensive, resilience, and transportation). We address the area of flooding hazards and watershed planning, and within the watershed context, and contribute to a larger governance network. Social network analysis methodologies can help bridge this gap, by extracting regional network data from existing planning documents, but we lack standardized approaches to incorporating network analysis with planning assessment tools. Our project will create a standardized multi-jurisdictional plan evaluation tool (Network Analysis in Plan Evaluation) using reproducible network methodologies.

We will apply the methodology to watersheds in Coastal Louisiana, and demonstrate how the NAPE methodologies can help understand key actors within planning networks, identify potential sources in governance and collaboration gaps, and help develop a method to use the planning process to address problems of socio-ecological fit in regional environmental and development policy. The work will foster future research by establishing standard reproducible methodology for conducting planning governance and plan quality assessments which incorporating multi-jurisdictional network data.

USING GOOGLE STREET VIEW IMAGERY TO PREDICT STREET LEVEL PARTICULATE AIR POLLUTION
Abstract ID: 984
Individual Paper Submission

QI, Meng [Virginia Polytechnic Institute and State University] mengqi@vt.edu, presenting author
LU, Tianjun [Virginia Polytechnic Institute and State University] tianjun@vt.edu, co-author
HANKEY, Steve [Virginia Polytechnic Institute and State University] hankey@vt.edu, co-author

Estimating spatial patterns of air pollution is necessary for human exposure and health impact assessment (Alexeeff et al., 2018). Studies show that urban air pollutant concentrations are unevenly distributed and can vary rapidly over very short distances, leading to health disparities at small spatial scales (Apte et al., 2017; Hankey et al., 2019). Understanding air pollution distribution at high spatial resolution will provide evidence for city planners to make precise policies in promoting healthier communities.

Land-use regression (LUR) is one approach which has been frequently applied to predict ambient air pollutant concentrations (Eeftens et al., 2012). However, traditional LUR uses GIS-derived variables, which are typically jurisdiction-specific (e.g., zoning ordinance) or are less precise (e.g., Census data) at large geographic scales. The traits of these data sources make it difficult to extend traditional LUR models from city to city. Google Street View (GSV) imagery provides street-level information of urban environment without the constraints of jurisdiction boundaries, which makes it a good potential data source for LUR. In this study, we investigate use of a promising new set of variables for LUR, i.e., features extracted from GSV imagery by a deep learning-based scene parsing technique (Zhao et al., 2017). The performance of GSV-only LUR is then compared to our previously developed LUR models (Hankey et al., 2019) which use traditional land use variables.

We previously collected ~120 hours of mobile monitoring data in Blacksburg, VA (Particle Number [PN] and Black Carbon [BC]) (Hankey et al., 2019). Daytime (12-h average) models were established to approximate long-term air pollutant concentrations. Traditional LUR models were developed with multiple variables, including land use, transportation and natural environment variables, all of which were collected separately. For GSV-only models developed in this study, we used GSV imagery as a single data source and collected ~14,000 GSV images within 2,000 meters of the mobile monitoring routes. Images were separated into 2 categories: (1) images within 50 meters of air pollution measurements to capture central features and (2) images aggregated within 8 buffers (250-2,000m) to capture background features. A deep learning model - PSPNet (Zhao et al., 2017) - was used to extract features from GSV images. Specifically, each pixel of an image is classified into different object classes, e.g., vegetation, buildings, cars, trucks, water, etc. The percentage of features within each image (and subsequently within each buffer) was used in stepwise linear regression models to develop GSV-only LUR models.

We found that the GSV-only models had comparable performance to LUR using traditional variables.

Adjusted R^2 (10-fold CV R^2) was 0.76 (0.65) for PN and 0.69 (0.58) for BC; the GSV-only models were 5.6% (-5.8%) higher for PN and 4.5% (3.6%) higher for BC than traditional LUR models. Furthermore, adjusted R^2 for PN (BC) models that used only GSV images within 50 meters of a monitoring route were 0.45 (0.41) suggesting that street-level images at the measurement location can describe a significant amount of variability for these pollutants. Collectively, our findings suggest that variables derived from GSV imagery is a promising data source for predicting street-level patterns of air pollution.

Our results suggest that GSV imagery may be an effective alternative to variables used in traditional LUR. GSV offers potentially two major advantages: (1) finer spatial (i.e., street-level) resolution and (2) the ability to apply consistent data collection and processing protocols across large geographies and political boundaries. This new promising approach could then be used to provide finer and more precise information for planners and policy makers.

INCLUSIVE RESILIENCE: EXAMINING EQUITY-CENTRED STRATEGIC PLANNING IN TORONTO, CANADA
Abstract ID: 991
Individual Paper Submission

MITCHELL, Carrie [University of Waterloo] carrie.mitchell@uwaterloo.ca, presenting author
FITZGIBBONS, Joanne [University of British Columbia] jo.fitzgibbons@ubc.ca, primary author

Existing but limited empirical research suggests that while inclusivity, equity and justice are centrally important to building resilience, City governments using a resilience framework for planning projects are not consistently prioritizing social equity in resultant city plans (Fitzgibbons & Mitchell, 2019a). Hence, more research is needed to unearth pathways toward more equitable resilience planning processes. The goal of this paper is to contribute to filling this empirical gap, asking whether and how principles of justice have been incorporated in in-situ resilience planning. We explore a case study of one equity-focused participant City participating in the "100 Resilient Cities" (100RC) program: the City of Toronto. Using key informant interviews and document analysis, this paper examines the approach taken by Toronto to weave social equity and inclusion throughout the "ResilientTO" planning process. We find that the Resilient Conversations approach, used by the City as part of the 100RC strategic planning process, supports the notion that a "negotiated resilience" approach (Harris et al., 2017) can help to

advance procedural justice in resilience planning. We argue that, with some important considerations, the Resilient Conversations process may represent a model practice for operationalizing negotiated resilience, and we hope that the findings of this research can inform more procedurally just strategic planning processes in North American cities.

Private land conservation in the U.S. is increasingly necessary in order to address sprawl, biome shifts, and other forms of habitat loss (both human and climate-driven). The conservation easement (CE), a negative easement in gross, is one of the most ubiquitous yet under-studied forms of private land conservation. Several scholars have been trying to isolate the landowner motivations to engage in CE placement. Ernst and Wallace (2008) showed that tax incentives, while not the primary reason for CE utilization, certainly facilitated the Larimer County, CO property owners' decision-making processes. Farmer et al. (2011) affirmed this finding with a slightly larger geographic sample of donors to land trusts in seven Midwestern states, using both a survey and interviews to show that place attachment was the primary reason for CE donation. Farmer et al. (2011) asserted that, while the lowest ranked of their motivations, "potentially one-third less land [would be] under conservation easements without financial incentives" (p. 833). Rissman et al.'s (2007) landowner survey in eight states focused on the conservation purposes within CEs held by The Nature Conservancy, assessing conservation targets and threats to biodiversity, as well as basic CE purpose, rather than donor motivation. Influenced by Kabii and Horowitz (2006)'s conceptual model for landowner motivations to conserve land, Brenner et al. (2013) used a pre- rather than post-test approach to study landowner's motivations to prospectively place a CE in central upstate New York. Their results revealed that land uses, particularly "recreation and wild food prospecting, are among the most powerful and significant predictors of landowners' willingness to consider conservation easements" (p. 30), as well as owning a large parcel of land. However, this study was extremely localized. The results of these studies, among others, suggest that owner motivations are complex and potentially conflicting, with no clear prioritization. These findings, in part, may be attributed to the limited scope of the study areas and/or the intent of the original survey, suggesting the need for a broader-based and regionally representative national survey.

In order to ascertain the motivations for CE use (especially the fiscal policy that promotes public subsidy on private land) more broadly than the Farmer et al. (2011) study, as well as the potential effect on other

landowners and on the biological value of the conserved lands held by all kinds of land trusts, we built on the work by Kabii and Horowitz (2006), Rissman et al. (2007), Ernst and Wallace (2008), Farmer et al. (2011), and Brenner et al. (2013), among others. We located the property owners in twelve counties in the eco-regionally representative and rapidly growing exurban areas of six states across the U.S. We generated a post-test survey instrument for dissemination via mail (Dillman et al., 2014) to a stratified, representative sample of the property owners with CEs placed between 1997 and 2008/2009 in each county.

The survey results allow us to evaluate the effect of federal and state tax incentives on CE placement (Farmer et al., 2011; Ernst & Wallace, 2008; Sundberg & Dye, 2006) and the potential differences in donation motivation based on income or education (Brenner et al., 2013). They also reveal the role of ideology and biological knowledge in individual decision-making regarding CE use. With results from a more expansive and geographically-representative survey, we are able to inform the planning community of the individual motivations influencing CE placement in growing exurban areas. The results will inform future policy changes at multiple governance scales (local to federal), and should give greater insight into how an individual's landholdings drive the choice and location of a CE, which can impact other land uses within the jurisdiction.

PEDESTRIAN BEHAVIOR BASED ON OUTDOOR THERMAL COMFORT AND MICRO-SCALE HEAT ISLAND, AUSTIN, TX
Abstract ID: 993
Individual Paper Submission

KIM, SeWoong [Texas A&M University] sewoongkim@tamu.edu, presenting author
BROWN, Robert [Texas A&M University] rbrown@arch.tamu.edu, co-author

Cities' built environments have changed with sprawl and development, particularly in downtown areas where changes have been rapid and remarkable. Urbanization has also resulted in a hotter thermal environment in cities. Recent changes in outdoor thermal environments are different from the past and could affect people's behavior patterns. In indoor environments, people can adjust the air temperature, although it is at the expense of increased energy consumption. However, people who must inevitably be active outdoors, such as pedestrians and construction workers, need to find places that are somewhat more thermally comfortable, or they need to change their paths. Pedestrians are easily affected by changing thermal comfort conditions based on the time of the day and zenith of the sun because the heat environment in the city changes hourly during the day. Thus, their thermal perceptions depend on where

they walk to avoid direct sunlight or strong winds, and these conditions could contribute to an uncomfortable microclimatic environment. Therefore, several factors should be considered and analyzed to understand the thermal comfort conditions on the street in the downtown area in a city. However, few studies have analyzed the relationship between the human thermal comfort index and the actual people volume on the street.

Most of the research related to urban heat island (UHI) has focused on mesoscale perspectives. However, more research is needed to address the limitations of existing UHI concepts, which are currently described by linear concepts to calculate and estimate UHI intensity. Additionally, to understand how the heat island phenomenon influences people's lives and behaviors at a more specific and detailed scale, researchers should categorize heat island characteristics considering both physical and temporal factors. Thus, a study should be conducted on how each scale of the heat island phenomenon affects people's behaviors and their living environments from a micro-scale perspective. People on the street are directly affected by micro-scale heat events rather than mesoscale conditions, so micro heat island (MHI)—heat island with micro-scale—should be considered to find countermeasures for the extreme heat event issues during the summer.

This research focuses on the relationship between MHI and people's behavior patterns on the street, such as pedestrians' decisions about their walking path and where they choose to stand or sit. The main goal of this research is to define an MHI concept and suggest a model based on the data collected from a mobile weather data collection campaign. The MHI model will be utilized to determine the factors that most influence pedestrians' flow and volume on the street and to suggest a way to determine how much of a direct relationship there is based on microclimatic weather data with pedestrians' behavior characteristics in terms of their outdoor thermal comfort level from a micro-scale.

MULTILEVEL GOVERNANCE IN AIR POLLUTION CONTROL: EXPLORING INCENTIVE MECHANISMS IN AUTHORITARIAN CHINA
Abstract ID: 995
Individual Paper Submission

LIAO, Lu [Cornell University] ll743@cornell.edu, presenting author

Jurisdictional pollution externality, has always been a severe challenge for effective environmental governance. In China, in the Beijing-Tianjin-Hebei and Yangtze River Delta and Pearl River Delta regions, 30% to 40% of the concentration of sulfur dioxide, 12% to 20% of the nitrogen oxides, and 16% to 26% of the inhalable particulate matter come from other cities. To reduce the problem of

environmental externalities, current scholarship has generally raised two solutions. The first thread of studies focusing on voluntary collaboration among decentralized jurisdictions, while local governments usually lack strong incentives for effective implementation. The second thread of studies seeks for the authority from the higher-level government to mitigate actions at local level. However, strong state interference might jeopardize local autonomy and impose substantial costs to local enforcement.

The Chinese case of air pollution control provides a perfect laboratory to examine these two competing theories regarding reducing environmental externalities. To solve the heavy air pollution problems, in 2012 the central government issued the "The 12th Five-Year Plan for Air Pollution Prevention and Control in Key Areas", aiming at seeking regional solution for air pollution control. This paper aims at exploring the effect of these competing types of regional environmental collaboration on environmental outcomes in authoritarian China. Specifically, I try to answer two questions: can environmental collaboration reduce air pollution spillover in China? Which types of collaboration are more effective in reducing environmental spillover?

To answer my questions, I draw air quality data from web and archiving data from annual reports of Ministry of Ecology and Environment of People's Republic of China. I compare air pollution spillover in the Yantze River Delta (more voluntary collaboration) and cities in the Beijing-Tianjin-Hebei (more higher-level intervention) using spatial-temporal regression. The baseline identification strategy is to compare air quality of monitoring stations that boarder other provinces with that of nonborder stations. To control for other confounding factors that might influence air quality such as wind direction, geology, and natural hazard, I also compare air quality of monitoring stations that on the regional boarder with those stations that located within the regions.

The results show that both collaboration mechanisms reduce air pollution in the Beijing-Tianjin-Hebei and Yantze River Delta regions. However, the spillover effects show that urban PM2.5 concentration decreases by 0.230% for the Beijing-Tianjin-Hebei region which received more higher-level intervention, while the voluntary collaboration in Yangtze River does not show any significant reduction impact on air pollution spillover. Through two contrasting case examples of regional environmental collaboration, this paper tests the effect of different regional collaborations on environmental outcomes. It enhances scholarly understanding of the power structure within different multilevel governance which heavily influence local governments' environmental decision-making.

RETREAT FROM THE URBAN WATERFRONT: A PATHWAY TO RESILIENCE & REPARATIONS - A CASE STUDY ON EDGEMERE, QUEENS
Abstract ID: 1006
Individual Paper Submission

ASINAS, Erica [Pratt Institute] erica.asinas@gmail.com, presenting author

According to the International Panel on Climate Change's Fifth Assessment Report, in the most optimistic scenario that global temperatures are capped at 1.5°C by 2100, sea levels will still increase at an average of 10 to 30 inches. For each vertical inch of sea level-rise, the ocean will move 50 to 100 inches inland, accelerating land loss, expanding the reach of hurricanes and storms, and forcibly displacing 72 to 182 million people by century's end.

Managed retreat is a coastal adaptation pathway that most effectively eliminates this risk, as it permanently and strategically relocates vulnerable populations out of harm's way. However, it is often dismissed for being politically contentious, socially and economically disruptive, and psychologically taxing. Furthermore, recent research suggests that bureaucratic processes that facilitate retreat in the US often perpetuate existing racial and wealth disparities, as well as cycles of gentrification, disinvestment, and displacement. This study explores how managed retreat can be equitably achieved in cities; specifically how communities can leverage the strategy as a unique opportunity to not only preserve their existing social fabric, but renew and re-establish components of humanity that have been eroded by a profit-driven and carbon-intensive economy.

A literature review of the managed retreat landscape was conducted, assessing the strategy's historic implementation in the US, as well as gaps and equity issues that must be addressed in its practice. In order to support these findings, a case study was conducted in Edgemere, an urban-coastal community located on a barrier island in the South of Queens, NY. The case study consisted of 1) an existing conditions analysis that used mixed-method research to understand the natural environment & climate, urban development, and socioeconomic context of the study area 2) qualitative interviews with local actors, such as city agencies and community-based organizations and 3) a focus group discussion with public housing residents.

Experts on managed retreat have stated that the more creative and far-reaching the approach, the greater potential retreat holds to not only secure communities' safety, but to transform and uplift them. Given the legacy of inequality driving urban development and flood protection patterns in the US, as evidenced by the case study in Edgemere, the extensive analysis and community engagement undertaken led to a set of policy development recommendations which also address broader societal goals of healing, reparations, just transition and inclusion. These include:

- Healing through Participatory Planning: Centering lived experience and healing-informed approaches to planning; and supporting informed participation and continuous social dialogue so residents are not tokenized in the decision-making process.
- Reparations through Financing & Funding: Decentralizing & democratizing wealth and decision-making by redirecting public and private investments to the communities they have historically harmed or neglected.
- Just Transition through Land Use & Coastal Management: Dismantling extractive and exclusive urban development by ensuring retreated properties support ecological preservation, green enterprise and inclusive, transgenerational wealth-building that will increase residents' economic & adaptive capacity through relocation.
- Inclusion through Policy & Legislation: Addressing high-level systems that create systemic barriers to managed retreat across the US by enacting legislation on greater geographic & political scales to maximize adaptation options and social protections for all.

Existing research on managed retreat has largely focused on the social justice implications of federally-funded buyouts in the US, often lacking community-centered approaches to addressing racialized inequality inherent in existing coastal adaptation trends. This study adds to a growing body of evidence related to the process of managed retreat in coastal, resource-constrained urban communities. The information uncovered is now being incorporated into ongoing resilience planning in the community of Edgemere, and opens broader discussion around innovations in equitable coastal adaptation.

DETANGLING COMMUNITY PRIORITIES IN STORMWATER MANAGEMENT: AN URBAN HONOLULU CASE STUDY
Abstract ID: 1028
Individual Paper Submission

ARIK, Aida [University of Hawaii at Manoa] aarik@hawaii.edu, presenting author

Dialogue between and within formal and relational institutions is a fundamental means of shaping desired outcomes in planning (Healey 1997). Coming to a common or acceptable understanding of "desired outcomes" can be challenging in stormwater management and planning because it is governed by a complex network of institutions, particularly when management entities are often silo-ed and top-down. For this study, I focus on stormwater management in the Ala Wai watershed in Honolulu, Hawaiʻi, where resistance to a U.S. Army Corps of Engineers Flood Risk Management Plan galvanized the community to seek alternative solutions to stormwater management. Specifically, the question motivating this research is: Where do stormwater management priorities for the Ala Wai watershed converge or diverge, as expressed by community members and water managers?

This study uses Q-methodology to elucidate specific social narratives within the broader discourse and the respective stormwater management priorities of each. Q-methodology is a means to bring objectivity to the study of subjectivity (Watts and Stenner 2013) and is applied within this community-based planning case study to understand individual priorities absent of a contentious atmosphere. The final outcome of the Q-method is to interpret the social narratives with the aid of a factor analysis of the sorted statement sets collected during individual interviews. The set of statements reflects an array of opinions expressed through various media outlets, websites and organizational material, interviews or community meetings, and other published literature that are not readily testable.

To disaggregate various aspects of desired outcomes for stormwater planning, this research uses a framework that combines the concepts of "soft path solutions" for 21st century water management from Gleick (2003) and the 2016 U.S. Environmental Protection Agency (EPA) "Guidelines for Voluntary Long-term Stormwater Planning." Within this framework, there are 14 objectives for stormwater planning, including improving water productivity and involving the community in decision-making from the "soft path solutions," and improving resilience, water quality, and decreasing runoff from the EPA guidelines, among other objectives. Opinion statements were collected through a comprehensive search of material related to stormwater management in Honolulu, then categorized using the 14 objectives in the framework. A total of 125 unique opinion statements were collected from 42 different sources. These statements were then refined and decontextualized into a final set of 36 statements that cover the range of stormwater planning objectives. In total, 20-30 interviews will be conducted with community leaders and

planners or professionals who have a working knowledge of stormwater and the various issues surrounding the Ala Wai watershed. During the interview, individuals are asked to sort the 36 statements according to the degree to which they agree with the statements relative to one another. The expected result of this research is to identify 3 to 6 social narratives to compare where ideas coalesce around stormwater priorities and where they diverge. Preliminary testing shows that stated ideological alignments (e.g., environmental planner, community activist) do not necessarily prescribe the priorities chosen by the individual, and thus understanding the underlying priority objectives is useful to community-driven planning efforts.

The uprising of the community in response to the Army Corps project is indicative of a flawed, top-down process that tends to cultivate distrust (Forester 1989). Understanding the points of agreement and disagreement can help initiate an authentic dialogue that builds on diversity and the interdependence of agents involved in the process (Innes and Booher 2010). Although this case focuses on Honolulu, complex stormwater management issues—which are becoming increasingly uncertain with climate change and sea-level rise—are not unique to Hawai'i and the priorities identified within the social narratives are broadly applicable.

EMPOWERING LOCAL CLIMATE ADAPTATION AND HAZARD MITIGATION OF COASTAL JURISDICTIONS THROUGH STATE COASTAL ZONE MANAGEMENT FEDERAL CONSISTENCY REVIEWS
Abstract ID: 1035
Individual Paper Submission

WADE, Heather [Texas A&M University] hwade@tamu.edu, presenting author
PEACOCK, Walter [Texas A&M University] peacock@tamu.edu, co-author

The planning literature suggests that local land use policies can be effective tools for reducing hazard risks, implementing climate adaptation and enhancing resilience (Burby and May, 1997; Burby, 1998; Burby, Deyle, Godshalk and Olshansky 2000; Daniels, 2014; Grover, 2019; Peacock et al. 2019, Woodruff, 2016; Buckner, 2016; BenDor, T. K., Spurlock, D., Woodruff, S. C., & Olander, L, 2017; Woodruff, S. C., & BenDor, T. K, 2016; Beatley, T., 2009; Stults, M., & Woodruff, S. C., 2017; Betsill, M. M., & Rabe, B. G., 2009). State and federal policies can promote, enhance, as well as constrain the abilities of local jurisdictions to address these issues (Berke, Crawford, Dixon, and Ericksen, 1999; Berke, Lyles & Smith, 2014; Brody & Highfield, 2005; Bunnell & Jepson 2011; Dyckman, St. John, & London, 2014). The Coastal Zone Management Act of 1972 (CZMA) provides states an opportunity to manage their coastal zone through funding coastal projects and conducting federal consistency reviews with respect to implementing enforceable policies (NOAA, 2016). Federal consistency is one of the carrots that states receive for participating in the CZMA, allowing states to review federal permits, licenses, and activities proposed within the coastal zone to ensure compliance with the state's coastal management program and its enforceable policies (NOAA, 2007). However, states have significant leeway in addressing federal consistency reviews in terms of 1) what federal activities, permits, licenses, and

applications are reviewed, 2) to what extent local land use policies and planning elements are included as enforceable policies and finally, 3) how local is defined in terms of scale and jurisdiction. For example, preliminary research findings show that Section 404 permits issued by the United States Army Corps of Engineers is the most common federal permit reviewed by state coastal management programs for consistency with the enforceable policies of the program. Further, some states default to state-level regulations as enforceable policies. Hence, consistency reviews are based exclusively on general state level regulations and policies. Other states, however, include local land use plans, policies, and regulations as enforceable policies within their coastal management plan (CMP). This paper describes and assesses the current federal consistency framework and addresses each of these dimensions with respect to state variability in application. It also offers a set of critical research questions and hypotheses that might fruitfully be explored by the planning research literature to assess the potential effectiveness of federal consistency for addressing hazard risk reduction, climate adaptation, and disaster resiliency among coastal jurisdictions.

TRAINING 'COASTAL NAVIGATORS' TO PROMOTE BETTER COASTAL SHORELAND MANAGEMENT
Abstract ID: 1036
Individual Paper Submission

NORTON, Richard [University of Michigan] rknorton@umich.edu, presenting author

Coastlines along the oceans and the Laurentian Great Lakes move landward over time naturally because of erosion. Climate change is accelerating that process along ocean coasts given sea level rise (SLR) and increased storminess (Siders 2019). Similarly, while the Great Lakes are not rising like the oceans, they do continually erode, and climate change is accelerating erosional processes along Great Lake shores because of increased storminess (Norton et al. 2018).

Accelerating erosion and SLR are prompting more calls for engineering solutions like the construction of seawalls and other hard shoreline 'armoring.' But there is no engineered solution yet devised that can stop erosion permanently without the need for regular repair, often at great public expense, and hardened structures eventually degrade—if not destroying altogether—the natural beach. Rather than paying repeatedly for the repair and restoration of structures, especially at the expense of the natural beach, academics and practitioners have long called for adopting a policy of 'managed retreat'—moving structures away from the shore as the shoreline moves (Siders 2019).

Managed retreat makes sense in theory, but the real challenge comes with implementing it in practice. There are at least two hurdles that proponents confront. First, many coastal localities are small and have limited planning and regulatory capacity, making it difficult for them to conduct the kinds of analyses required to justify managed retreat policies, or to garner the political commitment to implement such policies (Norton et al. 2018). Second, to the extent that erosional processes are highly uncertain, and especially because they are driven by climate change, the challenges of communicating risks to coastal communities and shoreland property owners are that much more complicated and contentious (Moser 2014; Vanderlinden et al. 2017). Beyond those well-known challenges, an additional complication is that managing coastal shorelands implicates complicated state legal doctrines speaking both to state and local authorities to regulate land use and to private versus public rights to shoreland properties (Norton & Welsh 2019).

This paper presents selected findings from an ongoing research program being conducted in Michigan on the management of its Great Lakes coasts. Drawing from prior research and surveys characterizing attitudes and understandings regarding shoreline dynamics and needs, part of that program has involved creating special training designed for 'coastal navigators'—local public officials, residents, and especially planning consultants. The state's goal is to promote better shoreland management by training knowledgeable and effective proponents at the local level—coastal navigators—who are positioned to promote in turn more effective shoreland management; i.e., policies that better balance private property rights and the conservation of natural beaches. That training incorporates tailored information on climate science, shoreline dynamics, and the legal implications of shoreland management in Michigan.

For training programs within the past year, we have conducted before-and-after surveys to gauge participants' understanding of the issues and potential changes in perspectives. We have found statistically significant evidence that the training provided shifts participants' attitudes, on average, more toward policies that would protect the natural beach, even at the expense of protecting beach houses, and more toward a stronger local role in adopting and implementing those policies. We conclude the paper by discussing its applicability to other settings, along with its limitations, and by identifying questions for further study.

RESILIENCE THRESHOLDS OF CLIMATE-INDUCED MIGRATION
Abstract ID: 1054
Individual Paper Submission

MARIN, Marielos Arlen [Universidad Centroamericana "José Simeón Cañas"]
marielos.arlen.marin@gmail.com, presenting author

Theories about the resilience thresholds of climate-induced migration are still in the early stages of development, with just a small number of papers addressing this topic. This study, based on decision theory, addressed it through the use of an agent-based model (ABM) that simulated the behavior of populations under climate change stressors, identifying the resilience thresholds beyond which individuals migrate. The components of this model came from empirical research of a case study and a logistic regression analysis in El Salvador to find the probabilistic functions that set the decision rule of the agents. This simulation proved to be a useful aid in gaining a greater understanding of the highly complex relationship between resilience thresholds and climate-induced migration, as well as the factors that influence the decision-making process to relocate.

The results articulated the complexity of assessing property and use rights (understood here as land tenure) and values (understood as social capital), both of which are considered as "slow-changing components of resilience in a social-ecological system" (Resilience Alliance, 2010, p. 6). By modeling a simplified representation of agents, I ran experiments to ascertain a clearer understanding of the participation of the intrinsic characteristics of agents in the decision-making process to migrate by defining the social capital networks - bonding and linking - of stakeholders who possessed different property rights and land tenure situations, i.e., owner, renter, free-user, and "colono" (caretaker). The key factors modeled a population of 100 agents in a time equivalent to 2000 ticks, and ran sensitivity analysis to calibrate the results.

The primary hypothesis for this model was that different agents respond to a trigger associated with droughts according to their resilient capacity. I hypothesized that different resilience thresholds would result from the interaction of heterogeneous agents with their environment and therefore influence their decision to migrate. The findings were in concordance with varied empirical research that has demonstrated that there is an association between migration and environmental factors and has highlighted the importance of "contextual factors on individual stress thresholds" (Hunter et al., 2003, p. 276). Along those lines, this simulation reproduced observed patterns that addressed agents' relationship to social capital - bonding and linking -, whether as an owner, renter, free-user, or caretakers, and their corresponding resilience thresholds to the occurrence of droughts.

While considering "micro-level studies of specific migratory experiences," (Castles, 2012, p. 8) to inform the model, this ABM provided an in-depth understanding of the "macro-level structural factors that shape human mobility" (Castles, 2012, p. 8) in the context of the relationship between resilience and climate-induced migration. Viewing the study from the macro-level, it is clear that social structures and land-tenure positionality affect resilience levels, which determine climate change migration patterns. It is also apparent that climate change migration patterns, in turn, affect social structures and land-tenure change. This information is pertinent to the field of planning because it offers essential information about all units of analysis of micro/individuals, households, and aggregates as they relate to resettlement plans.

The emergence of the decisions concerning migration depends on the resilience threshold of the individual members of the community, and that resilience is directly connected to the land tenure structure of that community. Overall, it was the owners who were more willing to relocate after a continuing slow-onset disaster such as drought, changing when the social capital plays a significant role. Knowing the behavior of owners is useful to consider when promoting managed retreat alternatives as a climate change adaptation. Therefore, planners need to be aware that these behavioral changes in places where the land tenure structure is varied.

COMMUNITY BASED GOVERNANCE MECHANISMS: COMMODIFICATION OF WATER OR CHANGE AGENTS FOR THE URBAN POOR
Abstract ID: 1063
Individual Paper Submission

AHMAD, Farhana [Cornell University] fta8@cornell.edu, presenting author

Entitlements are generally defined as the commodities/resources (material and non-material), through which one can establish ownership or command access to resources. Applying this analytic to a case study of water access in two sized cities one in Ghana, and Bangladesh I evaluate community water governance mechanisms in two low-income communities with different locational and socio-cultural characteristics. I also evaluate how different ways to provide entitlements affect access to formal piped water supply. The study uses a mixed methods approach including a 200 household survey, focus groups with community members, and semi-structured interviews with local opinion leaders. My results indicate that in my study communities, the community based approach provides a significantly richer portrait of water access beyond availability of piped water infrastructure. Among other factors that are important to everyday negotiations and entitlements related to water access, it is important to consider history and spatial structure of the settlement, familial and kin networks, the distance and waiting time to fetch water, and local leaders' perceptions of water issues, particularly how these compare with broader citizen understandings. In this way, an entitlements approach broadens the perspective beyond infrastructural endowments (e.g. piped water), to include a range of other socioeconomic, socio-cultural and local institutional characteristics. Drawing on the empirical examples, as well as related conceptual debates, the study questions how water access is defined, and how water governance processes might benefit from a broader understanding of access as well as links to differentiated vulnerabilities, notably in times of water-related stress or scarcity.

CITIZEN PARTICIPATION AND MUNICIPAL SUSTAINABILITY POLICY: CHARACTERISTICS INDICATING GREATER SCOPE AND INTENSITY OF PARTICIPATORY EFFORTS
Abstract ID: 1065
Individual Paper Submission

HOMSY, George [Binghamton University] ghomsy@binghamton.edu, presenting author
AMIRKHANYAN, Anna [The American University] amirkhan@american.edu, co-author

LAMBRIGHT, Kristina [Binghamton University] klambrig@binghamton.edu, co-author

Citizen participation is an integral part of public administration and urban planning practices. While its importance has been documented through qualitative studies on a case-by-case basis, research delving into public participation in a more generalizable way has been rarer. Specifically, little is known about the factors influencing the scope of public participation and its intensity. We statistically model data from a national survey of municipalities (n=1,303) and their sustainability policies to answer the following research question. What are the community characteristics predicting: (1) the number of opportunities residents have had to participate in planning strategies for sustainability and(2) the degree to which residents have had a meaningful impact on these efforts? Results suggest local governments with greater internal capacity and those with more participatory organizational cultures offer more forms of citizen participation and these public engagement opportunities are more meaningful. In addition, there is a positive correlation between both our dependent variables and the extent to which a community is committed to redistribution. Finally, in contrast to some past research, we find communities with more income diversity provide more meaningful ways for citizens to get involved and experiment with more kinds of participation. Taken as a whole, our results offer important insights into the type of communities that do a better job engaging citizens.

VARIATIONS IN GREENHOUSE GAS EMISSIONS ACROSS NEIGHBORHOODS IN EDMONTON
Abstract ID: 1067
Individual Paper Submission

WELEGEDARA, Nilusha [University of Alberta] yalingas@ualberta.ca, presenting author
AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author
GAJJAR, Shaival [University of Alberta] shaival@ualberta.ca, co-author

A greater proportion (~80 %) of the global energy-use related greenhouse gas (GHG) emissions originate from cities where nearly half of the world population resides (IEA, 2008). In Canada, much of the GHG emissions are from burning natural gas to heat residential and commercial buildings, burning gasoline and diesel fuel from cars and trucks, and consumption of electricity that generates from fossil fuels such as coal or natural gas power plants (Clark and Gagnon, 2008).

Across Canadian cities, Edmonton has shown the highest energy related GHG emissions (~19 metric tonnes of carbon dioxide equivalent) due to cold weather and coal-based electricity supply (Fercovic and Gulati, 2016). Thus GHG emission reduction is becoming an increasing concern at the municipal level to mitigate the impacts of climate change (City of Edmonton, 2020). However, the energy use and GHG emissions are not uniform across the city as spatial parameters such as area, arrangements, land use, population density, and road network are varied within the city at neighborhood scale. We explored whether the neighborhood and its elements such as building typology, land use, location and travel behavior have any impact on GHG emissions in order to create a configuration of neighborhood that

emits the least amount of GHG emissions. We have selected twelve neighborhoods in the city of Edmonton based on the maturity level (core, mature, established and developing), population density, and distance to the downtown to determine the variations in energy and greenhouse gas emission nexus across neighborhoods. The bottom-up modelling approach was used to calculate energy consumption and GHG emissions from each neighborhood considering major GHG emission sources which are: residential and commercial energy consumption, energy use in transportation, street lighting and, waste generation. Also net GHG emission in each neighborhood has estimated considering potential carbon sinks that are trees and green landscapes within each neighborhood.

Our preliminary results have shown that there are variations in GHG emissions per capita from different neighborhoods according to their age, public transit availability, and building typology. The highest impact of building typology and transportation on GHG emissions were shown in developing vs. older neighborhoods. The results indicated the importance of quantifying GHG emissions and identifying the main sectors that contribute to GHG emissions at the neighborhood level.

Our results could eventually help municipal officials to identify and implement GHG emission reduction strategies across neighborhoods that emit larger amount of GHG. The results are also useful for planners to intentionally consider neighborhood configuration, location and other parameters in developments in order to decrease the GHG emissions.

INLAND FROM THE COAST: FOSTERING RESILIENCE TO CLIMATE CHANGE
Abstract ID: 1071
Individual Paper Submission

MOSBY, Kim [Louisiana State University] kmosby1@my.uno.edu, presenting author
BIRCH, Traci [Louisiana State University] tbirch@lsu.edu, co-author

After the 2005 hurricanes devastated coastal Louisiana, federal funds helped many residents relocate to inland communities in the Baton Rouge capital region to decrease exposure to future flooding. In August 2016 over the course of two days, a low-pressure system dropped over 30 inches of rain across the Baton Rouge metropolitan area. Resultant flooding took thirteen lives and damaged more than 156,000 structures. Touted as a "one-in-1,000-year flood" this was the third such event to hit the southeastern US in 2016, and one of ten since 2010. Climate predictions indicate similar severe precipitation events are likely to increase in frequency and intensity in the future (Prein et al., 2016). The increasing convergence of inland and coastal communities through coastal erosion, sea level rise, rural to urban migration, and other factors is a phenomenon Louisiana is experiencing on an unparalleled scale; however, the issue is not unique to the state. Following recent storms and aided by federal disaster funds, residents across the nation are moving away from the coast to reduce their risk—only to be flooded repeatedly from rain events over inland watersheds.

In the face of increasing climate risk, improving community resilience requires reducing risk and encouraging processes that enhance the ability of households and communities to cope and adapt to environmental challenges. Building adaptive capacity necessitates allowing communities to define "better" according to their socio-cultural values and principles of sustainability (Freitag et al., 2014).

Emerging literature across disciplines suggests that engaging those most affected by policy decisions or climate change uncertainties is critical in galvanizing support for adaptation strategies (Campos et al., 2016). While many governments are actively engaging in measures to reduce climate risk, there is a tendency to concentrate on factors where government has a mandate (e.g. infrastructure modification). Often areas outside structural infrastructure, such as building social capital or bolstering mental health, are neglected. Effective climate adaptation has to go far beyond technical dimensions and engage those affected through science, planning, and design innovation (2016).

While regional recovery is underway, the 2016 floods exposed significant vulnerabilities that this and other inland-coastal regions increasingly face due to climate change. Top-down policy solutions that disregard local context often exacerbate social and economic vulnerabilities (Gotham, 2015). Strengthening community resilience requires policy-makers to incorporate strategies that emerge from local communities into decisions made at the federal and state levels (Birch & Carney, 2019). This study seeks to understand the multi-scalar connection between federal and state policies and local adaptation practices by asking: 1) How do federal and state government policies influence local development practices and community resilience in southeast Louisiana? 2) How can a greater understanding of environmental risk and wellbeing increase adaptive capacity in coupled inland-coastal regions? 3) How can wellbeing and adaptation scholarship be better incorporated into development decision-making at all levels to bolster community resilience?

To answer these questions, the qualitative study uses policy and document analysis, focus groups, and in-depth, semi-structured interviews with residents, elected officials, and design professionals in the Baton Rouge metropolitan region. The project also tests a community-based planning and design framework that allows residents to prioritize elements necessary for community wellbeing and resilience in an era of ever-increasing environmental risk. Initial findings show local stakeholders view federal flood insurance policies as increasing future flood risk for inland communities by incentivizing development practices detrimental to pre-existing neighborhoods. Findings suggest government policies should incentivize practices that bolster long-term resilience in floodplains. The study draws from research funded by the Gulf Research Program of the National Academies of Sciences, Engineering, and Medicine and the Robert Wood Johnson Foundation under award number 2000008299.

COMMUNITY DESIGN IN AN ERA OF CLIMATE CHANGE AND FIRE VULNERABILITY
Abstract ID: 1077
Individual Paper Submission

KIANI, Fatemeh [University of Utah] nedakiani1369@gmail.com, presenting author
EWING, Reid [University of Utah] ewing@arch.utah.edu, co-author
PROFFITT, David [University of Utah] david.proffitt@utah.edu, co-author

More than 50 people lost their lives in California wildfires this season. The "Camp Fire," "Woolsey Fire" and "Hill Fire" were just three of many wildfires in 2018 that burned more than 230,000 acres and destroyed 7,000 homes. As climate change intensifies, forecasters expect the frequency and severity of wildfires will continue. A recent insurance-industry study estimates there are 4.5-million homes worth more than at high or extreme risk of wildfire (Arindam, 2017). California, Arizona, Utah, Colorado, Washington, Oregon, and Idaho due to population growth in the wildland urban interface (WUI) and also the climate change phenomenon. We argue that planners have an important but presently overlooked role to play in developing the emerging paradigm of "fire resilient communities" and "fire resistant communities."

We coin the term "fire prevention through environmental design" (FPTED) – an analogue to the long-established idea of crime prevention through environmental design (CPTED) – to describe the approach planners can take when building fire resilience (Schwab, 2005; Ewing, 2016). Fire occurs when there is the right fuel, right weather and a source of ignition for it. Weather and ignition may be beyond the control of planners, but designing communities so there is less fuel at the WUI is something we can affect. The literature from other fields typically focuses on increasing fire resilience at the extremes of spatial scale – either macro-scale improvements to forest management or micro-scale changes to individual properties. But FPTED focuses on the missing middle of the community scale. We have already found two pioneering articles on the subject (Smith et al., 2016; Smith et al., 2018).

Smart growth can be considered a climate adaptation measure. Sprawl increases the wildland-urban interface as compared to compact development. In this study, we will use the Ewing-Hamidi metropolitan and county sprawl indices and satellite imagery to estimate just how much the interface increases in fire-prone states as development transitions from compact to sprawling areas.

Smart growth can also be considered a climate mitigation measure. As California's Sustainable Communities and Climate Protection Act (SB 375) emphasizes, even weather is affected in the long-run by urban development patterns.

At the meso and micro scales, smart growth also reduces fire risks. Actions that planners have been advocating for decades to make communities more livable will also make communities more fire resilient. Here two examples from APA's Best Development Practices:

Land Use Practice-4: Develop in clusters and keep the clusters small. Cluster developments are built at gross densities comparable to conventional developments, but leave more open space by reducing lot sizes; by leaving open spaces around housing, clusters will tend to protect them from the fire as a defensible fuel break.

Transportation Practice-1: Design the street network with multiple connections and relatively direct routes. More connected streets mean more escape routes from fires for residents and more access routes to individual properties for firefighters.

For this portion of the study, we will look for each best practice in the built-up areas that have been subject to wildfire devastation in the last season of wildfires.

Other prescriptions for fire resilience include to create defensible space around communities, avoid steep slopes, and use ignition-resistant building materials such as metal roofing and cement walls. The first two reminds us of planning principles. The term "defensible space" is being borrowed from Newman's book by that name in the literature on crime prevention through environmental design.

We believe the growing importance of addressing drought and other impacts of global warming will make FPTED an important new subfield that has heretofore been unrecognized by planners but is highly relevant to planning scholarship, practice, and education.

TRADEOFFS BETWEEN TREE SHADE AND SOLAR ACCESS: A 3D CITY MODEL AND SIMULATION APPROACH TO COMMUNITY DECARBONIZING
Abstract ID: 1091
Individual Paper Submission

PARK, Yujin [The Ohio State University] park.2329@osu.edu, presenting author
GULDMANN, Jean-Michel [The Ohio State University] guldmann.1@osu.edu, co-author

Urban energy consumption by buildings is one of the leading causes of greenhouse gas emissions. With expected increases in temperatures around the globe, energy demand for cooling buildings will continually grow, raising sustainability and affordability concerns (Pandit and Laband, 2010). Satisfying residential energy demand with renewable sources, therefore, is an important strategic planning issue.

Solar photovoltaic (PV) panels provide a sustainable alternative to generating residential electricity, and their efficiency rises with longer exposures to solar radiation. Many U.S. state and city governments have enacted solar rights laws and regulations in support of residential solar systems (Dillemuth and White, 2013). San Francisco was the first city to require installation of solar PV panels on all new buildings up to 10 stories in 2017. Solar energy planning (SEP) has the potential to satisfy a large fraction of residential cooling energy loads during warmer months.

Urban and landscape design also retains significant opportunities for reducing fossil energy use. Thermal environment planning (TEP) may regulate local temperatures and microclimatic conditions to relieve heat and energy stress. TEP is based on modifying land use and landscape by using green spaces and tree canopies. Urban trees can lower surface and air temperatures (SAT) by evapotranspiration and shading. Tree canopies shadowing the exterior of houses and other built-up structures reduce inside temperatures, thus lowering demand for cooling energy.

Both SEP and TEP focus on renewable and natural sources to reduce the energy burden. However, there is a fundamental conflict in SEP and TEP operations. Trees can reduce local SATs by casting shadows on building facades and rooftops but may simultaneously overshadow PV panels mounted on building surfaces, therefore inhibiting PV efficiency (Tooke et al., 2011). With more tree canopies and buildings under shade, the reductions in SAT become larger, but the access to solar radiation decreases.

This study develops and demonstrates a methodology to evaluate the tradeoffs between shade and solar benefits, using 3D urban simulation. This is the first attempt to link SEP and TEP to produce experimental evidence on the size and variation of tradeoffs between tree shade cooling and solar PV deployment. The four components of this research are: (a) developing a complete 3D city model incorporating realistic buildings, trees, and land covers; (b) carrying out diurnal hourly shadow simulation in summer months based on the 3D model and GIS functionalities, and creating a shadow profile over the urban surface while discriminating building versus tree shade; (c) estimating rooftop solar PV potential (KWh) in terms of maximum (without trees) and lesser levels of electricity generation, accounting for

insolation loss due to varying tree deployment; and (d) cost-benefit analysis of various scenarios of tree planting/growth in terms of temperature reductions and solar PV electricity production. Parameters required to assess the temperature reduction induced by different tree configurations are obtained from spatial regression modeling (Park & Guldmann, 2020), and energy gains from rooftop PV systems are estimated depending on spatial placement, system size, and hourly irradiation (Buffat et al., 2018). Urban thermal conditions are represented by land surface temperatures derived from Landsat 8 data at 30m resolution. Columbus, Ohio, is the study area, covering both urban and suburban areas.

The quantitative modeling of the tradeoffs between energy savings from tree shade and solar power is critical for judicious land-use and zoning decisions. Local solar energy conversion and tree planting programs need to clearly communicate the benefits and caveats of the shade and solar access to the public in the policy-making process. The research outcomes could be used to formulate a detailed framework that evaluates the outputs of community solar power planning and tree planting efforts.

PLANNERS' KNOWLEDGE, KNOW-HOW AND EXPERIENCE IN ECOLOGY AND ENVIRONMENTAL PLANNING
Abstract ID: 1126
Individual Paper Submission

GOCMEN, Asligul [University of Wisconsin-Madison] gocmen@wisc.edu, presenting author
LAURIAN, Lucie [University of Iowa] lucie-laurian@uiowa.edu, primary author

Since Beatley's 1995 proposal that sustainability provides the components of a new and improved planning model, sustainability has indeed become an established paradigm for planning in many U.S. communities. The need to prepare and adapt communities for climate change impacts only exacerbates the importance of adopting environmentally sound practices. Planners drive the design and implementation of local and regional sustainability efforts (e.g., Murtagh et al. 2019). A growing body of research shows that the adoption and implementation of sustainability programs is impacted by local planning capacity and by institutional structures and supports (Laurian and Crawford 2016; Göçmen and LaGro 2016; Lyles et al 2016).

While most studies focus on local government capacity and structures, the role of planners' training, knowledge base and experience in ecological and environmental planning has not been comprehensively investigated. Yet, the background and training of planners are constantly evolving as new cohorts of young planners enter the profession with training that may be different from that of their senior peers.

In this paper, we assess whether practicing planners are well-equipped with the knowledge and know-how needed to implement best practices in the areas of environmental planning. We also examine (1) the

relative contributions of formal and continuing education on planners' knowledge, (2) the extent to which personal, institutional, and community-based factors contribute to planners' knowledge, and (3) the extent to which planner's knowledge and experience impact the adoption of sustainability plans (broadly defined to include climate plans, hazard mitigation plans, green infrastructure, renewable energy plans, and habitat conservation plans).

We present the results of a web-based survey of 253 municipal planners working in 112 communities across the U.S. (drawn from a random sample of 219 municipalities stratified by region and city size). The survey was conducted in the Fall of 2019. Survey questions covered factual and procedural knowledge in several areas including alternative building and neighborhood design strategies; stormwater management; soil, water and air quality; climate change; vegetation; and wildlife. It also emphasized planners' source of knowledge, including educational background and continuing education credentials.

Our preliminary findings show that for the most part, planners are knowledgeable about ecology but they may lack knowledge on urbanization-induced impacts on natural resources. In addition, their procedural knowledge on best environmental planning practices vary. Overall, planners stated greater experience and knowledge related to vegetation-related practices (e.g., identifying trees at risk of infestation or native plants that support pollinators) than environmental practices in most other areas. Energy and resource-efficient building and neighborhood design strategies, and solid waste disposal requirements were among the areas planners stated least experience and knowledge in.

Our preliminary findings point to the need for communities, the American Planning Association, and planning programs in higher education institutions to provide and advocate training on the environmental impacts of urbanization, and environmental planning and management practices in order to promote environmental sustainability.

WHAT DETERMINES GREEN CONSUMERISM? A CASE STUDY OF KATHMANDU MUNICIPALITY, NEPAL
Abstract ID: 1140
Individual Paper Submission

NEPAL, Ratna Mani [Tribhuvan University] nepalratnamani@gmail.com, presenting author
GHIMIRE, Jiwnath [University of Hawaii at Manoa] jiwnath@hawaii.edu, co-author

Consumption habits are vital determinants of sustainability. Cities are often being criticized for wasteful consumption and unsustainable practices. They are also the pioneer of innovations to promote sustainable

behaviors. One such habit is the green consumerism. It is the behavior of considering the environment while making purchasing and non-purchasing decisions (Sharma & Joshi, 2017). Previous scholarship has used social, environmental, demographic, and economic factors as the determinants of green consumerism. Research also identified green consumerism as a process that includes the values, norms, and habits of the consumers (Peattie, 2010). Some studies have noticed a significant role of education and gender in green consumerism (Chekima, Syed Khalid Wafa, Igau, Chekima, & Sondoh, 2016). But there lies a research gap on how the historical background of individuals and the availability of goods and services influence the practices of green consumerism. Specifically, there is no research on how the migration, access to products and services, and social stratification can change sustainable consumption behaviors. Using the case study of Kathmandu Metropolitan City in Nepal, this research strives to explore the role of migration patterns, socioeconomic characteristics, and market access in determining the behavior of green consumerism.

Using stratified simple random sampling, a survey among ten wards of the Kathmandu Metropolitan City was administered. A total of 300 questionnaires were carried out at 20 shopping malls in those Wards. Survey questions focused on the understanding of green consumerism, individual purchasing behaviors, household consumption practices, availability of goods and services, socioeconomic characteristics, and the migration pattern of the individuals. The data was organized and analyzed using statistical analysis software (SPSS 14.0). Besides inferential statistics, multiple regression models were built to identify the relationship between the habits of green consumerism and migration history, access to goods and services, household consumption habits, and socioeconomic variables. Based on the results, it was found that there is a significant relationship between the practices of green consumerism and education, income, migration history, and access to goods and services. Social status and gender do not have a significant role in the behavior of green consumerism. The contributions of this research are: 1) urban residents who have some migration history tend to practice sustainable consumption behaviors, and 2) The fear of scarcity of goods and services hinders the practices of green consumerism. In the case of Kathmandu, the uncertainty of the availability of certain household goods negatively influenced the practices of green consumerism.

ROTHFEDER, Robin [University of Wisconsin - Stevens Point] rrothfed@uwsp.edu, presenting author

The landscape of central and northern Wisconsin is a complex matrix of different land cover types, land uses, and land owners. In this amenity-rich environment, lakes, and their adjacent shoreline properties, play a uniquely important social, ecological, and economic role. For example, the state's fishing industry is valued at over $2 billion annually (Williams, 2019), while the real estate market for lakeshore homes is valued at nearly $1 billion (WDNR, 2016). At the same time, Wisconsin's surface and groundwater resources face increasing environmental strains. In 2018, approximately 20% of the

state's surface water bodies were listed as impaired, with over 60% of cases driven by land use practices: sediment loading and suspended solids (from construction, development, etc.), and especially phosphorous loading (from wastewater facilities and agricultural runoff) (WDNR, 2018).

This context poses both pressing challenges and exciting opportunities for planners and natural resource managers: the majority of Wisconsin lakes are clean, high value amenities, but a large and growing proportion are polluted and otherwise degraded. In such circumstances, as Radomski and Carlson observe, "it is becoming increasingly important to prioritize where limited conservation funds could best be directed," and as such, difficult questions must be posed: "on which lakes should the state invest… (and) how much funding should go to implement lake protection efforts on unimpaired waters versus restoration efforts on impaired waters?" (2018, p. 401).

While Radomski and Carlson have focused on Minnesota, their work is now being extended to Wisconsin by a team of university faculty, graduate students, extension specialists, Department of Natural Resources staff, and others. The overarching applied research question driving our project is: how should Wisconsin prioritize lake conservation and restoration efforts and associated funding allocations? Methods employed to address this question include geospatial analysis, landowner surveys, and quantitative models (both biophysical and hedonic/economic), culminating in a suite of decision support tools for use in developing, prioritizing, and funding specific conservation and restoration projects.

Building towards these sophisticated tools, the first phase of our work addresses an essential preliminary question: what characterizes the social and ecological context of Wisconsin lakes and lakeshore properties? At ACSP 2020, I will present the results of rigorous scoping research, including geospatial analysis of Wisconsin's ~2,500 lakes and ~200,000 lakeshore parcels, as well as an attitudinal and behavioral survey of more than 1,000 shoreline property owners. This research reveals key temporal and spatial trends that either have not previously been explored or have not been connected in a larger social-ecological context, including lake water quality, property ownership and valuation, development and construction activity, conservation and restoration activity, etc. The implications are profound in advancing both the theory and practice of planning and resource management for lake-rich regions. As just one example, there is evidence that planners tend to over-value restoration of degraded features (e.g. phosphorous polluted lakes) and to under-value conservation of existing, high quality features (e.g. clean, clear lakes). These and other findings will offer insights for both scholars and practitioners in land use planning, environmental planning, watershed planning, water quality management, and a range of other related fields.

PLANNING FOR WASTE DIVERSION IN HIGH-RISE RESIDENTIAL BUILDINGS
Abstract ID: 1152

Individual Paper Submission

MACLAREN, Virginia [University of Toronto] maclaren@geog.utoronto.ca, presenting author
ALFRED, Emily [Toronto Environmental Alliance] emily@torontoenvironment.org, co-author

A fundamental principle of current waste management practice is the waste management hierarchy, which attests that it is better from an environmental perspective to reduce, reuse and recycle waste than send it to landfill. The implication is that waste diversion from landfill should be a priority in waste management planning. The challenge for residential waste management planners is that even though recycling, and to a much lesser extent, reuse and reduction, has been widely adopted by householders, its uptake is uneven in one particular segment of the population, namely those who live in high-rise buildings. High-rise buildings consistently under-perform single-family homes in terms of waste diversion (Lakhan 2016). In the City of the Toronto, for example, residents of single-family homes divert about 70% of their waste from landfill by means of recycling and organics waste diversion, while residents of multi-residential buildings divert less than 30%. The objective of this study was to assess the effectiveness of a novel approach developed by the Toronto Environmental Alliance (TEA) for increasing diversion in high-rises, namely the creation of building waste management teams tasked with creating a building Waste Diversion Action Plan (WDAP) and implementing that plan. The teams consisted of property management, building staff and resident leaders. TEA facilitated initiation of the plan and provided the teams with occasional coaching during the 12-month duration of the study.

Research on multi-residential waste diversion to date has focused almost entirely on factors that influence resident diversion behaviour, and to a lesser extent, that of building management/staff (Fallde 2015). Our research considered the attitudes and practices of both groups. Similarly, while research to date has focused on the effectiveness of single interventions, such as improving communications around sorting or improving convenience (e.g. DiGiacomo et al 2017), Lakhan (2016) found that certain interventions, such as increased convenience, are only effective in the presence of other interventions such as information provision. Hence understanding effectiveness may only be possible in the context of packages of initiatives such as those found in a WDAP. A conceptual framework that fits well with this approach is the Infrastructure-Service-Behaviour framework (Timlett and Williams 2011), which emphasizes the importance of addressing all three elements in the framework in order to elevate the quantity and quality of waste diversion. Infrastructure changes can make waste diversion more convenient, such as through providing door-to-door collection of recyclables for the elderly; service changes can include spot-checking of waste and recycling bins for contaminants; and behaviour change can be effected with education and feedback programs.

To test the WDAP approach, we selected six high-rise buildings and compared them to three 'model' buildings that already had excellent waste diversion performance and were comparable to the test buildings in size, age and resident composition. We measured several aspects of waste diversion performance, resident attitudes and practices and building team perceptions before and after the implementation of the WDAP. The WDAP buildings adopted a range of ISB interventions and some showed substantial increases in waste diversion, close to those experienced by the model buildings. However, two of the buildings dropped out of the study before its completion because of personnel changes or lack of commitment by the building teams. Interestingly, by the end of the study, many of the attitudes and self-reported practices of building residents in the remaining test buildings had converged towards those of the model building residents even for the two buildings where waste diversion had not improved a great deal.

THE WILL TO RETREAT: COMING TO TERMS WITH SEA LEVEL RISE IN FLORIDA'S COASTAL COMMUNITIES
Abstract ID: 1154
Individual Paper Submission

HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, presenting author
BUTLER, William [Florida State University] wbutler@fsu.edu, primary author
LANGE, Zechariah [Florida State University] zjl13@my.fsu.edu, co-author
NASELIUS, Ben [Florida State University] ban19c@my.fsu.edu, co-author
GORDON, Ben [Florida State University] bjg16@my.fsu.edu, co-author

The idea of retreat, seemingly anathema to the human condition, has increasingly become part of global consciousness in the face of climate change. Post-disaster retreat, both reactive and voluntary as well as collective managed relocation, have been part of the fabric of civilizations for millennia (Hino, et al., 2017). With the stability of the global climate system over the last 5,000 years, civilization has developed under an illusion of stationarity and predictability. As climate change has emerged, assumptions of stationarity have given way to uncertainty and instability. SLR may displace as many as 13.1 million people in the United States by the end of the century (Hauer, 2017). The Florida peninsula is at the apex of SLR vulnerability in the United States. Florida is home to three of the world's top-ten most economically vulnerable urban regions, about half of the US population at risk of inundation by 2100, and an economy that is highly dependent upon coastal tourism and functioning ecosystems (Hallegate et al., 2013; Hauer, 2017; Frank, 2020).

This paper explores the extent to which Florida's comprehensive plans are addressing the need to consider relocation or retreat strategies among their SLR adaptation measures. With the passage of the Peril of Flood Act in 2015, Florida's coastal municipalities were required to consider SLR impacts in their comprehensive plans, but the act did not specify how. Planners in the state are responding. Our analysis has shown that the number of plans considering sea level rise has gone from 22 in 2015 to 88 by mid-2019. At the same time, larger numbers are beginning signal the need to add retreat to the mix of potential strategies. Those even mentioning "retreat" have gone from three plans in 2015 (Butler, Deyle, and Mutnansky, 2016) to 17 plans by mid-2019. In this paper, we analyze the retreat language incorporated into these plans and explore the implications for both coastal planners and researchers.

Our findings suggest that while protection and accommodation strategies still dominate the SLR adaptation planning landscape, the focus on retreat strategies is growing. At the same time, the plans are not going quite far enough as a general rule. Most of the policies are general and vague, listing retreat among an array of options rather than specifying locations or types of facilities that will be part of relocation efforts. Where specified, the focus has been on relocation of public facilities and infrastructure up to now, largely ignoring relocation of private development. This suggests the continuation of an incremental approach to SLR adaptation planning as observed in prior research (Butler, Deyle, Mutnansky, 2016). However, that incremental approach is shifting in the face of the Peril of Flood Act mandate to consider SLR flood risks as an increasing number of coastal plans are taking bolder steps to build the foundation for the longer-term consequences associated with SLR.

INSTITUTIONAL DESIGN AND METROPOLITAN ENVIRONMENTAL PLANNING: BRIDGING THE GAP BETWEEN MUNICIPAL AUTONOMY AND REGIONAL ENVIRONMENTAL NEEDS
Abstract ID: 1180
Individual Paper Submission

RESTREPO-MIETH, Andrea [University of Pennsylvania, Perry World House] ar866@cornell.edu, presenting author

Decentralization has significantly altered how cities are governed and how much autonomy is granted to subnational governments. While conducive to increasing citizen participation and improving the quality of urban governance through greater autonomy and accountability (Campbell, 2003) increased municipal autonomy poses a significant challenge to conurbated municipalities needing to coordinate environmental plans among themselves and with their wider region. In the case of water, scholars have highlighted the importance of governance arrangements to achieve integrated water resources management (Grigg, 2016), tying initiatives to land-use plans to take advantage of the statutory authority of local municipalities and of implementing mechanisms and processes that can coordinate different agencies and organizations (Mitchell, 2005). Yet how those arrangements are negotiated among competing actors and how they come to be enforced in weak institutional contexts such as those found in the Global South merit greater attention. This paper seeks to contribute to the literature on institutional design at the subnational level, integrated water resource management and regional environmental planning by addressing two questions: how do disparate territorial and administrative entities negotiate and coordinate their interests in the formation of new metropolitan environmental institutions? Most importantly, in contexts of high levels of municipal autonomy and national arrangements privileging fragmented environmental authority, how are new environmental planning institutions enforced? Using process tracing to analyze the emergence and evolution of municipal and metropolitan environmental planning institutions and based on empirical research on metropolitan environmental planning in Colombia's Aburra River Valley (home to Medellin and nine other municipalities), this paper looks at the emergence and implementation of different institutional arrangements impacting the planning and management of water resources and air quality. Environmental planning in Medellin's metropolitan area is shared among the metropolitan authority (AMVA), departmental authorities (Corantioquia and Cornare), and to a varying extent the municipalities and national government. Land-use planning on the other hand is the exclusive purview of the municipalities which do not always abide by what is stipulated in their plans. While most of the environmental plans generated to date are non-binding, the ten municipalities have come to acknowledge their interdependence and their dependence on the wider region leading to the successful implementation of some environmental initiatives (Restrepo-Mieth & Perez-Jaramillo, forthcoming). Actions to protect water ecosystems are crucial given that 85 percent of the water consumed by the municipalities is captured outside their perimeter. Other initiatives, such as air quality management, have experienced mixed results: while the Aburra Valley's real-time air quality monitoring system is considered the best in Latin America, the region has experienced five environmental contingency episodes between March 2018 and March 2020 leading to recent fractures in the implementation of governance arrangements. An initial review of the findings shows that the existence of a metropolitan authority with legitimacy in the eyes of key stakeholders has aided the coordination and negotiation among municipalities leading to successful

outcomes, however, the entity's limited mandate creates loopholes that lead to fissures in governance arrangements. Second, the inability of the metropolitan authority to independently raise financial resources beyond what is currently stipulated leaves its agenda subject to political capture by Medellin, the most solvent municipality in the association. Third, a lack of uniform enforcement mechanisms across the various agencies limits the usefulness of coordination mechanisms therefore undermining frameworks set in place to plan and manage environmental needs. Findings from this research help advance the institutional approach within environmental planning theory by building on historical and sociological institutionalism theories in combination with integrated water resources management. Policy implications include the need for planners to pay close attention to gaps in enforcement mechanisms that may leave unrealized otherwise well-developed plans.

WHO'S GOT SOLAR?
Abstract ID: 1187
Individual Paper Submission

COFFMAN, Makena [University of Hawaii] makenaka@hawaii.edu, presenting author
HAYASHIDA, Sherilyn [University of Hawaii] sherilyh@hawaii.edu, co-author

The rapid and large-scale deployment of renewable energy is critical to mitigate the worst expected effects of climate change. Human activities are estimated to have already caused about 1°C of warming above pre-industrial levels, and it is likely to reach 1.5°C as early as 2030 without rapid decarbonization (IPCC, 2018). Rooftop solar photovoltaic (PV) is an important component of the portfolio for new renewable generation because it minimizes potential impacts and tradeoffs relating to land use and siting (van Zalk and Behrens, 2018). However, early adoption of residential solar photovoltaic within the U.S. has been dominated by higher income households and thus motivates the question of equitable benefit from PV policies (Borenstein, 2017; Moezzi et al., 2017). Hawaii has been at the forefront of solar PV deployment, with the highest per capita adoption in the U.S., largely due to having the highest electricity cost.

This study analyzes the role of income, home ownership and other demographic factors in residential solar PV adoption in Hawaii. Similar to Borenstein (2017), we use census data joined with the spatial distribution of solar PV. We obtain the solar PV data from building permits, available for Oahu and Maui counties. Regression results show that owner-occupied housing units, single-family residences, and income are, unsurprisingly, the most influential factors in explaining the differences in PV adoption between census tracts. We find that a 1% increase in owner-occupancy corresponds to a 25-33% increase in the share of households with PV, a 1% increase in the share of single-family dwellings corresponds to a 8-13% increase, and that a $10,000 increase in median income corresponds to a 1-3% increase. These findings suggest that single family owner-occupancy is a large barrier to entry within the market for solar PV. It also supports the proposition that landlords and tenants suffer from a "principal-agent" problem as

it relates to distributed energy (Sigrin and Mooney, 2018), where renters lack autonomy over decision-making regarding capital investments and landowners face a disconnect between cost and benefits of capital investments in rental assets.

While Sigrin and Mooney (2018) look at the technical potential of the enormous magnitude of solar PV that could be installed within low-to-moderate income homes, this paper uses Hawaii as a case study to assess alternative policy mechanisms that might enable this transition. In particular, we will assess our dataset for changes in PV installation patterns over time, accounting for programmatic changes to, for example, net energy metering, and as prices decline. Lastly, community-based renewable energy (CBRE) programs offer the opportunity to bringing in renters and underserved communities, though its efficacy will certainly depend on the relative rates in comparison to alternatives like utility-scale projects.

This research well aligns with the ACSP 2020 conference themes of equity and justice. The challenges posed by global climate change require swift response while supporting communities of diverse incomes and access to emerging technologies.

SOCIAL DISPARITIES IN FLOOD VULNERABILITY: VALIDATING INDICATORS ACROSS TIME, SPACE, AND SCALE OF ANALYSIS
Abstract ID: 1188
Individual Paper Submission

BORATE, Aishwarya [University of California Irvine] aborate@uci.edu, presenting author
ALLAIRE, Maura [University of California Irvine] mallaire@uci.edu, primary author

Flood losses continue to rise dramatically around the world, with multi-billion-dollar events becoming common. Communities in coastal regions are expected to face more frequent and intense coastal hazards. As communities work towards planning for the future, the strategic decisions are currently restrained by a limited understanding of vulnerability as a dynamic concept. The conventional risk assessments often assume constant vulnerability across space and time, and the indicators used are rarely validated. Much of the social vulnerability literature focuses on households or the county-level, rather than the community

level which is useful for integrated risk assessment and planning.

This study takes a different approach to develop robust measures of social vulnerability for coastal regions in the U.S. and statistically assess how these indicators vary spatially and temporally. The research builds on theory from the hazards-of-place model of vulnerability. An enhanced framework of the hazards-of-place model which recognizes the layered and dynamic processes of vulnerability will be used. First, a statistical analysis will be conducted to identify and validate vulnerability indicators by disaster phase: pre-disaster indicators that influence preparation and post-disaster indicators that affect recovery. Second, a cross-scale analysis will be performed to examine the variation of each indicator across unit of analysis – neighborhood, municipality, county, state, and region.

We use high resolution consumer spending data at the weekly level as well as quarterly business revenue by sector to validate the vulnerability indicators by examining the association between flood events and consumer consumption before, during, and after the onset of flood. The project uses Nielsen's Retail Scanner dataset (2006-2018), sector-level business revenue, and FEMA disaster declarations data.

The resulting methodology will help in identifying the types of communities that are vulnerable for the purposes of risk analysis and reduction. Additionally, the use of high resolution datasets will provide opportunities for including distributive justice issues in risk management. This approach will enable improved estimates of context specific vulnerability and allow for comparative vulnerability assessment at the community-level, for coastal communities across the country.

Social vulnerability is not incorporated into current recovery assistance decisions. This study will include post-disaster vulnerability indicators in order to identify communities limited in capacity to recover. Robust vulnerability measures developed through this study might vastly improve risk communication, adaptation investments, disaster mitigation and recovery programs, and distribution of disaster aid. The temporal and spatial dynamism of vulnerability makes the process of risk assessment and planning complex. Findings will inform the development of integrated risk analysis which is essential for understanding evolving risks in the face of nonstationary. Ultimately, identification of significant vulnerability indicators by disaster phase and scale will have major implications for emergency managers and will help in understanding cascades of social impacts.

Extreme temperatures pose a significant risk to human health, and are projected to worsen in a warming climate with increased intensity, duration and frequency of heat waves in the coming decades. Urban residents are at higher risk of heat exposure due to the urban heat island, a phenomenon in which built materials absorb and retain heat from the sun and elevate urban temperatures. Concurrent with a rapid rise in temperatures within US cities, the frequency of regional electrical grid failures is also rising in recent decades, resulting in a growing number of blackouts during periods of extreme heat. As mechanical air conditioning is a primary adaptive technology for managing rising temperatures in cities, we examine in this paper the impact of a prolonged blackout on heat exposure in residential structures during heat wave conditions, when air conditioning is most critical to human health. In such events, passive cooling strategies such as light-colored "cool" roofing can provide benefits without the need for an active power grid. This study seeks to answer: to what extent can cool roofing reduce indoor temperatures in a concurrent heat wave and blackout event for residential structures as compared to conventional roofing?

Data & Methods

Our research approach combines a coupled global and regional climate modeling system with a building energy performance model to simulate how a concurrent heat wave and grid failure event would impact residential building interior temperatures in Phoenix, AZ. Historic heat wave conditions are simulated across the city using Weather Research & Forecasting (WRF) regional climate models. These conditions drive interior temperatures in typical building prototypes generated by EnergyPlus in dense urban and sparse suburban environments, with both cool and conventional roofing materials, with and without air conditioning.

Results

We find building interior temperatures to exceed 114°F for single-family structures during the late afternoon of the simulated heat wave and blackout event. Furthermore, we find a substantial increase in heat exposure across residential buildings of up to 21.6°F in response to the loss of electrical power and mechanical cooling systems. Despite substantially higher outdoor temperatures due to the urban heat island, we find high density residential zones to experience marginally elevated building interior temperatures during blackouts relative to lower density zones. Our simulation of temperatures for three common residential structures with cool roofs finds only a modest impact on building interior climates. When averaged over the three building types, the benefits of cool roofs during blackout conditions was found to be less than 2°F, suggesting that other adaptive methods are needed to minimize extreme heat exposure.

Significance

This study is the first of its kind to combine linked indoor and outdoor temperature models during a concurrent heat wave and blackout event. Our warming climate, exacerbated by the urban heat island, constitute a significant threat to human health among urban populations Such risk is particularly severe among individuals unable to evacuate the blackout zone or otherwise obtain access to cooler environments. For residents of Phoenix lacking access to continuous mechanical air conditioning on a routine basis, building interior temperatures represent a significant health risk even when electrical grid systems are fully operational. The marginal thermal benefits of cool roofing found in this study imply that it should be only one part of a more comprehensive heat mitigation plan. Planners should look to a combination of policies such as enhancing passive vegetative cooling in UHI-vulnerable neighborhoods or targeting heat-sensitive populations for cooling centers. The importance of mechanical air conditioning found in this study further implies that planners should encourage greater local grid resilience through

policies like district energy or local renewables to protect communities at highest risk.

SUSTAINING SUSTAINABILITY: A LONGITUDINAL STUDY OF LOCAL GOVERNMENTS IN THE UNITED STATES
Abstract ID: 1209
Individual Paper Submission

KINZER, Kirsten [UNC Wilmington] kinzerk@uncw.edu, presenting author

Local government sustainability planning began as an unusual practice in the 1990s but is now quite common for local governments to adopt sustainability plans and policies. Across this thirty-year period, scholars have studied what constitutes "taking sustainability seriously" at the local level in great depth (Portney 2013). Scholars have also identified many individual factors leading to policy implementation success, such as adopting a sustainability plan rather than individual policies (Wheeler 2013), using performance metrics (Elgert 2013), partnering with non-governmental organizations, cross agency collaboration (Johnston 2013), and engaging the public in planning and implementation (Kinzer 2018). This study assesses the relationship between these success factors and sustaining local government sustainability efforts over time through a quantitative analysis of three surveys on sustainability policies and programs, disseminated in 2010, 2015, and 2020.

The data sources for this study include the 2010 and 2015 Local Government Sustainability Policies and Programs Survey conducted by the International City County Management Association (ICMA) and a 2020 survey conducted by the author. The 2010 and 2015 surveys were sent to every local government in the United States with a response rate of 25% in 2010 and 22% in 2015 (n = 2,176 and 1,899 respectively). The 2020 survey was sent only to the approximately 1,000 local governments that responded to both the 2010 and 2015 survey. This longitudinal data set tracks elements of sustainability planning over time, including plan and policy adoption, public support and engagement, staffing, and barriers to implementation. In addition, the 2020 survey includes a series of questions on the success factors identified in the literature, including the impact of indicator systems, the role of non-governmental partners, public engagement in policy change and implementation, and inter-departmental collaboration.

This study seeks to address the following research questions: Are local governments sustaining their efforts to become more sustainable places over time? What characterizes the communities that have sustained or increased policy adoption and implementation? Which of the success factors identified in qualitative literature on sustainability plan and policy implementation have a quantitative impact on sustaining sustainability? To answer these questions, the policy adoption and change from each survey

year was normalized and an index of progress in sub-areas of sustainability, such as energy conservation and green building, was calculated. Using these topical indexes, each community received a normalized sustainability policy score for 2010, 2015, and 2020. These scores were compared to track the degree to which a community is sustaining sustainability over time. This index was the dependent variable in both a correlation analysis and regression model testing its relationship with the various success factors captured in the 2020 survey.

Sustainability planners have limited time and must prioritize their work for maximum impact on meeting the goals laid out in their community's sustainability plan. This study provides guidance on how to set these priorities by identifying the degree to which factors, such as maintaining an indicator system or heavily engaging the public in implementation, are related to sustaining sustainability. The study sheds light on factors that are unimportant yet may occupy a significant amount of staff time and identifies the factors that have the strongest relationship to a sustained implementation effort. These factors are in turn the areas where sustainability directors and staff should focus the bulk of their time and energy to support implementation.

A MACHINE LEARNING APPROACH TO MODEL SPATIAL VARIATIONS OF DAILY FINE PARTICULATE MATTER (PM$_{2.5}$) AND NITROGEN DIOXIDE (NO$_2$) CONCENTRATIONS IN SHANGHAI, CHINA
Abstract ID: 1218
Individual Paper Submission

LIU, Chao [Tongji University] liuchao1020@gmail.com, presenting author
SONG, Xinyi [Shanghai Jiaotong University] songxinyi618@sjtu.edu.cn, co-author
PENG, Yubo [University of Florida] yb3710@163.com, co-author

It is challenging to predict high-resolution spatial-temporal patterns of intra-urban air pollution and identify impacting factors in regional scale. Studies have attempted to capture features of air pollutants such as fine particulate matter (PM$_{2.5}$) and nitrogen dioxide (NO$_2$) using traditional linear models like land use regression (LUR) but such methods overlooked factor multicollinearity, non-linear correlations and performs not well when processing daily data. While machine learning is increasingly used in environmental research and is a potential approach in improve the model fitness. Therefore, we planned to answer the research questions: could a nova machine learning model be exploited to assess the spatial-temporal variations of urban outdoor air pollutant concentrations and capture the relationship between air quality and built environment?

In this paper, a machine learning method - random forest was exploited to establish intra-urban PM$_{2.5}$ and NO$_2$ spatial-temporal variation models and compared to traditional LUR method. Taking City of Shanghai, China as the case area, 36 station-measured daily records in one year of PM$_{2.5}$ and NO$_2$ concentration and over 80 different predictors associated with meteorological and geographical

conditions, transportation, community population density, land use, and points of interest were used to construct LUR and random forest models. LUR used $PM_{2.5}$ and NO_2 concentration data from 36 monitoring stations as dependent variables, and 84 independent variables for $PM_{2.5}$ model, 81 independent variables for NO_2 model. Random forest used the same data ensembled decision trees. Outputs of all trees are aggregated to produce one final prediction. In order to achieve strong generalization performance of ensemble learning, individual learners in the ensemble was set independent level and different among each other.

Results from the two methods were compared, and impacting factors were identified. Explained variance (R^2) was used to quantify and compare model performance. The final LUR model explained 49.3% and 42.2% of the spatial variation in ambient $PM_{2.5}$ and NO_2, respectively, whereas the random forest model explained 78.1% and 60.5% of the variance. Regression mapping for unsampled sites on a grid pattern of 1km×1km was also implemented. The random forest models performed much better than the LUR model. In general, our findings suggest that the random forest approach offer a robust improvement in predicting performance compared to LUR model to estimate daily spatial variations in ambient $PM_{2.5}$ and NO_2.

The findings in this study may encourage urban planners to take into account the impacts of urban design on air quality. The methodology in this paper will also provide an alternative for analyzing spatial variations of outdoor air pollution concentrations in built-up environment.

ROLE OF CLIMATE RISK PERCEPTIONS IN MUNICIPAL LEVEL ADAPTATION PLANNING: A CASE STUDY OF COURTENAY, BRITISH COLUMBIA
Abstract ID: 1237
Individual Paper Submission

MURUGESAN, Vignesh [University of Waterloo] vmuruges@uwaterloo.ca, presenting author
MITCHELL, Carrie [University of Waterloo] carrie.mitchell@uwaterloo.ca, co-author

Risk perception is understood to play a key role in how decisions are made at both individual and organizational level (Slovic, Fischhoff, & Lichtenstein, 1982; Smallman, 1996). When it comes to planning for climate change, how municipal officials perceive climate change and associated risks could affect cities' adaptation planning processes (Lee & Hughes, 2017; Tang et al., 2010). However, this relationship remains underexplored, and therefore, we take the case study of the city of Courtenay, BC to address this gap. Using semi-structured interviews, focus group discussions with municipal officials in different departments, and official document analysis, we assessed municipal officials' climate risk perception and identify the adaptation measures recommended and taken in the city. Our study indicates that a high level of risk was perceived by most respondents. But there are disparities in how most officials

characterize risk in relation to other parts of Canada and the world which indicates spatial discounting i.e. officials ascribed less weightage to geographically distant effects in comparison to closer effects. The past experiences with natural hazards and events ascribed to climate change were found to increase respondents' risk perception and diminish spatial and temporal discounting. The knowledge of the effect of sea-level rise and vulnerable groups in their community also enhanced risk perception. Further, we observe strong congruence between the high-risk perception of officials and the planned measures by the city. But, notably, risk perceptions of the technical staff seem to have more influence on planned adaptation measures in comparison to non-technical municipal staff.

WHAT GOOD IS A MANDATE TO PLAN? RESPONDING TO THE PERIL OF FLOOD ACT FOR SEA LEVEL RISE ADAPTATION IN FLORIDA
Abstract ID: 1251
Individual Paper Submission

BUTLER, William [Florida State University] wbutler@fsu.edu, presenting author
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author
LANGE, Zechariah [Florida State University] zjl13@my.fsu.edu, co-author

Planning mandates have been found to improve plan quality and, when paired with local commitment and motivation to act, they lead to the adoption of strategies to shape development, affordable housing, hazard mitigation, and environmental protection (Dalton and Burby 1994; Hoch 2007). However, much remains to be explored regarding how the dynamics of state level mandates interact with local conditions to shape responses to climate adaptation (Bierbaum et al. 2013; Shi et al. 2015). With the passage of SB 1094 in 2015, the Peril of Flood Act (PoFA) in Florida, a state mandate changed the context for SLR adaptation planning by requiring local governments to consider the risks of sea level rise through the coastal management element of the comprehensive plan.

This paper examines the extent to which a state mandate spurred SLR planning in Florida. Through an analysis of 152 coastal comprehensive plans, we identify a range of responses to the mandate and propose potential explanations for the variability of language in the plans. Our work builds on prior analysis (Butler, Deyle, and Mutnansky, 2016) of sea level rise planning in Florida conducted prior to the PoFA which allows us to compare sea level rise planning in Florida pre and post-PoFA planning mandate to directly explicate the impact of the PoFA. Butler, Deyle, and Mutnansky (2016) found that 21 comprehensive plans addressed SLR in the state of Florida. In the four years since the Peril of Flood Act, there has been a significant increase in the adoption of sea level rise adaptation language in Florida's comprehensive plans. We find that as of the summer of 2019, 88 out of 211 of Florida's coastal counties and municipalities took sea level rise into account in their comprehensive plans. By 2023, all 211 should have language in their comprehensive plans that account for SLR.

Our findings suggest that planners in Florida have taken on the task of planning for SLR with a higher level of attention since the passage of the PoFA. Yet, there is great variability in responses which brings

up questions about implementing planning mandates. Our paper elucidates the variation across the plans in the state and explains the extent of and implications of variation in implementing the mandate. In terms of planning intelligence, we find that current and credible data as well as vulnerability assessments are emphasized while fewer communities commit to ongoing monitoring. Most plans have generalized responses although nearly half commit to protection and accommodation strategies. Less than a fifth consider avoidance or retreat strategies. Inter-local and regional collaboration for coordinating projects and strengthening planning intelligence dominates while working with state or federal entities is less frequently mentioned. We explore the implications of these findings by reflecting on how the mandate is situated as a specific policy within a general planning legal framework, evidence of complacent compliance, the opportunity created by flexibility within the mandate, and the motivations to go beyond the requirements of the mandate.

GREEN INFRASTRUCTURE AND BUILDING ENERGY PREDICTION
Abstract ID: 1261
Individual Paper Submission

HABEEB, Dana [Indiana University] dana@danahabeeb.com, presenting author
HAYES, Alexander [Indiana University] hayesall@iu.edu, co-author
BYRNE, April [Indiana University] apbyrne@iu.edu, co-author
NOLAN, Conor [Indiana University] cpnolan@iu.edu, co-author

In the United States, buildings account for approximately 40% of our energy consumption, utilize 70% of our electricity and are responsible for approximately 1/3 of our total greenhouse gas emissions. Green infrastructure can be an important strategy for reducing building energy demands [1]. Green infrastructure and tree canopy have been shown to reduce building energy loads in the summer by shading buildings and intercepting solar radiation and in the winter by shielding buildings from high winds. For example, tree canopy can reduce on average 30% of the residential energy demand during the summer season and 10% of the heating energy demand during the winter [2]. The green spaces surrounding buildings (grass, shrubs, and trees) can also indirectly reduce energy loads by cooling a building's microclimate.

In this research project, we present the results of a pilot study we are conducting to investigate how trees and green space impact building energy use on Indiana University's campus in Bloomington, IN. We are investigating this relationship in both winter and summer conditions to determine how trees and green space reduce peak energy demand during times of extreme temperatures. We analyzed three years of hourly energy data for six buildings on campus. These buildings were selected based on similarity of building programming, building size, and year of construction—but have differing urban form conditions

surrounding each building. Our aim is to use building energy data, building characteristics, and local environmental conditions to create historical and real-time models to better understand relationships between building energy and green infrastructure. Our pilot study builds the foundation for a future campus-level model.

The results of this research will help to quantify the benefits of green infrastructure to Indiana University's Capital Planning and Facilities department, as well as develop rules of thumb and recommendations for landscape services on campus. This research could also help quantify and monetize ecosystem services for universities, cities, and communities [3]. The results of our research could help individual land owners understand the ability of tree canopy to directly reduce their energy demand and could result in computer interfaces to help communicate this information to a variety of connected stakeholders. Additionally, this research could help validate, develop and improve current building energy models by specifically quantifying the tree canopy/building energy interactions in predictive models and by defining which key parameters are needed as inputs into models.

A TEMPORAL ANALYSIS OF CHANGES TO PER CAPITA OUTDOOR WATER USE IN THE GREATER DENVER REGION
Abstract ID: 1301
Individual Paper Submission

TROY, Austin [University of Colorado Denver] austin.troy@ucdenver.edu, presenting author
FOLLINGSTAD, Gretel [University of Colorado Denver] gretelfollingstad@gmail.com, co-author
TAYLOR, Robert [University of Colorado Denver] bobvtaylor@gmail.com, co-author

Water is a significant limiting factor to urban growth in much of the American West. A key question is whether per capita consumption can be reduced without compromising quality of life. Numerous characteristics of the built environment have been found to drive residential water demand, including parcel size and turf grass cover (Stoker and Rothfelder 2014), building age and value (Change et al 2017), housing type (Gahvidelfar et al. 2017), and neighborhood level factors such as social norms around landscaping (Barnett et al 2020). Not surprisingly then, even minor changes to design and permitting standards have been found to yield significant cumulative savings in residential water consumption (Stoker et al 2019).

While numerous cross-sectional studies of water use have been done to understand demand correlates, fewer have addressed changes in residential water demand over time, which is an important gap given the extent to which per capita rates have dropped throughout the West in recent years. Building on a previous cross-sectional analysis conducted by the authors, this study adds to this literature by analyzing an extensive time-series data set with hundreds of thousands of records of residence-level water consumption from several jurisdictions in the Colorado Front Range region. Looking across several years (between 5 and 16 depending on jurisdiction), it explores how per capita outdoor water use has changed over time in aggregate and in terms of per square foot irrigation rates, adjusting for climate. Through use of historical high-resolution land cover maps and subdivision maps, it explores the extent to which the overall decline in per capita use can be attributed to changes in land use and zoning that affect irrigable area per lot or per

household, versus changes to practices such as landscape composition or wastage through overwatering. We in turn study how those changes in landscaping practices, composition, and lots are driven by deliberate policies, such as landscaping ordinances, education campaigns, new zoning districts, or water pricing, as opposed to by other forces.

Hybrid cross-sectional and longitudinal approaches will be used to look at where irrigation rates changed the most, and what factors appear to predict these changes. To date, most data have been processed, cleaned and geocoded and cross-sectionally analyzed, but have yet to be temporally analyzed. The longitudinal study will use a combination of regression and difference-in-differences analysis to assess how changes in outdoor water usage at different spatial scales can be attributed to the predictive factors mentioned above and how those may be attributed to deliberate policies.

QUANTIFYING AURORA COLORADO'S WATER AND LAND USE NEXUS TO UNDERSTAND WATER BUDGETS FOR RESILIENT FUTURE DEVELOPMENT
Abstract ID: 1319
Individual Paper Submission

FOLLINGSTAD, Gretel [University of Colorado Denver] gretelfollingstad@gmail.com, presenting author

This research contributes to water resource resilience planning, to increase community scale capacity to prepare, plan, absorb, recover from and adapt to the effects of our changing climate on water supplies (Cutter et al., 2010; Romero-Lankao et al., 2016). Coupling growing population densities in urban areas with climate change creates greater vulnerability to future water scarcity. Mitigating these impacts involves community-scale changes (Romero-Lankao et al., 2016) such as land use zoning and community growth boundaries to minimize effects (Moser, 2010). To address these circumstances, this paper explores the determinants of urban water use by modeling urban tree transpiration and comparing those results with water use data for the City of Denver. From a water management perspective, understanding transpiration rates of urban trees is fundamental to improving the selection of water-conserving species (Bush et al., 2008). Moreover, efficiencies in water use, infrastructure and land uses are essential for resilient urban development and redevelopment, thus the land and water nexus is an important relationship for managing future water adequacy.

This study informs sustainable urban land use design, as a key component to building water resilience and mitigating the effects of future water scarcity and drought events. Using the Denver Region Council of

Government's urban growth simulation model projections of future growth and a detailed analysis of Aurora's water use, housing profile, demographic data and land use zoning data, this study models future water consumption into projected growth areas. This research will expand upon the few existing studies that have already integrated urban growth models with water consumption models (A. Polebitski & Palmer, 2010; A. S. Polebitski et al., 2010). One of the primary research questions is to determine the water footprint of future growth by assessing lot size, housing type and size and impervious area based on regressions of Aurora Water customer water use data. Understanding these determinants of historic and present water demand provides insight for estimating future urban water demand. The results can be used to shape future development through scenario planning for variations in key land use policies and planning tools such as zoning, ordinances, and landscaping guidelines for new developments, open spaces and parks. While many Western cities have water conservation programs and municipal regulations used in times of scarcity (Mansur & Olmstead, 2012), apart from some arid southwestern cities (Holway, 2009), most urban areas don't have strict land use policies that are shaped around future water resilience.

The project estimates household level water consumption, based on regressions of Aurora Water customer water use data. These coefficients are an important component to determining the baseline water demand (current status-quo) and formulating alternative scenarios such as the extent to which climate change and future population growth would increase water demand. This research allows for an assessment of the overall water footprint of different development types based on the detailed housing typology created using current housing and water use in Aurora.

Globally, the population continues to increase within these vulnerable areas that have high potentials for landslides and flooding (Douglas et al., 2008; Houghton et al., 2012; Menoni et al., 2012). While approximately 20% of the land area in the U.S. is located within coastal counties, more than half of the entire U.S. population occupy these counties, exposing tens of thousands of people to this extreme vulnerability (Beatley, 2009). Various scholars have studied the nexus of environmental conflicts and projections and modeling. Tebaldi, Strauss, and Zervas (2012) examined coastal communities and their

vulnerability to flooding. Their analysis modeled the effects of global temperature changes on sea level rise between 1979 and 2008, and included projections for 2050 as well. The study found that numerous locations will experience a local sea level rise in the near future.

Considering the nature and propensity of tropical storms in the Houston area, Zhu et al. (2015) examined a six decade record of daily precipitation and river discharge in four watersheds. Their findings showed that the more developed the watershed (i.e. Brays Bayou), the likelihood higher discharge would occur. This discharge rate is highly linked to areas of increased development and the amount of vegetation present. Ray et al. (2011) analyzed the effects of storm surge and inland rainfall on the floodplain of a coastal bayou in the Houston area by performing hydraulic modeling. The findings showed that rainfall in tandem with storm surge impacts affected flooding magnitude.

Urban resilienceis a new approach for empowering cities when facing natural disasters. Resiliencerefers to the capacity of communities to decrease or modify natural disasters and vulnerabilities including developing methods, analyzing the risk potentials, adopting strategies, social resilience, and improving knowledge on natural disaster mitigation (Berke and Campanella, 2006; Meyer et al., 2018). Immediately following natural disasters, gray and green infrastructure are expected to prevent excessive damage or manages the highest risks and hazards. One example is Buffalo Bayou Park in Houston, TX. Experienced by three foremost floods since its opening, including Hurricane Harvey, Buffalo Bayou Park is a potential precedent for resilient open-space design, planning, and operations in climate-sensitive and flood-prone coastal areas (Aman and Yildirim, 2019). Hurricane Harvey made landfall in Houston, Texas in 2017 along with a number of coastal cities, dropping more than 50 inches of rain onto Houston over a four-day duration.

Also, while strategies for mitigation assessment and implementation are generally propelled by regional associations with particular expertise in this area, the policies implemented often lack significant local and resident-based knowledge that can provide great value (Godschalk et al., 2003; Hurlimann et al., 2014; Meyer et al., 2018). This research studied the performance of Buffalo Bayou Park during and after Hurricane Harvey and used bilingual surveys to obtain the perceptions of Houston residents on the role of this park during natural disasters.

It used Environmental and social systems were analyzed to assess the park's performance as a resilient urban landscape. The paper presents analyses of quantitative and qualitative data which was conducted through a number of methods including secondary data analysis, mapping, on-site observation, and qualitative surveys. The results of this study shows that since the opening of Buffalo Bayou Park in 2015, it has performed as designed relative to flood events, restored ecologies and promoted pollinator habitat, educated the public on flood protection, and improved the health and well-being of park users and Houston residents. Planners and policymakers can use the results of this study as a reference for enhancing their resiliency strategies.

SOCIAL EQUITY IN PERFORMANCE OF STORMWATER INFRASTRUCTURE: FINDINGS FROM HOUSTON
Abstract ID: 1346
Individual Paper Submission

LEE, Jessica [Texas A&M University] jjlee8605@tamu.edu, presenting author
VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Stormwater management refers to investment and maintenance of stormwater infrastructure, which mitigates flooding by controlling surface water runoff flow in an area (e.g., watershed and/or neighborhood). Stormwater management infrastructure is provided by a municipality through a capital improvement plan. A growing number of studies have examined the uneven distribution of stormwater infrastructure across neighborhoods based on the racial/ethnic/income composition, using an environmental justice framework (Hendricks, 2017; Mandarano, et al., 2017; Porse, 2018). However, the previous studies are limited by data availability related to the types and measurement of infrastructure.

To address these gaps, this research examines the performance of stormwater infrastructure for diverse neighborhoods in the City of Houston, Texas. This research defines the performance of stormwater infrastructure as the degree to which stormwater infrastructure is characterized by proper design capacity and maintenance for reducing stormwater runoff during rainfall events. Specifically, we address the following question: How are the distribution, capacity, and condition of the stormwater infrastructure associated with neighborhood socio-demographic composition?

To answer, we merge secondary stormwater infrastructure spatial data from the City of Houston GIMS website with Census block group data and the impervious surface data from National Land Cover Database (2016). We conduct a descriptive analysis of the normalized density of infrastructure by types, socio-demographic composition, and urban development patterns across 1,426 Census block groups and use bivariate correlations and regression. The descriptive analysis is then used to identify neighborhoods for further qualitative study. We have 6 selected neighborhoods whose population density and neighborhood age are similar: Greater Heights (a White-dominated neighborhood with mostly roadside ditches), Sunnyside (a Black-dominated neighborhood with mostly roadside ditches), Northside/Northline (a Hispanic- dominated neighborhood with mostly roadside ditches), University Place (a White-dominated neighborhood with mostly storm sewer), Greater Third Ward (a Black- dominated neighborhood with mostly storm sewer), and Magnolia Park (a Hispanic- dominated neighborhood with mostly storm sewer). We do multiple case studies to compare the distribution, capacity, and condition of infrastructure elements based on the secondary data (e.g. stormwater infrastructure data, Census block group data, and the impervious surface) and primary condition assessment data measured through fieldwork. Condition assessment is based on the performance standards from Oti, et al. (2019).

The preliminary results support the hypotheses based on the findings from environmental justice and hazard vulnerability literature; 1) Neighborhoods with a higher percentage of Black or Hispanic and lower median household income have more roadside ditches and less storm sewers for stormwater management when controlling for density and imperviousness; 2) Socially vulnerable neighborhoods have more deteriorated and poorly maintained roadside ditches, storm sewers or culverts, inlets, and curb and gutters; and 3) Socially vulnerable neighborhoods are more likely to have inadequate infrastructure capacity and more vulnerable to flooding. The findings of this study have substantial implications for equitable stormwater management while developing flood mitigation strategies in capital improvement plans and land use plans.

AN AGE-INTEGRATED APPROACH TO IMPROVE THE TWO-STEP FLOATING CATCHMENT AREA METHOD TO MEASURE SPATIAL ACCESSIBILITY TO URBAN PARKS IN SHANGHAI, CHINA
Abstract ID: 1347
Individual Paper Submission

ZHONG, Mengqi [Tongji University] 476333440@qq.com, presenting author
YU, Yifan [Tongji University] zhongmq@tongji.edu.cn, co-author

The measures to improve the spatial accessibility to green infrastructure are important for achieving equality in the public environment system. To accurately evaluate the variations of the accessibility to park is a prerequisite for rationally allocating green space resources. This article studies the disparities in park accessibility in central urban areas of Shanghai and explores an appropriate accessibility measurement for the elderly, as a matter of promoting environmental justice. The urban planning department provides data on all parks of Shanghai and the demographic data are from the sixth census of Shanghai. Besides, the road network and POI data are collected from Gaode Map, one leading platform of Web GIS services in China. Firstly, using the network analysis method of GIS, this study analyzed pedestrian accessibility to urban parks in Shanghai and the subsequent serviceability of the parks. Then, we improve two-step floating catchment area (2SFCA) method and analyze environmental justice for spatial access to parks, which can identify more underserved areas compared to the traditional method. Additionally, we especially study spatial accessibility to parks for the elderly, who have poor mobility and need the nearest park service. The research finds spatial accessibility exhibited clustering characteristics: high accessibility areas are clustered near the old city center as well as along the Huangpu River, while low accessibility areas are distributed in periphery of central area. Moreover, both the increase of the amount and size of parks can significantly improve the accessibility of surrounding areas. The park accessibility of the elderly is generally consistent with the overall situation, however, the accessibility of them in the north and west area is quite poor, because of the limited parks and insufficient travel capacity of the elderly. These areas urgently need to improve park accessibility for the elderly and promote healthy aging.

RETHINKING "CAPACITY": THE ROLE OF ORGANIZATIONAL CHANGE IN ADVANCING RACIAL EQUITY THROUGH CLIMATE ADAPTATION PLANS
Abstract ID: 1349
Individual Paper Submission

SOLIS, Miriam [The University of Texas at Austin] solis@austin.utexas.edu, presenting author

A growing number of climate adaptations plans are incorporating racial equity as a guiding principle. This pursuit of equity, however, can lack meaning when insufficient capacity exists to operationalize equity goals (Schrock, Bassett, and Green 2015). This paper thus asks, how can planning departments be better equipped to advance racial equity? What organizational change is needed to advance these racial equity goals? The paper employs Ray's (2019) theory of racialized organizations as an analytical framework to understand how the inner-workings of planning departments can reproduce racism. The theory maintains that organizational rules and norms—including those of planning departments—contain racial meaning. These inner-workings lead to the reproduction of racism. The paper builds on planning theory that discusses the field's pursuit of social justice. For example, Healey (1998) argues for enhanced local governance capacity for a more effective "institutional web of the city." Fainstein (2010) draws on the work of Amartya Sen to encourage an "enhanced capabilities" approach. In this view, subjects must be prioritize social justice goals, insofar as their planning context enables them.

This paper draws on case study data from the City of Austin's Community Climate Plan to reach net-zero community-wide greenhouse gas emissions by 2050. In 2020, city officials led the process to review 2015 Plan progress and make necessary adjustments, including a stronger incorporation of racial equity goals. Through participant observation, semi-structured interviews, and official documents, this paper finds that several Austin departments made changes to departments' rules and norms to ensure that the Plan incorporated racial equity goals, as well as a clear plan to operationalize those goals. Preliminary findings support existing research on the importance of community pressure and input (Corburn 2005). They also reveal that the pursuit of racial equity shaped staffing decisions, budgets, and the planning process timeline.

The paper brings attention to how changes to planning departments' rules and norms can advance the pursuit of racial equity, as well as some of the tensions associated to this change. Among the paper's key lessons is that planning processes must approach racial equity as a type of expertise that needs to be funded and supported. The paper also supports existing critiques of the notion of "capacity," as commonly used in community and economic development literature and practice. The private, public, and philanthropic sectors often encourage community-based organizations to enhance their capacity to improve their programming and advocacy efforts. This paper considers whether the capacity concept more aptly applies to funders and decision-makers, as they assert their commitment to racial equity.

INTEGRATE CLIMATE ACTION: HOW CITIES IN CALIFORNIA PLAN FOR CLIMATE MITIGATION AND ADAPTATION THROUGH TRANSPORTATION AND LAND-USE
Abstract ID: 1383
Individual Paper Submission

ALEXANDER, Serena [San Jose State University] serena.alexander@sjsu.edu, presenting author
AGRAWAL, Asha [San Jose State University] asha.weinstein.agrawal@sjsu.edu, co-author
HOOPER, Ashley [UC Irvine] amhooper@uci.edu, co-author
BOSWELL, Michael [California Polytechnic State University, San Luis Obispo] mboswell@calpoly.edu, co-author

Cities in California have long acknowledged the need to plan effective responses to both the causes and the consequences of climate change. A central challenge for climate planning efforts has been identifying transportation and land-use (TLU) strategies that simultaneously reduce greenhouse gas emissions ("mitigation") and adapt communities so that they will be less affected by the adverse impacts of climate change ("adaptation"). Sets of policies that collectively address both mitigation and adaptation are known as "integrated actions." The value of integrated actions has recently become widely acknowledged; current research emphasizes the importance of integrating mitigation and adaptation in order to develop cost-effective strategies to combat climate change and protect vulnerable communities. This study explores municipal climate planning in California to determine whether cities incorporate integrated actions into their plans, assess the potential drivers of conflict between mitigation and adaptation in municipal plans, and identify ways the State of California can help cities more effectively incorporate integrated actions. The authors found that some cities did adopt packages of integrated actions, and, promisingly, two cities with recently updated climate plans explicitly focused on the need for integrated actions. However, most cities addressed climate mitigation and adaptation in separate efforts, potentially reducing synergies between the two types of action and even creating conflicts. Since the first generation of climate action plans focused primarily on mitigation of greenhouse gases (GHGs), adaptation strategies have not yet been effectively or fully combined into mitigation plans in many cities. Also, a cross-comparison of plan content and interview data suggests that cities often had sets of policies that could potentially create conflicts—mitigation policies that would undermine adaptation capacity, and vice versa. In addition, where a city did adopt integrated actions, these efforts are typically not labeled as such, nor do the policies appear within the same policy document. Nevertheless, the study findings suggest promising steps that both municipal and state government can take to support integrated TLU actions at the local level. For example, cities can proactively link the content in climate mitigation and adaptation plans, a process that will require building the capacity for cross-collaboration between the various departments in charge of developing, implementing and monitoring climate-related plans. As for the state government, it can provide funding specifically for planning and implementing integrated actions, offer technical support to help municipalities adopt programs and projects that produce integrated mitigation and adaptation benefits, and fund research in the area of integrated actions.

SUSTAINABILITY EVALUATION OF CLIMATE CHANGE ADAPTATION POLICIES AND TECHNOLOGIES; THE CASE OF THE BUSAN METROPOLITAN AREA IN KOREA
Abstract ID: 230
Poster

DONG, Ah Hyeon [Pusan National University] hyun_dong215@pusan.ac.kr, presenting author
KANG, Jung Eun [Pusan National University] jekang@pusan.ac.kr, co-author

Response to climate change is a concept that includes mitigation and adaptation. Climate change adaptation is needed to reduce the negative effects that are currently occurring or are expected to occur in the future, and to make the most of opportunities. Therefore, the goal of climate change is to reduce vulnerability caused by climate change and at the same time improve our ability to adapt to climate change. However, many efforts to adapt to climate change remain short-term and technical fixes for risk, which can have negative socioeconomic ramifications across communities. This can be called "maladaptation", and to prevent it, climate change adaptation should be oriented toward sustainable development. Specifically, climate change vulnerabilities should be reduced, or adaptive technologies and strategies should contribute to improving regional resilience. In response, this study evaluates the sustainability of the second set of climate change adaptation measures in the Busan metropolitan area in Korea.

This study used a plan assessment method that enables quantitative digitization and objective evaluation to assess the sustainability of 「the Second Climate Change Adaptation Plan」 in the Busan metropolitan area in Korea. In addition, the indicators for sustainability assessment were selected as assessment indicators by compiling the United Nation's strategic development goals (SDG) and the Korean SDG (K-SDG) indices, utilizing "gain and loss scores" to take into account both the positive and negative effects of climate change adaptation and technology on the local community. This study aims to measure the sustainability of technology and climate change adaptation in the Busan metropolitan area from two perspectives. First, the composite score of the impact degree was derived using the ranking and score method to assess the overall impact of the adaptation measures. Then, the assessment was conducted using the coverage score to derive not only the overall score but also how much the sustainability index was considered in terms of impact.

As a result of assessing the 30 climate change adaptation policies and technologies of the Busan metropolitan area, the implementation of projects to regenerate old and vulnerable areas of the national territory and coastal areas scored highest in the overall score: the forest sector was restored first utilizing ecological experience, then the national coastal areas were established to prevent flooding and tidal damage. Next, the detailed index shows that the implementation of projects to regenerate old and vulnerable residential areas of the national territory, the restoration and ecological experience of the forest

ecosystem sector, and the creation of energy self-sufficient islands and energy towns in the industrial energy sector, all affect various indicators. To sum up the results, it was found that among the measures and technologies for adapting to climate change in the Busan metropolitan area, the policy that most significantly affects its sustainability is the promotion of projects to regenerate old residential areas and vulnerable areas.

The sustainability assessment technology used in this study to enhance socioeconomic capabilities is different from other assessment techniques in that the assessment was carried out simultaneously by utilizing quantitative indicators in addition to qualitative assessment, which is a common method for evaluating sustainability. The assessment was performed by integrating economic, social, institutional, and environmental sectors. It is also meaningful that policies with qualitative characteristics have been quantitatively evaluated to facilitate communication among various stakeholders.

The degree of disasters brought about by natural calamities is increasing globally because of the intensified climate changes. In Korea, most of the natural disasters consist of storm and flood damage from typhoons and heavy rains. In addition, because of its topographical characteristics, where more than 70% of the country is mountainous, there is an increase in runoff in the urban areas in case of localized heavy rains, leading to great damage. There are various causes and types of urban disasters, and because the population is focused on urban areas, residential and industrial facilities have become so highly developed that in cases of disasters the damage is largely expanded, leading not only to property damage and loss of lives and also a total paralysis in urban functions. The "flood damage in urban cities" can be seen through damages incurred in the lives, physical bodies, and properties due to external floods, which are better known as regular floods, and internal floods, which occur when the sewage and other drainage systems cannot release storm water.

In recent times, flood damage in urban cities has worsened because of several factors, such as the increase in abnormal rainfall due to climate change and localized heavy rains, along with the urbanization from economic development. This gives rise to the need for comprehensive urban planning and preventive strategies. To reduce the flood damage in urban cities, there should be spatial structure designs and land use planning to evaluate the flood risk. However, as flood damage is caused by various factors, it is difficult to develop a predictive model. Therefore, the purpose of this study is to develop a flood

prediction function using machine learning and to establish a flood risk map.

This study used the 2014 Busan Metropolitan Flood Information Data, and the information was analyzed after dividing the grid on a 30m×30m scale. The actual analysis used four machine learning techniques such as the Decision Tree, Random Forest, Naïve Bayes, and Support Vector Machines using R-programming to develop the flood prediction model. In addition, the study developed a flood risk map using the Jenks Natural Breaks Classification of ArcMap and categorized and visualized the risks into five levels.

After comparing the four models, it was shown that the Random Forest model was the most appropriate for flood predictions. The weights of the variables were deduced from the importance of their contribution to the model, and the values from the results were used to develop the flood risk map. The results showed that the districts with the highest risks were Jeonggwan-eup, Gijang-gun, Geumjeong-gu, Dongnae-gu, and Yeonje-gu. The overall findings, which showed the districts' similar results when compared to areas with actual flood damage, revealed that the application level of the flood risk map is high. The results of this study will lead to the avoidance of inappropriate developments in areas with flood risks and induce developments in areas with low risks. In addition, the results of the study can be utilized for future guidelines on flood risk evaluations.

AN EVALUATION OF LOCAL CLIMATE CHANGE ADAPTATION PLANS ADDRESSING NATURAL DISASTER MITIGATION IN KOREA
Abstract ID: 801
Poster

CHOO, Mijin [Yonsei University] alwls2599@yonsei.ac.kr, presenting author
YOON, Dong Keun [Yonsei University] dkyoon@yonsei.ac.kr, co-author

Climate change risks globally occur and threat human lives and activities. Moreover, their impacts are expected to become more severe and intense in the future. To deal with the negative impacts of climate change, 'Adaptation and Mitigation' to climate change is considered as an important pillar for response to climate change (IPCC, 2014). Many countries are working to respond to climate change, as part of, they are establishing climate change adaptation plans. In Korea, the government has legally mandated to establish climate change adaptation plan in 2010 (Kim & Yun, 2014). A total of 212 local climate change adaptation plans were adopted, as of 2017. The general goal of the climate change adaptation plan is to build a safe society and reducing the risks from climate change. This adaptation plan is recognized as an essential way to reduce the potential impacts and damages from climate change. The purpose of this study is to evaluate the quality of local climate change adaptation plans in Korea. Many previous studies evaluating the plan quality; however, a few researches have been conducted regarding the quality of climate change adaptation plans in Korea. This study identifies the current status of the climate change adaptation plan and whether each plan has been established to respond appropriately to potential climate change risk impacts, especially natural disaster impact.

The total of 212 local climate change adaptation plans across the Korea are analyzed and compared. Before conducting the plan quality evaluation, plan content analysis procedures were employed to determine whether certain characteristics or criteria set out in advance are present in the plans (Berke & Godschalk, 2009). We develop several indicators to conduct contents analysis and plan quality evaluation. Plans are evaluated using a coding protocol consisting of such indicators based on six plan quality principles: fact base, goals, policies, public participation, coordination and implementation & monitoring. This study examined the regional differences in priorities of natural disaster risk reduction strategies to implement through spatial analysis. Moreover, this study examines the relationships between actual disaster damage and the local adaptation planning status and whether climate change adaptation plan affects reducing the disaster damage caused by climate change impacts.

The results of the analysis show that the local climate change adaptation plans are mainly focused on the improvement and reinforcement of physical structures to prevent damage from typhoon and heavy rain rather than socio-economic vulnerability mitigation. This study suggests that in order to strengthen local climate change adaptation plans, more policies managing socioeconomic or environmental vulnerability and enhancing public participation and cooperation should be further considered in the plan. This study would contribute to the establishment of more appropriate climate change adaptation plans in the future, considering the regional characteristics that may affect the plan quality.

AN EXAMINATION OF SEA-LEVEL VISUALIZATION TOOLS USED IN LAND USE PLANNING COMMUNICATION REGARDING MANAGED RETREAT
Abstract ID: 853
Poster

WANG, Yao [State University of New York College of Environmental Science and Forestry (ESF)] ywang401@syr.edu, presenting author
BRYANT, Margaret [State University of New York College of Environmental Science and Forestry] mbryant@esf.edu, co-author

In the United States, nearly five million people, living in 2.6 million houses, are within four feet of the high-tide sea level. This is below the 100-year flood line for most of the affected areas. Scientists are currently predicting that sea levels could rise another two to five feet this century. Coastal adaptation strategies can mitigate disaster risks, reduce socioeconomic vulnerability, and build social-ecological resilience in coastal zones. Three major coastal adaptation strategies are protection, accommodation, and managed retreat. Recently, Managed retreat has become an acceptable approach to address sea-level rises by some governments across the world (Esteves, 2014). Public participant is important component of the managed retreat. This research addresses the role of visualization in communicating with public about the process of managing retreat.

Managed retreat is a long-term adaptive strategy for planning land use changes to coastal areas (Fouqueray et al., 2018). Hino (2017, p. 364) defines it as "the strategic relocation of structures or abandonment of land to manage natural hazard risks." Managed retreat has several components: coastal planning, buy-out programs, regulations of allowed development types, and restoring habitats (Maygarden et al., 2019). To support land use planning and managed retreat processes, climate visualizations are powerful decision-making tools, which can increase public participation and address climate change (Sheppard, 2012). With visualization, participants in the planning process can improve their understanding of sea-level rise related issues. For example, people that are responsible for key decisions will not be experts in all aspects of climate change and its impacts. These people therefore need to be informed on what the scientific data says in a way that is easier to understand, which will enable more informed decision making processes. However, there is a lack of information regarding the effectiveness of climate visualizations in regard to managed retreat, when used in conjunction with land use planning communication. This research aims to fill this critical literature gap.

This poster will report the results of a survey of tools used to visualize the effects of sea-level rise. It will contain detailed information on various categories, functions, and designs of visualization platforms, such as Adaptation Tool Kit Sea-Level Rise and Coastal Land Use, Sea Level Rise Viewer, When Sea Levels Attack, Mapping Choices, and EarthTime Sea-Level Rise Tool. The results will be reported in a table categorizing and comparing the tools.

RESEARCH ON ECOLOGICAL SPACE MANAGEMENT AND CONTROL OF MOUNTAIN CITY BASED ON ECOLOGICAL SENSITIVITY EVALUATION -- TAKE FULING, CHINA AS AN EXAMPLE
Abstract ID: 868
Poster

ZHANG, Xuchen [Tongji University] 1910230@tongji.edu.cn, presenting author

Urban ecological space is the natural basis of urban survival and the ecological guarantee for the coordinated development of urban and rural areas. With the rapid development of urbanization, the scale of population and constructive land in many cities are constantly expanding, which poses a greater threat to urban ecological space, especially that in mountain cities with severe ecological problems. Under the background of "Ecological Civilization Construction " and "Beautiful China Construction ", how to protect the mountainous urban ecological space while realizing the economic development is an urgent problem for urban planning in the new era. Ecological sensitivity evaluation, as an important part of ecological environment impact analysis, can analyze and predict the possibility of regional ecosystem imbalance and environmental problems, which provides scientific and effective basis for urban ecological space management and control.

Fuling City, located in the transition zone between "East Sichuan parallel valley area" and " Middle area of dalou mountain and Wushan mountain " in the east of Sichuan Basin, is full of typical mountain characteristics. In addition, Fuling City，with forest area of 130100 hm2 and forest coverage rate of 45.2% (China's average is 22.96%), has good ecological conditions and high ecological protection value ，and the Yangtze River and Wujiang River pass through.

On the basis of combing the relevant theories and practices of ecological sensitivity evaluation, this paper selects five factors，including terrain sensitivity, soil erosion sensitivity, rocky desertification sensitivity, ecosystem sensitivity and acid rain sensitivity，to Construct a comprehensive evaluation system of ecological sensitivity，determines the weight of each factor by AHP method, and the individual factors are weighted and stacked through the GIS platform to obtain a comprehensive ecological sensitivity evaluation result.

The results show that Fuling City presents an ecological sensitivity pattern of "two zones, one area and many points" as a whole, which can be divided into four levels: ecological highly sensitive area(14.15%), ecological moderately sensitive area(38.22%), ecological low sensitive area(32.38%) and ecological non sensitive area(12.53%). The higher the ecological sensitivity is, the more vulnerable the ecosystem is and the more it needs to be protected and controlled.

Finally, this paper divides the urban ecological space of Fuling City into four ecological function regions, including 1)the metropolitan environmental control ecological function region, 2)the Industrial ecological function region along the river, 3)the agroforestry ecological function region of low mountain , 4)the ecological function region of mountain and forest tourism. In addition, this paper puts forward different ecological function orientation and key points of ecological environment protection, and points out different management and control strategies.

This research highlights the differences from plain cities from selected cases, evaluation factors, and control strategies, aiming at providing a reference for the ecological space management and control of other mountain cities.

ENERGY EFFICIENCY OR QUALITY OF LIFE: THE PARADOXICAL EFFECTS OF MEXICO'S GREEN MORTGAGE PROGRAM
Abstract ID: 940

Poster

GIOTTONINI B., M. Paloma [University of California Los Angeles] mpgiotto@ucla.edu, presenting author

Under the premise of improving housing for the poor while addressing the challenges of climate change, Mexico put in place a housing mechanism known as the Green Mortgage Program (GMP) to facilitate access to energy efficiency devices within its public housing sector. Today, the GMP is the largest and fastest growing effort to increase residential energy-efficiency in low-income households in the world. Since its implementation in 2011, it has facilitated the incorporation of energy efficiency appliances into more than three million dwellings in Mexico (Giottonini Badilla, 2018). The GMP has been presented as a win-win strategy to overcome barriers against the adoption of energy efficiency at the household level, namely up-front costs, lack of information, and availability of technologies among others (Hirst & Brown, 1990). Its apparent success has been well recognized but scarcely evaluated.

Through a case study of the implementation of the GMP in a city of Northern Mexico, I evaluate the outcomes of the GMP by comparing its performance to traditional households of similar characteristics. The analysis uses energy consumption data from electric utility bills and an original survey applied to 300 residents of GMP and traditional households, and it highlights three major findings: Firstly, GMP households are using the same or more electricity than their traditional, non-GMP counterparts. Consequently, the program is also not achieving its climate change mitigation efforts. Secondly, without reduction in electricity consumption, GMP households have not been able to achieve the expected improvements in living conditions as dictated by the program. Thirdly, the program increased the cost of housing by approximately 5-10% by incorporating the cost of the devices into the mortgage debt, therefore making housing less affordable. This result align with a similar study by Davis, Martínez & Taboada (2020). Based on these results I conclude that the GMP has been an abrupt failure in its two main goals: reducing energy consumption and improving the quality of life of low-income households.

However, the GMP has been successful in other areas at a larger scale: it has accelerated the growth of a market for energy efficiency appliances in Mexico. It has promoted the rapid creation of new standards and regulations to guide these changes, and has changed the perception and acceptance of the concept of energy efficiency in Mexican households. The paradoxical effects of the GMP lie in the fact that, while the program has provided these benefits for energy efficiency in Mexico, it has done so by imposing a significant financial burden on the lowest-income households.

These results provide valuable information to urban planners and policymakers about the creation, implementation, and evaluation of housing, energy, and climate change related policies; and also point to the urgent need to incorporate measures of quality and equity in the provision and evaluation of public housing initiatives.

SOCIO-ECOLOGICAL NETWORK ANALYSIS OF EXISTING WATERSHED PLANS IN THE UPPER PONTCHARTRAIN BASIN
Abstract ID: 961
Poster

LAMANA, Lindsey [Louisiana State University] llaman2@lsu.edu, presenting author
DOUTHAT, Thomas [Louisiana State University] tdouthat1@lsu.edu, primary author
IRVING, Jennifer [Louisiana State University] jirvin6@lsu.edu, co-author
REAMS, Margaret [Louisiana State University] mreams@lsu.edu, co-author

Louisiana's efforts to create watershed planning under the Louisiana Watershed Initiative (LWI), suggests the need to evaluate existing systems of governance at the watershed level, including plans, policies, and collaboration. This is often accomplished through plan evaluation methods. However, these do not have mechanisms to measure relationships among different types of plans or the interrelationship of plans in different jurisdictions within the watershed. To address this gap in Upper Pontchartrain Basin (USGS Hydrologic Unit 0807) and its sub-basins, we will conduct a comprehensive review of environmental hazard mitigation plans and evaluate key planning governance networks within this watershed using network analysis methodologies (Sayles, et al., 2019).

The first step is collecting and inventorying all historical and present planning documents and ordinances in the Upper Pontchartrain parishes and municipalities. These documents include Comprehensive/Master Plans, Hazard Mitigation Plans, and Coastal Zone Management Plans. We will evaluate them using a "Plan Evaluation Coding Protocol" that was created based on an extensive literature review of existing plan evaluation tools, the Emergency Management Agency's(FEMA) Community Rating System (2017), and Coastal Protection and Restoration Authority's (CPRA) Flood Risk and Resilience Program (2017). Will use social network analysis and document coding software to address three specific plan elements and code them as networks: 1) fact base, 2) policy tools and strategies, and 3) inter-organizational coordination and capabilities (Brody, 2008; Lyles, 2014). Fact base includes practical information that can help identify if crucial hazard problems are identified and consistent across jurisdictions. Policy, tools, and strategies are the structural and nonstructural controls outlined in plans that affect location and type of development. Coordination and capabilities involve collaboration and conflict management between local, parish, and regional governments. Finally, we will layer the networks onto an ArcMap to visualize the relationships in the watershed.

The results of this study will illustrate shared watershed planning and policy networks, which will allow for preliminary observations about gabs in our coastal hazards planning networks. Our method presents a rapid means of assessing, analyzing, and visualizing existing patterns and gaps in policy and collaboration in the Upper Pontchartrain Basin.

INTEGRATING ENVIRONMENTAL IMPACT ASSESSMENT (EIA) AND LIFE CYCLE ASSESSMENT (LCA) PROCESSES TO MOVE THE BIOECONOMY FORWARD FOR PLANNERS

Abstract ID: 1009
Poster

DELOYDE, Carolyn [Queen's University] carolyn.deloyde@queensu.ca, presenting author
MABEE, Warren [Queen's University] warren.mabee@queensu.ca, primary author

International commitments to lower greenhouse gas emissions can benefit from renewable energy development and implementation aimed at increasing the proportion of renewables in the energy supply. A low carbon future requires precision in the ways we measure potential environmental, economic and social impacts of bioeconomy programs, plans and projects. Current tools utilized by scientists and engineers working in this space include Life Cycle Assessment (LCA). Opportunity exists for the Environmental Impact Assessment (EIA) tool to integrate with the LCA process ensuring an open, balanced process to strengthen quality and credibility within Canada's bioeconomy. Life Cycle Assessment (LCA) has been identified in the literature as a promising tool to increase the performance of environmental assessments at different steps in the Environmental Impact Assessment (EIA) process as a tool for better decision making (Larrey-Lassalle et al., 2017; Židoniene & Kruopiene, 2015; Morero, Rodriguez, & Campanella, 2015; Manuilova, Suebsiri, & Wilson, 2009). The integration of EIA and LCA processes posit a key theoretical argument of increasing meaningful public participation to actualize fundamental principles of democracy and strengthening a program, plan or project's credibility. The LCA/EIA integrated process demonstrates a capacity to enhance social learning about the environment and multiple objectives, values and needs of participants through increased meaningful public participation. The integrated process is channel for the public to participate directly in the decisions that affect them – contributing to participatory democracy and increased bioeconomy and sustainability literacy.

Research Questions:

The research addresses the following questions based on the fact that municipalities and municipal planners are at the critical interface where action can be taken to reduce GHG emissions: How can planners integrate LCA and EIA processes to address GHG emissions? Can integrated EIA/LCA facilitated stakeholder workshops and participatory mapping exercises bring together community actors to develop plans to improve bioeconomy literacy and help move the low carbon economy forward? Can conservation and planning incorporated into the components of LCA/EIA result in multiple options to develop and redevelop our cities and apply new technologies?

Methodology:

This research is conducted through a five step process which includes:

1. Literature review;
2. Review of greenhouse gas emission reduction model outputs;
3. Review/adaptions of public participation models;
4. Review of current LCA/EIA processes;
5. Development of integrated EIA/LCA process.

Relevance to planning scholarship: This research will contribute to information required by planners and decision-makers with regard to descriptions of proposals, conditions and characteristics of the environment, applicable planning policy and regulatory objectives as well as the holistic identification of potential social, economic and environmental impacts. Integration of the LCA/EIA processes, guiding and operational principles, community values, and visions for the future can propel the transition to a low carbon economy and increase sustainability literacy. Planners can use this research to inform future practice of assessment tools.

BROWNFIELD DEVELOPMENT AND ENVIRONMENTAL JUSTICE: AN EQUITY ANALYSIS OF REMEDIATION PROGRAMS IN MINNESOTA
Abstract ID: 1062
Poster

DAVIS, Evan [University of Minnesota] davi3739@umn.edu, presenting author

Researchers and activists have documented a long history in the U.S. of communities of color and low income areas experiencing a disproportionate burden of pollution and toxic wastes. In response, some state and local pollution control programs have identified areas of environmental justice (EJ) concern. These areas are typically defined as having more than 50 percent residents of color or more than 40 percent of households with incomes less than 185 percent of the federal poverty level. The government has committed to establishing inclusive decision-making, reducing disparate environmental harm, and supporting these areas with intentional policies and resources.

Other studies have shown the promise of brownfield development as a means to environmental and economic improvement. Brownfield remediation, or the process of decontaminating uninhabitable toxic sites, can help open up new investment opportunities in underinvested areas. Given that under-resourced communities tend to have greater exposure to brownfields, it's possible that targeted funding for these areas would have a considerable social and economic impact.

Drawing on a series of remediation grant programs in Minnesota as a case study, this research investigates the extent to which the brownfield remediation program includes EJ areas. Using GIS, I map the spatial correlation between funded projects and areas of EJ concern.

Next, I explore the criteria for grant applications and analyze the compatibility of environmental justice objectives and project viability assessments. This involves content analysis and comparison of Request for Proposal (RFP) guidelines, Response Action Plans (RAPs), and the environmental justice framework and implementation reports. I argue that the grant-making model precludes many environmental justice areas due to their structural and economic limitations and the narrow project selection criteria.

Finally, I discuss some of the consequences of brownfield development in environmental justice areas. Brownfield development is situated within the larger context of green gentrification and thus may exacerbate existing social and economic inequalities. While brownfield development is a potentially important tool for communities bearing the burden of toxic waste, this research adds to the growing body of literature analyzing its accessibility and equity dimensions. Further research could expand on this preliminary study by investigating the opportunity costs of failing to invest in environmental justice areas.

EXAMINING ENVIRONMENTAL EQUITY BY PUBLIC PARK PROVISION IN POST-INDUSTRIAL CITIES: A CASE STUDY IN HARTFORD, CONNECTICUT, USA

Abstract ID: 1076
Poster

ZHANG, Pan [University of Connecticut] pan.zhang@uconn.edu, presenting author
PARK, Sohyun [University of Connecticut] sohyun.park@uconn.edu, co-author

Regular physical activities help reduce the risk of obesity, diabetes and cardiovascular disease for both adults and children. In addition, outdoor physical activities by contacting with nature benefit mental restoration, stress relief and overall well-beings. Outdoor physical activities in urban area largely relies on urban public parks, which provide ecosystem services and social integration spaces. Morerover, public parks, without requiring entry fees, are part of public-invested urban green space and environmental resources. Given all these benefits public parks have in cities, it is essential to have parks accessible to all populations equally. However, public parks are usually not evenly distributed within the city, and different cities have different composition of demographics and geographical context. Such park provision disparities will, in turn, exacerbate the health disparities.

Although there are a handful of studies examining the park distribution and environmental injustice issues in U.S. large cities, few studies have examined post-industrial cities, which are always identified by urban decay and decentralization issue. Nor is there literature studying park provision in Connecticut cities because Connecticut is less urbanized, less populated and has relatively lower poverty rate. However, post-industrial cities in Connecticut such as Hartford, New Haven, and Bridgeport have higher-than-average poverty rates and high health disparities in populations with asthma, diabetes, and obesity. In this regard, examining the spatial distribution of public parks and its relationship with demographics and social-economic drivers in these cities will inform future land use planning and decision-making process.

This study examined the spatial distribution of public parks in Hartford, CT for populations with different socio-economic status and ethnicity using three parameters: park proximity, park acreage, and park safety. Park proximity was measured by generating what is called Park Service Areas in Geographic Information System (GIS) based on the city street network. Using Geographically Weighted Regression model, we analyzed the difference of park provision by demographics and housing condition variables across 96 census block groups in Hartford, CT. Main findings include that African Americans have closer proximity to public parks than White or Hispanic populations, and block groups with lower median housing values appear to be in closer proximity to the public parks. Hispanic population has less acreage of available parks and more people per park acre. In terms of park safety, the population below poverty line faces higher crime rates in the area around their accessible parks, while owner-occupied housing dominant blocks has less crimes in and around their accessible parks. The results show Hispanic populations are more likely to have park congestion and populations with poor economic condition are less accessible to safe parks.

Future resources for public park development should be invested on improving park safety and adding parks in Hispanic-dominant neighborhoods by transferring vacant lots into green spaces. Public park legacies from 1930s, which remains today, are likely to contribute to the relatively less uneven park

distribution in Hartford, compared with the conditions in other U.S. cities that have considerable disparities among ethnic groups. Future studies are encouraged to examine the spatial-temporal change of public park legacy in Hartford to better inform the public park preservations and expand the scope of research on environmental justice to the Metropolitan Statistical Area (MSA) level.

CHILD-FRIENDLY COMMUNITIES: SPATIAL DISPARITY AMONG SCHOOL NEIGHBORHOODS IN TERMS OF ACCESS TO CHILD-FRIENDLY OPPORTUNITIES
Abstract ID: 1206
Poster

PARK, Amaryllis [Texas A&M University] apark27@tamu.edu, presenting author
LEE, Chanam [Texas A&M University] chanam@tamu.edu, co-author

The influence of built environment on health and related behaviors, such as physical activity (PA), of children is well established. Children's daily engagement with the outdoor environment not only promotes healthy PA, but also facilitates their social, cognitive and emotional development (Duncan, Ziol-Guest, & Kalil, 2010). The existing literature suggests that PA levels are higher among residents with activity-friendly environments. The gradual decline in children's PA over the years has led to an increased focus on the provision of better, child-friendly physical environments, especially in residential neighborhoods (Brown, 2019). However, the potential role of spatial inequality in terms of access to child-friendly environments in the school neighborhood in promoting or restricting children's PA engagement has not been fully examined (Broberg, Salminen, & Kyttä, 2013; Kyttä et al., 2018).

This study aims to examine spatial disparity in terms of access to PA opportunities or child-friendly environmental features among elementary school students. The primary objectives of the study are 1) to identify child- and family-friendly destinations; 2) to examine the association of child-friendly environments with school-level spatial inequalities in racial, economic, academic and health indices.

The study focuses on 77 elementary schools located in school attendance zones in the Austin Independent School District (AISD), Texas. The individual addresses of 8,053 sample students from the schools (average sampling rate of 0.64 from 4th and 5th grade students) were geocoded and used for school-level analyses. A list of child and parent-supportive destinations was created based on the existing literature on child-friendly environments/cities, and the evaluation of business types was categorized in the North

American Industry Classification System (NAICS). The association between child-supportive environments with racial, economic, academic and health indices at the school-level is examined using bivariate correlation analyses and spatial regression models such as geographically weighted regression model. Austin has a variety of destinations that can promote or restrict child development. The defined child- and parent-friendly destinations are categorized into seven domains: recreational; restaurant and food retail; other retail; health; social, cultural and educational; entertainment and active travel destinations. The preliminary results show that the restaurant and food retail category is positively associated with racial and economic indices, indicating that a higher percentage of Hispanic and economically disadvantaged students tend to have more food-related shops around them. Further analyses are required in order to break down healthy/unhealthy options.

As a first step toward developing evidence-based guidelines for child-friendly communities, this study defines the multiple contexts in school neighborhoods (school buffers and school attendance zones) in order to examine the mismatch between SES and available and accessible environmental supports. In addition, the differences between child-friendly and parent-friendly destinations as well as the discrepancies in accessibility to free versus paid facilities are discussed. The study supports future research aimed at creating or retrofitting the school neighborhood to promote healthy child development by encouraging child-friendly communities where children grow and develop holistically.

The Greater Houston region has a chronic flooding problem due to population growth and a sprawling built environment. Government practice to mitigate repeated losses due to extreme flooding has been to buyout homes and properties to improve flood resilience of communities. Residents who have experienced extreme flooding are more likely to agree to a buyout than those who have not, even though they remain at risk of inevitable flooding due to population growth and urban expansion (Robinson, et al., 2018). Recent literature suggests that the flood buyout process may produce patterns of inequity, resulting in the displacement of people of color from areas with high proportions of white and affluent residents (Mach, et al., 2019). Other research indicates the possibility of a white entitlement to buyout programs that inhibits success of disaster resilience for people of color (Benincasa, 2019).

To determine if the Houston area can become resilient to flood losses through a buyout program, we obtained buyout data for the Greater Houston region and mapped those buyouts using Geographic

Information Systems (GIS). We compared the buyout locations to maps of the social vulnerability index, demographics, access to food, and presence of floodplains for the counties that experienced extreme flooding in Hurricane Harvey and had also participated in buyouts from 1997-2017.   Our analysis indicated that people of color have a greater risk of being impacted by floods. It also indicated that buyouts in Greater Houston target marginalized groups more so than the white populations. With the certainty of more frequent and intense flooding, our findings reveals a need for policy revisions in the buyout process for the region to achieve resilience.

Climate change risks are increasing globally, and they are becoming more unpredictable. The Fifth Assessment Report of the IPCC highlighted the importance of climate change adaptation to reduce the climate change risks (IPCC, 2014). In Korea, the national and local governments established the implementation plans for climate change adaptation to increase public awareness and strengthen their adaptive capacity. To effectively manage and reduce the risks from climate change, it is necessary to understand how people perceive the problems caused by climate change risks and what are the driving factors for adaptation actions (Harvatt et al., 2011). Many previous studies have analyzed the relationship between overall climate risk perception and response to climate change, but there is a lack of research on the relationship between risk perceptions and coping behaviors for specific risks such as heat waves, flood, and droughts. This study examines public perceptions and coping behaviors for current and future climate risks including heat wave, fine dust, ozone, drought, landslide, wildfire, sea level rise, heavy snow and flood.

Based on the survey data from 1,200 people, we examine the variations in public perceptions depending on the type of climate risks. This study analyzes the relationship between public perception of climate change risk and behavior for climate change adaptation and damage reduction using structural equation modeling (SEM). Moreover, this study conducts comparative analysis of the impact of risk and education experience, geographic characteristics, and socio-economic characteristics on the risk perception and coping behavior for various climate risks.

The results indicate that risk perceptions for all climate change risks tends to increase over time, and the level of risk perception and their coping behaviors vary based on climate risk characteristics. The results also show that variables affecting risk perceptions and the effects of risk perception on coping behavior

vary from the type of climate risk. This study could provide useful information for the development of climate change adaptation plans and policies for enhancing climate change adaptive capacity.

TRACK 5 – GENDER & DIVERSITY IN PLANNING

TRACK 5 – PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

PLANTATION (HACIENDA) FUTURES IN TEXAS, JAMAICA, AND MEXICO: PLACEMAKING IN THE CONTEXT OF BLACK (UN)VISIBILITY AND ECONOMIC COLONIALITY
Pre-Organized Session 103 - Summary
Session Includes 472, 473, 474

SWEET, Elizabeth [University of Massachusetts, Boston] betsy.sweet@umb.edu, organizer

Black erasure is a thing, but it happens differently in different places. Time, space, and relationship considerations, absent in the philosophical basis of Western thinking (Dussel 2011; 2012; Dues and Fornazzari 2002), intervene and influence how erasure happens and how it is overcome. McKittrick (2011; 2014) uses the term (un)visible to describe erasure. By doing so she suggests that what is visible to some is (un)visible to others thereby removing the permanence and power of those who attempt to erase. At the same time ongoing coloniality (Quijano, 2007), covers up and embezzles the value(s) of Blackness and Black bodies. The ways that black diasporic people experience and respond to erasure and colonial economies is important to understand as planners attempt to retool and reimagine planning practice. Using cases from Texas, Jamaica and Mexico, these panel provide an opportunity to not only see how (un)visibility and coloniality maneuver across the Black diaspora but also how a Black sense of place is a site for witnessing traditions of grassroots planning, and how those practices might inform the reimagination of planning praxis towards alternate futures.

Objectives:

- Query the links between Black erasure and colonial economic structures
- Undo forgetting of Black power and Black strategies of land tenure
- Link slavery and convict leasing to contemporary economic realities

MORENOS/AS AND THE MEZTISO MYTH: SEEING BLACK POWER IN MORELOS, MEXICO
Abstract ID: 472
Abstract within Pre-Organized Session 103

SWEET, Elizabeth [University of Massachusetts, Boston] betsy.sweet@umb.edu, presenting author

Blackness in Mexico has been made (un)visible through a myriad of policies, practices and dominant cultural norms, yet the presence of Africa and its legacies persist. What are the unspoken and buried artifacts of Black culture, society, and political power that are being resurrected and claiming space? My ethnographic work in Morelos, a state with many ex-haciendas where sugar cane is still a principal crop, exposes Blackness in plain sight. Traditional Chinelo dancers with dreadlocks and the famous march of the widows in which men dress as bereaved women at the city of Yautepec's carnival, are glimpses into a rejection of Eurocentric colonial values. Morenos/as at the kitchen table laughing and joking in the face of

discrimination and violence poke fun at the dominant meztiso myth. The economics of survival in the face of Black erasure propel an emerging story that Africa is not the third root of Mexico, but indeed the first root. Embracing Africa's rhizomic presence in Mexico enables us to employ Tiffany King's use of Black Fungibility which she describes as an ". . .open-ended analytic accounting for both Black abjection and Black pursuits of life in the midst of subjection" (King 2016:1024). Although Black bodies in Mexico are principally seen as manual labor or as a commodity, this paper argues that the spaces of fun and vibrant laughter are in fact an important part of creating visibility and geographies of possibilities ". . . with the capacity to transform conditions of subjection" (King 2016: 1024), and behold Black power.

HAUNTING AS AGENCY: A CRITICAL CULTURAL LANDSCAPE APPROACH TO MAKING BLACK LABOR VISIBLE IN SUGAR LAND, TEXAS
Abstract ID: 473
Abstract within Pre-Organized Session 103

ROBERTS, Andrea [Texas A&M University] aroberts318@tamu.edu, presenting author

This paper contextualizes the most recent discovery of 95 forgotten graves of incarcerated laborers at a public school construction site within ongoing tensions around public history, race, and development in Sugar Land, Texas, a Houston-area bedroom community. Unearthed along with the graves is the state's long history of Black labor exploitation, from enslavement to convict leasing to employment with Imperial Sugar. In this article, I engage the haunting of Black laboring bodies in the landscape from the perspective of both that of a researcher and former resident of Fort Bend County confronted with the purposeful forgetting of Black geographies, bodies, and lives. I expose through critical analysis of government documents, online digital exhibits, maps, photos, and autoethnographic recollection of the area, the haunting of Black laboring bodies in not only the site of burial discovery but also two sites within the Sugar Land cultural landscape: Mayfield Park and the Imperial Sugar Refinery. I argue developers and government agencies perpetuate a mythic local history that, until the discovery of the 95, allowed them to disassociate itself from Sugar Land's history of Black labor exploitation before its incorporation as a city. The 95's haunting allows for an inventive awareness of the Black laboring bodies and thus redefines the cultural landscape rooted in plantation logics as a Black geography. I conclude with a discussion of the ways Black laboring bodies' haunting creates a space for a critical cultural landscape solution.

THE PLOT: SUSTAIN, REFUSE, PLAN
Abstract ID: 474
Abstract within Pre-Organized Session 103

GOFFE, Rachel [University of Toronto] rachel.goffe@utoronto.ca, presenting author

Contemporary talk about Jamaica reverberates around ongoing crises—of the economy, politics, safety and civility, a discourse in which informal settlements appear as barriers to development. In 2008 an elected official declared that one-third of the population are illegal squatters. While scholarship about informal settlements elsewhere tends to understand displacement as a project of the neoliberal state, the enormity of the number who are now deemed illegal begs the question: how did so many Jamaicans come to occupy land through durable yet insecure tenure, and how does policy to transform the regulation of land result in reconfiguring Black life? Through ethnographic research in an evicted community, this paper shows how the boundary around the formal economy is reconfigured, putting into question longstanding practices known as land capture. Rereading Jamaican historiography, the paper argues that this relation comes into being through the production of a Black labor force, self-sufficient and yet ready-at-hand, sustained through small parcels of land that Sylvia Wynter dubbed the plot. Not without land, but without ownership, Black Jamaicans have imbued the plot with itineraries that exceed sustenance. Following Wynter, the plot is read for multiple agenda: the plot of land, the plot to rebel, and the plot as alternative narrative. This work provides a generative framework for interrogating postcolonial state formation in relation to making the boundary of the "informal," an edge that postcolonial and Black Atlantic life straddles and reworks.

PLANNING BEYOND THE GAYBORHOOD
Pre-Organized Session 135 - Summary
Session Includes 663, 664, 665, 666

DOAN, Petra [Florida State University] pdoan@fsu.edu, organizer

Ghaziani (2019) has argued that too often the default conceptualization of queer urban spaces is the gayborhood. In reality it seems same sex partners are nearly everywhere according to US Census data from 2010 that shows same sex partners (and married same sex couples) residing every type of census district (urban, rural, peri-urban) in every state. While Collins (2004) linear model of gayborhood development may have accurately described the trajectory of gay residential patterns in the late 20th century, this model does not provide much useful information for planners seeking to ensure safe spaces for the broader LGBTQ community both in the United States and elsewhere. The papers in this session

explore alternative ways to conceptualize the development of queer spaces and the businesses and planning strategies that support them.

Objectives:

- Understand planning needs of the LGBTQ Community
- Improve planning outcomes for gayborhoods

CENTRIPETAL AND CENTRIFUGAL FORCES AND QUEER SPACES
Abstract ID: 663
Abstract within Pre-Organized Session 135

DOAN, Petra [Florida State University] pdoan@fsu.edu, presenting author

Ghaziani (2019) has argued that too often the default conceptualization of queer urban spaces is the gayborhood. The most visible gay villages that emerged in the late 1960s have attracted a good deal of academic research even though those spaces are mostly populated by white gay men. This narrow focus on one type of neighborhood has frequently eclipsed research on other types of LGBTQ areas as well as other geographies beyond the global north. For instance, Collins (2004) used the example drawn largely from the Soho neighborhood of London to argue for a linear stages model from marginal area to emergence then expansion and diversification, and finally to integration. In contrast, Ruting's (2008) study of gayborhoods outside Sydney suggests that the linear model is not always useful.

This paper critiques the linear model of queer spaces and seeks to develop a more robust model that might be potentially useful across the north-south divide. Urban spaces are always subject to a variety of forces and in the case of gayborhoods we suggest that each such place might be usefully analyzed in terms of the social, economic, and political pressures that act upon it. These influences might be described using a basic conceptual framework derived from physics: centripetal and centrifugal forces. This framework allows for the identification of centering (centripetal) and decentering (centrifugal) forces and the interplay between these forces is likely to be unique to each LGBTQ space analyzed, providing for more generalizability across different sizes of cities, across various cultural and ethnic areas, and a wider array of geographies.

This paper uses evidence from Atlanta and Tampa to explore how the interplay of these forces might explain the phenomena described in Doan (2019) of LGBTQ individuals who end up selecting and queering other neighborhoods at some distance from the queer focal area, though they still are drawn to the center for periodic entertainment and community gatherings.

QUEER SPACES IN ISTANBUL – AN EXPLORATION OF CONFLICTING FORCES
Abstract ID: 664
Abstract within Pre-Organized Session 135

ATALAY, Ozlem [Florida State University] oa17b@my.fsu.edu, presenting author
DOAN, Petra [Florida State University] pdoan@fsu.edu, co-author

Gayborhood formations that started in the late 1960s and for the most part continue into the early part of the 21st century have been the focus of scholarly research. Case-based descriptions of gayborhoods in large metropolitan areas have been used to describe "models" of gayborhood formation focusing on their emergence, rise and decline (Collins 2004; Ruting 2008). Furthermore, future of gayborhoods are also questioned through the discussions of the "post mo" (Nash 2013) or "post gay" (Ghaziani 2014) identities and proliferation of homonormativity.

However, this hyper focus on certain spaces often populated by white gay men in western geographies has dominated research on other types of LGBTQ spaces as well as other geographies beyond the global north. To understand the life of gayborhoods we would like to avoid linear models of change that are based on limited experience largely derived from western Europe, North America, and Australia. To do so, we develop the "centripetal and centrifugal forces" model which allows for the identification of centering (centripetal) and decentering (centrifugal) forces that are effective on the formation of queer spaces at differing visibility, concentration and time levels.

We utilize this model to explain the changes in Istanbul, Turkey using in depth interviews conducted with the members of the LGBTQ community and analyzing the archives of LGBTQ organizations as well as relevant newspaper coverages. Although the wider social and political context have created significant pressure on LGBTQ individuals to "not" be visible in most contexts in Turkey, people still carve out their own spaces, creating ephemeral, fluid, subtle, visible and known only to the "community" queer spaces that an outsider could not easily realize (Atalay and Doan 2019). We cannot read the linear 'emergence, rise and decline' model of a gayborhood formation, but we know the queer spaces in the district have been affected by the gentrification processes, changes in socio-economic conditions, and the built environment within the last 30 and particularly 15 years. And our 'centripetal and centrifugal forces' model assists us understanding these changes queer spaces have been experiencing within their particularities.

The utility of our model lays in its power of revealing the complex dynamics among various forces and their affects on the queer spaces which are quite different from each other across different geographies. While linear models are useful in pushing us to focus on queer spaces, the narrow and homonormative focus on a single end point (assimilation of LGBTQ people in wider society) is problematic. On the other hand, our model urges us to look at a wider variety of ways that community are formed and may be formed in the future at different levels of visibility in a variety of political and cultural contexts.

We also recognize that there are complex dynamics of forces operating at different layers and scales. In effect we argue for a queering of the unilinear model that seeks to "transform the material relations of oppression…[and] harness the productive power of representation and discourse to produce social space through performance and parody that explode the restrictive, oppressive grammar of binaries" (Foucault 1977 as cited in Derickson, 2009, p.4).

MAINSTREAM-ORIENTED BUSINESSES AND INSTITUTIONS SERVING LGBTQ PEOPLE IN SMALLER CITIES

Abstract ID: 665
Abstract within Pre-Organized Session 135

WHITTEMORE, Andrew [University of North Carolina at Chapel Hill] awhittem@email.unc.edu, presenting author

LGBTQ people in the United States (US) live in a time of increasing acceptance and assimilation, with many of them feeling comfortable living, working, and socializing more authentically and visibly in a variety of locales including suburbs, small towns, and other areas not associated with their communities in earlier decades. Still, this assimilation is not without its limits, and this may be all the more true for gender non-conforming people, LGBTQ people of color, and LGBTQ people without economic privilege (Ghaziani 2019; Goh 2018). In a time when many traditional centers of LGBTQ life are on the wane (Ghaziani 2014), some scholars have found evidence that many LGBTQ people, due to anti-assimilationist sentiments, gender identity, or intersecting class, racial, or ethnic identities, feel left without spaces where they can safely seek the level of self-affirmation, self-expression, and opportunities for organization that many cis-gendered, white middle-class gays and lesbians enjoyed in the "gayborhoods" of yore (Doan and Higgins, 2011). Scholarly understanding of the relative inclusivity of smaller US metropolitan areas, that never even had gayborhoods in the first place, is even murkier.

This paper explores the extent to which mainstream-oriented businesses and institutions position themselves to serve the practical needs for safety and social spaces among LGBTQ people living in a smaller metropolitan area of the generally conservative Southeastern US. The paper describes the built environment, demographic, and political characteristics of the areas where these entities cluster, and also locates them in respect to two distinct, somewhat opposed theorizations of their social potential. In one theorization, these business and institutions foster 'homonormative' spaces oriented toward a de-sexualized, white- and middle-class dominated, consumption-oriented gay citizen (see Bell and Binnie, 2004), while in the second these businesses and institutions are seen to adopt practices that foster physical and emotional safety, self-affirmation, self-expression, and social opportunities for a wide spectrum of LGBTQ workers, patrons, and visitors.

Research involved surveys of seven business districts across four counties composing the Durham-Chapel Hill MSA, in the US state of North Carolina. Surveys identified publicly visible indications of LGBTQ supportive spaces across these districts; for example, a rainbow "safe space" sticker on a storefront. Surveys revealed considerable variation in the number of businesses displaying LGBTQ-friendly symbols between districts with different built environment characteristics, and between districts within relatively more and less conservative counties. Interviews with owners and employees of businesses displaying public indicators of supportive spaces generally demonstrated that these businesses do offer safe and supportive environments for a wide spectrum of LGBTQ people, although certainly exceptions and room for improvement exists.

PLANNING FOR LGBTQ INCLUSION IN THE U.S. PUBLIC REALM
Abstract ID: 666
Abstract within Pre-Organized Session 135

FRISCH, Michael [University of Missouri-Kansas City] frischm@umkc.edu, presenting author

LGBTQ folks still face public discrimination in the United States. How then can the profession of urban planning act to increase LGBTQ inclusion within the public realm? This work provides a framework for urban planners to assess their own policies toward increased inclusion.

The role of the closet and gender presentation within public space and public planning processes has to be examined. Existing planning systems reinforce heteronormal understandings of the public realm (Frisch 2002). Public processes still reward the closet. Furthermore, public space still remains formally and informally regulated around notions of cis-gendered identity (Doan 2010). This paper will analyze the discourse on these issues.

Opponents claim that LGBTQ inclusion leads to their own exclusion (Eskridge and Wilson 2018). State legislatures and Federal courts debate these claims. Differential claims to the public realm must be analyzed within the structural frameworks of power in society (Fraser 2010). Opponents' discourse reproduces the power relationships of the closet and cis-gender presentation in the public sphere. Full LGBTQ inclusion then requires recognition.

In conclusion this paper identifies actions the urban planning profession can take to build this full recognition necessary to increase inclusion. These actions include measures addressing planning processes as well as institutional initiatives that promote inclusion.

Multicultural planning is planning for diverse publics. It is an approach to reasonably accommodate the identities and cultural/ religious differences of people in city-building activities. Just over two decades Mohammad Qadeer published his seminal work in 1997 on multicultural planning in the Journal of American Planning Association. He documented the types of cultural issues Canadian cities faced and how the planning system responded to them. Given the rise in transnational migration over the past two decades and the changing settlement patterns of immigrants beyond large gateway cities, it is time now to take stock of how and even whether our cities and rural regions have made further progress on this front.

The proposed roundtable will bring together academics and scholars from Canada and the US to discuss and debate the evolution of multicultural planning and the ways and means by which North American cities have accommodated the needs of racialized minorities and disadvantaged groups both inside and outside the 'cosmopolis'. The roundtable intends to discuss both planning theory and practice using examples and illustrations to gauge how inclusive our cities and rural regions have become since the mid-90s. The discussions will attempt to answer the following few questions: What is multicultural planning? Is it a separate genre of planning? How are Canadian and American municipalities responding to their changing demographics and in creating inclusive spaces? Has one country or region done better than the other?

Google Trends shows a preference for the word Latino, which peaked in 2010. In 2016 the term Latinx achieved 1% hits with a peak in 2019 (4%). In 2019, in comparison, the ethnonyms Hispanic and Latino were used 48% and 51%, respectively. As of August 5, 2019, in JAPA peer-reviewed articles, book reviews, and other writings, the term Hispanic had been used 238 times and Latino 124 times. Meanwhile, Latinx had been mentioned twice. Similarly, on APA's website, including Planning Magazine, blogs, webinars, conference panels, and social media, there were 108 entries for Hispanic, 128 for Latino, and 11 for Latinx—some of the content was sponsored by APA's interest group Latinos in Planning.

Based on JAPA's and APA's Latinx stats, which reflect what's submitted and accepted, we can conclude that planners are either not aware of the shift from Hispanic to Latino/a to Latinx or they are slow-adopters. One of the purposes of this article is to justify why planners should be aware of cultural trends. But, as demonstrated above, Latinx is not widely used. If Hispanics/Latin/o/a/x communities do not embrace the term, why should planners think about its use? Would adopting Latinx make planners out of touch? There is a tension that planners experience between adopting a term before gaining extensive recognition and be perceived, on the one hand, as tone-deaf technocrats who do not understand the communities they are trying to serve or, on the other hand, as ignorant, prejudiced, or bigoted.

Why should planners care about the changing nature of these ethnonyms? In 2017 there were 58.9 million Hispanics/Latin/o/a/x in the U.S. constituting 18% of the total population. This figure may represent a big undercount given that about one in ten adults who could have marked "yes" to the Hispanics/Latin/o/a/x question marked "no"—this is about 5.8 million people. Unauthorized populations are rarely captured by Census counts. Besides population growth, figure 1 presents five facts that show why planners need to understand better Hispanics/Latin/o/a/x.

Since planners are expected to communicate and plan for/with members of this growing ethnocultural group, this viewpoint is intended to help planners understand the evolution of these categorizations. One crucial step in becoming culturally competent or increasing one's cultural humility is to acknowledge differences. Thus, it is essential to understand that Hispanics/Latin/o/a/x are not a monolithic—they come from different ancestries, could be native or foreign-born, are citizens, non-citizens, authorized or unauthorized and, identify as Hispanic, Latino, Latina or Latinx. Failure to not understand history, cultural differences, and nuances can result in friction, hostility, and marginalization. This roundtable asks three questions (1) why do planners need to understand Hispanics/Latin/o/a/x/ better?, (2) how can planners understand the evolution of Hispanic, Latino, and Latinx terminology? and, (3) which strategies can help planners to decide which terms to use? In what follows, the participants examine where these descriptors originated and their relevance in planning practice and education. The article offers recommendations for practicing planners, including hiring diverse planners, asking community members about their preferred terms, preparing trainings, hosting conversations, mapping identities, and creating equity plans at the department or city level.

TRACK 5 – INDIVIDUAL ABSTRACTS

"GENDERED" PARKS AND PLAYGROUNDS – A CASE STUDY OF KARACHI, PAKISTAN THROUGH THE LENS OF RELIGION, CULTURE, SES, AND PLANNING PRACTICES."
Abstract ID: 121
Individual Paper Submission

SADAF, Afsheen [University of Florida] afsheen82@ufl.edu, presenting author

Physical activity is suggested as an effective guard against increasing wave of overweight and obesity across the globe. A large body of previous research indicates that the women participation in PA outside is not comparable to their counterparts and use of outdoor open spaces is strongly gendered. Earlier case studies of several urban locations also suggest that women involvement of PA outdoor is considerably suppressed by various reasons such as fear of safety, sexual assaults, distance to parks/playgrounds and presence of opposite gender. Also, some of the case studies done on female children concluded the similar findings. Similarly, playing sport too has predominantly been a men domain and maintained what is referred to as "hegemonic masculinity".

This case study focuses on how cultural and religious beliefs intersecting with SES and planning practices play an important role in creating gendered open spaces in the city of Karachi, a mega city of Pakistan with an estimated population of more than 23 million people. This study aims to explore the 'gendered' character of the parks/playgrounds with the help of three lenses: first, the role of 'Socio-economic Status'; second, 'Religion and Culture'; and third, 'Planning Practices'. While taking the ground of planning practices in Karachi where a very common pattern has been sought i.e. grouping open spaces (parks/playgrounds) together with mosques, we analyze the hypothesis that 'low-income neighborhoods/high poverty areas have less outdoor PA participation by women' with respect to our context as a result of this grouping. During the two prayers times (Asr & Maghrib), which usually coincides with peak hours of parks/playgrounds use (2-4 hours before sunset - seasonal variations count), these open spaces become completely occupied with men; a practice which deters the women to come outside and use these spaces due to strict cultural and religious boundaries set by religious clerics.

We aim to conduct a random survey of all kinds of neighborhood parks/playgrounds whether large or small (approx. N = 45-60 and at least n = 15-20 for each SES), in all three SES in Karachi urban areas where we found this grouping and count the total no of male and female participants including children of four years and above. A quantitative and qualitative analysis is conducted to examine the difference in PA outdoor between two genders with reference to each SES. The data is geo-coded and analyzed in ArcGIS/GEE, supported by detail photography of each selected park/playground during specific timing of peak use. The city population is widely diverse with respect to race and ethnicity as well as distinctly divided into neighborhood which belongs to different SES such as 'High-income', 'Middle-income', 'Low-income' and 'Informal Settlements/Slums'. Due to the controversial nature (illegal occupation) of informal settlements/slums on public land as well as absence of formal neighborhood plan; these settlements were excluded from the study.

This case study attempts to investigate a rather unique perspective of a planning process which has been found to render a gendered character to open spaces, consciously or unconsciously, in the city of Karachi. It will also add a new dimension in this area of research where racial, social, cultural and other planning processes have been studied and documented but the religiously rooted issues were not addressed at all. This might have happened because of difference in demographic characteristics as Pakistan is predominantly a country of mono faith population (97 % Muslims) as well as planning practices indigenous to an area. This research is likely to pave the way for future studies to investigate this new

dimension, wherever possible, to apply and compare its validity across the different regions of developing and developed world.

OCCUPATIONAL ASSIMILATION OF US IMMIGRANT
Abstract ID: 184
Individual Paper Submission

LEE, Annie [Rutgers, The State University of New Jersey] a.lee@rutgers.edu, presenting author
RODGERS, William [Rutgers, The State University of New Jersey] wrodgers@rutgers.edu, co-author

Due to data limitations, most research on US immigrants only examines the immigrants' economic performance post immigration. This approach may underestimate the immigrant's human capital obtained in the source countries. When immigrants migrate to new countries, immigrants' skills attained from the source country do not perfectly transfer to the new labor market (Akresh, 2006; Akresh, 2008; Banerjee and Phan, 2015; Chiswick et al, 2005). Similarly, US immigrants' occupational status drops when they first relocate to the new labor markets. As they stay longer in the destination-country, immigrants gradually assimilate to the new labor market and their occupational status gradually improves (Akresh, 2006; Akresh, 2008; Banerjee and Phan, 2015; Chiswick et al, 2005). Even though immigrants' occupational status improves as they assimilate to the new labor markets, immigrants' status could be still lower than their pre-immigration status. This implies that immigrants' human capital is not fully utilized. Therefore, it is important to examine how immigrants' occupational status changes before and after their move.

This paper uses the New Immigrant Survey (NIS), which provides US immigrants' pre and post immigration conditions, and estimates OLS & Heckman selection models to identify the occupational trajectories of US immigrants. We follow immigrants from the year 2000 to 2009 and find that immigrant occupational status follows a U-shaped pattern. Specifically, we trace down immigrants' occupational status in four periods; B1(last year employed abroad), A1(first year employed in the US), A2(2003) and A3(2009) periods. When US immigrants move to the US, they experience a sharp decline in their occupational status; Compared to the B2 period, immigrants' average occupational status dropped 17% in A1 period. After the move, immigrants gradually assimilate into the US labor market; Compared to the A1 period, 3% of the immigrants' occupational status increased in A2 period. Compared to the A2 period, 6% of the immigrants' occupational status increased in the A3 period. Our analysis reveals that immigrants' occupational status in the A3 period is lower than their pre-immigration occupational status (B1 period). This suggests that it is difficult for immigrants to recover their prior occupational status, even though some of them have resided in the US for almost ten years. The US is one of the largest immigrant-

receiving countries and immigrants play a crucial role in the US labor market. This result emphasizes that we need immigrant policies that help immigrants' assimilation process.

MOVING TOWARDS SAFETY: STUDENT'S PERCEPTION AND EXPERIENCE OF UNIVERSITY TRANSIT
Abstract ID: 246
Individual Paper Submission

MENDEZ, Joel [University of Kansas] JMendez2@ku.edu, presenting author

Public spaces and services are meant to be equally accessible to members of the community. The reality is that how one navigates and experiences these elements can very much be influenced by their race, gender, and/or sexual orientation. Studies which explore how public transportation service is experienced by members of the community at large commonly share one conclusion, women are less likely to feel safe in transit environments. This fear can lead women to make significant behavioral changes in hopes of reducing their risk of victimization. One common change that is made is the reduction of transit use. This decision can have adverse impacts on the quality of life of members of this segment of the population as it can significantly limit their mobility and access to essential services. Within a university environment, this decision can impact the college experience for women as it can limit both academic and social opportunities. When members of the student body do not have equal access to such opportunities, equality has not been achieved.

This study seeks to explore the female student body's experiences and perceptions towards university transit service. Particular attention is placed on examining how their perception of this service impacts their educational experience. Questions which drive this study include: 1) How do female students perceive their personal safety within university transit spaces? 2) What factors impact the perception of their personal safety? and 3) How do female students navigate these spaces as a result of their perceived safety?

Necessary data to conduct this study was collected via a university wide survey and student interviews at one major university. These methods are geared towards seeking participants' perceptions and assessments of travel on university transit services. The deployment of a university wide survey allowed the research to see how the travel behavior of members of the female student body varied from that of their male counterparts. The survey also allowed the researcher to identify any deviations in behavior which may be influenced by a respondent's race, gender, sexual orientation, or other personal characteristics.

Findings from this study will allow university transit agencies to gauge how effectively serving the needs of vulnerable members of their ridership base. This can inform planning and policy decisions that may contribute to the delivery of services that more adequately serves the needs of their patrons and expands

opportunities available to women within a university environment.

This study will inform a larger study which seeks to explore the prevalence of these issues at a national level. This will see the inclusion of the experiences of members of the student body at numerous universities throughout the country.

Illicit massage parlors purport to operate as legal businesses but serve as sites where sexual services are illegally bought and sold. Conflicts over these sites stem from community members who find them to be a public nuisance pitted against immigrant women workers who see massage parlor work as their best path for economic survival. Illicit massage parlors are a prominent aspect of the "indoor" (or "off-street") sex industry, now the most prevalent form of the sex industry (Sanders et al., 2009). Despite this growth, most research has focused on street prostitution (Lever et al., 2005). The growth in the industry has been traced in part to more aggressive policing of street-based prostitution, driving the sex industry into indoor venues and to the use of the Internet to connect clients and women working in the sex industry (Murphy and Venkatesh, 2006). Although "red-light districts" have long existed in cities (Hubbard and Sanders, 2003), illicit massage parlors have become more ubiquitous, moving into higher income areas in New York City (NYC), such as Midtown, and into middle-class immigrant areas in Los Angeles County (LAC), such as suburban Chinatowns. An Urban Institute study of medium-sized cities in the US found that the underground commercial sex economy was in some cities connected to sex trafficking, drug trafficking, and gang involvement (Dank et al., 2014).

To develop a conceptual model of inequality using structural, physical, and sexual violence as an important core element, we interviewed 116 Chinese and Korean women from October 2014 through July 2016 who provided sexual services in illicit massage parlors in New York City or Los Angeles County.

Participants were recruited through massage parlors, courthouses, ads in ethnic newspapers, online ads, and referrals from social services. The 60- to 90-minute interviews were conducted in language by trained bilingual interviewers. The participants were provided with a $100 incentive to compensate for work time lost.

The analysis indicated that many women carried out their work for the most part without violent or coercive incidents. However, 18% said that a client had hit them or otherwise hurt them physically in the last year, and an alarming 40% of study participants said that a client had forced them to have sex in the last year. These women are isolated from police protection because of the criminalization of prostitution and often their undocumented immigration status. Their fear of arrest for prostitution almost always superseded their fear of being robbed or assaulted by clients.

We propose a conceptual model of inequality that prioritizes attention to structural, physical, and sexual violence using the following elements: illicit massage parlor work as a labor issue (i.e., recognizing the less visible elements of urban globalized economies); illicit massage parlor work as a part of the larger immigrant story of survival (i.e., explained by many of the same dynamics shaping other immigrant experiences, rather than an anomaly); and illicit massage parlor work as a law enforcement reform issue (i.e., raids and arrests do not reduce or end illicit activity and exploitation, and instead, women are further victimized, and employers, clients, and other actors leverage fear of law enforcement to exploit women workers).

INDIGENOUS MOBILITY IN AN ERA OF MISSING, MURDERED AND INDIGENOUS WOMEN
Abstract ID: 299
Individual Paper Submission

HILL, Margo [Eastern Washington University] mhill86@ewu.edu, presenting author

There are thousands of deaths and disappearances of Native women and girls. These native women and girls vanish from tribal lands, rural communities and cities with no official accounting. Native Americans have unique mobility patterns as they travel from rural tribal territories to urban centers. The issue of safe travel for native girls and women involve indicators of health and risk factors. Tribal people are impacted by historical trauma, grief and loss of loved ones due to war, boarding schools, foster homes, forced assimilation, inadequate health care and bias in schools and legal systems. There is structural discrimination that exists in laws, public policies and institutional practices. We need to understand how these social structures have worked to devalue the lives of indigenous women and girls. The complicated jurisdictional scheme of Indian Country makes it difficult to protect native women. Tribal communities range from urban centers to the large land base reservations with rural, and isolated communities that exist with limited or non-existent Law Enforcement resources.

TRANS IN TRANSIT: PUBLIC TRANSPORTATION EXPERIENCES OF TRANSGENDER PEOPLE
Abstract ID: 369
Individual Paper Submission

GUY, Tam [University of California, Los Angeles] tamjguy@gmail.com, presenting author

Overview of research

Transgender and nonbinary identities are only recently being spoken of and acknowledged by the larger public. Often conveyed through the umbrella term trans, gender identities beyond the binary assigned at birth include, but are not limited to: transgender, nonbinary, two-spirit, genderqueer, genderfluid, gender non-conforming, pangender, agender, bi-gender, and third gender. It is vital to understand trans experiences as a part of planning resilient cities, equitable to everyone. The Southern California region, particularly Los Angeles, has been investing heavily in public transit as a part of the solution to reduce greenhouse gas emissions. Yet, not all groups of the public experience transit in the same way. For instance, studies show women as less likely to take transit due to perceptions and experiences of harassment and assault (Hsu, Boarnet, & Houston, 2019; Loukaitou-Sideris & Fink, 2009). Indeed, studies of power dynamics and space often focus on gender (Lubitow et al., 2017). Yet, the experiences of trans people in public spaces remains understudied, specifically as it pertains to transportation. A 2015 survey in the U.S. by National Center for Transgender Equality (NCTE) revealed that 34% of over twenty-seven thousand people who identify as trans reported experiencing unequal treatment or service, harassment, or assault on public transit (NCTE, 2015, p. 214). Understanding the experiences of people who identify as trans can inform policies, processes, and design in transportation planning.

Research question

What is the experience of taking public transit for people who identify as trans?

Research methodology + data source

This project required primary data collection. I conducted semi -structured interviews, approximately 1

hour each with half-hour follow-up interviews, with 6 people. I received IRB approval prior to recruitment. I recruited participants via UCLA's LGBT resource center and social media. Inclusion criteria were that participants use public transit at least once per week and identify within the trans umbrella. For this sample, I purposefully sought a diverse array of gender identities and expressions, as well as diverse racial and ethnic identities. As I myself identify as genderqueer and trans masc, I kept a reflexivity journal throughout the process. I transcribed the interviews. I will code and analyze the data for themes (software assist to-be-determined), ultimately writing a paper on the experiences revealed. The limitations of this study include its lack of generalizability, the possibility of a student-majority sample, and self-selection bias for participants willing to share their experiences.

Findings

Research in progress, paper to be finished by August 2020.

Implications and actionable conclusions

This is a pilot study for my dissertation. Since the transportation experiences of people who are transgender are understudied, a pilot study will help to generate robust interview instruments as the basis for a larger, mixed-methods study.

I expect the public transit experiences of people who hold trans identities will highlight issues for this group and its subgroups in the unique public spaces of transit. Knowing what is happening to people and how they deal with it on (or avoid) public transit can inform policies and procedures to make transit equitable in practice. It could inform instruction regarding the use of public space more broadly.

SINGLES IN CITIES: FEAR OF UNCERTAINTY AND COMMUNITY PARTICIPATION AMONG SINGLE WOMEN IN TOKYO
Abstract ID: 398
Individual Paper Submission

MATSUMOTO, Naka [Meiji University] nakam227@gmail.com, presenting author

In the past several decades, the number of single-person households in the city centers of large metropolitan areas has significantly increased (Klinenberg, 2012). Though socioeconomically, racially, ethnically, and generationally diverse, individuals in such households are often considered to be temporary residents with weaker ties to their neighbors and are viewed as being unengaged in neighborhood activities (Putnam, 1995). These factors may have a negative effect on neighborhood well-

being. Through an examination of such trends in Tokyo, Japan, this paper explores the social relationships singles have within and outside of their neighborhoods, as well as how the nature of such relationships influences a neighborhood's condition.

Though the population of Japan is aging and shrinking, Tokyo has been growing steadily. This is due in large part to an influx of younger generations from outside the region, given the city's high concentration of businesses and institutions of higher education (Ronald & Hirayama, 2009). In the past, as younger generations aged, they advanced economically and formed families composed of a working husband, a homemaker, and multiple children. These families also purchased houses, and the high instance of homeownership that resulted created a sense of stability in neighborhoods (Rohe & Stewart, 1996). However, in recent decades more people have stayed single. Both the academic literature and government reports suggest that the economic independence of women (as a result of an increased number of women in the workforce) and growing economic uncertainty (given that men can no longer support an entire family as solo breadwinners) are the major reasons for females and males staying single; marriage is no longer economically essential, and can even be considered a burden (Retherford, Ogawa, & Matsukura, 2001)

Without close family members around for support, singles may have limited social relationships, participate in neighborhood activities less often, and even become heavily reliant on social assistance in old age. In Japan, the impact on women might be greater, as a persistent gender pay gap makes it more difficult for many to save enough for retirement. In addition, a single woman is traditionally viewed as "abnormal" or as a "loser dog" (Sakai, 2003), which may exacerbate social isolation. Using recent survey data of approximately 2,600 singles age 35–64 living in central Tokyo, the paper explores the social relationships and neighborhood engagement of singles—particularly women—and discusses how their activities influence neighborhood well-being.

The results indicate that social relationships are influenced by a single person's gender and age cohort, as well as their parents' socioeconomic status and proximity to relatives and close friends. While single women age 50–64 have relatively active social relationships, both within and outside of the neighborhood, and feel less fear regarding the future, younger women between 35 and 49 tend to withdraw from neighborhood activities and worry more about finances, housing, and isolation. Uncertainty about the future related to social change and the threat of natural disasters, for example, and negative social perceptions associated with being single women, prevent them from participating in neighborhood activities and expanding their social networks. At the same time, younger single women do not completely avoid participating in neighborhood activities, as men often do, and remain open to the idea of remaining in the neighborhood as long-term residents.

Based on the results, this paper advocates for the engagement of local governments and neighborhood organizations in efforts to include singles—especially those who are younger women—in neighborhood activities. It also highlights as key to neighborhood well-being the elimination of economic gender gaps and a shift in social norms regarding family composition.

GOVERNING DIFFERENCE: URBAN POLICY AND MANAGED MULTICULTURE IN SINGAPORE
Abstract ID: 480
Individual Paper Submission

KHOO, Louisa-May [University of British Columbia] louisamayk@gmail.com, presenting author

This paper is about the governing of difference, and interrogates the role of the State in shaping the encounter experience of everyday multiculture in Singapore. As much as relations across difference are always visceral, affective and becoming, I contend that more attention needs to be paid to the rhythmic and systemic ways through which such encounters are negotiated and performed. I explore how the Singapore State manages diversity with a toolkit encompassing spatial interventions through urban planning and design, social policy and conceptions of 'othering', to consider the extent to which people are able to develop capacities to live with difference more widely. I draw on Mitchell Dean's (2010) work on governmentality as a conceptual scaffold to illuminate how the 'art of government' (Foucault, 1991) is practiced to manage difference in Singapore. A 'graduated sovereignty' (Ong, 2000) thus results when groups are subjected to different regimes of value (and punitive technologies) on account of their varying nationality, gender, ethnicity and human capital skills. This paper explicates how such 'graduated sovereignty' between and amongst the local citizens and foreigner segments of the populace play out socio-spatially in Singapore. In doing so, I examine if Gordon Allport's (1979) claim in his contact hypothesis that institutional supports mitigate intergroup prejudices, holds true.

Focusing on encounters (and non-encounters) across difference in everyday spaces within public housing and private housing neighbourhoods in Singapore, I highlight how such encounters are always embedded within the material organisation and social context of the specific neighbourhood and the State's larger discourse on difference, driven by Singapore's historical legacies and manifested in urban planning initiatives and housing regulations. I also draw on rationalities behind Singapore's urban policies through interviews with politicians and bureaucrats, as well as my tacit knowledges living and working as an urban planner in Singapore, to ask: How does urban policy shape encounters in everyday spaces? More significantly, how can urban policies be better mobilised to enhance people's capacities to learn to live with difference? In doing so, I make three claims. First, I argue that planning and policy initiatives influence intergroup socialities. In foregrounding the role of government agencies, my argument is not that we should dismiss the messy underside of intercultural relations but that scholarship on diversity needs to address practices of government (and its lack thereof) pertinently. Second, I believe the Singapore case is testimony of Allport's contact hypothesis, despite critique otherwise of its simplicity (e.g. Valentine, 2010; Matejskova and Leitner, 2011). Finally, I advocate that policy interventions can potentially enhance people's capacities towards intercultural learning and living with difference. The excesses of everyday life, particularly when habitualised choreographies and thinking are tested and breached, can enable a 'micropolitics of self-modification' (Connolly, 2002) to emerge. However, an ethos of tightly managed multiculture could also limit this possibility. It is my hope that insights drawn from the Singapore case, towards a better understanding of how and why urban governance may variously limit and foster a living with difference, may resonate and provide takeaways for the experiences of urban socialities in cities elsewhere.

EXCAVATING THE PROCESSES OF RACIAL FORMATION: BRIDGING ANTE-AND POST-BELLUM SPATIAL FRAMES IN CENTRAL VIRGINIA
Abstract ID: 560
Individual Paper Submission

DIAMOND, Alissa [University of Virginia] au2c@virginia.edu, presenting author

This paper studies the city of Charlottesville Virginia through the question: what successive racializing assemblages are in operation in cities over time, and can this examination begin to bridge gaps in planning and design theory across antebellum/postbellum and rural/urban divides? Using mapping and critical landscape analysis, this study focuses on Charlottesville's spatial and political systems of racialized power through a series of discrete time points that span from before the Civil War to the 20ᵗʰ century.

This study shows that while the spatial forms of racialization, and the social mechanisms of racial construction shift dramatically over time, the underlying logic of the invention of human hierarchies through the articulation of space remains.   By tracing the development of one mid-sized American Southern city through time, this analysis will explore how the semi-urban and suburban patterns seen in Charlottesville (and more broadly across the nation) are deeply imbricated in histories of rurality, agriculture, and slavery. This presentation will also explore implications of the findings: what would it mean for planners to understand localized space as as an accretion of these histories, and what would this shift in context mean for the practice in the present?

INCORPORATING SCHOOL BUS EXPERIENCES OF FAMILIES LIVING WITH CHILDHOOD DISABILITY INTO STUDENT TRANSPORT PLANNING
Abstract ID: 579
Individual Paper Submission

ROSS, Timothy [University of Toronto] tim.ross@mail.utoronto.ca, presenting author
BULIUNG, Ron [University of Toronto Mississauga] ron.buliung@utoronto.ca, co-author

Planning and carrying out student transport services for children with disabilities represents a complex challenge for schools, school boards, and student transport operators. At the same time, everyday experiences of school bus travel can be stressful and exclusionary for children with disabilities and their families. Despite the difficulties involved in planning, carrying out, and experiencing school bus travel for disabled children and their families, little has been written about how they experience school bus trips. Moreover, little has been written about how the experiences and critical perspectives of disabled children and their families can inform and improve student transport planning. In this paper, we present school bus travel-related findings from an ethnographic study of how families living with childhood disability experience everyday school travel across the Greater Toronto and Hamilton Area (GTHA) in Ontario, Canada. In this paper, we ask, "how are children with disabilities and their families experiencing everyday school bus trips?"

The findings presented in this paper emerged from interviews and photovoice (Wang and Burris, 1997) exercises conducted with parent-disabled child dyads (i.e., 15 parents, 15 disabled children) across the GTHA. All children had one of three genetic conditions that result in chronic physical disability and associated mobility impairment. These conditions were osteogenesis imperfecta (brittle bone disease), Duchenne muscular dystrophy, and spinal muscular atrophy. We employed a generous concept of work (Smith, 2005) throughout the study to continuously question how the families may be performing inequitable, obligatory activities that regularly go unrecognized as work, but are crucial to achieving everyday school bus trips. We also used Goodley's (2014) critical ableist studies perspective to help with recognizing ableism, questioning its normalcy, and to consider how normalized ableism shapes student transport planning.

This paper contributes to planning scholarship and practice in two ways. First, it adds to the literature (e.g., Ross & Buliung, 2019) that considers how current student transport planning and design can leave some families of disabled children having to perform inequitable work to gain education access that other families (i.e., those not living directly with childhood disability) need not even consider. Secondly, the paper shows the value of engaging the experiences and critical perspectives of families of disabled children in student transport planning processes. This is achieved by considering how the families experience and regard school bus route planning (i.e., for both typical and accessible buses), school bus designs, school bus pick-up/drop-off interfaces, and bus driver training. We argue that current school bus route planning practices and school bus designs often leave disabled children without opportunities for peer interaction during bus trips while their able-bodied peers enjoy and benefit from peer interaction during their bus trips. We also identify potential improvements to school bus pick-up/drop-off interfaces to enhance disabled children's safety during school bus transitions and to help reduce the workload of disabled children's parents. Lastly, we call for increased attention to school bus driver training to enhance disabled children's in-bus safety and experiences, and to address challenging relationships that sometimes exist between drivers and families. Throughout the paper we encourage student transport planning scholars and practitioners to engage families living with childhood disability more diligently, as the families can help to identify planning/design issues and solutions and, in turn, help to produce more equitable and inclusive education access.

ENGAGING DIVERSE COMMUNITIES ONLINE: TOWARDS A FRAMEWORK OF INCLUSIVE ENGAGEMENT

Abstract ID: 608
Individual Paper Submission

FOROUZANDEH, Peyvand [University of British Columbia] peyvand@alumni.ubc.ca, presenting author
SENBEL, Maged [University of British Columbia] maged.senbel@ubc.ca, co-author
EBNESHAHIDI, Marjanossadat [University of British Columbia] marjan.ebneshahidi@gmail.com, co-author

In this paper, our aim is to attain insights and provide recommendations for designing effective engagement of diverse populations in online municipal platforms. To integrate underrepresented community voices in planning processes, we identify key characteristics for designing inclusive municipal digital channels through the exploration of Canadian cities. Using mixed methods research, we ask what qualities do inclusive platform have, and what are the specific features and design implications that need special attention in the planning and development processes of such platforms?

Public participation encounters great challenges in the domain of urban planning concerning democratic decision-making and diverse citizen populations' appropriation of the future cities. Specifically, voices of underrepresented populations are often absent from planning discourse and current methods, tools and performance indicators do not effectively capture opinions representing the increasing diversity of cities (Fung & Wright, 2003). Meanwhile, new generations of participatory tools, media and platforms are seen as facilitators of citizen participation in different areas of urban planning (Hanzl, 2007), demonstrating the possibility to enrich public processes and address at least some traditional barriers to public participation (Afzalan & Muller, 2018). While many tools and methods have been proposed and utilized to ease the process of public participation and connect the decision-makers to the public, little has been done to guide and evaluate the inclusivity of these pervasive platforms.

The research in urban planning has introduced some key questions of public participation such as inclusiveness, representativeness, and participants' motivation to be involved in the planning process. It indicates that positive engagement experiences emerge where the participatory processes include tangible measures to ensure inclusiveness and levels of minority engagement are high (Olbrich, 2015). Otherwise, participatory mechanisms may reproduce the very types of inequalities that representative institutions are criticized for (Lupien, 2018). To provide a comprehensive vision and more light to these multifaceted issues, our study took both top-down and bottom-up research approaches to understand needs, limitations, values, motivations and preferences in design and use of municipal interfaces and platform schemes.

We seek to bridge the gap between urban planning and information technology design; and between municipalities using new digital technologies and underrepresented communities. We are probing the important elements in design and development of more inclusive digital interfaces in planning for online engagement of diverse communities through the exploration of the cities of Surrey and Vancouver, British Columbia, with diverse residents and high immigrant populations. Both cities have developed programs to expand the scope of immigrant integration. Through a partnership between academia, immigrant and settlement NGOs, and city of Vancouver and Surrey, we explored our research question from both the practitioner perspective and the resident perspective. Building on the insights gained through 6 focus groups, a survey with 299 respondents, 13 interviews with underrepresented citizen groups, 11 interviews with urban planning practitioners and other officials responsible for engaging underrepresented populations, and testing current municipal digital channels in Canada, we established a comprehensive framework for developing future inclusive platforms and interfaces. Through an iterative process, we identified 7 major clusters and 38 sub-categories that cover a wide range of topics on: inclusiveness; persuasiveness; usability; accessibility; trust, clarity and privacy; visualization and interactivity; and functionality.

The specific areas of application and the translation of research insights into practical recommendations are integrated in our proposed framework. The framework developed through this work is intended to

help include the voices and contributions of underrepresented and diverse communities. We offer insights that would be of interest to planning theorists and practitioners, municipal ICT developers, and community engagement experts as criteria to highlight multiple areas that need special attention and responsiveness during the planning and design phases.

GENDER IN THE COMMONS: PLANNING LESSONS FROM FARMER MANAGED IRRIGATION SYSTEMS
Abstract ID: 617
Individual Paper Submission

PUNJABI, Shruti [New York University] srp559@nyu.edu, presenting author
POKHAREL, Atul [New York University] pokharel@nyu.edu, primary author

How can locally-based resource governance be both sustainable and just, particularly for women? For planners, the idea of local commons governance has emerged as a promising alternative to state and market mechanisms for achieving environmental sustainability (Alexander, 2008). The "new institutional" approach to commons governance has made major contributions towards an understanding of the conditions that favor the survival of these arrangements. This approach is exemplified in the work led by E. Ostrom (1990), whose design principles for robust commons governance institutions have been often referred to by planners. This research program has identified nearly eighty factors that could affect sustainability of local resource governance. One of these factors is heterogeneity of various forms within these groups. Whether diversity helps or hinders local cooperation around shared resources is still in debate (Varughese, 2001). The general consensus is that women's participation is essential for sustainability although direct evidence of the role of gender over time in commons settings is relatively scarce (Zwarteveen, 2001). We focus on gender heterogeneity within these groups over time to ask two questions. First, what can we learn about female participation in governance using available longitudinal data on commons governance? And second, what modifications are necessary to the dominant approaches in order to better understand the relationship of gender to locally-based commons governance? To answer these questions, we analyze a novel dataset of long-surviving farmer managed irrigation systems in Nepal over three decades, the Nepal Irrigation Institutions and Systems (NIIS) dataset. This dataset was designed by Ostrom's team to test the predictions of the new institutional approach (Poteete, 2010). We find few direct avenues to examine gender heterogeneity using this survey design, with only 2 out of 500 variables directly referring to gender. We combine these findings with interviews of 837 group members to develop a fuller picture of gender in the commons over time. We find that a major obstacle to both assessing and incorporating gendered aspects into local resource governance is locally prevalent norms

about the role of women in society. Finally, we suggest a set of factors that planners can use to better incorporate gendered aspects of sustainable, locally-based resource governance in addition to the Ostromian approach.

EQUITY AND DIVERSITY IN THE 21ST CENTURY GLOBAL METROPOLIS: TWO CASE STUDIES OF GENTRIFICATION AND COMMUNITY PRESERVATION IN SEATTLE
Abstract ID: 627
Individual Paper Submission

CHALANA, Manish [University of Washington] chalana@uw.edu, presenting author

America's "urban renaissance" has set of a complex set of challenges regarding the roles of equity and diversity within preservation planning in the face of gentrification. This work explores these challenges through two older neighborhoods in Seattle: the Central District (CD) and Pike/Pine, traditionally black and gay neighborhoods, respectively. Neither is protected by traditional historic district legislation, and portions of each have recently been rezoned to encourage dense development within the city. The ensuing "revitalization" has come at a huge social cost that has dismantled and disrupted places and practices of resident populations, who have had to deal with displacement and dispossession. Even as the city recognizes these neighborhoods as associated with these groups, their efforts to have the populations remain in place have been minimal. Although research has shown that older built fabric provides economic and social benefit for cities, neither regulations created by planners for guiding redevelopment nor strategies created by preservationists for retaining urban heritage have been successful in reconciling these different, yet interconnected, sets of values. This work argues for a more creative, integrative collaboration between urban planning and historic preservation to simultaneously engage – and reconcile – social and economic tensions caused by urban redevelopment.

WOMEN PLANNING THE EVERYDAY/EVERYNIGHT: PARTICIPATORY ACTION RESEARCH AS A FEMINIST URBAN PLANNING METHODOLOGY

Abstract ID: 648
Individual Paper Submission

ORTIZ ESCALANTE, Sara [Col·lectiu Punt 6] saraortiz78@gmail.com, presenting author

Most research on planning the night focuses on Western city centers' 'night-time economy,' particularly neo-liberal economic revitalization practices related to leisure and alcohol consumption. Although some studies include gender and race analyses, few challenge the underlying male-centered, hetero-patriarchal, and racist night-time cultures. They also overlook the everyday/everynight needs of those people who due to productive, care, and reproductive work use the city after dark on a regular basis, and disregard night-time cycles outside city centers.

This dissertation examines the productive/reproductive continuum of the night economy by studying the everyday/everynight life of women nightshift workers in the Barcelona Metropolitan Area from an intersectional feminist perspective. Using Feminist Participatory Action Research (FPAR), I first analyze the role of contemporary urban planning and mobility practices in shaping women night workers' everyday/everynight life. Second, I examine the transformational potential of FPAR to promote feminist urban planning for night use.

The results reveal that women nightshift workers experience restricted public space access and differentiated right to the city, mainly because of fear of sexual violence rooted in hetero-patriarchal and gender, race, and class oppressive structures. Women continue using more sustainable modes of transport at night as they face several issues while commuting by foot or public transportation due to reduced frequency, irregular service, poor multimodal connections, and fear of sexual violence. This FPAR also highlights how women embody gender inequalities at work, at home, and in the city, carrying an unequal burden of domestic and care work, and paying through their health and wellbeing outcomes the gender inequalities in unpaid care work and gender discrimination in their workplaces.

I propose to move from a neoliberal approach of planning the night-time economy to an intersectional feminist approach to planning the everyday/everynight life, and argue that FPAR should be a central method of doing planning research and practice. Engaging the everyday/everynight users of cities and spaces – particularly diverse women – in planning analysis is essential to incorporate grounded knowledge that is often absent in institutional urban planning policies.

Individuals experiencing homelessness rely on access to public space to conduct activities necessary for survival. Conflict arises in spaces of interaction between domiciled and homeless individuals over a perceived incompatibility of public space use, prompting State intervention. As the urban core in US cities is revitalized, an emerging model of urban governance that seeks to exclude and relocate individuals experiencing homelessness has been introduced (Stuart, 2013). Justification for intervention is usually based on the following: maintaining order, protecting property values, and minimizing interference with consumption spaces. The presence of those experiencing homelessness is understood to devalue public space, requiring spatial containment (Beckett & Herbert, 2009).

The State intervenes through enactment and enforcement of policies that include increased surveillance and curbing visible "antisocial" behaviors, including begging, sleeping and sitting in public, and loitering in parks and on streets. The function of available spaces is also limited by closing public washrooms, securing dumpsters, and redesigning public benches. Those who experience homelessness face pockets of exclusion, surveillance and behavior restrictions when seeking safe spaces that protect them from the elements, and allow them to hide, sleep, stay warm and dry, and eat.

Risk profiles associated with the use of regulated and increasingly unavailable public space may vary significantly according to gender (Casey et al., 2008). Restricting access to some visible public use areas, such as parks or store fronts, may lead women to hide from the public eye as they try to meet some of their basic needs, thus facing greater risks of violence and abuse (Homeless Link, 2017; Benbow et al., 2019).

Our study seeks to explore the characteristics and location of urban spaces identified as safe or unsafe by women experiencing homelessness in the Orlando metropolitan area. The following questions guide our exploratory research: Which urban spaces are considered safe for women experiencing homelessness? Which physical characteristics make public spaces safe or unsafe (lighting, vegetation, residential or commercial buildings nearby, availability of Wi-Fi and power sources, abandoned structures, urban furniture)? Are there regulatory or enforcement constraints that contribute to perceptions of safety in public space (presence of others experiencing homelessness, police or private security surveillance, city ordinances regulating behavior)? How has law enforcement engaged homeless women while performing activities associated with their survival in public space?

The main data source is semi-structured interviews with women experiencing homelessness, recruited through service provider referral and snowball sampling (respondent driven). Participants recruit others from their personal networks who meet the eligibility criteria.

The study seeks to inform government and NGO's on short- and long-term actions that will lead to the creation or maintenance of safe public spaces for women experiencing homelessness. Although physical/spatial, regulatory and enforcement recommendations will be framed considering the Orlando MSA, applicability to other US MSA's is fairly likely due to the strong influence of broader structural conditions that have led to a growing homelessness problem, and the similarity in regulatory and enforcement frameworks to address the issue across the country.

THE 'HOW'S AND THE 'WHO'S OF EXCLUSION IN PUBLICLY-ACCESSIBLE SPACES: PRIVATIZATION IS JUST PART OF THE PROBLEM EVIDENCE FROM DOWNTOWN DALLAS SIGNATURE PARKS
Abstract ID: 788
Individual Paper Submission

GHAFFARI, Nazanin [The University of Texas at Arlington] nazanin.ghaffari@uta.edu, presenting author

Cities heavily rely on privatization to take over the functions formerly performed by different levels of the government. Yet, scholars criticized privatized public spaces for excluding people based on race, gender, class, as well as their beliefs, behaviors, and activities in the publicly-used space. It seems the notion of exclusion, whether social or political, has been identified as one of the wicked problems of the century. Despite the diverse line of thoughts concerning the concept, two categories of significant philosophers of exclusion may be distinguished: those who try to overcome exclusion by expanding the inclusive horizons to include the historically marginalized and disenfranchised groups (Rorty, 1989; Habermas, 1981); and the ones who views the problem as the result of the political system and power structure (Foucault, 1977; Arendt, 2006[1968]).

This paper explains how governance regimes in each downtown Dallas public spaces affect intersectional inclusion/exclusion. In other words, three questions will be answered of any space: who is to be excluded, how are they being excluded, and who wants to exclude them? This research benefits from a post-positivist comparative case analysis on three publicly-used signature parks deliberately selected in downtown Dallas representing different combinations of public/private ownership and management: (1) publicly-owned, publicly-managed; (2) publicly-owned, privately-managed; (3) privately-owned, privately-managed. The research methodology includes interviews with governance stakeholders; participant observation and intercept surveys, and content analysis of the calendars, local and social media. Triangulating the results inform us of how governance regimes exclude varying "undesirables" in each park.

This research denies the relation of privatization to the geography of inclusion and exclusion. However, it highlights management entities' visions, roles, and stance in the for- and non-profit spectrum in the exclusionary processes. Besides privatization, the governance regimes utilize fortification, commercialization, financialization, eventification, and the governance structure primarily through lack of representation for excluding users. On the contrary, each space initially aims to attract different 'publics' through physical programming. Although general practices seek to include individuals with physical and cognitive disabilities, members of Multicultural, racial, ethnic communities, members of LGBTQ+ communities, and members of Refugee, immigrant communities, mainly through programming publicly-used parks, still discrimination and exclusion are intersectional. The publicly-owned and managed case

restricts the use of space for 'planned' events, granting access through payment or membership. Otherwise, the 'homeless' and 'activists', as well as LGBTQ+ communities, claim the space for 'unplanned' activities despite the presence of security; 'Social activists' and 'protesters' are not welcomed in the publicly-owned and privately-managed case, where the private security severely restricts the presence of different types of 'undesirables.' However, women and children utilize the space for 'planned,' and 'unplanned' activities; 'Social activists,' 'protesters' and the 'homeless' use the privately-owned and managed park, which is owned and managed by a faith-based organization, whereas families are routinely absent in everyday life of the park. In these three case studies, deliberate exclusions happen through a lack of representativeness and private regulations and bylaws that are not posted for public information, thus purify parks of difference. Contrarily, symbolic exclusions occur through private and ticketed events and inaccessibility of events' schedules, as well as not informing unwanted users about the available programs and activities, and not representing diverse users in CGIs in local and social media.

TOWARDS COSMOPOLIS?: SKILLED MIGRATION AND THE FORMATION OF THE "COSMOPOLITAN GRID" IN SINGAPORE
Abstract ID: 791
Individual Paper Submission

CHAN, Felicity HH [Nanyang Technological University Singapore] felicitychan@ntu.edu.sg, presenting author

Planning for infrastructural and amenity space to attract transnational capital and skilled labor has become an important goal for cities that have the ambition to grow and stay economically prosperous in the world economy. Oftentimes, there is little attention given to the social, cultural and spatial dynamics of such local economic development plans because the urban change is deemed positive, with little to no negative externality, until friction and conflicts force an examination.

Using a case discussion of Singapore, a city-state in Southeast Asia that has aggressively pursued global city status through pro-immigration policy and pro-growth planning, this paper aims to discuss the physical and social formation of this infrastructural and amenity space that I call the "cosmopolitan grid" (Chan 2019). Similar to the electrical grid that promises footloose mobility to plug and play at will, the "cosmopolitan grid" is a physical and socio-cultural space that enables transnational elites to settle and feel at home, away from the established enclaves of expatriate services in the city center.

Firstly, I will discuss the socio-spatial dimensions of the "cosmopolitan grid" as an instance of urban planning's participation in globalizing a city. What are the spatial patterns of land use? What amenities are of particular importance? How has the grid expanded? And what are the implications of the grid expansion? Preliminary studies have shown that international schools and private condominiums are important amenities. The discussion will draw from interviews with government agencies and other community stakeholders, in addition to secondary documents about the planning of international schools.

Secondly, the expansion of the grid across the city also means that new communities of globally mobile immigrants have emerged in neighborhoods where locals have traditionally lived in demographically stable conditions for decades, introducing diversification and gentrification. This raises the following

questions: How do the intersections between the global-local manifest spatially and socially? How has this urban change shape the lived experience of the neighborhood? How do encounters look like? Is it one of "parallel lives" (Cantle 2005), or of inter-cultural life (Amin 2002, Sandercock 2003)? How cosmopolitan is this grid? To address these questions, I will draw on interviews and cognitive mapping with European transnational elites who are living in a heartland neighborhood of Singapore.

The findings of this paper will increase understanding of the less known effects and implications of skilled migration on urban development and its related socio-spatial dynamics, albeit based on a case example of Singapore. These findings build up the planning knowledge of locales of immigration. Further, through unpacking the process and content of the "cosmopolitan grid," the paper examines the connections between the spatial and social outcomes of planning. It poses the question: in what ways and to what extent does the physical intervention in the urban built environment shape the cosmopolitan outlook of cities.

NO PLACE FOR STREET VENDING IN FLUSHING, QUEENS: CONFLICTS OVER URBAN IMAGE, PLACEMAKING, AND PUBLIC SPACE IN AN IMMIGRANT ENCLAVE
Abstract ID: 856
Individual Paper Submission

DEVLIN, Ryan [Columbia University] rtd2101@columbia.edu, presenting author

Downtown Flushing, an East Asian enclave in the New York City borough of Queens, is experiencing a development boom, as offshore capital is helping to restructure the physical and social character of the neighborhood. As new hotels, malls, and offices rise, property interests and local politicians are seeking to position Flushing an upscale international business and shopping destination. The neighborhood's street vendors are not part of this new vision, and since April 2019 they have been officially banned from the area's sidewalks.

In order to justify the ban, political and business leaders painted vendors as interlopers and nuisances—unwanted and unwelcome in the neighborhood. The plan to ban vendors was portrayed as an initiative to "take back the streets" for the benefit of residents. This discourse was accepted uncritically by city-wide political leaders and city officials. But as with any neighborhood, Flushing is far from monolithic. The relatively unified anti-vendor, pro-development discourse hid deep conflicts in the area over what the neighborhood should be and what it should become. Working class and lower income East Asian immigrants, street vendors included, saw their interests sidelined by wealthier stakeholders—with the vendor ban being one of the more visible examples of impending changes.

This study seeks to get underneath the elite rhetoric put forth by development interests pro-business politicians to better understand conflicting visions of neighborhood futures in general, and public space and street vending in particular. In order to do this, several hundred surveys were administered to users in public space to gather opinions on overall quality of space and of street vendors. In addition, qualitative

interviews were performed with street vendors, store owners, activist groups, and community leaders to get a better sense of the conflict over public space and vending.

Overall, findings showed that, far from being unified in their disdain for vendors and support for redevelopment, neighborhood residents are deeply divided, with this divide falling sharply along class lines. Poorer residents were much more likely to support vendors, patronize vendors, and less likely to view vendors as a major cause of crowding in public space, while wealthier residents tended to see vendors as nuisances and inconvenient "reminders of poverty".

This research is important for planning and planners as it demonstrates the multiple conflicting interests that exist within what may seem like unified ethnic enclaves. All too often, planners accept narratives put forth about immigrant neighborhoods by those who claim to speak for the neighborhood and co-ethics This tends to obscure internal conflicts. This paper reminds planners of the importance of understanding ethnic enclaves as conflicted and internally diverse, rather than monolithic.

MAPPING DISRESPECT: USING PARTICIPATORY GIS TO ILLUMINATE REGIONAL TRANSIT INEQUITIES
Abstract ID: 865
Individual Paper Submission

WILSON, Barbara [University of Virginia] bbwilson@virginia.edu, presenting author
MONDSCHEIN, Andrew [University of Virginia] mondschein@virginia.edu, co-author
BURNETT, Camille [University of Kentucky] Camille.Burnett@uky.edu, co-author

Land use is riddled with spatial inequities, but identifying the overlapping socio-cultural, physical, and political barriers to redressing these inequities are preconditions to change. This study adopted a mixed method approach to addressing the following research questions: "How do interactions between spatial and transportation mismatches, often grounded in local and regional policy, limit accessibility for low income households?" and secondly, "How can policy and planning better address these challenges?" We also wanted to understand the opportunities and challenges that participatory mapping would play as a method for identification and analysis of those barriers.

Using a qualitative design combined with a participatory GIS mapping approach, we conducted seven focus groups with community members (N=79) and 10 interviews with transportation service providers to gather information about transportation practices, access, gaps and needs in the Charlottesville, Virginia region. Focus group and interview data were analyzed using NVIVO 12 and ArcGIS.

We found that for many low-income households, the experience of riding public transit was marked with feelings of being disrespected. Long waittimes and inaccessible systems fostered a sense that public and quasi-public systems were not designed with their needs in mind. The availability of affordable housing only in auto-dependent suburban and rural parts of the region undermines reliable access to jobs, healthcare, and other necessities. Like many mid-sized regions, transportation providers and policy makers in Charlottesville struggle to plan for access across urban, suburban, and rural settings that are increasingly interdependent, particularly as jobs and services centralize while affordable housing locates

further from existing transit services.

This paper focuses on the lessons learned from utilizing participatory mapping as a medium to identify barriers to transit equity. Media for mapping exercises, the ethics of such practices, as well as their challenges and opportunities for action-oriented research on transit inequities will be discussed.

THE DARK SIDE OF LOCAL INTEGRATION POLICIES: THE CASE OF DAY LABORERS IN THE UNITED STATES
Abstract ID: 924
Individual Paper Submission

NICHOLLS, Walter [University of California Irvine] wnicholl@uci.edu, presenting author

Central Themes:

This paper examines local integration policies through the case of immigrant day laborers.

The paper suggests that from the 1990s onwards day laborers presented local officials with a "wicked problem" (Rittel and Weber 1973). Most of the laborers were poor and recently arrived immigrants. They often searched for day work in visible locations like busy street corners and parking lots in predominately white suburbs (Valenzuela 2003; Theodore et. al. 2015). As pockets of day laborers flourished, local officials struggled to develop policies to govern the population. This paper examines the principal policies and their consequences.

Methodology

The paper analyzes local battles and policies concerning immigrant day laborers across the country and then focuses in on the Los Angeles suburb of Pasadena. To address local battles across the country, I gathered newspaper articles through LexisNexis searches with the keyword "day laborer". The resulting database consists of 1,503 newspaper articles, from which 12,652 claims were extracted. The database includes 75 newspapers from different localities. I then coded claims for municipality, stakeholders, types of arguments for and against immigrants, and types of policies.

The paper performs 17 with activists, advocacy organizations, and city officials with direct experience working on day laborer policies in Pasadena. The paper draws on historical archives from four immigrant advocacy organizations in Pasadena and minutes from 14 Pasadena City Council meetings for the period 2000-2010.

Findings

In the 1990s and 2000s, local elected officials across the country adopted various strategies to address immigrant day laborers in their jurisdictions. Two prominent strategies emerged. A punitive strategy sought to govern immigrants through force. Local officials employed established ordinances (loitering, traffic, housing regulations) and created new ones (bans on the public solicitation of work) to criminalize immigrant laborers and make their lives impossible. These efforts aimed to govern this "abnormal" population by banishing it (Foucault 1976). Additionally, a disciplinary strategy sought to govern immigrants by integrating and normalizing them with "worker centers". Through these centers, immigrants were provided a proper place to look for work and services to assimilate them into the local culture. The case of Pasadena demonstrates the limits of disciplined integration. Many day laborers resisted to seek out labor within worker centers. Their continued presence on the streets resulted in the rollout of increasingly punitive practices to compel "deviant" laborers to conform. The paper therefore conceives both strategies as aiming to achieve a common goal: the governance of a stigmatized and illegalized population.

Relevance

Immigration has become one of the defining features of urban change. While sociology and geography have addressed the issue with great sophistication (Varsanyi 2014), urban planning, with several notable exceptions (Gonzalez 2017), has been slow to examine the effects of immigrants on planning and policy. In a period when immigration is at the forefront of national politics, urban planners must address the issue more than ever.

SPACES THAT WORK FOR ME: A PHOTOVOICE STUDY
Abstract ID: 1013
Individual Paper Submission

CLARK, Kate [Dalhousie University] kate.clark@dal.ca, presenting author
TERASHIMA, Mikiko [Dalhousie University] mikiko.terashima@dal.ca, primary author
CASEY, Amanda [St. Francis Xavier University] acasey@stfx.ca, co-author

According to the World Health Organization (WHO, 2001 in Krahn, Walker, & Correa-De-Araujo, 2015), many individuals with physical, sensory, and cognitive challenges experience disability due to the external barriers they face in their communities. These individuals often suffer from feelings of isolation and inactive lifestyles as a result (Krahn, Walker, & Correa-De-Araujo, 2015). This puts onus on those who construct and regulate the built environment to make it barrier-free for persons with these diverse challenges. However, existing accessibility standards are producing spaces that are inadequate for the needs of many populations. There is a significant gap in knowledge about what kinds of spaces are accessible for different types of users, and what inclusive spaces look like. This project aims to fill this gap by engaging with persons with disabilities as experts on their experience of barriers in the built

environment.

Our study employs Photovoice, which is "a creative form of community-based participatory research" (Schleien et al., 2013, 213). The Photovoice method has been used by many studies engaging with underrepresented and equity-seeking groups to empower those who are often excluded or neglected by existing systems (Liebenberg, 2018; Nykiforuk et al., 2011). Photovoice can communicate and draw together participants' perceptions and experiences of barriers as well as design solutions in public space by asking participants to share their expertise using photography as a medium of communication. The pilot project was launched in March 2020 working with a group of individuals with intellectual disabilities in Halifax and Antigonish, Nova Scotia. We chose this group as target participants because they are especially underrepresented in community development processes (Schleien et al., 2013).

Participants were high-functioning adults living in residences serviced under the provincial government's supported apartment and group home programs. They could independently participate in the Photovoice activities and communicate their perspectives verbally to the research team. Most of the participants also had some mobility and vision challenges. We asked the participants to identify what spaces in their daily lives are exemplary for accessibility or show where they encounter barriers.

The photos and narratives provided by participants revealed concerns for personal safety and ease of mobility to and through building entrances as priority needs for (re)designing spaces they use regularly. Bus stops, churches, coffee shops, and sidewalks are elements in the built environment most of the participants identified as important. Their photos highlighted small obstructive objects, cracks in pavement, and narrow widths of curb cuts as design elements that determine sense of safety, though able-bodied populations may navigate through them without difficulties. The pilot activities also offered valuable considerations for engagement practices, particularly for communication materials and methods, time and cost provisions, and ethical considerations when working with vulnerable populations with different types and levels of abilities (Coons & Watson, 2013). For example, more direct, plain language with visuals was beneficial, and researchers could derive much more in-depth insights from each participant through one-on-one photo-taking exercises.

Our Photovoice project will be extended to include other underrepresented populations with accessibility needs, including wheelchair users, ageing populations, and persons who are blind or partially sighted. Notwithstanding, working with participants with intellectual disabilities provided an important and unique opportunity to examine engagement practices and develop strategies that are inclusive of this population, as well as to empower persons who are often overlooked by community development. Our intention is for the project to yield an anthology of images to inform standards for inclusive design. In addition, the practices used to conduct this study can inform recommendations for strategies to help planning researchers and professionals effectively engage with persons with many types and levels of disability on planning topics.

SONIC ORDER AS A MEANS TO POLICE BLACKNESS IN GENTRIFYING WASHINGTON D.C.

Abstract ID: 1119
Individual Paper Submission

REDDEN, Ty [Gettysburg College] tredden@gettysburg.edu, presenting author
CUNNINGHAM, Kourtney [Gettysburg College] cunnko01@gettysburg.edu, primary author

When Washington D.C. was declared the nation's capital in 1791, African Americans already comprised a quarter of the city's population. Later, during Reconstruction, Washington D.C. became a popular destination for African Americans leaving the American South (McQuirter 2003). With each passing decade, the African American population contributed to both the structural development and population growth of the city. As a result, African Americans and the results of their cultural production became an integral part of the District's urban fabric (Hyra 2015, 2017; Hopkinson 2012; Prince 2014).

One such example of African American cultural production, Go-Go music emerged in Washington D.C. heavily influenced by 1960s and 1970s Funk music. At that time, African Americans represented the population majority in the District, comprising 75% of the city's population by 1975. Washington D.C. residents had elected their first Black and home-rule mayor one year earlier and social justice activism flourished in the District including The Black Arts, Black Power, Women's, and Statehood movements (McQuirter 2003). Go-Go music materialized as an embodiment of Black cultural optimism, empowerment, and justice-centered activism, quickly becoming a pillar of African American cultural place-making via its public performances. The music would enrich the daily street traffic and the cultural character of the District's African American neighborhoods for the next 40 years (Hopkinson 2012).

Recently, income inequality and changing development patterns have fueled gentrification in Washington D.C. and resulted in the mass displacement of African Americans (Chronopoulos 2016; Hopkinson 2012; Hyra 2017; Prince 2014). Redevelopment is also resulting in the widespread loss of cultural spaces, specifically, Go-Go venues. Unfortunately, most gentrification literature focuses on residents' displacement experiences, leaving few works devoted to cultural venues and performances and the implications of their erasure from the urban landscape. This study explores the case of Central Communications, a privately owned telecommunications business located in a historically African American community on Chuck Brown Way, a thoroughfare named after a renowned Go-Go pioneer. Over the last 25 years, Donald Campbell, the owner of Central Communications has played Go-Go music from the speakers located at the shop's front entrance without incident. As the surrounding neighborhood has gentrified, noise complaints and threats of litigation from new, white residents have become frequent.

Gentrification creates a socially sanitized urban landscape that not only caters to the aesthetic tastes and preferred amenities of the elite/upper middle class but also is socially comfortable for whites (Hyra 2015, 2017). The authors detail the social impacts of gentrification in the District and demonstrate how Go-Go music is quickly becoming a casualty of urban redevelopment. Combining critical race theory and spatial injustice as conceptual frameworks, the authors pose Go-Go music as a Black cultural phenomenon whose endangered status reflects the displacement experienced by its predominantly Black constituents (Bell 1995; Crenshaw, Gotanda, Peller, & Thomas 1995; Delgado & Stefancic 2000; Delgado & Stefancic 2017; Fainstein 2009; Fincher & Iveson 2012; Marcus 2009; Taylor 1998). The authors also analyze the state of noise ordinances in gentrifying District neighborhoods, asserting that sonic order has been weaponized as a means to stigmatize and police Blackness. The arbitrary definition and selective enforcement of sonic order is a means to regulate the racialized context of a place, under the guise of colorblind urban policy. Employing ethnographic interviews with residents and Go-Go enthusiasts, the authors reveal the ways in which public and private interests work in tandem to erase Go-Go music, its cultural legacy, and the Black bodies that accompany it from the streets of Washington D.C.

PRESERVATION JUSTICE: A FRAMEWORK ON JUSTICE, EQUITY, DIVERSITY, AND JUSTICE
Abstract ID: 1153
Individual Paper Submission

MAGALONG, Michelle [University of Maryland, College Park] magalong@umd.edu, presenting author

This paper explores a framework centering the importance of justice, equity, diversity, and inclusion in historic preservation in underrepresented communities. In the field of historic preservation, standards and criteria are deemed critical in assessing the eligibility of a historic site or cultural resource for landmark designation. On the National Register of Historic Places, less than 8% of its listings are associated with communities of color, women, or LGBTQ communities. Issues of systematic disenfranchisement, discrimination, and displacement have (and continue) to shape these underrepresented communities and are often the barriers to participation of and by these groups in historic preservation efforts. This paper develops a theoretical framework to define and explore how issues of justice, equity, diversity, and inclusion drive community-driven preservation efforts in communities of color, women, or LGBTQ communities. What does preservation justice look like in underrepresented communities in terms of landmark nominations, community engagement, and preservation practice? What are the distinctions between justice, equity, preservation, and inclusion? How are these defined in preservation? Who gets to decide? This paper is developed as part of a research symposium slated for September 2020 where 20 preservation scholars and practitioners share their research and work in these underrepresented communities. This framework not only aims to understand the underpinnings to the disparities on the National Register but in preservation scholarship and planning in terms of telling the stories of diverse American people, events, and places.

WHAT'S GENDER, DIVERSITY AND DIFFERENCE GOT TO DO WITH IT? THE NEED FOR DIVERSITY MAINSTREAMING IN PUBLIC TRANSPORT POLICY: THE TWIN CASE OF WINDHOEK, NAMIBIA AND DELHI, INDIA
Abstract ID: 1184
Individual Paper Submission

MARATHE, Rewa [The University of Melbourne] marather@student.unimelb.edu.au, presenting author
YON, Alicia [The University of Melbourne] alicia.yon@gmail.com, primary author

This paper argues that transport systems need to be more inclusive and efficient by addressing diverse needs of the population they serves. Transport planning has largely been informed by gender-binary roles and patriarchal structures in society. The lack of inclusive and efficient transportation can have significant mobility impacts that can marginalise, unrecognise and/or misrecognise, ignore, invisibilise and endanger. Freedom of mobility is essential for an inclusive and safe society. Scholars have therefore issued continued calls for a focus on the mobility of people over vehicles to create more inclusive transport systems. Yet, mobility for women, gender-diverse and non–conforming sexualities remains limited at best and dangerous at worst. This is arguably more so in the Global South, which is characterised by lower levels of gender equality and other forms of human rights violations. Efforts to mainstream gender have yielded limited success due to the lack of consensus over what it means in transport planning. Specifically, the well-rehearsed argument that women have different mobility needs to men has failed due to the lack of recognition of the heterogeneity that exists within the category 'women', the fluidity of gender, and intersectional identities that emerge within a given socio-cultural context. The failure to consider diverse needs leaves transport systems ill-equipped to serve the needs of modern-day society, particularly within a globalising context and the emergence of new forms of citizenship. Framing mobility as a human right, this paper argues for the need to recognise that the freedom of equitable, safe, and easy movement can only be truly achieved when diverse mobility needs beyond binary and patriarchal conceptions are acknowledged and addressed.

This paper presents a review of the relevant transport policies in the cities of Windhoek, Namibia and Delhi, India to identify how they succeed or fail in addressing the diverse needs of women and non–binary individuals through an intersectional lens. Focusing on the lack of safety as a common denominator across the two cities, this paper examines how safety affects mobility for various groups of women and non-binary people and reinforce other forms of inequities. The findings reveal a failure to account for different experiences, needs, and expectations of and for transport among diverse women while rendering non–binary people invisible. The paper concludes with an argument for diversity mainstreaming in these cities as an approach for achieving inclusive and efficient transport systems. Thinking differently about the mobility for diverse groups must be rooted in the heterogeneity of unmet needs of diverse women and non–binary people – a leap forward for transport planning praxis.

NAMING OUR PLACE: BELONGING AND SPATIAL JUSTICE IN THE AMERICAN CITY
Abstract ID: 1195
Individual Paper Submission

KIM, Annette [University of Southern California] annettek@usc.edu, presenting author

This paper presents theoretical and empirical research about the naming and re-naming of places, using the example of the history of the Los Angeles region from the native Tongva to the present situation in which 93 languages are spoken by students in the public school system. It brings to focus the important role that words play in placemaking, connecting peoples, cultures, and space, as well as conversely the key role that their obliteration and erasure has been to conquest and dominating peoples and lands. Still, through the LA region's violent layers of histories of displacement and segregation, as well as the complexities of immigration and urbanization, some names have been able to persistently linger through informal, everyday practice and inscription into the built environment, and more recently the utterances of social media.

Contemporary cities and planners have a role to play in how we acknowledge and live with this history and in how we communicate who belongs today through placemaking related initiatives to democratize heritage, support legacy businesses, and map cultural assets.

This presentation critically reviews the ways planners have conceived of spatializing race/ethnicity including segregation maps, redlining maps, and cultural and heritage districts and interplays them with more recent data about informal naming practices.

It concludes with a prototype of web platform to be used in public schools that provides an alternative frameworks for how we might visually narrate and teach the story of multiple claims to the land over time, the myriad of places of belonging in the urban region, and the connections between them in order to promote a regional, civic viewpoint.

PLACE-BASED RACIAL HEALING AND JUSTICE IN RICHMOND, VIRGINIA: CONTESTED MEMORIES AND RADICAL FUTURES
Abstract ID: 1228
Individual Paper Submission

KNAPP, Courtney [Pratt Institute] cknapp@pratt.edu, presenting author

How do cities change when their residents decide to take on the monumental projects of place-based racial healing and justice? This paper examines the connections between planning, placemaking, and racial healing in Richmond, Virginia, a city with four centuries worth of dynamic social and political history, and a place that evolved into both the second largest domestic slave market in the United States and the capital of the Confederacy during the American Civil War. For more than three decades, elected and grassroots community leaders have deliberately engaged in the work of historical reckoning with these sinister histories— efforts that have taken a variety of spatial and place-based forms. This paper draws from extensive interviews with planners, elected officials, museum officials, artists, activists, archaeologists, and clergy who have engaged with these questions in Richmond over the past thirty years. In particular, I highlight two ongoing efforts: 1) the memorialization and redevelopment of the Lumpkins Jail site and Shockoe Bottom district, and their connection to the city's Trail of Enslaved Africans, and 2) efforts to disrupt and countervail the "Lost Cause" narrative of Confederate redemption inscribed throughout the city's public spaces, including and especially along its famed Monument Avenue corridor. Through these case studies, I demonstrate how a progressive Southern city with forty years of majority-African American elected leadership, has found common ground across difference to remake and reframe itself in light of this collective reckoning.

INCORPORATING SOCIAL PRACTICES IN PLANNING: A NEW APPROACH FOR EXPLORING HEALTHY BUILT ENVIRONMENTS FOR WOMEN
Abstract ID: 1272
Individual Paper Submission

STENBERG, Keely [University of Waterloo] kastenberg@uwaterloo.ca, presenting author
DEAN, Jennifer [University of Waterloo] jennifer.dean@uwaterloo.ca, co-author

The disciplines of planning and public health emerged in the 1850s to address the spread of infectious diseases in rapidly urbanizing areas. More recently, the collaboration between these professions re-emerged to address the rising prevalence of chronic diseases, and the important role of the physical environment as a determinant of key health behaviours (e.g., physical activity and nutritious eating). The collaborative relationship between public health and planning continues to be supported through the World Health Organization's Healthy Cities initiative and allied programs supporting healthy built environments and urban health equity.

Accordingly, spatial scholars inside and outside of planning have contributed to an extensive body of knowledge on the mechanisms through which physical and built environments shape human health. However, this growing body of knowledge has been criticized as a form of neo-environmental determinism, unilaterally treating built environments as producers of human health outcomes (Maller, 2018). Moreover, the extant literature on healthy built environments rarely addresses issues of equity for sub-populations, including women. The predominant conceptualizations used in healthy built environments literature ignores calls for more relational understandings of place within the discipline of planning that would further understandings of the dynamic relationship between humans and their (material) environments (Graham & Healey, 1999). This paper interrogates the theoretical paradigm

predominant in healthy built environments literature and draws on two other bodies of planning literature to offer a new approach to developing healthier places to live for women.

The first body of literature prioritises relational experiences and interpretations of planned communities, which is evident in the more recent focus on social practice theory (Maller, 2018). Social practices refer to actions that are regularly performed and are made up of materials, meanings, and competences within a given place (Shove, Pantzar, & Watson, 2012) rather than directly determined by the immediate built environment. Public health and planning scholar Cecily Maller (2018) argues that too little attention has been paid to the combined impact of non-human 'things' on health and the link between various social practices.

The second body of literature used in this paper is critical planning scholarship focused on issues of equity and gender in planning. Specifically, Greed and Reeves (2005) note that the social practices of men and women are heavily dictated by institutionalized norms. These norms may be reinforced by materials; in the planning discipline, for example, gender roles are often used to help determine the spatial needs of men and women (Huning, 2019). While there have been calls to increase understanding of gender in planning, less attention has been given to planning for women's health, specifically.

Overall, this paper proposes new directions for healthy built environments research and practice that is rooted in theories of relationality and social practice. In combination with the critical literature on equity and gender in planning, this work offers a new approach to explore the performance of gender and health practices in place as crucial elements of a more equitable and inclusive theoretical orientation of healthy built environments. Further, this novel approach to conceptualizing healthy built environments can illuminate opportunities for planning practitioners to create healthier places for women. The paper concludes with a discussion of how future research directions can explore how the social practices of women are reinforced through engagements with material elements in local environments, while also increasing our understanding of how women as agents adapt materials to suit their needs.

FROM THE CONCENTRIC ZONES TO CHI-RAQ: URBAN THEORY, CITY FILMS, AND THE PROBLEMATICS OF RACIAL SEGREGATION IN TODAY'S CHICAGO
Abstract ID: 1282
Individual Paper Submission

GOHARIPOUR, Hamed [The College of Wooster] Hamed_goharipour@yahoo.com, presenting author

Among the most persistent issues in many American cities is the racial segregation of residents. Despite declines in racial segregation across most US metropolitan areas in recent years, racial segregation may exist de facto through social norms, even when there is no strong individual preference for it, and causes several problems in cities, including discrimination, crime, and even dysfunction on urban services.

While Chicago's overall population is fairly evenly divided – approximately 32 percent white, 30 percent black, and 29 percent Hispanic – a closer look at non-quantitative representations of the city shows how Chicago suffers from this type of spatial disconnection. The disconnect is why Andrew Diamond, the author of Chicago on the Make, has called Chicago "a combination of Manhattan smashed against Detroit." City-films are examples of narrative, non-quantitative forms of urban representation that, despite the fact that the city is constructed as much by images and visual representations as by the physical environment, are neglected by urban planners. Having the ideas developed by the sociologists of Chicago school a hundred years ago as a theoretical basis, this research interprets the problematics of racial segregation in today's Chicago through two recent city-films set in Chicago: Canal Street (2018) and Chi-Raq (2015).

The narrative nature of cinema provides a unique imaginative context for interpreting both physical and nonphysical dimensions associated with urban segregation. There are three main reasons why this paper uses cinema as the lens of investigation. First, theoretically, movies constitute one very important form of urban action. Cinema indeed is the urban art of the 20th and 21st centuries. Movie is part of the life experience of people since the 20th century, and This is why Jackson (1973) believes that it would seem wasteful if not foolish to ignore that experience in researches. Second, methodologically, movies constitute a major source of evidence for grounding claims about urban structures, relations, and processes. Third, historically, movies are sensitive barometers of urban processes and movement. Cinematic analysis can provide particularly good indicators of urban changes.

Canal Street tells the story of a community that is torn apart and separated when the lives of two high school boys (one Black and one white) collide and force those around them to question the "lens" through which they see and relate to others. Chi-Raq is a modern-day adaptation of the ancient Greek play Lysistrata by Aristophanes. After the shooting death of a child hit by a stray bullet, a group of women organizes against the on-going violence in Chicago's Southside creating a movement that challenges the nature of race, sex and violence in America and around the world.

From a critical interpretive position, this research uses semiotics to identify and interpret "image-signs" in these two city-films in order to show how the cinematic representation of Chicago provides urban planners with a context for the study of the hidden side of racial segregation and its environmental roots.

REFUGEE WOMEN'S INVISIBLE AGENCY: AN INTERSECTIONAL INVESTIGATION INTO ROHINGYA WOMEN'S EVERYDAY SPACE IN THE CAMPS OF BANGLADESH
Abstract ID: 1350
Individual Paper Submission

SAMEEN, Shafinaz [University of Illinois at Urbana-Champaign] ssameen2@illinois.edu, presenting author

In refugee camps, especially in the global south context, the women in spite of their individual and gendered vulnerability take on everyday responsibilities towards families and therefore contribute to the everyday sustenance of the camps as a whole. However, the "protection" framework guides humanitarian interventions predominantly around the assumption of refugee women's victimhood and voicelessness. By virtue of seeing women as victims, these programs often fail to ensure meaningful participation by women and hence re-inscribe women's subordination. This paper, by shifting the vantage point to women's everyday spaces in the camps, reveals micro politics of everyday life and forms of women's agency that are otherwise unnoticed within the traditional definition of agency.

While feminist scholarship have contributed to re-framing the universal narratives of victimhood by portraying refugee women's different forms of agency (Oo & Kusakabe 2010; Utas 2005), these conversations mostly revolve around women's different tactical response in the form of utilizing male companionship, conforming to abusive relations and even trading sex for their benefit that seldom identify women outside the gendered power relations. The scholarship that has emerged by looking more closely at grassroots practices has however uncover women's everyday negotiations that challenge notion of voicelessness. Such scholarship (Shalhoub-Kevorkian, 2010; Thomson, 2013;) frames women's actions beyond just seeking protection and also defies the traditional forms of agency and establishes women as individual actors subjected to multiple identities.

In this paper, drawing on my extensive volunteer and research work in a Rohingyan refugee camp in Bangladesh, I aspire to contribute to an agency turn in the literature and governance of camps. A turn that moves away from the passive narratives of women's victimhood by seeking the strategies women adopt to accommodate their daily needs within the camp space. My research demonstrates two concomitant processes: While women's voices are not sought after in the camp planning, huge gender based programs are undertaken on behalf of women to 'educate' them about issues like health and family planning. Women refugees, as my ethnographic observation and focus group discussions indicate, however engage in multiple forms of actions that contribute to the everyday living in the restricted space of the camps. Never a part of camp's planning process, to expand their spatial mobility even for the use of toilets or collecting water, women make huge spatial and temporal negotiations. They make their movements invisible as this allows them certain movement beyond the curious eyes of men. While this invisibility when seen from the above can be taken as voicelessness and victimhood, if observed from the ground this sense of invisibility can be found in one hand as a 'domain' that guides women's sense of place and on the other an 'outcome' of women's agency at individual levels. I argue that the absence in the public sphere cannot thus justify them as powerless, because change making in the form of appropriation of existing spaces is happening on the ground every day. Therefore, women's agency needs to be defined not only in the 'formation of new' spaces but also in the 'revision' of existing spaces. This observation in conclusion is of significant value to a gender sensitive planning of refugee settlements by enabling a perspective of seeing women as actors of everyday space and advocating for the incorporation of women's voices in the camp planning process. It provides evidence that women make spatial negotiations that are unheard and therefore women's voices if included can bring significant changes in the planning decisions (Farrington 2019) that will not only benefit women in everyday space use but also in the long term is likely to establish women as agents.

IDENTIFYING JURISDICTIONAL OVERLAPS ON NATIVE AMERICAN RESERVATIONS AND OTHER TRIBAL LANDS

Abstract ID: 1353
Individual Paper Submission

SCULLY, Jason [Eastern Washington University] jscully@ewu.edu, presenting author

In the United States, planners working with tribal governments have noted that governance is often hampered by multiple jurisdictional boundaries that carve up Native American lands. These boundaries divide reservations into separate states, counties, school districts, and congressional districts, among others. The divisions then can lead to decreased sovereignty as tribal communities must broker agreements between multiple jurisdictions at different levels of governance. This can lead to challenges in coordinating services and can potentially create of uneven levels of services within the same tribal community. Lastly, the collective voting power of a tribal community may be split across jurisdictions thus reducing native representation at all levels of nontribal government.

This project attempts to quantify the degree to which federally recognized American Indian reservations and tribal lands are divided across states, counties, school districts and congressional districts using Geographic Information Systems (GIS). Esri's ArcMap Overlay Toolset was used to analyze instances of jurisdictional overlaps with 397 census-identified reservations and tribal areas in the continental United States. All data came from publicly available U.S. Census Bureau GIS layers.

Due to mismatches in scale between layers, the overlay process produced slivers of land. For example, rivers serving as borders were often drawn with a high level of detail in one layer and with abstracted straight lines in another. When two layers like this are juxtaposed, the overlapping area forms a sliver. Maps of each reservation split between two or more jurisdictions were visually inspected by two researchers to determine if the splits were artifacts of mismatched scales, or if they represented legitimate divisions.

Before visual inspection we found that 85.9% of reservations and tribal areas were inside only one state, 54.2% were inside one county, 39.5% were inside one school district, and 68.3% were inside only one 2010 U.S. Congressional District. Findings such as these are a necessary first step in documenting and validating the unique challenges facing planners and public officials working on and with tribal lands.

UNEVEN MOBILITY: EXAMINING SOCIO-MATERIAL ASSEMBLAGES OF NEWCOMER ADOLESCENTS' NON-SCHOOL TRAVEL IN MISSISSAUGA, CANADA.
Abstract ID: 1375
Individual Paper Submission

ALARASI, Haifa [University of Toronto] haifa.arasi@gmail.com, presenting author

With school travel by car on the rise and associated declining levels of active school travel (AST) especially in North American cities, the majority of studies on childhood mobility stem directly from concerns around decreased independent mobility and the decline in physical activity for younger children in their school journeys, citing the importance of developing healthier habits and lifelong patterns of sustainable travel. Albeit informative, the findings of these studies cannot be extended to non-school travel especially for older children because although their everyday routine is embedded within a culture of automobility, adolescents demonstrate a more nuanced, complex, and relatively independent travel patterns than their younger peers (Bates & Stone, 2015). This, coupled with their participation in extracurricular activities and/or employment opportunities means that as they age, they start transitioning into independent decision makers with mode choices that sometimes differ from their parents (Mitra & Buliung, 2015). This paper responds to this gap and examines adolescents' travel patterns with an expanded framework that draws heavily from theories of the new mobility paradigm (Sheller & Urry, 2006). In doing so, we focus on embodied mobilities and examine daily travel as a socially- embedded, relational process contributing to (re)organizing, (re)producing, and (re)structuring the socio-spatial logics of our cities (2006).

Drawing from a study that explores non-school travel of newcomers aged 13 – 19 in the city of Mississauga, Canada, this paper takes adolescents' travel patterns as an entry point to examine unique assemblages of mobilitie(s) in a suburban setting. We highlight an ethnographic methodological inquiry that enables an exploration at the everyday scale of the socio-material dimension of interdependent mobilities; and active meaning-making by the participating youth (Christensen & James, 2008). By employing a critical GIS approach (Cope & Elwood, 2009) that includes triangulated data collected through GPS mapping; semi-structured interviews; photovoice and videos, we present four visual narratives displaying uneven travel patterns that are mediated by the participants' gendered/racialized/aged bodies and socio-material affordances including their access to different travel modes and mobile technologies; their social network; and their familiarity with the built environment and logics of the transit system.

Examining an understudied population and underexplored embodied mobilities, allow us to extend the questions asked in childhood transportation studies to include an expanded inquiry on the silences of our own construction of childhood (Prout, 2004) and their associated mobility experiences. Moreover, our findings inform policies around children's independent active travel in light of Mississauga's new strategic vision that is supported by five strategic pillars of change (including developing a transit oriented city as a preferred, affordable, and accessible choice; a commitment to cultural diversity by ensuring thriving livelihoods for youth and new immigrants; and developing sustainable, safe, and connected neighbourhoods) (City of Mississauga, 2009).

PUBLIC PARTICIPATION OF ADULTS WITH AUTISM: KEY FINDINGS AND IMPLICATIONS FOR THE PLANNING PROCESS
Abstract ID: 25
Poster

KORNIYENKO, Gala [The Ohio State University] korniyenko.1@osu.edu, presenting author

This poster presents the results of the survey that measured the characteristics of inclusive participation for adults with autism. The implications of this research helps answer the question if the process of planning and designing communities is inclusive for adults with autism and if not, what possible changes can be made in order to make it inclusive. In general it helps understand the preferences for public participation for neurodiverse population, discover gaps in inclusive participation that omits people with autism, and what particular needs are for accommodation. This study gives planning professionals a better understanding of people with autism needs and preferences for public participation and help adults with autism advocate for their needs for the inclusive decision-making process.

Using the Six Feelings Framework, which was developed previously (OSU IRB - Study 2017B0464 "Planning and Design with Autistic Adults"), this study focuses on the adults with autism public participation in the decision-making process related to the planning and design of public realm.

This work contributes to the theories developed on the topic of public participation in planning and autism research and disability discourse. The ultimate goal of this research is to influence the decision-making process towards accommodation of existing public environment with people with autism in mind.

REVITALIZATION IN LOWELL MA: HISTORIC PRESERVATION AS POWER CONSOLIDATION

Abstract ID: 763
Poster

CAO, Weiyi [Harvard University] weiyi_cao@gsd.harvard.edu, presenting author

The changing nature of social and cultural values makes the assessment of historic designation projects difficult. It is particularly challenging to integrate cultural values with economic values, which is often outside the traditional purview of conservation professionals (Mason, 2002). In this paper focusing on Lowell's historical redevelopment, I first examine how the emphasis placed on specific values for the evaluation of Lowell's historic fabrics were strategically evolved and shaped, and how the designation of Lowell National Historical Park (LNHP) in 1978 predominantly served the purpose of economic revitalization. Since 1978, the redevelopment created many low-skill manufacturing jobs in the computer business and attracted a significant wave of immigration (Forrant & Strobel, 2011).

Then by collecting and mapping historical census data in GIS, I revealed how 1978's historic designation resulted in the demographic change of different ethnic groups in the Downtown area. Today, the city is composed of 20.9% Asian American residents, 49.1% White residents, 20.3% Latino residents, and 6.69% African American residents. However, a huge difference in population trends among ethnic groups is observed in the designated Lowell National Historical Park (LNHP) during the past 40 years. The White population decreases largely in the overall city but increases significantly within the area of LNHP since the designation. While the designation of LNHP saved the city from declining, it may have failed in benefiting all residents equally in cultural, social, and economic aspects. From the local historical newspaper back to the 1970s and 1980s, I found how the preservation and redevelopment process priced out minorities' small businesses, especially Asian groups.

Therefore I argue that redevelopment through historical designation serves as a form of resource distribution for the city of Lowell. While the establishment of industrial heritage created economic opportunities, its failure in recognizing the value of ethnic and cultural diversity created a privileged position for the city's earlier immigrants, primarily the European White population. Beneficiaries of the new industry of the city are largely not those who were displaced in the designation area. Because places are always constructed within the articulation of certain social relations, those persisting power and forces would determine to whom new benefits would flow. The neglected values of racial diversity and the lack of interventions in preserving the minority community in the designation incubated the inequality by forming a homogeneity in downtown's post-industrial economy.

FROM SOCIAL URBANISM TO *RECONCILIATION URBANISM:* DISSEMINATING KNOWLEDGE FROM MEDELLÍN, COLOMBIA TO TORONTO, CANADA

MALONEY, Keisha [University of Sheffield] maloney.keisha123@gmail.com, presenting author

Urban inequality often determines the marginalized lack representation in cities. This is often the case for the Indigenous population in Toronto, Canada, who struggle to see themselves reflected in the urban environment. This is largely the result of historical racism permeating current planning systems and policies rendering Indigenous input, experience, and representation often unnecessary (Woolford 2009). This research aims to promote the 'right to the city' (Lefebvre 1968) for marginalized groups by challenging planning processes. This research promotes the incorporation of Indigenous views into planning practices in an effort to reconcile the historical exclusion faced by Indigenous Canadians, defined as reconciliation urbanism. A framework for doing so is disseminated from the Medellín, Colombia 'Miracle' wherein social urbanism challenged the historical practice of prioritizing elite interests in urban planning projects. Social urbanism seeks to prioritize the excluded through urban planning, primarily by implementing participatory planning processes. What, and how, can planning processes in Toronto learn from Medellín regarding inclusive processes with excluded groups? How can we reconcile political and social conflicts through changing urban form? How can marginalized and oppressed groups obtain their 'right to the city' through changing current planning processes?

Implementing a case study review and conducting primary research in Medellín in the informal communities (comunas), the research develops an inclusive planning process extracted from Medellín. Site visits were made to numerous social urbanism interventions, including the community garden constructed on a former landfill, UVAs which serve as green community spaces, owned by the public utility company (EPM) and house water basins, the Escalaras Electricas and Metrocable system which transport informal dwellers to the core of Medellin. In an effort to contribute to the reversal of the origins of knowledge, typically coming from the global North, this research prioritized examples from Medellín as the blueprint for Torontonian inclusive planning interventions.

Comparing these two cases, the contextual background differs greatly. The dissemination of knowledge necessitates a filtering process that extracts and adapts knowledge suitable for the local planning culture, permitting comparisons between two contextually different cases (Khirfan 2011). What is relevant to extract is the process that occurred in Medellín leading to the development of inclusive and regenerative urban interventions. Examples from Medellín demonstrate when public spaces are created with and for excluded populations, investment serves material and symbolic purposes, improving the inclusion within the city and affirmation of identity. This initiates interaction between material recognition and symbolic recognition that culminates in supporting the right to the city for the excluded. This process, referred to as the Inclusive Planning Process, is detailed below:

It is not within the scope of the research to presume potential interventions, and it would not be applicable to replicate the examples found in Medellín in Toronto. This would undermine the importance of community participation and would lead to contextually irrelevant interventions. It is, however, possible to disseminate this process into the Torontonian context to improve inclusivity and work towards reconciliation urbanism over time. The key distinction is incorporation of reconciliation urbanism as an end goal.

The Inclusive Planning Process developed from the dissemination process has suggested process targets which can reconcile political and social conflicts, reduce urban inequality through creating change in the urban form, subsequently supporting the 'right to the city'. While the process for ensuring inclusive planning practices disseminated from Medellín is optimistic, its viability in practice must be assessed through implementation in various contexts, including in Toronto. By empowering the needs and perspectives of the excluded through infrastructures of inclusion, urban planning can play a significant role in the reduction of urban inequality, and therefore reconcile political and social processes.

TRACK 6 – HOUSING

TRACK 6 – PRE-ORGANIZED SESSION SUMMARIES AND ABSTRACTS FOR THE SESSIONS

ZONING AND HOUSING JUSTICE
Pre-Organized Session 34 - Summary
Session Includes 114, 115, 971

KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, organizer

In a time of intensified urban development and rising housing costs, zoning reform has emerged as a supply-side fix to the housing crisis and a strategic site of negotiation between real estate capital and public goods. We discuss research that engages with planning practices of upzoning and inclusionary zoning, asking how these zoning reforms interact with issues of spatial segregation, housing inequality, displacement and tenant movements, with an eye to the agency and positionality of planners and the potential for housing justice.

Objectives:

- land use inequality

UPZONING TOUCHES DOWN: A SPATIAL ANALYSIS OF ZONING REFORM POLICY
Abstract ID: 114
Abstract within Pre-Organized Session 34

KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, presenting author
KERRIGAN, Danielle [McGill University] danielle.kerrigan@mail.mcgill.ca, co-author

Over the past decade, as the housing crisis in large cities has intensified, zoning reform has become a common and controversial planning policy proposed to address housing affordability[1–3]. More specifically, some version of systematic 'as-of-right' pre-development up-zoning in existing urban areas (sometimes combined with inclusionary zoning) has been proposed or adopted in Seattle, Portland, Vancouver, Los Angeles, San Francisco, and Minneapolis and is being considered elsewhere.

There are three main arguments put forward to support up-zoning: affordability, equity, and sustainability. The presumed logic of up-zoning is that adding housing supply through residential redevelopment by allowing intensification will ease housing prices in high demand housing markets[4]. By allowing multi-unit buildings in residential areas dominated by single family homes, upzoning is cited as a way to address and undo patterns of residential class- and race-based segregation that are enforced through existing exclusionary and hierarchical zoning[5,6]. The increased density expected through up-zoning is cited as a way to shift transportation mode away from cars towards more sustainable, less fossil-fuel intensive modes such as walking, cycling and public transit.

This research is a spatial policy analysis that tests how these proposed zoning reforms are likely to address the claims of affordability, equity and sustainability by the way they touch down on the ground. Starting with the policy geographies in each of the cities, we identify how much the reforms propose to change the urban form, and use census data to see where and who they impact. In each city, we identify the policy areas and degree of intensification or redevelopment they entail. Using a representative streetscape from each policy area, we visualize the existing urban form and compare it to the changes

envisioned by the zoning reform. Next we document the types of housing by tenure and built form as well as the characteristics of the current residents (by racialization, immigration status, income) and the degree to which they would be affected by the zoning reform, with attention to existing affordable rental housing and the possibility of displacement through redevelopment. We compare this to the demographics and housing stock characteristics of the parts of the city that are least affected by this zoning reform. Finally, we look at the current mobilities and densities of the commute for each of the impacted and non-impacted areas to estimate possible mode shift, accounting for the interaction of socioeconomics with transit modes.

We conclude with a consideration of the policy discourse and governance source of the zoning reforms in each city, and a look at the political coalitions and social movements that have aligned in support or opposition. By comparing the political economy of each city's zoning reform policy with the way it touches down on the ground in terms of expected impacts on affordability, equity and sustainability, we can identify connections between the ideology, contestations and power relationships of policy formation and the spatial logics of implementation.

ZONING FOR THE HOUSING CRISIS – A DISCOURSE ANALYSIS
Abstract ID: 115
Abstract within Pre-Organized Session 34

KERRIGAN, Danielle [McGill University] danielle.kerrigan@mail.mcgill.ca, presenting author
KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, co-author

Across the U.S. and Canada, housing is increasingly acknowledged as unaffordable. Proposals to fix this affordability crisis through zoning reforms are ubiquitous. The 'zoning solution' to the affordable housing crisis has been advocated at all levels of government, from a 2016 White House paper recommending zoning liberalization (White House, 2016), to statewide bills in California, Oregon and Washington, to municipalities such as Minneapolis upzoning much of their single-family home residential land. Based largely on neoclassical economic ideas of supply and demand, the basic premise is that restrictive land use and zoning regulations are increasing the cost of construction (Glaeser & Gyourko, 2003) and artificially hinder the supply of housing, therefore raising the cost of housing for consumers. Despite the continuing empirical and theoretical debates within housing scholarship surrounding the link between land use laws and housing cost (Rodríguez-Pose & Storper, 2020; Been et al., 2019; Imbroscio, 2019; Glaeser & Gyourko, 2003) politicians and policymakers across the two countries have implemented, are debating or have proposed new legislation to reduce restrictive zoning regulations to increasing housing supply and in turn, reduce housing cost. The discursive target is often land zoned for the single-family home common across many Canadian and American cities.

By no means universally accepted, upzoning, or the 'zoning solution' has still achieved a level of prominence in the debate around housing affordability seemingly disproportionate to the evidence of

reductions in housing costs. How did zoning come to achieve this prominence as an accepted solution to the crisis of housing affordability? How did this idea spread among North American cities? What alternatives were precluded in the discussion? What are the reasons and logics given for upzoning as a response to the housing crisis? And finally, who does the discourse surrounding the zoning solution focus on and who does it exclude? To this end, this paper proposes to fill a gap in this literature by tracing the origins of the link between zoning and affordability across public discourse.

Through investigating federal, state, and municipal policy documents and media discourse surrounding proposed or actual changes to zoning regimes in Minneapolis, Los Angeles, and Seattle this paper will illustrate the genealogical links of the zoning solution to fix the affordable housing crisis. These proposed and actual zoning changes include Minneapolis's 2040 Plan, California's failed State Bill 50 and Proposition JJJ in the Los Angeles context and HALA and Washington State's proposed Accessory Dwelling Bills in the Seattle context. Each document will be coded for the arguments as to why housing is unaffordable, what the benefits of the 'upzoning' solution are (both related to and beyond housing affordability), who is expected to benefit and the actual proposed form of zoning solution among other key variables. Preliminary results suggest that the 'zoning solution' is not new, the call for upzoning and less municipal land controls broadly mirrors the rise of calls to reduce regulation during the 'neoliberal turn', instead the discourse has mutated to capture a changing problem as the need for affordable housing has become more acute. Persistent framing of the crisis as primarily a supply issue likely hinders other possible policy interventions such as direct public provision of housing, demand-side solutions, and improved tenant protections.

HOW DO UPZONINGS IMPACT NEIGHBORHOOD SOCIOECONOMIC CHANGE? EXAMINING GENTRIFICATION AND UPZONING ACTIVITY IN NEW YORK CITY
Abstract ID: 971
Abstract within Pre-Organized Session 34

DAVIS, Jenna [Columbia University] jmd2218@columbia.edu, presenting author

As cities across the country contend with rising rents and property values, recent scholarship has placed renewed attention on examining how various interventions in the built environment exacerbate gentrification pressures, from investments in public transit to green amenities. Although gentrification has long been conceptualized as a result of public sector, private market, and individual actions, recent scholarship has paid less attention to how public sector interventions and investments shape neighborhood change (Zuk, Bierbaum, Chapple, Gorska & Loukaitou-Sideris, 2018). This elision in the literature matters given that state interventions in the built environment could play an outsize role in determining how cities distribute costs and benefits across the urban fabric and which communities experience

subsequent risks and rewards. In particular, minimal research has examined how public sector-led upzonings, which permit higher allowable densities, shape subsequent neighborhood socioeconomic change.

Previous research to date has sought to identify the determinants of upzonings. For example, Gabbe (2019) investigates which parcel- and neighborhood-level characteristics influenced the likelihood that areas in select Silicon Valley cities (San Jose, Sunnyvale, and Santa Clara) were upzoned or downzoned in the early 2000s. In a related study, Been, Madar, and McDonnell (2014) examine the extent to which two different theories of urban growth–"growth machine" politics or "homevoter" theories–influenced the probability of parcels being upzoned or downzoned in New York City in the early 2000s. Examining a series of upzonings in Chicago between 2013 and 2015, Freemark (2019) investigates how upzonings affect changes in residential transaction values and short-term housing production levels. Yet, minimal research to date has examined how increasing the allowable density of a neighborhood affects subsequent demographic change.

This research paper will address this gap in the literature by investigating how a series of rezonings in New York City in the early 2000s impacted subsequent neighborhood socioeconomic change. Using a difference-in-differences approach, this paper will attempt to estimate the effect of upzonings on neighborhoods that experienced a high concentration of upzoning activity compared to similar neighborhoods that were not upzoned. This research is timely, as planners and policymakers have increasingly eyed upzonings as a solution to address the affordable housing crisis, but have been met with skepticism from several interest groups, from homeowners concerned about how upzoning will increase property values to community groups concerned that upzonings will increase gentrification pressures and disproportionality displace communities of color. As upzonings gain more traction among planners and policymakers, this research aims to illuminate the potential costs and benefits of upzonings.

PLANNING FOR 'INFORMALITY' IN LOW COST RENTAL HOUSING MARKETS – FROM SECONDARY DWELLINGS TO TINY HOMES AND ILLEGAL UNITS IN THE US, EUROPE AND AUSTRALIA
Pre-Organized Session 67 - Summary
Session Includes 273, 274, 275

GURRAN, Nicole [University of Sydney] nicole.gurran@sydney.edu.au, organizer

With affordability pressures afflicting cities throughout the world, there is rising interest in the potential for diverse and lower cost housing types to increase rental supply. A growing number of jurisdictions have reformed local planning codes to enable and even incentivise flexible housing types, from secondary dwellings to 'tiny homes', manufactured housing estates, micro apartments and room rental or capsule accommodation. The outcomes of these deregulatory initiatives to legitimise often longstanding sources of lower cost accommodation of uncertain legality remain unclear. This session brings together a range of research efforts from the US, Europe, and Australia, to examine emerging evidence on: • deregulatory

planning system initiatives designed to increase informal, diverse, or low cost rental housing • the prevalence and role of lower cost rental housing that remains non-compliant with existing planning regulation • implications for enforcement practices which must balance health and safety risks to occupants of unpermitted units against further exacerbating their housing vulnerability; and • comparative methodological approaches to researching the informal housing sector in the US, Europe and Australia.

Objectives:

- To understand and compare the role of 'informal' and diverse housing in low cost rental sub-markets across Europe, the US, and Australia.
- To appreciate tensions associated with illegally produced housing units and their regulation
- To consider the opportunities and risks associated with planning strategies to deregulate or encourage informal housing types as a response to affordability pressures.

IS 'INFORMAL' HOUSING AN AFFORDABILITY SOLUTION FOR EXPENSIVE CITIES? EVIDENCE FROM SYDNEY, AUSTRALIA
Abstract ID: 273
Abstract within Pre-Organized Session 67

GURRAN, Nicole [University of Sydney] nicole.gurran@sydney.edu.au, presenting author

With housing affordability pressures mounting in the world's wealthiest cities, low income earners are increasingly dependent on informal and sometimes substandard rental accommodation ranging from secondary units through to room rentals and subdivided apartments (Harris, 2018). Indeed, planning reform to enable secondary and micro rental units within established residential areas is increasingly promoted to allow households greater flexibility in meeting their changing housing needs while also encouraging lower cost rental housing provision through the private market (Anacker & Niedt, 2019; Wegmann & Chapple, 2014). But this informal rental market remains largely hidden from view, while the outcomes of reform efforts to enable more diverse and informal housing production remain under-researched.

This paper addresses these themes, examining the 'informal' housing sector and its contribution to low cost rental supply in Sydney, Australia. One of the world's most expensive cities, Sydney has witnessed a decade of planning reforms to deregulate 'informal' and low cost rental production alongside wider measures to boost housing supply. The paper examines these initiatives and their implications for understanding the role of informality within high cost housing markets, examining housing supply and affordability data over the period, reviewing a unique dataset of online rental listings, and drawing on interviews with local government personnel. Written descriptions and photographic images for a total of 285 lower cost rental listings advertised on the nation's largest property platform 'Realestate.com.au' were examined and classified according to dwelling type and rental value, building a unique window into informality and non-compliance across Sydney's low cost rental sector.

The findings show that informal secondary units and room rentals dominate Sydney's lower cost market, but rents remain high relative to incomes even for substandard accommodation. Further, and despite reforms to encourage new secondary dwellings and low cost rental supply, squalid and non-compliant housing persists, exposing tenants to serious risks. The findings suggest that in high cost cities such as Sydney, the informal sector occupies an important and largely unrecognised role in housing low income renters, but that more systemic reforms beyond the planning system are needed to improve housing outcomes for disadvantaged groups.

BUILDING A NATIONAL COMMUNITY TYPOLOGY OF REGULATIONS FOR ACCESSORY DWELLING UNITS (ADUS), MOBILE, RV, AND TINY HOMES IN THE UNITED STATES
Abstract ID: 274
Abstract within Pre-Organized Session 67

ANACKER, Katrin [George Mason University] kanacker@gmu.edu, presenting author

Over the past several years, most communities and many residents in the United States (U.S.) have been affected by a housing affordability crisis (Anacker, 2019). Most planners and policymakers have difficulties addressing the demand for housing as there is freedom of movement. Over the past several decades, housing policymakers have directly addressed housing supply through public housing for renters and the Section 8 New Construction and Substantial Rehabilitation for builders. Housing finance policymakers have indirectly addressed housing supply through Low Income Housing Tax Credits (LIHTCs), Community Development Block Grants (CDBGs), the HOME Investment Partnership program, federal, state, and local housing trust funds, and grants to Community Development Corporations (CDCs). Recent discussions of affordable housing supply have focused on Accessory Dwelling Units (ADUs; Anacker and Niedt, forthcoming) and converted garages (Brown et al., 2020). Interestingly, not much work has been undertaken on mobile, RV, and tiny homes in connection with the housing affordability crisis (Kahn, 2012; Peterson, 2018; Salamon & MacTavish, 2017; Sullivan, 2018). This study fills this gap.

I utilize the National Longitudinal Land Use Survey (NLLUS), conducted by Pendall in 1994, by Pendall, Wegman, and Martin in 2003, and by the Urban Institute and Pendall in 2019 (Urban Institute, n.d.). The NLLUS 1994 Land Use Dataset includes data on jurisdictions in the 25 most populous metropolitan statistical areas (MSAs) or Combined Metropolitan Statistical Areas (CMSAs) as of 1990 (n = 1,168). The NLLUS 2003 Land Use Dataset contains data on jurisdictions with populations over 10,000 in the 50 most populous MSAs and CMAs as of 2000 and 50 additional jurisdictions with fewer than 10,000 residents in metropolitan areas where jurisdictions with more than 10,000 people covered less than 60 percent of the total MSA land area (n = 1,845). The NLLUS 2019 Land Use Dataset includes data on jurisdictions with populations over 10,000 with the top 50 Core Based Statistical Areas (CBSA) and a sample of land use planning empowered jurisdictions with populations under 10,000 in select CBSAs (n = 1,703). For the combined three data sets there are 446 repeat respondents. I also utilize data from the decennial 1990, 2000, and 2010 Censuses and the American Community Survey (ACS; 2000s and 2010s).

I analyze demographic, socioeconomic, and housing characteristics in connection with regulations for Accessory Dwelling Units (ADUs), mobile, RV, and tiny homes through descriptive statistics and t-tests to build typologies for each of the 1994, 2003, 2019 data sets, and then for the longitudinal data set. Preliminary results indicate that more communities regulate mobile homes compared to tiny homes, RVs, and ADUs and that there are statistically significant differences in terms of demographic, socioeconomic, and housing characteristics. Finally, I also discuss federal, state, and local policy implications based on these results.

THE AFFORDABILITY ROLE OF ILLEGAL ACCESSORY HOUSING: A CHALLENGE TO STATIC PLANNING REGULATIONS AND ENFORCEMENT PRACTICES
Abstract ID: 275
Abstract within Pre-Organized Session 67

ALTERMAN, Rachelle [Technion-Israel Institute of Technology] alterman@technion.ac.il, presenting author
HOLZMAN-GAZIT, Yifat [College of Management] yifat.holzman.gazit@gmail.com, co-author
AVIAV, Orly [Technion University Neaman Research Institute] orlyar.law@gmail.com, co-author

In many cities across the world, accessory housing units and subdivided apartments violate planning regulations. Yet they are often an important component of affordable rental housing, thus posing difficult challenges to the static nature of planning regulations and to enforcement practices. The reported research focuses on accessory (illegal) housing units in neighborhoods with generally adequate housing standard. There, ADUs are a stock of rental housing that is more affordable than equivalent legal units because ADUs are usually retrofitted as part of an existing house or apartment and rely on pre-existing public infrastructure, without requiring significant public expenditures. Although illegality can hide substandard housing, ADUs in many, where the ADUs do not violate housing codes, they have many positives. They contribute towards gradual densification, have a low environmental footprint, and are socially and demographically diversifying. The paper reports on socio-legal research conducted in Israel - an especially intensive "laboratory" due to this country's fast-growing population and high housing prices. Illegal ADUs probably contribute an important part of the rental housing stock. New legislation (a second attempt) intended to enable the creation of legal ADUs or legalization of existing ones is likely to fail due to legal intransigence. The empirical research analyses the current and projected impacts of recently fortified enforcement in several case-study towns selected to represent a range of housing types, locations and prices. The findings indicate that instead of increasing affordable housing, as the legislation's objectives declare, the new rules might have the contrary effect. The conclusions point to the need for deep rethinking about the role of planning regulations, enforcement, and their capacity to meet dynamically changing housing needs.

PLANNING FOR AND RESPONDING TO STUDENT-DRIVEN HOUSING DEVELOPMENT IN UNIVERSITY NEIGHBORHOODS
Pre-Organized Session 70 - Summary
Session Includes 671, 672, 673, 674

MAWHORTER, Sarah [University of Southern California] smawhort@usc.edu, organizer

Rising college and university enrollments—and lagging dormitory construction—have fueled demand for student housing in recent years. Private developers have stepped in, building large multifamily housing complexes in campus-adjacent neighborhoods. This session interrogates the implications of these real estate trends for planning, with in-depth analyses of the development process that assess the consequences for students and higher education institutions, as well as for residents of surrounding neighborhoods. The papers include: an analysis of housing construction near university campuses across the US; a case study of university-led gentrification in Harlem, New York after World War II; an examination of zoning deregulation and student housing development in Champaign, Illinois; and a paper which delineates class and age conflicts around student housing in Waterloo, Ontario. Together, these papers consider planning responses to promote equitable and inclusive housing opportunities.

Objectives:

- Attendees will become familiar with past and current trends in student housing development.
- Attendees will understand how large-scale student housing development impacts campus-adjacent neighborhoods.
- Attendees will learn about a range of planning approaches and community responses to student housing development

THE RISE OF LARGE-SCALE STUDENT HOUSING DEVELOPMENTS IN UNIVERSITY NEIGHBORHOODS
Abstract ID: 671
Abstract within Pre-Organized Session 70

EHLENZ, Meagan [Arizona State University] meagan.ehlenz@asu.edu, presenting author
MAWHORTER, Sarah [University of Southern California] smawhort@usc.edu, co-author

Over the last two decades, higher education institutions (HEIs) and their neighborhoods have experienced significant change. At HEIs across the US, college and graduate student populations expanded rapidly from 2000 to 2016, with the generational swell of Millennials reaching young adulthood and higher-than-ever enrollment rates. Dormitory construction did not keep up, so students increasingly turned to off-campus housing alternatives (Arbury 2012). Concurrently, the US housing market went through major swings—from the housing boom of the early 2000s, to the 2008 foreclosure crisis and subsequent recession, to the rising rental affordability crisis. The confluence of these two changes stimulated new interest in campus-adjacent living in urban neighborhoods across the US. Private developers have increasingly pursued new multi-family residential projects near HEI campuses, constructing superblock buildings with floor plans and amenities that appeal to students (e.g., Gallun 2016). In many cases, these developments have been financed by real estate investment trusts (REITs), which have been eager to

capitalize on a new market fueled by off-campus student housing demands (Revington and August 2019; Revington et al. 2018). Collectively, these real estate trends hold substantial implications for HEIs, students, and adjacent neighborhoods—now and in the future.

In this paper, we investigate how new development has impacted the housing landscape in HEI neighborhoods. We assess housing development trends in HEI-adjacent neighborhoods across the US, focusing on the relatively recent phenomenon of large-scale rental projects marketed towards students. Quantitatively, we use The Integrated Postsecondary Education Data System data on HEIs combined with Census and ACS housing stock data to measure changes in the composition of rental housing units in census tracts within ¾ mile of four-year, degree-granting public and private non-profit institutions throughout the US from 2000 through 2018. We analyze changes in the stock of rental units in large multifamily structures as compared with smaller multifamily and single-family rentals, controlling for changes in full-time enrollment and dormitory construction. We contextualize this data with qualitative assessments of development in these neighborhoods, including interviews with multi-family residential developers and other real estate actors near HEIs.

Our research examines the degree of change in campus-adjacent neighborhoods and begins to quantify the reach of student-centered luxury apartment trends in urban HEI neighborhoods. Further, it calls into question the lasting legacies of these development trends for students, campus-adjacent neighborhoods, and small-scale rental units (e.g., Smith, Sage, and Balsdon 2014; Revington et al. 2018). We contend that increased student housing demand alongside the development of superblock-style apartment complexes has altered the fabric of many HEI-adjacent neighborhoods, changing the built environment for decades to come. Their presence introduces competition for small-scale landlords in these communities, as well as questions for the future of residential demand with projected enrollment declines. Further, the emergent "luxury" apartment trend creates new challenges for planners concerned with housing affordability for students and long-term neighborhood residents alike.

BUILDING THE GENTRIFICATION MODEL: COLUMBIA UNIVERSITY AND HARLEM, 1945 TO 1968
Abstract ID: 672
Abstract within Pre-Organized Session 70

TAYLOR, JR., Henry [University at Buffalo, The State University of New York] htaylor@buffalo.edu, presenting author

Gentrification and displacement are viewed as problems that emerged in cities during the 1990s and beyond. This paper argues that the gentrification danger emerged much earlier in New York City. In the aftermath of World War II, as big science and Cold War dynamics drove the expansion of Columbia, the university with the assistance of the University of Chicago, began to formulate a unique "gentrification" model for developing Harlem, a neighboring black community. With the assistance of Wilbur C. Munnecke, Vice-president of the University of Chicago, proposed a market-centered strategy that would attract "desirable" blacks to Harlem, while using a slum clearance strategy to uproot and displace "undesirable" blacks. The intent was to build a community based on "interracial" living for the middle-classes. Black residents fought back, and the student rebellions of the late 1960s put the strategy on hold.

A NEW SKYLINE FOR CHAMPAIGN: DID REZONING DRIVE STUDENTIFICATION?
Abstract ID: 673
Abstract within Pre-Organized Session 70

PENDALL, Rolf [University of Illinois at Urbana-Champaign] rpendall@illinois.edu, presenting author
PROCHASKA, Natalie [University of Illinois at Urbana-Champaign] prochask@illinois.edu, co-author
ALLRED, Dustin [University of Illinois at Urbana-Champaign] dallred2@illinois.edu, co-author
HILLYARD, Caitlin [University of Illinois at Urbana-Champaign] cah9@illinois.edu, co-author

The current housing affordability crisis has resulted in vocal challenges to local land-use regulations, especially in high-cost markets (Manville, Monkkonen, and Lens 2020, Wegmann 2020). In high-density neighborhoods, reducing or eliminating minimum parking requirements has been proposed as a way to unlock apartment construction (Chester, Fraser, Matute, Flower, & Pendyala, 2015; Gabbe & Pierce, 2017; Shoup, 2005). Amid all the protests and proposals, however, long-standing questions still persist: How much does land-use regulation really matter (Fischel 1989, Landis 1992, Pendall 1999)? More specifically, to what extent is zoning a reflection of what builders want to build more than a constraint— that is, is zoning endogenous (Pogodzinski and Sass 1994)? And even if zoning matters, what additional constraints to development might obstruct development of high-density housing that must be addressed before private-sector actors decide to build student apartments, or indeed any new apartments (Ehlenz 2018)?

We focus on a single case study of student housing in Champaign, Illinois to understand the relationship

between (de)regulation, housing demand, university imperatives, and local infrastructure policies. The analysis traces two recent regulatory reforms: eliminating parking requirements and modifying required open space ratios. We track the transformation of housing in the extended University of Illinois at Urbana-Champaign Campustown area and situate it within the complex adaptive system of local land-use change by relying on archival analysis and interviews with municipal planners, developers, university agents, and consultants with planning and/or development expertise in and around the study area.

We find that early place-making actions of a local entrepreneurial public university combined with changing student housing demand preferences to create an environment attractive to outside real estate development investment. The local municipality's by-right development approvals process recently amplified new development incentives when they eliminated all parking requirements. But we find that contrary to local claims that this change produced the increase in densification through multifamily student housing development in and around the core campus area, planned unit developments and exceptions to the zoning code created a de facto zoning change which dates back to earlier pioneering growth coalition place-making efforts.

Our results raise questions about policy prescriptions that call for rezoning as a panacea resolving high housing costs. As has often been shown, regulatory reforms work with support from plans, investments, and capital flows. Rezoning was only one action among many that have enabled the addition of 10- to 25-story buildings to Campustown's previous stock of 2- to 3-story apartments. At least as important were major infrastructure investments by the City and the university and the flow of capital into student housing following the single-family mortgage crisis. As well, the rezoning largely "legalized reality," rather than removing a constraint, since the City readily granted exceptions and variances well before changing the zoning.

STUDENT HOUSING AS INTERGENERATIONAL PLANNING PROBLEM: IMPLICATIONS FOR PRACTICE AND PRAXIS
Abstract ID: 674
Abstract within Pre-Organized Session 70

REVINGTON, Nicholas [University of Waterloo] nwrevington@gmail.com, presenting author

Scholars have coined the term "studentification" to refer to processes by which students become concentrated in particular urban neighbourhoods. This process may involve the conversion of existing housing stock, including so-called "single-family" homes, into student rentals, or – as is increasingly common – the development of private purpose-built student accommodations (PBSA) (Smith & Hubbard,

2014). In either case, studentification is associated with investments in the built environment catering to, and reliant on, the definition of a particular student life course stage. Problems such as noise and other behavioural issues, property maintenance shortcomings, and housing affordability concerns are common, precipitating planning responses. Yet, how issues are conceptualized shapes how planning practice responds. Many of the problems associated with student housing are symptomatic of class and age differences underlying studentification (Sage et al., 2012), requiring direct engagement with its inherent age-related conflicts in addition to market dynamics. Typical planning approaches to student housing have not engaged in this way, but rather have attempted to treat symptoms rather than root causes. The result has been a tendency to segregate students by keeping them out of certain areas through rental housing restrictions or directing them to other areas by encouraging PBSA development.

In this paper, I begin by outlining the class and age dimensions of conflicts relating to student housing, and planning attempts to resolve them. To conceptualize and address studentification as an intergenerational planning problem, I then advance a theoretical framework, mobilizing elements of urban political economy (Harvey, 1985) alongside the emerging concept of "intergenerationality," based on a relational life course perspective (Vanderbeck, 2019). This framework points to a radical reconfiguration of the politics of the "town and gown" relationship, and with it, alternative planning possibilities. Finally, I reflect on the practical implications of this shift for formal municipal planning, post-secondary education institutions, and housing advocates, respectively. The analysis is grounded in empirical evidence from more than four years of research in Waterloo, Ontario, including planning documents, real estate industry filings and grey literature, and semi-structured interviews with 44 key stakeholders and 27 students. Waterloo represents an ideal case for this research, home to two major universities and nearly half of Canada's private PBSA (Revington & August, 2019). As a dynamic site of studentification processes – both anticipated and responded to by planning – it therefore offers valuable lessons for other university cities. Findings point to concrete planning measures that can be taken to build an equitable and inclusive "post-studentification" city and provide a theoretical framework that can be adapted to other age-related planning conflicts.

EVOLVING SINGLE FAMILY NEIGHBORHOODS, PART 1: SINGLE FAMILY RENTALS & ACCESS TO OPPORTUNITY
Pre-Organized Session 85 - Summary
Session Includes 30, 390, 931

PFEIFFER, Deidre [Arizona State University] deidre.pfeiffer@asu.edu, organizer

U.S. single family home neighborhoods are evolving. These changes are occurring in response to shocks, like the recent Great Recession and foreclosure crisis, changing perceptions, such as growing interest in climate change and living in more walkable, diverse, and connected communities, and new policies allowing for multifamily development in historically single-family zoned neighborhoods. Questions

abound about how these changes manifest in particular kinds of places and are affecting diverse outcomes, from regional social equity in access to housing to social connectedness and capital among neighbors. This session will explore the nuances, trajectories, and outcomes of evolving single-family home neighborhoods and offer emerging lessons, projections, and ideas for planning practice.

Objectives:

- Evaluate how growth in single-family rentals relates to access to housing for diverse groups

EXPANDING THE GEOGRAPHY OF OPPORTUNITY? INSTITUTIONAL INVESTMENT IN SINGLE-FAMILY RENTAL HOUSING (SFR) IN THE ATLANTA METROPOLITAN AREA
Abstract ID: 30
Abstract within Pre-Organized Session 85

CHARLES, Suzanne [Cornell University] slc329@cornell.edu, presenting author

In the wake of the 2008 housing crisis in the United States, publicly traded institutional real estate investment firms—real estate investment trusts (REITs)—bought up foreclosed single-family houses in-bulk and converted them to single-family rental housing (SFR). Enabled by federal policies put in place to ameliorate effects of the crisis, SFR was initially located in neighborhoods with high rates of foreclosures and low house values (Immergluck, 2018). But in the 10 years since the crisis, REITs' investment portfolios have evolved to conform to their refined business strategies—to focus on SFR in neighborhoods with above average household incomes and well-regarded schools.

The increasing financialization of SFR, and the business practices of REITs in particular, contribute to housing insecurity and unaffordability; but, SFR may also serve as a means by which households gain access to desirable neighborhoods once only accessible to households with the wealth and the desire to purchase a house (Ihlanfeldt & Mayock, 2019; Pfeiffer & Lucio, 2015a, 2015b). Access to housing affects one's access to "opportunity structures," which Galster and Killen (1995, p. 7) define as the "social systems, markets, and institutions that aid in upward mobility." Advantaged neighborhoods foster intergenerational social mobility for children from low-income households through their high-quality schools, local social networks, and access to employment (Chetty et al., 2014). It follows, then, that SFR in advantaged neighborhoods may provide access to the spatially constituted opportunity structures therein.

The emergence of SFR REITs in suburban housing markets has altered how households access single-family housing. Yet, few studies examine the potential for REIT-owned SFR to counter housing exclusion and enhance access to the opportunity structures that some suburban neighborhoods offer. Using property-level data for all single-family houses in the 20-county Atlanta metropolitan area, this paper examines whether increases in REIT-owned SFR have enabled low-income households greater access to neighborhoods that offer greater opportunities for children–those within the attendance zones of high performing elementary schools—or if it has instead maintained and/or reinforced residential segregation in the region. Findings have implications for municipalities presently considering regulating SFR within their jurisdictions.

THE RISE OF SINGLE-FAMILY RENTALS IN SUBURBAN NEIGHBORHOODS: A QUESTION OF OPPORTUNITY FOR THE CHILDREN OF LOW-INCOME FAMILY RENTERS
Abstract ID: 390
Abstract within Pre-Organized Session 85

KHALEEL, Sahar [The Ohio State University] khaleel.3@buckeyemail.osu.edu, presenting author
HANLON, Bernadette [The Ohio State University] hanlon.42@osu.edu, primary author
AIRGOOD-OBRYCKI, Whitney [Joint Center for Housing Studies, Harvard University] whitney_airgood-obrycki@harvard.edu, co-author

There are advantages to living the suburbs. In general, suburban residents enjoy higher incomes, less poverty, more wealth, improved health, and better access to high quality schools than residents of cities (Squires and Kubrin, 2005; Logan, 2002; Logan, Minca, and Adar, 2012). Yet, the suburbs are changing. One area of transformation is the rise in suburban single-family rentals (Immergluck, 2018; Charles, 2020). This is, in part, because of the conversion of single-family homes from owner-occupied to rented following the foreclosure crisis (Eggers and Moumen, 2011). Investors purchased foreclosed homes to rent, taking advantage of the availability of vacated properties at a steep discount (Fields, Kohli and Schafran, 2016). Recent research notes the role of Real Estate Investment Trusts (REIT) in this process as large institutional investment firms bought portfolios of heavily discounted single-family homes to rent (Charles, 2019). The number of single-family rentals (SFR) increased by more than 2.5 million between 2009 and 2016 (Charles, 2019).

While large increases in SFR might negatively impact the social fabric of local communities, this rise might also expand single-family neighborhoods to renters who were previously excluded (Immergluck, 2018). This paper examines the potential benefits of the increase in SFRs in single-family neighborhoods for low-income renters. More specifically, we examine whether, because of rising SFRs, low-income renter families with children gained access to single-family neighborhoods of opportunity. Recent research notes the benefits specifically for children when they move to better neighborhoods (Chetty, Hendren and Katz, 2016). Moving from high-poverty to low-poverty neighborhoods may improve schooling outcomes (Johnson et al, 2002). Living in well-resourced and safe neighborhoods has a positive outcome on child health (Acevedo-Garcia, Noelke, McArdle, 2020). In this paper, we measure children's opportunity using the Child Opportunity Index, focusing on indicators related to education and health.

Using multinomial logistic regression, we identify the probability that low-income renter families with children live in neighborhoods where SFRs rose in the past decade. Preliminary findings suggest that despite rising SFRs, low-income renter families are more likely to live in low- and moderate- than high-opportunity neighborhoods. This research suggests there may be fewer benefits to low-income renter families of the rise in SFRs in single-family neighborhoods, and notes that not all single-family neighborhood have similar opportunities for children.

"OUR CUSTOMER IS AMERICA": HOUSING INSECURITY AND EVICTION IN LAS VEGAS'S POST-CRISIS RENTAL MARKETS
Abstract ID: 931
Abstract within Pre-Organized Session 85

SEYMOUR, Eric [Rutgers, The State University of New Jersey] eric.seymour@rutgers.edu, presenting author
AKERS, Joshua [University of Michigan-Dearborn] jmakers@umich.edu, co-author

In this paper, we examine "post-crisis" housing insecurity through an analysis of single-family rentals and residential motels and the evictions carried out on these properties in Las Vegas, Nevada. These are two important segments of the rental housing market from a policy perspective. Single-family rentals provide services typically associated with homeownership, but without the ownership benefits of housing security and wealth building. While renting is preferable to owning under certain conditions, it is important to investigate what happens when tenure choice is limited and landlords have increasingly become out-of-state corporate actors. In the wake of the foreclosure crisis, investors purchased hundreds of thousands of single-family homes in select markets and converted them to rentals. Activists and scholars have documented investor practices of fee gouging, raising rents, and automating evictions to maximize profits and safeguard investors' returns. Increased demand for rental housing since the crisis has constrained the options of low- and moderate-income households, tilting power toward investor-landlords and raising the odds of abuse. A similar, though less-remarked-upon dynamic plays out in residential motels, which often serve as housing of last resort. Households with impaired credit, irregular income, eviction records, and other barriers to mainstream rental housing often turn to motel operators charging relatively high rents for low-quality units.

Leveraging ten years of property ownership records, court-ordered evictions, and code enforcement violations, this paper examines post-crisis trends in ownership and evictions related to single-family rentals (SFR) and residential motels. We use logistic regression to test the association between eviction and ownership by large corporate landlords net of property and neighborhood characteristics. We find that local specialists, including one large entity who is also a major local motel operator, have both the highest adjusted and unadjusted eviction rates among large single-family landlords. Several large corporate landlords, like Blackstone (aka Invitation Homes), also exhibit higher odds of eviction relative to small landlords (< 15 SFR). Through descriptive analysis of motel ownership and evictions, we find large residential motels have both high absolute eviction numbers and high relative eviction rates. In the context of information obtained through interviews with tenants and legal aid attorneys, these results give additional shape to this segment of the rental market, where owners of residential motels leverage strong demand for housing with low barriers to entry while utilizing the confluence of short lease terms and rapid evictions to ensure returns. These results suggest the squeezing of renter households that would historically have been able to access and build wealth through homeownership, as well as the exploitation of the most precarious households consigned to the private market without assistance.

EVOLVING SINGLE FAMILY NEIGHBORHOODS, PART 2: ADAPTIVE PRACTICES & EVICTIONS
Pre-Organized Session 87 - Summary
Session Includes 301, 393, 395

CHARLES, Suzanne [Cornell University] scharles@cornell.edu, organizer

U.S. single family home neighborhoods are evolving. These changes are occurring in response to shocks, like the recent Great Recession and foreclosure crisis, changing perceptions, such as growing interest in climate change and living in more walkable, diverse, and connected communities, and new policies allowing for multifamily development in historically single-family zoned neighborhoods. Questions abound about how these changes manifest in particular kinds of places and are affecting diverse outcomes, from regional social equity in access to housing to social connectedness and capital among neighbors. This session will explore the nuances, trajectories, and outcomes of evolving single-family home neighborhoods and offer emerging lessons, projections, and ideas for planning practice.

Objectives:

- To assess how residents of single family home neighborhoods are adapting their homes to meet their needs.
- To describe why some landlords in single family neighborhoods choose to evict their tenants and others choose not to evict.

THE SUPPLY-SIDE OF EVICTION: THE MANY WAYS THAT LANDLORDS DEAL WITH BACK RENT
Abstract ID: 301
Abstract within Pre-Organized Session 87

DECKER, Nathaniel [University of California, Berkeley] ndecker@berkeley.edu, presenting author

In recent years scholarship has shown that evictions are very common across the US and cause severe, lingering disruptions in tenants' lives. Much of the scholarship on evictions (both formal and informal) has focused on who gets evicted, and the consequences of evictions on tenants (Desmond, 2016). Low-income women, particularly those with children, are disproportionately the target of evictions. Evictions hurt tenants in many ways. Studies show that moves caused by either formal eviction or the real threat of eviction are associated with worse mental and physical health outcomes, material hardship, and relocations to worse neighborhoods.

Evictions are usually discussed as the result of structural changes in the US economy, but the specific

reasons why landlords choose to evict tenants may also be important. For many years rents have increased faster than incomes and public subsidies have not risen to cover this gap. One result is more precarious housing situations, particularly at the low end of the market. However landlords are not a monolithic group, and there are signs that landlords consider eviction in very different ways. Garboden & Rosen (2019) find that, for some landlords, the threat of eviction is a routine method of rent-collection. Raymond et al. (2016) find that professional or corporate landlords evict tenants at higher rates than smaller scale "mom and pop" landlords. Why do some landlords immediately start the eviction process when rent is late, while others wait weeks or months?

This paper examines what the owners of small rental properties (1-4-unit properties) do when they have problems with their tenants, particularly regarding rent non-payment, and whether there are generalizable differences in how owners consider eviction. To answer these questions I designed and conducted a large survey of small rental property owners. The survey asked owners and managers how they dealt with tenant problems and the subject was probed in more detail in follow-up interviews. The survey was conducted on a stratified random sample of 53,000 owners in the top 150 metro areas in the US. Additionally, I conducted 161 interviews with an average duration of an hour.

Understanding the reasons why some landlords routinely use eviction to deal with tenant problems, while others use it as an option of last resort, could help governments craft effective and equitable policies meant to reduce eviction levels. States and municipalities have a broad range of interventions at their disposal such as right-to-counsel laws, just-cause statutes, and emergency rent subsidies. Understanding the behavior of landlords, in addition to the plight of tenants, will help ensure that public officials implement policies that limit the damage that eviction can cause in a fair and responsible way.

MUNICIPAL RESPONSES TO INFORMAL MULTIFAMILY HOUSING IN DIVERSE SUBURBS: THE CASE OF RAMAPO, NEW YORK
Abstract ID: 393
Abstract within Pre-Organized Session 87

HUENNEKENS, Joseph [Columbia University] jsh2228@columbia.edu, presenting author

Immigrants and ethnic minorities are at the front lines of challenging single family zoning in the suburbs. Yet the changes enacted by these communities tend to be ad-hoc and informal—and have thus far avoided serious academic attention. This is particularly true of single family home conversions, in which a house is subdivided, or otherwise altered, to accommodate additional residents. Conversions are glanced at in most accounts of so-called "ethnoburbs," but that literature tends to focus more on the aesthetics of immigrant-owned single family homes (Li, 2009, Cheng 2013, Lung Amman, 2017). Similarly, scholars and policymakers interested in overturning single family zoning tend to avoid the messy types of dense housing found in suburban ethnic enclaves (Manville et al, 2019). Yet, if we want to understand a post-single family future, we must engage seriously with the actual, existing densification experiments being undertaken in diverse suburbs. In particular, we must better understand how municipal authorities and

planners engage with "incoming" communities that pursue single family home conversions, how informal or quasi-legal housing practices are incorporated into formal law, and what happens after single family zoning is overturned.

This paper looks to investigate two questions. First, how do municipal authorities respond to demands for single family home conversions, especially when the demand comes from an ethnic or linguistic minority group? Second, what happens to the built environment, and local politics, after single family zoning is loosened to allow said conversions? These questions are explored through an investigation of one extreme case study: Ramapo, New York. In 1986, single family home conversions were legalized in Ramapo following at least a decade of aggressive censure from the municipality. The path to legalization proceeded in conjunction with the growing political power of the ultra-Orthodox Jewish community there, and culminated with the creation of an innovative zoning district that allows families to convert their homes into up to three units. Ramapo is a unique case where conversions "migrated" over time across a spectrum of legality and scale. As such, it can help clarify the variability of municipal responses to conversion. It also provides a rare window into what happens when flexible zoning is introduced into a heretofore uniformly single family suburban context.

This paper begins with an introduction to Ramapo and the unique housing pressures of ultra-Orthodox Jews. Archival records are then analyzed from the period between 1970 to 1986, to show how growing ultra-Orthodox political power forced municipal action to legalize single family home conversions. In the second section, archival records, semi structured interviews, municipal property records, and American Community Survey (ACS) data is used to determine whether the conversion law met its (openly stated) goal of absorbing, and containing, ultra-Orthodox housing demand. Preliminary findings indicate the answer is contradictory: the conversion district unlocked hundreds of new units, but it did not end informal housing practices in the ultra-Orthodox community—nor temper the municipal controversy around those practices. Finally, the paper concludes with a short discussion of what the Ramapo conversion district tells us about the possibilities and pitfalls of legalizing conversions and eliminating single family zoning. By analyzing Ramapo in relation to neighboring towns, the paper argues that issues of power and citizenship are crucial in determining how municipalities react to single family home conversions and that the relationship between single family zoning, affordability, and exclusion is more complex than commonly presented.

GARAGES AREN'T JUST FOR CARS: HOW SINGLE-FAMILY HOME RESIDENTS ARE REPURPOSING THEIR GARAGES TO PROSPER, PREACH, AND PLAY
Abstract ID: 395
Abstract within Pre-Organized Session 87

PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, presenting author

A common feature of the U.S. suburban landscape is the garage home, a kind of home where the garage and driveway take up a large portion of the front of the home. Garage homes use land efficiently, which offers profitability for developers and affordability to households; yet, they are blamed for various

neighborhood ills, including a lack of physical activity and socialization among neighbors (e.g., Hayden 2004; Bello & Adler 2004). Despite their popularity and concerns about their social impacts, there have been few attempts to explore the uses, prevalence, and geography of garage homes. This research helps to fill this gap by using a mixed-methods approach in Phoenix, Arizona, a quintessential suburban region.

First, I develop a taxonomy of garage home designs and uses through participant observation, an exploratory analysis of data from a windshield survey of Phoenix area single-family homes, and a systematic review of Instagram posts, traditional media, and the scholarly literature. Preliminary results show diverse kinds of adaptations, from gyms to churches to homes. Then, I use 2017 data from the U.S. Census and Phoenix Area Social Survey, which is a sample of twelve socially and ecologically distinct communities in the region, to quantify the prevalence of these designs and uses and explore their place-based correlates. I expect to find that these uses are correlated to distinct neighborhood dynamics.

Overall, this research will help to identify 1) to what extent garage homes define the U.S. suburban landscape, 2) how people adapt garage homes to meet their needs, as evident by their outward physical features, and 3) where different kinds of garage homes are most likely to occur. The findings will help local practitioners and advocates develop targeted strategies to harness the opportunities and remedy the potential harms of garage homes for residents.

NEW OR NOT? INCREMENTAL HOUSING NOW
Pre-Organized Session 90 - Summary
Session Includes 485, 486, 487, 489, 492

STIPHANY, Kristine [Texas Tech University] kstiphany@utexas.edu, organizer

Informal housing production is widely seen in the Global South as the incremental and adaptive response to conditions of housing inequality. Parallel processes in the United States are less understood, yet are the focus of emerging research about how planning might most appropriately meet the needs of economically disadvantaged communities. Indeed, the idea and practice of self-help housing, incremental housing and land subdivision, and housing regeneration underlie urban transformation in both the Global North and the South. We explore whether engagement with incremental housing processes – formal and informal – is radically new, or if this familiar form of city-making is being expressed in substantially new directions, forms, and geographies. This panel will present recent research that problematizes contemporary incremental housing through three comparative themes: 1) densification and renting; 2) housing subdivision; and 3) big and small data for mapping, monitoring, and measuring incremental housing. South – north knowledge networks provide a critical source for renewed attention to global housing inequalities.

Objectives:

- Exposure to recent work in the area of incremental housing, from a global comparative perspective.
- Enhanced understanding of informality and planning responses in the United States.
- Awareness of the potential for south – north knowledge networks to improve affordable housing globally.

THE MULTI-GENERATIONAL VERNACULAR: A STUDY OF INCREMENTAL SELF-BUILT HOUSING PROCESSES IN PAKISTAN
Abstract ID: 485
Abstract within Pre-Organized Session 90

BAQAI, Aabiya Noman [The University of Texas at Austin] aabiya.baqai@utexas.edu, presenting author

Self-built multi-generational housing is an essential part of neighborhood practices in much of Pakistan even today. This is due the sense of agency and autonomy many Pakistani families and communities thrive for in home-building processes (Tariq, 2012). An owned house, much like in many parts of the both developing and developed world, is associated with security and stability for communities in the region and plays a role in socio economic perceptions of each other (Malik et al., 2018). Although attempts have been made by the private sector to create more uniform housing communities in major cities of the country including Lahore, Islamabad and Karachi, self-building is still a major component of the housing market in Pakistan (Tariq, 2012). In addition, the multi-generational elements of housing stem from cultural and religious practices that promote integrated living between parents, their sons, and the sons' families. While neoliberal economies have inspired tendencies of nuclear family systems, specifically in urban communities, multi-generational family systems are still very much a prevalent component of household practices in middle and low-income neighborhoods. The combination of self-building and multi-generational needs, therefore, spark an incremental approach to the building process where basic ground level construction of housing on empty lots is ultimately converted to multiple stories of sections that are used by different members of the family usually categorized as aging grandparents, parents, and sons and their wives and children, over the course of multiple decades (Tariq, 2012).

Although much research has been done on microfinancing processes to facilitate incremental housing practices in low-income, informal communities and post-disaster relief (Tariq, 2011; 2012), there is not much detailed evidential research on multi-generational implications on incremental housing in Pakistan. Therefore, this paper aims to study incremental house-building practices specifically in the cities of Karachi and Islamabad through field research, that are aligned with creating more space for second and third generations. In addition to the spatial, material and economic components (Hanson, 1975), this study aims to explore the more social and gender-driven agencies in the self-building vernacular, and how this is framed in the larger policy agenda of local and national governments in terms of the promotion for urbanization and homeownership (Subhan and Ahmed, 2012).

Data will be collected through qualitative ethnographic field research in Summer 2020 in the cities of Karachi and Islamabad, particularly in neighborhoods that have predominantly low-income and middle-income households, across formal and informal neighborhoods. Neighborhoods will be identified through familial connections and relationships the author have in the two cities. This process will include interviews with families living in multigenerational households who have engaged in incremental self-building practices, and site visits, observations and photo journaling of the social and spatial elements of such practices. The aim is to highlight the intersectionality between class, legality and gender roles in the different households and delineate distinctions and patterns across these intersections in neighborhood characteristics and self-building processes. This will be tied to the larger constructs of urban governance and community agency in the country. The study will facilitate more South Asian perspectives of incremental housing alluded to cultural and traditional practices, and how this can impact perceptions on policy thinking and approaches to such self-built housing in the region, specifically in urban areas of Pakistan.

A BIG DATA APPROACH FOR THE IDENTIFICATION OF INFORMAL SUBDIVISIONS IN THE UNITED STATES

Abstract ID: 486
Abstract within Pre-Organized Session 90

DURST, Noah [Michigan State University] durstnoa@msu.edu, presenting author
HUANG, Huiqing [Michigan State University] huiqingh@msu.edu, co-author
SULLIVAN, Esther [University of Colorado Denver] esther.sullivan@ucdenver.edu, co-author
PARK, Hogeun [World Bank] hpark2@worldbank.org, co-author

Informal and unplanned residential development is accompanied by myriad negative consequences. In the United States, two relatively widespread but little studied types of neighborhood – mobile home communities and informal subdivisions – disproportionately expose residents to health, safety, and financial risks due to environmental, economic, and social vulnerability (Sullivan, 2018; Ward, 1999; Ward and Peters, 2007). The time-intensive nature of locating these communities limits their systematic study by scholars. This paper uses big data to develop a series of metrics capable of identifying and distinguishing between these communities. We use a data set of building footprints developed by Microsoft and released publicly in 2018 to measure the size, type, orientation, placement, and uniformity of housing in neighborhoods Hidalgo County, Texas, where more than 1,000 informal subdivisions have been documented by prior research (Durst, 2016). We use support vector machines and cross-validation to test the ability of these metrics to distinguish between three neighborhood types: informal subdivisions, mobile home parks, and formal subdivisions. Our models are capable of correctly classifying neighborhoods more than 95% of the time. We conclude by describing the methodological steps necessary to identify and systematically study these neighborhoods across the country.

FROM DWELLING ENVIRONMENTS TO DWELLING ECOLOGIES: RETHINKING GRASSROOTS DWELLING PRACTICE IN INCREMENTALLY SETTLED MARSHLANDS IN GUAYAQUIL, ECUADOR

Abstract ID: 487
Abstract within Pre-Organized Session 90

PEEK, Olga [University of Leuven (KU Leuven)] olgapeek@gmail.com, presenting author

The Latin American region once was a cradle for groundbreaking research on incremental urban development (Turner, 1963; Caminos, Turner & Steffian, 1969). While self-help and incremental housing approaches focusing on the housing agency have consolidated over time (Turner and Wakely, 2015), the deeper connection between housing, people's daily practices and the particular environmental condition of a place have got lost. Connecting grassroots dwelling practices with broader environmental questions and sustainability issues is, however, crucial as it often remains unclear how places are shaped through inhabitants' struggles and what true impacts ecological transformation can have on urban livelihoods built up over various decades (Hordijk, 1999; Hardoy et al., 2013).

This paper focuses on the consolidated informal settlements in Guayaquil, Ecuador: a former mangrove marshland that incrementally transformed into the most densely populated urban district. After sixty years of grassroots incremental transformation, the consolidated informal settlements have reached a tipping point and are facing growing challenges in relation to the many years of densification and inhabitation as well as the ecologically fragile conditions of the estuarine environment where the livelihoods are settled.

Drawing upon intensive and extensive field research in four low-income communities in Guayaquil, this paper will deploy an in-depth yet multi-scalar view on incrementalism and self-building in consolidated informal settlements. It will focus on the strategies that low-income households in consolidated informal settlements develop to improve their dwellings and neighborhoods, and the extent to which these strategies of self-organization and collective action allow households to cope with higher-level demands that have emerged after forty to sixty years of densification, intensive use of the dwelling environment, and radical ecological shifts. We found that while incremental trajectories for dwelling and neighborhood improvement have shown highly flexible and adaptable when it comes to interacting with changes in both social and ecological cycles, these grassroots developments primarily focused on improving people's direct living environments. Tackling longue-durée and higher-level demands that play at the environmental scales turn out to be extremely challenging for the older and currently unattended consolidated settlements that are in dire need of structural support.

We discuss how ´new´ methods of collaborative mapping can help (1) to better describe and visualize processes of incremental change and emergent demand for housing and ecological rehabilitation in older settlements and self-built environments, as well as (2) to pro-actively step into this complex setting and establishing a constructive dialogue between governing relationships and socio-morphological realities that play across multiple social-spatial scales in the city. The empirical studies from Guayaquil will provide evidence of how decision-making and design when combined effectively can steer future urban upgrading trajectories towards more equitable housing and ecological transformations.

COMPARING THE MICROECONOMICS OF INCREMENTAL HOUSING UPGRADING STRATEGIES FOR OWNER-OCCUPANT HOUSEHOLDS IN SÃO PAULO
Abstract ID: 489
Abstract within Pre-Organized Session 90

WEGMANN, Jake [The University of Texas at Austin] jagw@utexas.edu, presenting author
STIPHANY, Kristine [Texas Tech University] kstiphany@utexas.edu, primary author

In recent decades, slowing rates of urbanization in Latin America have led scholars of the built environment to shift more of their attention toward already built-up, "consolidated" urban settlements, as opposed to the strong focus on newly urbanized informal settlements in previous decades. In many cases, yesterday's settlement on the metropolitan periphery is today's "innerburb"—a now established urban community facing the pressures of an established neighborhood, including aging infrastructure, regularized ownership titles reverting to an informal state, and the strains of absorbing further population inflows (Ward, 2015).

Innerburb scholarship to date has focused on varying aspects of life in consolidated settlements, including aggregate effects on urban politics (Bayat, 2000) as well as perspectives on important on-the-ground realities such as the relationship between inter-generational property transfer and public policy (Jiménez Huerta and Cruz Solís, 2015), and unit sub-division for rental (Leung and Yiu, 2019). One important missing perspective has been that of household microeconomics: What are the financial considerations that households use to select among several possible options for intensifying the use of their property through incremental, self-help expansion and redevelopment? Our study aims to fill this gap.

Drawing on years of on-the-ground qualitative research in São Paulo conducted by one of the authors, our study identifies several common recurring patterns of the in-situ intensification of use of small properties carried out by residents of Heliópolis, a neighborhood located in the industrial Sacomã district, 11 kilometers from São Paulo's city center, and 13 kilometers from its easternmost margins. Using a variety of sources, we construct prototypical pro forma analyses, or economic projections, for each of the common intensification options, from the point of view of the owner-occupant household, for residential rental and commercial uses. These include the conversion and/or subdivision of existing spaces, the construction of new spaces, and the replacement of existing buildings with new ones. These pro forma analyses provide insight into the reasons that households in varying circumstances pursue certain physical and use options but not others. They also illustrate the unintended consequences of public policies, such as a locally-run household relocation voucher program instituted by the City of São Paulo, beginning in 2004. Although the impact of redeveloping or otherwise intensifying the use of a single property is limited, recurring patterns replicated hundreds or thousands of times add up to a profound, bottom-up transformation of a whole urban district.

By focusing on the budgets of individual household smallholders of property and taking seriously the real estate economics concept of real options (Titman, 1985)—in essence, the households' individual agency refracted through an economics lens—our study is intended to provide insights into processes of additive urban transformation. It also allows us to critically assess the effects, intended and otherwise, of policies such as the housing voucher, and others that a municipal government might consider pursuing to alter the trajectory of urban transformation.

ENVISIONING THE SUSTAINABLE HOUSING UPGRADING OF INFORMAL COMMUNITIES IN MEXICO CITY

Abstract ID: 492
Abstract within Pre-Organized Session 90

REYES, Ariadna [University of Pennsylvania] ariadna@upenn.edu, presenting author

After six decades of rapid urbanization, informal communities account for the largest proportion of urban areas in Latin American cities (Ward et al 2015). Given this reality, housing scholars and policymakers concur that participatory approaches to incremental housing may help revitalize the aging community infrastructure and housing stock in informal communities (Amoako et al., 2017; Caballero Moreno, 2019; Mullins, 2018). By fostering partnerships between residents and community-based organizations and local governments, non-governmental organizations, and the private sector, participatory slum upgrading projects may facilitate innovative and effective solutions to housing upgrading in low-income settlements. However, participatory slum upgrading projects require careful, empirical attention to building design, structural quality, and materials used for self-help housing improvement in informal communities (Amoako et al., 2017; Caballero Moreno, 2019; Sullivan and Ward, 2012).

Previous fieldwork conducted by the author in 2017 served to document the material characteristics and deficiencies of self-help housing in the colonia popular of Isidro Fabela, Mexico City. Previous research revealed that most self-built structures here are structurally sound made of concrete and durable materials, but have design severe shortcomings, such as faulty sewers, asbestos roofs, and unsafe staircases. My research revealed the broad spectrum of building quality in Isidro Fabela and suggests that self-built dwelling units are highly heterogeneous and thus have different needs for housing upgrading. Because of the complexity of building quality, residents require careful technical and financing assistance that may help families envision sustainable projects of housing upgrading in their homes. This article examines the opportunities provided by participatory approaches to sustainable housing upgrading in Isidro Fabela. The author will conduct fieldwork in Isidro Fabela, which includes architectural observations, construction surveys, and in-depth interviews that document the benefits of sustainable construction systems, such as insulating concrete roofs, and technological innovations, such as solar water heaters and rainwater harvesting systems, to improve building quality. The author will also investigate the approximate costs of sustainable upgrading solutions in order to envision potential sources of funding provided by local governments, private sector, NGOs, among others. In doing so, this investigation seeks to inform sustainable housing policies that help revitalize the housing stock of informal communities in Mexico, which may serve as a reference for other cities in Latin America.

PLANNING SOLUTIONS TO THE HOUSING CRISIS
Pre-Organized Session 156 - Summary
Session Includes 871, 872, 873, 1137

WALKS, Alan [University of Toronto] alan.walks@utoronto.edu, organizer

This sessions brings together scholars examining housing affordability, planning, and governance issues in the UK and Canada. The session first identifies key problems in rental housing policy and production, and in how land use planning and land markets have interacted with landlord-tenant laws to enable rising rents and displacement of tenants. It then moves to examine three case studies of how planning can facilitate more sustainable and equitable rental housing futures within three distinct policy arenas, including financial inclusion policies, cooperative housing programs, and community land trusts.

Objectives:

- To understand how different policies interact with planning to produce different housing outcomes, including displacement but also placement
- to understand how planning can facilitate inclusion, cooperative forms of housing, and community decision-making
- to understand and compare alternatives to the private rental market for delivering housing solutions

PLANNING FOR RENTAL HOUSING & THE LANDLORD-TENANT RELATION IN TORONTO
Abstract ID: 871
Abstract within Pre-Organized Session 156

HREICHE, Oula [Queen's University] 18oh3@queensu.ca, presenting author

While low- and middle- income rental housing has gained nascent traction in scholarly debates, the Canadian experience with private rental housing geographies remains undertheorized in the academic literature. In 2018, the suspension of rent-control on newly occupied units in Ontario emerged within a heated debate on the heightened unaffordability of the private rental market, particularly in Toronto, and the increased instances of evictions in what has become one of the tightest housing markets in the country. To that end, this research is concerned with how evictions, in their various manifestations, are framed in legal vocabulary, thus reproducing displacement and the landlord-tenant relation in a technical

and apolitical manner. In that vein, it examines the urban planning politics governing the private rental market in Toronto to unsettle the ideological role of the state therein. Building on insights from Marxian political economy and the content analysis of key policy documents, it raises the following questions: How may we historically and theoretically understand the role of the Canadian state in forging and mediating the landlord-tenant relation through legal geographies? How has this resulted in rental-based displacement? This investigation advances empirical insights to reveal how the displaced fall across certain class, racial, and gendered dimensions. It also argues that private rental housing markets in Toronto reproduce the neoliberal project of the state in disciplining working class tenants in favour of helping landlords overcome barriers to accumulation, through displacement. This theorization insists on unsettling the class alliances underwritten in the policy environment and legitimated through the legal framework governing landlord-tenant relations. It also adds nuance to the implications of displacement on the lives of working-class tenants in the city.

FINANCIAL CONSUMER PROTECTION, LITERACY, AND INCLUSION: IMPLICATIONS FOR CANADIAN URBAN PLANNING AND POLICY
Abstract ID: 872
Abstract within Pre-Organized Session 156

SIMONE, Dylan [University of Toronto] dylan.simone@mail.utoronto.ca, presenting author

Despite being only a decade from the global financial crisis, predictions and warnings of the next crisis have already begun to sound. In Canada, household debt levels have continued to increase, and property bubbles in its major cities – notably Toronto and Vancouver – are now ranked among the five largest worldwide. Like many nations, Canadian policy post-crisis focused on enacting programs of financial literacy in an effort to redistribute financial risk from the state and industry onto individuals and households. Unlike many nations, however, Canadian banks, regulators, and agencies have unilaterally espoused the myth that Canadian banks did not require a bailout in the crisis, and that Canadian banks are the envy of the world for their fiscal prudence, transparency, and stability.

Canada's largest banks are indeed among the world leaders prudentially managing liquidity and capital adequacy risks through the Basel standards. Yet, our banks have lagged behind their international peers in terms of market conduct risks – those relating to compliance with consumer protection legislation. Canada legislated a Federal Financial Consumer Protection Framework (FCPF), as part of Bill C-86 in December 2018, ten years post-financial crisis. This FCPF was justified as an urgent need in light of investigative findings by Canada's consumer watchdog, the Financial Consumer Agency of Canada (FCAC) in their March 2018 Domestic Bank Retail Sales Practice Review. Finding that retail bank culture was heavily anchored in sales, this report spurred the legislative process to pass the FCPF, concluding a decade-long series of attempts to do so.

Canadian financial regulation is highly fragmented. The Canadian Constitution ascribes exclusive

jurisdiction over banking to the federal government; however, it equally ascribes exclusive jurisdiction for consumer protection to the provincial and territorial governments. This fragmentation extends further: legal rights and responsibilities of banking consumers (federal domain) versus investors (provincial domain); forms of recourse and protection through external complaint bodies whether in banking (two organizations: one not-for-profit and one for-profit) or capital markets and securities (a single, mandated, neutral arbiter). As the complexity of financial products continue to evolve, and as the demarcations between retail banking and investment products dissolve, a financial system driven by fee-based profits and fine-based punishments generates structural incentives to sell the highest-margin products in the regulatory realm of lowest consumer protection.

These structural incentives manifest in the crucial, yet often misunderstood, role financial advisors play in garnering access to mortgages for homeownership. In Canada, Financial Advisor – spelled 'or' – is an unregulated title which anyone can use, regardless of training, education, or employment; Financial Adviser – spelled 'er' – is a regulated title under securities laws with a fiduciary duty to act in the client's best interest. Over 96 percent of all 'Advisors' in Canada – be it wealth, investment, mutual fund, retirement, etc. – are unregulated. Standard industry practice incentivizes 'hat switching,' whereby professional 'Advisers' (regulated by a securities agency) who additionally hold unregulated titles, can serve clients as 'Advisors' – without fiduciary duty.

In this paper, I analyze the Canadian Financial Capability Survey (Statistics Canada, 2009-2014-2019) to ascertain the statistical correlates of financial advisor use by Canadian households. I ask two sets of empirical questions: (1) How do trust in/use of financial advisors relate to levels of household wealth and indebtedness?; and, (2) How does the prevalence of advisor use vary by product types (mortgages, HELOCs, etc.) and socio-demographic groups (seniors, millennials, recent immigrants, etc.)? I conclude by demonstrating the pragmatic and performative roles urban planners can play in disrupting the unholy trinity undergirding Canadian housing policy: financial inclusion, financial literacy, and financial consumer protection.

PLANNING FOR SUSTAINABLE CO-OPERATIVE HOUSING IN CANADA
Abstract ID: 873
Abstract within Pre-Organized Session 156

AUGUST, Martine [University of Waterloo] martine.august@uwaterloo.ca, presenting author

In 1991 Asgard Green Cooperative Homes was built in Kitchener Waterloo, providing affordable, co-operatively managed rental homes for 70 families. As of 2019, with gentrification pressures encircling the site, the co-op faces crisis: with millions owing on outstanding mortgages, and mounting problems of housing deterioration. Through an analysis of Asgard Green's fortunes, this paper explores co-operative housing as an institution, crafted in Canada during the high-water mark of progressive housing policy, and often viewed with hope as radical alternative to market-based forms of housing provision. This

research asks what benefits the co-op has for members, and how its history sheds light on present-day struggles, with a goal to co-creating a plan for the co-op's ongoing sustainability. The method is community-engaged research (initiated by co-op members), using interviews with tenants and key informants (n=20), and reviews of co-op documents for two decades. The research found that the co-op was structurally set up to fail. Some of the reasons are specific: It was built on swampland by a shady contractor; it was built on the cusp of federal withdrawal from social housing; and it suffered from mismanagement and board dysfunction. More importantly, however, this paper argues that co-operative housing policy was what truly set up this co-op (and others) to fail, foreclosing on its promise to become an alternative to market housing. We reframe co-operative housing as a state strategy to reduce management costs (downloading these to tenants), to maximally enrich private lenders, and to discipline low- and moderate-income members (embodying the role of both tenant and landlord) to adhere strictly to market dictates or face bankruptcy, community dissolution, and displacement. The paper discusses how tenants in Asgard Green are fighting to save their community, and explores how co-op housing can achieve its radical potential.

COUNTERING DISPLACEMENT THROUGH COLLECTIVE OWNERSHIP: COMMUNITY LAND TRUST PLANNING AND ACTIVISM IN LONDON, UK AND TORONTO, CANADA
Abstract ID: 1137
Abstract within Pre-Organized Session 156

BUNCE, Susannah [University of Toronto Scarborough] susannah.bunce@utoronto.ca, presenting author

London, UK and Toronto, Canada are two global cities that face similar affordable housing pressures and, as such, are contexts for the pursuit of alternative and innovative solutions to the pressures of affordable housing constraints and gentrification and for a deeper consideration of community-based affordable housing needs. Community Land Trusts (CLTs) in London and Toronto have formed in response to similar challenges in both cities such as the encroachment of gentrification into traditionally affordable neighbourhoods and the difficulties of securing and retaining affordable housing in cities with increasingly expensive rental housing and homeownership costs. As a model that combines community-based planning and activist practices with collective land ownership, non-profit and non-governmental CLTs have been successful in forming at the neighbourhood level in both cities (Bunce, 2018; Moore & McKee, 2016) . CLTs have an active role in countering indirect and direct forms of displacement caused by gentrification (Davidson and Lees; Madden and Marcuse, 2016) through collective land ownership practices that aim to hold land in trust over the long-term. In this paper, I examine the processes of neighbourhood displacement caused by gentrification and concepts of indirect and direct displacement, as well the mechanisms of CLTs in countering displacement. The paper examines CLT mechanisms such as ground lease agreements between CLT organizations and residents, and land acquisition practices between CLT organizations and local governments, as ways to retain and encourage collective land ownership. Further, the paper explores municipal planning policies and regulations that provide a framework for CLT practices and the role of activist networks and practices in supporting CLT aspirations to counter displacement. This is demonstrated in examples such as local government and community activist support for the CLT initiatives in the Parkdale neighbourhood of Toronto and the activities of London Citizens in neighbourhoods of London's eastern and southern boroughs. The paper also examines some of the challenges faced by CLT organizations in both cities in relation to securing planning and funding support for land acquisition and affordable housing provision. This paper posits that

London and Toronto are informative and timely urban contexts for the study of community land trust planning and activism due to the explicit focus of neighbourhood-based CLTs in both cities on community mobilization and building a response to the impacts of gentrification and displacement.

HOUSING JUSTICE
Pre-Organized Session 166 - Summary
Session Includes 1000, 1001, 1002, 1003, 1004

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, organizer

To the extent it engages with theory, housing policy is largely centered on traditional planning theory. Often overlooked is a potentially fruitful engagement with political philosophy, which provides tools for addressing some of the fundamental questions facing housing policy today: who should be responsible for building affordable housing? What are the responsibilities of the state to provide shelter? Can inequalities in neighborhoods be justified – and what policy tools can ethically address them? Bringing together scholars in housing policy and political theory, this panel engages with these core philosophical questions in ways with direct policy relevance for housing policy. In doing so, it argues for a new research agenda addressing normative topics of ethics and justice as they relate to pressing housing policy issues facing planners today.

Objectives:

- To bring together housing policy and political theory in a fruitful manner.
- To begin to create new normative frameworks to help guide future housing policy.
- To create a community of scholars working in this area for future research and teaching.

REALIZING HOUSING JUSTICE THROUGH COMPREHENSIVE FEDERAL HOUSING POLICY REFORM
Abstract ID: 1000
Abstract within Pre-Organized Session 166

DAWKINS, Casey [University of Maryland] dawkins1@umd.edu, presenting author

The rising cost of housing has spurred a global conversation about the appropriate means and ends of housing policy. For those in the emergent housing justice movement, the failure of advanced industrialized nations to deliver adequate housing to the global poor is a moral failing and a human rights violation, as recently acknowledged by United Nations Special Rapporteur on Adequate Housing, Leilani Farha, who argued in a report to the United Nations General Assembly that "violations of the right to housing are as much failures in the administration of justice as they are failures of housing programmes"

(Farha, 2019, p. 3). From advocacy organizations such as the Right to the City Alliance to activist scholars affiliated with UCLA's Housing Justice in Unequal Cities Network, the idea of housing justice embodies a call to action on behalf of those with unmet housing needs (Madden and Marcuse, 2016; Roy and Malson, 2019).

Despite this rise in globally connected, locally centered housing advocacy work, the housing justice movement has yet to influence federal housing policy in the U.S., where advocates face three significant challenges. First, the U.S. has never ratified the International Covenant on Economic, Social, and Cultural Rights (ICESCR), the primary legal instrument implementing the global human right to housing outlined in the Universal Declaration of Human Rights (UDHR). The U.S. Supreme Court has upheld various constitutional protections for the rights of property owners while simultaneously denying any constitutional basis for U.S. citizens' positive right to housing. Second, the federal resources spent supporting homeownership, in the form of tax expenditures forgone to the mortgage interest deduction, far exceed the public subsidies supporting low-income renters and the homeless. Third, federal housing policies in the U.S. have historically been adopted in a piecemeal fashion and justified on the basis of pragmatic objectives – alleviating homelessness, reducing housing cost burdens, promoting affordable homeownership, supporting the home mortgage and home building industries – without appealing to fundamental moral principles. Each new policy and program faces opposition from a constituency committed to the protection of the previous generation's big idea. If housing justice is to become more than merely an empty slogan, more work is needed to flesh out a conception of housing justice that is grounded in basic moral principles that support practical solutions to a variety of housing problems.

This paper aims to close the gap between principle and practice with a proposal for comprehensive federal housing policy reform that is grounded in a conception of housing justice that appeals to fundamental moral principles. I argue that civic equality, an ideal where every citizen is treated as an equal in accordance with a shared understanding of what citizens owe to one another and what the government owes its citizens, provides a justification for national housing policy reforms that guarantee secure housing tenure to all citizens while reducing housing inequalities in a manner that is tenure neutral. My proposed "negative housing tax" is designed to achieve these aims and can be implemented in a nation such as the U.S. by altering the income tax treatment of homeownership to fund a guaranteed housing allowance. This paper describes the ideal of civic equality, explores its distributive implications, and outlines the elements of the negative housing tax proposal.

NUDGING TOWARDS JUSTICE? THE ETHICS OF EXPANDING NEIGHBORHOOD CHOICE
Abstract ID: 1001
Abstract within Pre-Organized Session 166

KELLY, Nicholas [Massachusetts Institute of Technology] nkelly@mit.edu, presenting author

This paper explores whether it is just to nudge low-income families to move to high opportunity areas. It focuses in particular on the ethics of digital tools indented to nudge individuals towards those neighborhoods. Bringing together literature in housing policy on segregation, and work in political

philosophy on the ethics of integration and nudging, it argues for a framework of judging the moral acceptability of such policies. It argues that such policies can be just if implemented correctly because the interaction of pure freedom of choice and structural injustices have created a self-perpetuating cycle segregation and inequality. However, it argues for complete transparency in order to respect for the dignity of families. It also addresses criticisms of integration as a normatively desirable goal as well as criticisms that such programs are paternalistic. It applies this framework to a range of housing mobility policy tools currently being developed in the United States.

CIVIL RIGHTS, HOUSING, AND POLITICAL CONFLICT
Abstract ID: 1002
Abstract within Pre-Organized Session 166

STEIL, Justin [Massachusetts Institute of Technology] steil@mit.edu, presenting author

Civil rights and fair housing policies with regard to housing and neighborhoods have been an unprecedented focus of federal attention and of political conflict over the past decade (O'Regan 2019). Pushed by civil rights advocates, the Department of Housing and Urban Development (HUD) during the Obama Administration advanced multiple major rulemakings at the intersection of civil rights and housing policy to address place-based inequalities in resources and access to opportunity, including the Disparate Effects Rule, the Small Area Fair Market Rent Rule, and the Affirmatively Furthering Fair Housing Rule (Johnson, 2014; Reina, Acolin, and Bostic 2019; O'Regan and Zimmerman, 2019). HUD also issued new guidance on civil rights and housing, such as the application of the Fair Housing Act to the use of criminal records by housing providers and liability for housing providers for hostile environment harassment or discriminatory housing practices. These efforts to give more certainty to federal civil rights laws were met with substantial resistance from conservative lawmakers, from some business associations, and sometimes from cities, states, and public housing authorities as well.

After the 2016 election, the new administration moved quickly to roll back the Obama-era policies that had been created over the prior decade (Steil and Kelly, 2019). These civil rights rollbacks have had mixed success thus far, but have gained momentum in 2019 and 2020. This paper analyzes the changes to the three major civil rights rules above that HUD has proposed since 2016 and identifies common justifications for and approaches to the recent rule changes, including the focus on encouraging deregulation and local control. The paper also analyzes opposition to these proposed rule change, through public advocacy, public comment, and litigation, and examines the successes and failures of that opposition.

THE GEOGRAPHY OF (ACTUALLY EXISTING) OPPORTUNITY: HOUSING CHOICE AS CAPITAL?
Abstract ID: 1003
Abstract within Pre-Organized Session 166

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, presenting author

Galster and Killen (1995) in their initial framing of a geography of opportunity conceptualize a series of spatially differentiated social and institutional relationships. Scholarship, advocacy, and policy drawing upon this framework has proliferated, and has institutionalized calls for the removal of barriers to equality of spatial access to opportunity. Underlying this conceptual framework are a series of normative assumptions which Casey Dawkins (2016) parses out. The framework is grounded in a liberal egalitarian approach to justice under which all citizens should have a baseline of access to certain resources – which are reflected within access to housing and the bundle of associated goods. Liberal egalitarian approaches to justice imply not only an equality of spatial access to opportunity – an area which research and policy have set out to address; but also equality of individual choice – an area that is arguably clear in theory but harder to implement in practice.

Given the incorporation of principles regarding equitable access to spatially mediated opportunity in HUD's recent directive on fair housing (2015), HUD's Sustainable Communities Initiative, and proposed small area fair market rent standards, can spatial access to opportunity be better supported by revisiting the assumptions behind equity in terms of housing choice? Building off of Dawkins' analysis of the Geography of Opportunity framework, I parse out the assumptions underlying just housing choice. Operationalizing just housing choice in terms of policy requires a series of implicit judgements regarding the moral worthiness of individual choices in relationship to efforts to promote spatial equity. I suggest that while the normative assumptions regarding choice and opportunity are compatible, that implicit judgements regarding actual housing choices have the potential to run counter to the pursuit of spatial justice.

THE END OF SINGLE-FAMILY ZONING IN MINNEAPOLIS: A YIMBY VICTORY OR A CASE OF RESTORATIVE PLANNING?
Abstract ID: 1004

Abstract within Pre-Organized Session 166

GOETZ, Edward [University of Minnesota] egoetz@umn.edu, presenting author

In 2019 Minneapolis became the first major city to completely eliminate single-family zoning districts. The City's move was quickly replicated by other governments including the State of Oregon. The

Minneapolis initiative came at a time when affordable housing advocates across the country are in a debate about whether upzoning and higher-density residential development could be an important part of the solution to the nation's affordable housing crisis. As such, the Minneapolis policy decision on single-family zoning is frequently interpreted as at least an implicit endorsement of the YIMBY (Yes In My Back Yard) movement's position that relaxing construction restrictions will help produce more affordable housing.

In this paper I examine the factors behind the City's policy decision and explain how, in fact, it was not part of a larger argument about affordability or the likely market reactions to new construction. Instead, City officials conceived of the idea in racial equity terms and saw it as a necessary corrective to the racially exclusionary origins of single-family zoning in Minneapolis and elsewhere.

Interviews with City officials involved in the formation of the policy reveal that the most influential actors were motivated not by a belief that the policy would produce more affordable housing, but by a desire to correct historic wrongs related to systems of racial exclusion.

TRACK 6 – ROUNDTABLE ABSTRACTS

A 'DOUBLE AGING' PLANNING RESEARCH AGENDA: CHALLENGES AND SOLUTIONS FOR AGING HIGH-RISE NEIGHBORHOODS
Abstract ID: 168
Roundtable

WHITE, James [The University of Glasgow] jtwhiteuk@gmail.com, organizer, moderator
WEBB, Brian [Cardiff University] webbb1@cardiff.ac.uk, participant
HARTT, Maxwell [Cardiff University] harttm1@cardiff.ac.uk, participant
FUJII, Sayaka [University of Tsukuba] fujii@sk.tsukuba.ac.jp, participant

The aging of urban populations is poised to become one of the most significant urban resiliency and housing design challenges of the 21st century, with far reaching implications for nearly every sector of society. Older adults are more likely than other age groups to spend extended periods of time in their immediate neighborhoods and, as a result, are more sensitive to the design of the built environment than

other age groups (Kerr et al., 2012). In addition, research on activity and life spaces indicates that, as we age, so too do our life spaces—they effectively shrink. This makes it important to understand the impact of the built environment on the wellbeing of individuals (Rosso et al., 2011). Explorations of aging do not typically distinguish between the age of housing, i.e. when it was built, and the age of the residents living in it. The aim of the roundtable discussion is to address this gap by developing a theoretical conceptualization of aging that links demographic aging with the physical aging of housing in the built environment. The roundtable participants call this concept 'double-aging'.

The lifespan of high-rise buildings and neighborhoods presents a particular 'double-aging' challenge and are therefore the primary focus of this roundtable discussion. Over the last twenty years, private property-led regeneration in major global cities has resulted in thousands of new high-rise developments (Pow, 2011). This trend has been characterized by policies that support urban intensification over suburban expansion and a strong international real estate market for inner city condominiums (Rogers et al., 2015).Yet, critical questions remain about the long-term stability of new high-rise buildings and neighborhoods and how adaptable this form of housing is, especially when viewed through the lifecycle of these developments and in light of demographic aging (Easthope, et al. 2014).

The roundtable discussion emerged out of a new international network that was established by the participants in 2019 and funded by the UK Research Councils. The participants have diverse research interests that span housing, demography, shrinking cities, high-rise buildings, vertical urbanization, and urban planning and design. The network has supported a series of research development workshops and field visits in the UK and Japan and brings together scholars from both of these countries, as well as Canada. This roundtable discussion will offer a series of perspectives on 'double aging' in high-rise neighborhoods drawn from emerging empirical research.

Japan, the UK and Canada will be the spatial focus of this discussion. Four specific examples of 'double-aging' will be briefly introduced as the basis for a wider conceptual discussion: (1) Dementia planning in the high-rise neighbourhood of Takashimadaira in Tokyo, Japan (2) A unit adaptation programme undertaken in a block of social housing apartments in Glasgow, Scotland; (3) The exponential growth of high-rise condominium neighborhoods in Toronto, Canada; and, (4) The over-occupancy of aging adults at the Motomachi social housing complex in Hiroshima, Japan. The roundtable will conclude by identifying a future research agenda on double-aging focused on the ways in which planning, public health, and housing market demands interact with cultural and individual concepts of care, community and the future planning and urban design of vertical high-rise housing.

TRACK 6 – INDIVIDUAL ABSTRACTS

IT TAKES A TINY HOUSE VILLAGE: A MIXED METHODS ASSESSMENT OF BARRIERS,

STRATEGIES, AND STAKEHOLDER PREFERENCES FOR TINY HOUSE VILLAGES FOR THE HOMELESS IN MISSOURI
Abstract ID: 12
Individual Paper Submission

EVANS, Krista [Missouri State University] KristaEvans@missouristate.edu, presenting author

There is increased interest in using tiny house villages to confront the growing issue of homelessness in the United States (U.S.) (Heben 2014; Segel 2015; Jackson et. al 2020). A recent inventory found that there are at least 115 tiny house villages for the homeless in the U.S. that are currently in operation, slated to open in the future, where efforts have been abandoned, or where the operational status of the villages is unknown (Evans, 2020). Although interest in addressing homelessness with tiny house villages continues to grow, these villages face numerous barriers, from restrictive land use laws to resident concerns about homeless populations. This research examines such barriers, strategies for urban integration, and stakeholder perceptions of various visual, physical, and social elements pertaining to these developments.

This mixed methods research involves a comparative case study of two tiny house villages for the homeless recently constructed and opened in Missouri: Eden Village, located in Springfield, and Veterans Community Project (VCP), in Kansas City. The comparative case study research was performed to answer the following questions: What are the challenges to integrating tiny house villages for the homeless and how have/are such challenges being addressed? What are strategies for the successful integration of these villages into communities? The comparative case study explores barriers and challenges faced by each tiny house village, in addition to strategies that allowed for the successful integration of the villages into urban communities. The study also involved a survey (including an embedded visual preference survey) of stakeholders in each community in order to understand if various visual, physical, and social elements related to tiny houses for the homeless influence community perceptions of these developments. Understanding community perceptions and preferences is important, as stakeholders are key actors in the development of land use policy. It is hypothesized that integrating stakeholder preferences for tiny house villages for the homeless may result in greater community support.

The study finds that NIMBYism (Not-in-my-backyard) is the greatest deterrent to villages. This is in compliance with the literature that finds NIMBYism to be a significant deterrent to both the integration of affordable housing and facilities to serve the homeless (Scally and Tighe 2015). However, the survey also finds that stakeholders have distinct preferences for several visual elements related to tiny house villages for the homeless, as well as for specific physical and social factors. For example, survey results indicate that stakeholders have a distinct and higher preference for tiny homes built in a traditional (vernacular) architectural style, over non-traditional (modern) architecture. The survey also finds that stakeholders perceptions of tiny house villages for the homeless are positively impacted by physical and social elements such as indoor plumbing, heating/air-conditioning, and the provision of mental health services, though many villages do not offer such amenities. Integrating stakeholder perceptions and preferences into plans and designs for tiny house villages for the homeless may result in less NIMBYism and greater community acceptance.

The research has resulted in a better understanding of the barriers to, and stakeholder preferences for, tiny house villages for the homeless. It is hoped that this research will aid those aiming to address homelessness through the integration of tiny house villages. The study contributes to a greater understanding of how tiny house villages for the homeless might be not only accommodated, but in a way that is perceived positively among communities.

SHIPS IN THE NIGHT? EXAMINING THE NEIGHBORHOOD DIVERSITY-SOCIAL INTERACTION MECHANISM USING MOBILE APPLICATION DATA

Abstract ID: 39
Individual Paper Submission

XU, Wenfei [Columbia University] wx2133@columbia.edu, presenting author

The notion that exposure to neighborhood diversity has the potential to improve socioeconomic outcomes is central to the current theory on neighborhood development and housing policy. It is seen as a response to socioeconomic and racial segregation at the neighborhood level, which can mediate social processes and amplify the concentration of poverty (Wilson, 1987). The promotion of neighborhood diversity through mixed-income neighborhoods currently drives affordable housing policy, though it has also been argued that it is spurs neighborhood gentrification. Despite its prevalence in housing policy, our current theoretical understanding of the mechanism linking neighborhood diversity, to exposure, to diverse social contact lacks sufficient empirical grounding (Galster and Friedrichs, 2015).

This research explores the possibility of using high density mobile phone application GPS data to improve our understanding of the diversity-social interaction mechanism by measuring the exposure to racial and ethnic diversity through experienced daily activities as well as potential social contact during these daily activities. In particular, it asks the question: What is the relationship between residential exposure to racial and ethnic diversity, as measured using census demographic data, experienced daily activity exposure to racial and ethnic diversity, and the exposure to racial and ethnic diversity in experienced social interaction clusters? The findings show: 1) there is a positive relationship between daily activity exposure to diversity and residential exposure to diversity; however, the exposure probability is much higher in daily activities. 2) Social interaction clusters also have higher exposure probability than residential exposures, but tend to be more spatially heterogeneous, revealing hyperlocal retail and commercial semi-public spaces of high exposure probabilities. Thus, the use of residential exposure measures may "average away" dynamic variability of exposure throughout the day.

IT'S NOT ALWAYS SUNNY IN SAN DIEGO FOR HOUSING CHOICE VOUCHER (HCV) HOLDERS: THE REPRODUCTION OF RACIAL AND SOCIOECONOMIC SEGREGATION UNDER THE CHOICE COMMUNITIES INITIATIVE
Abstract ID: 45
Individual Paper Submission

WANG, Chihuangji [University at Buffalo, The State University of New York] wangchihuangji@gmail.com, presenting author
PATTERSON, Kelly [University at Buffalo, The State University of New York] klp27@buffalo.edu, co-author
SILVERMAN, Robert [University at Buffalo, The State University of New York] rms35@buffalo.edu, co-author

This paper examines residential mobility patterns of housing choice voucher (HCV) holders in San Diego county. It focuses on whether HCV holders moved to higher opportunity ZIP codes following the adoption of the Choice Communities Initiative by the San Diego Housing Commission (SDHC) in 2018, which was designed to incentivize moves to opportunity neighborhoods via tiered payment standards at the ZIP code level. San Diego county was selected as a critical case for two reasons. First, prior research has identified it as a place with one of the lowest HCV subsidy levels relative to SAFMRs in the United States (Patterson & Silverman, 2019). Despite the goals of the Choice Communities Initiative, the SDHC has established a pattern of setting payment standards below SAFMRs in a manner that has been documented to impede moves to opportunity areas. Second, San Diego county is a critical case study because it typifies emerging demographic patterns in the United States. It is among the more racially and ethnically diverse populations in the country. For the 109 ZIP codes where data were available across the multiple data sets examined in our analysis, the 2017 ACS 5yr estimates reported that San Diego county was: 53% non-Hispanic white and 47% minority. In contrast, San Diego county's HCV recipients identified in our data were 22% non-Hispanic white and 78% minority in 2018. These HCV recipients clustered in 36 (33%) of the ZIP codes in the county, while the remaining 73 (67%) ZIP codes had no HCV recipients. Despite its large minority population, HCV holders in San Diego county, who are predominantly minority, remain segregated.

The analysis is based on a unique dataset that combines three data sources. One includes multi-year data obtained from the SDHC measuring the race, ethnicity, gender, household characteristics, housing unit characteristics, rent and public subsidy levels, ZIP codes, and residential mobility for over 14,000 individual HCV recipients in San Diego county. Another dataset includes population and housing characteristics at the ZIP code level from the American Community Survey (ACS). The third dataset includes small area fair market rents (SAFMRs) for ZIP codes and fair market rents (FMRs) for San Diego county. Data were analyzed using spatial statistics and GIS. These data were used to examine moves of HCV holders against the backdrop of local policy implementation aimed at promoting residential relocation to opportunity areas.

The results from our analysis focus on how the preexisting patterns of racial and socioeconomic segregation have been reinforced in San Diego County, despite the adoption of local policies with articulated goals to reverse them. It is observed that most moves happened within the lowest rent ZIP codes, regardless of races. Also, the number of HCV holders in the lowest rent ZIP codes increased in 2018 following the adoption of the Choice Communities Initiative. These findings build on prior research examining how patterns of inequality are reproduced despite efforts to promote the geographic mobility of HCV holders (Basolo, 2013; DeLuca et al., 2013; Patterson & Yoo, 2012; Wang & Walter, 2018). The findings from our analysis are used to identify areas where policies like the Choice Communities Initiative can be strengthened in order to achieve the goal of promoting opportunity moves.

DETROIT'S TAX FORECLOSURE CRISIS: SYMPTOM OR CAUSE OF DISINVESTMENT, LOSS OF HOMEOWNERSHIP, INCREASED HOUSING INSTABILITY?

Abstract ID: 89
Individual Paper Submission

DEWAR, Margaret [University of Michigan] medewar@umich.edu, presenting author

In 1999, the State of Michigan amended its property tax foreclosure law. The new law shortened the period of tax delinquency before foreclosure and sought to guarantee clear title at the end of the process. The goal was to facilitate the preservation and reuse of property that owners were abandoning. The new law was cited as a best practice for other states. Legislators did not foresee that tens of thousands of households would fail to pay property taxes and lose their homes and that many landlords also would not pay their taxes. From 2002 (the first year that properties were foreclosed under the new law) through 2019, more than 135,500 properties were foreclosed, more than 35 percent of all properties in the city. More than 25,400 of these properties had gone through foreclosure more than once. The scale of tax foreclosures has contributed to transforming Detroit from a majority-homeowner city to a majority renter city, facilitated investors' extraction of the last value from disinvested properties, and undermined neighborhood stability. Numerous articles and reports, both academic and journalistic, have looked at aspects of the problem, but no research has assessed the problem as a whole.

This paper will analyze why tax foreclosures increased so much and why they remain a major problem despite some recovery in property values since the severe recession. The causes to consider are numerous and diverse: for instance, increases in poverty and unemployment so that owners who could pay taxes in the past no longer could do so; loss of more than 80% of property value but no reassessment so that tax bills could approach property value; city government's lack of provision of public services—including fire and police—leading to owners' unwillingness to pay taxes; the extreme difficulty of selling a house in many neighborhoods leaving tax foreclosure as the only way to get out of ownership; investors' gaming of the system to continue milking properties; city failure to implement tax foreclosure prevention measures; incentives for county and city governments to continue high levels of foreclosure in order to raise funds to solve their budget problems. The paper will analyze how well reforms are likely to work in reducing tax foreclosures. The paper will use foreclosures data obtained from a nonprofit data warehouse and will use assessor and other data available on the city's open data portal. The paper will draw on the many reports and articles that have examined aspects of the problem. The synthesis of the data and others' findings will provide an overview that can aid understanding of the causes and effects of tax foreclosure and the impact of possible reforms in weak-market cities.

IMPLEMENTING SOCIAL MIX THROUGH AN AUSTERITY CRISIS: CONTESTED APPROACHES IN A NEW YORK CITY PUBLIC HOUSING REDEVELOPMENT
Abstract ID: 123
Individual Paper Submission

STAHL, Valerie [Columbia University] valerie.stahl@columbia.edu, presenting author

The New York City Housing Authority (NYCHA) is currently in a state of crisis. With crumbling infrastructure, a series of high-profile heat, hot water, and lead paint scandals, and a nearly $40 billion capital budget backlog, NYCHA has proposed a suite of austerity measures to help fill its burgeoning funding gap. This includes allowing for the development of mixed-income 'infill' housing through leasing 'underutilized' public housing land to private developers.

At the national level, despite decidedly mixed outcomes for existing residents, mixed-income housing has become a de facto housing policy approach in many US cities. While the effects of mixed-income communities are often chronicled after-the-fact in planning and housing literature, fewer studies consider the implementation of such projects or account for sustained resistance among existing residents (Goetz, 2016). Through chronicling the trajectory of a pilot infill site in New York City, this paper asks, how do key stakeholders divergently approach the implementation of a mixed-income housing development?

The paper employs a qualitative case study that includes data collection from over a year-and-a- half of participant observation at public meetings and protests, a comprehensive review of media and policy documents, advocacy-based research, and interviews with key tenant-activists, non-profit stakeholders, NYCHA policymakers, elected officials, and private developers. The research departs from a framework of pragmatism, which as Susan Saegert (2018) has noted, is a particularly useful theoretical approach for studies concerned with housing theory and policy, "allow[ing] for competing desires, interpretation of situations and policies and analyses of ends-means relationships within a framework of contentious politics" (p. 240). This is salient as housing policy often navigates the distinct goals of policymakers concerned with metrics like costs, units, and affordability rates versus the needs of residents who hold intimate, everyday experience in their homes and communities.

The results show that different actors mobilize the housing authority's state of crisis to competing ends. Public housing tenants and their allies are using the period of change as an opportunity to coalesce around progressive housing movements at the state and federal level, with the goals of resisting privatization through complete government-funded preservation of existing public housing. Meanwhile, NYCHA officials and selected developers are mobilizing the state of crisis to promote public-private partnerships as the singular way to improve troubled local housing authorities, maintaining that privatization measures are currently the only tool at their disposal from the federal government. Despite dramatically competing visions for implementation, both sides maintain that their ultimate goal is to repair existing public housing. The results also focus on how policymakers and tenants interact around the past, present, and future of public housing, an entity that has been deemed as a policy failure through histories of racist discourse while also being denied the federal, state, and local resources needed to thrive.

The results contribute to planning scholarship in 3 key ways. First, after long holding the title of the "public housing that worked" in the US (Bloom, 2008), this study provides one of the first in-depth accounts of NYCHA's recent period of crisis and change. Second, it contributes to a growing body of literature that considers the importance of chronicling the implementation and tenant resistance to mixed-income public housing redevelopment (Vale, 2019). Finally, through its pragmatic approach, it highlights the problem of what Vanessa Watson (2003) has termed "conflicting rationalities" in urban redevelopment, where striving for absolute consensus to planning problems can ultimately be an unrealistic and counterproductive way to approach implementation. The study also contributes to advocacy-based planning practice, as I have periodically conducted research for non-profit groups and NYCHA tenants, including through developing fact sheets, mapmaking, and drafting reports.

A MULTISCALAR APPROACH FOR MEASURING NEIGHBORHOOD POVERTY AND ITS IMPLICATIONS FOR AFFORDABLE HOUSING STUDY: THE CASE OF OHIO
Abstract ID: 182
Individual Paper Submission

YANG, Aram [The Ohio State University] yang.4201@buckeyemail.osu.edu, presenting author

Affordable housing's location can be key in the quality of the neighborhood in which residents find themselves, with neighborhood context influencing children's life opportunities and life outcomes. Extant studies have thus far measured neighborhood quality by defining dysfunctional neighborhoods, measuring the neighborhood quality with continuous indicators, measuring the geographic opportunities of neighborhoods, and measuring economic segregation (Ellis, Wright, Holloway, & Fiorio, 2018; Kasarda, 1993; Knaap, 2017; Massey & Denton, 1988; McClure & Johnson, 2015; Newman & Schnare, 1997; Pendall, 2000; Ricketts & Sawhill, 1988; S. Fowler, 2015; Walter & Wang, 2016). Many studies measuring neighborhood quality rely on fixed-geographic areas such as census tracts, blocks, and block groups. However, measuring neighborhood quality with fixed-geographic areas falls into the modifiable areal unit problem (MAUP). MAUP consists of the scale problem and the aggregation problem. First, the scale problem means that neighborhood measurement results will be sensitive to the scales of the unit of analysis. For instance, neighborhood measurement results with the census tract will differ from neighborhood measurement results using the census block. Second, the aggregation problem indicates that the boundaries that are drawn to divide geographic subareas can change neighborhood measurement results. In other words, even if we divide the study area into the same number of subareas, the way to draw the boundaries can change the neighborhood measurement. More recent work on segregation and neighborhood classification has developed a multiscalar approach to rectify MAUP (Fowler, 2016; Hennerdal & Nielsen, 2017; Lee et al., 2008; Östh, Clark, & Malmberg, 2015; Reardon et al., 2008).

In particular, the study of segregation indicates that segregation is a multiscalar phenomenon. Segregation as a multiscalar phenomenon is built upon the idea of an egocentric neighborhood –an individual's local environment. That is, individuals' local environments within the same census tract are not necessarily identical. For example, one's local environment at the center of a census tract may differ from another's

local environment at the edge of the census tract. Under the multiscalar approach, geographic scale becomes important in measuring neighborhood quality or any phenomena at the neighborhood level. Therefore, this study will employ a multiscalar approach by Clark et al. (2015) beginning with very small geographies—block groups with more than 12 neighboring block groups—and identifies increasingly large patterns of similarity or difference with k-nearest neighbors—up to groups of census block groups with more than 51,200 neighboring block groups—to measure neighborhood quality as a continuum of adjacent geographic relationships and suggests its implications for affordable housing research. Building upon the previous studies quality (Clark, Anderson, Östh, & Malmberg, 2015; Kasarda, 1993; Krysan & Crowder, 2017; Macallister et al., 2001; Pendall, 2000; Sampson, Morenoff, & Gannon-Rowley, 2002), I assume that the economic composition of the population in bespoke neighborhoods–neighborhoods with k-nearest neighbors—represents the neighborhood. Considering diverse scales of bespoke neighborhoods as a variable, I will classify neighborhoods in Ohio by population composition using the poverty rate and compare to existing measures to assess the impact on the understanding of neighborhood quality and context.

GENTRIFICATION, DISPLACEMENT, AND SPATIAL MISMATCH
Abstract ID: 185
Individual Paper Submission

LEE, Hyojung [Virginia Polytechnic Institute and State University] hyojunglee@vt.edu, presenting author
KRISTIN, Perkins [Georgetown University] Kristin.Perkins@georgetown.edu, co-author

The causes and consequences of gentrification have captured the attention of social scientists and been the subject of much recent research, both qualitative and quantitative. Building on findings from earlier research, recent studies often start with the hypothesis that gentrification causes or is at least associated with displacement of original residents, particularly lower-income and more vulnerable residents. Some studies of gentrification, especially those based on qualitative data, present evidence showing that gentrification has dire consequences for longtime residents of changing neighborhoods and for the character of the neighborhoods and cities in which they are located (Brown-Saracino 2017). Other research suggests that the negative consequences of gentrification for low income residents are far less dramatic and conclusive (Ding, Hwang, and Divringi 2016; Ellen and O'Regan 2011). In this paper, we investigate the association between gentrification and residential mobility in the time period following the

Great Recession.

We attempt to reconcile findings from prior work, both qualitative and quantitative, by using geocoded microdata from the 2011–2017 American Community Survey (ACS) in the top 100 metropolitan areas in the United States. We define neighborhoods at risk of gentrification in 2010, identify neighborhoods that did gentrify between 2010 and 2017, and compare individuals living in neighborhoods experiencing gentrification with similar individuals living in neighborhoods that are non-gentrifying. Our large national sample allows us to consider heterogeneity in the association between gentrification and residential mobility, investigating differential association by metropolitan population size. We also assess whether individual characteristics like race and ethnicity and education moderate the association between gentrification and residential mobility. In the analysis, we focus on how gentrification is associated with residential mobility and, for movers, destination neighborhood characteristics and individual employment outcomes.

Using linear probability models we find a modest positive significant association between gentrification and residential mobility, particularly in the top 50 most populous metropolitan areas. Non-Hispanic white and Hispanic residents of gentrifying neighborhoods have higher residential mobility rates compared with their counterparts in non-gentrifying neighborhoods; we find no significant association between gentrification and residential mobility among African Americans or Asian and Pacific Islanders. The positive association between gentrification and residential mobility appears to be limited to individuals with less than a college education. Among movers, those moving from a gentrifying neighborhood end up in neighborhoods with a lower poverty rate, on average, compared with movers from non-gentrifying neighborhoods. Movers from gentrifying neighborhoods are no less likely to be employed and their commutes are not significantly longer than movers from non-gentrifying neighborhoods.

HOUSING PLAN AND LOCATIONAL OUTCOMES: THE RESILIENT APPROACH FOR COASTAL COMMUNITIES IN THE UNITED STATES.
Abstract ID: 191
Individual Paper Submission

TRAN, Tho [Texas A&M University] thotran2211@gmail.com, presenting author
VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, primary author

Housing plays a central role in connecting individual, family, and society in human life. Provide decent housing at an affordable price, in a suitable living environment is the ultimate goal of housing policy in the United States, as well as many other countries. The U.S. Department of Housing and Urban Development (HUD) creates a financial mechanism that requires the submission of a Consolidated Housing Plan to support affordable housing development and other housing-related activity in a city, as a condition of receiving funding through the formula block grants. These funds are used to support the proposed affordable housing development agenda of the local jurisdiction. The plan plays a crucial role in

increasing affordable housing choice and providing quality community development activities for local people, especially for low-income households. Yet little research undertakes an evaluation of plan quality for Consolidated Housing Plans. Only two studies that tackled the housing issue in plan evaluation literature were found in a thorough literature search, and the most recent one was published a decade ago. More importantly, the quality of housing plan of coastal communities has never been addressed. This gap raises the concern toward how local government distributes federal resources in the areas that facing the increasing risk of natural disasters like a hurricane, flooding, and sea-level rise.

This research adopts the plan evaluation protocol in which the author developed in his previous research then apply to the coastal communities in the Gulf Coast and Florida. 60 coastal communities (30 cities and 30 counties) were chosen. Using four major criteria including Decent Housing, Suitable Living Environment, Economic Opportunity, and Fair Housing. The paper assesses the quality of the Consolidated Housing Plan by using the content analysis methodology. Each plan will be evaluated based on five components: Factual basis, Goals, Policies, Implementation, and Participation. The total score represents the overall quality of the plan.

The study compares the performance between coastal cities and coastal community in planning preparation to reveal the differences between two governmental levels. After that, two communities will be randomly chosen to reflect the outcomes of housing plan on coastal communities. By overlay the spatial distribution of housing and community development activities with the water-related risk map, the study indicates how the housing plan can impact local communities by the matching of geographic locations with vulnerable areas. Using Local Indicator of Spatial Association (LISA) and cluster analysis, this research will highlight the hot spot of low-income population and the concentration of public funded activities. More importantly, the geographic relation between these hot spots and the disaster risk will raise the concern toward how the public fund has been spent to address the resilient development of the needed population.

Finally, the findings are expected to create guidelines not only for policymakers but also for local authorities and researchers in supporting the affordable housing and community development nationwide.

SPACES OF AFFLUENCE: MIDDLE-CLASS NEIGHBORHOODS AND FORECLOSURES IN LOS ANGELES AND ATLANTA
Abstract ID: 240
Individual Paper Submission

LEE, C. Aujean [University of Oklahoma] aujean@ou.edu, presenting author

Residential segregation has been linked to higher foreclosure rates for racial minorities and immigrants in the United States. However, there are disparities by region. For instance, established immigrant gateways may reinforce these patterns because of its long-standing ethnic enclaves. Alternatively, newer immigrant gateways could provide opportunities for immigrants to live in integrated neighborhoods. Furthermore, housing markets have their own local and regional scale effects, where neighborhoods within a region

have more volatile prices than others.

In addition to regional factors, there are class disparities among minority and immigrant neighborhoods in part because federal policies favoring highly educated professionals contribute to concentrated affluence for some groups. These middle-class spaces offer housing and class-based resources (Lee, 2018), where socioeconomic advancement leads to coethnic concentration rather than dispersal (Chung & Brown, 2007; Logan et al., 2002). The impact of these middle-class areas also varies by region and type of immigrant gateway (Lee & Greenlee, 2020). This study fills a gap in literature by comparing individual foreclosure outcomes in different gateways and neighborhoods by class, nativity, and racial/ethnic group.

Here, I examined foreclosure outcomes for individual homeowners in Los Angeles, California and Atlanta, Georgia because they have different receiving communities, housing markets, and racial composition. While Los Angeles has had steady immigrant growth since World War II, Atlanta has experienced significant growth only from the 1990s (Singer, 2008). Using CoreLogic property records, I created a cohort of homeowners who purchased homes between 2000 and 2006 and assessed likelihood of foreclosure between 2008 and 2010. Homeowner neighborhoods were also categorized by class and nativity to focus on the impact of middle-class ethnic neighborhoods. Logistic regressions further tested if these effects persist, after accounting for homeowner characteristics.

I found that Los Angeles Latino and Asian neighborhoods differed in foreclosure patterns from Atlanta. In particular, Atlanta enclaves had higher foreclosure rates than their counterpart low-income neighborhoods with native-born residents; Los Angeles had opposite patterns. Because immigrants began moving in significant numbers from the 1990s, these homeowners may be the emerging second generation while Los Angeles has had time to develop immigrant and minority areas with varied class and nativity status. Los Angeles also had more pronounced class differences than Atlanta, while Atlanta had significant racial disparities between White and Black areas—these findings may reflect the former region's costly housing market.

The study elucidates how race, nativity, and class impact housing by a region's migration history and housing market. The findings not only help to understand differing reasons for racial segregation, but also how to create region-specific interventions. For instance, Los Angeles homeownership programs may need to focus on low-income areas across racial groups, while Atlanta resources could target enclaves and Black neighborhoods. Finally, the study challenges the hierarchy that situates White middle-class neighborhoods as the ideal for housing outcomes—depending on the region, coethnic resources and neighborhoods can also matter for socioeconomic mobility.

SECONDARY COSTS: A METROPOLITAN-LEVEL EXPLORATION OF HOW RISING HOME PRICES AND RENTS ARE EXACERBATING ECONOMIC AND SOCIAL INEQUALITIES
Abstract ID: 286
Individual Paper Submission

LANDIS, John [University of Pennsylvania] jlan@design.upenn.edu, presenting author

Between the end of the Great Recession in 2010 and December 2019, median home prices in the twenty U.S. housing markets tracked by the S&P Core Logic Case-Schiller Index increased by 46 percent. Over a shorter period—between 2013 and 2017, median rents in those same twenty markets increased by an average of 12 percent. With mortgage interest rates already at historically low levels and with household incomes going up much more slowly than housing costs, these price and rent increases translated into declining housing affordability, especially for low-income and moderate-income renters. The severity of this situation was not always evident from national statistics. Between 2010 and 2017, the overall share of U.S. renters paying more than 30 percent of their income for rent—the so-called excess burden rate—actually declined from 48% to 47%. The picture was very different for low and moderate-income renters making less than $35,000 per year. Adjusted for inflation, their excess rent burden rate rose from an already astronomical 80% in 2010 to an even higher 84% in 2017. (Over the same period, the share of low and moderate-income homeowners with excess burdens remained constant at 59%.)

Recent work at the Harvard Joint Center has provided a more accurate (and more concerning) picture of the rental affordability problem at the local level. Less well understood is how rising housing costs and declining affordability are slowly reshaping housing and economic outcomes at the community level. Using the American Community Survey and other federal data sources, this paper will explore the statistical correlation between rising home values and rents and multiple metropolitan-level housing and job market outcome measures, including: (i) changes in gross mover rates—the rates at which homeowners and renters move from one home to another; (ii) changes in in-migration and out-migration rates; (iii) changes in homelessness rates; (iv) changes in poverty rates; (v) changes in income inequality as measured by 90/10 ratios; (vi) changes in homeownership rates; (vii) changes in Black-White and Latino/non-Latino residential segregation levels; (viii) changes in the spatial concentration of poverty; (ix) changes in average commute times (on the assumption that people will "drive until they find affordable housing); and (x) changes in small business formation rates.

The general research hypothesis behind all these comparisons is that, depending on the place and income level, rising home values and rents are leaving fewer resources available to meet other needs or to pursue other opportunities, adding to household hardships and exacerbating social and economic inequalities.

The great advantage of this analysis will be its comprehensiveness. Rather than just looking at the 20 or 50 largest U.S. cities or metro areas—which is the case with most housing price and affordability studies—to the extent the data is available, this paper will consider all 384 U.S. metro areas. It will also explore the extent to which these different housing price-social and economic outcome relationships vary by region, rate of metropolitan job growth, racial composition, and population and household age structure. To the extent current housing price and affordability trends are undoing recent progress in reducing residential segregation and concentrated poverty, it may be necessary to rethink how federal housing programs are administered.

Natural disasters have been increasing in intensity while rental affordability has been declining in many cities. The intersection of these two trends presents an important challenge for policymakers and planners as well as an insightful test for theory. Natural hazards fundamentally disrupt housing markets by destroying destroy homes, displacing residents, and delaying transactions (Deryugina et al., 2018; Howell and Elliott, 2019). The long-run impact of any disaster depends critically on (1) how swiftly the housing market adjusts, (2) how costly and long the transition to a post-disaster equilibrium is, and (3) how equitably the costs are distributed across society. Planners play a key role in designing and carrying out adaptation strategies to minimize disaster damage, but also plan for emergency relief and longer-term recovery following a disaster (Berke et al., 2014).

In this paper, we use the multifamily rental market to measure these housing market dynamics. Most previous work on disaster recovery and housing markets has focused on homeowners, not renters. We fill this gap by asking how rents and vacancy rates evolve in the wake of hurricanes and tropical storms. We situate this question within the growing literature on natural disasters, documenting the decrease in asset prices, the lack of foresight by and subsequent out-migration of residents, and the many persistent, negative real economic outcomes that befall communities exposed to disaster damage despite post-disaster FEMA economic assistance (Bleemer and van der Klaauw, 2019). These findings underscore the importance of understanding how local markets fail to adjust rapidly or equitably. The rental market allows us to explore these frictions in a context where the power balance between buyer (tenant) and seller (landlord) is particularly asymmetric.

We compile a new database that matches disaster shocks to rental outcomes. The dataset contains property-level asking rents per unit and per square feet, vacancy rates, and a wide variety of building- and unit-level characteristics from CoStar, merged with ZIP code-level hurricane incidence, damage, and assistance from the Federal Emergency Management Agency (FEMA). We construct a panel difference-in-differences model that estimates the effect of the hurricanes from 2000Q1 to 2019Q3 on eight counties in Florida.

Results indicate that rents per unit and rents per square foot increase by almost 7% in the quarter following a hurricane but the effect diminishes over the next 2-4 years. Meanwhile, vacancy rates decrease slightly and then increase sharply and persistently, though their effect also moderates in the later years. The inverse relationship between rent levels and vacancy rates distinguish post-disaster rental markets from regular ones. We propose several possible theoretical explanations for these findings that change our understanding of how rental markets adjust and how some of the most vulnerable members of society are affected by market failures in times of distress. We discuss the potential for an expanded role for planners in mitigating these medium term shocks for renters, who are likely less able to deal with them compared to homeowners (Howell and Elliott, 2019).

"ONLY ONE BATHROOM!" ARE OUTMODED POSTWAR HOMES CONTRIBUTING TO NEIGHBORHOOD SORTING?
Abstract ID: 306
Individual Paper Submission

ROLHEISER, Lyndsey [Ryerson University] lrolheiser@ryerson.ca, presenting author

Many postwar neighborhoods across the United States are exhibiting signs of decline previously only observed in older central cities. With the characteristics of postwar housing being arguably undesirable by current standards, extant literature claims this functional obsolescence is contributing to levels of distress and decline. What remains unclear is whether the effect observed is due to housing age — postwar housing is vulnerable to physical depreciation given its age — or if there is a true postwar vintage effect influencing neighborhood sorting beyond what age alone would predict. A pooled panel model spanning 1990 to 2010 is used to address this question; three main findings emerge. First, neighborhoods with more postwar housing have populations that are older, more racialized, lower educated, and exhibit higher rates of homeownership than would otherwise be predicted by housing age. Second, a significant relationship between household income and postwar housing does not exist when considering metropolitan areas in aggregate. Third, when stratifying metropolitan areas by housing supply growth and price, more postwar housing in a neighborhood is associated with lower levels of income in metropolitan areas with high levels of housing supply growth and lower prices. This finding indicates that households may be sorting over undesirable postwar housing characteristics when affordable outside options exist.

OH, Jihun [Ulsan National Institute of Science and Technology] wlgnsdl414@unist.ac.kr, presenting author
KIM, Jeongseob [Ulsan National Institute of Science and Technology] jskim14@unist.ac.kr, co-author

Background: Shared living arrangement among young adults has been increasingly widespread way of life in the world, yet little is known about their social dynamics (Clark et al., 2018). Since those non-kin households are in a wide range of socioeconomic backgrounds, their personal relationship is the key to whether their shared living wanes or flourishes (Heath et al., 2017). The previous research bridges how the experience of shared living connects to various social outcomes like increased social capital or sense of community (Cho et al., 2019). Here, this study extends the bridge by figuring out which residents of the shared housing benefit from the social outcomes and which residents do not. Specifically, this study explores whether there is a potential exclusion of certain residents in shared housing due to their socioeconomic backgrounds rather than their personal traits or residential conditions.

Method: To confirm the positive impacts of shared living arrangement in terms of social dynamics and identify the potential exclusion among the residents of shared housing, we conducted a survey on 800 young single households who lived in Seoul, Korea. Among them, 300 residents lived in shared housing. The survey items include the personal traits, socioeconomic backgrounds, residential conditions, and social dynamics of the residents. We measured the social dynamics in various aspects such as acceptability with socioeconomically different people, social relationship, and social activity. With this data, to verify the positive social outcomes from shared living arrangement, we first examine the baseline differences in social dynamics between the residents of shared housing and other housing types. Then, to identify a potential exclusion among the residents of shared housing, we divide them into several groups based on their socioeconomic backgrounds (e.g. income level, gender, occupation, birthplace, etc.) and investigate how their social dynamics differ by each socioeconomic group.

Result: Our preliminary finding reveals that the residents of shared housing are more likely to have a 'healthy' life in terms of social dynamics than the residents living in other housing types. For example, they show higher satisfaction with their social relationship and participate in social activities more frequently. However, when we divide their socioeconomic group by monthly income level, the low-income group show less satisfaction with their social relationship and participate in social activities less frequently than the high-income group. It indicates the possibility that there can be a potential exclusion of certain socioeconomic group in shared housing. We will investigate a structural link for how their socioeconomic backgrounds connect to the potential exclusion of them.

Implication: While there is a growing interest in shared housing as one of the solutions for providing affordable living place to young single households in many global mega-cities (Woo et al., 2019), we detect a sign of potential exclusion of certain residents in shared housing. To mitigate the potential exclusion and make the shared housing to be both affordable and equitable housing option for young adults, we intend to suggest several guidelines on the management of shared housing.

LAMBA-NIEVES, Deepak [Center for a New Economy] deepak@grupocne.org, primary author

In post disaster contexts, information exchange is critical to the task of preparing recovery assessments, drawing up reconstruction scenarios and ultimately preparing recovery plans and executing needed projects. In the case of Hurricane María's devastating toll on Puerto Rico, detailed figures and analyses regarding areas that were hardest hit and who has been served have been lacking. Previous US-focused studies that examine eligibility and disbursement of federal post disaster assistance demonstrate persistent patterns. Analyses centered on the political dynamics of aid disbursement indicate that federal support for post disaster relief is not necessarily contingent on the level of damages, and that politics play an important role (Kamel & Loukaitou-Sideris 2004). As a result, places that are politically important to the President and localities with representatives on key congressional committees tend to receive more aid (Reeves 2011). With regards to the disbursement of federal assistance to families and individuals, the evidence indicates that persons with lower socioeconomic status suffer greater damages due to their housing conditions, and have a harder time receiving aid after a disaster (Grube et.al. 2018, Fothergill & Peek 2004). Overall, groups who are marginalized from social and political life, including women, non-citizen migrants, the poor, minorities and older and young populations tend to be at a disadvantage with regards to post disaster recovery opportunities, register relatively higher losses and pay relatively more to recover (Kamel & Loukaitou-Sideris 2004, Girard and Peacock 1997). Our study contributes to an ongoing-debates regarding the allocation of post disaster assistance and provides an important point of departure for future studies focused on recovery prospects. Furthermore, the data provided by FEMA on housing registrants for the IA program, which provides applicant-level information, allows for a more precise analysis of the determinants of aid allocation. Also, the post Hurricane María experience in Puerto Rico is an interesting case that can provide further insights into a still budding literature. Our analysis provides detailed insights regarding housing and personal property damages, and receipt of FEMA assistance following Hurricane María. It also shows which municipalities were most affected and where there are the greatest pending housing needs. We also conduct regression analysis to uncover the factors that explain levels of residential property damage, eligibility, receipt of housing assistance and pending needs. Beyond providing some general assistance trends, we sought to determine if poor households were adversely discriminated and if residing in what are locally known as "Special Communities" place IA applicants at a disadvantage. Results demonstrate that, at the aggregate level, households were not systematically discriminated if they were poor or geographically vulnerable. Nonetheless, poor households are left with a greater burden in the form of pending needs.

SEARCHING FOR SHELTER IN THE CONTEMPORARY HOUSING CRISIS: SPATIAL POLICY VIOLENCE AND HOMELESSNESS
Abstract ID: 337
Individual Paper Submission

BROWN, Lauren [University of British Columbia] laurenann.b@gmail.com, presenting author

Lauded as having "solved homelessness," a closer look at Utah's approach to homelessness and the housing "crisis" reveal a darker side (Yiftachel and Yacobi, 2003). By placing emergency shelter at the center of an analysis of contemporary housing policy, I unpack the "crisis" and how it was constructed by spatial policy violence, while highlighting how this crisis is experienced by people without access to housing in Salt Lake City, Utah. I report on findings from 115 semi-structured qualitative interviews conducted in 2019 and 2020 during the recent shelter reform effort where the state, city and county closed the main emergency shelter and moved to a dispersed services model, dramatically downsizing their shelter capacity in the process. The three new shelters are geographically separate and segregated by gender, with the men's shelter located in another city adjacent to the County Jail. As part of this change, the state also planned and implemented a large police operation that resulted in over 5,000 arrests.

Through this case study, I identify sites and processes of violence and harm, while highlighting the possibility of more transformative housing policies and planning practices. This research questions and challenges planning processes that too often exacerbate profound inequities through regulations and tools that result in displacement, alienation, and socio-spatial stigmatization for people experiencing homelessness (Watson, 2006; Yiftachel, 2009; Herring 2019; Mitchell, 1997). In my analysis, I engage 'spatial policy violence' as a frame to discuss the culmination of punitive spatial tactics in the local shelter reform effort, and how they are amplified along lines of race, gender, age, disability status, and other categories of difference. Spatial policy violence provides a critical analytic for spatial justice that could be useful in planning theory for thinking across a variety of sites and processes related to homelessness and informality.

RESIDENT-OWNED RESILIENCE: CAN COOPERATIVE LAND OWNERSHIP ENABLE TRANSFORMATIVE CLIMATE ADAPTATION FOR MANUFACTURED HOUSING COMMUNITIES?
Abstract ID: 340
Individual Paper Submission

LAMB, Zachary [Massachusetts Institute of Technology] zlamb@mit.edu, presenting author

SHI, Linda [Cornell University] lindashi@cornell.edu, co-author
KUMASAKA, Osamu [Massachusetts Institute of Technology] kumasaka@mit.edu, co-author
VALE, Lawrence [Massachusetts Institute of Technology] ljvale@mit.edu, co-author

This paper assesses how collective land ownership impacts the ability of low-income residents of manufactured housing communities (MHCs) to adapt to environmental stresses, especially those associated with climate change. Manufactured housing, commonly referred to as trailer or mobile homes, is the largest source of unsubsidized affordable housing in the United States, constituting nearly 10% of all new housing units constructed each year (Prosperity Now 2018). Many residents of MHCs face a dual burden of insecurity: they are disproportionately vulnerable to both environmental hazards like floods and tornadoes and displacement by eviction (Sullivan 2018; Rumbach, Sullivan, and Makarewicz 2020). To address the latter risk of displacement among MHC residents, Resident Owned Communities (ROC-USA) has helped residents in over 250 communities nationwide over the last decade to cooperatively buy the land on which their houses sit. There is little existing research on the relationship between collective land tenure and environmental vulnerability and resilience (Shi et al. 2018). Nevertheless, research on other settlement types has shown that increased housing tenure security can make low-income households more resilient to stresses, including natural hazards (Reale and Handmer 2011).

To fill this gap, we ask: how does cooperative land ownership enable or inhibit adaptation to environmental stresses among residents in U.S. manufactured housing communities? This mixed-methods research project draws on GIS analysis of all 250 ROC sites; analysis of documents and procedures from the co-op conversion process; interviews with ROC-USA staff and technical assistance providers who facilitate co-op conversions and community governance; and in-depth case studies of three ROC communities in the northeast U.S., the region with the greatest concentration of ROC communities.

Our findings suggest that the co-op ownership model can both enable and inhibit community resilience. Compared to similarly situated privately-owned MHC's, the resident cooperative ownership model appears to enable investments that support community resilience, from community storm shelters to upgraded drainage infrastructure. ROC communities were better able to address environmental hazards in cases where: co-op resident owners were especially aware of community threats and needs; co-op conversion and periodic refinancing processes included in-depth engineering studies and investments to address infrastructure deficits and capital improvement needs; and the ROC network enabled mutual learning as well as access to grants and low-cost capital for improvements. However, these benefits are not available to all MHC's, including smaller communities and those that are located in mapped 100-year floodplains, which are excluded by ROC-USA's policies. We find that, when communities do complete the co-op conversion process, co-op ownership can also inhibit adaptation to risks by: adding layers of costly and inflexible oversight of capital improvement processes; reducing access to conventional financing for infrastructure improvements; and slowing responses to threats due to new democratic governance procedures.

This research sheds light on the relationship between collective land tenure and resilience. Specifically, it helps inform policy and procedure changes for ROC-USA and other co-op advocates to encourage climate adaptation. It also points to state and federal policy reforms that could encourage more MHCs co-op conversions and support access to adaptation financing for co-ops. More broadly, the ROC model provides a concrete example of collective land ownership and governance that can advance "transformative adaptation" (Pelling 2010), centering the needs of low-income communities and addressing underlying causes of uneven vulnerability to climate-related hazards.

BARRIERS TO EFFECTIVE LOCAL ADMINISTRATION OF POST-HURRICANE MATTHEW BUYOUTS IN NORTH CAROLINA
Abstract ID: 368
Individual Paper Submission

CAMPBELL, Leah [University of North Carolina at Chapel Hill] lc401@live.unc.edu, presenting author
NGUYEN, Mai [University of North Carolina at Chapel Hill] mai@unc.edu, primary author
SCHWALLER, Nora [University of North Carolina at Chapel Hill] nschwall@live.unc.edu, co-author

Managed retreat – the strategic relocation of people and infrastructure from flood prone areas – is increasingly seen as a viable and necessary risk reduction strategy in response to the growing threat of widespread flooding (Siders 2019). In the U.S., managed retreat typically takes the form of government-facilitated buyout programs, the largest and oldest of which is the Federal Emergency Management Agency's (FEMA) Hazard Mitigation Grant Program (HMGP) (Mach et al. 2019). Though it is a federal program, HMGP relies on a complex allocation of responsibilities and resources between federal, state, and local entities (Greer and Binder 2017).

Little research to-date, however, has examined the experience of local HMGP administrators specifically, despite the critical role they play in the program as on-the-ground implementors (Greer and Bidner 2017). Instead, most of the existing literature focuses on the experience of affected residents and defines successful implementation based on the needs and values of participating homeowners (Binder et al. 2015; Mach et al. 2019). But as both the program initiators and closers, as well as the mediators between participants and higher levels of government, local administrators have a unique and nuanced perspective on the barriers to 'successful' program implementation.

To fill this gap, we gather interview data from 18 local HMGP administrators in North Carolina after Hurricane Matthew in 2016, and more than 300 newspaper articles related to post-Matthew buyouts, to understand program implementation from a local administrator perspective. Interviewees come from both city and county jurisdictions and work in various government departments including planning, emergency management, and construction. Newspaper articles come from North Carolina-based papers, from 2016 to the present, and were selected using a keyword search of Hurricane Matthew AND acquisition or buyout. Using both template and open thematic coding, we analyze the interviews and articles to understand the difficulties local administrators face in program implementation, the complexities of their relationship with affected residents and state officials, and the metrics by which they measure effective administration.

Preliminary findings illustrate that local administrators emphasize the same features identified in international case studies as critical to the success of buyouts, including rapid movement to maintain momentum, clear channels of communication, streamlined bureaucracy, flexibility, and public engagement (Vipe and Sella 2014). Our findings also suggest, though, that many these features are missing in HMGP administration in North Carolina. Limited staff capacity, turnovers, and program delays are seen as significant barriers to implementation. In most cases, administrators find themselves doing multiple jobs at the expense of their day-to-day responsibilities, which has become increasingly problematic as the program drags on. The relationship between local administrators and state officials is also clearly fraught as a lack of flexibility, clarity, and communication with the state has created

confusion and inefficiency at the local level. These results provide valuable insight on the unique challenges local administrators face as HMGP implementors, as well as the strategies they employ to overcome those challenges, which can inform policy efforts to improve the efficacy of HMGP.

AGING, PROPERTY TAXES, AND HOUSING ADJUSTMENTS: LESSONS FROM THE HEALTH AND RETIREMENT STUDY
Abstract ID: 370
Individual Paper Submission

KIM, Jinyhup [University of Maryland, College Park] jinyhup.kim@gmail.com, presenting author
DAWKINS, Casey [University of Maryland, College Park] dawkins1@umd.edu, co-author

The aging of the baby boomer cohort is poised to shape the U.S. housing market in dramatic ways. By 2015, seniors aged 65 or older will comprise one-fifth of the U.S. population and one-third of U.S. households (Joint Center of Housing Studies of Harvard University, 2014). The U.S. is seeing an unprecedented rise in the ratio of seniors to working-aged adults that is shifting the age composition of housing towards groups who are more likely to be sellers than buyers of housing, a shift that has dramatic consequences for U.S. housing supply and homeownership rates (Myers and Ryu, 2008).

This paper sheds light on the reasons why senior homeowners liquidate their housing wealth by ending homeownership or downsizing to less expensive homes. Using data from the 2004-2014 Health and Retirement Study (HRS), we estimate competing risks hazard regression models that examine the role of property taxes, property tax abatement programs, housing values, and other demographic determinants of housing demand on senior homeowner behavior under the presence and absence of mortgage debt. Simulations from our estimated models provide estimates of the degree to which property tax rates, housing values, and loan-to-value ratios influence the likelihood of dissaving housing wealth before, during, and after the Great Recession.

Our findings suggest that rising property taxes increase the probability that senior homeowners will become renters. High income seniors are less likely to consume their housing wealth through renting but are more likely to downsize to cheaper homes. Similarly, higher housing values decrease the likelihood of leaving homeownership but increase the probability of downsizing. Reliance on mortgage debt increases the likelihood that senior homeowners will consume their housing wealth through both renting and downsizing. Rising property taxes increase the probability of liquidating housing wealth through renting, but only when seniors own their homes outright without holding mortgage debt.

Models that examine the interaction between property taxes and tax abatement programs suggest that current policy approaches to increasing housing stability for seniors have proven largely unsuccessful. Seniors without mortgage debt are more likely to move to places that offer generous tax abatement programs. The main beneficiaries of property tax abatement programs have been wealthy populations less

likely to move. Seniors who live in high valued housing or who have higher incomes receive a modest transfer from abatement programs, while low-income seniors are more likely to transition from home-owning to renting even in places with generous property tax abatement programs.

The U.S. senior population will grow significantly over the next several decades. Policymakers need to consider effective policies and interventions to plan future housing environments in response to significant demand for affordable homeownership among seniors aged 65 and older. Our findings provide useful evidence that enables state and local government policymakers to tailor fiscal policies to enable senior populations to age in place.

ENDING GATED COMMUNITIES: THE RATIONALES FOR RESISTANCE IN CHINA
Abstract ID: 397
Individual Paper Submission

CHIU-SHEE, Colleen [Massachusetts Institute of Technology] xiq@mit.edu, presenting author
RYAN, Brent [Massachusetts Institute of Technology] bdr@mit.edu, co-author
VALE, Lawrence [Massachusetts Institute of Technology] ljvale@mit.edu, co-author

Since the 1980s, gated communities have spread globally, but their prevalence in China is often discussed as a unique case due to long tradition of gated living. In 2015, China announced a policy recommendation intending to end neighborhood enclosure. As of 2020, little transformation can be observed in Chinese cities, indicating resistance to the 2015 policy. To probe the resistance to the new policy, we conducted structured interviews with officials, design and development practitioners, and educators. They explain the new policy's failure in two ways: those who reject it completely justify gating as common sense and stress risks of ungating, whereas those who sympathize with the shift in administrative thinking express doubts about the policy's feasibility. The resistance indicates that top-down policy measures can experience both practical and ideological barriers in local implementation. Ungating in China will require resolution of both the entrenched ideological barriers and of the practical obstacles.

MIXED FEELINGS: THEORIZING SOCIAL MIX FROM THE PERSPECTIVES OF RACIALIZED RESIDENTS OF HAMBURG-WILHELMSBURG

Abstract ID: 415
Individual Paper Submission

CHAMBERLAIN, Julie [York University] juliechamberlain.research@gmail.com, presenting author

The notion of social mix has been a common sense in German urban planning for over a century, influencing housing policy and development at the level of neighbourhoods, blocks and buildings in many parts of the country. A recent example is the island neighbourhood of Wilhelmsburg, in the city of Hamburg. Since 2005, the city-state has implemented a subsidy for student housing, a social mix policy in public housing, and two major development event-projects, in an attempt to shift outside perceptions of the stigmatized, historically immigrant and working-class neighbourhood, and to attract new residents from the white, German middle class.

International scholarly debate about social mix planning is extensive and ongoing, and includes fundamental critiques of the evidence for claims about what social mix can do, as well as of the logics that underpin social mixing, particularly as they relate to the stigmatization of low-income and racialized people. Yet it is an extremely influential myth in the German context, according to some German housing and policy scholars, and an exception has been built into Germany's General Equality Law to enable social mix planning by allowing housing discrimination in the name of "neighbourhood balance." The meaning of 'balance' goes undefined, but critical race scholars in Germany have linked it to the nature of racism in the country, in which the imagination of self-segregating, un-German 'others' in urban spaces plays a vivid and central role. In this context, the common-sense status of social mix constitutes a serious challenge to planning for racial equity in German cities, as it starts from an assumption that racialized people and neighbourhoods are fundamentally problematic.

My doctoral research has investigated what this means for racialized neighbourhoods that are targeted for social mixing. In this paper, I explore social mix from the perspectives of racialized long-time residents of Hamburg-Wilhelmsburg, drawing primarily on ethnographic interviews that I conducted in 2017. I find that residents have mixed feelings about social mix: they link the 'mixing' of the island to both positive and negative developments in recent years, critique social mix as an 'illusion,' and also advocate for it as a solution to local problems. In the process, they re-articulate social mix in some counter-hegemonic ways, in particular arguing that social mix can challenge white Germans' racism and tendency to flee what they perceive as 'migrant' neighbourhoods.

This paper thus offers a critical discussion of the notion of social mix that centres the perspectives of people who are marginalized in the context of racialized inequality. It also explores what can be achieved through anti-racist research methodology, particularly regarding the negotiation of interpretive authority between researchers and participants. The paper thus offers food for thought for planners and planning researchers, while reporting unique findings from a context in which race-critical urban scholarship is quite scarce.

AFFORDABLE HOUSING PROGRAMS IN THE UAE: ARE THEY WORKING?
Abstract ID: 435
Individual Paper Submission

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, presenting author
SANGAPALA ARACHCHIGE DON DISSANAYAKE, Pradeep Dissanayake [University of Alberta] dissanyk@gmail.com, co-author

Adequate and affordable housing is a basic human need, but in the United Arab Emirates (UAE), a federation composed of seven emirates, housing is treated as a right of every Emirati national. Using interviews with municipal and housing officials and a survey of the beneficiaries of the housing schemes, the study evaluates the efficacy of the two national housing programs in the Emirate of Ras Al Khaimah that provide subsidies for affordable homeownership—the Sheikh Zayed Housing Program (SZHP) and the President's Initiative (PI).

Despite spending considerable public funds, very few published studies of various government-run housing programs in the UAE are available. Generally, the main challenge to affordable housing is a lack of resources, which has been studied extensively. Understanding housing situations where no issue exists with lack of resources is useful, but this must include explorations of what issues do emerge in such situations. In the UAE, this combination of factors has received little attention. In light of this, this study aims to answer the following three questions:

1. What is the current approach to the provision of affordable housing in the UAE?
2. How effective have the national housing programs—Sheikh Zayed Housing Program and the President's Initiative—been in making housing affordable to Emiratis, using Ras Al Khaimah as a case study?
3. How satisfied are the beneficiaries of the programs with the approval process, housing design, and locations?

The study found that the UAE's recent approach to housing has reoriented back towards a provider approach i.e. the government takes full responsibility for producing housing. The beneficiaries of the two housing programs seemed satisfied with the design of their homes but raised concerns about their locations. The locations and growth spurred by the two programs, especially SZHP, have significantly shaped the current sprawling urban form of the Ras Al Khaimah municipality. The question of the long-term sustainability of the two programs looms large, funded as they are entirely by the government, with limited participation from the private, non-profit, or informal sectors. To make housing programs financially and environmentally sustainable, every stakeholder must play a role: the federal government, the Emirate of Ras Al Khaimah, the Ras Al Khaimah Municipality, and the individual beneficiaries of the programs.

THE IMPACT OF RACIAL SEGREGATION ON FINTECH MORTGAGE LENDING PATTERNS
Abstract ID: 448
Individual Paper Submission

HAUPERT, Tyler [Columbia University] th2675@columbia.edu, presenting author

At traditional mortgage lending institutions, an in-person loan consultation involves an applicant submitting a suite of industry-standard underwriting inputs such as verification of income, a FICO credit score report, and employment history. Well-established statistical underwriting tools are then used to analyze these inputs to determine an applicant's creditworthiness. However, a new class of mortgage lending institutions popularly known as fintech – short for financial technology – lenders have begun underwriting loans using all-online applications and proprietary machine learning underwriting algorithms that process unprecedented amounts of applicant data to predict default risk (Buchak, Matvos, Piskorski, & Seru, 2018). The impact of these new techniques on the spatial distribution of mortgage credit is not immediately clear. Some suggest the lack of face-to-face consultations and the use of alternative data sources by fintech lenders will increase objectivity in loan underwriting, opening up opportunities for historically under-served groups and neighborhoods. Others see the potential for the inclusion of racial proxies in the data analyzed by fintech lenders, resulting in the penalization of nonwhite borrowers and segregated neighborhoods. Accordingly, calls for assessments of the impact of big data and machine learning algorithms on the racially variegated landscape of mortgage lending have recently intensified (e.g. O'Neil, 2017). While assessments of racial (Munnell, Tootell, Browne, & McEneaney, 1996) and spatial (Faber, 2017) disparities on loan approvals and subprime lending in the wider mortgage market form well-established canons, the literature comparing traditional and fintech mortgage lenders is in its infancy. Only one existing study compares racial disparities in fintech mortgage lending to those in traditional mortgage lending (Bartlett, Morse, Stanton, & Wallace, 2019). No existing research assesses the impact of racial segregation on the distribution of credit by fintech lenders. This paper fills this gap by answering the research question: how do racial disparities in loan approvals and subprime terms among fintech lenders differ from those among traditional lenders depending on metropolitan-level racial segregation? To answer this question, I utilize data collected under the auspices of the Home Mortgage Disclosure Act (HMDA) between 2015 and 2017 and an originally collected dataset classifying mortgage lenders as either fintech or traditional. I specify a series of linear probability models to predict the rates at which loans from fintech and traditional lenders are approved and characterized by subprime terms depending on a metropolitan area's level of racial segregation. Results suggest fintech lending exacerbates historical spatial disparities in the mortgage credit market by penalizing equally qualified nonwhite borrowers relative to white borrowers in more segregated metropolitan areas. These findings shed light on the continuing role of redlining and other discriminatory historical practices in today's mortgage market and suggest emerging lending technology must be more strictly scrutinized by regulators.

PRE-PLANNING FOR POST-DISASTER REHOUSING OF PUBLIC HOUSING RESIDENTS (CASE-STUDY: SALT LAKE COUNTY)
Abstract ID: 451
Individual Paper Submission

KHAJEHEI, Sayma [University of Utah] sayma.khajehei@utah.edu, presenting author
CHANDRASEKHAR, Divya [University of Utah] d.chandrasekhar@utah.edu, co-author

For public housing residents, post-disaster recovery is a function of local disaster housing plans and policies. These policies decide where these residents may go in the event of a disaster, when they can return, and to where exactly. These plans and policies however, are in turn dependent upon governmental capacity to manage disasters in general. Governments with recent disaster experience are typically better prepared to manage the next recovery due to an institutional learning effect. But what about governments in high hazard risk areas that have not experienced a recent disaster? Are they also equally prepared to re-house their public housing residents, possibly for years, in the event of a disaster?

While research on post-disaster recovery policy has grown in recent years, less focus has been paid to pre-disaster planning in at-risk communities. Even less attention has been paid to pre-disaster planning for post-disaster public housing recovery. This is a critical gap in both, disaster planning knowledge and practice, given how much it can undermine post-disaster recovery of one of our most vulnerable social groups, our public housing residents. Our study addresses this research gap by considering the status of pre-disaster planning for post-disaster public housing recovery in Salt Lake County (SL Co). The Wasatch region, which includes SL Co currently has a 1 in 7 chance of being hit by a 7.0 magnitude earthquake within the next 50 years. According to latest Census reports, it is also one of the fastest growing regions in the country. A 2015 earthquake scenario report estimated that nearly 263,300 individuals in the Wasatch region will be displaced in the event of an earthquake, requiring a massive rehousing effort by various governmental agencies, including the Salt Lake Housing Authority which currently manages 2,576 active housing vouchers.

Using Salt Lake County as a case study of an at-risk but disaster-inexperienced community, our study examines two questions: (i) How well is it prepared to rehouse its public housing residents in the event of an earthquake?; and (ii) What are the challenges and opportunities to promote pre-disaster planning for post-disaster public housing recovery in the region? Data collection is done through a review of public housing, disaster mitigation, disaster preparedness, and disaster response plans adopted by SL Co and its 17 constituent cities, and through ten semi-structured, open-ended key informant interviews with local

emergency management, city planning and housing officials. Data is analyzed using Atlas.ti software to identify themes related to the motivations, challenges and opportunities of pre-disaster planning for post-disaster public housing recovery. Preliminary findings suggest that SL Co and its constituent cities are generally not prepared to provide housing to public housing residents after disasters which could result in the high number of public health families being displaced and staying displaced in the event of an earthquake. Our findings act as a call for action in at-risk communities to conduct pre-disaster planning for post-disaster public housing recovery.

HOUSING AND HOMELESSNESS IN INDIGENOUS COMMUNITIES IN CANADA
Abstract ID: 490
Individual Paper Submission

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, presenting author

The purpose of this study is to assess the scope of the current housing and homelessness situation in the Tlicho region in the Northwest Territories (NWT) and identify solutions to ameliorate these issues. The study has multi-fold objectives:

*To assess the scope of the current housing and homelessness problem in the Tłı̨chǫ region of the NWT

*To determine the root causes of housing and homelessness issues in the region

*To analyze the housing policies of the Northwest Territories Housing Corporation (NWTHC); and

*To identify best practices and recommend effective strategies or solutions to ameliorate these housing and homelessness issues.

The Tłı̨chǫ region with its own self-government is just north of Great Slave Lake with a population of 3,176 across a land mass of 39,000 sq km, but the population is concentrated in four disparate communities - Behchokǫ̀, Gamètì, Wekweètì, and Whatì.

The study used a mixed-method approach to collect relevant data. NWTHC provided policy and program

documents and detailed customized datsets. This was then complemented by interviews with close to 60 individuals across the region over a period of seven months. The individuals included the current and former grand chiefs, the current chiefs, the elders in the communities, and Senior Administrative Officers, housing managers and other staff in each community. Also interviewed were several homeless individuals.

The study makes it abundantly clear that the housing and homelessness in the region are in a critical state, especially in Behchokǫ̀, where it is a full-blown crisis. Homelessness is visible in Behchokǫ̀, which constitutes unsheltered homeless people, making up a portion of a larger at-risk population. Hidden homelessness seems more prevalent in the other three communities where the homeless are provisionally accommodated by their friends or families. The factors responsible are largely consistent with the existing literature. This study, however, uncovers a few more nuanced aspects of housing, for instance, seismic socio-cultural shifts occurring within Indigenous communities, the effects of neo-liberalism, and the unintended consequences of housing policies. The policy recommendations suggest a set of responsibilities to be shouldered by the two key stakeholders—NWTHC and the Tlicho Government (TG). Among several recommendations were a place-based policy approach by NWTHC along with a greater role for TG in the provision of housing.

NEGOTIATING SHELTER: UNDERSTANDING THE RATIONALE BEHIND ENGAGING IN INFORMAL RENTAL ARRANGEMENTS

Abstract ID: 494
Individual Paper Submission

MILLER, Camden [University at Buffalo, SUNY] camdenmi@buffalo.edu, presenting author

Although more people are renting, as renter share of households has increased in proportion from 31% in 2004 to 35% in 2012, the number of problems faced by renters remains high (Joint Center for Housing Studies of Harvard University 2013). The United States private housing market within the capitalist system is broken in that it fails to function for people of low-incomes. This has become evident in many cities across the United States as rents have been increasing and real wages have been decreasing, thus resulting in an exorbitant proportions of evictions occurring due to the non-payment of rent (Partnership for the Public Good 2020). In the City of Buffalo, a majority of evictions are due to the inability of tenants to pay rent (Partnership for the Public Good 2020). This high level of evictions leads to pervasive negative compounding effects including, but not limited to, issues with employment, education, health,

housing quality, homelessness, and overall neighborhood conditions.

Unfortunately, there is no solution for affordable housing within the capitalist market framework for people with low-incomes, specifically within the private, urban housing market. One of the ways in which people with limited incomes attempt to make the broken system work is to engage in informal rental arrangements. Informal rental arrangements may encompass a wide variety of agreements including, but not limited to, having no signed, written document between the two parties or bartering services in exchange for housing. A previous study conducted by the author, originally intended to uncover the ways in which maintenance responsibilities are shared between landlords and tenants, revealed that a large number of renters rent homes without negotiating or signing formal leases.

The high propensity of non-lease renting can influence a number of factors within the social, economic, and physical environments of neighborhoods. As such, this project focuses on understanding why and how lease-less renting occurs. The project investigates two set of related questions: What forms of rental arrangements exist between landlords and renters in low-income neighborhoods? And, why do people engage in these rental agreements? Through extensive in-depth interviews with micro-level participants (landlords and renters engaging in informal rental arrangements) and macro-level participants (people who work in the field of housing dealing with people who engage in informal rental arrangements) this project attempts to understand why and how lease-less renting occurs. Additionally, through a content analysis of the recent changes made to the New York State Landlord-Tenant Law in July of 2019, this study analyzes how non-lease participants (both landlords and tenants) might be impacted.

The findings from this study provide much needed information into the undocumented world of non-traditional or informal rental arrangements, thus filling a gap in existing literature. By understanding how this 'invisible' group operates, the challenges they face, and how they ended up in this group, policies that better address this group of people can be made. By having better policies in place for this group of renters and landlords, there is the potential for more responsibility, accountability, subsidies, etc. to be in place to prevent the negative outcomes (eviction or homelessness) prior to them occurring.

Rent is the largest expense for most households. While most other expenditures can be cut back or delayed, rent is relatively fixed and the consequences for nonpayment, ultimately eviction and homelessness, are severe. In an Enterprise Community Partners survey, 95 percent of lower-income renters reported prioritizing rent over all other bills. High housing costs also lead to difficult decisions for renters. The State of the Nation's Housing report notes that cost-burdened households in the bottom expenditure quartile spend less on healthcare and food than unburdened households. Similarly, the Urban Institute found that about a quarter of all renters lack the reserve to cover a $400 expense, nearly a third are food insecure, and a fifth have problems paying medical bills.

This paper examines the geography of housing unaffordability across the United States by using a residual income approach to measure the extent and variation in shelter poverty (Stone, 2006) in the nation's metro and non-metro areas, building on previous studies by Grady (2019), Herbert, Hermann, & McCue (2018), and Kutty (2005). We ask: If the rent eats first, how many households have enough income left over to pay for a basic but comfortable standard of living? Our research questions are as follows:

 How many households across the country cannot afford a basic standard of living after paying for housing? Where are these households concentrated? What are the characteristics of these households?
 How large is the average deficit for households? How does this differ for households who spend more than 30 percent of their income on housing, a more traditional measure of housing cost burdens? To answer these questions, we use budgets from the Economic Policy Institute that include food, childcare, transportation, health care, taxes, and other necessities. These estimates are specific to counties and a range of household types. After adjustments, these baseline expenditures are merged with data on monthly rents, income, and household composition from the 2018 American Community Survey PUMS. After subtracting housing costs from income, we consider households burdened by rent when they have insufficient leftover income to cover all other expenditures that allow for a basic standard of living. We use logistic regression to highlight the household and geographic characteristics that are associated with a higher likelihood of deficit income. We find that households with children and low-income households in high-cost areas are more likely to have income deficits and have the largest deficits.

Ultimately, this research provides local, reproducible estimates of shelter poverty that can be aggregated to the national level. The findings are relevant to researchers, planners, and policymakers as they build on, supplement, and add to a growing body of literature on the extent and consequences of housing affordability.

NO PLACE IN THE CITY: THE SEGREGATION OF AFFORDABLE MARKET-RATE RENTALS IN BEIJING
Abstract ID: 530
Individual Paper Submission

WANG, Yi [University of Minnesota] wang8262@umn.edu, presenting author

GOETZ, Edward [University of Minnesota] egoetz@umn.edu, co-author

Since the implementation of the housing commodification policy in the 1990s, residential segregation by income has become an emerging concern in Chinese cities. Existing literature on residential segregation has mostly focused on the informal rental market (Harten & Kim, 2018; Wang et al., 2009; Wong et al., 2018; Zheng et al., 2009), and little is known about the formal market-rate rentals. Nevertheless, with the continuing clearance of informal settlements (Huang & Yi, 2015), formal market-rate rentals are likely to play a more pivotal role in the provision of affordable housing in the upcoming years.

Using data collected from two real estate brokerages, this paper examines changes in the spatial distribution of affordable market-rate rentals in Beijing between 2015 and 2018. We define rents as affordable if they are lower than 30% of the average monthly disposable income of households who lie in the bottom 40% of the income distribution. On a subdistrict-level, we measure the segregation of affordable rentals by the extent to which they are concentrated and unevenly distributed. On a city-level, we compare the degree of uneven distribution of the affordable and non-affordable rentals. We also use the POI (Point of Interest) data in 2014 to compute the average distance to the nearest subway station and the average number of restaurants, elementary schools, and medical services within a 1 km radius (10-minute walking distance) for rentals of different price ranges.

Our analysis suggests that: (1) not only the availability of affordable market-rate rentals decreased notably in the central city area, the remaining affordable units had also become more isolated in the central-city subdistricts; (2) when compared across rentals of different price ranges, the affordable rentals were the most segregated in both 2015 and 2018, with a city-level index of dissimilarity of 0.71 and 0.75 respectively; (3) the affordable rentals were often located in places with poor access to public transit and insufficient provision of urban amenities.

The rapid change of the distribution of affordable market-rate rentals coincides with a series of urban redevelopment initiatives. The relocation of "non-capital functions" and the following redevelopment of the vacated lands tend to drive up local housing prices, making rentals less affordable for the low-to-moderate-income population. Shantytown redevelopment and other similar urban renewal projects are also found to drive up the housing price, making formal market rentals less affordable. By reducing the affordable housing stock, the urban redevelopment initiatives in Beijing are forcing low-to-moderate-income renters to move further away from the city center.

There is a clear need for policy to enhance housing affordability in central locations. Urban redevelopment projects should provide renters adequate compensation that allows them to rent a unit in nearby neighborhoods for a temporary transition. Meanwhile, a wider implementation of the market-rate rental subsidy program would enhance the ability of low-to-moderate-income renters to find a decent place to live in the central city area.

FACTORS INFLUENCING HOUSING SATISFACTION OF INFORMAL HOUSING TENANTS: FOCUSING ON THE EFFECT OF SOCIAL CAPITAL BY HOUSING TYPE
Abstract ID: 565
Individual Paper Submission

CHUNG, I Re [Seoul National University] ire.chung@snu.ac.kr, presenting author
PARK, In Kwon [Seoul National University] parkik@snu.ac.kr, co-author

In many large cities where rapid urbanization continues, the majority of urban poor have been excluded from the housing market. Due to the lack of affordable housing and inadequate capability to cope with their housing needs, they are ultimately being pushed to informal housing. Not only is informal housing in poor living conditions, but its physical and spatial characteristics restrict the building of social capital among tenants. Many previous studies have indicated that social capital affects the housing satisfaction of both formal and informal housing households. There are, however, few studies that incorporates the effect of social capital by housing type specifically for the low-income tenants who live in informal housing. As there are variations in household and housing characteristics for different informal housing types, an elaborate study needs to be conducted for tenants living in informal housing specifically by housing type in regard to their quality of life.

This study aims to empirically analyze the factors that influence the housing satisfaction of tenants living in informal housing and specifically to examine their causal structure according to different housing types based on the 2017 Korea Informal Housing Survey data provided by the South Korean government. The number of households occupying informal housing - jjokbang (a small shabby cubicle), shanty/vinyl greenhouse, goshiwon (a tiny housing and studying unit at cheap prices) - in Korea has rapidly increased from 57,066 in 2005 to 393,792 in 2015. For this study, the multiple regression model and the path model are used.

The findings are as follows. First, the tenants of all types of informal housing show higher housing satisfaction as they live in better housing conditions. Second, except for the housing condition variable, social capital is the only factor that affects the housing satisfaction of tenants living in jjokbang, and these two variables have a positive relationship. It implies that since the majority of them are in middle-aged living alone, their social attachment within a community might be the only thing they can be satisfied with their housing. Third, the effect of social capital is not statistically significant for tenants of shanties and vinyl greenhouses have significant effects on their housing satisfaction. Due to the characteristics of their family-based housing unit, making social ties and networks with neighbors is relatively less important for them than earning a living for their family. Thus housing satisfaction of the tenants of this housing type depends more on income and cost of living. Finally, the tenants of goshiwon tend to be more sensitive to the housing size as well as the burden of housing costs. Although goshiwon is known to be a temporary residence for one-person household who prepare for employment while receiving a financial support from their family, the housing size and costs are the main factors that directly affect their housing satisfaction rather than social relations with neighbors.

These findings suggest that there should be various policy approaches depending on the housing types to improve housing satisfaction of informal housing tenants. Government support, such as a community capacity building program may be required to promote social ties and networks within communities specifically for the tenants living in jjokbang who are greatly affected by social capital. For the tenants of shanties and vinyl greenhouses, economic means including jobs are needed to support their family. Lastly, for the goshiwon tenants, policies that can upgrade their living conditions or reduce housing costs are effective.

FROM AUTHENTICITY TO 'AUTHENTICITY': MEDIA REPRESENTATIONS OF THE GENTRIFICATION OF TORONTO'S KENSINGTON MARKET
Abstract ID: 570
Individual Paper Submission

TOLFO, Paolo [Urban Strategies] pgstolfo@uwaterloo.ca, presenting author
DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, primary author

Gentrification has been described as one of the most politically loaded words in human geography (Davidson and Lees, 2005). The use of the term, particularly within the media, has increased dramatically over the past decade (Hochstenbach, 2017). However, despite this frequency of use, very few studies have examined the different narratives of gentrification that are portrayed in the media, how they change over time and to what extent they reflect, reinforce or contradict actual processes of change within urban space.

Many media representations of gentrification are rooted within specific neighbourhoods that are undergoing dramatic, and high-profile processes of change. The continued appearance of newspaper articles over many years gives us an opportunity to examine how these public narratives of gentrification change over time. Toronto's Kensington Market is one-such neighbourhood that has received significant attention in both local and national media. Historically an immigrant reception neighbourhood, the Market has been undergoing a process of gentrification for more than a decade. This is reflected not only in the upgrading of housing, but, more visibly, within its changing retail landscapes and other aspects that enhance quality of life, such as temporary pedestrian zones (McLean and Radher, 2013).

Building on existing research examining gentrification in the Canadian media more broadly (Tolfo and Doucet, 2017), this article will examine representations of gentrification in Kensington Market in both The Toronto Star and The Globe and Mail. Using Factiva, a powerful research database of newspapers and other publications, we identified all articles from these two publications that have discussed gentrification in Kensington over the past twenty years. We then code these articles based on their tone (positive, neutral, negative), the themes discussed and specific places within Kensington that are referenced.

What we find is that the meaning of gentrification in Kensington has changed significantly over time. We also find that a specific place, such as a shop or restaurant, can change its positionality within debates about gentrification as it become more 'authentic.' To this end, some businesses that were originally criticised for contributing to the gentrification of Kensington when they first opened, have, when going out of businesses a decade later, been lamented as 'victims of gentrification.'

Interpreting gentrification through a media-focused lens therefore enables scholars to better understand the shifting perceptions of both the process itself, and wider critiques and debates about contemporary urbanism that play out beyond the walls of academia. This is relevant for planning scholarship and practice because the framing of gentrification within the media helps to shape how spaces are interpreted by the public (Brown-Saracino and Rumpf, 2011) and evaluating these narratives provides insightful and

necessary information for the planning of more socially-just cities.

ARE DOWNTOWNS FULL?
Abstract ID: 620
Individual Paper Submission

BUNTEN, Devin [Massachusetts Institute of Technology] bunten@mit.edu, presenting author
ROLHEISER, Lyndsey [Ryerson University] lrolheiser@ryerson.ca, co-author

From 2010–2018, the U.S. experienced a relative boom in multifamily housing. Much of this housing was built near city centers on land cleared of two key former uses: industrial & parking, on the one hand, and of former neighborhoods, especially segregated Black communities (Fullilove 2016). Frequently, these clearances took place in the mid-twentieth century (Bunten, 2019; Gottlieb, 2019), leaving the land relatively free of residents—and importantly, free of neighbors. The lack of current neighbors makes these locations attractive sites for new housing development, which is regularly stymied by the opposition of nearby neighbors (Einstein et al 2019). The availability—and tremendous scale—of this already-cleared land has meant that cities were able to add thousands of new apartments with little effect on current residents. Are we running out of locations like these? In this paper, we investigate whether high-price cities are running short on large development sites. We argue that this the eventual shortage—combined with restrictive zoning in already-rich neighborhoods—would threaten a further increase in the pace and scale of gentrification in existing central communities.

NEIGHBORHOOD DETERMINANTS OF EVICTION FILINGS: A MICHIGAN STATEWIDE ANALYSIS

GOODSPEED, Robert [University of Michigan] rgoodspe@umich.edu, presenting author
BENTON, Elizabeth [Legal Services of South Central Michigan] ebenton@lsscm.org, co-author
SLUGG, Kyle [University of Michigan] kslugg@umich.edu, co-author

Interest in evictions has proliferated in recent years among researchers, policymakers, and housing advocates. This shift has been accompanied by an accumulation of empirical evidence that eviction is not merely a symptom of poverty, but also a cause of it: experiencing a forced move increases an employee's likelihood of losing their job (Desmond and Gershenson 2017), increases rates of depression (Burgard, Seefeldt, and Zelner 2012, Vasquez-Vera et al. 2017) and may impact physical health outcomes (Desmond and Kimbro 2015). Growing evidence has documented the prevalence and impact on U.S. communities of eviction case filings, which lead to forced moves and can result in costs and pose an obstacle to future housing for tenants (Immergluck et al. 2019).

Existing research relating evictions or eviction cases to neighborhood characteristics is geographically limited and often omits important housing or legal system variables. Drawing on administrative court records from nearly the entire state of Michigan, this paper reports an exploratory analysis of the relationship between eviction filings from 2014-2018 and a variety of neighborhood characteristics at the Census tract level, contributing to research that seeks greater understanding of the local characteristics related to eviction filing. We fit a negative binomial multivariate regression model to explain eviction case filings, and then fit separate models for urban and rural areas to explore differences in relationships due to their distinct housing markets. Our analysis confirms that statistical relationships exist between eviction filings and many variables documented in previous studies conducted for smaller geographic areas, including percent black population, educational attainment, single-mother households, and percentage of residents under 18. We also confirm the importance of variables that are emerging in the eviction literature such as foreclosures, job accessibility, and the presence of multifamily structures and subsidized housing units. Finally, we find a strong relationship between the presence of mobile homes and eviction filings in both urban and rural areas, becoming the first quantitative study to do so. Eviction filings in rural areas are related to percent single-mother households, job accessibility, and mortgage foreclosures, but not several variables important in explaining urban evictions such as poverty rate, housing cost burden, or percent black population.

The analysis suggests several policy implications. First, economic forces such as housing cost burden, low job accessibility, and lack of affordable mortgage payments are clearly major drivers of eviction filings, justifying ongoing efforts to address housing costs by boosting wages and facilitating the production of market-rate and subsidized housing. Second, although limited by the ecological nature of our variables, our findings about the demographics of places with high eviction rates suggest further efforts to investigate and address the discriminatory impact of evictions on single mothers, children, and African Americans. In particular, we agree with argument made by Matthew Desmond and others that the impact of eviction on children justifies a more aggressive public policy response to reduce evictions in general. Finally, our findings highlight the importance of focusing eviction-prevention efforts and policy attention on mobile homes and mobile home parks, which have been relatively neglected in prior research conducted in mainly urban and metropolitan settings.

Our data reveal that hundreds of thousands of Michigan residents face legal evictions, and that untold thousands are forcibly removed by agents of the state's courts. What is more, although the phenomenon of eviction arises from a constellation of factors, its effect is most likely to perpetuate disparities in health, employment, educational outcomes, and social wellbeing that are well documented in the state. Our analysis adds empirical detail to this general picture, highlighting the types of places most affected by eviction, and hopefully providing impetus for further action.

RENT BURDEN IMPACTS AND COPING STRATEGIES
Abstract ID: 644
Individual Paper Submission

ROSEN, Jovanna [University of Southern California] jovannar@price.usc.edu, presenting author
ANGST, Sean [University of Southern California] angst@usc.edu, co-author
DE GREGORIO, Soledad [University of Southern California] mdegrego@usc.edu, co-author
PAINTER, Gary [University of Southern California] gpainter@usc.edu, co-author

This paper draws from primary collected survey data (n=794) to examine the complex and nuanced effects of rent burden on renters, which extend far beyond the consumption tradeoffs identified in previous literature. Rental affordability is an issue of growing impact across the United States, particularly in urban areas. Affordability is generally assessed in terms of the household's rent-to-income ratio, where households paying over 30 percent of their income on rent are considered rent burdened. Research cites the 30 percent rent burden marker as an important threshold after which households begin to make critical tradeoffs between paying for rent, paying for medical services, and paying for food (Gabriel and Painter, 2018). These tradeoffs create disperse effects, including that children in rent burdened households perform more poorly in schools than those who are not (Holpuka and Newman, 2015; 2016).

Rent burden has become a particularly significant issue since the Great Recession, worsening over the past decades due to stagnant wages amidst growing housing costs. Rising housing costs are driven, in part, by low rental vacancy rates and insufficient affordable housing supply to meet demand (Gabriel & Painter, 2018). In 2017, nearly half the nation's renter population—47.4 percent of renter households—experienced rent burdened. Furthermore, rent burden has grown across most income groups, particularly in higher-cost regions and among low and middle-income populations (Harvard Joint Center for Housing Studies, 2019; Gabriel & Painter, 2018). In the Los Angeles region, 57 percent of renter households are rent burdened, and nearly one in three pay over 50 percent of their income on rent (Joint Center for Housing Studies of Harvard University, 2019). Since housing generally comprises the largest share of a household's budget, growth in housing costs deeply impacts the welfare of low-income households over the past decade. The growing scale of rent burden across the nation, as well as its significant and complex effects, underscores the importance of understanding this phenomenon both among households, but also within families and across broader communities.

Literature on rent burden has provided important insight into the scope and scale of the tradeoffs that families must make when they face rent burden, and has captured some of the broader effects of this phenomenon. However, because this literature has focused on quantitative studies using administrative data, much remains unknown about the nuanced, disperse and cumulative impacts of housing

affordability issues on households, but also families and communities, which are harder units of analysis to capture in administrative data. Furthermore, we lack a clear understanding of the ways in which rent burden may generate differential vulnerability across populations, and particularly among immigrant groups. This paper relies on primary collected survey data to generate a more nuanced understanding of the ways in which housing affordability exacerbates the vulnerability of residents and communities, suggesting significant and disperse effects.

We surveyed 794 residents across two Los Angeles neighborhoods, Central and South Los Angeles, through a 2-stage random block sampling design and a door-to-door, in-person approach. This methodology utilizes a geographically-based approach that covers all Census tracts within each area and employs random sampling of street blocks as well as households within street blocks to achieve a robust and valid sample. Surveys generally lasted between 40 minutes to 1 hour. We use these survey data to deepen our understanding of the nuanced and far-reaching effects of rent burden. We find strong differences in how residents and families cope with rent burden, including the trade-offs residents make, their duration and impacts, as well as differences across groups.

AFFORDABLE SOUTH LOS ANGELES: SURVIVAL, STRESS, & SUPPORT
Abstract ID: 655
Individual Paper Submission

ANGST, Sean [University of Southern California] angst@usc.edu, presenting author

Unaffordability has reached a crisis level across the United States due to rising rental costs and stagnating wages. As the imbalance between incomes and rents becomes more severe, it is exceedingly difficult for residents to maintain stable housing and meet their basic needs. Housing is particularly important because it structures access to employment and education, impacts health and wellness, and depletes much of community members' monthly budgets. Given this influence, housing offers an important entry point to study affordability and a key policy area where local governments can intervene to systematically improve residents' lives. This project examines the ways unaffordability and neighborhood change contribute to processes of housing instability. The knowledge generated can be used to design interventions that address residents' needs and concerns prior to the final outcomes of displacement, eviction, and houselessness.

Traditionally, research on affordability has focused around consumption trade-offs and displacement. When tenants pay more than 30 percent of their income on rent, they are forced to cut back on basic necessities such as food, utilities, healthcare, and education (Kirkpatrick & Tarasuk, 2011; Díaz McConnell, 2016; Pollack, et al., 2010; Newman & Holupka, 2016). There is limited understanding of the factors residents consider when making these trade-off decisions, however. In addition, research has shown that climbing housing prices lead to instability--particularly for vulnerable residents such as the

elderly, residents of color, and women (Sims, 2016). This literature provides data around the incidence of these events, but does not address the long-term impacts of subsisting at the margins while under threat of losing a home. Stress, fear, and unfair practices each play a role in residents' ability to retain shelter and survive.

South Los Angeles represents an important case study as the affordability crisis becomes more pervasive. Since the Great Recession, mounting development pressure and an overall housing shortage have led to quickly escalating housing costs and a diminishing supply of affordable homes throughout the area. This builds upon a legacy of unequal access to housing and severe income inequality that has resulted from exploitation, discrimination, deindustrialization, and disinvestment. Despite histories of exclusionary and destructive policy, residents have formed dense systems of support and resistance to remain in place.

Using South L.A. as a case study, this research is composed of two interrelated phases. First, 17 focus group conversations were facilitated with residents consisting of a 20 minute survey followed by a 75 minute conversation. Second, a door-to-door survey of 400 households was conducted using stratified randomization at the census block group level that took roughly 45 minutes as a semi-structured interview. This data was leveraged for mixed methods analysis to answer the following research questions:

1. How do unaffordability and neighborhood change contribute to processes of housing instability?
2. How do residents' identity and situational context impact the survival strategies they employ?
3. How do social and institutional supports buffer the impacts of the crisis?

This data reveals that Black and Latinx tenants have differential responses to the crisis due to varying access to social and institutional support as well as structural factors related to racism, sexism, and documentation status. In addition, I find that the impacts of unaffordability do not remain contained as one-time stressors. By forcing tenants to change the way they live, these strategies have long lasting impacts even after initial sacrifices are made. Although current pressures have strained the community infrastructure found throughout South L.A., residents' continuing resilience offers new ways to think about interventions that are grounded in community control and local assets. Project results were disseminated using diverse modalities including a community website, community zine, formal policy papers, and an art installation.

PROTECTING NEIGHBORHOOD PRIVILEGE: THE ONGOING IMPACT OF EXCLUSIONARY DEED RESTRICTIONS IN AUSTIN, TEXAS
Abstract ID: 675
Individual Paper Submission

MUELLER, Elizabeth [The University of Texas at Austin] ejmueller@austin.utexas.edu, presenting author

In the current context, where cities are debating changes to zoning meant to help them build their way out of the affordability crisis, inequities embedded in current land use patterns are critical to understand. In many cities, zoning created in the early twentieth century codified patterns created through prior real estate practices such as deed restrictions that protected property values in wealthy, white residential areas by excluding non-residential uses and also non-white people. Cities around the country have begun mapping the extent and location of racial deed restrictions in order to raise awareness of the roots of current patterns of exclusion and inequity embedded in neighborhoods. While private racial restrictions were overturned by the Supreme Court, such restrictions typically ran concurrently with, and were reinforced by, restrictions on the use of property and the intensity of development. These restrictions often remain in force and, research suggests, can produce the same racially exclusionary effects. In this paper, we explore the way that ongoing private restrictions continue to operate to exclude low-income, often minority residents from affluent, historically white neighborhoods. We focus on the case of Austin, Texas, a city whose original zoning strongly reflected the underlying patterns established by private deed restrictions, laying the foundation for the city's racially and economically segregated pattern of residential development. In recent years, the city has struggled to re-zone residential areas to implement its 2012 comprehensive plan, which calls for the creation of "complete communities" throughout the city and its 2016 Affordable Housing Strategic Blueprint, which calls for integration of affordable housing throughout the city. Building on Tretter's work documenting the existence of deed restrictions in central neighborhoods established before 1948, we review deeds to identify areas where restrictions specifically protect affluent, low density, single family neighborhoods from change. In this paper, we focus on neighborhoods that began with restrictions and that were coded as "most desirable" under the city's housing security (eg, "redlining") map in 1937. We compare the change over time in the population density and demographics in these neighborhoods to the city overall, and also project forward how proposed citywide rezoning—intended to expand housing opportunities--will deepen these inequities.

THE SPILLOVER EFFECT FROM TORONTO? GENTRIFICATION AND SPATIAL PATTERNS OF MIGRATION TO URBAN AND SUBURBAN HAMILTON
Abstract ID: 689
Individual Paper Submission

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, presenting author

Anecdotally, it seems as if almost everyone in Toronto knows someone who has moved to Hamilton. Cheaper housing costs, a vibrant arts scene and proximity to Toronto via a growing number of commuter trains means that Hamilton, 60 kilometres southwest of Toronto, receives a lot of media attention as an alternative to overpriced and congested Toronto (see Harrap, 2018; Hayes, 2016). These moves are

framed as households priced out of Toronto's gentrified and booming urban core relocating to neighbourhoods in and around downtown Hamilton, and subsequently contribute to their gentrification (Berman, 2017).

While there are many examples of this spillover gentrification (Amsterdam to Rotterdam, San Francisco to Oakland, Berlin to Leipzig), very little scholarly research has been done in understanding how gentrification spreads from major global cities to established mid-sized cities within commuting distance. The dominant view is that gentrification 'cascades' down the urban hierarchy (Lees, 2006), however, we tend to rely more on media accounts of people who have made these moves (Berman, 2017; Harrap, 2018), rather than empirical data on migration flows. While gentrification is happening in downtown Hamilton (Harris et al., 2015; Hayes, 2016), there has yet to be a thorough analysis of the migration flows from Toronto to better understand the role it plays in shaping neighbourhood change in Hamilton. Questions of how many people have moved from the Greater Toronto Area and which neighbourhoods in Hamilton they are settling in are major topics of conversation in planning and public debates within Hamilton, however, they primarily rely on anecdotes alone, something that is problematic if these are used to shape planning and policy decisions.

The aim of this paper is to quantify these anecdotal stories of migration from Toronto to Hamilton by examining intraprovincial migration patterns for those moving to Hamilton. To do this, custom data tabulation has been commissioned from Statistics Canada for both the 2006 and 2016 census. These data sets provides migration figures that shows, for each Census Tract in the Hamilton Census Metropolitan Area (CMA), the number of people that moved from every municipality in Ontario in the previous five years. Of primarily interest for this analysis are municipalities in and around Toronto and the different spatial settlement patterns (urban/suburban) within Hamilton. Two research questions will guide this paper:

1. How many people have moved to Hamilton from different parts of the Greater Toronto Area and have these migration flows increased between 2006 and 2016?

2. What neighbourhoods are in-movers to Hamilton settling in and to what extent does this vary according to different origin cities, specifically Toronto and its suburbs?

In 2016, Hamilton had a population of 536,917. The city encompasses older urban neighbourhoods, suburban areas, small villages that have become incorporated into the larger city and rural areas, some of which is farmland and protected by the greenbelt, while other parts are rapidly developing into new subdivisions. Despite growing media attention in recent years, migration from the city of Toronto to Hamilton has remained relatively constant since 2001. Most migrants from the city of Toronto are moving to older neighbourhoods in and around downtown Hamilton, particularly those close to the city's two train stations. These are also neighbourhoods where gentrification is most evident However, the largest migration flows to Hamilton are in various forms of suburban-to-suburban migration: households moving from municipalities around Toronto to suburban census tracts in Hamilton. While more numerous, this trend is less visible in planning debates. This overemphasis on downtown Toronto to downtown Hamilton migration risks detracting attention from this larger flow of people, which also has consequences for housing affordability in Hamilton's suburbs.

THE SPATIAL RELATIONSHIP BETWEEN EVICTION FILINGS, NEIGHBORHOOD CHARACTERISTICS, AND PROXIMITY TO THE CENTRAL BUSINESS DISTRICT: A CASE STUDY OF SALT LAKE COUNTY, UTAH
Abstract ID: 703
Individual Paper Submission

KIM, Keuntae [University of Utah] keuntae.kim@utah.edu, presenting author
GARCIA ZAMBRANA, Ivis [University of Utah] ivis.garcia@utah.edu, co-author
BREWER, Simon [University of Utah] simon.brewer@geog.utah.edu, co-author

There is an increasing body of academic literature analyzing evictions in different cities and contexts in the fields of urban studies, public health, sociology, geography, and housing studies. Other research has explored who is evicted, pathways to eviction, the uneven distribution of evictions, the psychological, health, social, economic and financial repercussions that eviction has on families with children, whether or not there is a relationship between gentrification and eviction, and what communities can do to organize or change legislation related to eviction. However, little is known about evictions within housing studies, and more research is needed on this topic (Greenberg, Gershenson, and Desmond 2016; Hartman and Robinson 2003).

This study investigates the link between neighborhood characteristics and the rate at which landlords file for eviction. Although research already exists on the realm of neighborhood characteristics associated with poverty and deprivation (Gutiérrez and Delclòs 2016; Desmond 2016; Hartman and Robinson 2003; Collinson 2011; Desmond 2012; Laniyonu 2019), the authors collected a total of 4,019 legal records of court-ordered evictions from Salt Lake County for 2015. Using this data, this study addresses the following questions: (1) Where in Salt Lake County do evictions occur? Answering this will help address two further questions: (2) Are poor and deprived neighborhoods disproportionately affected by eviction? And (3) Do evictions predominantly take place in areas of opportunity (e.g., close to the CBD, high-employment mix, and so on)? This study is based on the premise that evictions are highly dependent on contextual causality and that Salt Lake County would have different manifestations than other cities. Based on a list of variables used in previous housing eviction studies, twelve demographic and socioeconomic characteristics data were identified and used as covariates for analysis. Most of the data for covariates were collected at the Census block group level from the 2013-2017 American Community Survey (ACS) data, including 612 Census block groups for Salt Lake County.

To address research questions, this study uses spatial point pattern analysis widely used in geography, ecology, and epidemiology. Prior to modeling, we explore the intensity of the eviction point pattern dataset using a non-parametric estimation tool called kernel density estimation (KDE). As we expect, the KDE map shows the directional characteristics of the distribution of housing evictions. High eviction rates were also found along the main arterial route connecting downtown Salt Lake and the western part of Salt Lake County. This area has a greater proportion of non-white and Latino populations. Compared to majority-white neighborhoods, they are relatively underdeveloped areas with a high percentage of low-income households, which tend to be more vulnerable to housing evictions. The decay of eviction rates with distance from the CBD follows a similar pattern to the bid-rent curve of residential land use in von Thünen's bid rent theory. Our results show that low-income individuals in Salt Lake County tend to live closer to the CBD because of access to opportunities.

After the KDE mapping, the results from the inhomogenous Poisson point process model show that neighborhoods with fewer whites, more Hispanics, higher percentages of families below poverty, a higher percentage of households receiving food stamps, and higher unemployment are associated with more eviction filings. Authors also found a strong implicit link between eviction filings and accessibility of full-time employment, employment mix, short commute times, commuting by public transit, and walkability. From these results, this study contributes to expanding an understanding of the relationship

between evictions and neighborhood characteristics where evictions are located—especially, estimating the risk of evictions as a function of distance from CBD.

WHAT'S THE MATTER WITH NEW JERSEY? UNDERSTANDING THE FAILURE OF MT. LAUREL
Abstract ID: 751
Individual Paper Submission

SCHWARTZ, Alex [The New School] Schwartz@newschool.edu, presenting author

New Jersey is famous for the landmark Mount Laurel decisions of the state Supreme Court that ruled that the state constitution obligates all municipalities to address the need for affordable housing. In Mount Laurel 1, the court determined that municipalities must provide housing to all income groups, and meet a fair share of their region's housing needs. In Mount Laurel 2, the court gave developers the standing to sue local governments that use zoning or other means to prevent or impede development of affordable housing. In 1985, the state legislature established the Council on Affordable Housing (COAH) to determine regional housing needs and allocate this need to municipalities within each region. The legislation also made local governments immune from developer litigation if they submitted plans to COAH that adequately specified how they intended to meet their affordable housing obligations. COAH oversaw two phases of Mt Laurel implementation, from 1987 to 1993 and 1993 to 2000. During this period about 300 of the state's 566 municipalities submitted housing plans to COAH and an additional 78 were under court supervision.

What is not well known is that New Jersey failed to establish new affordable housing goals after 2000. The state took several years to propose a new set of goals, and when it finally did so, the courts rejected these goals, and the methodology used to determine them. All subsequent proposals were also rejected. After years of litigation, the state Supreme Court in 2015 declared COAH to be defunct and decided that the courts must once again be responsible for enforcement of the Mt. Laurel doctrine.

In this paper I examine why New Jersey failed to establish legally acceptable affordable housing goals after 2000, and consider how the long stalemate might have been avoided. In addition, the paper discusses the current status of Mt. Laurel and the extent to whichlocal governments have continued to support the development of affordable housing in the absence of state supervision.

DOES OWNING A HOUSE HELP LOW- AND MODERATE-INCOME HOUSEHOLDS SAVE MORE THAN RENTING?

Abstract ID: 758
Individual Paper Submission

LOH, Wei San [Rutgers, The State University of New Jersey] weisan.loh@rutgers.edu, presenting author
JAGANNATHAN, Radha [Rutgers, The State University of New Jersey] radha@rutgers.edu, co-author

Does owning a house help low- and moderate-income households to save more? Utilizing the Community Advantage Program Survey panel data that contain rich information of low- and moderate-income homeowners who are matched to a set of a similar group of renters, we examined the causal effect of homeownership on savings. This study investigates whether homeowners who received mortgages through the Community Advantage Program were less vulnerable than those who did not participate in the program due to more savings and cash flows during the 2008 housing crisis as a result of owning a house. Specifically, we used the Community Advantage Program Survey panel data from 2007 to 2012 to examine the causal effect of homeownership on savings in both short- (one year) and long-run (five year) periods. Using ordinal regression analyses and lagged variables to address the simultaneity issue between homeowners and savings, we found that being a homeowner allows a household to save more than being a renter not only during the normal period but interestingly also during the severe housing crisis period in 2008. These results remain robust even after controlling for important confounding factors such as income, education and the number of children attending schools or colleges. This study, therefore, contributes to the existing literature by providing further evidence on the importance of homeownership on savings for low- and moderate-income households using updated micro-level dataset of homeowners and renters that includes important periods such as the 2008 U.S. subprime mortgage crisis. This finding could also serve as a useful benchmark for policymakers in developing countries that are considering implementing similar types of housing programs.

CAN PUBLIC INVESTMENT IN MIXED-USE, PEDESTRIAN-ORIENTED DEVELOPMENTS LEAD TO DISPLACEMENT AND DETERIORATED HEALTH FOR LOW-INCOME HOUSEHOLDS?

Abstract ID: 771

Individual Paper Submission

SHULMAN, Lili [University of British Columbia] lili.shulman15@gmail.com, presenting author

Compact neighborhoods are generally viewed positively in research because they promote sustainable development and improve health. However, access to these health-promoting environments is limited to those populations that can afford them. Clearly, public investment has an impact on access to public goods, but who gets to benefit from those investments? The study's goal is to provide a broader understanding of the relationship between built environment design, housing costs, and health.

With a limited supply of affordable housing in many mixed-use, pedestrian-oriented environments, low-income renters are being displaced to more affordable, car-oriented environments. Is it possible that investment in Mixed-Use, Pedestrian-Oriented Design (MUPOD) or put differently, investment in environmental, progressive planning might actually have the unintended side-effect of benefiting those who are already better off at the expense of lower-income populations? Low-income renters, and minorities who are the least financially flexible, are also the most affected by this reorganization of investments and people (Riggs 2016).

My research contributes to the understanding of the following questions: is there a significant association between the degree of neighborhood MUPOD investment and housing costs in the Metro Vancouver context? Are low-income households forced to move when such investments occur? And if so, how does this displacement to more affordable, car-oriented neighborhoods impact their health?

High housing prices, social justice issues, limited boundaries for expansion, combined with mixed-use, pedestrian-oriented policies and inner-city investments, make Vancouver, BC an ideal case study to explore the proposed research questions. Median home and rent prices have increased significantly in nearly all of the largest metropolitan areas in North America over the past two decades. Vancouver is now known as the most difficult city in Canada (and one of the worst worldwide) for young adults to make a home.

Vancouver is also known for its inner-city, mixed-use, pedestrian-oriented urban design. Land-use policies created in the 1970s to protect Metro Vancouver's natural surroundings and agricultural land successfully managed to intensify development in existing neighborhoods and limit sprawl (Quastel, Moos, and Lynch 2012). Vancouver changed dramatically from being one of the leading North American metropolitans dominated by single-family houses, to one with the least of this type. This change, however, still leaves many of the metropolitan's neighborhoods un-densified, typically dominated by single-family houses.

My study uses housing and health data collected at the household level to explore neighborhood trends related to investment in mixed-use, pedestrian-oriented infrastructure. Cross-sectional data for this research is obtained from My Health My Community survey, Walk Score™, and BC Assessment Authority for a 2013/4 timeframe. Walk and Transit Scores are used to create a MUPOD index (N=106). MUPOD is then compared to other variables of interest using different estimation models to test for relationships between variables.

Findings from my research demonstrate that there is a mismatch between investment in mixed-use, pedestrian-oriented infrastructure and the health and housing opportunities for low income households. The research shows that planning is needed to address these inequities.

Investment in MUPOD infrastructure might exacerbate social inequality (Moos et al. 2018). By providing data-driven insights, the study's results support housing affordability policies such that lower income populations are not negatively impacted when affluent communities benefit from public investment in infrastructure.

ASSESSMENT OF GOVERNMENT INSTITUTIONS IN DELIVERY OF LAND AND HOUSING FOR INHABITANTS OF INFORMAL SETTLEMENTS, LAGOS, NIGERIA
Abstract ID: 803
Individual Paper Submission

ODEKUNLE, Folasade [Bells University of Technology, Nigeria] jokotadeshade@gmail.com, presenting author

The increase in population and human activities are escalating the demand on the limited land for settlements as experienced in Lagos, Nigeria. Through the pressure being mounted by the demand for land, it is a common phenomenon to see most undeveloped land being taken over informally by the immigrants who are mostly poor in order to satisfy their urban land needs and housing. As a result of this, many unauthorized residential, commercial and industrial developments are prominent within and at the periphery of most cities in the State. However, it is the responsibility of the government institutions involved in housing issues to make sure that lands and housing units are allocated effectively without any constrained access to any social groups. Thus, equity and fairness have been lost in service delivery of lands, housing resources and housing units by the government institutions when granting access through eligibility and criteria required from the low income groups.

For this study, the primary objective was to assess the effectiveness of government institutions' intervention in service delivery of land and housing units for the inhabitants of informal settlements in Lagos State with a view to achieving equity and justice between low income groups and the high income groups in a sustainable manner. Using a multi-stage sampling technique, the researchers employed both primary and secondary data. Five local governments with 23 informal settlements at the centre of the city were randomly selected. Three (3) set of questionnaires were used; one was directed to Planning institutions, one to Lagos State Urban Renewal Agency and other to residents in the informal areas. A total of 230 questionnaires were randomly distributed within the 23 informal areas selected. Other method engaged included taking of photographs. Data were analysed using descriptive statistics and inferential statistics at $p < 0.05$.

Findings revealed that the inhabitants were unable to meet up with the requirements of development permit and approval, felt neglected, lacked access to basic amenities, lands, housing resources and units. Government institutions noted that efforts were made but failed to meet the needs of the poor due to lack of capacity, failure to fund and steer upgrading, lack of coordination between the various stakeholders of development control, and lack of implementation of planning policies and regulations. Other findings also included less attention or total exclusion/marginalization of the disadvantaged groups in the programmes or projects of sustainable development goals. It is been argued that the activities of government institutions constraint access to land, housing units and resources. The study recommended that there should be adequate personnel, guided and effective enforcement of policies, and review of the activities of the institutions.

COUNTERING DEMOBILIZATION FROM HOUSING INSTABILITY THROUGH COMMUNITY CENTERED DATA

Abstract ID: 817
Individual Paper Submission

HOWELL, Kathryn [Virginia Commonwealth University] klhowell@vcu.edu, presenting author
TERESA, Benjamin [Virginia Commonwealth University] bfteresa@vcu.edu, co-author

Richmond, Virginia has one of the highest eviction rates in the country, demonstrating the widespread problem of housing instability. In neighborhoods that are majority white, eviction rates are below 5%, while African American and Latinx communities have rates that, in some cases exceed 20% or even 30%, threatening the stability of not just individual families, but entire communities. The importance of eviction is that it is more than the individual moment when a family receives a notice, loses in court, or is removed from a home. Instead, eviction is an indicator, result, and a cause of larger structural problems within the region, specifically, historic patterns of racial discrimination in the housing market and race-based dispossession of housing and community in Urban Renewal, redevelopment and highway projects throughout the 20th century. These patterns have resulted in a population with little access to property and political power.

Housing instability has greater implications for civic engagement and democracy. While research has argued that community engagement originates from homeownership, newer research argues that this is due to the stability and control conferred through homeownership, rather than ownership itself (Lindblad and Quercia 2015). Because households that have been displaced or expect to be displaced have to overcome the concurrent challenges of finding and keeping housing, accessing jobs, catching up in school and maintaining mental and physical health, they are unable keep up with voter registration (Squire et al 1987) much less engage in community organizations, local advocacy or political organizing. Thus, housing unstable households, regardless of tenure, are often unable to collectively advocate for changes in their buildings, neighborhoods or cities.

The consequences of "serial forced displacement" (Fullilove and Wallace, 2011)—the recurring patterns of involuntary movement from urban neighborhoods that concerted public and private action produce— are myriad, affecting individuals, families, and groups. Racial segregation frequently precedes displacement which then produces new segregation. These processes are as much as a threat to health and well-being as they are a potent political tool, historically wielded to displace Black people and people of color from positions from where they could exercise political power and build political capacity. Most obviously, physical displacement from home and community can strain and sever relationships that sustain organizing. Beyond the difficulty distance creates, having a sense of place is important for identity, claims-making, and for challenging the conditions that produce urban inequality (Good, 2017; Martin, 2007). We therefore understand eviction to be, at its root, about the reproduction of power and inequality as it is about housing needs.

This paper picks up in this space in Richmond and seeks to investigate the spaces for engagement that addresses the impacts of serial displacement. Using Richmond – and the work of the RVA Eviction Lab - as a case, we investigate the dual challenges of generational upheaval and a housing governance structure

focused on social service provision, rather than power and engagement. Specifically, we look at the responses to eviction, broadly categorized into legal assistance, emergency financial assistance, policy and organizing to understand what role academics and community-based practitioners can play in equalizing access to information, engaging marginalized communities and using data, broadly defined, to change power in communities of color.

COMMUNITY RESPONSE TO DEVELOPER-, PLANNER- AND DESIGNER-LED HOUSING PRODUCTION IN NEIGHBORHOODS EXPERIENCING GENTRIFICATION: THREE CASE STUDIES FROM LOS ANGELES
Abstract ID: 834
Individual Paper Submission

FALLETTA, Liz [University of Southern California] falletta@price.usc.edu, presenting author

Los Angeles is experiencing an acute housing shortage. Many Angelenos, shut out of the housing market and worried about gentrification, are beginning to push back on the bottoms-up discretionary processes vocal minorities have used to deflect housing development in the past. Meeting their demand for the production of more equitable, affordable and sustainable homes are a host of top-down initiatives at both the city and state levels designed to bypass NIMBYism and weaken local control. A new state law passed in 2016 and refined in 2019, for example, allows the by-right development of accessory dwelling units and junior accessory dwelling units on single-family lots, effectively allowing triplexes in the R1 zone. Los Angeles's Transit Oriented Communities Incentive Program, first implemented in 2017, offers valuable density and more expeditious approval processes in return for the creation of affordable housing near transit, upping allowable dwelling units as much as 70%.

But as these new tools and others are developed and implemented, there is disagreement among those who work to provide housing, namely, developers, planners and architects, on the best strategies to replace or reform the housing regulations that limited past supply. Developers point to the need to streamline land use regulation and reduce lengthy, multi-step approval processes that add time and cost. Planners cite the defacto prohibition of "missing middle" housing types and the comparatively small percentage of land zoned for multi-family. And designers identify restrictive zoning and building code parameters that hinder the development of new housing models. But which approach to reform is the most impactful on the ground, in neighborhoods where professionals are trying to build new housing? Will addressing process, prohibition or parameters work best to shift more citizens from NIMBYs to YIMBYs?

To better understand both the reception and perception of such housing initiatives, this paper examines community responses to developer-, planner- and designer-led housing production in three Los Angeles neighborhoods currently experiencing gentrification and resistance. In Boyle Heights, The Fifteen Group, a Miami based real estate development company, is poised to redevelop Wyvernwood Garden

Apartments, the first large scale garden apartment project built in Los Angeles, with quadruple the housing units and right of return for existing tenants after an earlier effort to redevelop failed to gain community support in 2011. In Silverlake, densification via the city's Small Lot Subdivision Ordinance, developed by the LA City Planning Department in 2005, continues to replace single family homes built on multi-family zoned lots as well as small scale rent controlled housing units with market rate for sale housing out of sync with past demographics and neighborhood character. And in Elysian Valley alongside the Los Angeles River (also known as Frogtown), the design non-profit LA Mas is working with LA County to design, approve, fund and build accessory dwelling units to house the formerly homeless who previously made their home on the river's banks. Is housing production led by one discipline rather than another more easily accepted or embraced by communities? How are communities responding to housing production in an era of decreasing local control?

A qualitative, inter-disciplinary case study approach is used to study the scope and impact of these initiatives on their communities, from the perspectives of real estate development, urban planning and design, including semi-structured interviews of stakeholders, compilation of in-depth case histories via primary and secondary source materials and observation and analysis of the built environment and its changes over time. It is hypothesized that just as these disciplinary silos make it difficult to produce housing, they also make it difficult for citizens, both longtimers and newcomers alike, to debate and embrace equitable neighborhood change.

BRINGING FAMILY HOME: EFFECTS OF HUD RENT ASSISTANCE ON FAMILY FUNCTIONING, STRESS, AND MENTAL HEALTH
Abstract ID: 866
Individual Paper Submission

JARAMILLO, Atticus [University of North Carolina at Chapel Hill] atticusa@live.unc.edu, presenting author
WEBB, Michael D. [University of North Carolina at Chapel Hill] webbmd@unc.edu, co-author
ROHE, William M. [University of North Carolina at Chapel Hill] brohe@unc.edu, co-author

Home environments are widely viewed as the foundation of family life. To date, however, little research has explored the extent to which the Department of Housing and Urban Development's (HUDs) rent assistance programs reduce stress within the family and support healthy family functioning – defined as "interactions and relationships within the family, particularly levels of conflict and cohesion, adaptability, organization, and quality of communication" (Lewandowski et al., 2010, p. 1027). This topic deserves attention because stress and family functioning are important predictors of health and well-being (Franks, Campbell, & Shields, 1992; Kelly, Hertzman, & Daniels, 1997). Thus, testing whether HUD rent assistance programs influence these outcomes can aid ongoing policy efforts to improve the lifelong health and well-being of low-income families.

The purpose of this paper, therefore, is to test whether the receipt of HUD rent assistance reduces stress within the family, thereby promoting healthy family functioning and positive mental health outcomes. We address this research aim via two stages of analysis. First, we test how the receipt of HUD rent assistance influences levels of stress and family functioning dynamics – such as levels warmth, conflict, and violence – among family members. Second, we test whether stress and family functioning variables moderate lifelong mental health outcomes.

To complete these two stages of analysis, we utilize a novel dataset that combines HUD administrative data with National Study of Longitudinal Adolescent to Adult Health (Add Health) data. These data provide us with a sample (N=583) of adolescents who resided in HUD-assisted housing between the ages of 12 and 19 and data on their health and well-being in early adulthood (age 24 -32) and adulthood (age 34-43). These data also allow us to construct a matched comparison group of adolescents who are demographically similar but did not reside in HUD-assisted housing at any point during their lives. We measure family functioning through self-reported data points, such as self-reported rates of interpersonal conflict and violence among family members. We measure stress through biomarker data, such as blood pressure and cortisol levels. We measure mental health outcomes using the Center for Epidemiologic Studies Depression Scale (CESD-20) and self-reported diagnoses of posttraumatic stress disorder (PTSD) and anxiety.

We utilize two causal inference strategies to tease out the treatment effects of HUD rent assistance on these outcomes. First, we use Coarsened Exact Matching (CEM) to construct a comparison group of low-income Add Health respondents that have never resided in HUD-assisted housing. Second, we employ difference-in-difference regression modeling to estimate whether HUD rent assistance explains differences in outcomes between our treatment and comparison groups.

This analysis will make several important contributions to the current literature. First, we provide one of the first panel studies of how HUD rent assistance influences lifelong health, thereby building upon previous studies that have relied on cross-sectional data (Slopen et al. 2018). Second, we provide an "under-the-skin" perspective on how HUD rent assistance influences lifelong health, as we have access to a number of biomarker measures of stress. Third, we directly test whether HUD rent assistance reduces stress and improves family functioning. This contribution is important because previous studies suggest that HUD rent assistance may improve health by reducing stress and supporting family functioning, but no studies have directly tested this hypothesis to date (Leventhal & Newman; 2010).

UP IN THE AIR: PRECARIOUS HEALTH CONDITIONS AND COMMUNITY ENGAGEMENT OF HIGH-RISE RESIDENTS IN TORONTO
Abstract ID: 876
Individual Paper Submission

GHAEM-MAGHAMI, Shervin [University of Toronto Mississauga]
shervin.ghaemmaghami@utoronto.ca, presenting author
KUUIRE, Vincent [University of Toronto Mississauga] vincent.kuuire@utoronto.ca, primary author

As a growing proportion of the world's population moves into high-density urban centres, cities face mounting challenges of creating adequate housing conditions to accommodate these flows. In such circumstances—as is the case in Toronto, Canada—polarization within cities can begin to take shape in the form of disappearing middle-income neighbourhoods, a small number of wealthy neighbourhoods, and increasing numbers of disadvantaged neighbourhoods (Hulchanski, 2010). Those facing pressing socio-economic conditions are becoming increasingly concentrated within the latter communities, captive within the high-rise towers that feature in the metropolitan skyline (United Way of Greater Toronto, 2011).

Research on such living conditions point to a need for additional investigation on the extent of their impacts on residents' physical and mental health and social well-being (Kearns et al., 2012) and a municipal commitment to the adoption of more robust policies to relieve these pressures (Krieger & Higgins, 2002; Lehrer & Wieditz, 2009). Using the socio-economic indicators of individuals and families living in high-rise residential buildings collected by the United Way of Greater Toronto, a primary objective of this research project was to identify how these factors correlate with perceived physical and mental health conditions. Further, we evaluate the extent to which the socio-economic circumstances of residents in these buildings affect perceptions of the security of their living arrangements (e.g., as it relates to crime, safety, and privacy), as well as how their conditions impact their attitudes toward engaging in activities that promote social cohesion and neighbourhood collective action. In light of our findings indicating that housing environment conditions complicate the role of socio-economic factors with respect to health outcomes and social cohesion for these residents of high-rise buildings in the Toronto area, we offer policy recommendations for the consideration of municipalities.

LEE, Chanam [Texas A&M University] chanam@tamu.edu, co-author

DARCY, McMaughan [Texas A&M University] d.mcmaughan@tamu.edu, co-author

Background: Housing and neighborhood environments are crucial for maintaining quality of life among low-income populations, including those living in affordable housing. Compared to their affluent counterparts, low-income populations tend to bear higher risks for lifestyle-related chronic conditions (e.g. obesity), and depend more on community resources for their daily activities. Mixed-use and walkable neighborhoods are being increasingly promoted for their health and sustainability benefits (U.S. Department of Health and Human Services, 2015), but have been criticized for not being affordable and accessible to low-income populations (Garde, 2004; Seasons, 2014).

Aims: This research examines affordable housing in the city of Austin, Texas to examine (1) income, racial/ethnic, and environmental disparities associated with their locations; and (2) the impacts of neighborhood walkability on affordable housing residents' physical activity, health, and cost of living.

Methods

For Aim 1, a total of 566 affordable housing properties (925,439 housing units) in Austin were geocoded. Two binary logistic regression models were conducted to predict the likelihood for a particular census block group to have (1) exclusively affordable properties (i.e., all units being affordable), and (2) mixed-income properties (i.e., with both affordable and market rate units), respectively, using its sociodemographic and physical environmental characteristics.

For Aim 2, we surveyed affordable housing residents for their physical activity, health, and cost of living, as well as relevant personal, social, and physical environmental factors. These residents are served by the same housing provider (one of the largest in Austin), which helps to reduce the impact from other confounding factors. Objective housing and neighborhood environmental features will be assessed using field audits and GIS analysis. Preliminary analyses included bivariate analyses, ANOVA for mean differences across groups living in low-, medium-, and high-walkability neighborhoods, and linear regressions predicting the outcomes using three blocks of variables (sociodemographic, housing type, and neighborhood walkability).

Findings

For Aim 1, two models showed interesting differences. Census block groups with greater percentage of low-income households or land-use mix were more likely to have presence of mixed-income affordable housing. In contrast, those with greater street density or land-use mix, lower ratios of non-Hispanic whites or high-income households, or lower population density are more likely to have presence of exclusively affordable housing. These findings indicated income-related disparities in locations for both types of affordable housing, and ethnicity-related disparities for locations of exclusively affordable housing. On the other hand, locations of affordable housing do seem to have overall advantages in neighborhood walkability (based on measures of land-use mix or street density), with the exception of disadvantage in relation to population density for exclusively affordable housing. This may be related to relevant policy initiatives in the city. Further analyses will also include safety measures to explore this additional layer of environmental disparities.

For Aim 2, we have collected 161 survey responses from 11 housing properties so far. The respondents are 73% female, 46% Hispanic, and very low income (62% with household income <$30,000). Bivariate analyses showed that neighborhood walkability was positively associated with transportation walking and transit use. ANOVA showed that residents in high-walkability neighborhoods walked more for transportation or recreation in the neighborhood than those in low-walkability neighborhoods. Linear regressions showed higher walkability to be associated with less driving, but not with walking, physical activity, health and cost of living. Further analysis will use mixed effects models to account for the hierarchical structure of the data, and include additional survey data (~300 in total) and GIS and field audit data.

Conclusions: Findings from this study can inform future design and planning of affordable housing and

relevant polices, to help address health and environmental inequities for this vulnerable population.

THE EFFECT OF FIRST-HAND HOMEOWNERSHIP EXPERIENCE ON TENURE CHOICE; ARE RENTERS WITH OWNING EXPERIENCE MORE LIKELY TO BE OWNERS?
Abstract ID: 886
Individual Paper Submission

CHOI, Seungbee [Virginia Polytechnic Institute and State University] sbchoi@vt.edu, presenting author

Homeowners often go back to renters leaving behind the various benefits of homeownership. The most reason why many people have lost their homeownership is foreclosure during and after the Great Recession. On the other hand, some of those may become renters because of non-economic issues such as shifts in working or family issues. For example, divorce is likely to generate at least one renter. Moving the workplace is also one of the forces that returns the owner to the renter. But are renters who experience ownership likely to become owners again? Does the effect of homeownership on tenure choice differ depending on why they lost homeownership? While indirect experience through parental homeownership is considered to have a positive effect on future homeownership, the effect of first-hand homeownership experience on the tenure choice remains underexplored. This study supplements logistic regression models of tenure choice using Panel Study of Income Dynamics (PSID) data for the last 10 years to help unpack the mechanisms driving the links between homeownership experience of renters and tenure choice. Samples are limited to householders under 45 years old to clarify the classification of reasons they give up homeownership. Estimation models are divided into four types depending on the reasons owners became the renters.; (1) Economic issue – foreclosure or unemployment; (2) Family Issue – divorce; (3) Job turnover; (4) Low satisfaction – in terms of education or neighborhood. It provides insights into the homeownership experience of renters-tenure choice relationship, and explores how that relationship varies systematically with household and market characteristics. Preliminary findings suggest that households that become renters because of economic hardship or low satisfaction are less likely to become owners again. Households that become renters due to job turnover are more likely to regain ownership within a few year after the move. Families who have been divorced have different effects depending on the presence of child and who takes custody.

THE EFFECTS OF ENVIRONMENTAL HAZARD ON HOME PRICE APPRECIATION
Abstract ID: 930
Individual Paper Submission

SWAYNE, Madison [San Diego State University] madi.swayne@gmail.com, presenting author

Environmental justice research seeks to understand how race and income influence the distribution of environmental hazards. These investigations repeatedly show that low-income communities of color are disproportionately burdened by pollution and noxious facilities (Mohai, Pellow, & Roberts, 2009) and minority move-in to contaminated neighborhoods is not driving these spatial patterns (Pastor, Sadd, & Hipp, 2001). With these well-documented spatial patterns there remains unanswered questions on the potential impacts environmental injustice may pose to housing markets which both reflect and drive the reproduction of inequality by race and income. Environmental hazards, among many other negative outcomes for health and human flourishing, can alter home values and wealth creation intergenerationally and across different groups. Neighborhood environmental hazards can lower home prices in multiple ways because they pose a nuisance. These nuisances can also influence homeowners' perceptions about the resale value of their homes, and thus discourage their on-going investments in home maintenance. In so doing, homeowners' decisions can compound the effects of the hazards on home prices. This paper analyzes these questions in residential neighborhoods across Los Angeles County.

This paper builds on three existing strands of research investigating: housing wealth and the housing wealth gap; hedonic impacts of amenities and disamenities on housing price levels; and the unjust distributions of environmental harm across poorer, minority neighborhoods. I investigate the relative appreciation rates between houses in census blocks with varying environmental contamination. Through repeat sales, I track how house prices in areas of differential environmental toxicity change over time, controlling for other house type structural characteristics. Home value appreciation in this study does differ statistically between neighborhoods with and without nearby environmental hazards. I find evidence that for homes in neighborhoods with intense environmental burdens, house prices appreciate one-percent per-year slower than homes with average and lower than average levels of environmental contamination. For homeowners in the most toxic areas, places which have long been identified as neighborhoods of environmental justice concern, the environmental effects on home price appreciation rates draw an additional red line around neighborhoods that have historically been subject to discrimination.

These results are based on eleven years of data from Los Angeles County, providing robust, large-scale evidence of impacts on residential property markets associated with environmental hazards. To measure environmental burdens, I rely on the U.S. Environmental Protection Agency's (EPA's) Risk-Screening Environmental Indicators (RSEI) data. RSEI data are the only nationwide environmental database that has been standardized across years for both polluters and pollutants. RSEI also relies on small geographic grid cell units and information on the toxicity and dispersion of chemical releases — providing more precise estimates of individual exposures to environmental harm (Ash and Fetter, 2004). Finally, this study improves on previous hedonic estimation studies that were aimed at understanding people's willingness to pay to avoid environmental disamenities (Boyle and Kiel, 2001). With the repeat sales approach methodology (Bailey, Muth, & Nourse, 1963) employed in this paper, I can instead estimate how the presence of environmental hazard impacts the appreciation rates of individual hazards by comparing properties to themselves over time. Taken together, my data and methodological approach provide stronger evidence of the long-term effects of concentrated environmental harm on real estate markets compared to previous investigations.

COMMUNITY ASSESSMENTS IN TRANSIT SHEDS OF MULTI-FAMILY SUBSIDIZED HOUSING UNITS IN THE CITY OF HOUSTON
Abstract ID: 948
Individual Paper Submission

PARK, Han John [Rice University] john.park@rice.edu, presenting author
CHOI, Kwangyul [University of Calgary] kwangyul.choi1@ucalgary.ca, co-author

The city of Houston has huge urban footprints with rapid population growth in the city and beyond its city limits. Houston has been struggling with accommodating growing vulnerable populations in its housing market and expanding efficient public transit service. Nonetheless, the lack of convenient transit service in the city has obstructed the equal accessibility of low-income families who have limited personal vehicles. Especially, many multi-family project-based public housing tenants have an impediment to access to a numerous number of places as the construction of public rental units is geographically limited without the connection with public transit.

Few studies have assessed the opportunity of the public housing tenants in relation to the transit system. This study focuses on renters in the multi-family subsidized housing and the tenants' opportunities within distances that transit service provides. In most cases, multi-family subsidized renters have limited car ownership, and the public transit system is a critical method for Houston's affordable housing tenants to accomplish daily travel needs, such as jobs, education, and grocery shopping, to name a few.

Some of the project-based affordable housing programs that subsidize low-income populations in multi-family type housing units have not been broadly assessed by previous housing scholars: Section 8 Project-Based Assistance, Section 202 Supportive Housing for the Elderly, and Section 811 Supportive Housing for Persons with Disabilities. In this study, we focus on the tenants in these multi-family subsidized housing units who are in general very low-income families and also underserved.

With transit travel time, we evaluate neighborhood characteristics and demographic characteristics, such as job opportunity index, labor market engagement index, school proficiency index, environmental health hazard index, affordability factors, and other sociodemographic characteristics. The transit sheds are generated based on the General Transit Feed Specification (GTFS), which provides information regarding the actual transit routes, stops, and schedule. The sheds are set up using the Houston METRO's public transit system, such as light rails and local buses within 30- and 60-minute transit thresholds from each public housing building.

We estimate current opportunities given to low-income tenants in the public housing units. We provide policy implications to attempt to achieve social equity by drawing housing policymakers' attention to public housing residents' locational benefit when the connection with the transportation system is taken into consideration. We further suggest recommendations for improved quality of publicly assisted housing tenants in the sprawling city setting.

HOUSING SUBMARKETS AND THE EFFECTS OF NEW CONSTRUCTION ON EXISTING RENTS
Abstract ID: 957
Individual Paper Submission

DAMIANO, Anthony [University of Minnesota] damia025@umn.edu, presenting author
FRENIER, Christopher [University of Minnesota] freni003@umn.edu, co-author

In the past 20 years, after decades of disinvestment and decline, central cities have seen a reversal of fortune and are experiencing rapid growth, particularly in the urban core (Couture, 2019). Many of these same places are now struggling with both housing unaffordability and housing shortages. These housing challenges have produced vigorous debate amongst policy makers, scholars, and activists about the role that new market-rate apartments play in alleviating housing affordably issues. Research has shown that new market-rate construction results in more affordable housing in the long-run, but much less is known about the neighborhood effects of new market-rate housing in the short-run (Been et al., 2019).

Emerging research on this topic has shown mixed results (Asquith et al. 2019; Li, 2019; Singh, 2020). Li (2019) and Asquith et al. (2019) find evidence that new market-rate construction lowers nearby rents, while Singh (2020) finds evidence that new construction results in slightly higher rents nearby. We contribute to this literature by explicitly incorporating housing submarket theory into our model (Galster & Rothenberg, 1991). We hypothesize that since housing units in a similar geographic area can vary significantly in type and quality that the effects of new market-rate housing could affect housing in heterogeneous ways based on the quality of existing housing.

Our work uses a novel dataset of building-level rents in Minneapolis, MN from 2000-2018, and a difference-in-difference study design to estimate how the construction of large market-rate apartment buildings effects rents in nearby units. We find little evidence that new construction affects rent in the aggregate. These null results, however, mask meaningful, heterogeneous treatment effects in different segments of the housing quality distribution. We estimate that lower quality housing close to new construction had 6.7 percent higher rents compared to similar buildings farther away from new construction. New construction had the opposite effect on higher-quality housing; rents were 1.7 percent lower close to new construction than in nearby buildings, but we cannot rule out a null effect. Effect sizes in all quality markets were stronger closer to new construction, and the effects persisted for at least two years after the new construction is completed.

This study reiterates the importance of understanding housing as a collection of submarkets rather than a

singular market. Our findings are important for planners and policymakers who seek to balance growth and protecting existing lower-income communities.

TRANSIT-ORIENTED DEVELOPMENT AND ITS LONG-TERM IMPACT ON LOCATION AFFORDABILITY: LESSONS FROM LOS ANGELES
Abstract ID: 965
Individual Paper Submission

SONG, Qi [University of California Irvine] songq3@uci.edu, presenting author

Location affordability, which integrates housing and transportation affordability, is critical to internalize the housing and transportation trade-off made by households and comprehend the real meaning of affordability for various income populations, especially for low-income households (Center for Transit-Oriented Development, 2009; Renne et al., 2016). There is a growing trend nowadays of combining transit-oriented development (TOD), with affordable housing by planners and policymakers to increase housing affordability while providing transit proximity (Boarnet et al., 2017). This study will contribute to a larger, emerging area of research on location affordability. On the one hand, the existing literature reveals a heated debate among housing affordability and social equity activists in response to the higher costs of housing in TOD and the resulting gentrification and displacement. On the other hand, transit-oriented neighborhoods generate lower vehicle miles traveled and more walk and transit trips (Ewing & Cervero, 2010), and thus reduce household transportation expenditures. The contradictory impacts of TOD on transportation and housing costs need to be integrated and analyzed as a whole. Given this, the study examines (1) how TOD influences the combined share of housing and transportation costs for households over time and (2) what TOD design characteristics such as density and connectivity contributes to increasing location affordability.

This study focused on analyses of two relatively new-established light rail transit corridors – Los Angeles Metro Exposition Line and Los Angeles Metro Gold Line – to explore the changing housing and transportation cost for residents living within a half-mile from 31 targeted rail stations by Census block group. The study identified four types of factors influencing location affordability from the literature, which are neighborhood characteristics, the local housing market, transit accessibility, and urban design. It first explored how the aggregated location affordability of these selected census block groups change across different phases of TOD, including the "planning phase," the "construction phase," and the "permanent phase." Housing and transportation cost for each census block group in different TOD phases were calculated based on U.S. Census data, Location Affordability Index Model created by U.S. Department of Housing & Urban Development, and the Housing + Transportation (H+T) Index from the Center for Neighborhood Technology. The results from the comparison of means tests indicate that the average location affordability stayed relatively constant when rail stations were planned and constructed,

but it decreased after their opening. Households in census block groups with a higher proportion of low-income minority populations located near the downtown area experienced the most significant increase in their combined housing and transportation costs.

Further, the study explored the impact of urban design features of TOD in the permanent phase on location affordability, using a multivariate regression analysis. By controlling variables measuring neighborhood characteristics, the local housing market and transit accessibility, the study examined the association between location affordability and urban design features of TOD such as scale and density, public spaces for human use, variety and complexity, pedestrian and cyclist orientation, and vehicular movement and parking. The results indicate that mixed-use and pedestrian-oriented design promote location affordability, while increasing household density contributes to higher location affordability only within a certain threshold.

Overall, the study emphasizes the necessity of early intervention from the local level to prevent gentrification and displacement of low-income minority households and the prospect of building mixed-income transit-adjacent communities which are dense, mixed-use and pedestrian-friendly.

ACHIEVING THE GOAL OF PERMANENT AFFORDABLE HOUSING: THE POTENTIAL OF COMMUNITY LAND TRUST AND LAND BANK COLLABORATION
Abstract ID: 973
Individual Paper Submission

PROCHASKA, Natalie [University of Illinois at Urbana-Champaign] prochask@illinois.edu, presenting author
LOWE, Jeffrey [Texas Southern University] Jeffrey.Lowe@tsu.edu, primary author
KEATING, W. Dennis [Cleveland State University] w.keating@csuohio.edu, co-author

Planners must remain committed to utopian ideals and values, should there be the opportunity to achieve social justice aims by promoting equitable development and power among the grassroots in plan and policy making. The community land trust (CLT) model advances these aims via democratizing land use and stewardship of public investment for permanent affordable housing (Davis, 2010; Lowe & Thaden, 2016; Thaden & Pickett, 2019). Few urban planners, however, are engaged or familiar with how CLTs use innovative tools for, rather than returning properties to productive usage subject to private ownership, placing land under social control and fostering housing security. One such tool gaining in popularity is the land bank (Alexander, 2015; Keating, 2013).

This research employs a multiple explanatory case-study approach that illuminates how CLT collaboration with land banks can increase scalability for social control of land and permanent affordable housing. We find that the vision of many local and regional policy makers for increasing the permanent

affordable housing stock has become bolder. This view is driven by varying political economic responses to more recent neighborhood changes resulting from increasing housing costs, gentrification, and the demographics of population changes. Political economy holds significant sway over CLT-land bank collaboration. The types of powers land banks have through enabling legislation matters. CLTs need land use policies, resources and supportive networks that enhance their capacity to expand community-controlled stewardship and preserve neighborhoods. Planners should be more involved in and voluble about CLT-land bank collaboration because the net positive pipeline potential helps resolve tension between capital and community while enhancing housing security, community control, and a broader social justice movement.

STUDYING THE PAST TO UNDERSTAND THE PRESENT: REDLINING, WHITE FLIGHT, AND QUALITY OF LIFE IN MILWAUKEE, WI
Abstract ID: 988
Individual Paper Submission

WARSAW, Phillip [Michigan State University] warsawph@msu.edu, presenting author
CANCEL, Yaidi [University of Wisconsin-Milwaukee] ycmartin@uwm.edu, co-author
SADLER, Rick [Michigan State University] sadlerr@msu.edu, co-author

Across the social sciences, a significant body of literature has linked the built and natural environments in communities to public health outcomes. A common observation in this literature is the correlation between low-SES households, a lack access to quality of life amenities such green space or food retailers, and poor public health outcomes. Historically, the analyses generating these findings have been 'flat' in nature, merely noting the current distribution of resources, and the resulting outcome. In recent years, a growing body of literature has made the explicit connection between the current distribution of urban amenities and historical processes of segregation, such as redlining, in an effort to . However, to date, limited scholarship has sought to quantify the correlation between historical segregation and current inequalities in access to quality of life amenities.

In this paper, we investigate historical and current economic and spatial patterns of housing segregation and disinvestment in Milwaukee, WI, and its association with measures of quality of life post-Great Recession, specifically access to green space and retailers such as food outlets. Following McClure et al (2019), we use a two-step modeling technique to analyze the relationship between neighborhood demographics and quality of life metrics, utilizing past segregation as a measure to quantify confounding bias introduced when ignoring past housing inequalities. Further, we operationalize our quality of life metrics in two ways: first as straight counts of retailers, parks, and other positive amenities within neighborhood units; and second, as the marginal price of an additional amenity within a neighborhood unit, as seen in Warsaw and Phaneuf (2019). In doing so, we provide a robust consideration of the connection between historical segregation and both the physical access to quality of life amenities

within the city, and the 'functional' access as defined by the feasibility of local community members to live in homes with said physical access to these amenities.

To quantify historical segregation, we employ HOLC shapefiles for Milwaukee County digitized by the Mapping Inequality project (Nelson et al 2020), in conjunction with shapefiles characterizing the patterns of blockbusting and white flight within the county during the 1970's and 1980's. We utilize publicly available parcel data and home purchase records provided by the City of Milwaukee to identify the location of local features such as parks, as well as determine home values across the city. Census data is used to identify demographics at the neighborhood level, and business records detailing the location of relevant retailers during the study period are provided by ReferenceUSA.

The findings of this work will provide scholars with an empirical basis for understanding the historical processes commonly linked to disparities in access to vital urban amenities which promote public health. In applied settings, the model developed by this paper will provide practitioners with a pluralistic view of the challenges facing underserved communities, and open opportunities for targeted investments to remedy the structural causes of inequality in urban contexts.

SEINE-SAINT-DENIS STYLE: HOW ONE *BANLIEUE*'S INSTITUTIONAL MODEL MIGHT BE THE SOLUTION TO THE GRAND PARIS HOUSING CRISIS
Abstract ID: 1008
Individual Paper Submission

MAAOUI, Magda [Columbia University] mm4964@columbia.edu, presenting author

2019-2020 marked a turning point for the Grand Paris. Debates over the challenges this metropolitan governance structure faced since its inception in 2016 were still heated. Local municipal elections oriented who would sit at the Conseil Métropolitain. The initial version of the metropolitan Housing Plan was dropped, because elected officials still refused the idea of a newly imposed financial equalization and housing construction rebalancing.

Balanced housing provision was supposed to be one of the pillars of the Grand Paris metropolitan project. Fifteen years later, it is almost at a standstill, with strong imbalances between territories (Maaoui 2020), and between social and market rate housing construction trends, even when production is on the rise. Behind the rhetoric of "new urban politics" (Enright 2016), path-dependency seems to prevail.

In a metropolitan area faced with a lingering housing crisis, the short-term strategy was to continue tapping into a mix of existing tools, such as the regional SDRIF plan and the state-enacted inclusionary zoning SRU Law. Still, this temporary approach does not offer a strong enough long-term framework for metropolitan negotiations with municipalities, for instance when it comes to yearly budget allocation decisions or financial equalization.

This notwithstanding, we consider that the Grand Paris case presents us with many lessons. We developed

a series of mixed-methods research cases that go a step further than the current literature, answering Dominique Lorrain's call for a "political economy of details" for the Grand Paris (Lorrain 2018), so as to grasp how housing provision works at a finer grain. The goal is to unveil the local "micropolitics of planning" (Forester 1999) that make up the larger metropolitan project, and to explore the challenges of finding the right governance strategy in the territorial mille-feuille in which Grand Paris agents operate.

We here present lessons from the fringes based in the Seine-Saint-Denis department, in the inner-ring northeastern banlieues of Paris. This department concentrates historically disinvested municipalities, which were historically red suburb enclaves, and are still mostly comprised of lower income minority neighborhoods. Seine-Saint-Denis counts the largest portion of the region's social housing stock, but is also the target of major redevelopment projects, such as those in line with the 2024 Olympics. It operates with heavy budget constraints, and yet functions as a pioneer for the Grand Paris, with the longer expertise it has in terms of intercommunal institutional governance. In conceptualizing this case study, this paper analyzes the role played by agents in charge of housing provision in the Établissement Public Territorial Plaine Commune. This intercommunal EPT relies on a body of expertise, incentive precedents, and financial and regulatory tools that are not bound to municipal limits, in order to structure an inclusive housing market for local residents.

Findings are drawn from interviews with elected officials, housing developers, community organizers and residents, as well as field observations in key community meetings and public hearings. Our analytical framework is strongly rooted in the approach developed by Bent Flyjberg's "phronetic social science" which considers how practitioners make use of their knowledge and act towards shaping an urban future within a clear ideological framework (Flyvbjerg 1998). This paper provides thick descriptions of how housing provision compromises are negotiated in Seine-Saint-Denis, and offers a potential roadmap for the institutional future of the Grand Paris.

HOUSING ASSISTANCE PROGRAMS AND NEIGHBORHOOD CHANGE ACROSS THE GREATER TORONTO AREA
Abstract ID: 1011
Individual Paper Submission

DANTZLER, Prentiss [Georgia State University] pdantzler@gsu.edu, presenting author

The largest payments people make monthly are housing expenses. Everyone needs a place to lay their head. This is most apparent in larger cities in which rising housing costs are causing many people to wonder if they will be able to afford to stay in their homes. As a result, many countries have tried to address housing affordability by providing financial assistance to those who cannot pay their monthly housing expenses on their own. One of the ways in which governments do this is by providing housing units directly to people in the form of public housing. Typically, these units are managed by a government agency. Because the government serves as the landlord, many have questioned whether or not the government should supply housing for those who cannot afford it given the province's neoliberal turn in

the 1990s (Hackworth & Moriah, 2006). This neoliberal turn is argued to be seen locally in the case of social mixing initiatives encouraged by agencies undertaking public housing restructuring across the Greater Toronto Area (GTA) (August, 2008; 2014). Within North America, the two largest government agencies that supply public housing are in New York, NY and Toronto, ON, respectively. And while there is a lot of literature on public housing in New York and other large U.S. cities, there is little research on the GTA. Given the increasingly unaffordable nature of the GTA, this study focuses on the relationships between housing assistance programs and neighborhood change. Several questions arise from this study: 1) What are the descriptive differences among housing assistance recipients across program types? 2) Does housing assistance allow tenants to stay in changing neighborhoods? 2) Are different housing assistance programs clustered in particular areas across the GTA? This study uses administrative data from the Toronto Community Housing (TCH). TCH is the largest social housing provider in Canada and the second largest in North America. TCH is wholly owned by the City of Toronto and operates in a non-profit manner. Toronto Community Housing has 2,100 buildings and 50 million square feet of residential space, which represent a $9 billion public asset. Using approximately a decade of administrative data, this study uniquely looks at the changing dynamics of households while also looking at changing neighborhood dynamics. Using a series of descriptive and spatial analyses, the study seeks to highlight the role of housing provisions in stabilizing households across an increasingly unaffordable urban area.

LOSING YOUR HOME IS BAD FOR YOUR HEALTH: SHORT- AND MEDIUM-TERM HEALTH EFFECTS OF EVICTION ON YOUNG ADULTS
Abstract ID: 1016
Individual Paper Submission

YUN, Jinhee [Cleveland State University] jhyun321@gmail.com, presenting author
HATCH, Megan E. [Cleveland State University] m.e.hatch@csuohio.edu, primary author

Until recently, the true scope of evictions in the U.S. was unknown. With the advent of new data sources, estimates suggest over 850,000 families are evicted each year (The Eviction Lab, 2018), elevating evictions to the top of the agenda in many jurisdictions. Cities such as New York City adopted right to council laws, which provide lawyers to some tenants facing eviction. More recently, San Jose, California, proposed halting evictions resulting from the COVID-19 virus. These policies are predicated on the idea that evictions have negative consequences for the families who are forced to leave their homes. Yet, the nature and duration of many consequences is relatively unknown. A developing literature suggests eviction can lead to housing instability and homelessness (Sandel et al., 2018), job loss, criminal justice system involvement, and problems in school. Another consequence of even the threat of eviction is poor health (Vásquez-Vera et al., 2017). For example, Desmond and Kimbro (2015) find mothers who were evicted were more likely to report poor health for themselves and their children, an effect that remains two years after the eviction. We build on this literature by examining the short- and medium-term effects of an eviction on the self-reported health of young adults.

We evaluate the relationship between evictions and health by using the restricted use version of the Add Health dataset, which follows 15,701 children through four survey waves, starting when they are in grades 7 through 12 through early adulthood (when they were between 25 to 34 years old). We use data from over 11,000 individuals in Waves III and IV of the survey (when respondents were aged 19 to 28

and 25 to 34, respectively), measuring whether the respondent experienced an eviction in the twelve months prior to each survey wave and their health in Wave IV. We measure health three ways: self-reported general health, the existence of two mental health disorders (anxiety and depression), and a composite of general and mental health. Using binary and multinomial logistic regression, we find evictions have both short- (twelve month) and medium-term (seven to eight years) negative impacts on health. While the negative health effects of a recent eviction are larger than the effects of an eviction years ago, both types of eviction are associated with poorer general and mental health.

Our research provides evidence that individuals who experience an eviction are more likely to report being in poor general health or experiencing mental health concerns, even seven years after an eviction. As state and local governments develop policies to reduce evictions, it is worth noting that any resulting decrease in evictions may have a positive impact on population health. Therefore, decision makers would do well to work with the public health community to develop effective anti-eviction policies.

FINANCIALIZED NEGLECT: EXAMINING SINGLE-FAMILY RENTAL CONDITION AND IMPACT OF LARGE OWNERS IN MEMPHIS, TENNESSEE
Abstract ID: 1046
Individual Paper Submission

HARRISON, Austin [Georgia State University] aharrison45@student.gsu.edu, presenting author

The decade following the sub-prime mortgage crisis has been characterized by an increase in single-family rentals across the national housing market. Communities hit the hardest by foreclosures are seeing an increase in a specific type of single-family rental financialization. The investors are often private equity or capital management firms, who control significant amounts of housing markets and sub-markets. A December 2018 Washington Post article on Cerberus Capital Management and their activity in Memphis, found that they are estimated to own close to 5,000 properties in the city-limits alone. Previous research has already shown that these ownership types evict residents at higher rates and the most common legal ownership structure, LLCs, facilitate trends of disinvestment (Raymond, 2018; Travis, 2019)

On the topic of property condition specifically, research suggests that this level of centralization and economies of scale could result in increased quality (Garboden & Newman, 2012). This is the same question at the center of this research: do institutional investors take care of their properties better than single-family rental property investors with smaller portfolios? To answer this, a rich parcel-level dataset collected from a volunteer driven windshield survey is used. The Bluff City Snapshot rated all properties on a 1-5 scale and generated a series of binary and categorical variables related to each aspect of the property. Combining this data with public tax records from the same time period as the survey, single-family rental investors are grouped into three categories based on number of properties each investor owns: institutional investor (n > 25), corporate investor (n = 10 – 24), and mom and pop (n < 10).

The impact of investor size is examined using a quantitative, multi-variate approach. A logistic regression model will assess the impact of institutional investors as opposed to smaller and more local investor types, controlling for other potential property condition impacts. The financialization of single-family rental properties is a nation-wide phenomenon and understanding the impact of different investment types will help inform neighborhood and housing planning strategies, while also informing rental housing policies at the state and local levels.

NEW STRATEGIES FOR CHEAP RENT: MANITOBA'S SOCIAL HOUSING PROVIDERS AS HYBRID ORGANIZATIONS
Abstract ID: 1059
Individual Paper Submission

COOPER, Sarah [University of Manitoba] sarah.cooper@umanitoba.ca, presenting author

Non-profit housing providers in Manitoba are finding new ways to subsidize low-cost housing. Moving beyond long-term funding agreements with the federal government, non-profit housing providers are using a combination of strategies, including internal subsidies, portable rent benefits, rent regulations, and reducing the depth/number of subsidies offered to continue to provide low-cost housing. The new National Housing Strategy, released in 2017, also offers funding for community housing providers, though details have not yet been released.

In this paper, I examine the strategies employed by non-profit housing providers through the lens of hybridity (Blessing, 2012; Skelcher and Smith, 2015). Neither public nor private, non-profit organizations operate in their own sphere, where Mullins and Jones (2015) note, the "competing logics of state, market and community play out continuously… with a variety of potential consequences, including continued state control alongside market mechanisms" (262). In Manitoba, non-profit organizations provide about half of the province's non-market low-cost housing. As federal and provincial housing policies change, so do the opportunities and constraints facing non-profit housing providers. As hybrid organizations, non-profits have mandates to address social goals; they also must engage with market forces, and respond to pressures from their local community.

Through interviews with non-profit housing providers, I examine how non-profit housing providers in Manitoba use their often newly-developed responsibility for rent structures. Four main strategies were identified by housing providers to continue to offer low-cost rents after long-term subsidies have expired. The first, internal subsidies, relies on having higher-income tenants who pay a higher level of rent to subsidize lower-income tenants. The second, Rent Assist, is a provincial portable rent benefit that pays housing costs up to 75 percent of median market rent; some housing providers have set rents at this level

to be accessible to tenants receiving Rent Assist. Third, provincial rent regulations shape how private-market landlords manage rents and properties with both constraints on landlords' practices and exemptions in certain situations. As previous funding agreements end, non-profit housing providers are likewise framed by Manitoba's rent regulations, and are drawing upon the exemptions to set rents that enable maximum flexibility. Finally, some housing providers are changing their rent mixes, often by reducing or eliminating the lowest cost units.

These strategies reflect varied pressures and opportunities for housing providers, as well as differing levels of philosophical and ethical willingness to change operations. Moving beyond the binary of state and market enables new perspectives on housing providers and the housing sector (Mullins and Jones, 2015). By theorizing the strategies of nonprofit housing providers within a framework of hybridity, a deeper understanding of their implications for low-cost housing provision become visible.

THE POLITICAL ECONOMY OF HOUSING AFFORDABILITY: NEW HOUSING AS REDISTRIBUTION VS REDISTRIBUTION THROUGH NEW HOUSING
Abstract ID: 1081
Individual Paper Submission

MANVILLE, Michael [University of California Los Angeles] mmanvill@ucla.edu, presenting author

Depending on who is asked, the idea that building more housing can make housing more affordable is either common sense or nonsense. Skeptics say that new housing makes housing more expensive. Inclusionary zoning laws, which require market rate developers to build or finance subsidized units, are premised on this belief. This article examines these conflicting views: that new housing enhances affordability, and is thus a form of progressive redistribution, or that it undermines affordability, and is thus justification for, and vehicle of, redistribution. Using Census data and existing literature, I argue that the latter view has little empirical or theoretical basis, and that inclusionary mandates primarily serve to protect most housing capital from redistribution. I conclude that governments should move away from inclusionary zoning and toward more Georgist approaches to affordable housing finance.

POLARIZED PATHS: CYCLING DESIRABILITY THROUGH A REAL ESTATE PERSPECTIVE

Abstract ID: 1084
Individual Paper Submission

MCDOUGALL, Emma [University of Waterloo] edmcdoug@uwaterloo.ca, presenting author
DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, primary author

Cycling is an inexpensive and environmentally friendly way to engage in physical activity via an individual's daily commute (Li & Joh, 2017). As a result, the development of cycling infrastructure is a major objective of many politicians, planners and cycling advocates, marketed for its personal, ecological and transportation benefits (Levine et al., 2018; Woodcock et al., 2014). However, a growing body of literature also suggests that cycling infrastructure plays into larger neoliberal planning goals, which has resulted in social exclusion and in extreme cases, gentrification (Ibsen & Olesen, 2018; Piatkowski & Marshall, 2015). This has sparked debates about what cycling infrastructure means for equity. Understanding the demands and perceptions of cycling across the varying geographies of an urban region helps us to interpret its impact. To do this, we have conducted a series of twenty-two interviews with Realtors and Developers, who hold privileged roles in a neighbourhood's development and identity. They simultaneously cater to existing desirability, while influencing that desirability through their own marketing tactics.

The aim of this paper is therefore to examine the perceptions of cycling desirability held by realtors and developers within a mid-sized region and assess what housing and neighbourhood factors play a role in shaping attitudes towards cycling. Our case study is the Tri-Cities of Waterloo Region in southern Ontario: Kitchener, Waterloo and Cambridge. Kitchener and Waterloo are undergoing widespread development and densification in their downtown cores, both because of their strong tech-based economies and because they are served by a new LRT system. Cambridge is also seeing development in its downtown, but is still largely understood as a suburban commuter town. Currently, Kitchener and Waterloo are testing a separated bike lane pilot in their downtown cores, motivated by larger changes ongoing within the region to each city's Cycling and Trails Master Plans. These changes contributed towards a growing polarization in density, urban form, mobility options and land use patterns between these core urban areas and suburban 'residential' neighbourhoods that constitute most of the region.

Our paper is part of a larger partnership project with local municipalities that is primarily tasked with evaluating to what extent cycling infrastructure influences residential property values. Realtors offer unique, qualitative insights into these questions, as well as the wider relationship between housing and mobility. We find that the primary factor in shaping attitudes towards cycling can be found in the somewhat fuzzy boundary between urban and suburban neighbourhoods. The high cost of building new parking downtown, changes in parking regulations and a strong demand for transportation alternatives among those looking for housing in the urban cores contributes to cycling infrastructure's growth in these parts of the cities. Urban living represents a particular lifestyle that prioritizes location and access to public and active modes of transportation, over drivability. Realtors indicate that their clients are experiencing cycling access as a valuable amenity, motivated by affordability and accessibility. On the contrary, in suburban locations, households are looking for larger properties and are either more willing to forfeit location, or have no desire to live in an urban core. These households are far less likely to consider cycling in their home buying decision, as they do not feature in their daily mobility patterns.

Overall, cycling is viewed by both Realtors and Developers as an aspect of urban development and 'revitalization' that can attract an economically vibrant class. This research has implications for considering how cycling infrastructure contributes to growing inequalities across the city; while the core urban areas have lower-than-average incomes today, they are also rapidly gentrifying, which raises important questions about who will have access to this cycling infrastructure in the future.

GENTRIFICATION AND DISPLACEMENT IN TORONTO: EXAMINING THE ROLE OF EVICTIONS
Abstract ID: 1086
Individual Paper Submission

MAH, Julie [University of Toronto] julie.mah@mail.utoronto.ca, presenting author

Forced displacement, in the form of an eviction, can lead to growing housing precarity and residential instability for low-income tenants (Desmond et al, 2015). There is a significant relationship between gentrification and evictions (Chum, 2015). However, the role that evictions play as a mechanism of gentrification-led displacement has generally been underappreciated in gentrification literature (Sims, 2016; Chum, 2015). Evictions can be a rich source of data due to its geographic and temporal dimensions, which offer researchers the opportunity to uncover whether any spatial concentrations exist over time (Sims, 2016). Significant rates and concentrations of evictions can be a good indicator of shifting housing markets and landlord behavior and intent (Sims, 2016). For example, 'renovictions' have become a well-known issue in Toronto, as landlords try to capitalize on rising housing values in a gentrifying neighbourhood by evicting tenants so that they can renovate and raise rents on the unit post-rehabilitation.

There are quantitative issues with measuring displacement given the data limitations, such as a lack of appropriate longitudinal data (Atkinson, 2000) and problems with data availability on the migration history of individual households, which are often insufficient or flawed (Easton et al, 2019). This lack of quantitative evidence to conclusively point to gentrification-induced displacement as a policy problem has enabled policy makers and planners to "pursue strategies of gentrification unchallenged by statistical evidence" of its most negative impact – the displacement of existing residents (Easton et al, 2019). To address the data limitations involved with quantifying displacement, a growing number of scholars have used evictions data as one way to circumvent the difficulties with collecting quantitative data on gentrification-induced displacement (Easton et al, 2019).

 This research explores the role of evictions in urban displacement processes and its relationship to gentrification both as an effect and potential indicator of gentrification pressures in a neighbourhood. To do so, this research looks at how and where evictions are occurring in Toronto with a particular focus on two gentrifying downtown neighbourhoods. In determining the prevalence and geographic concentrations of evictions over time and relating that to neighbourhood change, we can better understand how gentrification occurs, which can help inform more effective planning strategies to prevent and mitigate its negative impacts (e.g. displacement) for vulnerable residents. This research contributes to the emerging literature by exploring how evictions data can help address some of the limitations that currently exist with quantifying gentrification-induced displacement. Moreover, in better understanding how and why evictions occur and its connections to neighbourhood change, planners and policymakers can identify

ways to strengthen eviction prevention strategies, which will aid in the preservation of existing affordable housing.

The research examines the following questions: What are the spatial and temporal dimensions of evictions in Toronto? What are the reasons behind evictions? To address these questions, the paper empirically assesses the neighbourhood change patterns in Toronto over a 25-year period based on census data (1991-2016), using five housing and social class upgrading indicators (income, occupation and education, concentration of artists, housing values, and rents) to identify the census tracts that show signs of gentrifying. The spatio-temporal patterns of evictions in Toronto have also been mapped by using evictions data (2012-2017) from the Landlord and Tenant Board. Initial findings suggest that there are high concentrations of evictions occurring in racialized low-income communities in the central city and inner suburbs.

BUILT OUT CITIES? HOW CALIFORNIA CITIES RESTRICT HOUSING PRODUCTION THROUGH PROHIBITIONS AND PROCESS
Abstract ID: 1095
Individual Paper Submission

MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, presenting author
MANVILLE, Michael [University of California Los Angeles] mmanvill@g.ucla.edu, co-author
LENS, Michael [University of California Los Angeles] mlens@ucla.edu, co-author

Given high rents and prices in California, housing production is at a relative historic low. Scholarship has connected restrictive land use regulations to high prices, with limitations on new construction being the assumed mechanism. Less research has focused on which regulations are most binding and where. In this paper, we seek to disentangle the impacts of two dimensions of land use regulation—prohibitions and process—on housing production. We do so by using two new data sources: the Terner California Residential Land Use Survey Data Set, and zoning capacity estimates from the Housing Element of cities' general plans, in a model of recently-permitted housing (from 2013-2017). We find that an index of regulatory prohibitions against higher density development is strongly associated with less permitting, especially permitting of multifamily housing. An index of process is uncorrelated with permitting, though the base data for this index is not complete. There is also greater endogeneity in measures of process: places with more development are more likely to report delays and other process complexities as constraints on that development. We also test the hypothesis that land use restrictions have a greater impact on production in more expensive places. Our findings show that the interaction between available zoned capacity and housing costs is significant and consequential. Combined with the fact that most expensive places have relatively little remaining zoned capacity for new housing, our findings offer a more comprehensive explanation for the low levels of new housing production in the state.

ILLUMINATING THE HOUSING CRISIS: UNDERSTANDING HOW LOW-INCOME TENANTS ACT ON THEIR HOUSING ISSUES IN LOS ANGELES CITY
Abstract ID: 1099
Individual Paper Submission

MEDINA HUARITA, Edith [University of California Irvine] emedinah@uci.edu, presenting author

Low-income residents in the City of Los Angeles are currently struggling with steep rent increases. In addition, their lack of resources and the complexity of landlord-tenant regulations in the city have been obstacles when navigating their housing concerns, and for some, could lead to homelessness or living in intractable poverty. This study seeks to: a) understand how low-income tenants in Los Angeles perceive threats to their housing conditions, and b) explore various factors to distinguish individual protective actions they take when faced with such threats. The study will adapt the protective action decision model (PADM) as the theoretical framework for the analysis of tenants' decision-making about their housing concerns. PADM considers environmental cues, social cues, information sources, and individual characteristics as predictors of individuals' protective actions. In addition, the study considers the types of resources and strategies advocacy organizations (AOs) utilize, guided by the political mobilization theory (PMT) and political opportunity theory (POT), which will allow the study to explore factors that might play into the tenants' decision-making process when they use AOs' resources and strategies to address their housing issues. The study uses qualitative data from semi-structured interviews with tenants and AOs as well as content analysis. Results of the study will evaluate the flexibility and validity of PADM in the context of landlord-tenant relationships and provide insights into tenants' perceptions about their housing issues in the private rental sector.

INFORMAL SETTLEMENTS IN SOUTHERN CALIFORNIA: EXAMINING THE ROLE OF STREET-LEVEL BUREAUCRATS

Abstract ID: 1101
Individual Paper Submission

NEVAREZ MARTINEZ, Deyanira [University of California Irvine] nevarezd@uci.edu, presenting author

California is experiencing an unprecedented housing affordability crisis, with over 20% of all homeless individuals in the country residing within the state (Henry et al., 2018). The state has the largest share of unsheltered homeless in the country and some of the highest poverty rates in the nation, with approximately half of the population self-reporting being financially strained due to their housing costs (Johnson and Cuellar Mejia, 2019).

The housing situation in California (and other states) cannot be addressed sufficiently without understanding the living conditions of the poor and the actions of public servants charged with implementing housing regulations. For these reasons, this research focuses on everyday interactions between street-level bureaucrats (SLBs) and residents of informal settlements (e.g., homeless encampments and colonias) to examine when and how discretion is exercised. In this instance, the difference between how SLBs enforce the written law (i.e., the law in action) and what effect this has on outcomes in these settlements in Southern California. Study sites are located in two Southern California counties, Orange and Imperial. This qualitative study will employ an ethnographic multiple case study design (Yin, 2014) that aims to make sense of the concurrent criminalization of informal housing and homelessness and the persistence of these non-conforming spaces as opposed to their eradication.

As the housing crisis worsens, more and more people end up in precarious housing arrangements. When local government responds, SLBs like police, social workers, public health workers, and code enforcement become the emergency responders to the crisis. This study looks at housing precariousness to understand if and how SLBs are engaging in informal enforcement practices and whether they regulate different types of informal housing arrangements in distinct ways based on visibility, racial and ethnic makeup, familial status of residents, and local tolerance. Finally, the study seeks to identify the factors involved in triggering enforcement action and assess the effectiveness of discretionary decision making on preserving stable housing and neighborhoods for the most vulnerable people in the community.

MUCH ADO ABOUT AFFORDABILITY: NO ROOM AT THE INN FOR OPPORTUNITY?
Abstract ID: 1106
Individual Paper Submission

LOSEY, Clare [Texas A&M University] clare_losey@tamu.edu, presenting author
VAN ZANDT, Shannon [Texas A&M University] svanzandt@tamu.edu, co-author

Affordability presently poses, perhaps, the single most pressing issue to housing planners and policymakers. However, in the literature on affordability, these discussions often focus singularly on the relationship between housing costs and household income, vastly—and quite concerningly—ignoring, among other issues, the effects of locational attributes on affordability. Meanwhile, the geography of opportunity has garnered increasing attention in the planning and policy spheres. It closely resembles the scores of other concepts in sociology and planning that attempt to capture neighborhood composition, such as segregation, neighborhood disadvantage, concentrated poverty, and neighborhood effects—each recognizes the presence and persistence of socioeconomic disparities. However, the nuance of the geography of opportunity rests on its focus on the attributes of neighborhoods and the spatial distribution of structural characteristics—such as job accessibility, school quality, and access to public transportation—that affect opportunity for individuals (Galster & Killen, 1995; Patterson et al., 2016). The geography of opportunity serves as the foundation for the opportunity index, a measure recently published by the Department of Housing and Urban Development. The index reflects the poverty, school proficiency, jobs proximity, labor market engagement, transportation costs, transit trips, and environmental health of neighborhoods (Gourevitch et al., 2018).

Despite previous literature on the neighborhood opportunity of affordable rental housing, no literature has yet examined the relationship between neighborhood opportunity and affordable homeownership (Acevedo-Garcia et al., 2016; Heidelberg & Eckerd, 2011). This research positions affordable homeownership in the context of the structural characteristics of neighborhoods, such as job accessibility, school quality, and exposure to environmental hazards, thereby formally establishing the relationship between two interconnected concepts with significant implications for individuals' life outcomes. This research poses the question: Does neighborhood opportunity affect the type of home purchase mortgage originated? I articulate the relationship in the context of three geographies in Texas—the Austin-Round Rock MSA, McLennan County, and Cherokee County. These geographies depict a range of housing needs and each fulfills a unique category—a large metro facing severe shortages of affordable housing units, a relatively affordable mid-sized city, and a small, rural county with a declining housing stock and proportionally less funding for affordable housing compared to major cities.

Using HMDA home purchase mortgage origination data and HUD's Opportunity Index, I develop a binomial logistic regression model to estimate the effects of neighborhood opportunity on the type of mortgage (i.e., conventional or government-insured) originated in 2017 and 2018. Preliminary results for McLennan County reveal a negative association between neighborhood opportunity and the odds of receiving a government-insured mortgage. Controlling for the characteristics of the applicant and loan, a 10% increase in the opportunity index at the tract level decreases the probability of origination of government-insured mortgages by 29%.

This research bears significant policy implications—the federal government's long legacy of sacrificing opportunity for affordability in the siting of low-income households has perpetuated pre-existing socioeconomic disparities across neighborhoods. Borrowers with government-insured mortgages, who are overwhelmingly low-income and minority, remain secluded to specific neighborhoods. This research demonstrates the racialized contours of mortgage lending effectively ensure that historically underrepresented and marginalized populations do not benefit from a system designed for the white & wealthy; in essence, government-insured mortgages often hurt the very households they aim to help. The results indicate a need for mortgage finance interventions—for example, down payment assistance—that allow low-income households to seek higher loan amounts, thereby enhancing access to opportunity, or improvements to the structural characteristics of neighborhoods that reduce disparities in access to opportunity.

FAILING MALLS: OPTIMIZING OPPORTUNITIES FOR HOUSING
Abstract ID: 1107
Individual Paper Submission

BLANCO, Hilda [University of Southern California] hblanco@usc.edu, presenting author

California, as most of the country, is facing a transformation in retail (Credit Suisse 2018; Cushman and Wakefield 2018). Increasing Internet shopping, especially the growth of Amazon, and the increase in same day delivery, have ushered the closing of anchor stores, such as Macy's, Sears, JC Penney's, and the increasing closure of regional shopping malls, which have sizable footprints, ranging from 40-100+ acres (ICSC 2017). This trend offers opportunities for the redevelopment of failing malls to address pressing needs in California, the need for housing, especially, affordable housing, and efficient transit provision for such redevelopments. The housing shortage has reached a crisis stage in many parts of California, especially in the Los Angeles metropolitan region, which has one of the lowest home ownership rates, and the lowest vacancy rate for rentals in the country (Harvard Joint Center for Housing Studies 2018; US Census 2017). This opportunity to redevelop failing malls into housing, mixed use developments may be foreclosed by another trend--the increasing demand for in-town warehousing space to address same day, and 1 and 2 hour deliveries. What policy instruments do local or state governments have to promote housing/mixed use, at least in some sites? What should have priority from a sustainability perspective?

Building on previous research (Blanco and Wickstrom 2018), this research project uses available databases to first identify a set of distressed shopping malls (4-6) in the four largest metropolitan areas in California as potential sites for redevelopment. From a review of the relevant literature and available data and trends, it assesses the sites identified for their potential for mixed use, housing redevelopment, and for improvements in transit access. For the case studies of the distressed malls, the research project develops, from the footprint of the sites and their land use, transit access, and other characteristics, brief redevelopment sketches to identify potential housing units, and improved transit access options. It also develops (4-6) profiles of recently owner-redeveloped malls to determine their characteristics. In addition, the study identifies strategies that local and state governments could use to promote/incentivize housing/mixed use redevelopment in promising redevelopment sites. The study concludes with a comparison of the case studies of the distressed malls housing/mixed use redevelopment schemas identified in the research to the characteristics of recently owner-redeveloped malls along a set of sustainability criteria.
