When India went into its first pandemic lockdown in March 2020, media coverage exposed the plight of urban migrants returning to their home states, localities, and villages. The lockdowns exacerbated vulnerabilities already inherent in the migrant condition as workers struggled to make rent, access entitlement schemes, as well as recover back wages from employers. This paper, part of a larger project on migrant mobility injustices in India during the pandemic, shifts from the plight of migrants returning home in March 2020, to those who had no choice but to remain in cities. Based on interviews with migrant households, policymakers, and local activists, conducted in Gurugram, India between 2020 and 2022, this paper documents the survival strategies of home-based workers, in particular. It investigates the political possibilities and planning lessons for improving access to safe housing in the post-pandemic city. How did urban governments and planners acknowledge and address the crisis unfolding for migrant home-based workers who remained in informal settlements during lockdowns? What recourse have these households had during the pandemic? How have they negotiated with landlords and sought assistance, and from who have they received it?

Gurugram's outsized migrant labor force is often associated with construction, manufacturing, domestic service, or office work. Home-based workers, typically female, engage in small-scale textile and craft manufacturing--

multitasking domestic care and gig labor in one space (Chandrasekhar, 2014). Their contributions to the urban economy fundamentally challenge the notion of “working from home” as the domain of the privileged (Islam, 2022). Such workers receive limited attention, are less visible, but constitute some of the most precariously employed and housed urban migrants in Indian cities, “flexibly rooted” in place (Cowan, 2021). Already confined to the home for long hours, earning low wages without protections or evidence to demonstrate their employment status, home-based workers are subject to the exploitation of landlords and planning regimes that offer few protections from evictions and unsafe housing conditions (Chen and Sinha, 2016). The paper argues that policymakers and planners responding to the lessons of the pandemic must address this crisis of immobility among migrants locked down in places that serve the double burden as both home and place of work.

URBANIZATION FROM WITHIN: PLANNING FOR URBAN TRANSFORMATIONS IN INDIA'S COUNTRYSIDE

Abstract ID: 1345

Individual Paper Submission

RANDOLPH, Gregory [University of Southern California] grandolp@usc.edu, presenting author

Scholars generally imagine the urban transition as a massive population movement from rural areas to cities—a “depopulation of the countryside” (Davis & Golden, 1954). However, the Indian context complicates this simple model. Scholars have claimed that the country’s urbanization is primarily driven by “morphing places” (Mukhopadhyay et al., 2020) – that is, the transformation of villages into urban towns throughout India’s countryside, part of a surge in the number of small urban settlements throughout the Global South (Randolph & Deuskar, 2020). Research demonstrates that some agrarian regions in the country are reaching urban densities and experiencing structural transformation in their local economies despite witnessing negative net migration (Randolph, 2021). These urban transformations are fueled by the circulations of labor and capital that result from temporary out-migration to prosperous metropolitan areas; a changing climate that is compelling an exit from agriculture; and a shifting political economy in parts of rural India. Not only does this trend complicate the image of urbanization through permanent mass migration to cities; it also raises questions about what it means to plan for these nascent urban environments, whose underlying conditions of growth differ markedly from the metropolitan areas where planning research and practice are concentrated.

This paper studies this phenomenon of urbanization from within using a case study: the district of Begusarai in the northern state of Bihar. More than three-quarters of the district lives in dense agglomerations (greater than 1500 people/km²), the population of which grew by 1.4 million between 1990 and 2015. In the past two decades, Begusarai has witnessed a swift agrarian exit, with the share of workers in non-agricultural employment more than doubling to over 40 percent. These changes occurred even as the district attracted few in-migrants and saw roughly 3 percent of its population out-migrate—the demography of urbanization enabled entirely by natural population growth. I discuss the structural conditions that undergird Begusarai’s urbanization, using literature from development studies and economics; examine the temporary out-migration and other livelihood strategies that underpin its changing economy, using primary qualitative data; and unpack the implications of this form of urbanization for planning, using insights from a land use and built environment survey.

PLACES FOR THE DISPLACED: FORCIBLY DISPLACED PERSONS IN JUBA, SOUTH SUDAN

Abstract ID: 1370

Individual Paper Submission

BERKE, Timothy [University of Michigan] tberke@umich.edu, presenting author

Around the world, the number of people displaced from their homes continues to increase due to political conflict and climate change. Historically, an encampment approach has been used to house displaced persons by UN agencies and hosting nations. However, approximately sixty percent live in urban areas, not camps. Thus, there is a mismatch between where humanitarian aid is being provided and where it is needed. One important reason this seems to occur is that little is known about how displaced persons manage urban life and how they establish various relations, and networks, and integrate with often impoverished hosting populations. Considering that 85 percent of forcibly displaced persons are in low-income countries, their arrival also offers development opportunities for under-resourced cities and governments through external inputs from various United Nations agencies, bilateral donors, and international NGOs. Without a better understanding of the dynamics within communities, it is difficult to effectively plan how urban programs and facilities can serve people’s needs.

Framed around migration economics this research compares displaced persons and existing residents living in two “neighborhoods” in Juba, South Sudan, with those living in a nearby, rural designated displacement site to 1) better understand the different assets (e.g., social networks) displaced persons rely on for livelihood opportunities (e.g., employment), and 2) the impact the arrival of displaced persons has on cities and host communities?

To answer these questions a mixed-methods approach was used. The quantitative aspects included a random selection of 80 households at each of the three locations, for a total of 240 households. The qualitative aspects included document reviews, participant observation in markets and neighborhoods, and semi-structured interviews with UN agency officials, district government officials, local authorities (chiefs, etc.), and other service providers working in and around the sites of observation.

The main findings highlight 1) that displaced persons living in urban centers were more likely to have larger social networks when compared to those residing in designated displacement settings 2) both long-term residents and displaced persons indicated the cost of transportation as a barrier to finding employment, and 3) hosting populations perceived displaced persons as having positive impacts on local economies (e.g., paying rents, consumers for business).

If current trends continue, the world will witness increasing numbers of displaced people due to climate change and conflict. Anticipating that cities will receive the majority of displaced persons, we must proactively consider how urban strategies can best meet the needs of established residents as well as new arrivals. Without understanding the dynamics within communities, planners and social service providers will struggle to effectively design urban programs and facilities to serve the people’s needs. My research is an effort to begin and identify the barriers and opportunities that displaced person experience in cities as a means for advancing future urban policies and research.

REDEFINING CLIMATE-INDUCED RETREAT IN THE GLOBAL SOUTH

GELDIN, Samuel [University of Pennsylvania] sgeldin@upenn.edu, presenting author

As urban areas face a notable rise in flood-related casualties and economic losses due to climate change, academics and practitioners increasingly advocate applying the strategy of managed retreat. In the Global North, retreat programs typically involve the relocation of structures to areas of lower flood risk, often through buyouts, land use and zoning changes, as well as design-based techniques. However, in the Global South, national governments, development banks, and other knowledge brokers overwhelmingly employ retreat to relocate people to ostensibly lower-risk areas, which disproportionately affect informal settlers lacking legal land tenure. These forms of planned relocations in anticipation of future climate impacts join the list of many other historical reasons that states relocate marginalized groups. These include: addressing concentrated poverty, crime, and disease in slums; constructing large-scale urban development projects; redistributing land for capitalist production; “modernizing” non-sedentary groups of people; and quelling political unrest. Since non-climate rationales heavily influence purportedly climate-driven retreat activities, my study investigates how to refine the conceptualization of retreat in the Global South by examining place-based decision-making logics and practices in the Philippines.

To uncover the dominant retreat-related beliefs and practices of stakeholders involved in key state-supported relocation and adaptation programs in the Philippines, I employ text analysis and multi-stakeholder interviews. I selected six retreat-related project sites situated in different Metro Manila locales as case studies for examining how the retreat process plays out on the ground. I conducted 20 semi-structured, virtual interviews between April and November 2021 to discuss considerations and challenges at selected project sites. Informants, selected through snowball sample, include: state and local planners, contracted consultants, public and private engineers and architects, community organizations, homeowner associations, and project financiers. I also analyzed text from official flood and housing project documents, land use plans, building code regulations, and media reports to inform my lines of inquiry.

My study’s results suggest that state-led relocation patterns in the Philippines more often align with economically-driven land use changes than disaster-driven or planned modes of retreat. Retreat-related case studies emphasized the role of temporariness and short-term relocation, which did not confine neatly to the current conception of retreat as defined and practiced in the Global North, applied to Global South contexts. By beginning to detail key place-based factors, logics, and practices driving government-led relocation in the name of flood protection, this study opens up new pathways for characterizing retreat in the Global South. Planning scholars and practitioners can use these results to identify and facilitate more diverse, place-based forms of retreat-related adaptation. Rather than approaching retreat as an exercise for relocating people, stakeholders throughout the Global South should consider incorporating more land use and livelihood considerations – when feasible – to ensure that residents can safely stay-in-place as long as possible while they plan future movements.

CORPORATE LANDLORDS: HOUSING FINANCIALIZATION IN LATIN AMERICA

Abstract ID: 1413
Individual Paper Submission

URBINA-JULIO, Andrea [Cornell University] aru8@cornell.edu, presenting author

Recently, central districts in major Latin American cities have been rapidly increasing their density via high-rise projects. The case of Santiago is not different. This process partly occurred through financial capital increased via

private property buildings, focusing on small rental apartments (López-Morales, 2012). Through the last decades, the commodification of housing as well as the growing use of housing as an active integrated to the globalized financial market, has affected profoundly the way of understanding adequate housing as a right for everyone (Rolnik, 2015).

Indeed, after the financial crisis of 2008, the impacts on the housing market meant a general change in the financialization housing structure. Several countries in the Global South experienced rapid changes in tenure systems when real estate companies shifted their capital inflow to the rental market. For example, in Santiago, the population who rent increased from 20% to 28% (Casen, 2017) which also explains the homeownership fall since 2000 (Gilbert, 2015). In recent years, changes in the rental market have been tied to important transformations in property typology, leading to the emergence of dense high-rise housing developments. The difference from other high-rise buildings is that recent rental models have one private owner, one landlord, and more than 1,000 apartments for lease, a model namely "Corporate landlords". Thus, these buildings belong to international financial corporations, investment funds, insurance companies, real estate, and family firms.

Scholars have been studying these tenure models after the subprime crisis and their impacts on social and urban patterns in the US. However, in Latin America, the model's appearance is relatively new, and it is rapidly increasing. For instance, in Santiago, in 2020, they were 414 multi-family buildings under corporate landlords, and their construction rate is increasing every year; more than 70% of them are located in three communes of Santiago. Several reasons may be underlying the increment of this new rental typology. 1) The real estate business has, on average, augmented its capital gains between 50% to 100% in the last seven years (Ugarte, 2019); 2) an increase of two populations interested in living near the city center: young population and new immigrants; 3) the recently rental housing voucher policy; and 4) neoliberal governance in many of Latin America cities has generated a chronically underfunded situation for local governments, which have been forced to deregulate their urban normative as a way to attract new investments to their territories (Brenner et al., 2010; Harvey, 1989).

This paper analyzes these new renting trends, specifically under the corporate landlord models focusing on Santiago, Chile. The main questions of the research are centered on: What are the main characteristics of these new rental markets? Who invests, and how are these corporate landlords operating? What are their implications for the city? Who is the target population for these buildings? Is there any relationship between population income and housing typology? The methodology to address these questions is developed under qualitative analyses, specifically by in-depth interviews with key operations actors, such as developers, building workers, city planners, and administrators. I examine the role of the different actors involved in the operation, addressing the main character and social and urban impacts of this model. Moreover, I argue that the emergence of these trends in Latin American cities has increased housing financialization under a new model that promotes the financial market operation through a verticalization process of the city. This research will contribute to the urban planning and housing policy debate. Furthermore, it will contribute to the urban governance debate within developing cities in the Global South, where Corporate Landlords are a model increasingly rapidly as a new rental trend.

COMMUNITY ENGAGEMENT, PARTICIPATORY PRACTICES AND CARE DURING THE PANDEMIC OF COVID-19 IN SLUMS OF RIO DE JANEIRO, BRAZIL

Abstract ID: 1431

Individual Paper Submission

COUTINHO-SILVA, Rachel [Pontifical Catholic University of Rio de Janeiro] rachelcms@puc-rio.br, presenting author

This paper aims to reflect upon the new challenges imposed during the COVID-19 pandemic in three selected squatter settlements in the city of Rio de Janeiro, Brazil. During the outbreak of the sanitary crisis, themes such as the quality of housing and the urban environment, as well as care as a public policy, gained a criticality in the debates about planning policies. The outburst of COVID-19 in 2020 had a significant impact on vulnerable low-income communities in many parts of the world. Not only did the precarious urban and housing conditions made community contagion widespread, but also other factors, such as the impossibility of staying at home, the need to go to work and cope with crowded public transportation, the sudden loss of jobs and the economic effect on local commerce, had substantial consequences on the lives of slums' dwellers. In the face of such an emergency, local community groups quickly organized themselves and established solidarity actions across their territories to help vulnerable residents to cope with the pandemic crisis. Different social solidarity practices emerged offering diverse types of services, from the distribution of staple food, protection and hygiene items to the distribution of explanatory leaflets about preventive measures to deal with COVID-19. The appearance of these groups can be partly explained by the difficulties of the State to meet the urgent needs of these communities and the growing sense of solidarity in the face of this unpredictable public health crisis. These local groups use the Internet, social networks and virtual media to organize volunteers and gather financial and material resources. Some solidarity initiatives emerged from existing local community groups and others were formed during the outbreak of the COVID-19 pandemic. Based on solidarity, empathy and the ethics of care, these groups are adding a new dimension to community engagement and local governance. In this context, this paper intends to investigate the practices of participatory planning and solidarity actions that have taken place from March 2020 to March 2022 in three slums in Rio de Janeiro, Brazil (Favela da Rocinha, Pavão-Pavãozinho/Cantagalo and Babilônia/Chapéu Mangueira). This paper uses empirical evidence from the three favelas and articulate it with theories about grassroots practices and engagement, approaching the issue of participatory planning from the perspective of the ethics of care and social justice, particularly from feminist studies (Fisher; Tronto, 1990; Forester, 2020; Jon, 2020; Lefebvre, 2014). Due to the pandemic situation, the research methodology used remote mapping and digital ethnography, including information gathered from social networks, community websites as well as different kinds of media and online platforms. Previous ethnographic data gathered in these communities before the COVID-19 outburst complemented the empirical research. The preliminary results show that most solidarity initiatives during the pandemic outgrew from existent local grassroots groups acting together or in network with outside groups from other squatter settlements or NGOs. The paper contributes to instruct planning theory, practices and public policies in issues concerned with grassroots participatory planning. It supports the argument that community groups and dwellers of favelas are socio-spatial groups that produce knowledge and are capable of solidarity action in emergency situations, when the State fails to act promptly. It also reinforces the importance of bottom-up collaborative planning in the struggle for social justice.

TRANSACTION COSTS IN PLANNING FOR BASIC INFRASTRUCTURE SERVICES IN TRANSBORDER CITIES DESIGNATED FOR SEZs: A CASE OF BATAM CITY, INDONESIA

Abstract ID: 1492

Individual Paper Submission

PRASETYAWATI, Dian [University of Washington Seattle] dianp@uw.edu, presenting author
WHITTINGTON, Jan [University of Washington Seattle] janwhit@uw.edu, co-author

Since its first conception in the 1960s, special economic zone policy has found its home in many cities in developing economies. A recent UNCTAD report (United Nations, 2018, Table IV.2, p.138) shows that by 2019 the number of global SEZs reached 5,383 zones. Of those, 4,772 zones were in developing economies, and 374 were in developed countries. SEZ' planning strategy gains popularity as countries aim to increase their comparative advantage against neighboring countries (The World Bank, 2017; Farole and Akinci, 2011). Although scholarly publications argue that countries were motivated to build their own SEZs following success in Southern China (Nevelling, 2018), most SEZs developed in other countries could not emulate China's success. Alternatively, some countries joined in partnerships and clustered their SEZs around primary countries with higher economic capacity by forming a Regional Trade

Agreement (RTA) (Koyama Naoko in Farole and Akinci, 2011, p.80-83). In cities under RTA agreements, firms coming from higher-income countries benefited from relocating to SEZs in less developed subregions as they reduced production costs in the form of tax holidays, cheap labor, and land price discounts. Meanwhile, local firms and small business enterprises in less-developed subregions lacked the capital and skills and received the least benefit to relocate in SEZs (Farole and Akinci, 2011, p.130-135; Nadvi and Scmitz, 1994).

Taking the example from the city of Batam, this paper seeks to explain how RTA planning frameworks affect local planning institutions responsible for infrastructure development as planners select land for its highest and best use for foreign investments. Batam city has been a part of the SIJORI Growth Triangle RTA since the early 1990s. The SIJORI Growth Triangle framework was promoted by the Singaporean government to establish a regional economic marketplace in three transborder cities (Singapore-Johor-Batam) (Hutchinson and Chong, 2016; Bunnell, et.al., 2011). Over the years, Batam city has also become a hub of domestic markets and attracts mostly low-skilled local workers and firms seeking an opportunity to expand their businesses. As Batam city market institutions indicate a mixture of formal and a large proportion of informal market activities, the influence of exogenous planning such as the SIJORI Growth Triangle frameworks presents a question in planning for cities underhanded by RTA policy. How do planners in emerging economies resolve the infrastructure planning dilemma of inequitable growth in specially designated areas historically relying on discriminating land use policy to sustain its growth?

In answering this question, the study compares the original plan for water supply and street development with completed projects in SEZ areas and non-SEZ commercial centers in Batam city island from 2008-2014 and 2015-2019. The study also compares the planned and actual capital budget documents for Batam city outsourced from the National and local government agencies between 2008- 2019. Finally, this paper applies transaction cost economic theory to the study of SEZ areas and non-SEZs and measures ex-ante transaction costs at the design stage and ex-post expenses of monitoring and maladaptation such as the additional legal fees and adjustment to projects on-site, including the costs for informal adaptation to network systems (Alexander, 2001; Williamson, 1999). The analysis presented in this paper compares and contrasts the total transaction costs in areas designated as SEZs and non-SEZs and highlights the discrepancies of infrastructure costs affected by discriminatory land use practices.

Empirical findings clarify the impact of transborder policy on the patterns of infrastructure allocation and planning safeguards relating to equity. Findings in this study can provide inputs for planning instruments adaptation and weigh how planning can provide remedy by emphasizing ethical choices to plan for a more equitable distribution of infrastructure services.

LOCAL GOVERNMENT LEADERSHIP AND CITY PLANNING: ANALYZING CONVERGENCE AND DIVERGENCE

Abstract ID: 1510

Individual Paper Submission

LOPEZ, Carlos [Cornell University] cal382@cornell.edu, presenting author
BEARD, Victoria [Cornell University] vab57@cornell.edu, primary author

What can city planners learn from a better understanding of the perspectives of local leaders? Local leaders set agendas, define policy directions, and allocate fiscal resources that affect the capacity of planners inside and outside local government. Their decisions also affect the actions planners can take to address issues such as climate change, access to affordable and secure housing, and the provision of core urban services (Acuto & Rayner, 2016; Einstein et al., 2020). Acuto (2013), refers to the power that local leaders exert on global governance as a “scholarly oversight” and the comparative literature about local leadership is limited (Davies & Msengana-Ndlela, 2015; Stren & Friendly, 2019). We argue that urban planners, planning scholars, and those interested in global governance would benefit from a better understanding of priorities, perspective, and experience of local leaders.

The paper seeks to address this “scholarly oversight” and draw implications for urban planning scholarship and practice. The paper analyzes the Global Survey of City Leaders (GSCL), the first ever globally representative sample of executive leaders of local governments. Depending on the national context, executive leaders can be either elected or appointed, and have different titles including, but not limited to, mayor, municipal commissioner, governor, town clerk, chief executive, or chairperson. We randomly selected 1000 municipalities from a list of 1,860 urban agglomerations with a population above 300,000 maintained by the United Nations.

We are still collecting responses to the survey, but to date, more than 100 local government executive leaders (mayors) have responded, and we aim to have a minimum of 200 cities in our sample. An international research team contacted city leaders by email, mail, phone, fax, WhatsApp, and social media from January to June 2022 to explain the project and encourage them to participate. The survey is divided into substantive sections including: (a) local economic development; (b) built environment, housing, and infrastructure; (c) the natural environment and climate change; (d) public health, social mobility, and migration; (e) governance and finance; and (g) COVID-19 recovery. The survey instrument is translated into 23 languages.

The paper will begin with some discussion of the variation of governance structures and the diverse powers of local leaders around the world. It will explore various theoretical perspectives on the power of local leaders, structure, agency, and the process of transformative urban change. The paper is the first comparative, descriptive analysis of the new dataset to address some of the following research questions: How do the perspectives of executive leaders about the local economy, housing, infrastructure, climate change, and social conditions differ by geographic region, city size, and national level of urbanization? Are there patterns that correspond to a city’s location in a developed versus developing country context? The paper will shed light on the perspective of local leaders while drawing connection to how this both supports and constrains planning practice.

A COMPARATIVE STUDY ON THE RELATIONSHIP BETWEEN URBAN STREET CONNECTIVITY AND LIVABILITY: A FOCUS ON SPATIAL ANALYSES OF 30 CITIES IN THE WORLD

Abstract ID: 1552

Individual Paper Submission

NAM, Jiin [University of Seoul] poasana2021@uos.ac.kr, presenting author

KANG, Myounggu [University of Seoul] mk@uos.ac.kr, co-author

Street connectivity is one of the pivotal factors for sustainable urban development and mitigation of congestion in a city. Global city indices have been developed to evaluate competitiveness and livability of cities, including sub-indicators related to urban spatial features; sprawl, green space, natural assets, isolation, connectivity, public transportation and traffic congestion, etc. However, since these sub-indicators rarely include the street connectivity that is a fundamental element of a city, it is hard to figure out how urban spatial structures are relevant to livability of the cities. This study aims to find the relationship between the urban street connectivity and the livability by analyzing spatial patterns of 30 cities around the world. The street density and the intersection density represent the street connectivity. In this paper, Open Street Map (OSM) in QGIS was utilized to extract the road data of each city. With those data, the street density and the intersection density of the 30 cities were calculated. The result shows that the city where the street connectivity is high, the livability is also high. This paper has two implications; one is that it is based on empirical spatial analysis focusing on the relationship between the street connectivity and the livability of the cities, and another is that this work has set up the street data, which is the foundation of urban form, for the 30 cities. These data will be useful for further spatial analysis, in particular of those cities in developing countries.

This paper theorizes an alliance between universities, housing movements, advisory non-profits offices and informal dwellers' associations in Brazil in terms of co-production of knowledge and action. The network is part of a multi-year activist participatory action research¹ addressing one of Latin America's most pressing issues: the rapid, unequal and precarious informal urbanization of urban peripheries. With the goal of coalition building and housing advocacy, the Network of Favelas and Occupations, connects the experiences of young and consolidated informal areas in their struggle for adequate housing in São Paulo's Periphery. The Network raises awareness of land occupiers' rights, while advocating for transformational housing policy and universal access to public utilities, regardless of tenure status or age of the settlement.

The PAR approach emerged in the 1960s/70s, inspired by Paulo Freire² and the Latin American liberation theology movement, incorporating the participation of the poor in a pedagogical journey for self-emancipation and transformation of local and global structures of oppression.³ Building on this tradition, community participation and co-production of housing, popular urbanization plans, upgrading policies,⁴ serve to pressure the government to provide funds, while denouncing the structural causes of environmental injustices in informal and precarious settlements.⁵

We theorize three tactical components in the academic engagement: capacity building through service learning (extensão); knowledge exchange through the articulation of 14 younger and consolidated informal communities; and advocacy advancing funding and policy reform, for the right to occupy, hold ground, and upgrade through the celebration of popular symposia (Encontros de Favelas e Ocupações).

Informal dwellers are citizen-planners, creating secure shelter and resilient habitats. Universities must recognize their protagonism, joining their fight to defy inequalities. Occupying land and holding ground transforms the land occupiers' personal and positional identities. In raising awareness of one's position in the social relations of power, the role of the academic is to join forces, expanding the network of solidarity for social and housing justice.

HOW DO TRANSPORT WORKERS DO TRANSPORT PLANNING?

Abstract ID: 1673

Individual Paper Submission

KERZHNER, Tamara [University of California Berkeley] tamara.kerzhner@mail.huji.ac.il, presenting author

Urban mass transit in African cities, and around the world, relies on small-scale, privately owned and operated minibuses that operate with limited regulation and no subsidy or state support. These systems – often called “informal” transport, paratransit, or popular transport move hundreds of millions of people daily and provide a crucial mobility option for urban residents without access to private vehicles or formal, state managed, public transport.

Based on research in Lilongwe, Kampala and Nairobi, this project reveals the role that workers and organizations play in developing, organizing, and planning the route networks and operations of transport. With no support or protection, they must operate where profit is possible, often with little margin or room for error. Private transport operators must balance the competition between individual drivers for passengers, who often operate on exploitative daily contracts, with the needs of a particular terminal or the industry as a whole.

The comparative case study between three East African capitals with very different forms of organization in the transport sector reveals both structural differences and consistent patterns. Amalgamation into geographically delineated associations, based around origin and departure terminals or sub-metropolitan clusters of routes, creates careful management of competition in order to develop a fair division of work and profit between independent operators. This also means pro-active development and investment in new routes, motivated by passenger needs and perceived gaps in service. In city-wide networks, competition is instead balanced between existing routes, and the lack of localized organization, leads to forms of coordination failure and stymied route development and more caution in choices of destinations.

It is critical to recognize transport workers in such systems and cities – drivers, conductors, vehicle owners, mechanics, route managers and others in the urban labour ecosystem – as active agents of planning, urban growth and development, and public service providers. This is impossible to disentangle from the structural inequities and exploitation borne by this often-marginalized workforce. Workers and passengers are often pitched against one another in discourse and policy, with the labour rights and job quality of workers coming at the expense of the services available to passenger. Some writers and organizations (Attoh, 2019; ITF, 2018; Spooner & Mwanika, 2018) instead conceptualize an alliance.

This project, based on interviews with transport workers and managers in African cities, shows the relationship to passengers and the ‘reading’ of the city, power relations and unionization within the sector, use of data and measurement, and above all, coordination and cooperation that go into the development and expansion of “informal” route networks in African cities. Building on this, alliances with transport workers and passenger-worker solidarity can potentially be opened up as concrete planning practices, in which basic accessibility – routes, terminals, destinations – is co-developed between communities and operators.

HOW TO TRAIN YOUR CAPITALISTS: STATE-PRIVATE SECTOR DISCIPLINE AND ECONOMIC DYNAMISM IN JALISCO AND QUERÉTARO, MEXICO, 1980-2020

Abstract ID: 1686

Individual Paper Submission

Increased state intervention and new forms of industrial policy are subjects of increasingly intense interest due to both the abandonment of “Washington Consensus” neoliberalism in the COVID-19 pandemic as well as growing calls for decisive government action in the face of climate crisis, challenges to local resilience in global supply chains, and increased geopolitical rivalry. Yet while social scientists and policymakers alike seem to widely agree that states need to further assert themselves in the economy, the question remains of how states can learn to effectively meet the challenging, complex and uncertain issues to which they are called to respond.

Leveraging subnational variation in Mexico, a large middle-income developing country, we examine divergent regional development trajectories to contribute to the discussion of building state capacity for effective structural interventions in the economy. We focus on two Mexican states – Querétaro and Jalisco – which entered the neoliberal era with widely differing prospects. Jalisco, one of the largest and wealthiest states in Mexico, was forming what would become known as “Mexico’s Silicon Valley.” Meanwhile, Querétaro, a much smaller and historically poorer state, was trying – without advantages such as the maquiladora tax regime that was enjoyed in states along Mexico’s northern border at the time – to make headway in an intense competition to build up its manufacturing sector. Nevertheless, from the initiation of Mexico’s liberalization era in the early 1980s to the present, it was Querétaro, and not Jalisco, that flourished, attaining some of the highest levels of GDP per capita in the country while expanding its skilled workforce and advanced industries. During the same time, Jalisco was a relative laggard, and its vaunted “Silicon Valley” dissipated into a series of stagnant contract manufacturers for foreign firms.

We analyze this divergence from the perspective of state-business relations, focusing on the role the two local governments had in “disciplining” their various sources of capital investment – local, from other regions of Mexico, and international. Early on, Jalisco supported its local capitalists with subsidies and few curtailments on their investments. Meanwhile, Querétaro’s government enlisted local capitalists in a series of often failed, but usually disciplining, development efforts, such as aqueducts, railroads, and industrial parks. These different disciplining approaches affected the developmental priorities and perspectives of local capital. They also shaped the ways in which local capitalists integrated external investors into their business associations and taught them norms and routines of local politics. Through a process-tracing analysis of state-business relations, we examine how actors in each state introduced measures that varied in the extent to which they “disciplined” local and external capital towards long-term investment in public goods and workforce productivity. These process-based analyses illustrate how these interactions cumulatively affected local value chain insertion, as well as upgrading of workforce skills and firm capabilities. Building on cross-sectional and longitudinal industry-level comparisons within and across the two states, we establish propositions for how governments can assemble a “disciplinary repertoire” for capital in response to challenging environments of globalized production and investment.

REVISITING BRASÍLIA: PLANNING AND INEQUALITY IN THE DEMOCRATIC CITY

Abstract ID: 1706

Individual Paper Submission

GUINN, Andrew [Wayne State University] arguinn@wayne.edu, presenting author

Brasília is recognized in the North American planning literature as the quintessential modernist, planned city. The capital of Brazil, Brasília was established, ostensibly from scratch, in the remote center of the country in 1960, and it has since come to symbolize the failures of modernist planning: excessive separation of uses and dependence on private automobility; lack of vibrant streetscapes and authentic public spaces that support civil society; and failure to adapt to unplanned contingencies (corresponding with expansion of informal or unregulated activities and uses). Through important critiques of the city’s design (e.g., Scott 1998, Banerjee 2021), planners and social scientists have learned important lessons from Brasília about the dangers of high-modernist ideologies and top-down methods of planning and implementation. These critiques draw primarily on field research from the 1980s and earlier (Holston

1989), when the city was still relatively young and Brazil remained under a military dictatorship. To what extent is the critique of the modernist city still applicable to Brasília? How has democratization since 1985 shifted the dynamics of the city's urban development? Six decades after Brasília's creation, what is the legacy of its modernist design?

I address these questions through a "revisit" (Burawoy 2003) of James Holston's (1989) classic case study of Brasília in the early 1980s, asking a similar set of questions of an object and context that have transformed over time. Since the 1980s, Brasília and its context have changed significantly. Having transitioned to a democratic regime of planning and governance, the city now lies at the heart of Brazil's most rapidly growing metropolitan region, an amalgam of formal, informal, and regularized settlements. Following Holston, I will assess the framework and approach of the Federal District's planning efforts since the 1990s and their impact on society and the built environment in the planned core of the city as well as the region's outlying, poor and working-class administrative districts. The analysis is presented as a nested case study, assessing the region as a whole, as well as the dynamics of urban development in three administrative regions: the central "pilot plan" area, Cielândia (an older "satellite city") and Sol Nascente (a settlement regularized in 2019, formerly Brazil's largest favela). The case study draws on planning documents, secondary literature and news articles in Portuguese, and ethnographic-style fieldwork, including site visits and interviews with land use, housing, transportation and economic development planners, as well as residents and leaders of neighborhood associations. I find that in recent decades, politicians have regularly responded to democratic pressures with measures that extended recognition to informal settlements and upgrade poor residential districts, which residents vie. Also, during moments in the mid-1990s and 2000s, Brasília pioneered innovative social policies, slum upgrading programs, and expansions to the regional transit system -- which have rescaled and reshaped the dynamics of regional inequality.

Though today's Brasília is certainly not a city without inequalities or other urban problems, I argue that the established critiques of Brasília are incomplete and misleading in light of subsequent historical developments. Recognizing Brasília on the register of an ordinary city (Robinson 2006), and not simply as the exemplar of the modernist city, reveals a new set of practical lessons for the equitable development of cities in the Global South, especially those that inherit legacies of authoritarian political regimes or modernist "new town" designs (Wakeman 2016). I conclude with an appeal for a more active updating of case study scholarship in planning in order to accommodate the ongoing historical evolution of cities and offer up new lessons that may be of greater contemporary relevance.

BEST MANAGEMENT PRACTICES IN WATER GOVERNANCE AND CLIMATE ADAPTATION IN SASKATCHEWAN, CANADA- VOICES FROM THE PRAIRIES

Abstract ID: 1713

Individual Paper Submission

BHARDWAJ, Asmita [University of Regina] asmitabhardwaj8@gmail.com, presenting author

The "wicked problem" of climate change will create and increase risk for natural and human systems, risk that is spread unequally, making adaptation a critical challenge. The province of Saskatchewan contains 46% of Canada's farmland and is the breadbasket of Canada. This province faces intense climate variability, which will further exacerbate the already frequent droughts and floods.

The Canadian Disaster Database identifies "prairie drought" as the foremost costly disaster in Canada, the 2001/2002 drought years in Alberta and Saskatchewan caused a \$3.6 billion drop in Canadian agricultural production, a \$5.8 billion drop in Canada's gross domestic product, crop insurance payments in Saskatchewan were \$1.431 billion, SK farm income was negative in 2002, and there was a loss of 41,000 jobs.

To meet the challenges of water governance in Saskatchewan, Best Management Practices have been used to improve

water quality and control water pollution in various sectors such as agriculture, fisheries, aquaculture, forestry, and watershed management since the acceptance of the Clean Water Act 1972. Despite the fact that BMPs have been around for more than 50 years, Canada's water quality is at risk and is degrading. Even though toxic effluents are heavily regulated in Canada, release of nutrients into the watershed is common and elevated concentrations of these nutrients remain a critical water quality issue in Canada.

This poor water quality is possibly due to the fact that BMPs have been understood from the viewpoint of the disciplines of physical sciences and do not adequately reflect in governance and policy science. While exact correlation and causation may be difficult to establish between water governance and water quality, linkages now exist between the two in literature, globally and locally “the water crisis,” accentuated by climate change, is increasingly recognized as a crisis of water governance. It is implied as a crisis of decision-making processes between people, government, and business with respect to water. The water crisis cannot be solved simply through technical solutions.

To address the water governance and climate challenges, and when traditional and centralised systems of governance have proven inadequate many municipalities and communities in SK have developed a set of “best management practices” and adaptations to water and climate change challenges. These include drainage ditches for crop flooding, source water protection plans, waste-water treatment plants etc. These are important players as the 2001–2002 SK drought demonstrated the value of local and informal governance mechanisms as strong community spirit enforced compliance with water-saving strategies and the social cohesion of rural communities facilitated cooperative strategies to persuade senior water rights holders to share their allocations to maintain the viability of rural communities

However, not much is known about these community adaptive practices and they are not mainstreamed into policies and BMP literature. Policy (social) science are often treated as externalities in technical and scientific matters, and social scientists are called almost as an afterthought when scientific and/or technical work is completed.

It is important to know them as while Canadian municipalities build, own and maintain most of the infrastructure for the past 20 years, municipalities have been facing fiscal austerity due to increasing roles and responsibilities and decreasing revenues.

Using qualitative multiple case study method this research identifies and understands BMPs and their robustness as adaptive governance measures) in 13 Saskatchewan municipalities. This work is significant as adaptive institutions are much needed in the Prairies.

ENABLING LEGAL ENVIRONMENT FOR MEETING THE RATIONAL NEXUS PRINCIPLE: INSIGHTS FROM THE USE OF DEVELOPMENT CHARGES IN INDIA

Abstract ID: 1714

Individual Paper Submission

MATHUR, Shishir [San Jose State University] shishir.mathur@sjsu.edu, presenting author

Central theme or hypothesis

Governments at all levels—national to local—are fiscally constrained, especially in the developing countries of the Global South. The local and state governments in particular are in a fiscal bind in this region because, among others: a) a large proportion of tax and fee revenue typically accrues to national governments and b) local and state governments have very little authority to levy new taxes. In such a scenario, these countries urgently need additional

revenue sources to fund urban development, especially due to their rapid rate of urbanization. Development charges are a potential revenue source.

Among all the countries in the world, India is projected to increase its urban population the most—404 million between 2014 and 2050. In India, property developers typically pay development charges at the time of seeking government approval to change/institute the use of their land parcels and/or to improve them. The revenues from these charges are used to develop the infrastructure/services needed to service the proposed development. From a legal standpoint, these charges are considered a fee, not a tax. Accordingly, the courts in India, like those in the US, require these charges to meet the “nexus” and “rough proportionality” principles. The nexus principle stipulates that there should be a connection between the charges and the impacts caused by the charge-paying development. The rough proportionality principle calls for the charges to be in proportion to the cost of mitigating the impacts of the charge-paying development. Combined, these two principles constitute the “rational nexus” principle.

As local governments in India seek to increase development charges or to levy them, there is an urgent need to investigate how these charges can meet the rational nexus principle; otherwise, they can be successfully challenged in court. Indeed, the rational nexus principle was cited to legally challenge the state of Tamil Nadu’s Infrastructure and Amenity Fee. This paper seeks to begin to fill this research gap by reviewing several pieces of state-level enabling legislation to: a) show how the legislation hinders or promotes the rational nexus principle, and b) identify major insights that can help India and potentially other developing countries craft or amend legislation that can withstand legal challenges.

Approach and methodology

Using a recently published report by the Government of India, this study identifies development charge-related state-level legislation for 22 states. Next, using the strategies to promote the rational nexus principle identified in Mathur (2016), it examines whether/how these pieces of legislation hinder or support this principle. Finally, the study findings are synthesized to highlight how legislation can support or hinder the rational nexus principle.

Findings and relevance of work

Through a summary and synthesis of India’s development charge-enabling state legislation, this research advances the strand of applied research that seeks to examine ways to make development charges legally defensible by showing how they can be designed to meet the rational nexus principle. The extant research in this line of inquiry has been largely US-focused and calls for data-intensive studies as inputs for designing the charges. However, conducting such studies is often not feasible in many developing countries. Therefore, this study uses India as an example to examine whether: a) context-sensitive exemplars of how enabling legislation is promoting or could promote the rational nexus principle in a developing country already exist; and b) what are some of the ways these pieces of legislation hinder the rational nexus principle and how the hindrances can be removed. Finally, the study provides several key insights that jurisdictions in India and potentially in other Global South countries can use as they adopt/amend development charge-enabling legislation.

PLANNING CURRICULUM AND PROFESSIONAL PRACTICE IN MEXICO

Abstract ID: 1719

Individual Paper Submission

PEÑA, Sergio [El Colegio de la Frontera Norte] spena@colef.mx, presenting author

The objective of the article is to analyze to what extent planning curriculum is offering to practitioners the knowledge, skills, and abilities (KSA) that are demanded in the job market. Thus, the main question address: Is there a match

between the planning curriculum and professional practice? Answering this question is critical not only for the academic institutions that offer planning degrees, but also for the planning profession and practice. The article relevance is based on the premise advanced by Alterman (2017) that the planning profession, in order to achieve a consolidated status and a social prestige, needs to meet some criteria: a) there needs to be a demand of the KSA that society values and perceived as critical to their wellbeing; b) a profession that enjoys certain autonomy to develop solutions judged as the best; and c) the existence of a professional organization with strong links between the academic community and the profession. So, the article focuses on analyzing and testing the premises discussed previously.

The paper uses a mixed methodology that combined a qualitative content analysis and a standardized survey. On the one hand, the planning curriculum was analyzed based on 12 graduate programs and a total of 253 syllabi. Atlas.ti was used to code and analyze the content. On the other hand, planning practice information was gathered through a standardized survey of 141 planning practitioners. The definition of KSA developed by the AICP to certify planner and the ACSP Planning Accreditation Board (PAB) criteria were used as a tool or common denominator to compare and analyzed the two instruments. The common thread are: 1) plan making and implementation, 2) functional areas of practice, 3) KSA, and 4) ethics and social justice. For each of the four dimension exist indicators and they were ranked from the most useful (emphasize) to the least and then the ranking are compared to see the distance between the curriculum and the professional practice.

Among the main findings are the following: The results show that it is more common that planning curriculum to teach KSA related to communicative and collaborative planning (post-modern planning). However, the planning practitioners emphasize that the KSA that used more often in their daily practice are those more associated with rational planning (data collection, information analysis, statistics, etc.). Another relevant finding is that ethics and social justice are issues that Mexican planner do not pay much attention while the planning curriculum addresses social justice, however, ethics still missing or very marginal.

MAPPING SCENARIOS OF URBAN EXPANSION OF INFORMAL SETTLEMENTS

Abstract ID: 1753

Individual Paper Submission

SAMPER, Jota [University of Colorado Boulder] jota@colorado.edu, presenting author
BOANADA-FUCHS, Anthony [St. Gallen University] anthony.boanada-fuchs@unisg.ch, co-author
KUFFER, Monika [Department Urban and Regional Planning and Geo-information Management] m.kuffer@utwente.nl, co-author

It is well recognized that the urban growth motor is increasingly shifting to the Global South, where 98% of all future demographic growth is taking place. Considering resource consumption and particular land, this dominance is less visible, as cities in the Global North have a considerably higher per capita consumption. However, there is an agreement that the urban population increases at more significant rates in the Global South than in the North. Understanding the growth rate has profound implications for the future of cities, countries, regions, and the planet as a whole. However, there is significant uncertainty on how such change happens. A large share of the urban growth in the Global South is taking place informally and spatially manifests what the UN designates as "Slums."

This paper postulates two questions: First, looking at current trends and novel data, how much land would be occupied by informal settlements globally, and second and more importantly. How much land would be needed to achieve SDG Target 11.1 (access to adequate housing for all)? Data on informal urbanization is a great challenge as often it is of poor quality or just not available. While there are several initiatives to improve this situation, it will take years until data is collected and made available. In the perspective of the acute data shortage, we combine publicly

available data with novel research to carry out calculations with the following data sources and processes. We calculated housing needs for slum and non-slum population (1990, 2000, 2015, 2030). Projections for 2030 would be calculated by using linear projections of average growth rates.

These demographic numbers need to be related to space. Unfortunately, there is no global overview on spatial slum growth. The Atlas of Informality measure spatial expansion of informal settlements worldwide based on a growing sample that covers different slum types and their annual growth rate calculated. These individual case studies can only be meaningfully connected to the demographic numbers by relating them to city-wide slum inventories and by considering the relational share of different slum types. We have mapped twenty-four cities' informal settlements. The city-wide data and the global informal settlement neighborhood-level data permit extrapolating change trends and differences across regions. With this approach, it is possible to relate demographic to the spatial growth of slums and analyze the differences and similarities between world regions.

We found a deceleration of slum areas' urban growth from 2001 to 2015 concerning previous periods (5% vs. 0.5). However, we also found that urban boundaries do not capture a significant proportion of mapped slums, ranging from 52% to 1.2 %, depending on the world region. However, we found a negative correlation (-0.5) between % of slum area within municipal boundaries and the ratio of municipal area and urban center area. While more data points (particularly on the slum inventory level) will make the calculations more robust, these findings demonstrated growth patterns across regions and fundamental deficiencies in current methods for capturing periurban slum growth worldwide and which comprise current growth estimates.

The findings of the research are relevant for the following reasons:

1. It will provide data-based insights on a highly pertinent topic of contemporary urbanization (growth outside planning capacities). It allows differentiating growth dynamics in distinct world regions to identify similarities and differences.
2. Outlining different growth scenarios (based on housing space standards) provides a precise measure for decision-makers about the full spatial consequences of reducing socio-spatial inequality and exclusion.
3. The research findings provide proof of concept and support a call for a more comprehensive data collection of slums and informal settlements.

INFORMAL CAR SHARE (ICS) ADAPTATION STRATEGIES TO SERVICE DISRUPTIONS IN LATIN AMERICAN CITIES

Abstract ID: 1772

Individual Paper Submission

GUERRA, Vanessa [University of Virginia] tvc5md@virginia.edu, presenting author

Latin American cities are challenged by the effects of population growth, inequality, unstable political cycles, corruption, and the effects of climate change. As a consequence, the quality of life for Latin Americans is being compromised. One of the main challenges the region is facing is the lack of resilience in its cities and in its multiple infrastructure systems. However, many cities in the region do not understand how these systems function. Informal

Car Share (ICS) is an example of a part of many cities' complex transportation systems that is not well understood by local governments. ICS is a self-organized system of private vehicles that provide transportation for a fare. ICS is unregulated by any type of government. Just like other, more formal transportation systems, ICS is facing natural and political disruptions while it continues to grow. However, existing definitions of ICS are based on traditional effectiveness and performance indicators, and these are insufficient to describe how it functions and adapts to system disruptions. This research explores the characteristics of ICS that make it resilient. I used UN-Habitat's resiliency characteristics: persistency, adaptability and inclusiveness to explore ICS. I used the City of Quito, Ecuador, as an analytic case because of its similarity with many developing cities within the Andean region of South America. I focused on two peripheral communities and conducted 22 semi-structured interviews with drivers and users. Findings show that users and drivers within the ICS network use eight basic strategies to circumvent natural and political disruptions. These eight adaptation strategies align well with UN-Habitat's features of resilient urban systems. While ICS is an illegal, informal system, how it functions and adapts may provide insights useful for more formal transportation systems that operate in similar political and built environments.

DISASTER RESPONSE - PLANNING ON THE FLY

Abstract ID: 1778

Individual Paper Submission

TARU, Taru [University of Michigan] tarutaru@umich.edu, presenting author

The Covid 19 pandemic took most of the world by surprise. Even though there had been epidemics like Ebola and SARs in the last decade - the responses and protocols generated from those playbooks had seen limited takers. It was also clear that the pandemic-induced crisis, like most disasters (Solnit 2010), affected the vulnerable populations disproportionately, often skewing the state's response towards exacerbating their precarity (Joyce 2021). In India, during the first wave of the pandemic, the central government announced a comprehensive lockdown that effectively shut down the economic engines of the country. The urban poor, especially the poorer migrants, lost their livelihoods and therefore lost their only means of subsistence. They struggled to survive, either by venturing to return home or by attempting to stay in place. In most places, the grassroots organizations, and the local governments had to mount an effective response to this multi-faceted crisis (Pal, 2018; Ali, 2016). This response ranged from ensuring basic necessities in cordoned areas that were marked the “red zone”, advocating for and making provisions for migrant workers stranded across the country and world, to creating ways to help them return and ensure efficient quarantine facilities. This paper examines the efforts made by a state-civil society organization that rapidly formed in response in the State of Jharkhand, India, called the Jharkhand State Control Room (JSCR).

The JSCR registered and aided more than a million people who sought help during the first wave of the pandemic. Through interviews, content analysis, surveys, and embedded observation, I studied the evolution of various procedures that the JSCR developed to respond along with their contexts, impacts, and constraints. Without a guidebook for waging such a massive response, or how to operate through this unique, hybrid institution, I found that iterative procedure making, continued feedback loops (Thompson 2010) and street-level bureaucracy (Lipsky 1980) helped staff plan on the fly - building their disaster response as they went. I end by looking at related disaster response mechanisms, and lessons that can be drawn from other planning scenarios that rely on “creative discretion” and “context responsive improvising” (Forester et al., 2021), exploring how key parameters like accountability, feedback, impact assessment and flexibility are critical to the creation of successful response procedures.

CLIMATE JUSTICE IS SOCIAL JUSTICE: ARTICULATING PEOPLES' RIGHTS TO THE CITY IN MUMBAI

Abstract ID: 1849

Individual Paper Submission

WAGLE, Paroma [University of British Columbia] Paroma.Wagle@ubc.ca, presenting author

PHILIP, Kavita [University of British Columbia] kavita.philip@ubc.ca, co-author

The impacts of climate change on urban life are especially catastrophic for historically marginalised communities. Many cities and marginalised sections of their citizenry have already been grappling with diverse vulnerabilities including acute problems of access to basic urban services like housing, water, sanitation, and transport. Climate crises will further compound and aggravate the already existing and historical urban inequalities—social, political, and economic. In this context, the question we want to ask is how do we make urban climate justice measures incorporate the lived experiences of historically marginalized communities?

Often, the two challenges of urban inequality and climate change are thought of in isolation from one another. While one is considered baggage of the past, the other is the challenge of the future. We argue that the future city cannot be envisioned and its challenges cannot be addressed without looking at existing and historical inequalities and cleavages. This paper further argues that the agenda for urban climate justice should be elaborated and strengthened by learning from the ideas, actions, and demands made by urban social movements involved in the struggle for equitable access to basic urban services. It builds on the works of various scholars on two relevant themes of urban climate justice and right to city; and takes ahead the assertion that ‘urban climate justice is right to city’. To this end, the paper turns to the narratives, argumentations, and articulations of rights and claims pertaining to multidimensional urban inequalities made by social movements on behalf of marginalized urban communities.

The three pillars of urban climate justice, namely distributive, procedural, and recognitional, call for fair distribution of benefits and disadvantages, participation in decision-making, and recognizing existing and historical forms of inequalities. This paper develops grounded activist voices to argue that climate justice is best envisioned through the pursuit of two core elements of the concept of right to city — access to urban services, and the democratic right to exercise collective power to reshape the processes of urbanization.

We draw upon data from a broader research conducted in the city of Mumbai, India, that involved multi-round and extended semi-structured interviews, conducted over a period of ten months in 2019-20, of sixty-four respondents representing different key actor-groups: (a) academic and independent experts (b) elected and unelected politicians, (c) activists and leaders of social justice movements, and (d) municipal officials, technocrats, and bureaucrats. In this paper, we focus on our data on social justice movements in Mumbai, who are making powerful claims to the city by operationalizing the notion of a “right to the city.” We trace how the activist leaders of three social movements – The Ghar Bachao Ghar Banao Andolan (“Save a home, build a home” movement), Pani Haq Samiti (Right to Water Committee) and the Right to Pee movement – are articulating this as a collaborative movement for right to the city. What we could learn from these articulations is that the social justice movements in Mumbai have already formed latent yet powerful frameworks and on-ground, action-oriented models that speak both to the amelioration of the effects of historical and current inequalities, as well as the visions of a future just city. They have, in essence, been working to claim both the access to urban services and resources, as well as space and involvement in reshaping the process of urbanisation. We describe how these articulations can help us define the distributional, procedural, and recognitional justice requirements of the city’s climate justice agenda. We conclude that listening to such ‘voices from below’ will help us make urban climate justice an attainable goal.

MECHANISMS OF INCLUSIVE URBANIZATION IN SUB-SAHARAN AFRICAN COUNTRIES

Abstract ID: 1850

Individual Paper Submission

RU, Yating [Cornell University] yr97@cornell.edu, presenting author

HAILE, Beliyou [International Food Policy Research Institute] B.Haile@cgiar.org, co-author

CARRUTHERS, John [Cornell University] john.carruthers@cornell.edu, co-author

Sub-Saharan African (SSA) countries are undergoing urbanization at an unprecedentedly rapid rate. In 2019, among the top 20 countries with the fastest urbanization rates in the world, 17 are located in SSA (World Bank, 2020). It is projected that by 2050, the African urban population will triple, and 6 out of 10 people on that continent will live in urban areas (United Nations, 2018; UNICEF and UN Habitat, 2020). Increasingly, urbanization is seen as a development tool to promote economic development, reduce poverty, and improve individual wellbeing in SSA. Previous research has found that urban residents possess better economic status, living conditions, and health outcomes than their rural counterparts in SSA (Gollin et al, 2017; Parienté, 2017). Nevertheless, much is unknown about the underlying mechanisms of inclusive urbanization. Moreover, the urbanization discourse in international development often takes place at an aggregate level without reflecting the potential heterogeneous effects of secondary towns and large cities (Christiaensen and Kanbur, 2017). This obscurity hinders efficient investments and interventions for more inclusive urbanization in SSA. Researchers at UN-Habitat, World Bank, Brookings Institute, and other development organizations have called for more research and policy analysis into urbanization mechanisms and heterogeneity between secondary towns and large cities in SSA (Barofsky et al, 2016; Council on Foreign Relations, 2007; Christiaensen and Kanbur, 2017; Saghir and Santoro, 2017; UN-Habitat, 2020).

This study proposes to (1) investigate the causal relationship between urbanization and child nutritional outcomes – an important indicator for population health and human capital productivity in SSA; (2) study the underlying pathways linking urbanization and child nutritional outcomes, such as improved access to water and sanitation, housing, food diversity, medical care, and education; and (3) differentiate potentially heterogeneous effects of the development of secondary towns and large cities. The primary empirical strategy is to use difference-in-difference and matching to analyze a pseudo-panel dataset we built from Demographic and Health Surveys (DHS), satellite data, and population maps. The pseudo-panel is constructed from repeated cross-sectional data of DHS using spatial interpolation methods, which include information on child nutritional outcomes and many relevant variables, such as food intake (only recent rounds), housing quality, electricity, health service, water and sanitation, and parents' occupation and education, etc. Then we use provided household GPS coordinates to link them to urbanization indicators constructed from high-resolution satellite data and population maps. The urban indicators help us find places that did not experience urbanization, experienced urbanization with secondary towns, or experienced urbanization with large cities in the past three decades. We match similar villages from the three groups and conduct a difference-in-difference analysis.

While previous literature has demonstrated the association between more urbanized areas and better economic and health outcomes in SSA (Amare et al, 2020; Ru et al, 2022), very few studies have proved causality and underlying pathways. Neither is there robust evidence on the contribution of secondary towns versus big cities (Christiaensen and Kanbur, 2018). Thus, this paper aims to fill in the literature gap and leverage big data from remote sensing and large-scale household surveys to provide empirical evidence on causality, mechanisms, as well as heterogeneous effects of different-sized cities. The results will inform policy decisions on building more inclusive cities for the next generation in SSA.

OF INDIVIDUALS AND INSTITUTIONS: LEADERSHIP IN PARTICIPATORY UPGRADING IN INDONESIA

Abstract ID: 1856

Individual Paper Submission

DAS, Ashok [University of Hawaii] ashokdas@hawaii.edu, presenting author

Critical investigations of pro-poor initiatives such as participatory upgrading have revealed that participation's success often hinges upon complex contextual nuances, often pertaining to the nature of institutions. Yet, in general, planning scholarship has scarcely explored why and how enabling factors may exist, to begin with, why certain individuals demonstrate exceptional leadership, and how institutions and institutional arrangements influence and are transformed by effective leadership, especially in the Global South. Understanding such nuances is useful for policymakers, planners, scholars, and activists, when inspired to emulate or prescribe successful policies, to appreciate potentials and caveats germane to context. This paper clarifies why and how the Indonesian city of Surabaya, a pioneer of urban upgrading, was able to catalyze community participation. It also argues that albeit developing a robust participatory ethos around the upgrading of kampung (poor settlements), the utilization and institutionalization of participation can yet grow in scale, scope, and inclusivity. Specifically, it attributes Surabaya's success with participation to pioneering leadership that introduced prudent planning innovations; political will; policy persistence; a permeating administrative structure; and productive partnerships that deepened trust with local universities and communities. In doing so, this institutional analysis with a historical perspective stresses the role of transformational leadership—something frequently acknowledged but insufficiently probed by planning scholarship. With planning research's focus privileging institutions, our understanding of how individuals can transform institutions is yet cursory. Rarely has planning literature discussed the influences, circumstances, and incentives of transformational leadership, conditions for which could be fostered by such understanding. This paper draws upon multiple sources of data: secondary literature; field notes and observations from numerous transect walks; conversations about local planning; news media reports; the author's prior primary research, spanning over a dozen years; and, in particular, from fieldwork for a larger project (2017) to understand how innovative upgrading policies proved transformative in Surabaya—for which the author conducted 18 in-depth, semi-structured interviews in English and Bahasa Indonesia.

JABODETABEK: PLANNING AND GOVERNING A MEGACITY REGION

Abstract ID: 1878

SILVER, Christopher [University of Florida] silver2@ufl.edu, presenting author

Jakarta, Indonesia anchors the largest megacity region in Southeast Asia, and purportedly the second most populous in the world. Plans prepared in the early years of the Indonesia Republic (1970s) called for creation of satellite cities utilizing lands along the edge of the capital city to accommodate anticipated population growth. Implementation of the plan turned out much differently than anticipated. Beginning in the 1980s and continuing through the 1990s, the original satellite settlements became twenty new town developments that haphazardly carved up over 16,000 hectares of agricultural lands for residential development and industrial parks throughout the region. Four new cities and their own growing peripheral settlements, plus the Dutch colonial city of Bogor, claimed over two-thirds of the more than 30 million residents by 2020 in the region now known as Jabodetabek.

Equally improved economic expansion in the peri-urban region complements the population growth. Government data tracking foreign direct investment in the Jakarta region between 1990 and 2012 showed that \$12.5 trillion fueled industrial expansion in the outlying region, particularly in Bekasi, with virtually no industrial investments added to Jakarta proper. Industrialization in Jakarta's the peri-urban region signaled the shift in a national economy traditionally led by oil and agriculture to one relying on more diverse exports. Indraprahasta and Derudder (2019) declared that peri-urban developments represented a step toward "world city formation," a longstanding goal of Jakarta's and Indonesia's leadership. Peri-urban development clearly challenged the longstanding urban primacy of Jakarta itself.

Transformation of the nation's capital city from the focal point of global stature to simply one among many urban partners in a vast regional complex point to the reduced primacy of Jakarta. The decision of the Indonesian government, announced in April 2019, to transfer the national government functions from Jakarta to a new green city, Nusantara, on the island of Kalimantan, confirmed the changing stature of Jakarta. With the region gaining legitimacy in its own right, and as Jakarta transitions from a national government center to a financial and service hub, the focus will shift to the city-region scale as the opportunities and challenges of urban life in Indonesia take new forms. This study will examine development, planning and governing in this megaurban region since it was first conceptualized during the New Order regime. It will focus on three critical questions. First, how has development of the new cities of in the megaurban region introduced new forms of urbanization and what have been the benefits and costs of this process? Second, what initiatives have been undertaken to address the problems identified in regional plans to serve the broader region and what problems persist? Finally, what governance structure(s) are necessary to ensure that the megapolitan region can effectively address critical needs of a population that is likely to continue growing well beyond the current 30 million mark.

BETWEEN THE FORMAL AND THE INFORMAL: THE EVOLUTION OF A HYBRID BUILDING SYSTEM

Abstract ID: 1879

Individual Paper Submission

VALLADARES, Arturo [McGill University] arturo.valladares@mail.mcgill.ca, presenting author
BORNSTEIN, Lisa [McGill University] lisa.bornstein@mcgill.ca, co-author

The informal settlements of the developing world are often conceptualized as opposed to formality and are seen as an undesirable approach to planning (El-Masri and Kellett, 2001). By looking at interventions led under the scope of the Community Architect Program in La Habana Vieja and using notions of 'hybridity', a concept proposed by Latin American anthropologist García-Canclini (1989) to respond to changes in cultural patterns produced by globalization,

my research questions the validity of this widespread notion that there are only two oppositional approaches to the development of the built environment. The paper explores three questions: what are the characteristics and types of built environments in the area; what sets of logics and actors – or building systems – are producing them; and what lessons do we learn about hybridity, as contrasted with formality or informality, in urban development from the case of Old Havana?

Review of literature, reflection on the development of the built environment, and extensive fieldwork (i.e. semi-structured interviews with architects, planners and residents) led to the identification of five fundamental elements in the development of the built environment. These are: design decisions, building technologies and materials, labor, financing, and regulations. The process of identifying and conceptualizing these elements allowed for developing a more refined version of the concept of building systems as present by Alexander et al (2012). Building upon Alexander's definition of building systems, I argue that these are ways that organize these five fundamental elements during the development of a building, a neighborhood or a city and that the concept has the potential to link forces at the macro-levels of politics with architectural and planning outcomes. Using this multi-dimensional definition of a building system, the article examines the evolution of a 'hybrid' system in La Habana Vieja through the 'borrowing' and 'mixing' of elements from both 'informal' and 'formal' approaches to the production of the built environment. This 'hybrid' system, when functioning well, provides residents with choices throughout the design process, allowing them to have control over the configuration of their homes and apartments. Equally, this hybrid system assures that all construction is kept in line with existing urban regulations. The paper argues that, by adopting 'hybrid' approaches to the production and management of the built environment, planning departments can develop more sensitive responses to the management of settlements in the developing world. Also, this proposed multi-dimensional definition of building systems can help to better conceptualize the production of built environments and urban geographies.

ARQUERO DE ALARCON, Maria [University of Michigan Taubman College] marquero@umich.edu, presenting author

PIMENTEL WALKER, Ana Paula [University of Michigan Taubman College] appiment@umich.edu, co-author

FERRARA, Luciana [Universidade Federal do ABC] luciana.ferrara@ufabc.edu.br, co-author

BOTTON, Fernando [Universidade Federal do ABC] f.botton@ufabc.edu.br, co-author

In the city of São Paulo, as in many countries of the Global South, the affordable housing crisis pushes low-income families to ever more distant urban peripheries (Caldeira, 2017; Maricatto, 2014) and drives the densification of consolidated informal and precarious settlements and irregular subdivisions, and the emergence of young land occupations (Pimentel Walker & Arquero de Alarcón, 2018). While some governments put in place comprehensive upgrading policies and funding, they tend to prioritize investments in areas with potential for real estate development and land value capture (Pimentel Walker et al 2021). As a result, informal dwellers occupying environmentally sensitive areas are left alone to provide for infrastructure and other incremental improvements.

This paper analyses the trajectory of three young land occupations and eleven consolidated informal and precarious settlements in the Southern periphery of São Paulo. Methods include in-depth interviews with fourteen community leaders documenting the trajectory of their occupations and settlements regarding the occurrence of land conflicts, the stage(s) of infrastructural improvements and urbanization, and history of eviction threats, evolving forms of community organizing, the gender roles, access to water, and covid-19 impacts. City-wide and community maps complete the portrait of each settlement in the Community Atlas. Last, six structured interviews with professionals working with social architecture non-profit firms, legal aid offices, the public defender office, and the housing movements offer additional insights into the entanglements in the long-term struggle for informal dwellers to attain the right to the city. These interviews took place virtually via video conference due to the pandemic between June and December 2020, as part of the Participatory Action Research (PAR) (Chevalier and Buckles, 2019).

The goal of the interviews has been to increase knowledge about the trajectories of young land occupations, informal and precarious settlements, and irregular subdivisions in the Southern periphery of São Paulo City, while fostering coalition building and co-producing strategies to advance tenure security and upgrading. The project aims to facilitate community organizing and coalition building and develop policy recommendations and advocacy tools that will change the long-lasting pattern of unequal urban development. Findings demonstrate that while young land occupations are the most vulnerable in the fight for acquiring tenure security, consolidated precarious settlements struggle to maintain it in the face of ever-expanding urban redevelopment projects and real estate pressures. Tenure insecurity can also affect communities that have been formally recognized under official land regularization programs.

THE COST OF CENTRAL AMERICAN MIGRATION

Abstract ID: 1919

Individual Paper Submission

WILLIAMS, Sarah [Massachusetts Institute of Technology] sew@mit.edu, presenting author
 BOTTONNE, Rossella [World Food Program] rossella.bottone@wfp.org, co-author
 RUIZ SOTO, Ariel [Migration Policy Institute] ARuiz@migrationpolicy.org, co-author
 LOUIE, Ashley [Massachusetts Institute of Technology] alouie@mit.edu, co-author

The number of refugees and asylum-seekers from the northern countries in Central America has soared in the past 5 years, and studies show that food security, violence, and climate variability are factors for why people flee. With over 47,000 asylum-seekers from Central America worldwide, the phenomenon of migration out of destitution from Central America is likely to increase in 2021. This research explores the factors that drive people in El Salvador, Guatemala, and Honduras to consider and decide to migrate irregularly or regularly, as well as the cost and economic implications of migration for households and communities throughout the region. Using a survey administered by the WFP of 5,000 households in El Salvador, Guatemala, and Honduras in June 2021. Analysis of the data shows that migration from Central America costs close to 2.2 billion dollars in 2020. This cost is fundraised by the migrants through diverse means, everything from family and friends abroad to bank loans. The migrants' debt is compounded by the fact that only 57% of migrants reach their destination. Our research also shows the main reasons people migrate from this region are economics. Migrants cite not being able to provide basic needs for their families. Our analysis also shows that remittances only provide for basic needs, showing families depend on them to survive. Ultimately the work shows that the Economic cost of migration is shouldered by the migrant while both the US and the country of origin benefit from the economics involved.

THE GEOGRAPHY OF METROPOLITAN INEQUALITY: HOW DOES MUNICIPAL PUBLIC FINANCE INFLUENCE URBAN SERVICE AND INFRASTRUCTURE DISPARITIES?

Abstract ID: 1927

Individual Paper Submission

ECHAVARRIA CANALES, Aurora [University of California Los Angeles] auroraechavarria@gmail.com, presenting author

The absence of metropolitan governance creates significant divergences in municipal finances, which manifests in unequal levels of service and infrastructure provision among neighboring municipalities. In the context of the United States, scholars have identified the problems that arise due to fragmented local governments, such as segregation and unequal access to public goods. However, no significant study has yet investigated how these dynamic manifests in metropolitan regions with larger municipal governments. Taking Mexico as a case study, this project analyzes how variations in revenue collection capacities at a municipal level influence inequality at a metropolitan scale. This analysis assesses the impact that varying revenue raising capacities have on urban service and infrastructure provision at a local level and tests the hypothesis that a lack of metropolitan governance leads to more unequal local urban environments. This research contributes to contemporary theory on the geography of public finances and metropolitan inequality in the Global South.

REBUILDING SOCIAL LIFE POST-DISASTER: A CASE STUDY OF CARLES, PHILIPPINES AFTER TYPHOON YOLANDA

Abstract ID: 2001

Individual Paper Submission

NGUYỄN, Lan [University of San Diego] lannguyen@sandiego.edu, presenting author
MANGGASANG, Julieto [Municipality of Carles] jmanggasang@yahoo.com, co-author

Community relocation post-disaster often focuses on rehousing disaster survivors. Scholars argue that government plans need to shift from "rehousing" to "rebuilding social life" post-disaster. This requires a holistic approach to rebuilding communities that includes infrastructure and services for housing, education, economic well-being, health care, and safety. There are not many studies that investigate the process of rebuilding social life especially in rural areas. In this paper, we examine four aspects of social life which include social capital (bonding, bridging, and linking), economic well-being, educational opportunities, and safety at an individual level in the Municipality of Carles, Province of Iloilo, Philippines to better understand how people are managing relocation and social life. In November 2013 one of the largest super-typhoons ever recorded hit landfall in the Philippines affecting over 16 million people in 596 municipalities. In Carles alone, over 65,000 people were affected, 10,000 homes were totally or partially destroyed, 430 hectares of fisheries were damaged, and nearly 3,000 fishing boats were totally or partially destroyed. After the disaster the government forbade development 40 meters from the shore and began the process of developing socialized housing in safe zones for disaster survivors. Carles was allotted 10,000 new homes. In 2019, a little over a year after people started moving into the new housing sites, we conducted semi-structured interviews with two municipal managers to understand the municipality's approach to community relocation and rebuilding social life. We then interviewed 14 relocated residents (8 residents from the island barangays, a small territorial and administrative local government district, and 6 residents from mainland barangays) at four housing sites on the

mainland to understand the process of relocation and rebuilding social life for each household. We found that the municipalities approach to relocating people from the same barangay to the same development site sustained bonding ties with extended family and neighbors. Bonding ties within a household became weaker because oftentimes seniors and head of household males stayed on the island to maintain their livelihoods. Bridging ties were being developed with people from other barangays that were relocated to the same housing development site. Most respondents who moved to a new barangay said that they would change their political local affiliation after the election cycle. The linking ties at the relocation site remain weak. In terms of economic well-being, all respondents went from being an informal settler to a formal settler with land and property. Housing stability helps people establish a new life in a new place over the long term. For islanders, it is more affordable to send their children to high school and college while living on the mainland because they do not have to pay for room and board. Islanders were living on the mainland during school months and returning to the island when school was out of session. Some people decided to find other job opportunities because subsistence fishing was too unstable. Most respondents were satisfied with the quality of the housing units and believed that the unit could withstand another super-typhoon. Respondents from the island barangays also said that their family members who remain on the islands can evacuate to their new homes before a storm hits landfall. This study demonstrates that relocation and rebuilding social life is a long-term process that can be sustained when government institutions support and facilitate the process. The availability of having two homes allows residents to gradually rebuild their lives in meaningful ways.

THE INFLUENCE OF INDIVIDUAL PERCEPTIONS OF INCOME DISTRIBUTION AND SOCIAL CLASS ON LIFE SATISFACTION: CONSIDERING THE DEVELOPMENT LEVEL OF THE REGION

Abstract ID: 1483

Poster

AHN, Soonbeom [Yonsei University] soonbeomahn@yonsei.ac.kr, presenting author
LIM, Up [Yonsei University] uplim@yonsei.ac.kr, co-author

Purpose and Research Question

The purpose of this study is to empirically analyze the effects of perceptions of fairness in income distribution and individuals' subjective perceptions of social class on life satisfaction. In these days, one of Korea's main concerns is balance and distribution. Korea has achieved rapid economic development under the principle of growth first policy, but income inequality and polarization due to the unbalanced development of the country are being raised as chronic social and economic problems. In previous studies, it is known that social fairness and social class are related to an individual's life satisfaction (Ngamaba, 2017; Ngamaba et al., 2018; Martino&Prilleltensky, 2020; Tang&Tan, 2022). However, there is still little interest in differences in life satisfaction due to disparities at the regional level. Therefore, in this study, 1) we analyzed the effect of perception of fairness in income distribution and the subjective perception of social class of individuals on life satisfaction, and 2) show the pattern of these effects depending on the degree of development between regions.

Data and Methods

This study used the "2019 Gyeonggi-do Social Survey". Gyeonggi-do is considered to be the largest single region in Korea in terms of population and industry. Both the population and the regional gross domestic product have values of more than 25% of the national level (as of 2020). In addition, the northern and southern regions of Gyeonggi-do have a large imbalance in terms of population, economy, and system. This is because geographically, the northern

part was relatively alienated, unlike the case of the southern part, which was developed at the national level in connection with Seoul. Therefore, there is a large imbalance between the north and the south, which has been dealt with in various recent studies. It can be seen that these characteristics of Gyeonggi-do increase the external validity of the study and can be used as basic data for empirical analysis. As a research method, the dependent variable is life satisfaction, and the main explanatory variables are 1) perception of fairness of income distribution, 2) individual perception of subjective social class, and 3) degree of regional development. The analysis was performed using logistic regression analysis including several control variables.

Finding

As a result of the analysis, individuals who perceive that income distribution is fair have a higher probability of having a better level of life satisfaction. Also, it was found that the higher one's perception of subjective social class was, the higher the probability of having a better level of life satisfaction. This can be interpreted as having a positive effect on the fairness of income distribution and individual social class on life satisfaction. Likewise, it was found that individuals living in areas with a high degree of development had a higher level of life satisfaction, and also the influence of major explanatory variables on life satisfaction was low. These results show that in order to increase people's subjective life satisfaction, 1) it is necessary to create a social environment that can feel fair in terms of income distribution policies and wealth accumulation, and 2) diversified policies according to the degree of development that can alleviate regional imbalances. From the planner's point of view, considering that the Republic of Korea is economically and socially sufficiently developed, policies that can take care of individuals or regions who have been marginalized in the process so far are necessary. Considering that economic development is path-dependent and polarization is getting worse, planners should step in and think about these issues (Llerena & Lorentz, 2003).

IMMIGRANTS SHELTERS IN THE BORDER CITY OF CIUDAD JUÁREZ

Abstract ID: 2000

Poster

VAZQUEZ CASTILLO, Maria Teresa [Universidad Autonoma de Ciudad Juarez] ma.tere.vazquez@gmail.com, presenting author

In August 2018, the border city of Ciudad Juárez witnessed the abrupt and massive arrival of immigrants mainly from Cuba, Central and South America. The Casa del Migrante regularly housed those immigrants on their way to the United States, but the number of immigrants exceeded the shelter's capacity to house them. More than 5,000 people arrived at the end of 2018 and the beginning of 2019. At the beginning of 2021 and despite the Covid-19 pandemic, the number of migrants reported just in one month reached 17,445 (Inmigración, 2021). The government of Ciudad Juárez was overwhelmed, and the federal government intervened by opening one of the largest shelters for immigrants in the city, the Leona Vicario. In addition, informal community initiatives also emerged to house diverse communities. That was the case of the Casa de Colores, a shelter for immigrant trans women, located in the center of the city. These are some of the shelters for immigrants in the city, as little by little other sites opened while, because of COVID, others closed. This poster presents the location of the shelters for immigrants in Ciudad Juárez, a city that has always seen immigrants on their way to the neighboring country, but not in the numbers that abruptly filled the city with new accents and new colors, with people coming and going due to policy of Remain in Mexico. This immigration policy, implemented during the Trump administration, forces immigrants to remain in Mexico until they are given an appointment for their immigration interview. This context has put enormous pressure on planning for immigrants in Mexican border cities, such as Ciudad Juárez. Field research, interviews with planners, organizers, and residents of the shelters serve to document the planning of this temporary housing for immigrants. The poster also locates them spatially with the intention of sharing it online and of being a resource among the immigrants who arrive to the city (La Sección Amarilla, 2022). This is part of a work in progress to document these immigrant sites and

resources to make them available online for the immigrant community. It will further contribute to trace the influence of these sites and their populations on planning this border and industrial city.

Track 8 – Land Use Policy & Governance

Track 8 Pre-Organized Session Summaries and Abstracts for the Sessions

NEGOTIATING THE POLITICS OF LAND AND VALUE 1

Pre-Organized Session 16 - Summary

Session Includes 1161, 1162, 1163, 1164

SHIH, Mi [Rutgers, The State University of New Jersey] mi.shih@ejb.rutgers.edu, organizer

Amidst the globally widespread use of planning tools to facilitate land value extraction, there is growing contestation over valorizing land as an income-generating asset. In this organized session, we examine how the politics of land and value are negotiated through social practices by focusing on three major themes. First, we will discuss the plurality of land value and the conflicts between competing values. Session participants will examine how the conflicting types of land values come into focus as rapid urbanization and entrepreneurial governance have pushed large-scale land development to localities and regions that are usually environmentally precarious, socially marginal, and economically disadvantaged. Our second theme is valuation techniques and the ascribing of value to place. We will examine the ways in which valuation techniques and tools are employed in particular urban places as well as the resulting socioeconomic impacts on land and housing markets and people's everyday lives. Finally, we will examine the morality of land development and the place of the public in defining, negotiating, and anchoring captured value.

Objectives:

- To learn about the mechanisms, tools, practices, debates, and politics of land development and land value capture

NEGOTIATING INTENSIFICATION IN TORONTO: CONTESTED PRACTICES AND DISCRETIONARY APPROACHES

Abstract ID: 1161

Abstract within Pre-Organized Session 16

SORENSEN, Andre [University of Toronto] andre.sorensen@utoronto.ca, presenting author

Since 2000 Toronto has seen a surge of intensification and redevelopment within existing built up areas, prompted by 'smart growth' policies to reduce urban sprawl and shifting residential location preferences in favour of downtown locations. At the same time, the city enacted policies to increase land value capture (LVC) through development charges (DCs), density bonus agreements (s37), and park space requirements (s45), to finance and build infrastructure related to increased densities. Land value capture associated with intensification processes can be an important source of municipal finance, and varies greatly between jurisdictions, and research has shown that the details of practice matter greatly for outcomes (Shih and Shieh 2020, Weber 2021). In Ontario density bonus exactions have been contentious, are vigorously opposed by the development industry, and have recently been revised through major reforms to planning laws by the current Progressive Conservative government in 2020, 2021, and 2022 in response to development industry lobbying and an ongoing housing affordability crisis. In Toronto, density bonus and park space benefits are negotiated on a discretionary case by case basis, and are often appealed to planning administrative tribunals such as the Ontario Municipal Board (OMB). They have also been the focus of planning research. Moore (2013) argued that discretionary negotiated benefits tended to politicize development control in Toronto, while Biggar and Siemiatycki (2020) argue that discretionary negotiations over exactions tend to increase uncertainty, allow inconsistency in exactions, lengthen timelines for planning permissions, and create opportunities for corruption. It is unclear how much discretion exists in practice, however, in the value of exactions, as Toronto maintains relatively robust policy guidance regulating such negotiations. This paper examines the variability in time and space of LVC practice in Toronto, quantifying and mapping the amount of LVC for all developments with density bonus agreements. A key metric for evaluation will be the value of negotiated benefits standardized per square meter of built floorspace, mapped by address and date of planning permission. This will allow an analysis of the variation of exactions over time, by location, and comparing cases approved by city council with those that were appealed to the OMB. It is hypothesized that LVC rates have increased greatly over time, and vary with distance from the downtown, but vary little between nearby developments or through administrative appeal, and are dwarfed by payments for development charges.

THE POST-NEOLIBERAL GOVERNANCE OF SANTIAGO'S VERTICAL DEVELOPMENT

Abstract ID: 1162

Abstract within Pre-Organized Session 16

LOPEZ-MORALES, Ernesto [University of Chile] elopez@uchilefau.cl, presenting author
GARRIDO, Odette [University of Chile] odette.garrido@ug.uchile.cl, co-author

In rapidly verticalizing cities, urban land value depends on different variables. First, soil characteristics and the land site: its size, shape, and proportion. Second, location and the built environment around the land site: services, amenities, transport facilities (in Santiago, the Metro network decisively valorizes land; López-Morales et al., 2019), and green areas. These valorizing urban attributes are not inherent but inseparable from the land site. Third, urban regulations, which in Chile are defined by each borough's building codes, a set of norms that allow the air-volume that corporate developers later materialize, namely FAR-based potential ground rents (Hackworth, 2007), increased development rights (Shih et al., 2018) or air rights (Chen, 2019). Fourth, as under neoliberalism, corporate agents aim at maximizing profit, public and corporate agents struggle to set urban building codes. In Chile, every urban code is a monetary instrument, and every monetary instrument is political.

In Greater Santiago, a new wave of leftist, post-neoliberal mayors has seized different borough governments under the promise of redefining urban market rules and limiting the extreme exploitation of air rights in certain areas. They aim at a more livable, equally distributed, democratic (Vergara, 2021), and affordable city. This paper seeks to assess how this current post-neoliberal governance affects (or not) Santiago's corporate-led urban verticalization, its discourses and the tools it uses (e.g., land use, FARs, densities, etc.), and the social and environmental effects it creates (e.g., developers departing to other, unregulated areas, gentrification, etc.) We focus on the San Miguel borough, a former working-class industrial zone in south Santiago, as a study case. San Miguel has been under intensive privately-led high-rise redevelopment for three decades. The Metro network expansion and loose FARs have helped concentrate intensive housing vertical redevelopment along the Metro lines; still, San Miguel's long-term traditional residents have struggled to avoid verticalization exacerbating its adverse social and environmental effects – this borough's new government emerges from those struggles. We use a single-case study methodology with micro observations of San Miguel's local space and social narratives becoming instrumental in helping to reveal the social and urban implications of this new, post-neoliberal governance. We triangulate the data with official public and market information.

REMAKING COMMUNITY: CREATING AND RECREATING NEWARK'S CENTRAL WARD

Abstract ID: 1163

Abstract within Pre-Organized Session 16

NEWMAN, Kathe [Rutgers University] knewman@rutgers.edu, presenting author

Newark's Central Ward has been re-created multiple times in the past 100 years. Using archival materials and existing literature, this paper explores three especially significant transformations and the processes that shaped them: 1) the creation of a racially segregated community, 2) the demolition of that neighborhood and the production of dense highrise public housing, and 3) the demolition of most of the highrise public housing and the production of low-density housing. The paper explores the assemblage of multiscalar processes and human and nonhuman actors that came together to reshape this community. Of special interest is the interplay between policy, market, politics, race, income, and land/property and especially the justifications for and enabling of demolition and reconstruction. Highrise public housing production and demolition are often told through narrow narratives focused on policy objectives. Though those are critical, this paper grounds the way those policy objectives played out in the context of the everyday life of the city.

LIQUID ASSETS: RIVERFRONT DEVELOPMENT AND THE CASE OF LINCOLN YARDS

Abstract ID: 1164

Abstract within Pre-Organized Session 16

WEBER, Rachel [University of Illinois Chicago] rachelw@uic.edu, presenting author
YILDIZ, Sevin [University of Illinois Chicago] sevin@uic.edu, co-author

The Lincoln Yards project is possibly the largest redevelopment projects in Chicago's history. Developer Sterling Bay purchased 55 acres of land within the North Branch Industrial Corridor flanking the Chicago River that previously had been protected by a zoning designation restricting non-industrial uses. Sterling Bay has planned an ambitious mixed residential, retail, and entertainment development that includes thousands of on-site jobs and housing units.

As is the case with water features across the world, the Chicago River was one of the main attractions for Sterling Bay. Industrial land in the area had not fully capitalized the river's amenity value. The area had been zoned for manufacturing, a kind that turned its back on the River (the tanneries and small fabricators previously inhabiting the area did use the river, but as a dumping ground). Knowing that land values would increase if they lifted industrial zoning, the City designated a Tax Increment Financing (TIF) district there and agreed to allocate \$1.2 billion to Sterling Bay – the largest TIF subsidy in the City's history.

Land values already were rising rapidly in anticipation of the project and fearing this appreciation would undermine its status as "blighted," Mayor Rahm Emanuel pushed the TIF designation decision through City Council in early 2019. In effect, the city was racing to get out ahead of the speculation that Sterling Bay's purchase and its own policies induced - in order to pay for the subsidy it had already committed. TIF can turn municipalities into a co-speculator with the developer, relying on value uplift to pay back costs for infrastructure and subsidies (Weber 2021).

At the same time, there is a strong need for major ecological investments along the Chicago River, a fragile ecosystem that absorbs run-off and risks flooding due to extreme weather events. The current plan for Lincoln Yards lacks an integrative approach for the corridor and instead develops impervious surfaces for the new thousands of workers, residents, and visitors that may worsen the effects of climate change. Advocates have been pushing the city and developer to consider new models of riparian development that include natural edges, wetlands, and passive landscaping. Climate adaptations could include special ordinances, overlay zoning, and a complex matrix of setback tools to shape the planning process of large-scale sites.

Our case study analyzes how the city balances its role as co-speculator with demands to attend to the river's ecological

role. We document the planning and construction process for Lincoln Yards from 2017 through 2023, when the city made decisions about boundaries, environmental requirements, and financing. We create financial and ecological histories of the project, piecing together interview data (with municipal planners, elected officials, the development team, and advocacy and advisory organizations), newspaper articles, and property value information to gain a fuller understanding how its environmental features evolved. We develop a detailed timeline of key events that maps onto charts identifying changes in property values over time.

We hypothesize that the financial relationships embodied by TIF create a disincentive to use public revenues to pay for ecological restoration, which likely will not cause property values to increase as much or as visibly as other infrastructures and amenities. Our work has implication for other cities as property speculation around rivers has increased, as has conflict between those seeking to capture the incremental increases in land values from that speculation.

VERTICAL URBANISATION AND THE IMPLICATIONS OF PLANNING FOR AND WITH HIGH-RISE NEIGHBOURHOODS (WITH PERSPECTIVES FROM ACSP AND AESOP SCHOLARS)

Pre-Organized Session 24 - Summary

Session Includes 1132, 1133, 1134, 1202, 1203

WHITE, James [University of Glasgow] jamest.white@glasgow.ac.uk, organizer

‘Vertical urbanisation’ is a global phenomenon that has manifested itself in the development of high-rise neighbourhoods in cities around the world. The planning, design and development of these vertical neighbourhoods is the result of numerous forces, including demographic change, migration, global flows of finance, sustainable policies that favour density and urban intensification, and changing real estate markets. Urban planners play a key role not only in facilitating the design and development of these vertical neighbourhoods but also in addressing and managing the variegated impacts of these developments on the built environment and the residents that live in and around them. This session seeks to advance a more local understanding of ‘vertical urbanisation’ through a series of papers focused on Toronto, Canada, to explore the high-rise social relations that stem from the spatial, aesthetic, and socio-economic planning outcomes present in high-rise neighbourhoods.

Objectives:

- Understanding how high-rise building and neighbourhoods are planned
- Understanding the design implications of high-rise buildings and neighbourhoods
- Understanding the social and physical impacts of high-rise buildings and neighbourhoods

CONDO LAND: THE PLANNING, URBAN DESIGN AND ARCHITECTURE OF VERTICAL URBANISATION ON TORONTO’S RAILWAY LANDS

Abstract ID: 1132

Abstract within Pre-Organized Session 24

WHITE, James [The University of Glasgow] jamest.white@glasgow.ac.uk, presenting author

Over the past twenty years many global cities have experienced ‘vertical urbanisation’ (Nethercote, 2018) fuelled by inward urban migration, global flows of real estate capital (Rogers et al., 2015), and planning policies that favour intensification (Searle and Filion, 2011). The form of vertical urbanisation differs from place to place, but one clear trend is the development of tall condominium communities that offer luxurious amenities alongside new community facilities.

Toronto, Canada, has been a hotbed of vertical urbanisation since the early 2000s. The city’s downtown and inner-

city neighbourhoods have rapidly densified as a result of favourable planning policies and a buoyant real estate market. Rosen and Walks (2015) have coined the term 'condo-ism' to describe this phenomenon, casting Toronto's experience as a form of urban neoliberalism that has distorted the social fabric of the city and profoundly re-shaped its physical form.

What is missing from the literature on Toronto's condo-ism is an understanding of how the new places and spaces of condo-ism have been created and what role the City of Toronto has played in regulating the form and function of vertical urbanisation. To address this, this research focuses on CityPlace, a mega-project of some 30 residential high-rises and associated community facilities built between 1997 and 2022 on a former rail marshalling yard called the Railway Lands. The research casts CityPlace as a microcosm of Toronto's condo-ism and one that is emblematic of the new vertical building typologies that are reshaping Toronto and other global cities.

Through a longitudinal case study conducted over eight years and encompassing key informant interviews, archival research and field observations, the research unpacks the design and masterplanning of condo-ism. It illustrates the ways in which the tools of 'design governance' (Carmona, 2017) have regulated the delivery of CityPlace and describes how the principal developer produced an altogether new scale of high-rise condominium development in Toronto.

While design excellence has not been achieved, the planners who sought to facilitate the creation of a mixed-use neighbourhood can argue that a new, largely residential, urban district has emerged. Yet, this achievement is overshadowed by the developer's ruthless exploitation of the gaps in Toronto's planning processes to maximise their profits – and the planners' submission to their demands. All told, the developer managed to secure density increases that more than doubled the number of private condominiums built on the Railway Lands, yet over the same period, the number of affordable houses was halved and many of the promised community facilities took years to materialise.

Stepping back from the case, the research argues that the pressure to satisfy the demands of a rapacious residential real estate industry operating in a booming property market should not come at the expense of creating places where communities can thrive. The case demonstrates how these pressures can precipitate the creation of a vertical neighbourhood that is less diverse in terms of tenure, unit size, and mixed use than it might otherwise have been. Drawing comparisons with other large developments in Toronto and further afield, the paper argues that the story of CityPlace is emblematic of an alarmingly flexible approach to planning and design that is acquiescent to the demands of a rapacious development industry – what the paper terms "planning by concession" – and which raises critical questions about the long-term resilience of Canadian city-making in the 21st century.

CONDOMINIUM NEIGHBOURHOOD CHANGE: TRACING THE IMPACT OF TORONTO'S HIGH-RISE BOOM

Abstract ID: 1133

Abstract within Pre-Organized Session 24

WEBB, Brian [Cardiff University] webbb1@cardiff.ac.uk, presenting author

To meet demand for housing, high-rise neighbourhood development has been utilised as a means of providing housing ownership options while also stimulating investment in urban areas. In their early incarnations the development of high-end apartment neighbourhoods typically act as a driver of urban gentrification and neighbourhood renewal due to the increase in middle-class residents. More recent high-end residential urban development has been marketed towards younger and more mobile populations as well as for investment rental purposes. There are also concerns that the new high-rise developments in urban cores are not being built so as to accommodate a range of demographics and also causes displacement of existing socio-demographic groups.

This paper seeks to understand socio-demographic neighbourhood level change resulting from high-rise condominium development in Toronto, Canada over the past 20 years. City data on registered condominium

developments is first used to classify condominium neighbourhoods as well as distinguish them from less developed neighbourhoods in the city. Key socio-demographic census variables are then used to develop an understanding of how different condominium neighbourhoods have changed in relation to other parts of the city. A typology of condominium neighbourhood change is developed to understand how high-rise development has altered the socio-economic characteristics of neighbourhoods in Toronto and what ramifications this has more widely for other cities pursuing similar high-rise condominium intensification strategies. Finally, wider reflections on the long-term impacts of high-rise condominium neighbourhoods as a form of vertical urbanisation are discussed.

FROM THE GENTRIFICATION OF THE CITY TO THE CONDOIZATION OF GENTRIFICATION? ASSESSING VERTICAL URBANIZATION IN CANADIAN METROPOLI

Abstract ID: 1134

Abstract within Pre-Organized Session 24

GRISDALE, Sean [University of Toronto] sean.grisdale@mail.utoronto.ca, presenting author

WALKS, Alan [University of Toronto] alan.walks@utoronto.ca, co-author

In expensive global cities like Toronto, processes of displacement and gentrification are increasingly associated with a major turn towards high-rise condominium development as the primary mode of new home building (Walks, Hawes and Simone, 2021). In many Canadian cities, a greater percentage of not only owner-occupied but also rental housing stock in the city's core is made up of these new-build, high-rise, "luxury" condo units (Rosen and Walks, 2015). In turn, these units tend to be much more expensive than existing rental stock and can only be afforded by certain demographics of people. As gentrification is traditionally understood to be a process associated with conversion of rental housing to owner-occupied housing that results in the direct displacement of existing, working-class residents (Glass, 1964), some contend that new-build gentrification cannot be considered as such because it does not result in direct displacement (Boddy 2007, Buzar, Hall and Ogden 2007). However, as Marcuse (1985) notes, indirect, exclusionary displacement can be seen even in neighborhoods that maintain or are even expanding their rental stock, insofar as rents are increasing such that when one household moves out, that another similar house would not be able to afford the same unit. Furthermore, many scholars of gentrification define it as the production of space for ever-more privileged residents. Acknowledging these expanded understandings of gentrification, and drawing on preliminary analysis of custom census data, this paper adds to more recent research in gentrification studies looking at how high density, market condominium development may be driving and continuing processes of gentrification in Toronto, Montreal and Vancouver (Walks and Maaranen, 2008) not only through displacement of renters by owners, but also by the turnover of renters within existing units, as well as the demand for vacant units that can be let on short-term rental markets. In this paper we test for three changes within the inner cities of Toronto, Montreal and Vancouver: a) disproportionate changes in income and social status, tenure, real (relative) rents and land values/house prices in neighbourhoods within the vicinity of new condominium development (ie "spillover effects"); b) changes in the incomes, social status, and real rents within existing condominium buildings (ie rental upward filtering), and c) changes in the price of inner-city condominium units relative to the metropolitan average change, as well as relative to the average change in the non-condominium sector (the relative re-positioning the value of the condo within inner-city space). Drawing on this three-part analysis, we demonstrate how the condominium – a key articulation of the verticalization of the inner city – has affected gentrification patterns in large Canadian cities, as well as the extent to which the condo sector itself has gentrified relative to other part of the larger housing system in each study city.

HIGH-RISE LIVING, PUBLIC SPACE AND SOCIAL SUSTAINABILITY

Abstract ID: 1202

Abstract within Pre-Organized Session 24

LEHRER, Ute [York University] lehrer@yorku.ca, presenting author

MARCH, Loren [University of Toronto] lorenmackenziemarch@gmail.com, co-author

Central theme and research question: High-rise buildings have long been a significant form in urban development. But this vertical form of living comes with its own challenges and the COVID-19 pandemic of the last two years has magnified some of the problems for life in close proximity. The high-rise is not just as a built form; it is also a place where unique configurations of shared spaces and spatial practices exist. While a large body of work has emerged that seeks to understand the implications of verticality for urban living, very little has been said about the role of shared amenity spaces. In this paper, we will focus on the role of common spaces in high-rise buildings. How might these common areas destabilize or transgress the vertical form? Conceptually, following Henri Lefebvre's fertile theorization of the social production of space, we will argue that shared spaces, as a multidimensional phenomenon, have the potential to become public space.

Approach and methodology: The role of public space in high-rise apartments will be deliberated by using examples from two different time periods: from the 1950 to the 1980s and from the 2000 to today, research that builds on earlier and more recent work. We observe revisitations of past imaginaries and built forms in high-rise development, whose emergent hybrid and contradictory forms of public space now pose new possibilities for everyday life and spatial practice in these buildings. Within verticality's built and social environments, there is great potential for the fostering of transformative capacity around what John Friedmann describes as the “Good society”. If social sustainability in urban design is understood as infrastructure supporting social and cultural life, then these common spaces are sites of precisely that: creating opportunities for social sustainability. The paper will draw from both theoretical work in the context of public space and high-rise living, as well as original field research which will be conducted over the summer months. We will conduct interview with inhabitants of selected high-rise neighborhoods in Toronto and how they make use of amenities. We will address experiences before, during and after the of the pandemic with these and other shared spaces (such as lobbies and elevators).

Meaningful findings: Since the analysis of shared spaces in condominiums is something that is seldomly done, we hope to contribute to a better understanding of these spaces in the social wellbeing of its inhabitants.

Relevance and implications of your work to planning scholarship, practice, and/or education: This research can guide planning for future high-rise neighborhoods, focusing not only on its economic viability but also its social sustainability.

LIVING WITH INEQUALITIES: EXPLORING THE SOCIAL AMONG RACIALIZED NEW IMMIGRANTS RESIDING IN A 'MIXED' SUBURBAN NEIGHBOURHOOD OF TORONTO

Abstract ID: 1203

GHOSH, Sutama [Toronto Metropolitan University] sutama@ryerson.ca, presenting author

Within the past two decades, neighbourhood has reemerged as an appropriate analytical scale for socio-spatial analysis. In this context, Canadian urban geographers have been particularly captivated by suburbanisms. While debates have centred around the universality of the processes and outcomes of suburbanisms, concerns have been raised regarding the fast pace in which Canadian cities are becoming more socially and spatially polarized. Although smaller in scale, qualitative research studies have advanced this discussion by not only questioning previously taken-for-granted conceptions and borders of neighbourhoods, but also demonstrating that, like homeowners, renters in high-rise apartments engage in neighbouring practices to form “vertical neighbourhoods”. These studies have also shown that the borders of such neighbourhoods as identified by participants do not match with those defined by the city.

Using intersectionality as an interpretive framework, this paper documents and analyzes the experiences of racialized minorities within a structurally and socially mixed neighbourhood - Rexdale. The study analyses information collected from census data (2001 to 2016), field observations, 10 key informant interviews, 8 focus group discussions, and 40 follow-up in-depth interviews with current residents. The focus group and interview participants were selected with maximal variation sampling in mind, and therefore included both long and short-term residents, renters and homeowners, and immigrants from a variety of countries (e.g., the Caribbean, India, Pakistan, Colombia, and Iraq). The study found that the changing infrastructural and socio-demographic context of Rexdale not only differentially affected the everyday lives of residents, but also their individual and social resilience to overcome increasing inequalities.

NEGOTIATING THE POLITICS OF LAND AND VALUE 2

Pre-Organized Session 26 - Summary

Session Includes 1166, 1167, 1168, 1263

SHIH, Mi [Rutgers, The State University of New Jersey, mi.shih@ejb.rutgers.edu, organizer

Amidst the globally widespread use of planning tools to facilitate land value extraction, there is growing contestation over valorizing land as an income-generating asset. In this organized session, we examine how the politics of land and value are negotiated through social practices by focusing on three major themes. First, we will discuss the plurality of land value and the conflicts between competing values. Session participants will examine how the conflicting types of land values come into focus as rapid urbanization and entrepreneurial governance have pushed large-scale land development to localities and regions that are usually environmentally precarious, socially marginal, and economically disadvantaged. Our second theme is valuation techniques and the ascribing of value to place. We will examine the ways in which valuation techniques and tools are employed in particular urban places as well as the resulting socioeconomic impacts on land and housing markets and people's everyday lives. Finally, we will examine the morality of land development and the place of the public in defining, negotiating, and anchoring captured value.

Objectives:

- To learn about the mechanisms, tools, practices, debates, and politics of land development and land value capture

FULFILLMENT PROPHECY: THE POLITICS OF AMAZON'S EXPANSION IN GREATER CHICAGOLAND

Abstract ID: 1166

NOLAN, Lauren [Rutgers, The State University of New Jersey] len27@scarletmail.rutgers.edu, presenting author

This paper considers the politics and processes surrounding Amazon's development of multiple large-scale fulfillment centers in Chicago's south suburbs. The geography of goods movement has changed appreciably over the past decade, and decentralization and consolidation in supply chain management and warehousing (Giuliano et al., 2013) has placed strategically-situated communities like Chicago's south suburbs at the center of debates over the benefits of such facilities, the environmental and other costs they impose, and how planning decisions should be made. This paper examines these debates through a case study drawn from document and public record analysis of local planning processes. It examines three facets of Amazon's expansion. First are the tools municipalities have used to usher in the development of these fulfillment centers. Tax breaks and other economic development tools remain controversial (Bartik, 2020), and this case documents how these tools have been deployed in the local context. Second, it illuminates the political processes and power structures governing the placement of these facilities—processes that unfold amid structural conditions impacting investment and disinvestment, land valuation, and equity concerns. Chicago's south suburbs, still reeling from the foreclosure crisis with declining tax revenues that drive property tax rates to double that of Chicago's northern and western suburbs, are eager to attract jobs and tax ratables. However, warehousing distribution facilities produce significant negative environmental externalities (Dablanc et al., 2013), and minoritized communities, which characterizes much of Chicago's south suburbs, are already home to a disproportionate share of warehousing facilities (Yuan, 2021). Third, this paper explores the role of the public in the development process, narratives various actors use to characterize these developments, and what they mean for the futures of these communities. Nondisclosure agreements, secrecy, and intermediaries steering mobile capital (Wood & Phelps, 2020) undermine the role of the public in the decision-making process. This paper furthers our understanding of how these political processes and mechanisms unfold in the warehouse development context, and the tensions and tradeoffs they produce. Specifically, it illuminates questions of who benefits from such development, who bears the cost, and who gets to make these planning decisions.

CIVIC MOBILIZATION AND PUBLIC LAND IN WEST PHILADELPHIA'S MANTUA NEIGHBORHOOD 2013-2022

Abstract ID: 1167

Abstract within Pre-Organized Session 26

WOLF-POWERS, Anna Laura [Hunter College, City University of New York] aw2416@hunter.cuny.edu, presenting author

This paper considers the land-related actions of civil society organizations in the West Philadelphia neighborhood of Mantua in the 2010s, a time during which Drexel University's assembly of land and capital for innovation-themed real estate projects was exerting extreme upward pressure on property prices in that neighborhood and other nearby low-income areas. It explores the terms on which resident-controlled groups mobilized to gain title to city-owned land so as to initiate new development they saw as compatible with the character of their neighborhood: namely, renter- and owner-occupied units affordable to people with stable but relatively low incomes. As market-driven appreciation of real estate close to Drexel's uCity Square and Schuylkill Yards developments proceeded, leaders in Mantua identified publicly owned vacant land as a potential resource and moved to enable mission-driven organizations to acquire it. At the same time, they engaged in what many members of the larger policy community regarded as a misguided effort to change neighborhood zoning to disallow as-of-right development of multi-unit buildings.

Mantua organizations' modestly successful efforts during this period illustrate the profound obstacles that face community actors attempting to valorize land as a source of social, cultural, and ecological value separate from its worth as a fungible financial asset. As they negotiated the byzantine politics of economic development policy, land use

regulation, and public land disposition in the City of Philadelphia, the groups found themselves in a variety of governmental arenas where land-related social practices were distorted both by perceived fiscal imperatives and by constructions of value wedded to the interests of distant financial investors. The paper speculates on the potential for grassroots organizations and progressive legislators to create institutions and norms that disrupt these dynamics going forward.

CONSTRUCTING VALUE THROUGH ACTION: NEGOTIATING THE POLITICS OF INFORMAL HOUSING AND PUBLIC LAND

Abstract ID: 1168

Abstract within Pre-Organized Session 26

SHIH, Mi [Rutgers, The State University of New Jersey] mi.shih@ejb.rutgers.edu, presenting author
LIN, Fang-Cheng [Trans-Pacific Community Design] fchenglin@gmail.com, co-author
KANG, Min-Jay [National Taiwan University] kminjay@ntu.edu.tw, co-author
LIU, John K.C. [National Taiwan University] kcliu@ntu.edu.tw, co-author

The neglect, exclusion, and demolition faced by residents in informal settlements, a form and way of life particularly salient in cities in the Global South, suggest that the value of autoconstructed housing, while existential to the urban poor and widely accepted by urban scholars, has yet to be politically recognized by the formal governance and property regime (Caldeira, 2017; Simone, 2019; Turner, 1972). In this article, our empirical entry point is a case study based on ethnographic fieldwork of an informal settlement called Treasure Hill in Taipei, Taiwan. We interrogate the years-long and highly contested process of participatory, action-based planning through which community planners and residents negotiated the politics of occupation of public land in order to give value to self-built housing, community networks, and the material landscape of urban autoconstruction.

The history of Treasure Hill exemplifies how zoning practice often sidesteps and obscures difficult political-economic questions of systemic disinvestment in housing that are the structural roots of autoconstruction and informality. Straddling the Japanese ruling (1895-1945) and the KMT regime after WWII, a no-build zone was legally in place to protect the water of the Xindian River that skirted along Treasure Hill. It was also during this period marked by supposedly military-style land-use control, however, that Treasure Hill grew into a bustling settlement built by low-ranking veterans, rural migrants, and the urban poor—the segments of the urban population most often cast outside of state-sponsored housing schemes in postwar Taiwan. In 1980, the Taipei City Government rezoned the land on which more than 300 households had already lived for decades as an urban park, officially declaring residents' self-help homes illegal constructions and foreshadowing threats of demolition. This snapshot of Treasure Hill's decades-long encounter with demolition-inflected exclusionary zoning echoes AbdouMaliq Simone's statement that informality embodies "the sanctioned dis-attention to particular realities" (ibid, p. 617).

Drawing insights from scholarship on the social construction of value and ethnographic work on value making, conflicting values, and value transformation (McAuliffe and Rogers, 2019; Starecheski, 2016), we show that to give value to Treasure Hill, planners and residents have undertaken three main actions: 1) making informal housing politically visible; 2) leveraging beyond-local, non-zoning legal frameworks to legitimize autoconstructed spaces; and 3) using local knowledge to negotiate regulatory standards. In the article, we detail how in each action planners and residents insert agency into gaps in bureaucratic inertia, regulatory rigidity, technical depoliticization, dominant discourses, and habitual practices. We will also show that these actions create conditions for a political space where the legitimate uses and users of public land are no longer predetermined by land-use zoning and building codes but are negotiated through a social process of participation and engagement. The value that is given to Treasure Hill through actions of participatory planning and social negotiation is, then, not assigned in a narrowly economic sense but instead is constructed to include moral, social, and political values. Our work echoes what Simone argues: that to think about informality is to "constantly re-open the question of value—what is to be valued, by whom, and how?" (ibid, p. 618).

THE VIRTUOUS CIRCUIT: HONG KONG'S TAUTOLOGIES OF VALUE

Abstract ID: 1263

Abstract within Pre-Organized Session 26

GERLOFS, Ben [The University of Hong Kong] bgerlofs@hku.hk, presenting author

This paper investigates the relationship between popular understandings and ideologies of value and the politics of urban redevelopment in Hong Kong, drawing on iterative case study research focusing on neighborhood change conducted over two years in three distinct areas of the city. Across a host of political-economic transformations of the former British colony and Chinese Special Administrative Region, many scholars have argued that particular ways of conceiving of and perceiving the relationship between land, property, and value in Hong Kong have inhered among residents, which remain remarkably robust. In this paper, I argue that these discursive frames can and do shape the processes and outcomes of urban redevelopment in a variety of ways, from everyday parlance and the behaviors of individual residents to dynamic machinations of public policy. I theorize this relationship as a kind of feedback loop, which I refer to as the “virtuous circuit”, whereby policymakers and urban residents alike make and justify decisions based on shared understandings of value. Through several empirical examples, I outline some of the salient operational junctures in this circuit as well as its implications for the geographies of contemporary Hong Kong.

GOVERNING URBAN DEVELOPMENT: BETWEEN REGULATION AND COLLABORATION (ACSP-AESOP)

Pre-Organized Session 42 - Summary

Session Includes 1222, 1223, 1225, 1226, 1432

BIGGAR, Jeffrey [Dalhousie University] Jeffrey.biggar@dal.ca, organizer

Global real estate pressures and urbanization trends are pushing cities to expand and diversify their interactions with the property development industry. Cities complement their traditional planning roles with mechanisms ranging from multi-sectoral collaborations to entrepreneurial ventures that position cities as explicit market actors. Drawing on cases from diverse local contexts, this session will explore the implications of planning-development entanglements: Is an entrepreneurial mindset required to navigate the current commodified urban landscape, and does this shift come at the expense of other policy objectives? How do local actors employ development-oriented tools (i.e., negotiations) to fulfill objectives such as sustainability, intensification, social equity, and racial justice? To what

extent do development actors (planners and local groups) understand the variance within the private development sector in terms of local networks and specialization, and how do these actors leverage it to get the outcomes they want?

Objectives:

- Present empirical evidence on the current state of planning-development entanglements in varying local contexts.
- Understand how different local actors influence decision making processes in development and secure benefits from development projects
- Foster an interdisciplinary network of development-focused scholars.

COLLABORATIVE DEVELOPMENT OF SOCIAL INFRASTRUCTURE: LEARNING FROM TORONTO'S CREATIVE MIXED-USE MODEL

Abstract ID: 1222

Abstract within Pre-Organized Session 42

GEVA, Yinnon [University of Toronto] y.geva@utoronto.ca, presenting author
SIEMIATYCKI, Matti [University of Toronto] siemiatycki@geog.utoronto.ca, co-author

Finding space for social infrastructure is becoming increasingly difficult in cities experiencing densification and market pressures. Integrating social infrastructure into mixed-use real estate developments is a solution to these challenges that is also beneficial from an urban design standpoint (Mualam et al., 2019). Yet this approach faces notable obstacles: multi-sectoral collaborations are inherently complex and deter risk-averse partners (Huxham & Vangen, 2005); spatial exactions and other negotiation mechanisms are prone to manipulation by developers and politicians alike (Biggar, 2021); and the social benefit of mixing has been called into question in the face of exclusionary practices such as “poor doors”.

This study explores a potential solution to these issues found in an emergent form of development dubbed “Creative Mixed-Use”. The term refers to projects developed through ad-hoc partnerships between public, private, and nonprofit organizations, offering site-specific mixes of for-profit and social uses (Shipman & Siemiatycki, 2022). In the rapidly-densifying city of Toronto, such developments have introduced affordable housing, homeless shelters, and various community, health and education facilities. To conceptualize this model and assess its transferability to other setting, we ask: What processes and conditions that contribute to successful mixed-use social infrastructure development? How can mixed-use design achieve synergy at the building and urban scale? And what are the limitations of this model as a vehicle for social equity?

Our research builds on a census of 55 projects that were examined through interviews with stakeholders involved in development, and through a dataset of planning reports, media articles, professional case studies, and publicity materials. We draw on two main approaches to thematically analyze the data: the Theory of Collaborative Advantage (Huxham & Vangen, 2005), which identifies pathways to overcome tensions in collaborative efforts; and the literature on real estate governance, which explores the co-evolution of agendas and practices among planners and real estate market actors (Geva & Rosen, 2022).

Findings show that parties in all sectors seek collaboration when impasses (such as planning restrictions or community objections) prohibit them from achieving their goals alone. “Champion” individuals and high-capacity organizations supported the process by lending their reputation to risky projects and facilitating replication in other locations. A range of mixing patterns, from complete separation to full integration of uses, is utilized to accommodate the unique needs of each form of social infrastructure. The model is limited by the capability of social actors to engage in market actions, maximize the return on their investments and assets, and secure sustainable ownership and management agreements.

BARRIERS TO INTENSIFICATION IN THE MID-SIZED CANADIAN CITY: A CASE STUDY OF REGINA, SK

Abstract ID: 1223

Abstract within Pre-Organized Session 42

GRAHAM, Rylan [University of Northern British Columbia] Rylan.Graham@unbc.ca, presenting author

Regina, Saskatchewan, comparable to many of Canada's mid-sized cities, has established a policy agenda that aims to curb sprawl and encourage intensification. However, relative to Canada's largest cities, mid-sized cities have faced challenges in altering growth patterns and are less likely to see a significant shift towards intensification. Mid-sized cities are typically characterized as being dispersed, decentralized, and highly auto-dependent (Filion et al., 2004). Moreover, previous research found that residents prefer the convenience, privacy, and space that mid-sized cities offer (Bunting et al., 2007). Perhaps unsurprisingly, Regina has struggled to implement its 30% annual intensification target and is lagging well behind on the target to attract 10,000 new residents to the city centre – despite a policy shift nearly a decade ago. This research seeks to better understand why both targets have not been successfully implemented and why the 'say-do-gap' perpetuates. Specifically, this research addresses two central questions:

-What are the barriers impeding Regina's intensification targets?

-How can the City mitigate these barriers and stimulate market-led intensification?

To address these questions, a series of semi-structured interviews were conducted with experts involved with Regina's planning and development industry. Our findings uncover the most significant barriers impeding the implementation of the City's intensification targets. Moreover, based on informant insight, we identify the tools, actions, and programs that the municipality might enact to overcome the barriers identified and "prime the pump" to stimulate developer-led intensification. These findings offer an important contribution in understanding growth patterns in small and mid-sized Canadian cities, an understudied cohort of cities (Hartt & Hollander, 2018; Seasons, 2003).

URBAN REGENERATION IN CHINA: RECENT POLICY SHIFT FROM PROPERTY-LED REDEVELOPMENT TO MICRO-REGENERATION

Abstract ID: 1225

Abstract within Pre-Organized Session 42

WANG, Manqi [University College London] manqi.wang.16@ucl.ac.uk, presenting author

ZHANG, Fangzhu [University College London] fangzhu.zhang@ucl.ac.uk, co-author

FULONG, Wu [University College London] fulong.wu@ucl.ac.uk, co-author

An extensive literature documents the incentives, practices, and social impacts of large-scale property-led redevelopment in China (He and Wu, 2005). However, in 2015, the municipal government of Guangzhou drafted a new redevelopment policy called "micro-regeneration" (weigaizao), aiming to promote a new round of urban

redevelopment without large-scale demolition. Although some recent research discusses the new redevelopment policy from the perspective of governance (Wang et al., 2022; Wu et al., 2022), a few questions remain unanswered. Why does the redevelopment policy shift from large-scale property-led to micro-regeneration? Who are the key actors in micro-regeneration? How has the micro-regeneration process been influenced, co-produced, and implemented by different actors? What are the new features of this new type of redevelopment?

A mixed-method research design (semi-structured interviews, non-participant observations, and desk research) is incorporated for conducting this research, and we select a single case to have an in-depth understanding of the policy shift. The Yongqingfang case is a pilot project of Guangzhou, the provincial capital of Guangdong Province in southern China. We find that the policy shift from large-scale demolition to small-scale and incremental micro-regeneration is attributed to political, cultural, economic, and financial reasons (Wu, 2016). Politically, micro-regeneration is a tactic adopted by the local state to tackle the issue of increasing social contestations generated by large-scale redevelopment. Culturally, historical and cultural elements are selectively preserved to facilitate creative industry and increase land value. Economically, the policy helps the local state improve land-use efficiency by replacing the traditional neighborhood with a commercial and tourist hub. Financially, it is a new strategy for the local state to mobilize market investment to facilitate a new round of urban redevelopment.

In sum, the practices of this new type of redevelopment can be better captured as a performance of “state entrepreneurialism” that combines “planning centrality” and “market instruments” in local development agendas (Wu, 2018). The local state uses various market instruments such as real estate development and commercialization of local culture and heritage to achieve its specific economic, political, and social objectives at different times. The various performances of the local state are due to the changing strategies of the central government. This policy transformation also indicates “state sovereignty” here is to achieve the objectives of the state, which is not necessarily confined to revenue maximization (Wu et al., 2021). In terms of social impacts, though grassroots have changed the pace and direction of the redevelopment, most of the local residents in the neighborhood are displaced. To fully understand the policy shift from large-scale property-led redevelopment to micro-regeneration and its practices in urban China, more in-depth case studies and causality analysis are needed for future research.

GOVERNING URBAN DEVELOPMENT FUTURES IN LATIN AMERICA

Abstract ID: 1226

Abstract within Pre-Organized Session 42

BLANC, Francesca [Politecnico di Torino] Francesca.blanc@polito.it, presenting author

Spatial governance and planning systems (SGPSs) are intended as the heterogeneous institutional frameworks allowing the management and the regulation of spatial organization within a certain society. The state-market relationship has been historically acknowledged as the main driver of spatial development, with recent contributions reckoning the complementary role of the necessity and the necessity-market in steering spatial development in the global South, and specifically in Latin American countries (Abramo, 2012). As reckoned by a number of scholars, spatial planning frequently occurs as the final stage of the urban development process when the land occupation and the building activities have already taken place. This happens in several countries from the global South, where the state seems not able to steer the urban development and consequently acts through an ‘ex-post regularization activity’ (Blanc et al., 2022), by acknowledging the land-use development rights already taken on the ground. However, when looking at the non-bureaucratized practices, it is possible to reckon ‘[an]other institutional’ (Ibid., 2022), i.e. the existence of alternative planning practices emerging from outside the official SGPSs. This paper compares the empirical research previously developed by the author in six Latin American countries –namely Argentina, Bolivia, Chile, Ecuador, Peru, and Uruguay– in so doing adopting ‘a posteriori comparison’ methodological approach (Montero & Baiocchi, 2021), which means looking through the cases after the research has been done. The heterogeneity of the cases and their peculiarities allow to reflect on the existing frictions

between the official SGPSs and the current planning practices. Even if spatial planning tools exist, they are often outdated or do not respond to the current societal needs, and the lack of participatory instances in planning processes stands out as a common feature. This situation has forced the civil society to produce alternative forms of ‘institutionality’, by leading to informal land-use management practices or to the mobilization of legal expertise to solve urban conflicts through the courts (Sotomayor et al., forthcoming). As a consequence, the same definition of SGPS as an ‘institutional technology’ (Janin Rivolin, 2012) is here questioned. What perspectives does the ‘other institutionality’ open to? The research findings suggest that the emerging ‘other institutionality’ is the one that better seems to face the dynamic and changing societal needs bypassing the existing rigid and outdated planning tools as well as the lack of participatory planning instances. Governing urban development futures in Latin America and beyond necessarily goes through a more fluid and broader understanding of SGPSs themselves, which could benefit the actions of both the policymakers and the practitioners involved in planning processes, as well as it opens to interesting research avenues both in the global South and in the global North.

PROGRESSIVE CITY IN A NEOLIBERAL STATE: EXPLORING RENTAL HOUSING POLICY IN TEL AVIV-JAFFA

Abstract ID: 1432

Abstract within Pre-Organized Session 42

ROSEN, Gillad [The Institute of Urban and Regional Studies, The Hebrew University of Jerusalem]
gillad.rosen@mail.huji.ac.il, presenting author

CHARNEY, Igal [University of Haifa] charney@geo.haifa.ac.il, co-author

MEYER WEISSBERG, Camila [Institute of Urban and Regional Studies, The Hebrew University of Jerusalem]
camila.meyerweiss@mail.huji.ac.il, co-author

Housing policy has been in the firm grip of Israel’s central government agencies, which traditionally favored homeownership. However, the rapidly growing cost of living and housing unaffordability nationwide has brought the government to reconsider its housing policy. As a result, it has introduced policies that support increasing housing supply and developing long-term rental projects. Recently, long-term rentals in the form of Built-to-Rent have been a fast growing sector in housing markets across the globe (August, 2020; Nethercote, 2020; Brill & Durrant, 2021). This research focuses on the entrepreneurial and inclusive housing path the city of Tel-Aviv-Jaffa has adopted. Tel Aviv is the country’s most influential and innovative municipality, often metaphorically addressed as a separate entity within Israel – the “State of Tel Aviv”. We examine the motivations and the mechanisms that Tel Aviv applies towards securing a more social-sensitive rental housing policy which does not yield to the exclusivity of the neoliberal agenda. For this purpose we use a mixed-method approach based chiefly on semi-structured interviews conducted with key players in the local and national housing industry, and analysis of municipal reports, plans, and planning committees protocols. Theoretically our work engages with current debates on equity planning and financialization of rental housing (Biggar & Friendly, 2022; Geva & Rosen, 2022). The ability of Tel Aviv to pursue a more progressive housing policy than dictated by the state builds on its institutional capacities: visionary leadership, professional planning staff, land and financial resources. As a forerunner, Tel Aviv promotes several intervention paths. First, it forms ad-hoc collaborations with the state-owned rental housing corporation. Second, it acts as a developer on municipal-owned land to promote long-term rental housing. Third, the municipality advances urban regeneration and residential intensification, and negotiates with developers to increase the number of rental apartments in these projects.

CLIMATE CHANGE IN FLORIDA: FISCAL, GOVERNANCE, COMMUNITY AND LAND USE PERSPECTIVES

Pre-Organized Session 57 - Summary

Session Includes 1115, 1362, 1363, 1364

LINKOUS, Evangeline [University of South Florida] elinkous@usf.edu, organizer

Florida is often considered ground zero for climate change impacts in the U.S. However, the policy response in Florida has been limited and incremental, all while population growth and coastal real estate development continue with few signs of slowdown. This session brings together a group of Florida-based scholars to highlight the breadth of climate change-related issues facing Florida. Papers in this session address issues of climate displacement, fiscal vulnerability, institutional capacity, and land use planning policy. Collectively, this session explores how policy responses for Florida's coastal areas will impact economic, environmental, and community resiliency in the Sunshine State.

Objectives:

- Present and assess Florida local government policies that respond to climate change
- Highlight the impacts of climate change on Florida communities
- Examine opportunities, challenges, and barriers to enhancing coastal area planning in Florida

DENSITY INCREASES IN THE COASTAL HIGH HAZARD AREA: HOW FLORIDA LOCAL GOVERNMENTS REGULATE NEW RESIDENTIAL DEVELOPMENT IN FLOOD ZONES

Abstract ID: 1115

Abstract within Pre-Organized Session 57

LINKOUS, Evangeline [University of South Florida] elinkous@usf.edu, presenting author

This research examines Florida local government policies that address development in the places where people, property, and infrastructure are most at risk from storm surges. Under Florida Statutes, Coastal High Hazard Areas (CHHA) are defined as the area below the elevation of a Category 1 storm surge line and are those places most likely to be significantly damaged or submerged by sea water. Florida requires that local governments designate CHHA areas within the local comprehensive plan and limit CHHA development in accordance with the hurricane evacuation capacities supported by local transportation infrastructure. Although Florida's CHHA rules have changed over time since first adopted as part of the 1985 Growth Management Act, the overall intent has been to limit development in the CHHA for the purpose of maintaining evacuation capacity and minimizing loss related to public infrastructure and other public expenditures (Puszkin-Chevlin and Esnard, 2009).

Many Florida communities have long-established policies prohibiting additional residential density in the CHHA, resulting in zoning codes that are "frozen in time" (Puszkin-Chevlin and Esnard, 2009, 36). This led to concerns about the abilities of some communities to accommodate projected population growth, support economic development, and provide affordable housing. These concerns were amplified following a 2016 update to the Florida Sea, Lake, and Overland Surges from Hurricanes (SLOSH) model used to identify the CHHA. In many communities, the update resulted in a significant expansion of the CHHA. For example, the City of St. Petersburg faced a 41% increase in the CHHA following the 2016 model update; this in turn resulted in text amendments to their Comprehensive Plan in

2020 that shifted from a strict prohibition of new development in the CHHA to a criteria-based project evaluation approach.

This research provides a survey of Florida local government policies for accommodating residential density in the CHHA. Specifically, it addresses three research questions:

- What are the local government's baseline rules for addressing new density in the CHHA?
- How have requests for additional density in the CHHA been decided over the last decade?
- What changes to the CHHA density rules have been considered or adopted since the 2016 update?

The research includes two phases. In phase one, a survey of local government comprehensive plans that include Coastal Management Elements was conducted to identify policies for addressing new density in the CHHA. Policies were analyzed to identify major approaches, such as those that strictly limit new density, those that incorporate incentives such as transferable development rights that direct density to specific areas, and those that use criteria such as building code or hurricane evacuation standards to permit density increases. For this phase, data collection is complete and analysis is underway.

In phase two, case studies of at least four Florida communities will be conducted (Summer and Fall 2022) to examine how requests for additional density in the CHHA have been decided over the last decade and to identify CHHA density rule changes that have been proposed or adopted. The case study research will include interviews with key stakeholders, a review of relevant planning decision meeting minutes, and analysis of local media coverage.

The research will provide information about best practices in addressing density in flood prone areas. Florida's experiences provide instructive lessons on the balancing act involved between protecting human lives and public assets, preventing climate gentrification, and accommodating demand for housing and redevelopment near existing urban infrastructure.

ADVOCACY PERSPECTIVES ON CLIMATE GENTRIFICATION IN FLORIDA: CASES STUDIES FROM DUVAL, PINELLAS AND MIAMI-DADE COUNTIES

Abstract ID: 1362

Abstract within Pre-Organized Session 57

HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, presenting author
JACKSON, April [University of Illinois Chicago] ajacks29@uic.edu, co-author
BUTLER, William [Florida State University] wbutler@fsu.edu, co-author

Encroaching sea levels may lead to eventual mass migration away from Florida's densely populated coast. Lower income communities of color located inland on higher ground may become prime relocation sites for investment and climate upgrading to create new safe havens for climate migrants. These inland communities are often marginalized in planning and decision-making process and receive little of the technical assistance, funding or economic benefits associated with climate adaptations (Morrow et al. 2019). Scholars have begun to speculate about where coastal residents might move (Hauer et al. 2020) and the impact it will have on existing inland residents which has given rise to increasing interest in the potential and process of "climate gentrification" (Keenan et al. 2018). However, planners and policymakers have yet to focus much attention on these converging dynamics of displacement (Butler et al. 2021).

While public sector actors have been slow to adopt policies and practices to get ahead of the sea level rise problem (Fu, 2020), non-profit and community organizations involved in affordable housing, community development and environmental justice have taken the lead in bringing attention to the potential impacts and desired policy directs to address climate gentrification. In this paper, we ask: What are advocacy planning organizations doing to address climate gentrification concerns and what impacts are they having on public discourse, projects, plans, and policies? The paper presents comparisons across key advocacy organizations in large coastal metro regions of Miami, Tampa Bay, and Jacksonville and their approaches to promote more climate equitable and resilient decision-making processes and outcomes for inland lower income communities of color.

Catalyst Miami is a vocal grassroots organization operating across different spheres related to environmental and social justice. Groundworks JAX in Jacksonville seeks to advance an integrated incorporation of economic, environment, education, and equity principles to empower residents through environmental planning processes. United Way Suncoast in Tampa Bay Region is a multi-jurisdictional spanning organization focused on breaking the cycle of poverty by establishing local programs to help increase individual and household incomes and build financial assets. These organizations and others like them are working to call attention to climate equity issues in their respective regions and push the public sector to develop more robust responses. They are working to identify community needs, conduct visioning activities, developing plans, and building capacity to implement programs and projects in at-risk neighborhoods.

The pathways in which these organizations operate to advocate for their constituents vary. Catalyst Miami is highly engaged in political dialogue with city officials and policy makers and also working to empower residents to spearhead organizing campaigns that challenge city actions. Groundworks JAX seeks to develop more collaborative relationships with government but access to and inclusion in decision making processes continue to lag. United Way is well recognized with a wide range of partnerships to support community and neighborhood development. However, these connections do not extend to climate and resilience planning efforts. These cases indicate a growing concern about the pace of gentrification related displacement in many lower income neighborhoods and often frustrated by the lack of attention to affordable housing and the compounding impacts climate change will have on these trends. Coalitions and collaborations developed by these community advocacy organizations are helping to fill gaps left by city-county agencies.

This research highlights the important role advocacy planning organizations play in promoting more locally applicable and integrated approaches to bring together resilience programs, affordable housing programs, and neighborhood stabilization programs into a more coordinated effort to address climate impacts, manage externalities of climate adaptations and chart an equitable and climate resilient Florida.

Built on sea, sunshine, and sand, Florida relies on in-migration and coastal development for retirees, snowbirds, second homeowners, and vacationers (Chapin, 2017; Grunwald, 2006). Reliance on and support for growth permeates the state's land governance system, from its tax structure, to zoning and land use regulations, to infrastructure policies. In this context, climate change not only physically threatens the built environment, but also an entire urban governance framework that depends on the stationarity of land. While state and local climate adaptation efforts are advancing, major disconnects remain between advocacy for physical infrastructure resilience on one hand and contending with fiscal and governance realities of climate impacts on the other (Shi & Varuzzo, 2020).

In this paper, we ask, what are the impacts of sea level rise (SLR) for Florida's municipal fiscal stress? We conduct a spatial analysis of municipal own source revenues at risk of chronic inundation in coastal Florida due to 6.4 feet of SLR, which may take place by 2100. To our knowledge, this is the first statewide, municipal assessment of fiscal impact for Florida, though other studies have estimated the risks to businesses, infrastructure, property values, and fiscal risks at aggregated levels (such as census county divisions or the state) (see e.g., Fu et al., 2016). We complement this with a statewide survey of local coastal planners and managers to assess how they are attempting to fund SLR adaptation responses and what barriers they face.

We find that 209 or 51% of Florida's 411 municipalities are impacted by 6.4 feet of SLR, with 106 municipalities having over 25% of their current total revenues deriving from sources that may be chronically inundated by 2100. An estimated \$1.35 billion property taxes and \$1.82 billion in user fees and charges (as of 2015) are at risk given projected SLR, equaling 50% of the total property taxes, fees, and charges currently collected from these locales. The most fiscally exposed municipalities are disproportionately whiter, wealthier, denser, and more land constrained compared to those with lower exposure. Coastal planners and managers identify the costs of planning and implementing SLR adaptation projects as the top barriers to making progress on SLR adaptation in the state (Butler et al., 2021). Moreover, survey respondents noted that they depend heavily on current staffing and local budget allocations to address SLR adaptation. This poses a fiscal conundrum as they struggle to protect sources of tax revenue. Yet, we find no relationship between the level to which municipalities are fiscally exposed and their prioritization of climate adaptation.

These findings affect the feasibility, equity, and scale of future adaptation. First, local officials are underestimating the fiscal impacts of climate change. They are relying on revenue sources for adaptation that will become increasingly eroded by climate change, market internalization of climate risks, and property devaluation following flood insurance premium hikes, thereby undermining local adaptive capacity. Second, the comparative privilege of affected communities raises questions about the level of priority such communities should receive, as well as concerns of regional gentrification and displacement if these communities move to less affected inland communities. Finally, both these concerns raise the issue of the appropriate scale of land governance and tax redistribution to overcome the current constraints facing coastal and near-coast communities. Below, we discuss the context and drivers behind Florida's fiscal vulnerability, present the findings from each dataset followed by their cross-cutting implications, and conclude with implications for state and local policy.

BUILDING CLIMATE CAPACITY AT THE REGIONAL SCALE: DIVERSE PATHWAYS OF CLIMATE COLLABORATIVES IN FLORIDA

GOODISON, Crystal [University of Florida] goody@geoplan.ufl.edu, presenting author
LAHAV, Sean [Florida State University] slahav21@gmail.com, co-author
BUTLER, William [Florida State University] wbutler@fsu.edu, co-author
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author

Regional climate collaboratives (RCCs) have emerged since the mid-to-late 2000s to build local capacity, exchange knowledge, and work collaboratively to address climate impacts across sectors and jurisdictions. Drawing from a lineage of regional planning and collaborative governance approaches, RCCs are largely voluntary, ad-hoc networks with no legal authority. One of the earliest groups, the Southeast Florida Regional Climate Change Compact, established in 2009 (Vella et al., 2016), has motivated other regions in Florida to follow suit. The regions of Tampa Bay, East Central Florida, and Northeast Florida each have formalized collaboratives, with discussions underway in other regions. While RCCs appear to be the chosen vehicle to catalyze climate action in Florida, the challenges of voluntary, regional collaboration loom large. These groups must contend with lack of funding, institutional constraints, lack of authority, respecting local authority and autonomy, and defining shared goals (Adams & French, 2019, Bennett & Grannis, 2017, Shi, 2017).

Even with these hurdles, RCCs in Florida are gaining momentum, attracting members, and building legitimacy. In this research, we used a comparative case study method to examine the origins of four Florida's RCCs, their approaches to network building, and the early outcomes of their collaborative efforts. We applied Innes and Booher's (1999) Consensus Building and Complex Adaptive Systems framework to our analysis of RCCs as a way to evaluate the extent to which these groups build the foundations of effective regional climate action. In particular, we examine the intangible outcomes (products) developed as foundational first-order effects, which include social, intellectual, and political capital. This research is based on a long-term data collection effort on regional planning for climate change adaptation in Florida. Since 2012, the authors have independently and collectively been involved in various aspects of this work from studying specific RCCs to participating directly in them. Primary data sources include documents, interviews, and participant observations.

Our comparative cases highlight how different approaches to regional collaboration build intangible products (social, intellectual, and political capital), which are foundation for facilitating tangible outcomes later. As network entities, RCCs develop the structure that allows individuals and groups to connect, build trust, and share resources. We found that RCCs convened stakeholders through steering committee meetings, workshops, and summits, which provided opportunities to build social capital and deepen relationships. We also find that RCCs have helped local governments navigate the complexity and uncertainty of climate change planning by positioning themselves as the hubs for knowledge and information exchange. Florida RCCs have been effective at sharing information, training stakeholders on tools and adaptation strategies, and pooling resources to develop technical information, such as unified sea level rise (SLR) projections. These activities have built intellectual capital, helping to shape mutual understanding and problem frames while using agreed upon data and information to define, refine, and inform planning efforts. Finally, we find that RCCs are building political legitimacy and buy-in at multiple scales. The elected bodies of numerous local governments have voted to adopt MOUs, which commit to collaboration with the RCCs. At the state level, the Compact influenced state level policy with establishment of Adaptation Action Areas to address areas at risk from SLR. RCCs also gained statewide legitimacy during the 2021 legislative session when they were singled out for funding to support SLR adaptation efforts.

Our cases show the diverse ways in which RCCs in Florida are developing intangible products, which lay the groundwork for future work and results on the ground. As cities and counties continue to invest in RCCs, more scholarship is needed to determine the limits of these collaborative vehicles and how early outcomes might translate into long-term outcomes for addressing climate change impacts.

PLANNING FOR INCLUSIVE CITIES: OVERCOMING CONSTRAINTS TO FAIR HOUSING IN CALIFORNIA AND BEYOND

Pre-Organized Session 121 - Summary

Session Includes 1867, 1868, 1869, 1870

MONKKONEN, Paavo [University of California, Los Angeles] paavo.monkkonen@ucla.edu, organizer

The papers in this session focus on efforts to regulate local land use planning, and details of the challenges in forcing local governments to change land use planning practice in a way that is necessary to create inclusive cities. California's incorporation of an Affirmatively Furthering Fair Housing (AFFH) mandate into its existing statewide planning process raises questions about how higher levels of government can most effectively encourage local governments to change and the conflation of race and income in the analysis and implementation of fair housing. Papers in the panel focus on these new questions and challenges, as well as a longstanding component of California's statewide housing planning process, the analysis (and removal) of constraints to housing production, and the measurement of opportunity.

Objectives:

- How and whether local governments are affirmatively furthering fair housing, and how this can be assessed
- Tensions in the use of income as a proxy for race in fair housing analysis and implementation
- Analysis of constraints to housing production

ARE CALIFORNIA CITIES AFFIRMATIVELY FURTHERING FAIR HOUSING?

Abstract ID: 1867

Abstract within Pre-Organized Session 121

MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, presenting author

The Affirmatively Furthering Fair Housing (AFFH) component of the 1968 federal Fair Housing Act required local governments to take actions to reverse the legacy of racial segregation in cities. Federal AFFH rules were never aggressively implemented. In 2017, California began requiring local governments to AFFH in periodic updates to housing plans, with detailed lists of sites apt for affordable housing development. A state level AFFH rule creates a greater potential for change because unlike federal leverage over municipalities, which is limited to funding, state governments can and do insert themselves directly into land use planning. Yet, measurement and expectations are major challenges to progress on AFFH. Current approaches to fair housing analysis are often copious but do not measure plans in a manner that can assess potential for change. In this study, we ask, are Southern California cities promoting segregation or inclusion across neighborhoods through their housing plans? We answer this question by analyzing the neighborhood characteristics of multi-family zoning in roughly 200 cities as well as the parcels these cities are making available for affordable housing development in their housing plans. We assess whether any of these plans will change the status quo connection between zoning and opportunity. The findings raise a core challenge for the AFFH mandate, without clear expectations will cities make the necessary changes to “replace segregated living patterns with truly integrated and balanced living patterns”?

THE CONFLATION OF RACE AND SOCIOECONOMIC STATUS IN FAIR HOUSING PLANNING EFFORTS

Abstract ID: 1868

Abstract within Pre-Organized Session 121

SILVERSTEIN, Thomas [Lawyers' Committee for Civil Rights Under Law] tsilverstein@lawyerscommittee.org, presenting author

The federal Fair Housing Act's affirmatively furthering fair housing (AFFH) mandate requires that federal agencies that administer housing and community developments funds, as well as their state and local government grantees, explicitly consider race and patterns of residential racial segregation when designing and implementing housing and community development programs. See *Shannon v. U.S. Dep't of Hous. & Urb. Dev.*, 436 F.2d 809, 821-22 (3d Cir. 1970) (listing factors that the federal government should take into account when making housing investments); see also *Otero v. New York City Hous. Auth.*, 484 F.2d 1122, 1133-34 (2d Cir. 1973) (holding that the federal government's AFFH obligation extended to a local housing authority administering federal funds). Moreover, claims that focusing on housing needs by income level, without also considering race, is sufficient to fulfill AFFH obligations have not been successful. *U.S. ex rel. Anti-Discrimination Center of Metro New York, Inc. v. Westchester County*, 668 F. Supp. 2d 548, 564-65 (S.D.N.Y. 2009) (holding that use of income as a proxy for race in a municipal fair housing plan did not comply with the AFFH obligation). When the State of California created a state law AFFH obligation through the passage of A.B. 686 in 2018, the Legislature decided to embed the requirement to produce local fair housing plans in the existing Housing Element law, which requires municipalities to engage in planning that facilitates the development of sufficient housing at various income levels to satisfy their Regional Housing Needs Allocations (RHNA's). In other words, although A.B. 686 itself both directly and indirectly requires that local governments consider race, the law seeks to leverage existing structures that focus on socioeconomic status. As California local governments begin to comply with A.B. 686 by producing fair housing plans as components of their Housing Elements, this structure invites the questions of (1) whether local Housing Elements include policies and programs that reflect explicit consideration of race and patterns of residential racial segregation rather than relying on race-neutral, predominantly income-based proxies and (2) whether administration by the California Department of Housing and Community Development (HCD) and regional councils of governments of the overarching structure for Housing Elements and their AFFH component likewise avoid the conflation of race and socioeconomic status. To begin to gain a partial understanding of the answers of these two questions, I will assess (1) the extent to which Housing Elements submitted to HCD by local governments in Southern California that include both high-income predominantly, white census tracts and high-income census tracts where people of color comprise larger shares of people of color differentiate between those areas in prioritizing zoning changes and identifying sites for future development; (2) the extent to which Housing Elements submitted to HCD by local governments in Southern California with higher concentrations of white residents than the region as a whole analyze the impact of local preferences for admission to affordable housing and call for the elimination or modification of such preferences; and (3) the extent to which RHNA allocations for high-income local governments differ based on the racial demographics of those communities. To the extent that this research reveals systemic failures to race, rather than socioeconomic status, in AFFH efforts, it could inform recommendations for future HCD guidance and for changes to the RHNA process to create better alignment with the AFFH mandate of A.B. 686.

MEASURING LOCAL POLICY TO ADVANCE FAIR HOUSING

Abstract ID: 1869

ONEILL, Moira [University of Virginia] moiraoneill@virginia.edu, presenting author
ELEMENDORF, Christopher [University of California, Davis] cselmendorf@ucdavis.edu, co-author
MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, co-author
BIBER, Eric [University of California, Berkeley] ebiber@law.berkeley.edu, co-author

California's enactment of AB 686 in 2017 to Affirmatively Further Fair Housing requires all cities and counties to take "meaningful action" to affirmatively further fair housing (AFFH) (Housing Discrimination: affirmatively furthering fair housing, AB-686 Chapter 958 "Bill Analysis" and "Text," 2017-2018 Reg. Ses.; Bill Analysis, Housing Discrimination: affirmatively furthering fair housing, AB-686 Chapter 958, 2017-2018 Reg. Ses.; Housing Discrimination: affirmatively furthering fair housing, AB-686 Chapter 958, 2017-2018 Reg. Ses.). AB 686 requires that local governments use local, state, and federal data in this process. This requirement builds on California's signature fair share Housing Element law.

Housing Element law requires jurisdictions to plan and zone for density to accommodate their regional housing need (Cal. Gov't. Code § 65583 et seq.). The law requires (among other things) that cities and counties identify and correct for regulatory constraints on housing production that would support meeting production targets set by a Regional Housing Need Allocation (Cal. Gov. Code Sections 65580 to 65889.11). Although Housing Element law uses density as a proxy for affordability of housing for low-income residents, the law considers that regulatory obstacles to production, particularly affordable development, can include more than inadequate land zoned for density. Development review processes can operate to burden, limit, or block multi-family and affordable housing. Thus Housing Element law also demands cities identify process constraints to production within the planning process, propose corrections, and annually report out on development approvals and denials. Recent amendments to this law increase local level reporting requirements, theoretically providing even more local level data to inform and correct for regulatory constraints to fair housing goals.

Are cities identifying regulatory constraints on production? Are the annual reports accurate? This paper examines whether 24 California have identified any regulatory constraints in recent planning processes and proposed policy corrections. The research draws on granular local-level data on how land use regulation (state and local) impacts multi-family development. This allows us to compare each cities' self-assessment of its own regulation in the planning process, and the quality of its annual reporting, against independently verified and cleaned housing approval data. The analysis offers insight into whether California's AFFH and Housing Element law is on track to produce quality local level data to identify and correct for regulatory constraints on housing production—particularly affordable housing production—to support fair housing policy.

HAVE CALIFORNIA'S ACCESSORY DWELLING UNIT REFORMS LEVELED THE PLAYING FIELD AMONG CITIES?

Abstract ID: 1870

Abstract within Pre-Organized Session 121

MARANTZ, Nicholas [University of California Irvine] nmarantz@uci.edu, presenting author
ELMENDORF, Christopher [University of California, Davis] cselmendorf@ucdavis.edu, co-author
KIM, Youjin [University of California, Irvine] youjinbk@uci.edu, co-author

Housing advocates have long touted accessory dwelling units (ADUs) as a potential solution to soaring housing costs in coastal metro areas. Beginning in the early 1980s, California legislators repeatedly modified state law to foster ADU development, but – until recently – these reforms were widely viewed as ineffectual. State law empowered local governments to permit ADUs, but did not sufficiently constrain localities from imposing onerous substantive and procedural requirements on ADU development. State legislators recognized this problem, and – between 2015 and

2017 – adopted a set of reforms essentially requiring local governments to establish reasonable, objective criteria for ADUs and to approve code-compliant units on lots with single-family homes. In 2019, the legislature went even further, barring minimum lot size requirements for ADUs; strictly limiting local impact fees on ADUs; invalidating any covenants, conditions, and restrictions (CCRs) promulgated by homeowners associations (HOAs) that prohibit or unreasonably restrict ADUs; and requiring cities to approve ADU projects that conform to state-law criteria irrespective of local zoning. In 2020, the legislature required HOAs to lift restraints on the rental of ADUs.

This article assesses whether the changes between 2015 and 2017 facilitated ADU construction equally across jurisdictions, and it will lay the groundwork for further research assessing the impacts of the 2019 and 2020 reforms, which we will complete once data on ADU production for 2021 (and later years) becomes available. In principle, the 2015-2017 reforms should have substantially leveled the playing field for ADUs, allowing their development in previously recalcitrant jurisdictions. Yet, given California's long history of creative municipal tactics to limit housing supply, it is possible that – after controlling for a variety of supply and demand factors that could explain the construction of ADUs – we may observe residual variation among municipalities.

This article is the first, to our knowledge, to analyze the relationship between ADU development, single-family zoning, and HOAs' CCRs. Our analyses consist of descriptive statistics, coupled with parcel-level regression models. We fit one model with jurisdiction fixed effects, which indicate which cities are permissive (or restrictive) of ADUs relative to a reference jurisdiction. This model can provide guidance for California policymakers, and it also provides a template for other states to evaluate municipal performance vis-à-vis statewide reforms. A second set of hierarchical models, with varying intercepts for jurisdictions, enables us to identify jurisdiction-level features that may be associated with ADU regulation, such as median single-family lot size, the percentage of residents who are homeowners, and a variety of other demographic characteristics that may constrain ADU development. This second set of models helps to identify the jurisdiction-level factors that may explain variation in ADU development.

THE STATE OF BROWNFIELDS REVITALIZATION AND REUSE RESEARCH – A 30-YEAR RETROSPECTIVE

Abstract ID: 1158
Roundtable

DE SOUSA, Christopher [Toronto Metropolitan University] chris.desousa@ryerson.ca, organizer, moderator
COFFIN, Sarah [Saint Louis University] sarah.coffin@slu.edu, participant
HEBERLE, Lauren [University of Louisville] lauren.heberle@louisville.edu, participant
CARROLL, Ann [George Washington University] anncarrol72@email.gwu.edu, participant
SCHILLING, Joseph [The Urban Institute] JSchilling@urban.org, participant
WHITEHEAD, Sandra [George Washington University] swhitehead@gwu.edu, participant

Since the 1990s, the reuse of brownfield sites has emerged as a core strategy in government efforts to remediate pollution and promote community revitalization, regeneration, and sustainability. Planning scholars along with researchers from engineering, architecture, public health, and a host of other disciplines, have played an integral role in generating studies that critically examine, assess, and advance brownfield planning, policy, and practice globally. This roundtable explores the evolution and current state of brownfields research. It also examined gaps and opportunities in need of further investigation to further community and policy actions related to investigating, remediating, and managing potentially contaminated sites. The session will also touch on the ACSP conference themes associated with strengthening community action for dismantling structural racism and disinvestment and reducing the disproportionate risks experienced by communities of colour, Indigenous populations, and areas of low income.

Seasoned brownfields researchers and practitioners will initiate the session by offering short summaries of their viewpoints and engage in discussion with each other and the audience. They will draw on a new paper reviewing brownfields research in the United States written by a dozen brownfield scholars and practitioners who have met regularly at the US EPA's Brownfields conferences and the ACSP to discuss the state of the literature. The roundtable will also touch on the state of brownfields research in Canada, and brownfield researchers from other countries are also invited to share their viewpoints. The organizers also welcome those not directly involved in brownfields research to join the session and engage in the discussion.

LAMB, Zachary [University of California Berkeley] zlambda@berkeley.edu, participant

Property rights regimes play a central role in shaping urban land governance, yet their impact on climate change adaptation remains under researched, theorized, and debated. This roundtable will explore how dominant property regimes constrain effective and just adaptation. We will also explore how alternative property regimes, from customary, Indigenous, and informal practices to community land trusts, cooperatives, and conservation and rolling easements may enable socially-just and ecologically restorative adaptation.

Critiques of climate action increasingly highlight the inequity of climate investments and the potential for gentrification and displacement. Much as land ownership and property rights are central to racial capitalism and other forms of uneven development, property relations also shape who stands to benefit or suffer from investments in climate adaptation. And yet, property regimes are seldom at the center of research on planning and design for climate action.

Discussions of property within planning scholarship have long been dominated by two, often starkly separated, disciplinary areas: 1) policy-oriented analysis of planning law and land use regulation; and 2) critical theoretical inquiry into the roots and implications of uneven development. The looming imperative of widespread, large-scale climate adaptation demands new syntheses, joining these two lines of inquiry with other modes of analysis and intervention, including those associated with environmental and climate governance; hazard mitigation and post-disaster recovery; and urban design.

This roundtable will bring together researchers from across diverse sub-disciplinary perspectives and methodological orientations to chart a research agenda for governing land and property for a dynamic earth. The organizers will offer framing remarks outlining "the difficult character of property" (after Krueckeberg 1995 and Blomley 2017) for climate change adaptation, focusing on three problematic mismatches between characteristics of dominant 'Western' property regimes and the demands of effective and just adaptation. First, privatized property regimes treat landscapes as static where climate change has made their dynamism increasingly clear. Second, dominant property regimes are atomizing and fragmenting when climate adaptation demands collective action. Finally, privatized property regimes impose a universalizing commodity logic to land where just adaptation requires attention to place-based socio-ecological dynamics.

Roundtable participants and audience members will be invited to share insights from related research or case studies that expand or challenge the above framework.

RESIDENTIAL ZONING DIVISIONS AND ITS RELATIONSHIP TO HEAVY COMMERCIAL AND INDUSTRIAL ZONING

Abstract ID: 1020

Individual Paper Submission

QUATTRO, Christine [University of Pennsylvania] cmquat@upenn.edu, presenting author

When Euclidean Zoning was first adopted in the United States, two of the four original categories of land use were residential. This established a distinction between single-family housing and multi-family housing from the start of zoning law. Society perceived multi-family housing as residences for people of a lesser class, likened to parasites by the Supreme Court. This resulted in Euclidean zoning models treating multi-family residences as a more intense land use, paired more often with commercial and industrial districts than single-family residences. As housing affordability and inclusivity become a primary focus for planning departments around the country, an examination of the treatment of residential zoning districts becomes critical. This analysis challenges the ideology that multi-family zoning districts are a housing land use appropriately paired with higher intensity zoning districts such as heavy commercial and industrial districts (HIZONE) and instead supposes that all residential units of a city (and the people who reside in them) deserve equal protection from uses known to cause environmental hazards and lessen the quality of life, regardless of the density of development. This study examines the zoning codes of 13 case cities, identifies the delineation of housing types produced by the code, and seeks to determine if higher tiers of residential development are more likely to be within closer proximity of heavy commercial and industrial zoning than their lower density, single-family counterparts. As homeownership continues to be out of reach for many people in the US today, an analysis of the placement of more affordable housing types, such as apartment housing, is significant to the field of planning.

ZONING FOR AFFORDABILITY? THE EFFECTS OF UPZONING AROUND TRAIN STATIONS IN ZURICH

Abstract ID: 1077

Individual Paper Submission

LUTZ, Elena [Swiss Federal Institute of Technology] elelutz@ethz.ch, presenting author
KAUFMANN, David [Swiss Federal Institute of Technology] kadavid@ethz.ch, co-author
WICKI, Michael [Swiss Federal Institute of Technology] wimi@ethz.ch, co-author

This paper studies the effect of an urban planning policy that increased the allowed density of residential housing near local train stations in the agglomeration of Zurich in Switzerland. Specifically, we evaluate the effect of this policy on new housing construction, rents, and the socioeconomic composition of the households living in the areas where the policy took place. We are interested in whether the policy led to the construction of new high-end housing around the train stations, spurring gentrification and displacement of poor households. Conversely, the policy could also help make housing close to the train stations more affordable by increasing the local housing supply. Overall, the policy we evaluate can be understood as a form of transit-oriented development, as it aimed at creating walkable, mixed-use neighborhoods with good access to public transit. However, since Zurich already possesses a well-developed public transit network, the planning department of Zurich chose to increase the amount of housing close to train stations instead of “classic” transit-oriented development of adding new train stations. As more and more cities around the world expand their public transit networks, increasingly many cities will pursue this strategy. Therefore, our evaluation of this type of planning policy in Zurich holds potentially interesting insights on the effects of such programs, which may be relevant for other cities and countries.

To evaluate the effect of the change in the zoning plans around the train station, we study 24 highly frequented train stations in the agglomeration of Zurich, defined as train stations with two or more lines in fare zones 1 and 2 of the public transit network. Of these 24 train stations, nine received a change in zoning plans towards higher allowed densities. To identify which train stations were treated in which year, we use harmonized annual parcel-level zoning plans from 1996 to 2019. We use GIS to identify on which plots a change in the zoning plan took place, focusing on the area within half a mile from the train station. To study the effects of the zoning plan changes on housing supply, we use the Swiss Housing Census. The census contains detailed data on all buildings. Additionally, we use geo-coded webscraped rent data for the years 2004 to 2020 to study rents, and geo-coded data on households including their income and when they moved into or away from the areas we study to study the socioeconomic composition of local households. This very detailed data enables us to evaluate the effects of the program accurately and over a long period of 25 years. We use descriptive evidence and an event study design to quantify the effects of the policy.

Our findings show that allowing for higher densities significantly increases the amount of new housing construction around the train stations. However, the changes in the zoning plans on average do not significantly increase or lower the rents households in the area around the treated train stations pay compared to non-treated train stations. Yet, there is considerable heterogeneity across train stations. This is an interesting finding, as it shows that changing zoning plans to allow for higher densities does not necessarily result in the construction of expensive high-end housing, but depending on the local circumstances can create more housing at a price that does not differ from untreated areas. Future results will also show whether the policy changed the composition of the households living around the train station towards richer or younger households. Thus, our paper holds interesting insights into what planners can expect when increasing the allowed density of residential construction around transit hubs in large cities.

PLACELESSNESS AND PLACEMAKING: HOW DO CHARACTERISTICS OF PUBLIC PLACE AFFECT PEOPLE'S SENSE OF PLACE?

Abstract ID: 1079

Individual Paper Submission

LI, Xiangyu [University of California Irvine] xiangl29@uci.edu, presenting author
DANG, Anrong [Tsinghua University] danrong@mail.tsinghua.edu.cn, co-author

Urban lifestyles and spatial characteristics contribute to people's increasing insensitivity of place, which is coined by human geographers as placelessness — “the casual eradication of distinctive places and the making of standardized landscapes that results from an insensitivity to the significance of place” (Relph, 1979, Preface). This type of cognitive dissonance of place not only challenges urban planners to rethink cities that can deliver meaningful experiences for diverse groups of urban dwellers but intertwines with environmental and economic concerns. It is against this background that placemaking represents a paradigm shift in thinking about planning and design, from a primary focus on buildings and roads to a focus on public place and human activity (Courage et al., 2020).

Although some placemaking strategies are perceived as instrumental in creating public places that are distinctively meaningful to the inhabitants, less is known about how various characteristics of public places affect people's sense of place. Previous studies have systematically examined the factors contributing to the quality of public place (QOPP) and multi-dimensional metrics that capture people's sense of place. Based upon the QOPP factors suggested from previous research, confirmatory factor analysis has been conducted to generate a set of factors for spatially-sampled communities in the Beijing-Tianjin-Hebei metropolitan region, and regression analyses has been performed to identify factors related to human activity patterns (cellular data), people's evaluation of place identity (survey data), and people's sense of attachment (interview and survey data). A technical framework has been applied for the collection and analysis of the large spatial dataset for the study (Dang & Wang, 2021). Explicit consideration has been given to urban-rural differences in the study area and spatial autocorrelation in the spatially explicit dataset by employing a hybrid spatial sampling method (Kim & Li, 2021). Preliminary findings indicate that people's sense of place is a complex construct that is influenced by a range of public place characteristics. This ongoing regional-scale research effort contributes to the theoretical debates on how planning and design may transform placeless urban space into vibrant and socially cohesive communities in developing countries.

PERCEPTIONS TOWARDS UPZONING: A PARCEL-LEVEL ANALYSIS OF SENTIMENT TOWARDS THE MINNEAPOLIS 2040 PLAN

Abstract ID: 1086

Individual Paper Submission

DAVIS, Jenna [Columbia University] jmd2218@columbia.edu, presenting author
HUENNEKENS, Joseph [Columbia University] jsh2228@columbia.edu, co-author
RONG, Helena [Columbia University] hhr2112@columbia.edu, co-author

As cities across the country struggle with rising housing affordability challenges, a number of municipalities have upzoned their residential areas to allow for increased built capacity. In 2019, Minneapolis made headlines when it became the first major city in the United States to eliminate single-family zoning and allow triplexes in residential areas throughout that city. While an existing body of scholarship has examined how individual and neighborhood-level factors influence sentiment towards specific high-density housing developments, minimal research has explored public perceptions towards land use reforms that systematically allow for greater density, such as jurisdiction-wide upzonings (Einstein, Glick & Palmer 2019; Pendall 1999; Trounstein 2021; Whittemore & BenDor 2019). To begin to

address this gap in the literature, we qualitatively coded hundreds of public comments received about the Minneapolis 2040 Plan, identifying the degree to which comments were supportive or opposed to the Plan. After assembling a unique parcel-level database, we conducted a multinomial logistic regression model to explore how sentiment towards upzoning varied based on parcel and neighborhood-level characteristics. As additional cities consider upzoning residential areas as a way to push back on exclusionary zoning, this project aims to help planners and policymakers understand nuanced public perceptions towards upzoning based on neighborhood conditions.

YIMBY DIVIDED: A QUALITATIVE CONTENT ANALYSIS

Abstract ID: 1087

Individual Paper Submission

HUENNEKENS, Joseph [Columbia University, GSAPP] jsh2228@columbia.edu, presenting author

DAVIS, Jenna [Columbia University, GSAPP] jmd2218@columbia.edu, co-author

An established body of scholarship frames land use conflicts as schematically divided between pro-development “growth coalitions” and groups of anti-development civic activists known as “NIMBYs” (Einstein et al., 2019; Molotch, 1976; Pendall, 1999). This dynamic has been upended by the arrival of “YIMBYs”—activists who advocate for additional housing production—onto the land use scene (Tapp, 2021; Wyly, 2021). YIMBY activists and organizations have played important roles in recent land use policy shifts, especially in California. However, minimal scholarship has directly examined these new actors, nor their relationship to NIMBYs. We leverage a unique online data source to examine YIMBYs, starting from their conflictual relationship with NIMBYs. Using a qualitative coding process, we investigate how a large sample of self-identified YIMBYs discussed NIMBYism, and the arguments they used to respond to NIMBY critiques. We find that commenters responded in two ways: either attacking the personal motives of NIMBYs or countering NIMBYism through specific policy proposals. We further find that YIMBYs—or at least the group of YIMBYs that we studied—are surprisingly ideologically diverse, displaying divergent attitudes toward deregulation, housing supply, and rent control, among other issues.

A LOCAL PERSPECTIVE ON MULTI-LEVEL GOVERNANCE OF FARMLAND: TRANSFORMATION OF SOCIAL CAPITAL IN A JAPANESE AGRARIAN COMMUNITY

Abstract ID: 1117

Individual Paper Submission

NISHI, Maiko [United Nations University Institute for the Advanced Study of Sustainability (UNU-IAS)]

nmaiko@hotmail.com, presenting author

Local communities often complement formal institutions to enable local participation and facilitate learning and negotiations among stakeholders for more sustainable land use planning (Siiba, Adams, and Cobbinah 2018). Historically developed in a place-based context, these communities offer a field for intimate observation and learning on local ecological processes and allow for policy alignment to environmental changes on a finer scale (Berkes 2009). At the same time, they entail social processes on the ground where stakeholders share culture, norms and identity and spiritually connect to place, giving rise to social capital that can help mobilize local resources and promote collective action towards a common vision (Dressel et al. 2020). However, land use outcomes are contingent on complex interactions between social, ecological, and institutional conditions across scales, requiring multi-level perspectives for planning (Nenadovic and Epstein 2016). In this regard, different forms of social capital – including bridging (between heterogeneous groups) and linking (to organizations at larger scales) besides bonding among the locals – have been proposed as what can altogether effect local-level collective action and transmit its efficacy across scales and levels (Dressel et al. 2020). Complementary roles of these different forms have also been suggested to better manage shocks, referring to the responses to the COVID-19 pandemic (Wong and Kohler 2020).

This paper explores the roles of local communities in (re)configuring different forms of social capital to govern farmland use in the context of agricultural abandonment in Japan. Local agrarian communities have traditionally served as a lowest-level agency for collective action to implement agricultural policy. Even with the recent introduction of farmland banking, in which semi-governmental intermediaries at the prefectural level are deployed to bypass local negotiations and promote tenancy on a larger scale, local communities have played a critical role in decision making and implementation for farmland aggregation, sometimes serving as a de-facto gatekeeper of entries of new farmers. Nevertheless, the place-based context of these communities has been drastically changing. Following the continued shrinking and aging of farm population, many agrarian communities now comprise a handful of aged farmers, whereas most constituents do not have intimate and tangible connection to farmland. Furthermore, the COVID-19 pandemic has made considerable socio-economic impacts on these communities, changing frequency and modes of human-nature and human-human interactions. If social capital of agrarian communities has essentially built on intimate interactions of people and farmland in locality, how does the change in the place-based context affect the ways in which local communities configure social capital? How does such change influence the roles of local communities in facilitating sustainable land use planning?

This study takes a case study approach to delve into the change in the process of governing farmland, considering the change in farmers' place connection and its impacts on social capital. It focuses on a local community that has served as an institution to facilitate collective management of agricultural infrastructure (including farmland) for land-extensive farming for rice production. Drawing on a panel study of over 25 farmers (including both those engaging in farming and landowners disengaging from farming) for the period between 2016 and 2022, it examines how their subjective connection to place has changed over time and if any such change has affected their social relationships in managing agricultural infrastructure and planning farmland use. The study points to the increasing reliance on bridging and linking social capital to productively manage farmland, while suggesting that place connection remains as a key to forge and enhance bonding social capital within the community. The paper contributes to delineating the relationships between different forms of social capital and provides implications for multi-level governance for sustainable land use planning.

WHAT GAVE RISE TO CHINA'S LAND FINANCE?

Abstract ID: 1120

XU, Nannan [University of British Columbia] nxudec@gmail.com, presenting author

The first two decades of the 21st century witness an unprecedented development of China's city regions, most of which are buttressed by massive infrastructure development. While it is well known that the land finance practice, or *tudi caizheng*, helped Chinese local governments capture land value for financing infrastructures, few studies seriously explain how the land finance practice took its shape. How did the Chinese local governments create such an institutional tool to control land and capture land value? What are the factors shaping the financial arrangements that the city governments pledge on future land value to borrow funds for building infrastructures?

This study systematically investigates the origin and development of China's land and infrastructure institutions. Borrowing the methods of process tracing and 'semi-negative case' study from political science, this study observes a three-decades evolution of China's 37 city regions' land and infrastructure development institutions. It concludes that the institutions are determined by five factors, i.e., the central government's policy, local government's development strategy, local government's administrative reform, the competition of land control between city government and land occupiers, and the local financial resources. This study also provides an insight to the regional differences in China's land finance practices. This research reveals that the emergence and development of China's land finance practices stem from an enduring and meticulous efforts of central policymaking, local strategy-making and administrative reform. This discovery contradicts the dominant belief that China's land finance practice is a by-product of a 1990s' fiscal-federalist reform. It will provide new Chinese references for countries in Asia and other parts of the world in making urban development policies.

A GREEN WALL LIMITING FUTURE OUTWARD EXPANSION OF CANADA'S LARGE METROPOLITAN AREAS

Abstract ID: 1126

Individual Paper Submission

TOWNSEND, Craig [Concordia University] craig.townsend@concordia.ca, presenting author

KIM, Youjung [Concordia University] youjung.kim@concordia.ca, co-author

Average metropolitan-wide densities have grown over the last three decades in Toronto and Vancouver, Canada's first and third largest metropolitan areas. This is often attributed to proactive urban planning following design principles of Transit-Oriented Development and New Urbanism, as well as general urban infill and intensification as growth strategies. In addition, the protection of non-urban land from development may also be a cause of densification; the outward expansion of Canada's largest metropolitan areas may be running up against a wall of protected green space. This protected non-urban area includes land designated for use as parks, greenways, watersheds, ecological reserves, conservation areas, and natural heritage areas. In addition, there is a substantial amount of land used for agriculture, and protection of that agricultural land from conversion to urban uses. Canada's provincial governments legislate protection of farmland from urban expansion to varying extents (Alterman, 1997; Connell, 2021) but there has been little in the way of research considering the effect of farmland preservation combined with other types of land protection, or the effects of those protections on actual or potential expansion of those metropolitan areas. In Vancouver since the early 1970s, the agricultural land has protected under the auspices of a provincially legislated reserve of agricultural land, and in metropolitan planning it has in the past been referred to together with the natural area as a green zone (Tomalty, 2002). In Toronto since the late 1990s, agricultural land has been protected together with natural lands (particularly the Niagara Escarpment) to form a "green belt" that was expanded in the early 2000s (Burchfield et al, 2015).

Spatial data on the protected land comprising these protected green zones is available from a variety of government sources. However, the data has not been synthesized to enable comparisons between metropolitan areas, municipalities, or provinces. The first of this paper's objectives is to assemble data and to compare remaining

developable land, with different types of protection, in Canada's three largest metropolitan areas (Montreal, Toronto, and Vancouver) as well as in metropolitan areas bordering Toronto (i.e. Barrie, Guelph, Hamilton, and Oshawa) and Vancouver (Abbotsford-Mission). Research on Portland's well-researched urban growth boundary suggested that it caused "spillovers" into adjacent areas (Jun, 2004) and analysis of adjacent metropolitan areas in Canada will be used to address the possibility that this has already occurred or has the potential to occur in the future. The second objective is to estimate the land available for future urban development, using satellite data showing the most recent extent of the built-up areas and estimating the unbuilt land that is not part of the protected green zones.

While spatial data on protected land area is available, the strength of the legal protection at present, and in the future, is uncertain. Most parkland and conservation area owned publicly is unlikely to be developed. However, the case of agricultural land which is owned privately it is different. As the quantity of developable land decreases and the price of developable land increases, there is mounting pressure. This paper compares the amount of potential land available for future urban development based on different scenarios for the removal of protection of agricultural land.

This paper is the first to quantify multiple types of protection of non-urban land in multiple cities within Canada, and provides evidence that restricting building on the edges of metropolitan areas is associated with densification. Given the strong emphasis of recent urban planning on densification, this research suggests that strong protection of non-urban land from conversion to urban uses can play a key role in helping planners and their communities achieve greater densification and related benefits.

A GLOBAL PERSPECTIVE ON LAND USE REGULATIONS AND INFORMAL SETTLEMENTS

Abstract ID: 1128

Individual Paper Submission

HEIKKILA, Eric [University of Southern California] heikkila@usc.edu, presenting author
GOYTIA, Cynthia [UTDT] cgoytia@utdt.edu, co-author

This paper examines the relationship between land use regulations and housing outcomes, especially housing affordability and informality. The relationship between land use regulations, enforcement and informal housing outcomes is fraught with potential idiosyncrasies rooted in their specific contexts. Local institutions, cultures, stages of economic development, geographical topography, political orientations and historical legacies are all factors that could influence and shape informal housing outcomes. Competing jurisdictions within the local metropolitan region can also complicate the process by which housing outcomes are determined. Notwithstanding such considerations, the empirical results reported here underline several key messages. Using a unique and important database of 191 metropolitan areas from all regions of the world, it assesses whether there are consistent emergent patterns from a global perspective that may in turn be useful for informing policy on land use regulations in specific locales and contexts.

With so much diversity within regions, it is striking that regional fixed effects would explain more than half the variance in the prevalence of informal settlements across this diverse collection of cities. This suggests that there is indeed a "continental divide"; that Latin America and the Caribbean, sub-Saharan Africa, Southeast Asia, and so on, are in fact meaningful lenses through which to understand urban development patterns. On the other hand, there is also reason to believe that much of these regional effects may be linked to the degree of urbanization, as those regions whose cities had the highest shares of informal settlements were also the regions with the lowest levels of urbanization and growing recently and faster. This again underscores the dynamic nature of the relationships, suggesting that what on the surface appears to be a regional effect, may in fact be based more fundamentally on the stage of urbanization and the way in which this urbanization is occurring.

The empirical results point to a number of striking conclusions. Empirical evidence from across the globe underlines the dynamic nature of the interaction between land use regulations and informality. In the long run, the evidence

strongly suggests that more restrictive land use regulations lead to more rapid growth in informal settlements. This result conforms with prior literature that emphasizes the exclusionary effects of land use regulations. As more restrictive regulations are applied, households find themselves with fewer options outside the informal sector. This phenomenon is accentuated during periods of rapid urbanization. But from a static perspective, the situation looks quite different over the short run, since cities with more stringent land use regulations tend to have fewer informal settlements, and this finding is strengthened further when those land use regulations are coupled with active enforcement.

IDENTIFYING RESIDENTIAL INFILL DEVELOPMENT AND ITS FACTORS: A DEEP-LEARNING IMAGE DETECTION APPROACH

Abstract ID: 1148

Individual Paper Submission

JUN, Hee-Jung [Sungkyunkwan University] hjun@skku.edu, presenting author

KIM, Dohyung [California State Polytechnic University, Pomona] dohyungkim@cpp.edu, primary author

HEO, Jae-Pil [Sungkyunkwan University] jaepilheo@g.skku.edu, co-author

KIM, Ji-hwan [Sungkyunkwan University] damien911224@gmail.com, co-author

Urban sprawl is a symbol of poor urban planning due to its many negative consequences including environmental factors (e.g., higher air pollution and loss of biodiversity), transportation factors (e.g., increased traffic congestion), public health factors (e.g., higher rates of obesity), and more (Liu and Meng 2020). As one of smart growth strategies, infill development has become a pleasing alternative to urban sprawl. Infill development refers to urban development in areas built up already (often near the center of cities and towns), which offer existing transportation and utility infrastructure that provide opportunities for repurposing or replacing existing buildings or parking lots (USEPA 2014; Jun et al. 2017). While infill development is widely accepted by cities as an alternative to urban sprawl, a very dearth of research has attempted to identify infill development and the factors affecting infill development. The broad definition of infill development, which often mix-used with redevelopment, revitalization, and/or mixed-use development. In reality, it is also not straightforward to identify the locations that infill developments occurred (Kim et al., 2022)

Filling this research gap, this paper explores residential infill development in the City of Los Angeles by employing a deep-learning model and multilevel logistic regression model. First, we developed a deep-learning algorithm identifying residential infill development by comparing the historical aerial photographs of properties between 2014 and 2017, a test dataset. Then, we applied the deep-learning algorithm to another set of the historical aerial photographs of properties between 2016 and 2020, a training dataset, to detect residential infill development. Next, using the outputs of the training dataset as the dependent variable (i.e., infill development=1; non-infill development=0), we constructed a multilevel logistic regression model that examines factors affecting residential infill development. In the multilevel logistic regression model, we included the physical conditions of the properties (e.g., lot size and distance to bus stop) and the characteristics of neighborhoods at which the properties are located (e.g., racial composition and income level) as level-1 and level-2 independent variables, respectively. The multilevel logistic estimates show that both the property- and neighborhood-level characteristics are related to residential infill development. The findings of this paper will help cities identify infill development more efficiently. Also, the findings will help planners take appropriate actions and regulations that promote residential infill developments in the areas where there are higher benefits to reduce the negative impacts of urban sprawl.

GOVERNING THE GREENBELT DEVELOPMENT IN CHINA’S MEGA-CITIES : THE CASE OF ZHANGJIABANG GREEN WEDGE IN PUDONG NEW DISTRICT, SHANGHAI

Abstract ID: 1179

Individual Paper Submission

XU, Yilei [Shanghai PuDong Exploration (Group)Co., Ltd] 117492037@qq.com, presenting author
CHEN, Chen [Tongji University] tjupchenchen@tongji.edu.cn, co-author

At the beginning of its birth, the traditional greenbelt was used as a management tool to control the growth of urban space (Sturzaker & Mell, 2017). But now a new generation of greenbelts are not only a tool to control urban growth, but also a green space which supports economic development, provide ecosystem services and construct regional identity (Amati,2008; Macdonald et al.,2021). After World War II, the greenbelt theory was widely spread from Britain to all over the world. As the earliest city to accept the western urban planning theory in China, Shanghai planned greenbelt in the Greater Shanghai Plan as early as 1946, and this concept of greenbelt has remained as an important spatial strategy in different versions of Shanghai’s master plan after the founding of the People’s Republic of China. In recent years, with the proposal of "Ecological Civilization" (sheng tai wen ming) and "Park City" (gong yuan cheng shi) movement, China’s mega-cities are paying more and more attention to green space in urban areas. The planning, development and governance of greenbelt and green wedges have undergone transformation, facing a series of new challenges. Having reviewed both English and Chinese literature, the authors developed an analytical framework of "subject-object-tool-effect" (SOTE) to compare the different governance models of green belts. Firstly, this research delves into the comparative study on the governance model of five countries: Britain, the United States, Australia, South Korea and Germany, and argues that three major governance model of greenbelt has prevailed in both developed and developing countries: "top-down", "bottom-up" and "public-private partnership". Second, this research focuses on the governance model of greenbelt in Pudong New District, Shanghai. In the past three decades, the green wedges are considered as an important part of Shanghai’s greenbelt and have been continuously constructed according to the planning ordinance, receiving well recognition in both its innovative governance model and physical form. Again, applying the SOTE analytical framework, this research looks into the governance model of Zhangjiabang Green Wedge for more nuanced understanding of how the governance model actually works in contemporary Chinese mega-cities. Using mixed methods including site investigation, literature review, face-to-face interview, questionnaire survey and spatial analytical methods, this research investigates the changing governance culture of Zhangjiabang Green Wedge from the interplay between major actors, different governance tools, and planning regulations, respectively. The preliminary findings reveal that: 1) The greenbelt in Pudong District, represented by Zhangjiabang Green Wedge, is featured by its complexity in physical form, social fabric and diverse stakeholders, raising a series of new problems and challenges in urban governance. 2) Under the background of decentralization, the governance model of Zhangjiabang Green Wedge is featured by fragmentation of urban space and diversification of stakeholders, which is similar to the bottom-up model in previous research. However, unlike the decentralized privatization regime in Western countries (Daniels,2010; Han & Go, 2019), the governance subject of Zhangjiabang Green Wedge is the local government and state-owned real estate company, and the purpose of development is not just for profit maximization, but a more sustainable governance model that balance economy, society and environment. Finally, this research discusses the possible vision towards a network-based governance model in China’s megacities, providing policy implications for megacities in both developed and developing countries with similar institutional contexts.

REGIONAL SPRAWL, RACE, AND GREEN INFRASTRUCTURE: AN EMPIRICAL EXPLORATION IN SOUTHEAST MICHIGAN

Abstract ID: 1218

Individual Paper Submission

GOODSPEED, Robert [University of Michigan] rgoodspe@umich.edu, presenting author

CONEDERA, Katelynn [University of Michigan] conedera@umich.edu, co-author

FIKADU, Tilahun [University of Michigan] tfikadu@umich.edu, co-author

Urban growth in many places worldwide continues to take the low-density development patterns often called urban sprawl. Definitions of sprawl typically include low population densities, auto-oriented transportation infrastructure, separation of land uses, and a prevalence of single family housing (Galster et al. 2001). Recently, U.S. sprawl has been documented in both the fast-growing sunbelt and in slower-growing Northeast and Midwest (Pendall, 2003). Although policy interest in sprawl has declined in recent years, it remains relevant due to its link with many problems like land consumption, social equity, local government budgets, air quality, traffic safety, and energy and water inefficiency, among others (Ewing and Hamidi, 2015).

Our paper contributes to newer research on the topic that moves beyond narrow studies of urban form to show how sprawl connects to other issues. In particular, our empirical analysis explores the relationships between sprawl, race and green infrastructure. Race has long been recognized as the backdrop for U.S. land use planning (Thomas and Ritzdorf, 1997), but too rarely analyzed in sprawl studies despite “part of the motivation and much of the effect of sprawl has been to segregate metropolitan areas racially.” (Baum, 2004, 14). Second, we investigate the detailed relationship between urban form and green infrastructure, since recent research has showed that communities can add both housing and tree canopy (Gounaridis, Newell and Goodspeed, 2020). We investigate both issues by focusing on change over time. In summary, our paper investigates the research question: what is the relationship between changes to urban form, forested landscapes, and racial demographics over time?

We investigate this question through a quantitative study focused on the 231 local jurisdictions within the seven-county Southeast Michigan region. Our analytical strategy exploits the high degree of municipal fragmentation to explore patterns across a wide range of community types. Our change analysis includes demographic data drawn from the 1990 and 2010 Censuses and novel land cover data describing forest cover and building footprints derived from remote sensing data collected in 2005 and 2015. Given our goal of exploring diverse relationships which exist among these variables across communities, our primarily analytical strategy is cluster analysis conducted among 11 variables describing key dimensions of demographic, built environment, and land use change.

Although the analysis phase is ongoing, preliminary results document the complex relationships among these variables. Although the fastest-growing communities generally have lower racial diversity, those with the highest diversity fall into several categories. Some racially diverse communities have seen housing unit growth, such as Superior township (68%) and Canton (71%). A few, such as Hamtramck, Ypsilanti, and Harper Woods have housing unit change close to zero. Most of these have had their share of white population decline by over 20%. A few communities have lower white population declines, such as Ypsilanti (-9%) and Ann Arbor (-10%) suggesting slower change trajectories. Among the 39 communities whose forested land increased over the study period, all but five also saw an increase in housing units over the same time period. Similarly, communities which saw some of the largest declines in housing units over the study time period, such as Highland Park (-33%) and Detroit (-14.8%) also saw decreases in forested land over a similar period (-0.75% and -5.6%).

Our study contributes to a richer understanding of what Baum called the “sprawl system,” illustrating that for communities in places without any state-level smart growth policy – which is typical across the U.S. – different trajectories of change are possible. By highlighting this diversity, we set the stage for further investigation of how local communities can pursue diverse, green, and compact communities through local planning initiatives.

THE SOCIOECONOMIC IMPLICATIONS OF VACANT URBAN LAND: A STUDY ON VACANT PARCELS IN NEIGHBORHOODS OF NEW YORK CITY

Abstract ID: 1307

Individual Paper Submission

CHEN, Liang [The Ohio State University] chen.7584@osu.edu, presenting author

Vacant urban land has been an ubiquitous phenomenon for the U.S. cities. On one hand, vacant urban land often conveys negative images of urban decline and contributes to a series of socioeconomic problems, including high local crime rates, property devaluation, urban poverty, and local government financial strains. On the other hand, vacant urban land is also viewed as the hidden treasure or fortuitous landscape in urban settings due to its potential for infill development and ecological services. Previous studies on vacant urban land are intercity level studies and have revealed the associations between urban vacancies and socioeconomic conditions at the city level. However, these studies have not fully explored and addressed associations at the neighborhood level. To explore how vacant urban land is associated with socioeconomic conditions at the neighborhood level, this research chose the 59 community districts in New York City as the study sample. The land-use inventory dataset used in this research is the PLUTO dataset, a GIS-based dataset retrieved from the NYC Planning Department. Moreover, the demographic data in this research are from the NYC Youth and Community Development Department, and the economic data are from the NYC Finance Department. The above datasets were merged based on geographic information. Clustering effects of vacant parcels and associations between the vacant land ratio and critical socioeconomic indicators were examined at the neighborhood level through geographic analyses and OLS regression models. This research shows how socioeconomic factors are associated with vacant urban land at the neighborhood level, and suggests that these associations are not entirely identical to conclusions of previous intercity studies. To be more specific, this research shows that the racial diversity indicator positively affects the vacant land ratio at the neighborhood level, which is consistent with previous intercity studies. Nevertheless, this research also shows that both the poverty rate and unemployment rate are negatively associated with the vacant land ratio at the neighborhood level, which is the opposite of what previous intercity studies have shown. The findings of this research not only can contribute to the urban land management, land-use planning, and municipal regulations related to vacant urban land, but also may restructure urban land-use systems and change governments' orientations of vacant urban land.

THE IMPACT OF ZONING ON BROWNFIELD DEVELOPMENT POTENTIAL: LAND SALE EVIDENCE FROM HONG KONG

Abstract ID: 1312

Individual Paper Submission

LI, Xin [City University of Hong Kong] xinli87@cityu.edu.hk, presenting author

Empirical evidence has shown that the sales of brownfields are frequently deterred not only by technical or financial difficulties, but also by institutional obstacles, such as zoning. Conventionally, governments enact land-use regulations to minimize the negative externalities of incompatible land uses and to ensure environmental quality. Scholars have provided empirical evidence that brownfields are often sold at a discounted price than greenfields. A question remains to be answered is to what extent regulatory restrictions (e.g., zoning) on land use affects brownfield transactions in the private market. On the one hand, in the absence of zoning, land owners may not be subject to regulatory restrictions imposed by the government, thus being relatively flexible in operating certain activities on the site. Such flexibility of land uses may allow a price premium during sales than sites that are subject to zoning plans. On the other hand, land-use regulations are likely to reduce the market value of individual properties due to constraints on development.

Although Hong Kong's urbanization rate is close to 100% in terms of population, its built-up land accounts for only 25% of the entire territory, with the 75% undeveloped and mostly preserved as country parks. Still, vacant land sales among private parties have been quite active, many of which involve non-agricultural land in the rural area. Our research questions are: (1) Between land parcels that are covered by zoning plans and those that are not, how much does zoning affect their prices? and (2) Between brownfields and greenfields, how do different types of zones promote land sales? To answer these questions, we plan to employ several difference-in-differences regression models, relying on panel data, which includes 2,100 parcels sold in 2019, among which 15.4% are brownfields and 4% not covered by any zoning plans.

BEYOND WORDS: WHY AND HOW SETTLERS RETURN LAND TO NATIVE NATIONS

Abstract ID: 1361

Individual Paper Submission

LYLES, Ward [University of Kansas] wardlyles@ku.edu, presenting author

The growing trend of organizations in the United States offering land acknowledgement statements that recognize Native peoples as traditional stewards of local land begs the question: what about the land? Native peoples offer numerous rationales for the return of land to their sovereign control in a movement gaining attention as #Landback. Most settlers (a collective term for non-Natives) in the US likely never even contemplate the idea of Native peoples regaining control of land beyond existing reservations. Yet, unbeknownst to most people, individual settlers, non-profits, land trusts, churches, and even governments agencies across the US have or are transferring land ranging in size from tiny plots to extensive tracts to Native nations.

Native scholars and activists clearly and forcefully state their rationales for #Landback. They detail legal rights based in treaties, laws, and court cases. They describe ancestral, spiritual, and ethical conceptions of land as a relative, conceptions that go beyond common Western notions of land as something to dominate or steward. They also argue that most Native nations treat the land more sustainably than private and public landowners in the US, while recognizing that exceptions exist. The Black Hills of South Dakota exemplify the damage #Landback aims to reverse. Settlers have degraded the ecosystem through mining, grazing, and sprawling development. Adding insult to injury, sacred mountain Tunkasila Sakpe Paha is now Mount Rushmore. Meanwhile, Non-Native scholars, policy makers, and professionals in land policy, planning, and management have paid scant attention to #Landback. If taken seriously, #Landback challenges the dominant ethos in the US of land as something to 'use.' In turn, it rejects the exploitation of land for short-term, individualized economic gain, which is widely recognized as a key source of wealth in the US and as a core driver of climate change, racial injustice, and wealth inequity. Thus, successful examples of #Landback have profound implications for reconciling historic oppression of Native peoples and charting a path to a livable future with a sustainable economy, healthy ecosystems, and increased equity.

This paper arises from an ongoing project exploring four research themes: 1) settler motivations to return land; 2) mechanisms of land transfer; 3) barriers to land transfer; and 4) impacts of #Landback, including whether land

management differs after transfer. The research design consists two phases: 1) a synthesis of the literature on #Landback and a summary of the results of a scan of instances of #Landback across the United States [Focus of this paper]; and 2) matched pairs of #Landback initiatives selected to enable comparison across and within regions of the country, the size and types of parcels transferred, and the individuals and organizations involved, among other characteristics [Ongoing research for future paper].

This research sheds light on core features of the #Landback movement, including its geographic distribution, variations in characteristics and motivations of settlers; and patterns in other features of land transfers (e.g. size, timing, existing land use, etc.). The preliminary findings offer insights of interest to scholars and practitioners alike, although the findings perhaps raise more questions than they answer.

A CONCEPTUAL FRAMEWORK FOR STUDYING AND CONTRIBUTING TO GREAT LAKES AND OCEAN COASTAL MANAGEMENT DECISION-MAKING

Abstract ID: 1410

Individual Paper Submission

NORTON, Richard [University of Michigan] rkorton@umich.edu, presenting author

Great Lakes and ocean coastal shorelands are valuable resources both ecologically and socially, and they are desirable places to live, work, and play. Most are privately owned. Governments play an important role in managing the development and use of those privately owned shorelands to ensure adequate conservation of the natural and social resources they encompass. Natural scientists have demonstrated that imprudent shoreland use is yielding significant ecological harms to coastal habitats and growing risks to coastal properties, and they have called for improved public planning for those shorelands accordingly. Planning researchers have focused on improving plan-making methods and processes, but less so on improving plan implementation through coastal management activities like regulation. Both recognize the benefits of co-producing natural and social-scientific knowledge, but neither has situated fully the ways in which decision-makers' knowledge, capacities, and motivations interact to influence coastal management decision-making outputs and outcomes.

Drawing from and synthesizing multiple literatures, this paper presents a conceptual framework that will hopefully be useful to planning scholars as they study how to improve plan implementation through improved coastal management decision-making, and to natural scientists as they work to ensure their knowledge contributes meaningfully to that decision-making. The framework is set within the institutional arrangements that structure coastal management processes, and it highlights the ways in which key decision-maker attributes—their collective knowledge, capacities, and commitments—influence decision-making actions and outputs. In addition to the coastal shoreland management policy domain, this framework should be useful in other land use policy and governance domains as well, especially those characterized by settings subject to both strong development pressures and high ecological and social risks, such as floodplains and the wildland-urban interface.

MAPPING THE ROLE OF NON-GOVERNMENTAL BRIDGING ORGANIZATIONS IN OPERATIONALIZING STORMWATER GREEN INFRASTRUCTURE IN RESIDENTIAL NEIGHBORHOODS.

Abstract ID: 1446

Individual Paper Submission

AHMED, Hazem [University of Waterloo, School of Planning] hazem.ahmed@uwaterloo.ca, presenting author
PARKER, Dawn [University of Waterloo, School of Planning] deparker@uwaterloo.ca, co-author

Stormwater best management practices suggest transforming private yards into functional nodes of a decentralized landscape network (green infrastructure - GI) complementing municipal stormwater systems. This is particularly relevant in our case study in the Grand River Watershed - Ontario, where single-family properties occupy around 60% of residential developments. However, such a decentralization approach requires employing collaborative efforts beyond the capacity of municipalities. Residents' low uptake of municipal stormwater fee credit and GI rebate programs indicates that current incentives are insufficient in inducing homeowners to adopt GI interventions (e.g., rain gardens and barrels) in their yards. Besides the economic and technical constraints, evidence points to social conformity barriers combined with low acceptability of non-conventional yard landscapes. Therefore, an initial critical mass of homeowners adoption is required. Previous research investigated key actors' roles and perceptions. The need for collaborative frameworks incorporating key actors is a common finding of relevant works. However, a comprehensive understanding of the interrelationships between key actors within a decentralized stormwater GI network, including local communities, remains an understudied area. Our work explores barriers and drivers for developing GI collaborative planning frameworks in residential neighborhoods. Based on evidence from five municipalities (Kitchener, Waterloo, Cambridge, Guelph, and Hamilton) within the Grand River Watershed, we analyze the role of two non-governmental (Reep, and Green Venture) bridging organizations (BOs) in facilitating collaboration between key actors.

We combine qualitative inquiry with quantitative metrics to conduct a mixed-methods social network analysis. We invite city representatives for an online survey to develop socio-matrices representing established partnerships between key actors in stormwater GI residential programs. The matrices feed-in (1) a one-mode network analysis that examines direct connections in-between municipalities or links with other actors and (2) a two-mode network analysis to study the in-direct connections mediated via BOs. Additionally, we investigate implemented GI residential programs through semi-structured interviews with Reep and Green Venture members. The interviews are recorded and responses are transcribed to conduct detailed coding. Key themes deduced include (1) collaborative ties with a focus on reasons that allowed for the establishment of connections and their arrangements, (2) time frame of programs, (3) funding resources, and (4) outputs from each program. We use collected data to develop stratified maps visualizing the landscape of established connections. Quantitatively, we analyze the structural and relational measures of the identified collaborative ties, such as degree centrality, to quantify the number of connections attached to each actor. Finally, we run short interviews for a follow-on qualitative validation of the preliminary findings with cities' and BOs representatives.

Applying a network perspective suggests that long-term collaboration between multiple stakeholders, including single-family homeowners, is required to achieve flood resilience and protect water resources at the watershed scale. Our preliminary findings reveal the central role of BOs' in overcoming cross-scale barriers within institutional and social environments. Furthermore, BOs' role included connecting scientific entities and other relevant actors, such as this research. However, sustained funding is required to incorporate other potential functions of BOs, such as devising micro-financing models, and capacity building of city representatives.

This research contributes to planning literature addressing the integration of social and built infrastructures, e.g., socio-hydrology, through an empirically derived description of the role of non-governmental bridging organizations. Insights from the case studies could guide other mid-sized cities in southern Ontario towards aligning the interest of different actors, co-generation of environmental knowledge, and building the social capital required to achieve adaptive stormwater co-management at the watershed scale. As more relevant case studies emerge, extending the social network analysis to include other dimensions, such as trust networks, paves the way to identify best practices in collaborative planning for decentralized green infrastructure networks.

A LIVING DEFINITION FOR HISTORIC PRESERVATION WITH RESILIENCY IN MIND.

Abstract ID: 1504

Individual Paper Submission

JOHNSON, Drew [University of Florida] johnsond1@ufl.edu, presenting author

KAMAL, Azza [University of Florida] azzakamal@ufl.edu, primary author

The built environment is crucial to the understanding and longevity of human history with how it highlights the change in design, structure, and technology developed over time. Historic preservation is currently defined by different schools of thought based on field of research and backgrounds. With coastal cities being threatened by sea level rise (SLR) and other natural hazards from climate change, it is important to find ways to protect both the significance of historic structures and the physical buildings, monuments, and sites important to human history. Within the most recent release, the National Oceanic and Atmospheric Administration (NOAA, 2022) projects around 10-12 inches of SLR within the next 30 years (NOAA, 2022). This is considered a century's worth of SLR condensed into one third of the time. Even though resiliency has been a part of psychology, construction, and philosophy for communities and their abilities to rebound from major events throughout history, there is no operational definition available for implementation. Once identified and defined, it can pave that way for better implementation of a process to replace existing insufficient definitions. A living definition could also be redefined over time to adjust to emerging needs and address issues pertaining to threats of natural hazards in historic areas, which help to preserve the human history (National Park Service, 2021).

This paper offers an approach for creating a versatile, yet practical definition and procedures for historic preservation that incorporates the parameters of resiliency. As such, a new definition allows local municipalities and communities to revisit their comprehensive plans and focus on preparing for increased threats from natural hazards due to climate change by prioritizing a resiliency-tailored policy and ordinances. It will also ensure that the social and political aspects are considered as well as the environmental, which are the three pillars to sustainability and are the core attributes of historic preservation (National Park Service, 2021). Recognizing a new perspective in historic preservation relies on recognizing that local communities and cultural landscapes are fragile and continuously evolving, thus protecting these resources preserves America's heritage and fulfills the goal of the historic preservation movement (Webb, 1987). As climate change has become an accelerant of communities instability, which also threatens national security and regional stability (American Security Project, 2012), it makes the case for advocating for more resiliency within preservation is greater than ever for communities to stay together and protect their heritage.

Our methodology focused on identifying the current definitions of historic preservation through content analysis to compare existing design guidelines in major US cities with designated historic preservation districts. The six cities, which were selected based on their location in various US climate zones, included St. Augustine, FL, Philadelphia, PA, New York City, NY, Boston, MA, San Antonio, TX, and San Francisco, CA. The review also included an analysis of the federal historic preservation guidelines by the Secretary of the Interior. The analysis showed a lack of references to the issue pertaining to climate change and the response to natural hazards that threaten historic structures and sites. The creation of new tools to better define terms for local and state governments that account for the protection of historic districts is needed. Resilience within historic design guidelines can ensure that the communities and

structures that are important to human history are preserved and protected for future generations. The unguided focus of preservation is not keeping up with the current philosophy and knowledge known about SLR and climate change as we continue to encounter more recurring natural hazards events.

NAVIGATING ENVIRONMENTAL JUSTICE IMPLEMENTATION AND SUPPRESSION IN GENERAL PLANS: LESSONS FROM CALIFORNIA'S SENATE BILL 1000

Abstract ID: 1573

Individual Paper Submission

ZUÑIGA, Michelle [University of North Carolina at Charlotte] mzuniga@uncc.edu, presenting author
MENDEZ, Michael [University of California Irvine] mamende6@uci.edu, co-author

The field of urban planning still has an uneasy relationship with racial and environmental justice. Poor planning decisions and discriminatory practices, for example, continue to heighten the burdens of environmental contamination in low-income neighborhoods and communities of color, in comparison to white, wealthy communities. Since the 1980s, activists have garnered some scholarly and regulatory support for changes to policy and planning processes, but planners have been slow to adopt an explicit environmental justice framework in land use policies. Adopted in 2016 and implemented in 2018, California's Senate Bill 1000 law now calls for local jurisdictions to identify disadvantaged communities and to include environmental justice considerations (land use policies, analyses, and other methods to address environmental inequities) in their general plans. There is much to learn from the ways planners have navigated the implementation or suppression of this environmental justice mandate, and the challenges communities, and organizations have encountered along the way. More direction on how best to implement environmental justice is needed to guide jurisdictions undergoing comprehensive revisions of general plans. This study assesses the approaches to environmental justice that California local jurisdictions with high levels of cumulative environmental impact are developing in their general land use plans.

In this research, we use a variety of sources and approaches to explore the development and implementation of environmental justice considerations in general plans from communities around California. We use data from 33 interviews with planners (public and private sector), environmental justice leaders, and the state Attorney General's Office, as well as a document analysis of environmental justice considerations made in 35 general plans, to assess the scope of coverage and the barriers experienced. Results from this study indicate positive outcomes such as the development of environmental justice advisory committees, and the use of comprehensive analyses to guide equitable land-use decisions. However, results also highlight the challenges that include, a lack of political will (resistance and even hostility) toward environmental justice from planners and policymakers, and minimal resources to carry out measures. To address these challenges, we conclude our study with policy recommendations to bolster the work of planners across the nation that will be working with communities in developing environmental justice considerations in general plans.

THE SHIFTING COALITION FOR LAND-USE AND TRANSPORT POLICY REFORM IN THE UNITED STATES

Abstract ID: 1608

Individual Paper Submission

LEVINE, Jonathan [University of Michigan] jnthnlvn@umich.edu, presenting author

The game of urban land-use planning is a three-part affair within which municipal anti-growth, pro-growth, and social-justice coalitions compete (and occasionally collaborate), wrote Berke et al. in 2006. In the anti-growth corner are neighborhood associations representing homeowner interests who seek to limit development densities and defend the character—whether quasi-rural, historic, or simply exclusive—of their residential environments. Within this anti-growth coalition, homeowners are frequently allied with environmental groups concerned about the threat that development can pose to the ecological integrity of the landscape). The pro-growth coalition, earlier referred to as the “growth machine,” consists of firms and institutions that stand to profit monetarily from growth: developers, landowners, building-industry interests, downtown and suburban businesses, and chambers of commerce. The social advocacy coalition of low-income and minority populations and progressive activists strive for a more equitable distribution of material and environmental resources in cities and regions and focus on issues of affordable housing, environmental injustice, tenant protection, and access to economic opportunity.

In the intervening years, municipal planning and politics in the United States has seen the emergence of a “pro-housing” coalition, transforming the game of urban land-use planning from a three- to a four-part affair. The coalition seeks liberalization of rules, from parking regulations to single-family zoning, that have constrained housing development in accessible areas, pushing it to more remote locales. The coalition has seen a number of surprising successes since 2016 jurisdictions around the country. By 2021, the pro-housing framing had even given municipal land-use policy a partisan and national-level cast with Donald Trump arguing that Democrats will “eliminate single-family zoning, bringing who knows into your suburbs, so your communities will be unsafe and your housing values will go down,” while the Biden White House found that a “key factor driving limited housing supply is local zoning restrictions. For example, rigid single-family zoning, a practice linked with racial segregation, has prevented the construction of multi-family units, which would allow for higher density and an increased supply of housing.”

This paper outlines ideas common to the pro-housing coalition, together with internal controversies and their implications for vital municipal alliances. It argues that the planning “game” described by Berke et al., when expanded to all four coalitions, is also an apt structuring of municipal electoral politics in many U.S. cities and towns. Finally, it describes major families of policy reform that fit under the “pro-housing” label and how these ideas have played out in selected jurisdictions.

ON A BETTER UNDERSTANDING OF LAND-USE REGULATION AND ITS RELATIONSHIP WITH INFORMALITY IN LATIN AMERICAN COUNTRIES

Abstract ID: 1626

Individual Paper Submission

GOYTIA, Cynthia [Torcuato Di Tella University] cgoytia@utdt.edu, presenting author

The incidence and growth of informal settlements in Latin America represent some of the most pressing public policy issues in the region. This paper explores the relationship that land-policy instruments have on urban informality and

on the supply of serviced land when a group of land-use management tools are consistently applied and enforced. This is the third paper of this research project and presents a set of empirical findings in relation to this complex topic of how to mitigate informal land development. The study develops a methodology to estimate a Dose-Response-Function (DRF), which suitably allows us for a better inspection into the association between the policy instrument and the policy target, in this case, the effect on mitigating informal land development, by increasing the share of households with connection to infrastructure service and better-quality housing and tenure conditions. The results from the empirical analysis start to suggest that the prospects of mitigation of informal development in cities hinge on the quality of their land policies foundation, which underpin not only the relevance of their existence but also enforcement, continuous support, and quality. The results suggest that these municipalities were better positioned to foster the size of their formal land and housing sector rather than the informal one. This seems particularly relevant even when controlling by all the other possible cofounders, like the sociodemographic condition of households and the effective implementation of other social housing programs. Nevertheless, we cannot generalize since the effects and their strength are different conditional on the instrument, its level of enforcement, years of implementation and quality.

This paper examines how land use regulations applied in the formal sector can influence housing outcomes in both the formal and informal sectors, using metropolitan Buenos Aires as our case study. The contributions of this paper are several-fold. At the theoretical level, our model specification provides a direct test of a crowding-out hypothesis by which binding land use regulations limit the absorptive capacity of the formal sector, thereby creating spillover into the informal sector. The theoretical base model is also extended to accommodate two alternative adjustment mechanisms: a Tiebout mechanism and an Alonso mechanism. At a methodological level, we employ two distinct yet complementary datasets. First, we conducted a survey of representative households living in informal settlements and in nearby formal areas. The other dataset is derived from an innovative Census matching technique applied to the National Expenditure Survey (ENGH) of Argentina. Notwithstanding these rather distinctive approaches, both methods yielded surprisingly similar results. Finally, at an empirical level, our findings confirm the existence of a rent premium for accessing the formal housing sector, consistent with our model predictions. Our results also show a strong interconnection between infrastructure provision and housing outcomes, which underscores the important role of infrastructure both in delineating formal sector housing developments and in delivering essential housing services, broadly defined. Our empirical findings also suggest that the Alonso adjustment mechanism may be prevalent in metropolitan Buenos Aires, in contrast to places like metropolitan Los Angeles, where the Tiebout mechanism is more prevalent.

The transportation and land use planning paradigm is shifting away from segregated land uses connected by highways and streets to more compact, mixed-use developments connected by high-quality transit. This new paradigm has brought transit-oriented development (TOD) to the fore, and researchers continue to highlight advantages of this style of well-integrated land use and transportation planning. As noted by Cervero (2004) and others, TOD has gained huge currency in the U.S. as a "means of promoting smart growth, injecting vitality into declining inner-city settings, and expanding lifestyle choices." TOD is promoted, in part, as a way to overcome "drive 'til you qualify" by offering multifamily housing that reduces housing plus transportation (H+T) costs (Hamidi and Ewing, 2015).

Housing costs are reduced through high-density land uses that amortize land costs over more units and uses. Transportation costs are reduced by providing alternatives to private vehicle ownership and use through complementary land uses proximate to transit. These savings accrue, in part, from the availability of high-quality transit and walking opportunities within mixed-use TODs and surrounding neighborhoods. Yet, ironically, all these good effects could be negated if these same accessibility advantages drive up rents to the point where they are no longer affordable for lower-income households. Accessibility provided by TOD helps drive up rents, increasing the H in H+T (Boarnet et al., 2017).

In this study, we explore the role of transit-oriented development in producing affordable housing. Using a list of eight criteria, we identified 85 TODs in 23 rail-served regions. By employing a variety of research techniques, we concluded that, on average, 20 percent of units in TODs are affordable to households earning between 50 and 80 percent of the Area-Median-Income (i.e., low- and moderate-income households, respectively). While 13 percent of the units are designated affordable housing (DAH), the remaining 7 percent are naturally occurring affordable housing (NOAH). Our results also show that the very fragmented and localized approach to affordable housing provision has resulted in an uneven distribution where 60 percent of the 85 TODs offer none or less than 10 percent of their units as affordable, while 14 percent of the TODs are 100-percent affordable.

Furthermore, both voluntary and regulatory measures adopted at city, county and state levels to incentivize the production of affordable housing have only limited impact, resulting on average in 5-10 percent of affordable units and rarely exceeding 15 percent. In addition, they produce units affordable to households earning about 80 percent of the AMI. Top-down regulatory measures seem to have a very limited impact on numbers of affordable units offered in TODs and are less effective than bottom-up voluntary and targeted programs, policies, and actions. This means that various forms of Inclusionary Housing Policies and Zoning (the way they are currently implemented) are ineffective in producing affordable housing in TODs.

In addition, not many of the projects we examined were subject to any affordable housing requirement put in place by the city/county/state when they were planned and built. Furthermore, even now half of the projects are not subject to any regulatory requirements regarding the production of income-restricted units. Generally, the projects that made the difference and highly impacted the overall affordability of a given TOD or region were the few ones that were 100-percent affordable. They were almost exclusively built by non-profit developers or CDCs using multiple sources of private and public funding and always included LIHTC funding. They produced housing affordable to households earning less than 60 percent of the AMI.

AN AGENT-BASED MODELING ON DIVERSIFIED URBAN EXPANSION IN THE AUSTIN-ROUND ROCK METROPOLITAN AREA

Abstract ID: 1668

Individual Paper Submission

GUO, Jiani [University of Texas at Austin] jiani_guo@utexas.edu, presenting author

ZHANG, Ming [University of Texas at Austin] zhangm@austin.utexas.edu, co-author

Scholars and policy makers have long interested in urban expansion and the environmental and social impacts associated with various patterns of spatial growth processes. Much of the existing literature has acknowledged the diverse urban expansion patterns among different counties and different metropolitan areas. Relatively, few has explored the heterogeneity of growth patterns within the metropolitan region. More often than not, heterogeneous urban expansion processes have been simplified as suburbanization that focuses on the expansion in urban peripheries while overlooking the changes in the central city. Research has provided inadequate empirical evidence on the divergent expansion patterns and their underlying driving forces focusing on within-metropolitan variations. This research uses the Austin metropolitan area in Texas, a booming metropolitan, as an example, to answer two questions: 1) how urban expansion patterns differ in the central city, City of Austin, and major suburban cities like Round Rock, Cedar Park, and 2) how transportation infrastructure and local development policies influence the urban expansion differently in the metropolitan area. To answer the first research question, this research, primarily using the landcover and imperviousness data from the National Landcover Database (NLCD), will first use the density gradient to map the spatiotemporal patterns of different cities. An agent-based modeling tool, SLEUTH, will be used to assist the analysis. The second question will be examined by using the statistical model with other ancillary data from the U.S. Census Bureau and the U.S. Bureau of Economic Analysis. This research can provide a detailed picture of metropolitan scale urban expansion and inform the policymakers to address the spatial growth disparity within the metropolitan region.

WHOSE INTERESTS? WHOSE PERSPECTIVES? CLIMATE ACTION ON THE GROUND

Abstract ID: 1738

Individual Paper Submission

BIRCH, Traci [Louisiana State University] tbirch@lsu.edu, presenting author

NELSON, Marla [University of New Orleans] mnelson@uno.edu, primary author

EHRENFEUCHT, Renia [University of New Mexico] rehrenfeucht@unm.edu, co-author

Coastal planners and residents face imminent adaptation decisions in response to climate-induced environmental change. Although existing policies are evolving to tackle weaknesses in past programs (Smith et al 2021), scholars

have argued that the current policies are insufficient for addressing the complex and changing situations that residents experience (Bronen, 2015). In this paper we view adaptation as a socio-political process that mediates how public officials, individuals and communities respond and adapt to social and environmental changes (Eriksen, Nightingale, & Eakin 2015). This paper explores differing and sometimes contradictory knowledge, values and goals that shape adaptation perspectives, policy and action in bayou communities along the Gulf of Mexico. Bayou communities are most closely associated with Cajun and Creole cultures, though in Louisiana there are also sizable populations of Native American residents, particularly in Terrebonne Parish where the bulk of this study was conducted. These communities are vulnerable to climate impacts such as sea level rise, land loss, and increased storm frequency and intensity, and technological disasters such as direct impacts from the 2010 BP Oil Spill, all of which have dramatically impacted day-to-day life in the region. We draw on interviews with 58 residents of Louisiana's lower bayou communities and 29 public officials, and an analysis of coastal and adaptation plans for the region. It asks the question: How do contradictions and differing perspectives embedded in adaptation plans and policies shape climate action in the lower bayou communities? The plans and policies that guide development recognize both in situ adaptation and relocation initiatives as necessary coastal adaptation strategies. Yet different plans and programs have contradictory values, goals and intended outcomes. Coastal residents draw attention to the contradictions when explaining their willingness to participate in initiatives including programs to assist people who are moving from the coast. Three core tensions include economic development for recreation versus residential development or removing development from parts of the region; the emphasis on private property ownership and compensation rather than the complex land tenure and land claims; and how culture is defined in ways that overlooks cultural lifeways and practices. The contradictions and how they impact coastal residents can reproduce some communities' disadvantage while assisting others and prevent effective action and resident participation. This presentation contributes to planning practice by highlighting how divergent perspectives by residents and planners influence public sector and resident action and decision-making. It contributes to planning theory by exploring various levels of meaning in planning documents with attention to the way their assumptions can further structures of disadvantage for residents. Currently, too little research assesses how effectively coastal policies address sea-level and other coastal changes (Gussmann and Hinkel 2021). Future research is additionally needed to understand what factors influence residents' acceptance of climate adaptation policy, and the outcomes of the adopted policies.

PATTERNS OF DEMOLITION AND THE POTENTIAL OF DECONSTRUCTION: UNDERSTANDING THE DETERMINANTS OF DEMOLITION TO INFORM SALVAGE AND DECONSTRUCTION SUPPORTIVE POLICIES IN ITHACA, NEW YORK

Abstract ID: 1809

Individual Paper Submission

MINNER, Jennifer [Cornell University] jm2359@cornell.edu, presenting author
 RANGARAJAN, Shriya [Cornell University] sr2248@cornell.edu, co-author
 HEISEL, Felix [Cornell University] felix.heisel@cornell.edu, co-author

Demolition and redevelopment of buildings are implicated in several challenges in urban planning, among them addressing neighborhood change such as patterns of disinvestment, gentrification, and displacement. Previous scholarship on patterns in demolition activity has often focused on vacancy and abandonment in large cities with shrinking populations (Yin & Silverman, 2015). Another reason for analyzing patterns in demolition activity comes from the need to understand building material stocks and flows and potential for reuse and conservation of embodied carbon (Berrill & Hertwich, 2021, Heisel et al., 2022). Part of the motivation to study demolition patterns in Ithaca, New York is to inform the work of the Circularity, Reuse and Zero Waste Development (CROWD) network. CROWD consists of university researchers, community partners, and local government officials who are working together to advance salvage, reuse, and deconstruction as sustainable alternatives to demolition.

In this paper, we use spatial analysis to develop a geographically weighted regression model of demolition activity in

the City of Ithaca. Ithaca is located in Upstate New York and home to Cornell University and Ithaca College. We hypothesize that conditions particular to Ithaca such as high redevelopment activity in neighborhoods proximate to these institutions, demographic makeup of the city dominated by a floating student population, and recent adoption of Planned Unit Development overlay zoning, and other mechanisms to encourage redevelopment, distinguish this study from others that have explored demolition activity in Buffalo, New York and Quebec, Canada (Dubé et al., 2018; Weaver & Knight, 2018).

Data on demolition activity, extracted from historical data on building permits issued by the City of Ithaca since 1987 is combined with parcel/building level characteristics received from the Office of the County Tax Assessment to develop a dataset of redevelopment activity. We combined this with three categories of explanatory variables: building stock characteristics (e.g. property age), neighborhood characteristics (e.g. proximity to places of interest), and policy variables that underlie the patterns of neighborhood change (e.g. zoning). Preliminary analysis suggests that the intensity of demolition activity has remained relatively constant over the years and spatial shifts have occurred over the decades with a concentration of demolition activities in particular neighborhoods. Further, the spatial analysis identified the most significant associations between demolition and neighborhood change variables.

This spatial analysis of demolition activity was paired with a qualitative analysis of interviews with key developers, architects, salvage specialists, and demolition contractors to understand informal and formal efforts that have been employed to conserve buildings and building material through salvage, adaptive reuse, or deconstruction. In addition, the research included participatory action research and a pilot project involving salvage and deconstruction. This mixed methods research has implications not only on modeling demolition patterns within smaller cities, but also understanding the opportunities and challenges to adoption of local government policies that are supportive of salvage, adaptive reuse, and deconstruction activities in the context of a smaller college town.

HIGHEST AND BEST DISUSE: URBAN DECLINE, DEMOLITION, AND THE VALUE OF VACANT LAND IN DETROIT, MI

Abstract ID: 1882

Individual Paper Submission

KOSCIELNIAK, Michael [Eastern Michigan University] rjkoscielniak@emich.edu, presenting author

In April 2014, the Detroit Demolition Program (DDP) started the process of demolishing 40,000 publicly-owned vacant properties in Detroit, MI. City leaders framed demolition as a necessary response to the rampant mortgage and property tax foreclosure that destabilized and sank neighborhoods in the previous decade. For Mayor Mike Duggan and his allies, the DDP enabled reinvestment and the promise of highest and best uses. Vacant land could be profitable. Regional wreckers seized on the opportunity to secure lucrative demolition contracts expected to surpass \$250 million. For them, the DDP enabled a market and supply chain that could maximize their income while concentrating the financial benefits of demolishing into the hands of suburban and speculative interests. Rather than portending future value, vacant land was profitable now.

In this paper, I draw on five years of mixed-methods research on the DDP, its operations, and its accomplishments. I show how the demand for 10 million cubic yards of backfill material altered the use and value of vacant land in Detroit (Koscielniak, 2021). On average, each of the DDP demolitions will require 250 cubic yards of material. I track the flows of this material and the conditions of its production to illustrate how wreckers and haulers working in the

DDP transformed the city's derelict land into temporary logistical spaces within a regionalized demolition process. By dumping large volumes of backfill material on residential parcels scattered across Detroit, wreckers and haulers avoided costly testing and monitoring processes while also maximizing the returns from demolishing the city. This process of concealment was undertaken with the full knowledge of the DDP and AKT Peerless, the local environmental consultant contracted to formalize and regulate the program's backfill operations. By reproducing the illusion of compliance these contractors also furthered their interests and produced concrete earnings. Moreover, AKT Peerless persistently approved residential addresses in Detroit as backfill sources despite widely-available evidence contradicting that conclusion. These acts of subterfuge and manipulation illustrate the variety of economically-productive purposes vacant land can hold within a declining city. Rather than achieve highest and best uses, the DDP encouraged and accommodated highest and best disuses that continued the production of decline in Detroit (Seymour & Akers, 2022). Through the process of land-use debasement, wreckers and haulers extracted value from the city's neighborhoods while gilding the speculation and suburbanization that subverts any hopes for Detroit's equitable revitalization (Koscielniak, 2022). I conclude that concerns about gentrification in the city remain premature in light of the multifarious pathways available to generate income from the destruction of Detroit's built environment.

THE RISE OF REZONINGS: WHY ARE REZONINGS BECOMING COMMONPLACE IN CANADIAN CITIES AND WHAT SHOULD WE BE THINKING ABOUT THEM?

Abstract ID: 1885

Individual Paper Submission

LAMONTAGNE, Neal [University of Alberta] nlamonta@ualberta.ca, presenting author

Rezoning, or more specifically, leveraging privately-initiated and project-specific rezoning applications as both an ad hoc and intentional strategy to add flexibility, secure public benefits, and/or expand regulatory control, has become a widespread and increasingly mainstream practice in North American cities. Building on data and case studies of Canadian cities, this paper documents the growing and evolving role of rezonings as a specific mode of regulatory practice and seeks to provide critical context and perspective of the how and why rezonings are on the rise and the implications.

Despite their centrality in contemporary planning practice, rezoning represent a gap in the evolving literature on zoning and regulation. At one level they are a pragmatic response to the inadequacies of zoning and to the pressure on local governments to adapt in a neoliberal era. They are an opening in the firmament of zoning practice, creating new opportunities for cities to leverage their land use authority to deliver tangible public benefits and to respond to the complexity of development in the contemporary city but also new vulnerabilities to capture by sophisticated development and community interests. Recognizing the controversial nature of rezoning, this paper provides data and insight into why they persist and proliferate, what they teach us about planning practice, how they are impacting urban development markets, and how they can be adapted to better serve public interests.

The paper uses a quantitative analysis of development approvals in cities in three Canadian metropolitan regions (Metro Vancouver, Edmonton Metropolitan Region and Greater Toronto) to document the extent and typology of rezoning practices (the rise). This foundational analysis is supplemented by policy review and interviews with local government officials to understand the context of rezonings, the intentions and the implications.

WETLAND WARS: WHY (SOME) ENVIRONMENTALISTS ARE FIGHTING THE PLANNED ECOLOGICAL RESTORATION OF LOS ANGELES’ LAST REMAINING WETLAND

Abstract ID: 1990

Individual Paper Submission

PETERS, Deike [Soka University of America] dpeters@soka.edu, presenting author

The ecological restoration of urban greenspaces has been hailed as a key path to achieving sustainability and climate resilience (Klaus and Kiehl, 2021) and to promoting ‘biophilic cities’ (Beatley and Newman, 2013). But in highly degraded urban environments, a serious question exists as to which version of ‘nature’ could and should be restored.

The main purpose of the paper is to reveal the highly contested notion of the core ideas, practices and science of ‘ecological restoration’. About 95% of California’s coastal wetlands have either been destroyed or are highly degraded due to agricultural and urban development. The remaining 200,000 acres still fulfill important functions for threatened species, flood control, water filtration and carbon sequestration. In LA, 600 of the originally 2000-acre Ballona Wetlands remain as a much degraded yet ecologically and recreationally important open space. In late 2019, the state published a so-called ‘restoration’ plan that would remove millions of yards of infill and concrete levees from the channeled creek to create a new tidal wetland while also providing many new miles of elevated multi-use paths, thus creating a new natural landscape with high human use value that in fact differs substantially from what was historically present at this site, thus questioning the very notion of ecological “restoration”. My discourse analytical approach evaluates multiple stakeholders’ perspectives via document analysis and interviews. Many cast doubt on the sustainability, scientific value and the ‘correctness’ of the state’s eco-engineering-oriented large-scale restoration efforts (Doyle and Drew, 2008). Local environmental activists are pitted against scientists, policy makers, planners and other environmental experts, arguing that vulnerable species would be endangered and that current freshwater functions should be preserved instead. Yet others argue for ‘multispecies justice’ (Heise and Christensen, 2020).

SOCIAL TRUST AND FLOOD RISK: THE CASE OF DAR ES SALAAM

Abstract ID: 2036

Individual Paper Submission

THOMAS, Ryan [Cornell University] rmt235@cornell.edu, presenting author

Trust is the foundation of legitimacy for public actions. Growing exposure to environmental and technological hazards is expected to erode trust in social institutions, thus threatening the legitimacy of public actors (Beck, 1992). This raises the question of what institutions will be trusted to govern cities in a climate changed world. While planners are often biased toward government agencies to provide solutions, many cities experience low government capacity to manage climatic risks, like flooding. In cities dominated by urban informality, such as Dar es Salaam, Tanzania, urban dwellers rely on a suite of social institutions to understand flood risk and take adaptive actions

(John, 2020; c.f. van Voorst, 2016 on Jakarta). By contrast, government agencies often rely on hydrological models and scenarios to design interventions into the flood infrastructure that can have a disruptive presence in flood-prone neighborhoods. In Dar es Salaam, Tanzania, levels of public trust in the government to provide this kind of top-down storm water management is low. Instead of relying on government, resilience can come from informal institutions like information sharing through social networks and protective action outside regulations (Satterthwaite et al., 2020). Dar es Salaam presents interesting case to explore this possibility because of its pervasive experience of flooding, low government capacity, recent programming on flood infrastructure and informal settlement upgrading.

In this context, we ask, which social institutions—including civil society, government, and friends and family—do residents of Dar es Salaam, Tanzania, trust (or not trust) to mitigate flood risk and provide recovery services? What drives trust in these social institutions? Specifically, what is the relationship between flood risk perceptions and political trust? How is trust distributed spatially? How does flood exposure mediate this relationship? And, to what extent does flood exposure affect patterns of trust in social institutions more broadly?

We present findings from mixed methods research drawing on a spatially random household survey (n=995) in six wards in Dar es Salaam, with follow up focus group and in-depth interviews. The research was conducted with individuals who are directly, indirectly, and not affected by flooding, and with varying socioeconomic statuses. We analyze the survey data using multivariate statistics and regressions to understand drivers of risk perceptions and trust in various social institutions. We also conducted spatial analysis to examine the spatial diversity of trust relationships in each neighborhood.

The survey finds that trust in government and civil society declines with flood exposure and trust in friends and family increases. Several factors mediate this relationship, including risk perceptions, household income, the type of tenure and perceived security, and flood exposure regime. Overall, we conclude that trust in associations and kinship groups represent substitute strategies to dealing with flood risks. The implication for practice is that public action for climate adaptation can gain legitimacy by supporting a range of trusted institutions, rather than focusing capacity building efforts solely on government agencies. These trusted institutions may vary across neighborhoods, demographic indicators, and flood exposure.

SHAPING PLANS THROUGH SUSTAINABILITY AND RESILIENCE CONCEPTS

Abstract ID: 2042

Individual Paper Submission

BERKE, Philip [University of North Carolina at Chapel Hill] pberke@email.unc.edu, presenting author
BENDOR, Todd [University of North Carolina at Chapel Hill] bendor@unc.edu, co-author
RODRIGUEZ, Daniel [University of California-Berkeley] danrod@berkeley.edu, co-author
SONG, Yan [University of North Carolina at Chapel Hill] ys@email.unc.edu, co-author

The United Nations Human Settlements Programme (UN-Habitat) notes that “global agendas having resilience as a key concept will ensure that the call for sustainable and resilient cities leaves no one behind” (UN-Habitat 2018). This quote suggests that plans should integrate “sustainable development” and “resilience” to achieve more prosperous, equitable, and healthy living environments, and adapt to the dynamics of a changing climate.

States and cities are increasingly integrating sustainability and resilience concepts to shape plans. Examples include the New Jersey Sustainability and Resilience local planning program, Denver’s Climate Action and Sustainability Plan, and Toronto’s Resilience and Sustainable Action Plan. Such plans mark the emergence of a new type of comprehensive planning that integrates both concepts.

However, sustainability goals and resilience goals can be at odds with one another. Building compact urban forms

that support multiple dimensions of sustainability in floodplains is well-documented (Stevens, Berke and Song 2010). Critics argue that both concepts often overlook or minimize the impacts of plans on low-income communities, people of color, and migrant communities that face multiple forms of injustice (Anguelovski et al. 2016, Meerow et al. 2019). They maintain that insufficient attention is given to uneven power relationships and politics.

-In this paper, we address these critiques by presenting a new model of comprehensive planning that integrates sustainability and resilience concepts. We draw on the “sustainability triangle” model, originally conceived by planning scholar Scott Campbell (1996), that planners apply to understand the diverging priorities and conflicts among government, private and civic sector actors, and the various population groups who are affected by land use change. We extend the model to include the concept of “resilience,” which requires adaptive responses to a range of social, economic, and environmental disruptions, each of which are amplified by climate change, economic globalization, cultural shifts, and displaced populations. We illustrate the usefulness of an integrated sustainability and resilience model by examining how the Denver multi-scaled comprehensive plan simultaneously strives to reconcile conflicts and support land use policy solutions that advance sustainable outcomes and promote adaptive actions to impacts of climate change.

To foster the use and influence of plans we draw on the major conceptual traditions in planning—rational planning, collaboration, and urban design. We review the strengths and limitations of each tradition. Next, we discuss how the best features of each can be used to create and implement plans that progressively guide change that support resilience through adaptation after disruptions, and balance the multiple goals of the sustainability triangle model. We then illustrate how the practices are successfully used in Baltimore’s citywide comprehensive plan and neighborhood planning program aimed at creating resilient and sustainable places. The Baltimore case describes a capacity building planning process that primarily addresses the goals and priorities of poor, racially segregated neighborhoods. All planning activities apply an “equity lens” that guides a sustained interchange among neighborhood groups, technical analysis, and urban design proposals.

‘MAINSTREAMING’ THE MUNDANE: CONSTRUCTION PERMITTING PRACTICES AND FLOOD RESPONSES IN PERI-URBAN MUNICIPALITIES IN MEXICO

Abstract ID: 2056

Individual Paper Submission

BAIRD-ZARS, Bernadette [Columbia University] b.baird@columbia.edu, presenting author

In the low-income outskirts of Guadalajara, seasonal flooding is both predictable and unexpected: every summer, a different set of low-income subdivisions become inaccessible for weeks at a time. Municipal public works departments respond with pumps, canals and berms, acknowledging that these are likely a stopgap against worsening storms and ongoing urbanization. Yet less is understood about the actions that municipalities take ‘upstream’ in the practices of permitting and subdivision review to prevent new construction and request shifts that mitigate the likelihood of flood damage to lives and property.

Drawing on fieldwork in three municipalities’ permitting sub-departments, this paper examines how daily practices of construction permit requirements, review protocols, processing times and exceptions shift in response to highly visible flooding disasters. Initial interviews with residents and municipal officials suggest that some localities carry on authorizing growth ‘as usual’, many have improvised and adapted ad-hoc patterns of permitting practice to both restrict new building and enable rapid reconstruction. Analyses of spatio-temporal patterns of newly-available permitting data from the past decade will hopefully clarify if and when these shifts in municipal practice translate to actually occurring change in the type and location of new growth.

The municipalities in peri-urban Guadalajara are not alone. Local governments struggle develop effective local action to prevent and mitigate urban flooding – the largest-scale impact of climate change and one that overwhelmingly occurs in cities of the global South (Guha-Sapir et al, 2022). The overlay of institutional and spatial analysis will ideally contribute to two identified gaps in knowledge. First, there is an acknowledged lag between flood adaptation goals and the everyday practices of planning policy (Hurlimann, Moosavi and Browne, 2021) and specifically land use tools administered by municipalities (Runhaar et al 2018), yet little exploration of how municipalities themselves are adapting the ‘mundane’ practices such as permits. Second, the unwritten informal yet routinized practices of land use practice are increasingly recognized as institutions (Singerman Ray, Baird-Zars and Sclar 2019) but remain little-explored, in particular in the Mexican legal and urban context (Rodríguez Valladares 2020) and in response to the broad mandates of climate adaptation planning.

EXPLORING THE IMPACTS OF INNOVATION DISTRICTS ON CIVIC INCLUSION, SOCIAL WELL-BEING, AND EQUITY, A CASE STUDY OF FORT WORTH MEDICAL INNOVATION DISTRICT, TX

Abstract ID: 1395

Poster

MOZAFFARIAN, Ladan [University of Texas at Arlington] ladan.mozaffarian@uta.edu, presenting author

During the last few decades, cities in the U.S. and worldwide have shown great interest in becoming more innovative to attract investment and fulfill their residents' needs. Accordingly, planners and policymakers have developed various urban models to promote innovation within urban areas. Innovation districts are among the most current and the fastest-growing development models discussed by scholars (Engel et al., 2018; Katz & Wagner, 2014) and considered by policymakers, city officials, and developers. Besides, the literature broadly discusses the economic benefits of innovation districts, such as an increase in the number of jobs (specifically highly-paying jobs), an increase in investment absorption (by attracting the talented workforce, start-ups, tech-based corporations, and headquarters), an increase in property value, an increase in demand for goods and services, and a rise to revenue (Engel et al., 2018; Katz & Wagner, 2014; Read, 2016).

Though existing studies on urban gentrification patterns have highlighted adverse effects of new development on communities in the form of displacement and loss of power, they have yet to consider residents' views on civic inclusivity, social well-being, and equity as well as policymakers' perspectives on these topics. Also, the potential negative externalities of innovation districts, such as social/economic inequities, racial inequalities, gentrification, displacement, and exclusion (Esmaeilpoorarabi et al., 2020; Stehlin, 2016) have rarely been discussed in the literature. Therefore, residents' perception of the new development, their awareness of its impacts on their life, and the extent of residents' inclusivity should be comprehensively studied. In addition, it is crucial to understand how policymakers consider and respond to the negative social impacts of innovation districts. This study aims to understand 1) What are the impacts of innovation districts on social well-being and equity? 2) How and to what extent are residents engaged (civic inclusion) in different stages, from developing the idea to operating the innovation districts? 3) What is the residents' perception of innovation districts' impacts on their life? And 4) How do

policymakers respond to the negative social impacts of innovation districts?

This study employs qualitative research methods and dives into this research puzzle in the context of the Fort Worth Medical Innovation District (FW-MID) in Texas. Our methodology includes two significant steps of data collection. The first step is "Document Retrieval/Document Review," conducted in the study's first phase. The next step (which completes the study's second phase) is to survey the FW-MID residents and interview city officials and developers. This phase is supported by the "ACSP Diversity & Inclusion Fellowship" to complement our results in providing more reliable findings regarding the negative social impacts of FW-MID on residents. The results of this phase will be added to the final version of the research.

In the study's first phase, we reviewed several related documents, including City council minute meetings and agenda, magazine articles and newsletter, and professional reports to evaluate the local residents' role and engagement level when developing the FW-MID. To this point, our findings reveal that, despite the great attention to the area's potential to become a thriving innovation district and the tremendous consideration of the future economic benefits of this innovation district, there is little evidence of engaging residents and public communities in different stages of developing the FW-MID. In its implication, the results of this study could provide insights and awareness for policymakers, planners, and developers regarding the social impacts of innovation districts on residents. Therefore, city officials and developers could use our results to consider both positive and negative externalities of these new developments before rushing to the decision-making stage and will include residents' opinions and preferences to mitigate the negative social impacts of innovation districts.

EXAMINING THE EQUITY OF ACCESS TO HEALTH CARE: A COMPARISON BETWEEN SHANGHAI AND LOS ANGELES

Abstract ID: 1015

Individual Paper Submission

DUAN, Leilei [University of Southern California] leileidu@usc.edu, presenting author
GU, Zongni [Nanjing University] lexieleileiduan@gmail.com, primary author

Background:

Equity of healthcare has been discussed in various research fields and domains (Culyer and Wagstaff, 1993; Delbosc, and Currie, 2011; Neutens, 2015). Accessing healthcare services, especially hospitals, is recognized as an important factor affecting people's health (Guagliardo, 2004). However, the spatial disparities of hospitals' supply, people's demands, and transportation resources make uneven equity of accessing hospitals (Geurs and Van Wee, 2004). Moreover, the outbreak of covid-19 pandemic makes people realize the importance of rapidly accessing health resources (Kang et al., 2020). Although the measurement of geographical accessibility and the optimization of health services locations are widely discussed (Higgs, 2004), there lacks study comparing the access to healthcare facilities in different regions. This study analyzes the accessibility to healthcare in Shanghai and Los Angeles, and then compares the spatial equity and the social equity in accessing health care between those two typical metropolises.

Method:

This research applies the enhanced two-step floating catchment area (E2SFCA) and hotspot analysis to investigate the characteristics of accessing hospitals in Shanghai and Los Angeles in different travel modes. Then, we used the Lorenz curve and Gini index to compare the spatial equity and the social equity in accessing hospitals between Shanghai and Los Angeles.

Results:

The result of this research suggests that the 1) the access to health care resources in metropolis posed the similar patterns which shows a trend of distance decay from the city center to outward area. 2) low-income populations or people who live in the urban fringe had low accessibility to hospitals, this phenomenon performs identical in both two metropolises, whilst such magnitude in healthcare accessibility disparity varies across cities.

Conclusion:

This study explores the possible reasons behind the differences discovered in the result session from various perspectives. The findings of this research contribute to any public health research that utilize health care resource distributions. A future research in preparation is to explore the COVID-19 reaction from Shanghai and Los Angeles based on the findings of this study.

WESTON, Shanley [University of Guelph] westons@uoguelph.ca, co-author

This session will address the capacity of municipal planning departments to support local and regional agri-food systems. More specifically this session draws on research looking at capacity of municipal planning departments across the province of Ontario. Ontario is home to some of the best agricultural land in Canada and produces over 200 agricultural commodities. Municipalities are the most local level of government responsible for implementing provincial policy and making land-use planning decisions. The capacity of municipal planning departments has the potential to enhance or hinder local and regional agri-food systems.

Preliminary research focused on the Greenbelt region of Ontario revealed that planning department capacity is varied. For example, Oxford County and Huron County have eleven and nine planners respectively, while neither Dufferin County or Elgin County employ even one full-time planner. Varied capacity can also be seen in the types of programs, plans, and initiatives that municipalities take on beyond provincially mandated activities. Examples of this include: Halton Region's Rural Agricultural Strategy, Grey County's Ag 4.0 Conference, and the Agri-food Venture Center in Northumberland County, among others.

Varied municipal capacity affects the consistent implementation of provincial policy, the ability of municipalities to act proactively, and has implications for agri-food systems stakeholders. Findings from this research are relevant to planners across North America and speaks more generally to the role of the planning profession in supporting and facilitating local and regional agri-food systems that are vibrant, resilient, and robust.

Research Questions:

- How does the capacity of planning departments to support agri-food systems vary across the province of Ontario?
- What challenges do planning departments face when dealing with agri-food related priorities and issues?
- How does municipal capacity affect the implementation of rural and agriculture related provincial priorities and directives at the local and regional level?
- What strategies can be used to increase the capacity of municipalities to support agri-food systems?

Methods: Our research team has previously completed research looking at municipal capacity to support agri-food systems in 66 municipalities in the Greenbelt region of Ontario. Current research looks to expand this study to the rest of the province, including northern Ontario. Our findings are informed by a mixed methods approach including surveys, semi-structured interviews, document analysis, and secondary data sources. Case studies will be used to showcase the varied realities of municipal planning departments across the province.

Findings: Preliminary findings reveal that planning department capacity is varied across the province, not only in terms of staffing and budget, but also related to in-house expertise and knowledge related to agri-food systems. It is expected that data collection for this project will be complete in August 2022.

Relevance: Municipalities are the most local level of government responsible for land-use planning decisions in Ontario. Municipal decisions have the ability to enhance or hinder local and regional agri-food systems. These food systems are an important part of local and regional resilience, particularly in a context of increasing volatility and instability. It is critical that we understand the role and capacity of planning departments in supporting agri-food systems across regional geographies.

This study investigates business-level economic and environment factors — business types, adapting design strategies, surrounding neighborhood characteristics — impacting food retail business continuity during the pandemic. The study conducts two waves of field audits for 921 businesses from 44 census block groups in Seattle, Washington, during the first two peaks of the pandemic. The field audits observe a 25% business closure rate in May and Jun 2020 and about a 15% closure rate in Nov and Dec 2020 and a variety of indoor and outdoor adapting design strategies. The study finds that businesses in walkable storefronts and food court areas have a higher chance of closing than those in strip malls, standalone buildings, and converted residential dwellings. Interestingly, design strategies shaped by health guidelines, such as the provision of sanitizers or distancing marks, were found to have no effect on the continuation of business operations. Design strategies could have potentially facilitated safe communication and interaction between businesses and their customers, including signage posting and the placement of counters at entryways, show more significant and positive effects. Relocations of workers and residents during the pandemic and the racial mix in the surrounding neighborhoods also affect the economic resilience of the food retail industry, as suggested by the effects of residential population density, job density, and percentage of non-Asian people of color. Findings of the study help identify businesses and neighborhoods that are economically vulnerable and provide guidelines for design strategies that strengthen the resilience of small businesses in the ongoing pandemic.

AGING PLAYFULLY: PLAY AS A PLANNING INTERVENTION TO SUPPORT OLDER ADULT WELLBEING

Abstract ID: 1229

Individual Paper Submission

VINCENT, Ellory [Queen's University] ellory.vincent@queensu.ca, presenting author
HARTT, Maxwell [Queen's University] m.hartt@queensu.ca, primary author

As people age, their physical and cognitive worlds can shrink as they become increasingly likely to experience impairment (physical, sensory, or cognitive) or reduced mobility (Myers et al., 2005). The academic and public health literature typically equates the reduction in older adult mobility and ability with heightened risks and barriers in the local environment. Interactions between physical and social environments and individual competencies can produce a limiting environment that can result in decreased physical and mental wellbeing (Lawton, 1970). If the interactions between physical and social environments and individual competencies can generate a limiting environment, the reverse may also be true - that through targeted intervention these components can interact to form an enabling environment for older adults. Age-friendly planning has emerged as a critical discourse for interventions to develop enabling environments by minimizing the risks associated with aging (O'Brien, 2014). While preventative measures are important, there is more to inclusive design than caution and access. Built and social environments could be developed to optimize opportunities for older adult wellbeing, not only to minimize risk. We contend that the conceptualization and practical realities of enabling environments can, and should, be extended to include proactively positive measures. Enabling environments can do more than minimize risk. They can encourage fun. They can generate play.

We propose that play, defined as spontaneous and creative behaviour, is an overlooked and underappreciated means to augment enabling environments and support older adult wellbeing. Play has only recently emerged as an urban design consideration capable of improving interactions and experiences with the built environment, and thus far is limited to the child-friendly context (Donoff & Bridgman, 2017). Our paper introduces a new conceptual framework of older adult sociospatial environmental wellbeing. Through an environmental gerontological perspective we draw on both the age-friendly and child-friendly literature to (1) conceptualize how the interrelationships between physical and social environments and individual competencies produce an environmental continuum spanning limiting to enabling environments and (2) consider how play as an intervention promotes positive interaction amongst an individual's physical and social environments and competencies, and in doing so, can generate new and reinforce existing enabling environments.

Using the conceptual framework as a guiding analytical tool, we examine the age-friendly community and aging-in-place models to delineate how play interventions can be integrated into existing models to improve the physical and mental health of older adults. In addition to outlining opportunities to integrate play into age-friendly designs and policies, we also explore the potential for play interventions to facilitate and bolster intergenerational engagement and relationships. The conceptual framework serves as a tool that can be used by planners and policymakers to reevaluate perceptions of older adult interaction with local environments. Moreover, by exploring aging and play through a planning lens, we advance a new direction in age-friendly planning while contributing to the existing discourse on older adult wellbeing, inclusive and equitable age-friendly environments, and play as an urban design consideration.

THE COMPLEXITY OF FOOD SHOPPING BEHAVIORS OVER THE COURSE OF THE PANDEMIC: ONLINE, IN-STORE, OR BOTH?

Abstract ID: 1233

Individual Paper Submission

CLIFTON, Kelly [Portland State University] kclifton@pdx.edu, presenting author
CURRANS, Kristina [University of Arizona] curransk@arizona.edu, co-author

When the World Health Organization declared COVID-19 a pandemic in March 2020, household provisioning behavior was dramatically impacted as stay-at-home orders were enacted and stores and restaurants modified their hours, capacity, and policies. In response, consumers had to consider their risk tolerance while making decisions about when, where, and how often to shop for groceries. Initially, many changed locations and shopped less frequently (Shamin, et al., 2021). While many consumers embraced ordering prepared meals (e.g. pizza, Chinese food) online prior to the pandemic, they had been comparatively slower to adopt online ordering for fresh foods and other grocery items (Semuels, 2019). Whether by choice or necessity, many consumers tried e-grocery shopping for the first time in response to COVID, according to early studies (Bounie et al., 2020; Salon et al., 2021). However, information is lacking on how food acquisition behaviors have changed over the varying circumstances of the pandemic and the interplay between in-store and online shopping and the factors correlated with these behaviors.

In this study, we examine food shopping behaviors over the course of the pandemic using a novel dataset derived from a repeated, cross-sectional, online survey of consumers in five U.S. states: Arizona, Florida, Michigan, Oregon, and Washington. Data were collected over four waves between September 2020 and November 2021, enabling us to capture provisioning behavior at various stages of the pandemic as the virus intermittently surged and waned, and as vaccinations became widely available. The survey includes questions about household socio-demographics, composition, and resources, and shopping preferences and behaviors, including frequency, locations, and use of e-commerce and delivery, as well as barriers to access. The data are weighted to be representative of the states from which they were collected.

Our aggregate analysis demonstrates the considerable growth of online shopping adoption over the pandemic. Prior to 2020, consumers had been slow to adopt online grocery shopping—a 2019 Gallup poll found that only 5% of respondents were ordering groceries online for pick-up or delivery at least once a week (Jones & Kashanchi, 2019). Our results show a significant jump in use—24% of respondents indicated they were ordering groceries online at least once per week by early 2021. At the same time, in-store grocery shopping has varied with COVID incidence. Unsurprisingly, in-store grocery shopping rates experienced a major drop in the early days of the pandemic. These rates rebounded in early 2021 only to fall again with the surge of the Delta variant.

We will present additional findings from multivariate statistical analysis at the individual household level about these changes over the four waves of the survey; their associations with characteristics of the consumers, their location, and public policy; and the potential “stickiness” of those behaviors over the long term.

Results from this study are relevant for understanding the adoption of e-commerce for food shopping and the implications for transportation demand into the future. The trips generated from in-store and online shopping appear to be complementary as online shoppers generate 40% more food shopping trips than in-store shoppers. This suggests there will be a need to consider the sustainability impacts of the use of these technologies relative to their health, convenience, and accessibility benefits. Policy interventions may be necessary to manage curb space, ensure equitable access, and mitigate the negative environmental effects.

CRITICAL FOOD POLICY LITERACY: CONCEPTUALIZING COMMUNITY'S FOOD POLICY ENGAGEMENT

Abstract ID: 1423

Individual Paper Submission

RAMOS GERENA, Carol E. [University at Buffalo, The State University of New York] carolram@buffalo.edu, presenting author

Food policies should be informed by those who it intends to serve. Still, policy-making processes remain exclusive to specific voices, knowledge, and experiences. Food activists, organizations, and academia have worked to make policy processes inclusive by training communities in food policy, potentially increasing their food policy literacy.

Recently, attention towards food policy has been growing in part from food activists, local food policy councils, and other insurgent organizations engaged in food systems transformations. Over the last two decades, municipal-scale food policy has gained increasing attention from policymakers, international organizations, and community food activists.

Despite the growth in municipal food policy institutions (venues) that may become learning hubs and places to exchange information about how to strengthen and transform food systems in each context, food policy processes and policy tools remain foreign for many communities. Food policy literacy is impeded by limited access to usable or comprehensible knowledge and information, leaving communities outside of the policy decision-making table.

This paper maps scholarship that unpacks how people's literacy about food policy and systems is defined and understood. The review asks: How is literacy tied to food policy understood? What does (or, what could) it mean for an individual (or community) to be food policy literate? How can people's critical literacy tied to food policy transform food systems?

The ideas in this paper are drawn from a review of peer-reviewed literature. The primary databases utilized to retrieve the literature in this review were Web of Science, JSTOR, and Google Scholar. Articles were searched using a number of key phrases pertinent to food policy literacy. Articles written in English and published in peer-reviewed journals from 1990-to 2021 were included (from any geography). Ultimately, forty articles were reviewed and analyzed. Articles were broadly in the following two domains: a) food scholarship that dealt with food literacy, food policy, and food systems, and b) policy scholarship that dealt with policy literacy. These two bodies of scholarship were reviewed to elucidate key principles of critical food policy literacy, in conversation with critical literacies from Paulo Freire.

Existing literature has thoroughly defined food literacy (FL) and policy literacy (PL), but there is a limited number of articles defining food policy literacy (in fact, only one article in the author's search resulted in a paper that explicitly used the term 'food policy literacy'). Policy literacy left without inserting food, or food literacy without inserting policy will leave a lack of clarity or consensus about the knowledge/power relationships within food policy engagement.

This paper argues that making food policy processes, information, and training accessible to community actors can better prepare them to participate in, interpret, and control food system policies, especially at the municipal level. The paper is built on the premise that a clear understanding of food policies is a necessary, if insufficient, condition for communities' engagement in food systems policy formulation, planning, and implementation.

This paper proposes five principles for conceptualizing critical food policy literacy that supports food systems transformations, which are aligned with Freire's work. The paper suggests that efforts to promote food policy literacy must facilitate communities to: "read the world," "read the word," be critically aware of food policy processes and systems, learn contextually and through authentic practice, and enable people to negotiate and transform the world (their context) collectively.

These principles can be a starting point for theorizing, planning, executing, and testing food policy education and training efforts. People's lack of knowledge or awareness in food policy processes is not a reasonable justification for their exclusion. Instead, those engaged with food policy – including food system planners – should facilitate knowledge sharing with communities.

Black women have been central to activism in the United States. The 1960s and 1970s are no exception. Prolific Civil Rights Era organizations relied on Black women. Black women fundraised, boycotted, and supplied food (Potorti 2014). Without their work, many of the historical moments of the Civil Rights Era, such as the Montgomery Bus Boycott, would not have been possible (Opie 2017). Beyond Civil Rights organizations, Black women heavily involved themselves in the Black Power movement. Even without formal channels, they carried the movement's values in their activism and community building (White 2011, Reese 2021, McCutcheon 2019).

The 1960s was a decade of emerging leaders. Community leaders fought inequity in their communities considering race, gender, and class. In Buffalo, NY, the story of such leaders is centered on the role of Black women. While there is considerable scholarship on Black communities in Buffalo (Williams 1999, Taylor 2018), and on food systems in Buffalo (Raja 2008), there is little documentation of Black women's historic role in the food system, and their impact on the food system. In three notable examples, Ms. Ruby Butts founded the first health food store in East Buffalo (Griffin et al, forthcoming), while Ms. Della Miller founded a food co-op in 1968. Ms. Gail Wells participated in a school breakfast program as a member of a local university's Black Students Union. These leaders continue to shape the food movement in Buffalo today.

In this paper, we document the stories of Black women leaders in the predominantly African-American neighborhoods of Buffalo, NY during the 1960s, and their impact on the food system. Through the interviews, the authors document how leaders understood their role within the community in the 1960s and the food justice movement as a whole.

This paper centers 1960s East Buffalo and its active Black women community leaders. Specific neighborhoods of Buffalo, a post-industrial city, were and are impacted by racialized investment choices. In particular, East Buffalo, the city's historically African-American neighborhood, experienced redlining. Post 1950s, businesses - including grocery stores - moved to affluent areas while East Buffalo experienced disinvestment.

This paper uses qualitative oral histories as its primary form of data collection. Data will be gathered using an interview tool for unstructured open-ended interviews. Interview data will be supplemented with a review of newspaper records from the 1960s centering community-led food work in Buffalo. The empirical component of this research is not yet complete. That said, the authors have completed a literature review, reviewed newspaper records, and conducted participant observation as part of the Buffalo Food Equity Network, a coalition of Black, brown, and indigenous people working towards food equity in Buffalo. We anticipate that oral history interviews with Black women leaders will be completed in the next two months.

The City of Buffalo has a long history of leadership by Black women whose impact on the food system continues today. Yet, contemporary scholarship on food systems planning - including that centering the city of Buffalo - is largely silent on the historic role of Black women. Results from this paper tease out the influence of Black women's leadership on the food system.

Planners and local governments around the US embark on policy efforts to strengthen food systems. Yet, these policy efforts can be ahistorical when overlooking the community-led work in food environments in Black neighborhoods. Black women were effectively steering, caring, protecting, and nourishing community food infrastructure -- even before food systems planning was on planners' radar. Findings from this paper will help planners locate contemporary policies within historic work of Black women.

ARE STATE-LEVEL FOOD SYSTEMS CHARTERS AND PLANS HELPING TO SCALE UP THE ALTERNATIVE FOOD MOVEMENT?

Abstract ID: 1429

Individual Paper Submission

HOEY, Lesli [University of Michigan] lhoey@umich.edu, presenting author
 WUNSCH, Jessica [NYU Furman Center] jwunsch@umich.edu, co-author
 COLASANTI, Kathryn [University of Michigan] kcolasan@umich.edu, co-author
 ANANDANPILLAI, Mrithula [Beckett & Raeder, Inc.] mrithula@umich.edu, co-author

The 2010 Michigan Good Food Charter was one of the first collaborative, statewide visions for building a more just, green, and healthy food system. At least 18 states and multi-state collaborations now have similar food systems charters and strategic plans. These initiatives share a desire to unite fragmented efforts, share knowledge and resources, and ultimately, scale up the alternative food movement. Looking at Michigan a decade later and in the midst of hundreds of stakeholders devising another 10-year plan, we ask: What impact, if any, are these ambitious, participatory planning efforts having on food systems, and in particular, on state-level food policy?

Framed around policy science theories, our methods include a content analysis of food-systems related legislative bills that were passed and attempted over the last 20 years, before and after the launch of the Charter. We also carried out interviews with over two dozen policy advocates in Michigan – including lobbyists, activists, and advocacy organizations – as well as state legislators and bureaucrats who have acted as policy champions.

We discuss in our findings how food systems problems were effectively (and not so successfully) framed to have political resonance among legislators, how advocates took advantage of – or failed to leverage – strategic windows of opportunity (e.g., the launch of the Charter, shifts in the political balance across different administrations, COVID-19, etc.), and how coalitions were mobilized and utilized for policy advocacy (e.g., a short-lived, statewide food policy council, and numerous Charter-inspired food systems networks). Our case study of Michigan – particularly the food systems issues that have remained blind spots, topics that have been most contentious, and the issues that have been most amenable to state-level policy change -- suggests what may await advocates in other politically divided places. Ultimately, we suggest ways that state-level food systems charters and plans can be strategically leveraged to build more momentum around food systems transformation.

****Please note:** I submitted this abstract for last year's ACSP conference, but had to pull out. I fully expect to be able to present this year. I haven't presented this paper and we haven't published it yet -- my co-authors and I plan to submit the draft for publication around the time of the conference.

MICROMOBILITY SAFETY FOR OLDER ADULTS: DOES THE BUILT ENVIRONMENT MATTER?

Abstract ID: 1441

Individual Paper Submission

YANG, Wookjae [University of Utah] wookjae.yang@utah.edu, presenting author
HONG, Andy [University of Utah] a.hong@utah.edu, co-author

Micromobility has become increasingly popular in cities worldwide. However, there is a discrepancy between safety regulations and micromobility behavior patterns in neighborhoods, leading to a 282% increase in fatal injuries involving micromobility over the past three years. In particular, older adults had the highest rates of injuries related to micromobility, making them the most vulnerable population in the emerging mobility paradigm.

This paper seeks to identify environmental factors associated with micromobility crashes involving older adults in Korea.

Micromobility-related crash data were sourced from Traffic Accident Analysis System (TAAS) of South Korea between 2017 and 2020. We combined the TAAS location data with other built environment data to explore the risk factors and crash patterns of older adults. TAAS accounts for the actual number of fatalities, injuries, and accidents information of offenders or victims. Built environment data include Ds - density, land use diversity, design, destination accessibility, and distance to transit, which are widely used variables in explaining the relationship between travel behavior and land use. The accidents are nested within built environments and regional boundaries. Generalized linear mixed model was used for the analysis to explain grouped/clustered data structure with noncontinuous outcomes, such as binary responses or counts.

The results suggested that built environment variables, i.e., density, design, diversity, distance to transit, had strong influences on fatal injuries of older adults either offender or victim. Specifically, injuries occurred in the neighborhoods with better accessibility to facilities for medical health and seniors. In terms of built environment factors, the point of interest, especially health care and senior center, had higher impacts on crash rates than D variables that are more closely related to economic activities. Ironically, the shorter distance from senior safety zone to accident location was, older adults had the higher chances of being injured, which implies that new design guidelines of senior safety zone for micromobility should be considered. For urban planning and design practices, differentiated approaches are necessary for the safety of older adults using micromobility.

IS THE RELATIONSHIP BETWEEN THE WALKABLE URBAN FORM AND WALKING MODERATED BY STREETSCAPES?

Abstract ID: 1473

Individual Paper Submission

KOO, Bon Woo [Georgia Institute of Technology] bkoo34@gatech.edu, presenting author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author
BOTCHWEY, Nisha [University of Minnesota] botchwey@umn.edu, co-author
HIPPI, Aaron [North Carolina State University] jahipp@ncsu.edu, co-author

Background: The literature on walkability has often characterized walkable built environment by operationalizing the accessibility aspect of the built environment. Accessibility measures, such as residential density, land use mix, intersection density, proximity to transit and other destinations, showed significant associations with walking and

physical activity (Ameli et. al., 2015). Based on ecological models, past studies also demonstrated that the effects of accessibility can be moderated by various personal, social, and organizational factors (Adkins et al., 2017).

However, focusing on the accessibility aspect of walkability poses two limitations. First, while accessibility pertains to 'Are there nearby places to walk to?', another important but less examined aspect of walkability is 'How good is the walking experience?' This quality aspect of walkable built environment can be another factor that can strengthen or weaken the effect of accessibility, yet few studies have tested moderation effects. The quality aspect of walkability can be divided into crime safety, traffic safety, and pleurability (Alfonzo, 2005). These characteristics are formed by micro-scale streetscape features, such as sidewalks and crosswalks, absence of graffiti and abandoned houses, and street trees. The second limitation is that the measures of accessibility are more challenging to modify than micro-scale features, limiting the applicability of the research findings in planning practice. Additionally, the cost of measuring micro-scale features is another major challenge for research and planning practice. Although computer vision can help reduce the cost, the extent to which computer vision-based data can replicate past findings is untested.

Objective: This study hypothesizes that the quality aspect of walkability can not only provide direct and positive effects to walking (i.e., main effects) but also can strengthen the effect of accessibility-based walkability measures (i.e., interaction effects). This study tests this hypothesis using computer vision-based measures of micro-scale features.

Method: The National Household Travel Survey 2017 was used to retrieve trip-level data on travel mode (i.e., dependent variable), socio-economic/demographic variables, and other trip-specific variables. Five macro-scale features were measured using GIS. Computer vision-based methods were used to measure 13 micro-scale streetscape features that subsequently formed measures of traffic safety at intersections, traffic safety along the segments, crime safety, and pleurability (Koo et al., 2021; Koo et al., 2022). Correlation analysis was conducted to examine the relationship among accessibility measures and micro-scale streetscape features. A total of 20 binary logistic regression models were fitted to examine the main and interaction effects of each pair of accessibility and quality aspects of walkability on walking mode choice.

Results: Moderate correlations were observed between micro-scale features and accessibility measures, with a few strong correlations (e.g., walk signal and Walk Score had a correlation coefficient of 0.577, $p < 0.001$). Sidewalk buffers, absence of graffiti, and greenery were negatively associated with accessibility measures. After adjusting for the controls, all five macro-scale features showed significant positive associations with walking mode choice. Traffic safety at intersections consistently showed significant positive interaction effects with four out of five macro-scale features but had insignificant main effects. Pleurability consistently showed significant positive main effects but no interaction effects. Crime safety had a significant interaction effect with proximity to transit. In some cases, the interaction effect was large enough that poor micro-scale features can suppress the positive effect of accessibility measures.

Conclusions: Computer vision-based measures for the quality aspect of walkability are associated with walking mode choice through direct effects and by moderating the effects of accessibility aspect of walkability. Modifiable features in micro-scale can strengthen the effect of accessibility measures, which are harder to modify. Computer vision-based data collection can provide a scalable method for research and planning practice.

HOW CAN WE MEASURE BETTER? CREATING A MULTIDIMENSIONAL SPATIAL MODEL OF FOOD ACCESS IN UPSTATE NEW YORK.

Abstract ID: 1530

RANGARAJAN, Shriya [Cornell University] sr2248@cornell.edu, presenting author

Food deserts, that is, areas with insufficient access to healthy and affordable food, do not have a consistent definition. Studies have found them concentrated in low-income, racially disadvantaged neighborhoods and typified them as either a problem of physical access - in terms of the geographical proximity of residents to outlets offering healthy foods - or financial access – measured in terms of affordability of such foods (Walker et al., 2010). Primarily framed as a social equity concept, some scholars have also examined the health implications of food access with mixed results: where some have found an association between differential food access and health indicators like obesity (Cooksey-Stowers et al., 2017), others have found no correlation.

In the first part of this paper, I critically examine the food access literature to identify limitations in the measurement of food deserts. Strategies to identify food deserts vary by the spatial scale of analysis (Bao & Tong, 2017). Food basket studies which compare food offerings in neighborhood stores are not scalable, while large scale identification such as that employed by the Food Access Research Atlas of the US Department of Agriculture are not sufficiently granular. The latter typically classifies places into binaries of ‘food desert’/‘not a food desert’ (Rhone et al., 2017) which does not provide insight into the degree of food access. It also obscures other food access situations, for e.g., food swamps – areas with high numbers of establishments offering less healthy food alternatives. Challenges with incorporating food price or affordability, insufficient understanding of behavioral factors, few studies which examine rural areas, and varied evidence on the health impacts, are other shortcomings. These together confuse the nature of appropriate policy responses. Multiple scholars have called for a multidimensional index that addresses the above, while also being flexible to rapidly evolving food environment (Rose et al., 2010).

In the second part, I propose an alternative methodology to measure food access using publicly accessible datasets. I use location data on various food establishments – grocery stores, restaurants, fast food, convenience stores, and farmers’ markets - scraped from Google Maps using the Places API. These are filtered to varying distances from the centroids of census tracts in Upstate New York. This is combined with tract-level health data sourced from the PLACES dataset of the Centers for Disease Control and Prevention (CDC) and socioeconomic indicators from the Census. Using this large-scale dataset, I examine two questions: (i) How can more granular measures of food access be implemented at scale? (ii) How do social equity and community health outcomes – the two suggested impacts of food deserts - vary by the food environment? I use the Spatial Durbin model to demonstrate two geographically weighted regressions: (i) Food environment as a function of racial composition and income levels; (ii) Obesity rates as a function of the food environment. Preliminary results suggest that current strategies under-identify food deserts in rural areas; it also confirms previous studies that indicate convenience stores as contributing to poor community health outcomes. Using variables that are statistically significant in their influence on the food environment, I suggest a multidimensional measure of food access.

Contributions of this research are, firstly, an analysis of limitations in food access measurement and a corresponding framework for addressing these. Secondly, a multivariate model that examines questions fundamental to the food access literature using publicly available data. An important implication of this work is a re-conceptualization of food access beyond the simple dichotomy of a food desert or not. I instead suggest more nuanced measures that include multiple aspects of the food environment which are more actionable at the policy level.

SOCIAL AND STRUCTURAL DETERMINANTS OF FOOD SECURITY AND MENTAL HEALTH

Abstract ID: 1550

Individual Paper Submission

MUI, Yeeli [Johns Hopkins Bloomberg School of Public Health] ymui1@jhu.edu, presenting author
HEADRICK, Gabby [Johns Hopkins Bloomberg School of Public Health] gheadri1@jhmi.edu, co-author
RAJA, Samina [University at Buffalo, The State University of New York] sraja@buffalo.edu, co-author

Background: Food insecurity is a complex public health issue shaped by socioeconomic conditions, infrastructure, and available resources, all of which vary by spatial contexts. Decades of public health interventions have promoted “access by all people at all times to enough food for an active, healthy life” with some success. Yet, racial disparities in food insecurity persist and, in some cases, are widening. This is especially concerning as the complex relationships between food insecurity and mental health remain underinvestigated.

Scholars are increasingly drawing attention to structural determinants of health, which refer to cultural norms, policies, institutions, and practices that generate or reinforce individual socioeconomic position through the distribution (or maldistribution) of neighborhood resources, including food. In particular, there is growing research examining the legacy of redlining practices that isolated Black Americans from housing and economic opportunities, and continue to shape concentrated social, economic, and health disadvantage today. Despite these challenges, individuals and families adapt by utilizing a variety of food supports to ensure households’ food security. However, there is little empirical evidence of households’ foodscapes (i.e., the geographic scope of food acquisition from key food sources), how households navigate their food environments, and the potentially mediating role of social networks on health. Addressing these knowledge gaps is consequential for fostering food system policies and practices that are reflective of people’s lived experiences, resources, and priorities.

Objective(s): This analysis examines social and structural determinants of health by evaluating associations between 1) historic redlining and current day food environments, 2) food security, mental health, and households’ foodscapes, and 3) household’s social networks and their foodscapes.

Methods: This study is nested within “Growing Food Policy from the Ground Up,” a participatory action research project in East Buffalo, NY, where structural racism in housing, education, and economic opportunities have had lasting impacts on families’ access to key resources. Using primary data from a cross-sectional survey of approximately 250 households, we will employ geospatial analysis tools to link households’ key food sources with secondary data on the built environment (e.g., street networks, food environment). Food security will be measured using the 6-item USDA Household Food Security Survey Module. Food procurement will be measured through recall of the past 30 days, asking about the types and locations of food sources from which food was collected as well as mode of transportation used to procure food from each identified source. Mental health will be measured through recall of anxiety and depression over the past 12 months using CDC’s National Health Interview Survey. Social networks will be characterized by using the name generator approach and asking about individuals who provide food-related support. Using spatial analyses, we will explore the extent to which health can be explained by households’ foodscapes as well as the mediating effect of social networks.

Results: We hypothesize that historically redlined neighborhoods will have less health-promoting food environments, compared to historically non-redlined neighborhoods. More expansive foodscapes are also hypothesized to be associated with food security and mental health; this relationship may be mediated by households’ social network characteristics.

Implications for planning practice: This study will inform policy solutions to improve social and structural determinants of health. Outcomes from this research aim to draw attention to how local government can support food security and mental health through policies that are reflective of residents’ resources and lived experiences navigating their food environments.

FARMERS MARKETS AND FOOD EQUITY IN RURAL COMMUNITIES

Abstract ID: 1570

Individual Paper Submission

ELY-LEDESMA, Edna [University of Wisconsin-Madison] eledesma@wisc.edu, presenting author

Farmers Markets promote a sense of place and history, especially in rural and suburban landscapes. Their position in the community brings together a multitude of partners which can work together to help the market grow its food equity efforts. Not only do benefits' programs at markets increase access to healthy, locally grown foods, but they also increase sales and diversify the income stream of vendors coming to sell. Many farmers markets in Wisconsin, especially in rural areas, have shared the same story: they ran an EBT/FoodShare program on a limited budget, until funding or resources ran out. Our survey of 15 market managers across Wisconsin in 2020 revealed that for a farmers market EBT/credit/debit program to be successful, it needs to include 1) financial support for markets to run a token system or for individual farmers to purchase their own EBT/credit/debit machines, and 2) incentive programs to use EBT/FoodShare, such as Double-Your-SNAP-Dollar.

Only 1 out of 6 Wisconsin adults consume the recommended five or more servings of fruits and vegetables (F&V) a day (DHS, 2021). Greater F&V intake is associated with many positive health outcomes (CDC, 2017; Kaur & Aeri, 2019), most notably reducing chronic health conditions (e.g., diabetes, cardiovascular diseases, obesity) that account for most of Wisconsin health costs (DHS). Increasing F&V intake by as little as 0.4 daily servings has been estimated to reduce national health care spending and lost economic productivity by billions of dollars while preventing millions of chronic illnesses and improving quality of life, (Ekwaru, et al, 2016; Lee, et al. 2019). F&V are the most frequently purchased type of food at farmers markets. Consumers who buy food at farmers markets purchase 1.5 times more F&V than people who buy food only at non-direct retailers (Economic Research Service, 2018).

While all Wisconsin residents would benefit from increasing their F&V intake (DHS, 2020), this is especially true for low-income populations (Pechey & Monsivais, 2016; Rehm, et al 2015). A two-year study in 10 Wisconsin farmers markets found that 99 percent of food assistance beneficiaries increased their F&V intake by shopping at the farmers market (Krokowski, 2014). The presence of farmers markets and the ability to redeem SNAP at the farmers market directly increases F&V intake of SNAP recipients (Economic Research Service, 2018; Krokowski, 2014; Jones & Bhatia, 2011; Dimitri, et al. 2015; Buttenheim, et al, 2012). While these programs are resource intensive, preliminary research has shown that an investment in farmers markets can have an exponential impact on the economy (Ledesma et. al, 2021). For example, Farm 2 Facts (F2F) demonstrated a high percentage increase in SNAP sales in the Village of Brown Deer, WI, with the net percentage increase being over 500%, after their implementation of F2F.

This paper presents research from a USDA Local Food Promotion Program grant. The grant established a Central Wisconsin Farmers Market Collaborative (including Stevens Point, Marshfield, Wausau, Waupaca, Adams-Friendship, and Wisconsin Rapids) that studied how to support individual markets to:

1. ascertain the readiness of their communities to invest in EBT/credit/debit services at the market;
2. develop a business plan (in communities with sufficient readiness) to fund starting a new, or strengthen existing EBT/credit/debit services at the farmers market;
3. evaluate the economic and social impact of well-supported and sustained EBT/credit/debit services on market vendors and local businesses, SNAP-eligible residents (fruit and vegetable purchases, inclusion), and partner entities and residents generally; and
4. establish ongoing impact and needs assessment to ensure EBT/credit/debit programs are sustained while also evolving in response to local needs to ensure that the market is accessible to all members of the community, including low-income, minority and differently abled.

THE SPATIAL LOCATION OF CANNABIS DISPENSARIES IN THE UNITED STATES: WHO HAS ACCESS?

Abstract ID: 1592

Individual Paper Submission

LOWERY, Bryce [University of Oklahoma] bryce.c.lowery@ou.edu, presenting author
SWAYNE, Madison [San Diego State University] swayne@usc.edu, co-author

Introduction: In recent years, cannabis legalization has proliferated in the U.S. Currently, 37 states allow for legal medical cannabis use and 18 allow recreational use. The growth of cannabis for medical and recreational purposes has important implications for the field of planning because the spatial location of dispensaries is often determined by local land use and municipal policies. Despite Federal laws that continue to criminalize the sale, possession, and use of cannabis, local authorities are increasingly engaged in promulgating regulation, drafting land use policies, and developing permitting processes to adapt to state policies that allow medical and recreational use of cannabis products (Rosenthal & Fraijo Jr., 2011). Yet, little is understood about how to balance the competing demands of community, public health advocates, and cannabis entrepreneurs, leaving many practicing planners to replicate already developed policies or create new policies from scratch.

Historical perspectives frequently position cannabis as an illegal substance and problematic public health challenge, but increasingly evidence suggests that cannabis offers economic opportunities, particularly in communities that experience the disproportionate impacts of cannabis criminalization. Cannabis dispensaries are often associated with increased risk of cannabis-related hospitalization and greater alcohol outlet density. (Mair et al., 2021). Additionally, dispensaries are associated with increased crime (Hughes, Pacula, Weinberger, 2020). Developing policies to address problematic implications of cannabis sales often involves buffering of sensitive uses, limiting dispensaries to specific zones, and permits and licenses issued for business operation.

Moving beyond perspectives that position cannabis production and dispensaries as locally undesirable land uses (Németh & Ross, 2014), a number of municipalities are looking to confront this problematic perspective through direct social equity programs that prioritize criminal justice reform and equal access to opportunity (e.g. City of Los Angeles Social Equity Program, City of San Diego Cannabis Equity Program). Scholars and practitioners are increasingly aware of the potential economic, public health, and equity benefits of cannabis policy to potentially reduce harms enacted on communities of color as part of the American war on drugs (Kavousi, et al., 2021).

Methods: We explore the relationship between community level socioeconomic status and dispensary location across states that have legalized medical and recreational use. We look to understand if dispensary locations tend to be found more frequently in communities dense with wealthy, well educated white folks, in diverse places, or in other communities of color that have historically been impacted the most by the criminalization of cannabis. To obtain the spatial location of dispensaries across the United State, we scraped addresses from weedmaps.com on November 1, 2021. The scrape resulted in location data on 5,467 dispensaries in 38 states. We use Esri ArcGIS Pro 2.9 to match the location of each dispensary to 2020 US Census Bureau tract level data to determine how nearby community sociodemographic characteristics influence access to cannabis dispensaries differently. Data on race and ethnicity were derived from the United States Census 2020 Profile of General Population and Housing Characteristics (DP-5). Data on poverty were derived from the United States Census 2020 American Community Survey Five Year Estimates for Selected Economic Characteristics (S1501). Census tracts were coded to indicate areas of concentrated poverty. Data on education were derived from the United States Census 2020 American Community Survey Five Year Estimates for Selected Social Characteristics (S1701).

Results: Results of this work are forthcoming and will be presented at the conference.

ASSOCIATIONS BETWEEN THE CHARACTERISTICS OF TREES AND STREET CRIME: A CASE STUDY OF THE DOWNTOWN AUSTIN, TX

Abstract ID: 1641

Individual Paper Submission

KIM, Youjung [Concordia University] youjung.kim@concordia.ca, presenting author

KOO, Bon Woo [Georgia Institute of Technology] bkoo34@gatech.edu, co-author

LEE, Sungmin [Texas A&M University] sungminlee@tamu.edu, primary author

Background: Urban trees play a critical role in livable and sustainable communities. Several studies have demonstrated that urban nature and trees can promote people's physical health and mental health, increase property values, attract more tourists, and even improve safety in a neighborhood (Turner-Skoff & Cavender, 2019). Even the presence of shaded trees and the quality of trees can promote street activities and influence visitors to actively enjoy urban downtown and shopping areas (Wolf, 2005). Many studies have found an inverse relationship between urban tree canopy and crime particularly when there are higher-canopy trees that are less likely to block views and provide criminals a place to hide (Kondo et al., 2017; Kuo & Sullivan, 2001; Lee, 2021). Although considerable efforts have been made towards addressing the role of the overall tree canopy on crime, a few studies have attempted to comprehensively examine a set of tree-related characteristics by using multiple measures through remote sensing, green view index (GVI) images, and audit-based inventory in relation to street crime, especially in the city's downtown with busy street activities. This study sought to examine to what extent the characteristics of trees were associated with street crime at the street segment scale. Understanding the influencing mechanism of the urban trees on crime is important to crime prevention and urban forestry management.

Methods: We used data from downtown Austin, Texas. To analyze micro-level crime incidents, we used a street segment as the unit of analysis. 541 street segments within the downtown neighborhood (size: 4.51 square km). Crime data for 2012-2019 were used. Crime types in this study included assault as a part of violent crime and theft as a part of property crime. The characteristics of trees have been quantified through remote sensing, inventory-based manual audit, and GVI images. Remote sensing tree canopy cover (heretofore, tree-aerial) was measured using a 2014 high-resolution land cover layer (1m). The street tree inventory dataset (tree-inventory) of 2020 was downloaded from the Austin Open Data, which includes the number of trees, diameter at breast height, and species. We also measured the GVI to assess street-level greenery. GVI was calculated by employing 360 degrees panoramic Google Street View images at 20-meter intervals. We controlled our models for the other greenery (% Plant + % Grass), land use type (e.g. residential and commercial), and total job count of adjacent blocks. We then build negative binomial models after adding street segment length as an exposure variable to explain the associations of tree characteristics with street crime rate.

Results: A total of 949 assaults and 1,436 thefts were observed on the streets in downtown Austin, TX during the 2012-2019 timeframe. After adjusting for our control variables, GVI and tree-aerial had inverse relationships with both street assault and street theft for street assault. Among the tree-inventory, the density of trees was not significantly associated with street crimes while tree diameter was negatively associated with both street assault and street theft.

Findings: This study confirmed that urban trees were beneficial to a reduction in street crime in downtown Austin, TX, which could help provide potential evidence-based downtown redevelopment strategies to improve livability and safety. Our findings suggest that both GVI and tree-aerial can be used complementary to street tree inventory. Both GVI and satellite imagery are cost-effective and feasible resources to measure the amount of tree canopy in relation to street crime. To maximize the benefits of urban trees in crime prevention, the appropriate size of trees in terms of diameter at breast height would be also considered.

FOOD RECOVERY PROGRAMS: PLANNING FOR EFFICIENCY, EFFECTIVENESS, AND EQUITY

Abstract ID: 1642

Individual Paper Submission

AI, Ning [University of Illinois Chicago] ain@uic.edu, presenting author

About one third of food grown for human consumption is wasted and ends up in landfills each year (Lipinski, 2013; Buzby et al, 2014). Concurrently, about one in nine Americans experience some food insecurity every year (USDA, 2021). Food recovery programs (FRPs), which recover edible food and redistribute it among communities in need, can be a solution to dual challenges of food wastage and insecurity. Recovering food for human consumption also reduces environmental impacts of landfill disposal, alleviates resource demand for food production, and improves food disparities. FRPs, however, have been under-appreciated in sustainability and resiliency planning. Without planning or coordination at the local or regional level, FRPs often experience secondary food wastage, economic inefficiencies, and short-lived program operations. To scale up the benefits of FRPs, system-wide coordination for resource management is needed.

This study advocates for more proactive planning for FRPs and assesses existing and emerging FRPs with a focus on their cost effectiveness, environmental performance, and equity goals. Focusing on the goal of food security, this study first compares the cost effectiveness of three solutions: (1) the federal Supplemental Nutrition Assistance Program (SNAP); (2) collecting and re-distributing donated food (the most common type of existing FRPs); and (3) partnering with large donors (e.g., grocery stores) and preparing surplus food into value-added meals (O'Donnell et al., 2015). Numerical information is analyzed whenever data availability enables. Acknowledging cost variations across regions, this analysis focuses on categorical differences, instead of itemized cost calculations. While food assistance programs such as SNAP tend to meet the goals of food security reliably, they tend to be the most expensive option to society and generally do not reduce food waste as FRPs. All FRPs, with or without food preparations, also involve significant costs throughout logistical chains (e.g., food collection, storage, and delivery). The unit cost of small-scale FRPs is particularly high, which suggests high participation rates (both donors and food outlets) matter. The potential revenue from selling cooked meals may help defray some of the FRP costs, which can be crucial for the long-term viability of FRPs.

Notably, FRPs shift long-haul waste transport services destined for a regional landfill location to many local and short pick-up and delivery trips (Zheng and Ai, 2021). This study assesses the sensitivity of system-boundary definition and unit of analysis in economy efficiency and environmental performance evaluations. National average data are coupled with community-specific data in the city of Chicago. Initial results show that climate impacts from FRPs highly depend on the study design (e.g., local vs. regional, food consumption/disposal vs. the entire food cycle). Food recovery potential and ensuing climate impacts also vary by sector and by community. Again, FRP participation rates stand out as a significant factor in program performance.

Both economic and environmental analyses of FRPs reveal a shift of cost and resource burdens among various infrastructure programs, across adjacent communities, and between federal and local governments. However, through a multi-disciplinary literature review (e.g., operations research, transportation, health, and industrial engineering, as well as planning), this study finds a general lack of equity analysis of FRPs, especially in numerical terms. Not surprisingly, definitions of an "equitable" solution vary across disciplines and studies, if explicit definitions are provided at all (Horst et. al., 2017; Mui et. al, 2022). The relatively vague goal of equity and lack of measurable metrics of FRPs (and sustainability performance in general) possibly hinder the design, implementation, and evaluation of FRPs. This study demonstrates the need for system-wide and multi-criteria analyses of FRPs as well as the missing role of planners in integrating FRPs in sustainability and resiliency planning.

To address numerous challenges associated with population aging, increased attention has been paid to building age-friendly cities and communities (AFCC). However, limited robust evidence exists to develop and implement evidence-based policies and strategies that enable a societal transformation to age-friendly communities. This research addresses this gap by conducting a scoping review of interventions designed to promote AFCC around the world. Of the initial 3,105 publications, 27 peer-reviewed journal articles were identified to have both health and social outcomes of AFCC interventions. Based on the synthesis of the results, four major themes emerged: physical activity interventions (n=11), educational interventions (n=9), multi-domain interventions (n=5), and other interventions (n=2). The results showed that many of the successful interventions used a partnership model and behavioral change theories to inform program design and implementation. The results also indicated that social participation and engagement played a key role in making the interventions successful. However, the results revealed that the literature is dominated by individual-focused approaches, suggesting that more research on environment-focused interventions is needed. Future research should develop an integrated framework that considers both programming strategies as well as urban design and planning strategies. This review offers important insights to inform policies and practices aimed at promoting old adults' health and social outcomes.

URBAN OASES: USE OF COMMUNITY GARDENS TO IMPROVE FOOD ACCESS AND POSITIVE CULTURAL IDENTITY AMONG US REFUGEE POPULATIONS

Abstract ID: 1666

Individual Paper Submission

KENNY, Chayce [Saint Louis University] chayce.kenny@slu.edu, presenting author

Food insecurity among refugees in the United States is disproportionately prevalent, is detrimental to a host of social, physical, and mental health markers, and is uniquely situated to exacerbate the psycho-social and mental health impacts of acculturative stress, displacement, and other aspects of refugee experiences.

Through a syncretic analysis of public health data regarding food insecurity and nutrition among refugees, sociological studies on refugee identity and social formation, and ethnographic accounts of the relation between food and identity, this paper will put relay a new understanding on the unique and reflexive relationship between health, identity, and food security among refugees in the United States. By recognizing the ways that food insecurity among refugees is contextually empowered to harm the wellbeing and health of this population, we will see that an approach to addressing food system and security based solely on access to adequate food is itself inadequate. The purpose of this paper is to show that a food security intervention that seeks to fully and holistically support the health and wellbeing of refugee populations in the United States must be centered on community and cultural identity, culturally relevant food sovereignty, and capacity building.

Following the establishment of the importance of a holistic and comprehensive social, cultural, and material approach to food access, this paper will then move to address the role that land utilization and urban food system planning have in. First, by reviewing existing literature on the impact that community gardens have on physical health and food access, as well as literature discussing the ways community gardens support positive social and cultural identity formation. Second, by critiquing contemporary approaches to urban food systems planning which do not incorporate the social and cultural aspects of food systems, and how these approaches have often missed opportunity for positive impact. Finally, by analysing existing data regarding vacant urban space and the potential for future development of community gardens and the material benefit they could have to communities and cities.

In these three steps, this paper will establish that community gardens are an apt response to the issues of food insecurity and cultural identity among refugees, will emphasize the importance of a new and holistic response (which can be found through a rethinking of community gardens), and then will lay out a practical way forward towards, and the potential benefits of, utilizing community gardens to this end. This will culminate in the conclusion that the creation and maintenance of community gardens which provide access and agency over culturally relevant foodstuffs for refugee populations ought to be instituted as a means of fighting food insecurity and culture loss among refugees in the United States.

This paper seeks to be more than simply a practical analysis of the issues caused by food insecurity and how community gardens might ameliorate these issues, work which has been done in many variations already. Its significance and call to action is that it is centered on a theoretical reimagining of how we respond to material issues like food insecurity in such a way that recognizes and incorporates the cultural and intangible aspects of a community. In doing so, it seeks to challenge planners and policy makers to ensure that their work is done with an awareness and valorization of the social and cultural stakes of their projects and the need to fully situate their plans in the contexts of the targeted communities.

UNDERSTANDING THE EVERYDAY LIVES OF THE HOUSELESS THROUGH COGNITIVE MAPS: A HUMAN-CENTERED ANALYSIS OF THEIR HOME TERRITORIES AND NEEDS

Abstract ID: 1676

Individual Paper Submission

APPLEYARD, Bruce [San Diego State University] bappleyard@sdsu.edu, presenting author

How do the houseless view their world? What are the most important places in their daily lives? What are the important things that make up what could be considered their homes? What barriers exist? These, and many other questions, are what we tried to address by having houseless individuals draw cognitive/image maps of their daily lives.

Starting in Spring 2021, and with support from the Social and Economic Vulnerabilities Initiative (SEVI), Dr. Appleyard's Faculty Student Mentorship Program (FSMP) Sustainability, Livability, and Equity (SLE) research team at San Diego State University conducted human-centered cognitive/image mapping exercises with houseless individuals in San Diego and Los Angeles, based on principles set forth by Kevin Lynch's "Image of the City" (Lynch, 1960). This research chronicles the everyday patterns that were found among the maps and surveys which: a) applies human-centered approaches toward understanding what creates their home territories and communities, and b) gives useful insight on how we should provide better housing, accessibility, and services to the houseless.

This research uniquely captures the experiences of the houseless. Principally, we were able to learn about how the houseless perceive the environment of their daily lives – what places are important to them, and what barriers exist. Essentially we were looking at all the critical elements of their home territories – where they find food, water, satisfy their toilet needs, charge their phones, socialize, spend time with friends, etc. In sum, we captured the key components of what could be considered their homes. Allowing them to subjectively recreate their experiences through cognitive mapping enables us to gain an empathetic understanding of their daily endeavors and an opportunity to address their needs through human-centered design approaches.

Specifically, to conduct our research we went out into the field and asked houseless individuals to draw maps (on blank pieces of paper) of their surroundings and daily routines, which were marked with symbols to identify important locations. We then had them mark the important locations on printed maps so we could then geo-code this information.

Thus far, over 100 total maps have been gathered - about 90% were drawn in the San Diego area and about 10% were drawn in the Los Angeles area. From our review, we have found 13 recurring patterns. One of them is that the houseless often travel in regular routes throughout their day, sometimes using transit or bicycling, but often on foot. This speaks to the need for services to be close to where the houseless live to support their mobility restrictions. Some participants were employed, with some choosing to work to collect recyclables or to help clean floors, streets, or shops they frequented. Parks and alleys were marked as places of importance as they offered safe spaces to congregate and travel through. Some important additional findings include the need for safe storage, adequate toilet access, & better relationship with law enforcement.

This work can ultimately help promote better quality of life for the houseless by helping design and plan for better shelters and services. Through better access to services and opportunities and better ways to help them meet their most critical needs, the home territories and lives of the houseless can be justly improved.

It's not so much about what the maps say about the houseless, but what they say about us. Many see the homeless as a problem, an eyesore, something to be "solved" by being removed and simply swept away. These maps show the humanity of people at the center of their own world trying to make things work day-to-day in what we've come to call through our research, their "homes".

PLANNING FOR AND REACTING TO FOOD EMERGENCIES: LESSONS FROM TORONTO AND BEYOND

Abstract ID: 1681

Individual Paper Submission

NASR, Joe [Toronto Metropolitan University] joenasr@sympatico.ca, presenting author

Planners have a long history of involvement in anticipating potential emergencies through land use controls and other plans for evacuation and displacement, and even more so, involvement in addressing the impacts of emergencies, from plans for temporary settlements of refugees to reconstruction schemes for devastated neighborhoods and cities. However, while their work has dealt with a variety of urban systems over the years, the impacts of emergencies on food systems was largely left to other actors, whether offices of emergency management or disaster relief agencies. The rise of food system planning as an area of interest for planners has generally not focused on the role of sudden disruptions, whether ‘natural’ disasters, wars or epidemics.

The COVID-19 pandemic has been such a disruption at the global scale, and one that highlighted a number of deficiencies in the global food system as well as deficiencies that are grounded in the urban context – as has long been warned by food advocates (Raja 2020). Municipal actors have played a critical role in the response mechanisms to this massive disruption, including the sudden shocks to the urban food system. Meanwhile, community-based food system actors also undertook dramatic shifts in their work, whether closing, pivoting, expanding, or embarking in new directions. These shifts not only challenged both sets of actors – they also enabled new modes of operation, new flexibility, and new forms of collaboration (Cohen 2022; Jones, Hill and Beardmore 2022). This became a moment and space for highlighting the possibilities of a ‘hybrid governance’ of urban food systems (Manganelli 2022).

This paper will consider where plans, planning and planners fit within anticipation of emergencies in relation to urban food systems, and particularly, where they fit in responses to such emergencies. It will use the experience of five large cities – Toronto, Vancouver, Baltimore, New York City and Milan – to examine what preparedness (if any) was in place for the impacts of major emergencies on their food systems, and where planning may have laid a foundation for responses during COVID-19. It will then focus on the current pandemic to analyze how the hybrid responses that were rapidly put in place in different cities related to the planning frameworks in place and the work of planners. It will conclude with some directions that can help connect food systems planning and emergency planning, while highlighting how the synergy seen in the hybrid governance during crisis can inform the work of planners and other municipal actors beyond the emergency mode provided by the pandemic.

This analysis is largely based on research undertaken through a university-city partnership. The project assessed emergency response preparedness in food security practice and investigated the responses of municipal and community-based actors to address heightened food insecurity during the outbreak and recovery; it compared Toronto to the four other cities to evaluate how equity and resiliency concerns were considered before and during the outbreak. At its center were 52 interviews with 28 actors from community-based food programs in Toronto and 24 municipal actors from the five cities (including planners).

Just months before the pandemic hit, Toronto City Council had directed all City Divisions to develop a “food lens” for their respective work by the end of 2020 “to leverage divisional work to support the objectives of eliminating food insecurity and addressing the climate emergency across the City of Toronto” (City of Toronto 2019). The City’s Planning Department could have used this impetus to connect food system planning and emergency planning, ahead of a wave that it did not see coming.

MANDATING HEALTH EQUITY THROUGH PLANNING PRACTICE: A CRITICAL DISCOURSE ANALYSIS OF GOVERNMENT POLICIES REGULATING PLANNING FOR HEALTHY COMMUNITIES

Abstract ID: 1692

Individual Paper Submission

STENBERG, Keely [University of Waterloo] kastenberg@uwaterloo.ca, presenting author
DEAN, Jennifer [University of Waterloo] Jennifer.dean@uwaterloo.ca, co-author

Health inequities pertain to the unequal distribution of health status and resources for health that are both avoidable and unfair (World Health Organization, 2018). According to the World Health Organization (2018), health inequities can be positively influenced by government policies. Similarly, policies can be designed to specifically and explicitly prioritize marginalized populations (e.g., those experiencing health inequities) (Young, 1990). The potential for various government entities to influence health is reflected and reinforced by recommendations for those working outside of the healthcare sector to consider the impact of their work on the health of individuals and populations through a Health in All Policies approach (Corburn, 2017). In alignment with this perspective, planning practitioners, for example, have the potential to impact health equity through the provision of community resources (Corburn, 2017), such as facilitating access to basic needs (e.g., affordable housing, nutritious food) and managing well-being through infrastructure (e.g., green and blue spaces, walkable communities). Yet, a recent study indicated that opportunities for planning practitioners to support healthy community development may be limited by policies, either because such policies do not exist or because of policies with competing objectives (Pineo et al., 2020).

The purpose of this paper is to interrogate governmental policies that promote health in planned communities of the Region of Waterloo, Ontario, Canada. This case study site was selected due to the local range in urbanization and the multicultural populace, allowing for comparison of policies across landscapes within a highly diverse and regulated space. Planning policies from four levels of government and enacted since the World Health Organization's implementation of the Healthy Cities initiative in 1980 are retrieved in order to trace how healthy community priorities have changed over time. A critical discourse analysis approach guided by Bacchi's (2009) Problem Representation Framework is used to evaluate the policies over space and time. This framework facilitates the investigation of power by looking at the issues present, the assumptions embedded, and the populations considered within each policy (Bacchi, 2009).

The findings of this research expose the limits of existing planning regulations for acting on health inequities and highlights the power rooted within these policies that ultimately influence the health of residents in planned communities (Bacchi, 2009). Further, the paper discusses opportunities for various levels of government to promote healthy communities while providing suggestions to empower planners with clear mandates (Corburn, 2017). Planners may use the findings of this work to carefully reflect on their own practice as advocates and change agents in their community with respect to the health and health inequities of population sub-groups. Finally, the paper concludes with a discussion of future possibilities for planners to positively influence health and limit health inequities, as well as avenues for future research to explore indirect policies guiding the planning of healthy communities and the effective engagement of planners in contributing to place-based health decisions.

COMMUNITY PERCEPTIONS OF SMALL-TOWN FOOD ENVIRONMENT, HOME GARDENING, AND FOOD EQUITY

Abstract ID: 1705

Individual Paper Submission

MEENAR, Mahbubur [Rowan University] meenar@rowan.edu, presenting author

The purpose of this paper is to understand community perceptions of local food environment, community food security (CFS), and food equity in a small town food landscape. Food equity ensures that all people have the right to grow, procure, and/or consume healthful, affordable, and culturally preferred foods. Researchers have outlined several key factors a food system must achieve to be considered equitable: nutritional adequacy; food affordability; cultural preferences; social and spatial equity in the food system; and people's agency in the food system. For planning to address issues of food equity, it must thus empower the individuals who are typically the victims in/of inequitable food systems to serve as local experts in discussing those issues and in developing solutions. Still, community food production resources may be unevenly distributed across areas limiting the successful activity of home gardening. Participation in home gardening is highly linked to home ownership and income; some or all aspects of economic advantage determine whether a person can participate in food self-provisioning.

Within this context, we ask the following three research questions: (1) Does community perceptions of food equity and community food security vary based on their micro-level location, income, and race? (2) Do residents consider home gardening as a tool to address food inequity? (3) Why do some residents succeed with home gardening while others face major challenges?

In this study, we followed a community-based participatory research approach, a form of shared leadership/participatory research under the Community Engaged Research (CEnR) framework, by forming partnerships with 15 community members including residents and representatives of cross-sector and cross-disciplinary organizations in a small college town in New Jersey. To answer our research questions, we interviewed 30 residents and stakeholders. We recruited 30 residents in a three-month home-based vegetable gardening program, which included customized gardening workshops and health coaching activities. We did a pre- and post-program surveys and follow-up interviews of the 25 participants who completed the program. The results presented here are based on an analysis of the survey and interview data using descriptive statistics, content analysis, and coding.

Our initial analysis has revealed that resident perception of place-based social issues vary according to their micro-level location (e.g., a block) regardless of their income or race. Residents living in blocks that do not have easy access to healthful and affordable food options have more negative perceptions of the status of food equity in their community. Residents in this town do not view the practice of home gardening fulfilling a neoliberal agenda. Some of our gardening program participants were more successful than others. Those who did not make a good progress with the program faced several issues, including lack of access to land, lack of time, lack of planning, and lack of commitment. Participants generally mentioned many challenges they faced with the space requirement, sun exposure, pest/animal control, weather pattern, and cost. Our analysis of interviews included the following themes directly connected to the concept of food equity: food culture, equitable access to land/food, fair and equitable prices and wages, human health, ecological sustainability, transportation access, access to health information, home resources, natural resources, technologies, government structures, laws, and policies.

We conclude by summarizing the key findings and a discussion on how our understanding of public perceptions related to food equity, community food security, and local food environment may become useful in creating planning and policy decisions at the local level.

PERCEIVED AND OBJECTIVE MEASURES OF AGE-FRIENDLY COMMUNITY

Abstract ID: 1736

Individual Paper Submission

HONG, Andy [University of Utah] a.hong@utah.edu, presenting author

Background

Globally, there are about 720 million people in the world aged 65 years or over, and that number is expected to double in the next three decades (UN, 2020). Because the risk of developing chronic health conditions increases as people age, this demographic shift will put an increasing pressure on social and health care systems (Prince et al., 2015). In response to these challenges, increased attention has been given to the WHO's Age-Friendly Cities and Communities (AFCC) concept that focuses on local actions that create age-friendly environments to help older adults remain healthy and active in their own communities (WHO, 2007). However, there is still little consensus on how age-friendliness should be measured and operationalized, and how different measures contribute to our understanding of an age-friendly environment and its relationship to older adults' health.

Objectives

The objectives of this research are to examine perceived (e.g., people's perception) and objective (e.g., geographic data) measures of an age-friendly environment and assess their associations with older adults' health. Furthermore, this research examines whether the association between the age-friendly environments and self-reported health differs by race/ethnicity, socioeconomic status, and sex.

Methods

This research involves secondary data analysis of two data sets, the 2017 AARP Age-friendly Community Surveys and AARP Livability Index. The primary outcome is the self-rated health measure from the AARP Community Survey. The age-friendly environments are characterized by two types of measures, perceived and objective measures. For analysis, we first assess the discrepancy between the perceived and objective measures of age-friendly environment, using a Wilcoxon t-test and an Intraclass Correlation Coefficient (ICC) test. We then examine associations of perceived and objective measures of the age-friendly environment with self-reported health. Lastly, we explore potential moderating effects by including interaction terms or conducting effect modifications by race/ethnicity, socioeconomic status, and gender.

Implications

This research seeks to provide deeper insights into the characteristics of age-friendly communities that matter to older adults. The results will inform policymakers and practitioners for designing place-based interventions to promote the health and wellbeing of older adults.

EXAMINING THE COMMUNITY-LEVEL CONTEXTS OF PUBLIC SCHOOL CLOSURES, AND THE FATE OF CLOSED SCHOOL PROPERTIES, IN ONTARIO, CANADA

Abstract ID: 1755

Individual Paper Submission

COLLINS, Patricia [Queen's University] patricia.collins@queensu.ca, presenting author

Planners have long recognized that public schools are essential elements of complete and liveable communities [1]. And yet, over the past decade, a growing number of public schools have been permanently closed across Canada, particularly in Ontario, owing to declining enrolments, aging infrastructure, and reduced government funding that is tied to enrolment numbers [2]. Ontario's Ministry of Education's Pupil Accommodation Review (PAR) guidelines

direct public school boards to assess the potential impacts of school closures on student learning opportunities and school boards' budgets [3], despite pleas from local stakeholders for more comprehensive analyses of the consequences of closures on surrounding communities [4]. The lack of attention paid by school boards to these broader consequences have led some communities in Ontario, including rural and lower-income communities, to wonder if they are being disproportionately targeted for school closures and to express concerns about the long-term liveability of their community without a school [5]. These concerns triggered intense public criticism of PAR processes, leading the Ontario government to introduce a moratorium on PARs in 2017 so that the guidelines could be revised.

While this moratorium remains in place nearly 5 years later, little is known about the characteristics of the communities in which school closures have taken place in Ontario and the fate of these closed school properties. Accordingly, the objective of this study was to document the scope of school closures in Ontario since 2011, the socio-demographic profiles of the communities in which these closures took place, as well as the current use of closed school properties. Comparable details for open school locations and surrounding communities were also gathered, to enable comparisons between communities where schools have closed to those where schools have remained open. All of these details were compiled into an SPSS dataset, and analyzed using descriptive statistics and Chi-squared tests.

A total of 406 publicly funded schools in Ontario were closed since 2011, and 4,825 schools are currently open. Of the closed schools, 27% were located in rural communities (i.e., population of under 10k), compared to just 15% of currently open schools ($p < 0.001$). Communities in which schools closed were more likely to have the highest levels of material deprivation (25% for closed school communities vs. 18% for open school communities) and social deprivation (23% vs 16%) ($p < 0.001$). The closed school properties have been repurposed in a range of ways; 16% have been converted to some form of community use, while another 16% are being used for educational purposes (typically private), and 11% have become residential properties. Of the 88 closed school properties that are currently sitting dormant or under construction, 59% are slated for residential development. There was little variation in the fate of closed school properties by community size.

This study offers critical insights regarding the contexts and consequences of public school closures in Ontario. Specifically, the findings suggest that rural and more deprived communities have indeed experienced disproportionately more public school closures in Ontario since 2011. These are communities that likely have fewer resources to mitigate harms arising from the loss of these community assets, which raises important questions about the equity implications of PAR processes in Ontario. However, the findings also indicate that closed school properties are often repurposed into other uses that may offer benefits to the wider community, such as parks, community centres, and commercial spaces. More research is needed to understand how these repurposed properties contribute to the liveability of these communities.

CAPTURING URBAN PUBLIC SPACE EXPERIENCES AND IN-SITU MENTAL WELLBEING FOR INDIVIDUALS LIVING WITH MENTAL ILLNESS

Abstract ID: 1757

Individual Paper Submission

LIVINGSTON, Brittany [Toronto Metropolitan University] brittany.livingston@ryerson.ca, presenting author
BIGLIERI, Samantha [Toronto Metropolitan University] samantha.biglieri@ryerson.ca, co-author

BACKGROUND: It has become increasingly vital to promote positive mental wellbeing in cities as urban residency is increasingly associated with poor mental health, linking urban public space characteristics and usage to mental wellbeing (CUDMH, 2019). Collectively, this research seems to present a 'universal' checklist of targeted urban design features to support the mental wellbeing of the general population. Less is known about how the effects of place may differently affect subpopulations, including those who may be most at risk of experiencing lower mental wellbeing

(like individuals living with mental illness), further entrenching inequalities of public space accessibility and its psychosocial benefits. Individuals living with mental illness may especially benefit from a targeted understanding of the wellness impacts of frequenting public spaces. As Toronto residents aged 18-29 are particularly at risk of experiencing lower mental wellbeing (CAMH, 2020), there is a pertinent need for further research into how urban public spaces may shape their experiences.

RESEARCH OBJECTIVE: Understand how young Torontonians living with mental illness perceive public spaces and the impact on their mental wellbeing through three themes already identified in the literature: public space as offering connection to nature; as promoting physical activity; and as facilitating social interaction.

APPROACH: Employing a social-ecological approach (Francis et al., 2012), this study recognizes the intersectional relationship between individuals and their socio-spatial environments, shaping peoples' unique perceptions of and experiences within public space. This study used experience sampling methods (ESM), a reliable data collection method that offers an opportunity to accurately study people during everyday life by capturing self-reports of experiences as they occur in-situ (Doherty et al., 2014). It removes the need for direct interaction with a researcher, reduces researcher interference and need for participant recall, all important in studying public space experiences of young adults with mental illness.

METHOD: Participants (Toronto residents aged 18-28 with diagnosed mental illness) used a smartphone application to capture in-situ understandings of their everyday experiences in public spaces over two weeks. Specifically, this research captured in-the-moment experiences, asking questions about the three main themes. This included multiple-choice sentiment questions (e.g., happy vs. sad), open-ended questions on how the spaces made them feel, and asked participants to take photos or videos to illustrate their written responses.

FINDINGS: This research revealed that spending time in a public space that fosters a sense of social connection most significantly enhanced mental wellbeing for this group, with participants noting the thematic intersectionality shaping their subjective experiences. Some participants felt connected to others without direct social interaction in the spaces they visited, while others felt secluded and isolated in spaces with similar spatial characteristics. Additionally, participants felt comfortable being active in public spaces with sports amenities and people exercising - yet felt self-conscious doing so where it could attract unwelcome attention. Participants described natural features, especially trees and open fields, as a source of relaxation, comfort, safety, and familiarity. Participants also associated lack of greenspace in the spaces they visited with a deficient sense of community or belonging. Participating in the research study may have also garnered psychosocial benefits, having increased participants' motivation to visit public spaces.

RELEVANCE: The planning research landscape has been critiqued for lacking diverse participants by age and disability, thus perpetuating the exclusion of spatially marginalized groups and resulting in poor evidence-based practices (Stafford & Baldwin, 2018). This study empirically adds to the existing literature on mental wellbeing for the general population in public spaces by offering insight into the lived experiences of a frequently marginalized group - people living with mental illness. These insights offer planning practitioners tangible ways of actualizing inclusion in public space design and programming.

A TALE OF TWO CITIES: UNPACKING THE SUCCESS AND FAILURE OF SCHOOL STREET INTERVENTION LAUNCHES IN TWO CANADIAN CITIES

Abstract ID: 1764

Individual Paper Submission

SMITH, Laura [Queen's University] smith.laura@queensu.ca, presenting author
GOSSELIN, Veronique [University of Montreal] veronique.gosselin.1@umontreal.ca, co-author
COLLINS, Patricia [Queen's University] patricia.collins@queensu.ca, co-author
FROHLICH, Katherine [University of Montreal] katherine.frohlich@umontreal.ca, co-author

To promote children's wellbeing, a growing number of cities are looking for ways to become more child-friendly (UNICEF, 2004), and street-based interventions that enable children to engage in outdoor free play and independent mobility are innovative strategies that support child-friendly cities. School streets are one such innovation that involve closing streets around elementary schools to vehicular traffic before and after the school day to improve children's safety as they come and go from school, while providing opportunities for children to safely play and socialize on the street with friends and peers (MUEC, 2020). Despite their apparent simplicity, launching these interventions in communities dominated by automobiles is enormously challenging and success is not guaranteed. However, little is known about why these interventions are successfully launched in some places but not others.

As part of the Levelling the Playing Fields project, School Streets were planned for a period of one year during the 2021-2022 school year in two Canadian cities (Montréal, Québec and Kingston, Ontario) in neighbourhoods with comparable socio-economic profiles. Site selection, stakeholder and community engagement and mobilization, and logistics planning activities were led by implementation partners in both cities, using the same participatory urban planning approach (CEUM, 2015). However, only the Kingston School Street intervention was successfully launched. Using a critical realist evaluation methodology (Pawson & Tilley, 1997), this paper documents the contextual elements and key mechanisms that enabled and constrained the launch of these School Streets in these cities.

We employed a comparative case study approach to study the contexts and mechanisms surrounding the School Street interventions in Montreal, QC and Kingston, ON. Data were collected using two qualitative methods: document analysis (i.e., emails, meeting notes, and other relevant reports produced since the beginning of the project in 2019) and semi-structured interviews with key stakeholders. We conducted a qualitative thematic analysis to code the data and used the context-mechanism-outcome framework, treating the launch of the School Streets as the intended outcome.

For both sites, community-based not-for-profits led the mobilization of elected officials, municipal staff, and school administrators to garner support for the interventions, which was characterised by frequent communication and regular events. Establishing trust, improving participants' understanding of the project, raising awareness about the need for innovation, creating a shared vision of the intervention, attributing roles, and resolving conflicts were key mechanisms at play during the mobilization phase in both cities. In Kingston, pre-existing relationships among the stakeholders and the presence of a "champion" school principal appear to have facilitated the processes and ultimately, the launch of the School Street. While the mobilization phase ultimately facilitated a change in the municipal by-laws to allow School Streets in Montreal, the inability to convince a school principal of the benefits of the intervention prevented the parents and, eventually, the whole community from moving forward with the intervention in that city.

School Streets hold considerable promise for promoting child-friendly cities. However, mobilizing community and stakeholder support for such initiatives requires considerable effort and success is not guaranteed. The findings from this study offer critical insights for planning practitioners regarding the contexts and mechanisms that support the launch of street-based initiatives, while broadening our understanding of the ways in which critical realism can be applied in evaluation research.

MOVE TO PROSPER: PATHWAYS TO MATERNAL & CHILD HEALTH IMPROVEMENT

Abstract ID: 1872

Individual Paper Submission

REECE, Jason [The Ohio State University] reece.35@osu.edu, presenting author

Housing quality and neighborhood conditions have a profound impact on maternal and child health. In the context of the U.S. housing market, lower-income families are more likely to live in distressed housing and neighborhood environments. The likelihood of living in distressed housing or neighborhood environments is even greater for children from marginalized racial and ethnic populations. Although the literature on housing quality and child health literature is rich, there is limited research exploring the processes of how fair housing strategies, such as housing mobility, directly impact child health.

Housing mobility programs are designed to expand housing opportunities in healthier environments for lower income families. These programs utilize various forms of housing assistance to create affordable rental opportunities for families seeking to relocate from distressed neighborhood environments to high resource neighborhoods. Mobility programs generally seek to provide housing opportunities in neighborhoods that are safer, have high resource services (such as local educational systems) or are closer to employment opportunities. Housing mobility programs aim to remedy the multiple fair housing barriers facing low income communities and communities of color.

The following case analysis identifies the mechanisms influencing physical, mental and emotional health improvement for parents and children participating in a housing mobility program. Our study focuses on Move to PROSPER (MTP), a pilot housing mobility program in Columbus, OH. MTP provides access to safe housing in high resource neighborhoods and extensive life coaching. Participants volunteer for the program, agreeing to participate for three to four years of life coaching and other programming while receiving rental assistance for market rate rental units in high resource neighborhoods in the metropolitan region. The study utilizes longitudinal data generated from the experiences of ten families and 18 children over the course of four years to develop a conceptual model of the pathways to child health improvement triggered by a housing mobility intervention.

We find four dominant pathways (indoor air quality improvement, environmental stress reduction, family stress reduction, and enhanced resource access) that contributed to health improvements for families in the MTP housing mobility program. Our analysis finds a temporal aspect to the emergence of positive outcomes for children in the program. Early physical health impacts on children occurred immediately after relocation. Once established in new communities, improved educational outcomes, economic outcomes and socio-emotional health would emerge in the later years of program intervention. We conclude by discussing the intersection of our conceptual model with existing literature and the implications for planning to support maternal and child health.

DIET QUALITY AND FRESH FRUITS AND VEGETABLES INTAKE: A STUDY OF THE DIMENSIONS OF ACCESS IN THE AFRICAN AMERICAN COMMUNITY IN LEXINGTON, KENTUCKY

Abstract ID: 1914

Individual Paper Submission

USHER, Kareem [The Ohio State University] usher.21@osu.edu, presenting author
ADAMS, Ingrid [The Ohio State University] ingrid.adams@osumc.edu, co-author
FIGUEROA, Wilson [The Ohio State University] Wilson.figueroa@osumc.edu, co-author
PORR, Adam [The Ohio State University] porr.4@osu.edu, co-author

In this study we investigate the independent and combined effects of objective and subjective dimensions of access to fresh fruits and vegetables and on diet quality as measured by the Healthy Eating Index among the African American community in a medium sized mid-western city. Utilizing a mixed-methods approach, we analyzed a more holistic

conceptualization of food access at the neighborhood scale. We found that diet quality was positively affected by the combined effects of the presence of fast-food stores, residents' age (35 years and older) and grocery stores within a 1-mile radius of residents' homes. Whereas fresh fruits and vegetables intake was positively affected by the joint effects of residents' age, Body Mass Index (BMI) above 30 (obese) and grocery store presence within the 1-mile radius. However, the combined effects of residents' BMI below 30 (non-obese) and grocery store presence within a 2-mile radius was negatively correlated with fruit and vegetable intake in residents. These findings strongly support more research to be conducted on the independent and combined effects of perception and objective measures on access to fresh fruits and vegetables and other variables to better understand the dynamics of the neighborhood food environment and how this impacts food-buying decisions.

EFFECT OF GREEN WALLS ON THE PSYCHOLOGICAL WELL-BEING OF PEDESTRIAN

Abstract ID: 1939

Individual Paper Submission

KANG, Mingu [Seoul National University] 1996km9@snu.ac.kr, presenting author
YOON, Heeyeun [Seoul National University] hyoon@snu.ac.kr, co-author

Modern cities have faced a substantial level of land scarcity for green spaces, and in reaction to such condition, recently, greening vertical surfaces of building structures have attracted attentions in urban landscape. Plants absorb less heat compared to concrete, and make cooling effects through transpiration, thus alleviates the urban heat island effect (Balany et al., 2020). In addition, green walls provide aesthetic pleasure to pedestrians, as it is more accessible – even visually – than green roofs (Koch et al., 2020).

Most of the relevant studies have analyzed the cooling effect of green walls by measuring the operative temperature, transpiration of foliage and skin temperature (Zhang et al., 2019; Sedghikhanshir., 2022). Rather than physiological effects, only a few studies have analyzed psychological effects with some limitation to yield practical implication. First most of the studies have been conducted in indoor or virtual environment (Mostajeran et al., 2021). Limited number of studies used the actual green walls while most of the study used visual materials such as photos and videos (Mostajeran et al., 2021; Sedghikhanshir et al., 2022). The effects of the green walls, as we suppose, are made both physiologically and psychologically. First, green walls improve thermal comfort by lowering the body temperature through the cooling effect caused by transpiration of foliage. Second, green walls improve visual satisfactions or reliefs and consequently increases a comfort level.

Against this backdrop, we investigate the effect of green roof physiologically and psychologically, to discern which takes larger role in enhancing human comfort level, using electroencephalogram (EEG), the Profile of Mood States (POMS), heart rate and body temperature. EEG is a method of recording brain activity by observing neurotransmitters secreted from the cerebral cortex. EEG signals are classified according to the frequency domain, and each signal contains different physiological and psychological information. The brain wave measuring equipment to be used in this experiment is the Epoc X manufactured by Emotiv. We would analyze EEG through MATLAB's toolbox, EEGLAB. In addition, we would analyze the emotional changes of subjects through six indicators (stress, engagement, focus, interest, and relaxation) provided by Emotiv. The POMS was developed to measure mood changes of subjects with six factors: tension, anger, vigor, fatigue, depression, confusion and a total mood disturbance. We use K-POMS-B which was modified to suit South Korea culture. It consists of 30 items rated on a five-point Likert-like scale. In addition, during the experiment, we would measure the subject's heart rate and body temperature.

The study is conducted on the rooftop of Seoul National University, South Korea. In the site, three types of green walls are installed: a blank panel, a panel with living plants and a panel of artificial plants. A total of sixty healthy adults

participated in the study: 30 participants in Experiment 1 (panels without shade screen and mist spray) and 30 participants in Experiment 2 (panels with screen shade and mist spray). Each experiment involved four tasks. The general task order is: (1) blank panel task assessing participant's baseline state; (2) artificial plants panel task testing panel's visual effect on participant; (3) rear-living plants panel task testing panel's cooling effect on participant; (4) living plants panel task testing panel's visual and cooling effect simultaneously on participant. Each task consisted of staring at a panel for 7 minutes, filling out the POMS for 3 minutes. Through this study, we can discern which takes larger role in enhancing human comfort level between physiological and psychological effect of green walls.

BEAT THE HEAT: ENGAGING COMMUNITIES TO BETTER PLAN AND PREPARE FOR EXTREME HEAT

Abstract ID: 2039

Individual Paper Submission

HABEEB, Dana [Indiana University] dana@danahabeeb.com, presenting author

The most recent climate assessment report highlights the urgent need for communities to increase their focus on both climate adaptation and climate mitigation.¹ Heat waves are projected to be one of the main climate crises impacting communities across the globe. In the United States, extreme heat is responsible for more fatalities annually than all other natural disasters combined.² Not only are heat waves increasing across cities in the United States,³ but unprecedented record-breaking heat wave events, such as the Portland heat wave of 2021, demonstrate the need for communities to create effective heat response protocols. Many cities across the United States including Midwestern cities are doing little to prepare for extreme heat. Understanding how heat waves impact local residents, and tailoring mitigation and adaption strategies to address increased heat exposure and vulnerability, enables communities to be better prepared for future extreme heat events.

In this paper, we describe a new state funded initiative: the *Beat the Heat* program. The *Beat the Heat* program is a two-year initiative working directly with two cities in Indiana (Richmond and Clarksville) to develop heat response plans tailored for their communities. The project begins with a community needs assessment. The community needs assessment consists of three parts: gathering community feedback through surveys, focus groups and heat observations; quantifying heat exposure using hyperlocal temperature mapping; and identifying priority areas for intervention. We describe the community needs assessment and detail our construction of two local heat vulnerability indices (HVI) and discuss strengths and difficulties in HVI creation for small communities. The community needs assessment is used to better understand how people in the community respond to extreme heat and identifies services and amenities residents prefer in their communities. It reveals how residents receive information about heat and uncovers social and neighborhood support structures present in the communities. We detail our process and methods for each protocol of the project and demonstrate how each city is using the community needs assessment to prototype heat response strategies for their community.

With temperatures increasing across Indiana, the *Beat the Heat* program highlights benefits of co-creating knowledge, protocols, and policies with communities. Working directly with local government leaders, we are creating tailored strategies designed to protect at-risk vulnerable residents. The communities working with the *Beat the Heat* program are not only preparing and empowering their local communities to respond to the challenges of extreme heat, but also pioneering a model that could guide heat mitigation strategies for other communities throughout the state of Indiana.

INTERSECTIONS (OR LACK THEREOF) OF THEORY AND FOOD SYSTEM PLANNING

Abstract ID: 2044

Individual Paper Submission

ZUTZ, Clare [University of Texas at Austin] clarezutz@utexas.edu, presenting author
BORN, Branden [University of Washington Seattle] brandenborn@gmail.com, co-author

Over the past two decades, the planning field has increasingly engaged in food systems research. The seminal article “The Food System: A Stranger to the Planning Field” brought food systems into the planning conversation and argued the discipline, by the nature of its focus on improvement of communities and the interconnections between various systems, must include food systems in its areas of study (Pothukuchi and Kaufman 2000). This call to action was met when the *Journal of Planning Education and Research* released a special issue on “Planning for Community Food Systems” (Kaufman et al. 2004). The articles from this issue paved the way for a body of work focused largely on the performance and empirical understanding of the food system. What this work lacked was a clear understanding of the context and motivation beyond broad conceptions of capitalism, efficiency, and social justice; it lacked a strong theoretical grounding. But why should we care about engagement with theory?

The issues planners seek to tackle within the food system are often thought of as “wicked problems” because of the challenges with problem formulation and solution identification, among other factors (Rittel and Webber 1973). This complexity necessitates a stronger theoretical foundation to clarify questions and identify where planners can and should intervene in the food system. In our paper, we trace the recent history of food systems planning through a systematic literature review, with elucidating case examples, to identify how theory has been both implicitly and explicitly used in food systems planning. We borrow concepts from related disciplines that are more advanced in their consideration of food systems, such as geography and sociology. We also discuss ideas such as food justice and food democracy, alongside more radical critiques (cf. Born and Purcell 2006). We find that while scholarship is evolving, as evidenced by the work of Raja et al. (2014) and others, an explicit recognition of theory in food systems planning is still new.

As the planning field works to build a more inclusive food system, this paper will strengthen the field’s scholarship by providing a more comprehensive understanding of how theory has and can enhance food systems research.

FOOD PRICE IMPACTS ON FOOD SECURITY: A REVIEW OF RECENT EVIDENCE ACROSS STAKEHOLDER CATEGORIES AND IMPLICATIONS FOR PLANNERS

Abstract ID: 2045

Individual Paper Submission

Abstract: The world market prices of staple crops (e.g., rice, maize, wheat, legumes) increased dramatically over 2006-07, 2010-11 and 2020-2022. This reversed the long-run pattern of declining farm-level real^[1] prices of food commodities since the past 50 years. Food prices are important for welfare since they determine the real income of the population. The food insecurity impacts of higher staple commodity prices are particularly significant for Low-and-Middle-Income Countries (LMICs), where poverty and food insecurity are highly concentrated. Low-income groups routinely spend more than half of their income on food consumption. As a result, rising food costs are impacting poverty, consumption patterns, maternal and child health and nutrition across LMICs.

At present, gaps persist in understanding intra-household (i.e., within household) and overtime (especially the short run) impacts of higher food prices across various stakeholder categories. Although the mechanisms to attain and maintain food security are constantly evolving, well-designed and well-targeted safety nets can only be achieved if the current knowledge gaps regarding food price effects at the household and individual levels can be addressed.

To summarize the existing knowledge about the welfare impacts of high food prices for different categories of stakeholders in LMICs and associated policy and planning implications, we conducted a systematic review of recent economic, planning, developmental, and sociological literature. The goals of this review are to provide a resource for the analysis of food price impacts on food security across a range of stakeholder categories in LMICs; summarize extant evidence regarding food price associations with poverty and food security issues in varying spatial and economic contexts in LMICs; and provide a framework for thinking about the role of food price analysis in research, intervention design and evaluation, and creation of public food security policy. We were guided by four main questions:

1. What is the recent evidence regarding the food security impacts of higher food prices and the associated methodological tools?
2. What are the food security impacts of higher food prices across stakeholder categories of net-food buyers (who buy more food than they sell) and net-food sellers (those who sell more food than they buy) at the household and individual levels in Global South countries?
3. What are the gaps in knowledge, policy and planning regarding the food insecurities generated by structural and seasonal changes in food prices?
4. How can research on the food security impacts of higher food price be improved in LMICs and what directions might future research on food security in LMICs in view of current gaps in understanding? Is there a role for community and regional planners in addressing these debates?

The analysis demonstrates that higher food prices espouse different welfare implications for different groups and regions in a country. For instance, food prices entail conflicting policy perspectives for farmers on the one hand (availability perspective) and for consumers (access perspective) on the other hand. This necessitates nuanced policy interventions and consensus-building across the various stakeholder categories. Moreover, causal evidence regarding the impact of food price fluctuations on males and females within a household, including information on associated coping strategies is notably lacking, especially for shorter time scales ranging from a few months to a year. In addition, findings from existing studies are undermined by methodological weaknesses. A strong case can be made for greater reliance on participatory and community-based research approaches propounded by planners for addressing such shortcomings. In addition, planners' technical skills and their expertise in mediating negotiations and agenda-setting related to politically and socially contentious issues such as food pricing can be important in addressing the present challenges.

[1] Nominal prices adjusted for inflation i.e., rising average prices.

EXAMINING SUBURBAN NEIGHBOURHOOD EXPERIENCES OF PEOPLE LIVING WITH DEMENTIA DURING COVID-19: A CASE STUDY OF OSHAWA, ONTARIO

Abstract ID: 2051

Individual Paper Submission

BIGLIERI, Samantha [Toronto Metropolitan University] samantha.biglieri@ryerson.ca, presenting author
VIJAYAKUMAR, Roslyn [Toronto Metropolitan University] rvijayakumar@ryerson.ca, co-author
LUU, Sophia [Toronto Metropolitan University] sophia.luu@ryerson.ca, co-author

Background: The WHO calls dementia "the leading cause of dependency and disability among older persons" and is an umbrella term describing symptoms like impaired memory, confusion navigating space, inability to focus, and issues with communication, reasoning, depth perception and judgement. Most environmental research on supporting PLWD takes place within congregate living settings, despite 2/3 of PLWD in Canada residing within the community. For PLWD, continued access to their surrounding neighbourhood has many benefits: improved mental/physical health, more social interaction, and sense of worth and dignity. This research is nascent and the COVID-19 pandemic has further compounded the need to study these experiences, as the pandemic has altered our access to amenities, physical activity levels and social interactions. For PLWD, it is acute - increased rates of social isolation, fear, and anxiety due to closure of social programs/activities, and interruptions in daily routines and social networks (Chirico et al., 2022, Cohen et al., 2020). COVID-19 has also disproportionately impacted our socio-spatial peripheries, prompting pleas to study the pandemic from the suburbs, instead of city centres, and from the perspective of marginalized folks. This study examines the influence of spatial arrangements and place on the wellbeing of six community-dwelling people living with dementia in Oshawa, Ontario during the COVID-19 pandemic.

Theoretical Framework: This research is informed theoretically by critical theories of urban planning, and the understanding of place as socio-spatial, and relational. Planning is not value neutral (Hamraie, 2013). This study is an opportunity to see the experiences of PLWD through the lens of the neighbourhood (Ward, Clark & Phillipson, 2021) and an expanded definition of care (Biglieri, 2021) during the COVID-19 pandemic. The pandemic has affected more than just access to these services, it has affected everyday routines in uneven ways (e.g. PLWD being more 'at-risk' than other groups, and thus more likely to restrict movement, which goes back to an ableist and ageist approach to policy).

Research Design: Using an exploratory cross case study and a variety of participatory methods (one-on-one semi-structured interviews, photovoice capture, GPS tracking and travel diaries), this study combines: (1) 'physical measures' of neighbourhood (through measuring activity-spaces and mobility patterns using GPS tracking, travel diaries and interviews) over time (by asking if this was normal, what has changed since the pandemic, what are they hoping will happen in the future); and (2) 'socio-spatial relational understandings' of the neighbourhood (through photovoice and semi-structured interviews) exploring the meaning of places, and how those places/people within them care for the PLWD and how they care for them. Analysis of the photovoice data indicates the importance of particular types of built spaces for PLWD during the pandemic in their neighbourhoods, including: green and blue spaces, proximity to infrastructures (e.g. healthcare, social care), places of remembrance and reminiscence, community connection spaces, and small personal displays in yards as a harbinger of joy. The restrictions to public spaces due to COVID-19 and busy, noisy road conditions were perceived as negative built environment aspects. Further, built environments produced feelings of both anxiety and comfort and joy, depending on its characteristics. From a social perspective, PLWD highlighted the importance of being known by more 'distant others' (the retail worker or pharmacist remembering who they were), being known by close others (family members, spiritual communities), and connections with more-than-human others (like pets). They also highlighted the negative impacts of COVID-19 restrictions on their previous ability to socialize in their communities.

Takeaways: This study worked with PLWD to identify socio-spatial barriers and supports, and will provide guidance to practitioners on creating inclusive neighbourhoods for PLWD moving forward in a 'post-pandemic' world.

TOO OLD FOR RISKY PLAY? A CONCEPTUAL FRAMEWORK FOR LATER LIFE RISKY PLAY

Abstract ID: 1823

Poster

EMPEY-SALISBURY, Madison [Queen's University] 21mes25@queensu.ca, presenting author
HARTT, Maxwell [Queen's University] m.hartt@queensu.ca, primary author

Age-friendly community planning has become a pertinent policy issue for planning scholars and practitioners (Lee & Tan, 2019). The goal of age-friendly planning is to develop and maintain communities with supportive social and physical environments where older adults can age in place and continue to engage in community life (Scott, 2021). However, age-friendly planning has been criticized for being paternalistic, compounding ageist policies and practices, and problematizing later life (Joy, 2020). This paper broadens the theoretical and practical parameters of the age-friendly model to introduce a ludic lens to empower older adults to engage with their community and dismantle the limiting place-based and societal structural barriers to aging well. Specifically, we cross siloed disciplinary boundaries to call upon the child-friendly literature to explore the feasibility of risky play to support successful aging among older adults. Risky play is a form of play where participants face feelings of uncertainty and the potential of injury as they navigate environments that challenge their mental and physical limits (Sandseter, 2010). By engaging in activities that push these limits, older adults can strengthen their cognitive and physical functions, while mitigating risks associated with aging.

Our paper combines and expands age-friendly and risky play models to introduce a new conceptual framework for later life risky play. The framework details how the intellectual, emotional, and physical benefits of risky play can contribute to improved mental and physical wellbeing of older adults. In doing so, we demonstrate how the risky play concept is (and is not) compatible with current age-friendly planning policy and how it can be actualized into targeted community interventions to support individual older adult quality of life and broader community cohesion and wellbeing. This project is the first to examine the possibilities of risky play in age-friendly community planning. By advancing a conceptual model of later life risky play and articulating tangible recommendations for planning practice, the findings establish a new direction in age-friendly planning while contributing to the existing discourse on older adult wellbeing, loneliness, and best practices for outdoor spaces.

ASSESSING ACTIVE AND HEALTHY COMMUNITY ENVIRONMENT USING PEDESTRIAN BODY RESPONSES TO ENVIRONMENT FEATURES WITH WEARABLE SENSORS

Abstract ID: 1893

Poster

Physical activity and walking can be facilitated or constrained by the conditions of built environment attributes. Residents are more active and walk more in neighborhoods that have good residential conditions, have sidewalks with few obstructions, are free from physical disorder and other safety issues, and in which locations, goods and services can be accessed by walking. Therefore the detection and collection of information about facilitators and barriers to walkable environment is a crucial element to effectively design active, safe and healthy community. Following the popularity of the research topic, a variety of pedestrian environment assessment metrics have been proposed and tested, but they are inconsistent, subjective and limited. Conventional approaches are perception interview, opinion surveys, or visual evaluation of built environment conditions. Researchers and local agencies mainly rely on field observation methods that utilize inspectors and audit questions to rate walking environment. These approaches are often influenced by respondents' emotion, experience and intimacy. Additionally these measures do not adequately capture the differences of various population groups, though barriers and facilitators to individuals' physical activity likely vary by age, physical ability, and gender. Therefore there is a critical need to develop an objective, efficient, and reliable assessment methodology.

To fill the research gap, we propose an innovative and noble approach to assess the built environment using physical body responses with wearable sensors and machine learning methods. A human interacts with environment, and a body response is the physical and automatic reaction of a body to a surrounding stimulus. Such responses can provide beneficial information that can be used to investigate the relationship between human's activities and built environments.

The objective of the research is to develop a reliable and efficient community assessment tool by integrating visual audits with sensing data measuring residents' body responses to their built environments in order to evaluate and improve the quality of these human-made spaces. It also investigates the interconnectedness among built environment conditions and body responses and walking behaviors. The research empirically identifies facilitators and barriers of walking environment.

The research findings contribute to the methodological improvement in walkable environment assessment. Previously unavailable neighborhood assessment data will be collected and analyzed using innovative geospatial technology and sensing platform. It also contributes to the knowledge territory of the interconnectedness among built environment features and physical activity.

THE IMPACT OF COVID-19 LOCKDOWN ON EATING HABITS AND THEIR ASSOCIATION WITH SOCIO-DEMOGRAPHICS AND BUILT ENVIRONMENT

Abstract ID: 1978

Poster

HWANG, UiJeong [Georgia Institute of Technology] uhwang3@gatech.edu, presenting author
GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

The COVID-19 lockdown has totally changed everyone's lifestyle and our eating habit is clearly one of those things that were affected. Studies on the eating habit changes during the pandemic commonly point out that our dietary behaviors became healthier: people have been eating more both in quantity and frequency, particularly snacks, sweets, and food with poor nutrition, but eating less fruits and vegetables. The sedentariness due to teleworking and home-schooling made it difficult for people to motivate themselves to keep their healthy, regular eating patterns. Moreover, the lockdown-induced, negative psychological states (e.g., anxiety, tension, stress, depression, or boredom) made people end up with high sugar intake and food addiction symptoms.

What is much less discussed in the literature is how the changes vary by different socio-demographic populations and built environments. Both socio-demographics and the built environment are essential factors that contribute to our eating behaviors: studies claim that people with lower educational background and income are more likely to have unhealthy dietary habits due to high priority on price and familiarity; race and ethnicity are significantly correlated with the food choice; there is a strong association between the built environment, dietary behavior, physical activity,

and obesity. Therefore, it is plausible to expect that the changes in eating habits due to the pandemic may have been different by neighborhoods because of those factors. However, there is little research that examined the relationship in the U.S. context. Moreover, most studies have relied on online survey data, yet no study has explored the 'revealed' dietary preference.

Therefore, this study seeks to examine 1) how the COVID-19 pandemic has affected eating habits and 2) how the changes in eating habits vary by neighborhoods with different socio-demographic populations and the built environment. By utilizing 117,000 Points-of-interest (POIs) and 15 million visitor pattern data in the Atlanta region provided by SafeGraph, the study analyzes and visualizes people's restaurant visiting patterns (e.g., type of food, dine-in/take-out, visiting frequency, and distance from home) before and during the pandemic. The study then employs a regression model to explain eating habit changes based on socio-demographics and built environment factors (e.g., density, land use, network connectivity, walkability, food access, and transportation options) at the visitors' home neighborhood (i.e., Census Tract) level.

Our preliminary analysis focusing on the fast-food consumption behavior shows intriguing results: people have been eating more fast-food during the pandemic. Even though the total number of restaurant visits as well as the total number of dine-ins have returned to the before-pandemic level since March 2021, the unhealthier eating habit still persists in 2022. In addition, the trend is significantly correlated with the neighborhood characteristics in terms of both socioeconomic status (e.g., income and race) and the built environment (e.g., distance to the nearest grocery store and walkability). The findings add to the literature by demonstrating the characteristics of neighborhoods that are vulnerable/resilient to a crisis like the pandemic lockdown in terms of food access and community health.

Track 10 Pre-Organized Session Summaries and Abstracts for the Sessions

BLACK PLANNING: CENTERING BLACK KNOWLEDGE AND EXPERIENCES IN PLANNING EDUCATION

Pre-Organized Session 48 - Summary

Session Includes 1407, 1408, 1409, 1693, 1813

UGARTE, Magdalena [Toronto Metropolitan University] magdalena@ryerson.ca, organizer

This session brings together planning educators and community-based practitioners who have engaged in pedagogical approaches that centre Black planning practices and knowledge. The authors reflect on examples of coursework, course redesign, and/or curricular changes that have sought to centre the diverse planning work and experiences of Black communities, advance anti-racism discussions in planning, and help develop professional competencies through an explicit anti-racism lens. The session pays particular attention to the role that community-university collaborations and community-engaged research can play in supporting the planning work of Black communities and organizations, providing planning students with experiential learning opportunities that raise awareness about systemic discrimination and strengthen their commitment to challenge them through their practice, and providing educators with an enhanced capacity and knowledge to engage with Black communities and organizations, as well as to deliver the transformative training that is needed to disrupt longstanding patterns of exclusion and anti-Black racism in planning.

Objectives:

- Increased knowledge about the complicity of planning with anti-Black racism.
- Increased knowledge about the potential and limits of community-engaged teaching in advancing anti-racism discussions in planning education.
- Preliminary insights about student experience in the context of experiential learning courses that centre Black experiences with planning.

BLACK URBANISM IN CANADA: EXPANDING PLANNING AND ANTI-RACISM COMPETENCIES THROUGH COMMUNITY-ENGAGED RESEARCH AND DIGITAL STORYTELLING

Planning has a contentious history with/in Black communities, shaped by a legacy of settler colonialism, racial capitalism, and White supremacy that has created inequitable outcomes for Indigenous, Black, and other communities of color until this day (Dorries, Hugill, and Tomiak, 2019). Since even before the establishment of planning as a profession, tools and practices that now fall under the umbrella of planning – including the creation of the Indigenous reserve system, restrictive covenants, residential segregation, exclusionary zoning, urban renewal-induced displacement, and the location of polluting facilities in historically racialized areas – have shaped informal and formal practices of settlement, land tenure and use, urban and regional planning, and development that have marginalized Black communities (Thomas, 1994; Agyeman, 2020; McKittrick, 2011). The impacts of such practices continue today, and are in part reproduced through planning education approaches and curricula that do not centre the planning work and experiences of Black communities historically and today, overlook planning's past and present role in anti-Black practices, and center White narratives in planning (Bates et al., 2018) Sandercock, 1998; Ahsan et al., 2020; Lundi, 2020).

This paper reflects on a collaborative course re-design project called Black Experiences with Planning in Canada, which brought together five Black-led community organizations leading planning, place-making, and community building work in different Canadian cities and the School of Urban and Regional Planning (SURP) at X/Toronto Metropolitan University. We critically examine different aspects of the project and what this experience might mean for deeper, longer-term transformations in planning pedagogy and curricula that centre the experiences and work of Black communities and organizations.

Between January and December 2021, the Black Planning Project (BPP) formally collaborated with SURP to co-redesign two core courses – Advanced Planning Studio and Advanced Field Research. Four organizations were invited as community partners for the courses: Akoma Holdings Inc., Hogan’s Alley Society, A Different Booklist Cultural Centre, and Black Futures Now TO. Substantively, the courses’ goal was to examine planning’s role in anti-Black racist urban practices in Canada, centre Black urbanism and the work of Black-led organizations historically and today, and de-privilege White narratives in planning education. Pedagogically, the courses sought to deepen experiential learning and community-engaged teaching by engaging students in community-based research with a partner organization to learn about their work and connect it to broader discussions about planning, anti-Black racism, Black resistance, Afrofuturism, and Africentric design. Methodologically, students received training and explored digital storytelling as a means to share their research, producing short mini-documentaries that foreground the planning work of their partner organization. Ultimately, the purpose of Black Experiences with Planning in Canada was to open up spaces in the planning curriculum to train planners that are more aware and ethically committed to planning for racial justice and equity.

The paper shares preliminary learnings from our collective reflection process, which was also informed by the results of a post-course survey circulated among students to gather their experiences. First, we explore the pedagogical potential and challenges of community-engaged audiovisual methodologies to explore discussions of anti-Black racism in planning. Second, we discuss the complexities of assessing student learning when the goal is to foster a concern for and commitment to racial justice among future planning professionals. The paper ends with a discussion about what is required from universities to ensure collaborations of this kind – which seek to embody respectful and ethical relationships in service-learning by sharing responsibilities, ensuring partner organizations are adequately compensated, and supporting the community partners’ agendas – can be sustained over time.

TEACHING DIGITAL CURATION AS PLACE PRESERVATION

Abstract ID: 1408

Abstract within Pre-Organized Session 48

ROBERTS, Andrea [Texas A&M University] aroberts318@tamu.edu, presenting author

The author will share her pedagogical innovations and challenges encountered when introducing digital curation as a research method to future preservationists, designers, and planners. More specifically, she recounts the challenges which have emerged and the insights gleaned from integrating The Texas Freedom Colonies Atlas and Survey—a virtual and engaged research project with social justice aims—into assigned coursework. She shares evaluations and written reflections that indicate that some students value direct engagement with communities. In contrast, others perceive lectures and assignments centering on African American placemaking and planning as peripheral to the canonical content in Planning History and Theory courses. She reveals ways that coursework which includes engagement directly with grassroots African American preservationists and planners, both advances and complicates project-based learning for planning students. Applying the digital humanities in her pedagogy has led her to conclude that these platforms offer educators creative strategies for integrating social theory and humanistic inquiry into social science and professional teaching. In addition, she has made visible communities and equity issues not otherwise apparent to future planners by foregrounding the humanities.

YOUTH, RACE, AND FAITH IN TORONTO'S REGENT PARK

Abstract ID: 1409

Abstract within Pre-Organized Session 48

MEHTA, Aditi [University of Toronto] aditi.mehta@utoronto.ca, presenting author

Urban studies researchers across the world have been studying Regent Park's billion-dollar redevelopment process in Toronto and how the newly "revitalized" mixed-income neighborhood has affected long-time social housing residents, who are primarily Black and Muslim immigrants (Brail and Kumar, 2017; August, 2014; Laughlin and Johnson, 2011). However, few of these studies incorporate the perspectives of Black and Muslim residents, specifically youth. This article analyzes the pedagogy of a course collaboration from 2019 and 2020 in which undergraduate Urban Studies students and youth members of a neighborhood media arts non-profit sought to design research projects about the rapidly changing community. The class was committed to principles of "knowledge justice" and participatory action research (PAR), in which academics and community residents are collaborative partners in the process of designing an inquiry for the purposes of social change (Torre et al, 2012). In this paper, I ask: What did Black and Muslim youth media from Regent Park uncover about their neighborhood's redevelopment that academic scholarship missed?

Undergraduate students and youth residents envisioned and co-produced their own media projects addressing gentrification in Regent Park from the Black Muslim youth perspective. These projects included a podcast which explores how the Rap and Hip Hop culture of the neighborhood disintegrated during redevelopment; a YouTube mockumentary that exposes how inaccessible the neighborhood's new public amenities are to long-time social housing residents; a zine documenting subversive art and memorabilia of the rapidly changing neighborhood; a photography exhibition that counters mainstream media stereotypes; and a video that contextualizes what it means to be a young Muslim woman from Regent Park in the broader narrative of Islamophobia in Toronto. Analysis of these media projects, participant observation, focus groups, and students' written reflections reveal that practitioners and scholars need better strategies to understand intersectional identities and how they influence experiences of the built environment. The pedagogy of this collaboration highlights innovative ways for educators to teach students how local knowledge about the city can be shared and understood across different population groups.

BLACK PLANNING AT MIT

Abstract ID: 1693

Abstract within Pre-Organized Session 48

WILLIAMS, Darien [Massachusetts Institute of Technology] darienaw@mit.edu, presenting author
JAMES, Erica [Massachusetts Institute of Technology] ejames@mit.edu, primary author
HALL, Enjoli [Massachusetts Institute of Technology] enjoli@mit.edu, co-author

What is planning? Who or what institutions have had the formal capacity to ‘plan’ in the modernist, rationalist sense of the term? What does it mean to ascribe to planning a racial, ethnic, or national descriptor, such as “Black”? In this course we explore how bringing together the terms ‘Black’ and ‘planning’ expands our understanding of the history of planning as an organized activity, the relationships among planners and institutions like “the state,” and ways that subjugated populations enact plans that imagine possible futures against, alongside, and beyond structures of oppression. We trace multiple genealogies of Black planning in relation to the emergence of imperial capitalism, colonialism, neocolonialism, and neoliberalism, primarily in a trans-Atlantic (or what Édouard Glissant calls an African archipelagic) context. By exploring “Black Planning” (or planning in Black), we recognize that Black and Blackness are contested identities, embodied racial monikers, sociopolitical locations, material and geographic spaces, processes, legal statuses, and grounds for generative creativity that have changed temporally and globally. We review select examples of how Blackness has been deployed discursively to inform geopolitics and the formal practice of planning historically. We also analyze cases and spaces of Black Planning. If, as the work of Afrofuturist writers suggests, Blackness is a state of mind that engenders the capacity to shapeshift physically, spiritually, and otherwise, what does this mean for planners, designers, architects, and others seeking to plan in Black? We plan to present details about a class with the following learning objectives:

- Describe the purpose and value of desire-based frameworks that center Black people’s aspirations, acts of creation, and intellectual traditions for studying and working with Black communities
- Articulate key ideas, frameworks, and movements associated with the Black Radical Tradition, and the sociohistorical and political economic contexts that give rise to them
- Characterize and critically assess different approaches to community planning and development at a variety of social and spatial scales, through the lens of different Black radical formations
- Draw from a diversity of sources, media, and knowledge traditions that reflect the diversity of Black epistemologies and ideologies in order to make claims about strategies and struggles for justice, self-determination, and freedom
- Create a safe and healthy learning environment that values and engages in practices of care, self-reflection, political education, and imagination

CENTRING THE BLACK EXPERIENCE IN PLANNING COURSES

Abstract ID: 1813

Abstract within Pre-Organized Session 48

LEWIS, Nemoy [Toronto Metropolitan University] nemoy.lewis@ryerson.ca, presenting author

Historically the discipline of planning has been called to task for its investment in plantation logics and willful annihilation of Black and indigenous spaces across the Americas and the rest of the diaspora. While the abolition of slavery more than 400 years ago, scholars like Hartman (2019), Sharpe (2016), Walcott (2021), and Gilmore (2007) reminds us of the unrelenting violence in “the afterlife of slavery.” Planning educators and urbanist have been working attentively to reverse this course and chart a new trajectory— one that centres anti-colonialism, Blackness, and antiblackness as a means to dismantle repressive learning that upholds the logics of white supremacy. The classroom offers educators an important venue to cultivate such critical discussion regarding Black people’s humanity to inspire and cultivate the courage in students to resist planning practices that help negate Black people’s humanity. How might planning educators make use of analytical categories such as the human to inspire students to resist the

dehumanization, social and literal death of Black people? This paper provides an intervention into current planning pedagogical practices that contributes to the reckoning of white supremacy in the discipline and helps provide insights on how to improve the lives of Black, Indigenous, and other people of colour.

Courtney E. Knapp (2018) appropriately notes, becoming and remaining an anti-racist planner requires tremendous “guts.” Some planning educators proffer various pedagogical approaches including storytelling, and personal testimonies, autobiography, and memoirs to examine socio-spatial issues that help keep Black and other racialized spaces underdeveloped (Knapp 2018, Lung-Amam et al. 2015, Forester 1987). However, these approaches often centre discussions solely on racism without distinguishing the unique experience of Black people’s oppression. In fact, some scholars argue antiblackness must be distinguished from racism to capture the unique dehumanization of Black people and the underpinning logic that renders Blackness as abject (Jung and Vargas 2021).

This article offers a critical reflection on the re-design of a graduate seminar titled Housing and Redevelopment at a Canadian university. Unlike, traditional housing courses that seek to provide students insight on pressing housing issues in Canada without centring Black humanity, miss opportunities to inspire them to value the experiences of Black people. By centring Black humanity in the course, students are able to develop critical perspective regarding various planning procedures and practices that serve to oppress and dehumanize Black people. Additionally, examining key housing problems such as housing affordability, racial discrimination, banishment, financialization, gentrification, evictions, and dispossession through an antiblackness framework allow students to see how these issues facilitate the negation of Black humanity. The paper closes with a discussion on how planning educators could potentially centre Black humanity to inspire and develop the courage in students to begin planning for a just society that is no longer predicated on antiblackness.

TEACHING DATA SCIENCE IN URBAN PLANNING

Abstract ID: 1248

Roundtable

MILLARD-BALL, Adam [University of California Los Angeles] adammb@ucla.edu, organizer, moderator

BOEING, Geoff [University of Southern California] boeing@usc.edu, participant

JIANG, Shan [Tufts University] shan.jiang@tufts.edu, participant

GONZALEZ, Marta [University of California Berkeley] martag@berkeley.edu, participant

VANKY, Anthony [University of Michigan] avanky@umich.edu, participant

GIS and statistics have long been mainstays of planning curricula. However, more schools are complementing these courses with offerings in data science, urban informatics, urban and spatial analytics, and similar topics. A hallmark of these courses is that they typically teach students to code in languages such as Python or R, as well as introducing analytical methods and discussing the theoretical underpinnings and planning applications.

This roundtable is the first in a proposed two-part roundtable on technology, planning, and data science. It will not only reflect pedagogical approaches, contents, and skills taught in data science-related courses in planning programs

but also discuss why and how they matter for planning curricula in a broader sense, and how diversity, equity, inclusion, and justice (DEIJ) can be addressed and taught in analytical-heavy courses.

More specifically, roundtable participants will discuss their first-hand perspectives from teaching and curriculum development, including:

- What planning schools teach in data science. Most data science courses emphasize basic coding and data wrangling skills. Beyond that, instructors have a broad range of topics that they emphasize, including but not limited to spatial analysis, machine learning, image processing, and natural language processing. How are the analytical skills taught in ways to connect with planning applications? How have instructors integrated critical approaches and reflections?
- Analytical skills that matter for urban planning students and graduates. Roundtable participants will reflect on the broader learning goals and skills that data science courses seek to build, and the balance between familiarity with specific packages and a deeper understanding of algorithms and methods such as machine learning. How does data science fit into a planner's constellation of tools? How have these analytical skills helped planning students in their career development?
- Pedagogical approaches. How have instructors engaged students with a wide range of coding experience coming into the course? How have they taught noncoders to code for the first time? What pedagogical innovations have proved most effective?
- Curricular development. How do data science and urban informatics courses fit into the broader landscape of planning curricula? How do they complement courses in GIS, statistics, and other planning methods? What are the possibilities to address diversity, equity, inclusion, and justice in these courses?

ZONING FOR EQUITY: DISMANTLING EXCLUSIONARY LAND USE AND DEVELOPMENT PRACTICES, ONE STEP AT A TIME

Abstract ID: 1505

Roundtable

KIM, Minjee [Florida State University] m.kim@fsu.edu, organizer, moderator
PENDALL, Rolf [University of Illinois at Urbana-Champaign] rpendall@illinois.edu, participant
PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, participant
GOETZ, Edward [University of Minnesota] egoetz@umn.edu, participant
MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, participant

In 2021, a group of planning educators launched a multi-campus course titled "Zoning for Equity." The idea was to use the classroom as a vehicle for developing and introducing concrete and practical solutions to push local and state-level land use, zoning, and development practices toward greater equity, ultimately dismantling exclusionary land use and development patterns from the ground up. Accordingly, the course has been deliberately designed to be picked up by additional planning programs, propagating the incremental and grass-roots challenges to established land use and development practices.

This year marks the second year of Zoning for Equity. As new and returning campuses join us, we will discuss the local projects that have been, are, and will be taken up by each campus. We will start building a repository of the scope and scale of local projects, possible ranges and scale of practical solutions, and effective strategies for implementing the proposed changes. We will compare the challenges and opportunities faced in each local context to start identifying the conditions under which changes can be implemented. These conditions may include but are not limited to local and state administrative capacity, the political makeup of elected officials, strength of community and advocacy organizations, local and state political culture, and regulatory contexts. We strongly welcome interested planning educators to join us at this Roundtable and further consider joining the collective in the future.

Dr. Joanna Ganning recently published an important analysis of the planning doctoral job market with the goal of informing prospective students and job seekers about employment prospects and spurring pedagogical discussions in the discipline (Ganning, 2022). Her article provides quantitative insights into an “over-supplied academic job market [that] exerts a sorting process on its applicants” (Ganning, 2022, np). While it is critical to quantitatively understand this topic, we felt it left out perceptions from recent Ph.D. graduates who are making complicated decisions about remaining in academia, pursuing multiple pathways following graduation, and navigating demoralizing academic job markets.

After reflecting on Ganning’s analysis, we thought it important to provide a more nuanced description of the landscape that planning graduates encounter based on our collective experiences. This roundtable discussion brings together recent graduates from Research 1 (R1) Ph.D. planning programs across the United States and Canada to shed light on the complicated, often blurry paths, and ever-changing expectations that recent graduates face. We intend to discuss the increasingly competitive academic job market and the pragmatic implications of the shifting expectations for graduates, evolving training and support needs, and suggestions for a more compassionate tenure-track market. We will also situate this conversation in a larger reflection on the neoliberal academy that promotes a culture of competitiveness over care and production over purpose that is always present but especially visible in the “sorting process” described by Ganning (Ganning, 2022; Museus & Sasaki, 2021). We will unpack how people navigate these systems that are seemingly antithetical, or even hostile, to the very type of transformative and radical planning work needed to address the most pressing planning issues of our time (Corbera et al., 2020; Mountz et al., 2015; Porter et al., 2012).

During our roundtable session we will ask participants to reflect on the following questions: As you were finishing your Ph.D., what did you envision for your future, and what paths did you end up taking? What were your experiences in various job markets? What do you wish you knew about those markets while pursuing your Ph.D.? As a more critical scholar, how do you view the contradictions between your work, our discipline, and the academy? How do those contradictions inform or complicate your decisions to stay or leave academia? What do we need to unsettle or transform to co-create a discipline and a future that centers justice, care, and compassion?

Track 10 Individual Paper Submissions

“WALK IT LIKE I TALK IT”: A CASE STUDY OF COMMUNITY-BASED SERVICE LEARNING IN PLANNING CLASSROOM IN COLLABORATION WITH THE LOCAL GRASSROOTS ORGANIZATIONS

Abstract ID: 1031

Individual Paper Submission

HE, Qian [The University of Texas at Arlington] qian.he@mavs.uta.edu, presenting author

Participatory pedagogy engages students in the process of learning and empowers them to play an active role during the learning experience. It provides an approach with a student-centered learning experience and enables the students to become part of the content as well as the structure of the educational process (Andersen & Ponti, 2014). The value of participatory pedagogy is particularly important in the field of urban planning, where emphasizing the importance of the democratic process holds a fundamental meaning to the learning outcome. From citizen participation to citizen empowerment (Arnstein, 1967; Rocha, 1997), planning theory recognizes the importance of public engagement in urban planning practice and education, and calls for creating the capacity of engaging in the process (Nussbaum, 2013). This is especially important while the planning paradigm shifts from the rational technician to the communicative action and interactive practice in planning (Innes, 1995). In a multicultural world that we live in, the meaning of teaching equity and advocacy planning with the awareness of reflexivity and positionality is increasingly acknowledged (Beebejaun, 2006, 2022; Botchwey & Umemoto, 2020; Lung-Amam et al., 2015; Tate, 2021; Wilson, 2020). Informed by the importance of participatory pedagogy, teaching practices such as service learning and experiential learning have been applied in the urban planning classrooms in recent years, especially in collaboration with local planning organizations across the public sector, private sector, non-profit and grassroots organizations (Deeley, 2010; Tyson & Low, 1987). Particularly, service learning is one form of experiential learning. It combines academic coursework with various degrees of service work within the community (Deeley, 2010). As an outcome, students gain in-depth knowledge about the community while embedding themselves in the process of problem-identification and problem-solving.

This study provides a case study of service learning in an undergraduate class in urban planning. The step-by-step case analysis demonstrates how service learning helps to achieve the outcome of citizen engagement in the local urban planning project in collaboration with a local grassroots organization in Arlington, TX, through a Walk Audit project. A walk audit is an activity in which a team, or an individual, intentionally observes the surrounding environment in a participatory way and evaluates the condition of the walkability of the examined area. In this case, the walk audit project was co-conducted with the local grassroots organization, Walkable Arlington, through an informal partnership from Summer 2021 to Spring 2022. Using the ArcGIS survey tool (“Survey123”) and field notes, two different groups of students were led by the Walk Audit guide to walk around the area, observe the pedestrian and walkability-related built environment, and document the observational outcome. This case study demonstrates that how participatory pedagogy, in partnership with the local grassroots organization, could help empower the students to critically evaluate the process of the planning project, the procedures of public participation, and how the project outcomes could be fundamentally influenced by the degree of citizen engagement through service learning experience in urban planning classroom.

OPEN EDUCATIONAL RESOURCES (OER): AN OPPORTUNITY WE SHOULD NOT MISS IN URBAN PLANNING EDUCATION

Abstract ID: 1242

Individual Paper Submission

RALEY, Amber [University of Texas Arlington] amber.raley@mavs.uta.edu, presenting author

AUDIRAC, Ivonne [University of Texas at Arlington] audirac@uta.edu, co-author

HESARI, Elham [University of Texas Arlington] exh9979@mavs.uta.edu, co-author

Open educational resources (OER) are at the core of the global open education movement which seeks to enhance equity and democratize education through quality educational content accessible online for free. It is also part of a larger movement aiming “to establish tertiary education and lifelong learning as a human right” (Blessinger and Bliss 2016, 15). The U.S. OER movement grew in response to the escalating costs of college textbooks and the pressure from coalitions of student organizations, academic and research libraries, and stakeholder advocates (Sparks, 2017). Within urban planning education rising costs are not only a barrier to entry for traditionally underrepresented groups but also a challenge to expanding and diversifying the urban planning profession. In recognition of equity and inclusion issues, states have passed legislation endorsing OER programs, and the U.S. Department of Education’s Fund for the Improvement of Postsecondary Education (FIPSE) has funded OER projects since 2018. Enabling Transportation Planning Professional Advancement was one of the four FIPSE awardees of 2020-21 (Audirac, et al., 2022). The project seeks to create quality industry-vetted transportation planning OER materials with the goal of lowering the barriers to educational attainment and career entry.

The aim of this paper is twofold. First, to describe the landscape analysis of existing urban planning-related OER materials—through a search of international, national, and state OER repositories—and the resulting landscape’s dearth of urban planning content, which points to an opportunity that planning education should not miss. Second, to report on the findings of a five-step systematic literature review (SLR) (Okoli and Schabram 2010) of the barriers and incentives of OER creation and adoption in higher education and in urban and transportation planning. It discusses primary barriers to OER adoption and several incentives to potentially overcome these barriers, including student cost benefits (monetary and course withdrawal reduction) and pedagogical benefits related to student success.

Other disciplines are leveraging OER to improve access to relevant and affordable education, however, urban planning has lagged in these efforts. Adoption of OER materials in planning education can contribute to leveling access to urban planning, a high-demand profession (BLS 2021) in a way that promotes social justice, defined by Fraser (2005) as “parity of participation.” Additionally, adoption of OER textbooks in urban planning, especially in low gender development index (GDI) countries, may help amplify the voices of female instructors and professors and promote more gender equality and representation in the field.

THE PLANNING STUDIO SERIES: AN INTER-DISCIPLINARY, PROBLEM-SOLVING APPROACH

Abstract ID: 1412

Individual Paper Submission

FUENTES, Alberto [Georgia Institute of Technology] alberto.fuentes@inta.gatech.edu, presenting author
ROSS-EUQUANT, Catherine [Georgia Institute of Technology] cross@euquant.com, co-author

How do planning studios adjust to the need for an increasingly inter-disciplinary approach to problem-solving, integrating students from various areas of study, a diverse faculty, and partners with cross-cutting knowledge and needs? This research leverages a longitudinal design comprising a detailed analysis of three successive studios undertaken in Puerto Rico between 2019 and 2022. We obtained empirical material for analysis through interviews, focus groups, studio presentations, reports, geo-spatial analysis, asset mapping, and validation exercises. This methodology allowed us to draw lessons conducive to more fruitful and complex studios

These lessons, which challenge the conventional studio wisdom, may be divided into four studio stages: preparation, pre-fieldwork/travel course delivery, fieldwork/travel, and post-fieldwork/travel course delivery. When it comes to the preparation stage, our findings caution against hierarchical “one-shot” studios that involve the selection of local partners based on their close connection to faculty and the unilateral definition of priorities and activities by faculty. Instead, a studio series, consisting of multiple consecutive iterations in the exact location, is likely to better serve an inter-disciplinary approach to problem-solving. So is a process for partner selection conducted systematically, involving surveys, in-depth interviews of “finalists,” student feedback, and an approach to studio priority and deliverable definition that heavily relies on students in direct negotiation with selected partners.

In terms of the pre-fieldwork/travel course delivery stage, our research highlights the drawbacks of adopting a narrow conventional planning focus, limiting collaborations to the selected partner, and concentrating communications with partners in faculty hands. Instead, to foster inter-disciplinary problem-solving, planning studios should embrace work with various local and international actors and selected partners. This approach should include invited lectures by faculty and other guests with sundry areas of expertise related to studio activities; and devolve responsibility for client communications to studio students, if possible, in collaboration with local students associated with the selected partner. It should also promote parallel activities and deliverables (i.e., activities and deliverables not directly supported by the studio) that complement and broaden the impact of studio products.

For the fieldwork/travel stage, our findings reveal the limitations of conventional studios heavily reliant on a narrow range of data collection activities (i.e., community tours, interviews) and whose preliminary results are validated through a general presentation at the end of the period of fieldwork. We propose fieldwork involving a wide range of activities, including tours and interviews, community mapping initiatives, joint design projects (e.g., solar energy delivery, organizational website), volunteering in ongoing partner events, and visiting other “model” communities. Notably, intense interaction with local experts and university alumni is a critical component. Furthermore, our findings favor an ongoing validation process involving tailored presentations to different audiences and interactive data-gathering events.

Finally, our research underscores the benefits of a post-fieldwork/travel course delivery stage that prioritizes ongoing progress reviews with partners and other collaborators and a final presentation delivered to a broad, interdisciplinary audience. That runs counter to more conventional approaches that support student-centered analysis of empirical fieldwork material and targeted final presentations to partners and planners.

PLACING PUBLIC SCHOOLS IN PLANNING EDUCATION

Abstract ID: 1488

Individual Paper Submission

BIERBAUM, Ariel [University of Maryland] bierbaum@umd.edu, presenting author

Schools are physical, social, and political infrastructure, integral to healthy and resilient communities. The links between planning and public education run deep, with volumes of empirical research documenting the intersections of housing and school segregation, school quality and housing markets, transportation equity and school travel, and schools and community development. Despite its connections to the core activities and goals of planning practice, the topic of planning for or with schools and school districts remains absent in planning graduate programs. Certainly, individuals with formal training in planning find themselves working in school districts across the country (see e.g., the American Planning Association's Public Schools Interest Group). Further, individual courses have over the years engaged young people in schools in planning projects (see e.g., (McKoy & Vincent, 2007). But as a field, planning has and does not systematically apply the technical or theoretical tools of planning to the public education sector.

In this paper, I provide in-depth reflection and analysis of two instructional efforts at the planning-education nexus. The first is a practicum course designed to engage graduate planning students in research and design of school facilities planning in Philadelphia. Students explored the historical and contemporary interrelationships among metropolitan policy, neighborhood conditions, planning practice, and public education; learned about school facilities planning, management, and inequities; and analyzed trade-offs of different participatory planning and governance models for school facilities planning and management. Working in response to parent and community organizers fighting for safe and healthy school buildings, the students developed a toolkit and recommendations to address the concerns of direct and indirect stakeholders around planning for the Philadelphia School District's facilities, including a participatory framework and governance model.

The second effort is a course for mid-career education leaders pursuing a doctorate in education (EdD). In this course, students learn and use frameworks, tools, and knowledge from planning and urban studies to turn a spatial lens on schools. They grapple with the "place" of schooling within neighborhoods, cities, and regions. Substantively, they examine non-school arenas (i.e., housing, transportation, neighborhood development) and the ways these contextual factors set conditions for learning. They practice using GIS, asset-based community mapping techniques, and power-mapping tools to situate their school-based problems-of-practice in broader metropolitan geographies of opportunity.

I first establish theoretical alignments between planning and public education, in both pragmatist (Schon, 1984) and emancipatory traditions (hooks, 1994). Then, I describe the courses' student compositions, learning goals, pedagogical approaches, and course outcomes. I demonstrate how my pedagogy draws on learning theories of metacognition (Pintrich, 2002) and communities of practice (Wenger, 1998) along with planning theories of reflective practice (Schon, 1984) to support professional development of both planning and education graduate students. I argue that teaching courses at the nexus of planning and education to both graduate planning and education students requires careful attention to the units of analysis, vocabularies, orientations, and politics of two fields of practice. Based on students' reflective assignments, I identify how these kinds of interdisciplinary courses inform and transform professional identity and practice. I conclude with discussion and recommendations about how theoretical traditions across the fields of planning and education can strengthen leadership development in both arenas. Specifically, I suggest ways that planning educators can foster a pipeline of planning practitioners who are competent in and sensitive to school planning issues and how planning education can be integrated into professional development for education leaders.

WRESTLING WITH THE CANON: URBAN THEORY FOR MASTER OF PLANNING STUDENTS IN THE UNITED STATES

Abstract ID: 1509

Individual Paper Submission

UREY, Gwendolyn [California State Polytechnic University, Pomona] gurey@cpp.edu, presenting author

Students earning master's degrees from PAB-accredited programs must learn some urban theory, along with planning theory. This paper addresses urban theory, describing an exercise in wrestling with what is canonical knowledge in this area.

Recent literature calls for changes to the texts assigned in various areas of planning education, documenting lack of diversity of authors assigned, for example, in courses on sustainability (Millard-Ball et al 2021). A comparative study of how the global south was presented in five geography texts finds that coverage of the south was limited in both quantity and quality—and as exceptions rather than “[sites] from which to develop (universal) theory” (Lawhon and Le Roux 2019, 11). A subsequent paper by the same authors and their students (from the global south) discusses the problem of maintaining notions of “northern” and “southern” urbanism. For an urban geography class, this would mean including “less of the canon” and more perspectives from the south as central to any urban geographical theme” (Lawhon et al 2020, 7).

Lack of diversity in the curriculum contributes to perceptions of bias among students of color, as so well documented by García et al (2021). Their research reinforces the need for planning curricula to not only include courses about diversity and inclusion in planning, but also to “integrate diversity throughout” core curricula. Parallel movements in many academic disciplines have gathered momentum, as characterized by the title of an uprising of provocative student videos in the U.K, such as.: Why is my Curriculum White (UCL)? Why is my Curriculum White (LSE)?

Many planning students learn urban theory in courses that have adopted LeGates and Stout's City Reader, now in its 7th edition. The textbook is irresistible to instructors, as it crams so much of the canon into a single 8-part volume. Excellent essays introduce each part, and a shorter essay introduces each of about 8 readings in each part. Readings are excerpted from classic articles and books. I supplement the Reader with diverse sources and topics as well as writers who directly challenge canonical ideas. My supplements do not come wrapped in the essays, and are not excerpted, so students have to read more than the “essence” of the ideas presented.

In 2020, I engaged first year master's students (majority non-white) in developing decolonized reader materials. Early in the term, students formed book clubs, choosing from a list I provided. Students read *Slavery by Another Name*, *Color of Law*, *Folklore of the Freeway*, *Empire of the Summer Moon*, *Caste*, and *My Name is Red* (a novel, not on my list). Clubs made presentations for the midterm, arguing for where in the Reader ideas from their book would address omissions or provide a needed perspective—and which existing reading it should replace. For the final, each student excerpted their book and wrote the accompanying introductory essay.

Although their excerpting skills may need work, students' insights in their introductory essays demonstrate that they care about the omissions and missing perspectives in the *Reader*. Their essays identify alternative knowledge and perspectives of value to their understanding of forces shaping urbanism. This paper analyzes the parts of the reader chosen by students and the themes they develop in their essays.

The book club exercise has many limitations as a means of decolonizing a syllabus. Pedagogically, it carries additional burdens, such as developing a sense of community under pandemic/remote instruction conditions, and learning to work as a team. Nonetheless, especially in a program where the majority of students are non-white, students need to be engaged in the greater project of decolonizing the syllabus.

EXPLORING LEARNING CIRCLES AS A TEACHING METHOD FOR TEAM BUILDING AND REFLECTION

Abstract ID: 1544

Individual Paper Submission

GEBHARDT, Matthew [Portland State University] mfg@pdx.edu, presenting author

This paper and presentation explore the use of learning circles as an approach to teaching team building and for facilitating reflective practice, two central learning goals for planning programs (the first of which is explicitly required by Planning Accreditation Board (PAB) standards). It presents a case study of the redesign and delivery an early graduate-level course on planning practice and ethics using learning circles to improve course and program outcomes around these two goals. The redesign was undertaken in response to feedback from both faculty and students at the end of the graduate program that identified the need for more explicit training in these two areas, particularly teamwork.

Planning practice often involves working as part of a team. In planning education, students are prepared for this through courses and assignments that require teamwork. In many programs, this includes a core or culminating workshop or studio experience. Despite many opportunities to work in teams in secondary school or undergraduate programs, students do not always arrive in a planning program prepared to form effective teams or to navigate the challenging interpersonal dynamics of teamwork. Indeed, they often arrive having experienced more dysfunctional than effective team environments and are apprehensive about future teamwork. Students are often thrust into team environments with little instruction, with the belief that they either have already learned about teamwork or will figure it out by doing, a situation as likely to reinforce unproductive behaviors as productive ones. Reflection has been discussed in planning as an important skill to facilitate learning and ongoing improvement, including for teamwork (Willson, 2021). Yet reflection, like teamwork, is often something that students are asked to do as part of a course, but there may not be explicit teaching, time set aside, or opportunities for group reflection. It may be difficult to find time for this teaching within a program given all the other important information and skills that must also be taught.

The above might not be the case at all planning schools, but were the circumstances at my school that led to the redesign of a second term (in a trimester system) course on planning practice and ethics. The teaching method chosen was learning circles. Learning circles use cooperative, team-based learning as a means to explore together significant questions or create a meaningful project. Research has consistently shown that people remember more details and understand concepts better when they learn by doing and discussing instead of passively listening. The approach is adapted from “literature circles”, a technique based on the idea and backed by experience that student learning gains are improved “when given choices, time, responsibility, a little guidance, and a workable structure” (Daniels, 2002, 1).

This paper describes the use of learning circles as a method for teaching and practicing both teamwork and reflective practice. In learning circles, students work perform a rotating series of roles that model important teamwork skills, while collaboratively working to investigate a problem. For the course discussed, these problems were weekly planning scenarios that prompted students to consider dynamics of planning practice and individually and collectively reflect on the ethical questions they raised. After describing the model and case, the paper uses student and instructor reflections to discuss the benefits and challenges of the model and suggest ways that planning faculty interested in the model might incorporate it into courses, with specific considerations of teaching in an online and hybrid environment.

THE LIMITS OF THE LIVING LABORATORY: A CASE STUDY ON THE UNIVERSITY CAMPUS AS A TESTBED FOR URBAN TECHNOLOGY DEVELOPMENT

Abstract ID: 1685

Individual Paper Submission

VANKY, Anthony [University of Michigan] avanky@umich.edu, presenting author

With the increased adoption of technological and data-centric practices in cities, universities have responded by creating programs in urban data science, urban informatics, smart cities, and civic technologies. At the same time, city governments seeking to partner with the so-called innovation sector have worked to incubate startups and new practices. These forces have made the “living laboratory” a popular term as each has sought to test these technological solutions in situ, outside of the traditional laboratory environment, and as a means of collective discovery. However, with the general public exposed to the benefits and costs of these explorations, questions have emerged on how and whether this engagement model can satisfy the needs to protect citizens and enable exploration.

Instigated by the creation of a degree program that centers on the design and development of technological solutions to urban and civic problems, a living laboratory for student experimentation is being proposed on the campus of the University of Michigan. This endeavor seeks to provide a pedagogical environment where students can access large campus datasets and offer a physical place to situate sensors and surveillance systems that support classroom and research exercises. These technologies would have the campus occupants as research subjects through their everyday inhabitation of the academic spaces. Although its campus lacks the traditional harms found in communities, ethical questions remain about creating such an experimental environment.

This paper presents findings from interviews with diverse stakeholders during the discussion phase of this learning ecosystem and raises the conflicting concerns of different groups within the university. It presents the widely-varied perspectives on research governance, transparency and privacy, facilities and public safety, and equity and inclusion. These findings offer a view on the more significant governance issues and harm to larger communities outside the academic ecosystem. It presents a more complex picture of innovation governance for cities.

FINDING THE ART IN THE ART AND SCIENCE OF STAFF REPORTS

Abstract ID: 1718

Individual Paper Submission

JOHNSON, Bonnie [University of Kansas] bojojohn@ku.edu, presenting author

Staff reports are the most ubiquitous written document created by planners working for local governments around the world. Little is known about them, but they are often not easy to read. Their purpose is to take applications made by property owners for changes to the use of their land or build buildings on their property (from residential housing to commercial shops, maintaining or altering historic features, a temporary building and parking lot, for example), analyze their viability in terms of governmental policies and goals, and then provide that analysis to elected or appointed boards to make their decisions. Previous research shows that staff reports have not changed much over time (Johnson & Lyles, 2016). The conundrum with these reports, and others that planners are known for, is best said by Sandercock (2003, p. 21) who notes that policy reports are “dry as dust. Life’s juices have been squeezed from them.” How can we bring life to these lifeless documents?

For this study, I am working with planning students to understand if using art (Pinder, 2008), “fashion thinking” (Nixon & Blakley, 2012; Särämäkari & Vänskä, 2020), and avant-garde (Jagodzinski, 2013) versions of staff reports result in better day-to-day staff reports. My hypothesis is that staff reports will not change unless we activate different ways of thinking about them. With students, I used a new technique of teaching based on “fashion thinking” including a mood board (McDonagh & Storer, 2004), avant-garde versions of a staff reports, and a traditional but “new” type of video staff report. The results indicate that the process does break down some preconceived notions of how staff reports must be written. The process allows student planners to “pull back the curtain” on their internal dialogues and “expert ways of knowing” (Wiske, 1998). Results of yet unpublished research with planning

commissioners across the country indicates that this is the exact sort of information they are looking for in the staff reports they get. Unexpected results are students indicating that the process of creating the avant-garde staff reports helped with their mental health (Schweitzer, 2016).

THE MILL CREEK INITIATIVE. AN EXPERIMENTAL PEDAGOGICAL APPROACH

Abstract ID: 1787

Individual Paper Submission

PALAZZO, Danilo [University of Cincinnati] palazzdo@ucmail.uc.edu, presenting author

MEHTA, Shilpa [University of Cincinnati] mehtasp@ucmail.uc.edu, co-author

The School of Planning at the University of Cincinnati has undertaken an ambitious initiative – Mill Creek | Reviving an Urban Waterway – that presents an experimental approach to planning education using multiple studio-based and theory courses focused on the Mill Creek for two consecutive years. The overall goal of the initiative is to (a) shine a spotlight on Mill Creek as a regional and multi-jurisdictional entity, (b) conduct multi-scalar analysis and propose multi-disciplinary solutions and recommendations, and (c) revive the waterway and the communities around it. The initiative provides a unique experience to the students as well as generates analysis, recommendations, ideas, and design proposals for the watershed where the school is located. We anticipate that the [hyper]topical and iterative pedagogical approach combined with knowledge sharing, replication and scaling can add significant breadth and depth to the discourse around the Mill Creek.

The Mill Creek is a 28.4-mile stream in Southwest Ohio that flows through Butler County (OH) and Hamilton County (OH) into the Ohio River. According to the Mill Creek Alliance, the Mill Creek watershed includes 37 townships, cities, and villages in Greater Cincinnati and more than 450,000 people who live in the watershed ⁽¹⁾. The Mill Creek has been critical to Cincinnati's growth but after two hundred years of intense economic growth and unmitigated pollution, the Mill Creek was designated as one of North America's most endangered urban waterways in 1996 ⁽²⁾.

The School of Planning recognizes the Mill Creek Watershed as an ideal laboratory for planning education and study at an urban university that can add real and tangible value to the community. Several issues addressed in planning education, including natural resource protection, housing, economic development, social equity, environmental justice, health, design, transportation, infrastructure, recreation, and others are prominent in the valley. The inter-relationship of these topics and the correlation to community outcomes is well researched ⁽³⁾ but this initiative creates a unique opportunity to proactively model the impacts and solution using the Mill Creek watershed as a proving ground for our pedagogical model. It is also an opportunity to model stewardship for our students and impact the future of the urban waterway through service learning.

This multi-semester catalog of multi-scalar and multi-disciplinary courses involving undergraduate and graduate programs in planning and landscape architecture is conducted in collaboration with local and regional partners such as Mill Creek Alliance, Green Umbrella/Tri-State Trails, City of Cincinnati, Hamilton County, Butler County/West Chester Township, Cincinnati Parks, Metropolitan Sewer District and OKI. This collaborative approach represents the new landscape of university-based community research and action but brings potential conflicts of interest as a result of varying participant motivations and the imperative to balance the interests and values of the community with pedagogical needs ⁽⁴⁾.

The paper will reflect on the current state of the initiative with examples of how the region has been considered in studios and classes outcomes and with a summary of the reactions from the stakeholders, the faculty, and the students involved. We will also discuss ways to synthesize the collective outcomes from the courses to benefit the

school, community, and our partners. Multiplicity of audiences and complexity of content requires telescoping communication that allows for varying degrees of engagement. This paper will present our thoughts and process for the same.

PROMOTING A SUSTAINABLE FUTURE FOR AND WITH THE MIDDLETOWN COMMUNITY: UNIVERSITY-COMMUNITY PARTNERSHIP THROUGH PLANNING EDUCATION

Abstract ID: 1799

Individual Paper Submission

YOO, Sanglim [Ball State University] syoo@bsu.edu, presenting author

Higher education institutions have a vested interest in building strong relationships with the communities that surround their campuses. University-Community partnerships are frequently used to enhance translational research efforts and education for students while benefiting the community. These collaborative relationships ideally involve a mutually beneficial exchange in which community agency partners provide knowledge concerning vulnerable populations, their most urgent needs, and the best methods for meeting those needs (Minkler, 2005). However, challenges remain in evaluating such efforts when it comes to the small and midsized towns and cities of the US which usually struggle in attracting innovation and social changes. This study focused on the unique community-university partnership created between the city of Muncie, Indiana, and Ball State University (BSU) through Immersive Learning.

Muncie, Indiana, home of BSU, has known as “Middletown” by Robert and Helen Lynd ()’s sociological case studies of the social life of the community titled and is said to be one of the most studied cities of its size in the US. Muncie has established its manufacturing and industrial reputation since the Indiana Gas Boom of the 1880s. However, after decades of industrial decline starting around the 1980s, many of its flagship industries moved out of the region resulting in many underutilized former industrial sites, often called brownfields. According to US Environmental Protection Agency (EPA), there are more than 30 brownfields in Muncie.

BSU is Indiana’s only public higher education institution with a college of architecture and urban planning. Since its founding in 1966, the College of Architecture and Planning has established and promoted programs that combine teaching, research, and service activities that focus on community-based projects. BSU declares itself as a community-engaged institution, defining community engagement as the mutually beneficial exchange of knowledge and resources in a context of partnership and reciprocity with communities. To promote educational excellence through community-engaged activities, BSU provides a unique learning opportunity for students by creating a university-community partnership to address the challenges of the community through immersive learning. Department of Urban Planning has been shown a strong record of successful immersive learning activities creating a partnership with Muncie and East

Against the above backdrop, PLAN203 Regional Analysis and Design Studio was designed under the theme of promoting a sustainable future for and with the community. Since 2018, partnering with Sierra Club Hoosier Chapter’s Beyond Coal Campaign, PLAN203 studio has implemented the “Brownfields to Brightfields” Project to assess the solar potential of brownfields in Muncie for finding sustainable development potentials.

This research case will case study a community-engaged planning education endeavor of the department of urban planning at BSU, Muncie, IN, using the “Brownfields to Brightfields” immersive learning project. This immersive learning project was designed to assess the solar energy production potentials of brownfields in the area to promote a sustainable future for the community as well as to promote the community-university partnership. This research will show how the planning program – community partner project was designed based on a holistic and comprehensive understanding of a community, how this innovative pedagogy improved the planning education, and how this approach created benefits for students and the community. The matrix of success will be assessed using the Association of American Colleges and University’s VALUE rubric for students, the community, and the project.

DELIBERATE – DECIDE - DISCUSS: FLIPPING CASE STUDY LEARNING WITH A PRACTICAL JUDGMENT SIMULATION

Abstract ID: 1812

Individual Paper Submission

WILLSON, Richard [California State Polytechnic University, Pomona] rwwillson@cpp.edu, presenting author

Active learning prepares planning students to recognize the grounded, multi-paradigmatic, ethical-political aspects of practice. The gold standard for active learning is community-based projects, but there are other ways to use active learning in a planning curriculum. Case studies are an important element, but the predominance of descriptive case studies does not fully reveal the potential of cases. As historical accounts, descriptive cases generally do not engage students in moments of reflection-in-action and practical judgment (see Fischler 2012 on reflective practice). This paper explains the structure and use of a multi-media learning object (MMLO) that presents a scenario, asks for a decision among plausible courses of action, and structures individual and group reflection.

Cases are receiving attention in planning scholarship and education (e.g., Lincoln Land Institute case study series), and in planning for racial equity and justice (Krumholz & Wertheim Hexter 2018). A previous paper (Willson 2020) argued that planning educators should “wake up” case studies by organizing them around a reflection framework concerning key practical judgments. Only a small number of the Lincoln Land Institute case series are termed “inquiry cases” in which the case reader is posed with a question about how to proceed (for example, Finn 2020). This MMLO differs from others in providing discrete choices of planning approach so that users of the MMLO can make direct comparisons.

The MMLO includes: 1) a reflection framework (Willson 2021), 2) a planning scenario that presents plausible courses of action and a user prompt for an initial choice, 3) information on possible outcomes of each choice and a user prompts to assign likelihoods to each one, 4) an opportunity to confirm the initial choice or choose differently, and 5) individual reflection and group discussions on the choices made. Small group conversations focus on each user’s reasoning for their initial and final choice, revealing differences in assumptions about context, personal commitments, and ways of reasoning.

The MMLO was a collaboration between the author and Cal Poly Pomona’s Center for Faculty Development, which provides pedagogical and programming assistance. It addresses issues in developing the MMLO including ensuring that the framework is intuitive for the user, confirming that all courses of action are plausible, and brevity so that the MMLO worked on a computer screen. The paper presents an analysis of student results from using the MMLO. It includes information on the distribution of choices across different groups of students, frequencies with which students change their initial judgment after reflection on outcomes, and the results of user satisfaction surveys of the MMLO.

The MMLO is intended for use in planning education and in professional development. While not initially developed for ethics questions, it is well-suited to use with AICP Code of Ethics cases. The MMLO currently has four cases and can be accessed at <https://elearning.cpp.edu/learning-objects/practical-judgments/>

The paper finds positive results from the “deliberate - decide – discuss” model. Having completed the MMLO, students enter small group discussion having already made a reflective practical judgment, creating a rich environment for learning. Simulation tools such as the MMLO described here provide an opening for students to develop a capacity for reflective choice that will be helpful throughout their practice careers.

WHAT TEACHING STRATEGIES HELP PLANNING STUDENTS FIND CULTURAL COMMUNITY RESEARCH MEANINGFUL?

Abstract ID: 1964

Individual Paper Submission

WIGFALL, La Barbara [Kansas State University] lbjw@ksu.edu, presenting author
KINGERY-PAGE, Katie [Kansas State University] kkp@ksu.edu, co-author

In 2016, Association of Collegiate Schools of Planning, Planners of Color Interest Group researchers published a diversity climate survey of planning students in the *Journal of Planning Education and Research* (Greenlee et al. 2008). Their findings included a gap between the value of diversity to planning departments and the experiences of students. The study called for planning educators to make planning education more inclusive and provide better preparation for serving diverse audiences (Greenlee et al., 2008).

Students entering planning programs have a limited perception of the profession and awareness of the impacts of structural racism. They are motivated to change the world through community engagement but may not see a path to accomplish change. Students want to be prepared for the work world but may not be interested in disinvested neighborhood revitalization that demands the input of disfranchised people for a successful outcome. Selecting a pedagogical process that acknowledges inclusive values through meaningful actions and community capacity building is challenging for faculty when they are tasked to impart knowledge, achieve some understanding, and guide student experiences in less than one semester's course.

To address the research question of, "What teaching strategies help planning students find cultural community research meaningful?" the authors reflect upon community-based teaching and learning as a scaffolded approach to increasing student capacity for intercultural learning. Intercultural learning is often described as leading to intercultural competence or sensitivity (Bennett, 1986; Bennett, 2008).

When residents appear to have similar values, economic means, and education backgrounds as students, they may feel familiar enough to navigate a community project. But there is always a need to dig deeper into multicultural residents' disconnections, disillusionment and discontent, community climate and mistrust to help students make meaning of the work they do in communities. If students are not thoughtfully prepared, then working in culturally diverse communities without cultural understanding will result in less effective engagement strategies for the community they serve and/or less meaningful student learning outcomes (Greenlee et al., 2018).

The authors use a reflective, participatory action approach to develop, refine and communicate their practice in the classroom and with communities, where students experience intercultural encounters through community-based learning. Authors' strategies for preparing students to work with diverse community partners will be presented through three examples:

- Building intercultural competence through defined and evolving approaches, beginning with freshman students;
- Overcoming structural institutional barriers in community-based learning in a planning and design competition for Nicodemus, Kansas, a historic Black agrarian community in the Midwest; and
- Partnering with diverse stakeholders on design and planning dialogues for a pocket park to commemorate a complex Civil Rights event in Wichita, Kansas.

Planning faculty should be preparing their students to inclusively serve broad audiences. This session will offer strategies including classroom activities and reflective questions for students gleaned through community development projects in a higher education, community-based learning context. These case studies demonstrate how meaningful community change can also result in self-discovery for the students.

CITIES AND CLIMATE CHANGE PEDAGOGIES: FROM KNOWLEDGE TO SKILLS AND ABILITIES WHEN ADDRESSING THE WICKED PROBLEM

Abstract ID: 1997

Individual Paper Submission

MARIN, Marielos Arlen [Universidad Centroamericana "José Simeón Cañas"] marielos.arlen.marin@gmail.com, presenting author

Teaching cities and climate change mean more than transferring knowledge and skills beyond the effects of the phenomena. Planners and professionals must deal with sustainability, poverty, extreme heat, sea-level rise, habitat loss, drought, water scarcity, and food deserts. These are topics that matter to everyone. It has been included across broader social contexts and in courses about planning for climate change, cities and climate change, sustainability, energy, and green infrastructure.

Theoretical analyses have recognized the complexity of climate change and the contextual features of a climate change pedagogy across countries, and the different scholarly visions for education learning techniques (Perkins, et al, 2018). Also, the sophisticated understanding of the scientific basis of climate change affects the corresponding disciplines of future professionals, which gives the students a newfound sense of personal responsibility and agency for addressing climate change (Coleman, et al, 2017). Therefore, universities have engaged in understanding the phenomena and the complex interactions between social, economic, and environmental systems with programs that lack coherence. Moreover, teaching often focuses on climate problems rather than progressively scaffolding students' skills for finding practical solutions. (Cross and Congreve, 2020).

This research evaluates the primary skills and actions when planning to deal with a wicked problem. By considering the research question: is teaching cities and climate change the key to advancing climate actions through activism among students? The research uses a sequential exploratory mixed method design with former students of the Cities and Climate Change course at the Central American University Jose Simeon Cañas - UCA, by its Spanish acronym - in El Salvador. The sample considered active students enrolled in the course for four semesters from 2020 to 2021. The objective is to understand the primary learning outcomes after taking the course. This study derives from semi-structured interviews and surveys with a sample of former students enrolled in the course. The sample collected and analyzed data in two consecutive phases within one study. In the quantitative phase, the sample comprised 150 of 618 students enrolled, and the results were analyzed using exploratory factor analysis. The qualitative data derives from 32 semi-structured interviews.

In the qualitative phase, great themes included that the classes promote the application of theory to concrete situations and set up the basis for other courses that were not specifically designed around climate change as a central focus in the curriculum of their careers. Also, the complex approach to climate change teaching was not easily understood by all levels of students, which makes it challenging to engage students with wicked problems. In the quantitative phase, several factors were obtained that classified the skills into two groups: "knowledge skills" that relate to the scientific basis of climate change and specific skills for their professions and critical thinking; and "skills and abilities" that include changes in some personal practices that include flexibility and adaptability, interactions with other social, political, and cultural access, and a minimum degree of agency.

This paper highlights the importance of the pedagogy used as a tool for integrating cities and climate change into courses from multiple disciplines to increase agency among students. The contribution of the research helps to identify more appropriate methods that include skills and complexity in the programs that foster and improve students' preparedness for cities under climate change and meaningful climate change. Finally, any given course should be "solution-focused" applied to mitigation, adaptation, and resilience to climate change.

This paper examines student, instructor, and mentor experiences with a university-community collaboration built on preventing displacement and building Beloved Community. We find that students, faculty, and administrators recognize the transformational capacity of interdisciplinary, team-based, real-world learning within the context of collaboration and intercultural communication.

Our collaborative exercise differs from most because it is simultaneously:

1. Interdisciplinary by design, including all five college departments.
2. A multi-year project, entailing commitment and coordination at the college level.
3. Co-created with the community partner, including regular teaching, community visits, and organizational meetings.

Despite the challenges of un-inclusive educational and professional spaces in urban planning, our study shows that enabling professional, cross-cultural, and interdisciplinary work coupled with intercultural communication training holds promise for changing classrooms and workplaces. Students, faculty, and administrators alike recognize the potential and appropriateness of this work. Community partners have found that they can leverage municipal and university resources to move community goals forward. Through the Nehemiah Initiative Seattle-UW College of Built Environments (NI-CBE) collaboration, we provide educational and professional training for graduate students and assist with pre-development service needs of local Black churches.

This paper discusses how we are changing teaching and learning in our college. We examine the NI-CBE collaboration in the context of parallel efforts toward supporting equity, diversity, and inclusion (EDI) at the University of Washington and as a part of a broader move toward more equitable and inclusive communities. We introduced the collaboration and its model of community-based redevelopment in a previous paper (Born, Berney et al., 2021), and are now interrogating the collaboration from the planning education and pedagogy perspective. This paper provides takeaways for planners working towards anti-racist futures.

We use course evaluations and a follow-up survey, community partner and mentor feedback, and reflective discussions among the faculty of each of the classes involved to evaluate impact. We find that the professional development aspects are important and well-supported by students. And, leadership from both partners combined with a commitment to a long-term engagement helps navigate the complexity of the university-community relationship. Challenges include the short duration of classes, cross-cultural and cross-disciplinary communication, different values, and the culture and bureaucracy of the university.

We examine our practices against the planning pedagogy literature, particularly studio-based education opportunities, interdisciplinarity, and university-community collaborations, and working and teaching in cross-cultural settings. Finally, we examine challenges, catalysts, and successes over the last three years of teaching. Our

contributions to planning academics and practitioners are in two main areas: the impacts of the collaboration on the CBE and our professional training, and our engagement with the growing professional need for interdisciplinarity and intercultural competency.

MOUND UP NEIGHBORHOOD REVITALIZATION PLAN: LESSONS FROM A REPARATORY COMMUNITY - UNIVERSITY PARTNERSHIP

Abstract ID: 2071

Individual Paper Submission

WHITMIRE, Mary Elizabeth [Rhodes College] whiml-22@rhodes.edu, presenting author
HARRISON, Austin [Rhodes College] aharrison45@student.gsu.edu, co-author

For the last two years, the Rhodes College Urban Studies program has been working with a coalition of community based organizations and activists to take a more reparatory approach to participatory planning. This approach acknowledges the systemic violence and trauma enacted on the Orange Mound neighborhood, the oldest Black neighborhood in Memphis and one of the first in America with a large number of land owners as early as the 19th, early 20th century. Since the 1960s, local, state, and federal policies have crippled community infrastructure and systems, while in the recent years the neighborhood is becoming landlocked by appreciating housing sub-markets.

This research tells the story of this community-university partnership that builds from the recognition of longstanding histories of extractive partnerships, in both universities and greater planning processes, that often reflect a top-down approach that does not fulfill this potential. This study aims to determine what it looks like to build power through integrating a participatory approach to neighborhood planning. To build out this idea of Reparatory Community - University Partnership, interviews with community stakeholders, professors working on the partnership, and students involved in the work were analyzed alongside content analysis of similar neighborhood revitalization plans. The results suggest that this approach positions residents as meaningful developers and may act as a roadmap to future partnerships seeking to create a collaborative neighborhood development plan. The impact on urban planning pedagogy is also considered.

BOTCHWEY, Nisha [University of Minnesota] botchwey@umn.edu, co-author

In planning we typically discuss reflection as a tool to cement learning from practice-based or experiential learning opportunities. Reflection is often a core component of community-engaged projects and classroom experiences and we consider ‘reflection-in-action’ an important frame for effectively engaging communities in planning practice (Baldwin & Rosier, 2017; Botchwey & Umemoto, 2018; Das et al., 2020). However, we rarely (1) center reflection as an activity in which to directly build specific metacognitive, relational, and social/emotional skills, and (2) provide students with sufficiently structured practices to support their development as reflective practitioners. Educators often lack the tools to effectively support students in building their capacity for reflection, and by failing to center it in the classroom we tacitly communicate that reflection is not actually important.

This project analyzes the effectiveness of structured reflection activities at supporting planning students in developing critical social and emotional capabilities. These capabilities support planners in engaging in embodied praxis and in effectively leveraging their expertise to support communities develop a vision for their shared futures.

Specifically, this research leverages a mixed methods design which includes qualitative data coding of master’s students’ work (N=40) as well as quantitative data collected using pre-existing psychometric scales for cognitive development, emotional intelligence, and holistic thinking. Results of the work show student growth in reflective capabilities and in psychometric constructs. This work suggests that educators should integrate more structured reflection activities into required coursework and makes a methodological contribution by leveraging educational and psychological scales into planning pedagogy research.

PERFORMING PUBLIC PARTICIPATION - SESSION 2: CRITICAL PERSPECTIVES ON EMERGING TECHNOLOGIES FOR PARTICIPATORY PLANNING

Pre-Organized Session 40 - Summary
Session Includes 1513, 1514, 1515, 1516

MILZ, Dan [University of Hawaii] dmilz@hawaii.edu, organizer

This panel focuses on the expanding role that information and communication technologies play in participatory planning processes. Technology should broaden the reach of participatory planning processes, but it is not clear that the benefits outweigh the costs. The pandemic has illustrated the distinctions between the strengths of planning technologies and their drawbacks, making this an opportune time to ask: are planning technologies deepening engagement or are they reproducing the performative approaches of in-person participation? Have planning theories kept pace with the technological advances, and if not, where should planners turn for theoretical insights? How might planning technologies be designed to fulfill the goals of public participation? This panel is part of a series of pre-organized sessions grouped under the heading, Performing Public Participation: Reinvigorating a Critical Research Agenda for Urban Planning and Public Policy. These sessions aim to ‘take-stock’ of significant changes to the theory and practice of public participation and to establish an agenda for research and practice for the middle of the twenty-first century.

Objectives:

- Articulate the benefits and and threats of technology for participatory planning
- Identify potential opportunities for technology to improve participatory planning practices
- Describe theoretical limits and advancements that need to be considered to integrate technology into participatory planning processes

BIGGER, BETTER, FASTER: PICK TWO – EXAMINING THE OPPORTUNITIES AND CHALLENGES OF PARTICIPATION TECHNOLOGY IN PLANNING PRACTICE

Abstract ID: 1513
Abstract within Pre-Organized Session 40

ROBINSON, Pamela [Toronto Metropolitan University] pamela.robinson@ryerson.ca, presenting author
JOHNSON, Peter [University of Waterloo] peter.johnson@uwaterloo.ca, co-author

In 2020 (Johnson et. al, 2020), we conducted research on how municipal deployment of smart city technology was titling the relationship between residents and city hall towards one that was more transactional. This research was conducted before the COVID-19 pandemic which served as an accelerant for technology adoption in public participation processes (Robinson and Johnson, 2021).

Now, more local governments are returning to in-person work, and re-commencing in-person public meetings. The Government of Canada is also gearing up to launch a second round of the Smart Cities Challenge. How have the past two years of technology adoption shaped the channels of communication between government and citizen? Right now is an appropriate time to examine what kinds of technology urban planners are using as part of their work with the public, and to evaluate what the impacts of these technologies might be on planner-resident relationships. The timing of this examination is driven by advances in technology, pandemic-driven technology uptake and by a broader movement in planning questioning the impacts of technology on our practice (Potts, 2020). We ask what are the conceptual and practical implications for the introduction and increased reliance on mediating technologies to shape these relationships? This paper will explore opportunities and challenges presented by the rapid adoption of participatory technologies within a comparably short time period. We identify the impacts of digital technologies on the quality, speed, and spread of citizen participation, and the potential for these technologies to shift participation

towards a transactional mode, and away from deeper modes of engagement. We conclude with recommendations for future planning research and guidance for practicing planners.

DIGITAL PARTICIPATORY GOVERNANCE: RESOLVING OR HARD-CODING COMMUNICATIVE PLANNING'S DEMOCRATIC DEFICITS?

Abstract ID: 1514

Abstract within Pre-Organized Session 40

BOYCO, Morgan [University of Waterloo, School of Planning] mwboyco@uwaterloo.ca, presenting author

Digitally mediated participation in planning processes has grown significantly, particularly during the COVID era (Milz & Gervich, 2020) and, in an emergent, although belated, digital turn for participatory planning theory, there is a growing body of research attempting to trace this growth and grapple with its implications (e.g., Afzalan & Muller, 2018; Evans-Cowley & Hollander, 2010; Wilson & Tewdwr-Jones, 2022). Despite these efforts, digital participatory planning has not been fully drawn into the productive debates around theories of participation for democratic planning. Of those planning scholars engaged with this work, many are focused on implementation questions for digital tools and whether Internet Communications Technologies (ICTs) or digital Planning Support Systems (PSS) can help achieve the *deliberative* democratic goals of participatory planning, with little interwoven critique of participation itself. This conceptual paper will interrogate the digital modality of deliberative planning more critically by drawing it into debates that have emerged in participatory theory between communicative and agonistic approaches.

Communicative and agonistic positions form opposing pillars of our contemporary theoretical conceptualizations of participatory planning. The dialectic between these pillars, including critiques of collaboration from the postpolitical lens and the tensions between conflict and consensus, are key elements of planning theory. More recently, various efforts to bridge or dismantle the communicative-agonistic divide have emerged while continuing debates in deliberative political theory, not always reflected in planning debates, have brought further nuance. However, despite their growing prominence in planning theory and practice, examinations of digital technologies for participatory process have not been fully structured onto this dual foundation. In fact, it appears that conceptions of digital participatory planning have sailed past some of these elemental debates, risking in digital engagement theory and practice a replication, or perhaps an exacerbation, of the limitations of the communicative approach. There is an under-recognized danger, for example, that digital participatory governance may be yet another way for state actors to simultaneously claim to empower citizens while using a participatory mechanism to bring order to a process or bracket out dissent.

In addition, this paper examines how a digitized politics itself might address some of the democratic deficits of deliberative participation identified by postpolitical critiques. Digital participatory planning literature and postpolitics/agonistic planning literature seem to have been insulated from one another to their mutual disbenefit. Following Smith (2017), with the advent and near ubiquity of networked communications technologies, this may be the first time democratic agonistic disruption and a thorough politicization of deliberative spheres is actually possible, opening new sites of resistance as well as cooperation in participatory planning.

THE UPS AND DOWNS OF TECHNOLOGY IN PLANNING

Abstract ID: 1515

Abstract within Pre-Organized Session 40

MEI-SINGH, Manu [University of Hawaii] manums@hawaii.edu, presenting author

There are two competing narratives about technology in planning, one utopian and the other dystopian. The utopian worldview includes open-source software, voting, public testimony, virtual reality, social media, social networks, et cetera (Afzalan, 2012; Al-Kodmany, 2001) and sees promise that technology can expand participation and empower citizens. The dystopian perspective includes smart cities technology and blends computer science, human computer interaction, big data, and engineering (Batty, et al; 2012). Some speculate that data collected from or given by citizens and the Internet will become the new city infrastructure — from mitigating crime, to monitoring pollution levels — technology will literally make the city smarter (Batty, et al, 2012). These scholars see a new and unavoidable dawn approaching where human settlements will be interconnected for the betterment of all. The dystopian view — that technology will exacerbate existing inequalities and power dynamics can be found in a variety of fields as well — Information studies, human computer interaction, geography, gender studies and so on (Sadowski, 2020).

Drawing on Gandy's (2005) ideas on Cyborg Urbanization, this research is synthesizing these two viewpoints. Gandy encourages planners to work the concept of the Cyborg, 1) this in between and not fully developed space of what cities could be and 2) reactionary to what cities have become where old abandoned technology (i.e., train-hards, steel mills, etc.) meets new cybernetics; an incomplete digitization process that's changing human settlements (Gandy, 2005). In other words, the city of the future will not wholly be a tech utopia or dystopia; it will be something of a "Frankenstein" instead. How will planning practice contribute to this integration, and how might these ongoing efforts create a Utopia for some and Dystopia for others as kluge together the city of the future — how can grassroots and community planners sift these various binaries to create their ideal future within this Cyborg Landscape?

Because of my unique position in the geography of community planning and technology, I am able to actively study the technologists who are working to create the Cyborg City. I have conducted interviews with technologists from the Progressive Coders Network, and the Detroit Community Technology Project, who are contributing to grassroots and civic urban planning projects and have been creating educational materials for grassroots communities to ownership of their technology needs. I have also conducted auto-ethnographic research based on my first-hand experience as a program director and kumu (teacher) for the Purple Mai'a Foundation in Honolulu Hawai'i. In this capacity I have engaged, supported and watched the Native Hawaiian community use technology and entrepreneurship to revitalize their culture, language and organize against the larger U.S. hegemony for further land rights.

Analysis of interview and observational data, raises new questions and presents critical possibilities on what cyborg participatory planning can look like within this shifting topology; a praxis of real world problem solving on how to make technology work for marginalized communities and community planning, to create new interventions that can help community planners rethink technology, the internet, smart cities, and public participation.

Abstract within Pre-Organized Session 40

ZELLNER, Moira [Northeastern University] m.zellner@northeastern.edu, presenting author

KHAN, Mohsin [Northeastern University] khan.mohs@northeastern.edu, co-author

MASSEY, Dean [Northeastern University] de.massey@northeastern.edu, co-author

Participatory modeling is a collaborative approach to formalize shared representations of a problem and, through the joint modeling process, design and test solutions to that problem. This approach is particularly well-suited to address complex social and environmental problems like climate change, social and economic justice, and sustainable resource management, where interaction effects among multiple actors and factors make the causes and consequences of the problem unclear, and where a diversity of values and perspectives may lead to conflict about concrete pathways forward. Engaging in participatory modeling with different modeling techniques helps elicit diverse stakeholder knowledge (formal/informal, explicit/tacit, scientific/experiential) and harnesses this diversity to move from conflict to solutions as the collaboration strengthens relationship-building, empathy, trust, systems thinking, and collective agency for decision-making.

In recent years, scholars and practitioners developing and conducting various forms of participatory modeling have come together as a community and coalesced this rapidly growing application of knowledge co-production. This effort has contributed to streamlining the field in terms of standards for consistent reporting of participatory modeling cases (Gray et al., 2018), lessons learned in the cumulative experience of participatory modelers (Sterling et al., 2019), a guide to align approaches with problem types (Voinov et al., 2018), and future directions and recommendations for improvement (Hedelin et al., 2021; Jordan et al., 2018). Publication of cases contribute to the accumulation of experience on the various dimensions highlighted for improvement, most notably, assessment of the modeling products and outputs.

Despite the potential of participatory modeling to inform planning and policy, this practice has yet to become a mainstream approach in our field. The reasons are several. First, it is hard to standardize the approach, as it must be heavily tailored to the characteristics and context of each planning problem, including the stakeholders engaged in the process. Second, it is onerous; it requires long-term commitment and a broad range of skills (e.g., modeling, visualization, facilitation) that can only be attained through extensive training and collaboration. Finally, there are multiple dimensions in participatory modeling to attend to beyond engagement and modeling. The first two reasons are currently being addressed with a resurgence of knowledge co-production and ethical participation in scholarship, in practice, and more recently in funding agendas. Still, most of the development of the practice has focused on modeling tools and engagement techniques, and often without a clear articulation between them. We propose a framework that articulates these and other necessary dimensions of participatory modeling to further evolve and scale up this approach for planning and decision-making. We build on prior work to structure our participatory modeling framework around the iterative steps involved and the outcomes guiding the design of each step, from problem definition to preference elicitation, to collaborative model building and simulation, to deliberation of tradeoffs across solutions, to implementation (figure will be attached). Engagement and assessment traverse the entire participatory modeling process to support collaborative sense making and synthesis, and to provide the information necessary for evaluation and adjustment.

We use this framework to identify gaps and the interdisciplinary scholarship to draw from, to move this practice from potential to realization. Here, we highlight aspects of interface design and model biases, value elicitation and inclusion, management of diversity and innovation through facilitation, and the potential and need for novel assessment methodologies. We anticipate that this framework can account for the increasingly complex, diverse, and interconnected social systems, and harness it for social learning, creative solution-building and democratic decision-making.

PERFORMING PUBLIC PARTICIPATION - SESSION 3: LEARNING THE ROPES OF PARTICIPATION FROM THE GRASSROOTS

Pre-Organized Session 85 - Summary

Session Includes 1454, 1455, 1456, 1457, 1458

BARRY, Janice [University of Waterloo] janice.barry@uwaterloo.ca, organizer

Community members' engagement in participatory planning requires an investment of tremendous amounts of time and emotional labor that is not well recognized within the planning profession (Inch 2015). What would participatory planning look like if planners listened more closely to citizen experiences? As several scholars note (Legacy, 2017, Beebejaun & Vanderhoven 2010, Laskey, 2019), the best sources of inspiration for overcoming the perceived crisis in participatory planning lie in the informal organizing of community groups, whose efforts often stand in stark contrast to the increasingly bureaucratic approaches used by professional planners. In this panel, we draw together scholars who are building new practices and theories of participatory planning from the ground up. This panel is part of a series of pre-organized sessions grouped under the heading, Performing Public Participation: Reinvigorating a Critical Research Agenda for Urban Planning. These sessions aim to 'take-stock' of significant changes to the theory and practice of public participations and to establish an agenda for research and practice for the middle of the 21st century.

Objectives:

- Appreciate citizen experiences of public participation and citizen-led processes
- Learn about how this could be used to improve current practice

REVISITING THEORIES OF “PARTICIPATION” TO ADDRESS THE FAILURES OF “REPORTING BACK”

Abstract ID: 1454

Abstract within Pre-Organized Session 85

RIVERA, Danielle [University of California Berkeley] dzrivera@berkeley.edu, presenting author

Best practices for participation in planning and policymaking suggest that practitioners “report back” to participants as the final stage of any participatory process. This constitutes a critical recognition of the time and energy participants expend on participatory processes. While an indispensable goal, reporting back remains elusive, as evidenced by critiques from community-based organizers and scholarly evaluations of participation in practice (Hamideh, 2020; Karner, et al., 2019). Many of these studies have long eluded to foundational and procedural errors in how participation is defined and conceived (Cornwall, 2008; White, 1996). Here, community input on the problems with dominant participatory approaches are examined through feedback from heavily over-researched communities in California and Texas. To support these insights, student input from the author's own course on “Participation + Engagement” is also reviewed. Of note, there is a widespread lack of resources and tools aimed specifically at defining or identifying how to “reporting back.” While it is considered “best practice” to report back to participants, the question posed here is: why is it so difficult to undertake reporting back in practice? For both practitioners and researchers?

Building upon these observations from the field and from the author's teaching, this paper systematically examines alternative participatory approaches which better integrate efforts to report back to participants and community

partners from the outset. Such approaches largely diverge from dominant participation frameworks (from IAP2 and other similar organizations), instead using a fundamentally different theoretical basis for framing “participant” and “participation” relative to the community. After proposing a typology of these approaches, the paper concludes with suggestions for how our teachings and theorizations of participation must be reframed to eliminate the issues of “reporting back” by re-envisioning the relationship between practitioner/researcher and community from the outset. Ultimately, what is questioned is whether reporting back, itself, is a symptom of the very issues widely-identified with participation.

COMMUNITY KNOWLEDGE SLAPS BACK: WHEN RESIDENTS DISRUPT PLANNING THROUGH SELF-ORGANIZED INSURGENCY

Abstract ID: 1455

Abstract within Pre-Organized Session 85

LASKEY, Allison [Wayne State University] ablaskey@wayne.edu, presenting author

After her group issued a set of demands to “Stop Displacement, Resegregation, and Gentrification” in Detroit, Toyia Watts, president of the grassroots neighborhood organization Charlevoix Village Association (CVA), began using the phrase “Knowledge is Power” to guide their activity. Traditionally, planning and policy relied heavily on expert knowledge to make decisions, but mass movements of the 1960s won measures to hold the state accountable, enforce transparency, and gain input in policy processes. Ms. Watts and CVA were trying to employ these mechanisms of public participation to make the state-directed planning and revitalization process for their neighborhood answer the needs and wants of long-term working class Black residents. However, CVA found that they had to disrupt the planning process to make their voices heard (e.g. by publicizing demands for equitable development, transforming the structure of planning meetings, and shutting down meetings altogether). These insurgent modes of engagement relied on an analysis of power that built residents’ collective understanding of not only why it was necessary to battle developers and the state, but also how to intervene strategically, so they would not get coopted, neutralized, or crushed but actually win concessions and shift the terms of engagement in their favor.

This paper uses CVA’s example to engage with planning’s theories of knowledge. How is community knowledge distinct from, and how does it interact with, other types of planning knowledge? How can working class and oppressed communities use their knowledge to promote justice in the planning process?

This paper examines the role of community knowledge in planning theory to investigate how planning uses knowledge as a tool of power, and how disadvantaged communities can collectively engage their own power to contest the state when planning is not meeting their needs. The example of CVA demonstrates how a self-organized insurgent group can intervene with disproportionate influence to challenge neoliberal planning. Ethnographic data collected through participant observation, interviews, and document analysis from 2017-2019 demonstrate that the state engaged with community knowledge by restricting and channeling it. Residents learned from this experience how to break through these restrictions and bypass bureaucratic channels to demand more resources for their community. Residents learned how to strategically target their collective critique to achieve significant results (e.g. increasing the affordability of developments, stopping a neighborhood development, and elevating issues such as home repair grants into a political hot-button). By sharing knowledge with other grassroots organizations around housing justice, they leveraged their impact and elevated their struggle to a city-wide level. CVA offers an example of how working class and oppressed communities can “flip the script” on institutional public participation by building planning theory from the grassroots.

WORKING WITH THE GREY AREAS: BUILDING AN ADVOCACY GRASSROOTS NETWORK IN DOUGLAS COUNTY, KS

Abstract ID: 1456

Abstract within Pre-Organized Session 85

OVERSTREET, Kelly [University of Kansas] keheiman@ku.edu, presenting author
 LYLES, Ward [University of Kansas] wardlyles@ku.edu, co-author

Should planners use planning processes to catalyze and/or enhance grassroots networks so they can become anchors in community decision making, especially when it comes to promoting equity? If yes, how can they do so? This paper aims to help answer these questions by 1) engaging with ongoing theoretical debates about planner roles, administrative discretion, and public engagement while also 2) providing empirical evidence from a regionally groundbreaking local climate adaptation planning process.

Existing public engagement scholarship helps construct our conceptual framework. Lessons from collaborative planning indicate that strong local champions are an important component of effective collaborations (Innes and Booher 2010). Studies within hazards and climate scholarship show that local planning capacity, commitment among decision-makers, and broader community capacity rooted in wealth and education can result in stronger planning efforts (Woodruff 2018). Meanwhile, scholarly debates over the use of administrative discretion among street-level bureaucrats (Maynard-Moody and Musheno 2000) overlaps in many ways with debates about different roles for planners (e.g., technician, advocate, community organizer). Increased attention to the role of emotions, relationship, identity – and their relationships to the use and exercise of power – raise novel and pressing questions on the importance of so-called soft skills in public engagement (Lyles and White 2019). Our core research questions explore if and how planners foster stronger grassroots networks and with what effect?

Climate planning spaces are natural and appropriate settings for exploring innovative and collaborative public engagement practices that engage grassroots groups. Arguably the poster child for “wicked problems” climate change poses significant risks to all of us and yet also threatens to impact the most vulnerable among us, often along the same land use lines that were established by institutional practices such as red lining and urban renewal. In many states and localities climate planning now takes place in a super-charged political environment where violent resistance to relatively benign interventions, like wearing masks to prevent disease spread in a pandemic, do not portend well for effective climate interventions.

Our research arises from an ongoing longitudinal study that has unfolded concurrently with a local climate adaptation planning process in a midwestern city. Our deep case study design includes conventional data sources like participant observation (hundreds of hours of multiple years), document review (plans, news, etc.), online surveys (led by the local government), interviews (conducted by local community coordinators), and “practice-focused oral histories” (Forrester, 2006) from local officials and grassroots organizers about their experience as part of a collaborative public engagement process. Our research approach also includes active participation in the design and implementation of the planning process by the authors. As a result, we analyze and integrate qualitative and quantitative data to help shed light into one the gray areas of planning practice. We also describe and reflect on the myriad adjustments made in the face of the COVID-19 disruption, local elections, and staff shakeups, among other real-world, messy constraints that many planners face when seeking to foster deep long-term collaborative engagement.

Our analysis provides broadly applicable theoretical insights, while also sharing innovative practices of tremendous relevance to planners and policy makers. Our findings indicate that long-term relationship building, entrepreneurial leadership, and empowered administrative discretion can help take formal public engagement from a mere box to be checked, to the driving force and focus of a planning process. They also highlight the importance of keeping resources in the community, fostering relationships through storytelling and conversation, and managing up within local governments.

COUNTER-PROFESSIONAL HISTORIES AND COMMUNITY ACTION IN THE UK

Abstract ID: 1457

Abstract within Pre-Organized Session 85

INCH, Andy [University of Sheffield] a.inch@sheffield.ac.uk, presenting author
SLADE, Jason [University of Sheffield] j.slade@sheffield.ac.uk, co-author

Critical scholarship has long problematised the manifold ways repressive power relations are reproduced under the cover of calls for public participation in planning (e.g. Huxley, 2013). Disenchanted with promises of inclusive governance, much recent planning theory has followed John Friedmann's injunction to explore "the great counter-tradition to state centric planning that ...emerged from within civil society" (Friedmann, 2011, 60). The turn towards civil society as a locus of progressive agency in planning theory, whilst not uncontested, has tended to decentre the role of both professional expertise and the state in favour of 'citizen planners' whose insurgent practices creatively challenge hegemonic social relations (Mirafteb, 2009; Huq, 2021). Sandercock's (1998) call for the development of 'counter-histories' to uncover the myriad insurgencies through which people have collectively struggled for the futures of their communities remains central to these debates.

This paper seeks to contribute to the building of critical counter-histories of public participation in planning by reconsidering the role in insurgent practices of those Robert Goodman (1972) labelled 'counter-professionals'. Partly inspired by ideas of advocacy planning emanating from the United States, from the late 1960s onwards a generation of students, activists, planners and architects became heavily involved in the community action movement in the United Kingdom. By lending their time, effort and support to community-based movements these 'counter-professionals' sought to build a counter-tradition, challenging the paternalism of the post-war state, developing new models of radical planning practice and laying the foundations for a new and more democratic society beyond the limits of then newly introduced requirements for public participation.

Although this period arguably reshaped the political imagination of planning in the UK, the historical record of the movement remains patchy and has tended to focus on relatively few high-profile episodes and individuals. The energies the community action moment generated were often intense and episodic, their legacies were not always fully recorded and hopes for social transformation were largely defeated in struggles against the rise of neoliberalism in the 1980s. The paper addresses these gaps by drawing on a series of around thirty oral history interviews with key figures involved in these initiatives, along with analysis of the magazine *Community Action* that was published from 1972-1990.

For many of those involved their experiences proved formative, whether leading to disillusion with the planning project and its prospects for effecting real political change, or to long careers spent 'working the spaces of power' in and against various state projects as horizons of possibility shifted over time (Newman, 2012). Although the archive we have constructed is inevitably partial and parochial, tracking the values, tactics, lived experiences and subsequent careers of our interviewees generates rich insight into wider struggles for a more radically participatory planning. Drawing on this, the paper reconsiders debates about counter-professional practices as they have figured in successive understandings of advocacy, radical and insurgent planning. We conclude by reflecting on the seemingly constrained conditions of possibility for counter-professional practice in the UK today and the lessons that might be drawn from the community action moment for contemporary attempts to construct a counter-hegemonic planning project.

POST-RATIONAL PLANNING ENGAGEMENT-OPPORTUNITIES FOR RENEWING PRACTICE

Abstract ID: 1458

Abstract within Pre-Organized Session 85

TATE, Laura [University of Victoria (UVic) and Laura Tate Associates (LTA)] laura@lauratate.ca, presenting author

Public engagement should be about supporting broader public goals, including strengthening democracy and fostering social justice. Yet for planners working in public sector agencies, engagement goals can often be obscured by pragmatic agency needs, which can take precedence. Of particular concern is when neighborhood planning exercises are configured to promote equal but not equitable input (Fainstein, 2010; Fainstein and Lubinsky, 2020; see also Quick & Feldman, 2011). Activists as well have experienced problems with engagement, particularly if past dialogue processes have been used to manipulate them (see Ganesh & Zoller, 2012). In this context, there is growing recognition that a focus on dialogue alone may not suffice to foster good and socially just outcomes through community planning (Fainstein).

This presentation discusses the value of renewing public engagement practice through a post-rational outlook focused on practical competencies and sensibilities. A post-rational renewal builds on existing legal recognition, in such jurisdictions as Washington State and California, that good planning practice requires additional public engagement beyond public hearings.

Post-rational engagement acknowledges the role of rising inequality along with time and lifestyle pressures which pose yet further obstacles to robust and equitable engagement processes. This includes recognizing populism and polarization as ways of thinking and protesting –responses which require more nuanced reflection and counter-response from those conducting engagement. On a related note, post-rational engagement entails becoming more comfortable with the emotional side of engagement (Lyles and White, 2019). Furthermore, it recognizes what new understandings from other disciplines including communication, adult education, psychology, and cognitive science might have to offer. For example, adult education provides a helpful set of constructs for presenting information used in engagement processes, while communications studies help us more effectively unpack how social media and legacy media both shape the social reality(ies) in which engagement occurs.

The presentation responds to this evolving interdisciplinary literature, and also gives an overview of the author's emerging empirical research in this area. This research base provides a platform for better targeting refinements to community engagement related to land use planning processes. It reflects a structured approach for gathering new evidence, including evidence which considers both participants' experiences of, and outcomes from, engagement processes structured by public sector agencies, including local, state, and provincial levels of government. The proposed new approach recognizes a need for mixed methods approaches, which can shed light on both processes and outcomes together. The presentation illustrates this approach with a comparative document analysis case study, to be drawn from two communities in British Columbia, both outside the Metro Vancouver region. It then examines what a post-rational lens can tell us (and alternately what it omits) about where engagement methods need to go next. The presentation concludes with recommendations for future research in this area.

PERFORMING PUBLIC PARTICIPATION - SESSION 1: EXPLORING THE ONGOING CRISIS IN PARTICIPATORY PLANNING

Pre-Organized Session 90 - Summary
Session Includes 1478, 1479, 1481, 1482

GERVICH, Curt [SUNY Plattsburgh] cgerv001@plattsburgh.edu, organizer

Has participatory planning reached a tipping point that borders on a full-blown theoretical and practical crisis? Despite the fact that planning students train to design and implement public engagement opportunities, the efficacy of the tools of participation are questionable and Arnstien's promise of citizen empowerment remains unfulfilled. The push to frame participatory planning as a set of standardized skills may reinforce rather than challenge technocratic plan-making. Participatory planning is often an entrenched bureaucratic process and box-ticking exercise that does not represent a genuine opportunity for residents to sway public decisions. It may even reproduce racial and socio-economic inequities. COVID-19 heightens threats to engagement, making this an opportune time to ask: is participatory planning working, or is it performative? This panel is part of a series titled: Performing Public Participation: Reinvigorating a Critical Research Agenda for Urban Planning and Public Policy. These sessions take-stock of changes to the theory and practice of public participation and establish a contemporary agenda for research and practice.

Objectives:

- Describe the inextricable link between planning and participation
- Explain how participatory planning is at a point of crisis
- Evaluate participatory planning as it is currently practiced and in light of the ways it is and is not living up to its potential

THE INTERNATIONAL ASSOCIATION FOR PUBLIC PARTICIPATION AND THE PLANNING PRACTITIONER: NEW CONFLICTS IN PARTICIPATORY PLANNING

Abstract ID: 1478

Abstract within Pre-Organized Session 90

BARRY, Janice [University of Waterloo] janice.barry@uwaterloo.ca, presenting author
NOVACEVSKI, Matt [University of Melbourne] m.novacevski@unimelb.edu.au, co-author
BOYCO, Morgan [University of Waterloo, School of Planning] mwboyco@uwaterloo.ca, co-author
LEGACY, Crystal [University of Melbourne] crystal.legacy@unimelb.edu.au, co-author

Across its evolution as a practice and profession, planning has remained in various states of tension with ideas of public participation. The trajectory of planning, from the period of modernism onwards, has involved the recognition of participation as a core part of planning (Lane 2005). Some would even go so far as to suggest that participation is not simply a part of planning; it is planning (Frediani & Cociña 2019). Yet, the design and facilitation of public participation processes is increasingly done by non-planners, with specially trained community engagement practitioners stepping into this role (Bherer, Gauthier & Simard 2017). This shift in responsibilities needs to be set within the context of new complexities and dynamics that are emerging out of a simultaneous expansion of public participation in some contexts and processes, and its narrowing through formalisation in others. As we have argued elsewhere, the formalization of public participation, through the setting of various standards and institutional requirements, is part of broader efforts to legitimize the practice. In this paper, we consider the extent to which this quest for legitimacy extends to individual practitioners and raises questions about the tensions that specialized training and specialized practitioners pose to transformative planning practice.

We report results from an ongoing research project that explores the intersections between the International Association of Public Participation (IAP2) and professional planning practice in Canada and Australia. IAP2 has become one of the most recognizable providers of specialized training and has created new certification schemes for public participation professionals. We trace this evolution and use exploratory interviews with professional planners to highlight how the profession is responding to the emergence of these new forms of expertise and certification schemes. Our interviews with both IAP2-involved planning practitioners and planners who are experienced community engagement practitioners but who have not sought IAP2 training reveal several points of tension, including the possibility of a bifurcation between or a consolidation of planning and public participation professionals. We use these findings to ask critical questions about the degree to which IAP2 training courses and certification schemes support or constrain the further evolution of participatory planning theory and practice.

SHAPING ENGAGEMENT WITH EVIDENCE- A NEW APPROACH TO ASSESSING WHAT DOES AND DOES NOT WORK

Abstract ID: 1479

Abstract within Pre-Organized Session 90

WOLOWIC, Jennifer [Simon Fraser University] jwolowic@sfu.ca, presenting author

TATE, Laura [University of Victoria (UVic) and Laura Tate Associates (LTA)] laura@lauratate.ca, primary author

DEVEAUX, Monique [University of Guelph] mdeveaux@uoguelph.ca, co-author

For several North American communities facing housing affordability issues, there have been corresponding concerns about the role of problematic engagement processes in creating or compounding those issues. For example, in some US states, perceptions about engagement and its impact on affordability have led to proposals for automatically enabling moderate density increases “by right”, without engagement. These proposals include sweeping state-wide or municipal-wide provisions to allow accessory dwelling units (secondary suites); duplexes; triplexes; four-plexes; and other multi-family units without requiring public input on such projects (see Kuhlmann, 2021). Several Canadian jurisdictions are considering similar proposals (Canada-BC Expert Panel, 2021). In all cases, however, there may be a missed opportunity for deeper consideration of how to improve the caliber of engagement, rather than discarding it altogether.

Within the planning scholarship, discussions of the link between land use decisions, public engagement and democracy have long been influenced by Habermasian-informed principles of deliberative democracy, as interpreted by communicative and collaborative planning scholars like John Forester, Patsy Healey, and Judith Innes. These interpretations, and the others they inspired, carried an implicit presumption that effective dialogue was crucial for socially just, equitable outcomes. Yet, even highly attentive and thorough engagement structures appear today to remain insufficient for addressing equity gaps that remain unresolved during, or perhaps exacerbated through, land use engagement processes (Fainstein and Lubinsky, 2020). It is now time to unpack where, when and how such dialogues can impede socially just outcomes, in order to work towards remedying these problems. Our goal is to avoid having engagement relegated as a “frill”, instead of being treated as a crucial component of the land use decision process.

We are researchers with interests in engagement and its implications for good planning, democracy, and socially just outcomes across jurisdictions. Understanding these relationships is increasingly crucial, in light of growing global perceptions that current systems are failing average people (Edelman, 2019:15). Our proposed project will explore the need and potential for new engagement processes in ways that better validate community concerns, while acknowledging more fundamental questions about whether or not democratic systems are working for people. As part of our process, we acknowledge a need for approaches which are sensitive to local contexts, and which seek to avoid globalizing recommendations --even as they address problems which are beginning to seem increasingly universal. In this paper, we will consider the more recent literature on engagement concerns together with parameters for a new process, in the hopes of eventually generating a stronger evidence base on current barriers to socially just outcomes through engagement processes.

In exploring these new parameters, we will use a mixed-methods process gathering evidence from specific jurisdictions, beginning with British Columbia (BC). Our research will include a scientific public opinion poll, aimed at better understanding the barriers to participating in land use engagement processes (including, but not limited to public hearings). Such an approach is seldom used in planning research; and yet the practice of including independent public opinion data to inform government agency policies is quite common (see Birch and Petry, 2012). Our process will also entail interview and document analysis research in five distinct BC communities, in order to triangulate results for more relevant BC practice recommendations. Once our work in BC is complete, we hope to launch a subsequent phase to consider practices and evidence from other North American jurisdictions, using a similar (but not identical) process applied in other local contexts. Presenting this research at ACSP will be a key part of the process, helping us to obtain feedback, and to make comparisons with others who share these concerns.

THE GOOD PROCESS AND THE BAD PLAN

Abstract ID: 1481

Abstract within Pre-Organized Session 90

MILZ, Dan [University of Hawaii] dmilz@hawaii.edu, presenting author
 GERVICH, Curt [SUNY Plattsburgh] cgerv001@plattsburgh.edu, co-author

How can a good process produce a bad plan? The City of Plattsburgh, New York's efforts to develop a plan to revitalize its downtown might provide some answers to this question. In the fall of 2016 and spring of 2017, Plattsburgh developed a plan to revitalize its central business district. The process was funded through the State of New York's Downtown Revitalization Initiative, and the goal was to develop a strategy for allocating nearly \$10 million for projects to catalyze private-sector investment in the City's downtown core. The controversy around the plan has grown over the last five years, and community members remain unsatisfied with the City's approach to prioritizing the various projects and allocating the State's funds.

This research uses Plattsburgh as an exploratory case to emphasize the connection between participatory processes that are well-designed (i.e., good processes) and resulting plans that are poorly suited to a community's needs and values (i.e., bad plans). We rely on empirical data gathered during the process, including interviews with key participants, audio/video records of public planning meetings, and public documents to tell this story. Through analysis of this evidence, we explore the ways in which this controversy is rooted in both a well-designed process and a plan that sought consensus through compromise. We found that a highly active and thoughtful citizenry was able to see through the ways in which local political elites manipulated the process to achieve predetermined outcomes. From this case, we draw important theoretical and practical insights for planning scholars and practitioners.

The realization that planners are more than "apolitical problem solvers," coupled with decades of empirical observations that planners do more than apply scientific procedures to urban and social problems, ushered in a new era of planning practice. Over the last several decades, planners have been taught the importance of community organizing and outreach, they learned to design planning processes that included and depended upon public participation, and they cultured facilitation and dispute resolution skills. To wit, planners began to host public meetings that went above and beyond the formalized rituals of public hearings. Now, under the best circumstances, members of the public engage in hands-on planning activities that encourage their active participation in the plan-making process. The innovations to practical methods are indeed many and profound. Nevertheless, recent research demonstrates the ways in which even these highly innovative participatory planning processes have failed to live up to their own hype and expectations. Planning processes are critiqued on the grounds that they are highly polished performances of democratic action that do not allow the public to make meaningful contributions to the plan itself. The case of Plattsburgh's DRI is another critical piece of evidence supporting these arguments, and it suggests that participatory planning theories and practices deserve greater attention.

BREAKING THE FOURTH WALL ON PLANNING BOARD MEETINGS: GOFFMAN'S DRAMATURGICAL METAPHOR AND PLANNING PRACTICE

Abstract ID: 1482

Abstract within Pre-Organized Session 90

GERVICH, Curt [SUNY Plattsburgh] cgerv001@plattsburgh.edu, presenting author

MILZ, Dan [University of Hawaii] Dmilz@hawaii.edu, co-author

Erving Goffman's dramaturgical metaphor (1959) views everyday social interactions through the lens of theatrical performance. People are actors. The social-ecological landscape is a stage. Societal norms and values provide direction and semi-script the dialogue. Goffman's theory is useful for considering how people present themselves to others. For example, the roles people play shift with context, and our abilities to adapt the characters we play and the ways we interpret others are crucial for managing our expectations in social relationships. The dramaturgical metaphor also facilitates our progress through interactive processes such as meeting a new person, making a bank transaction or enjoying a cup of coffee with a friend. By understanding the plotlines in which we are embedded we move through these stories successfully, accomplishing and constructing social life as we go. The metaphor also helps us avoid conflict, adapt when things go awry and build and maintain integrity in social institutions (Kivisto and Pittman, 2013).

The research described in this presentation views municipal planning board meetings as performative, theatrical events. They include staging, scripts, and props, alongside a healthy dose of improv. Board members sit at the dias, chairpersons bang the gavel, Robert's Rules of Order structures the dialogue, and members of the public and those with applications before the board sit in a gallery and speak from the podium. These common features of staging, script, direction and roles provide organization for conducting public business, reinforce power and authority, create shared meaning and send signals about community values (Kertzer, 1988; McComas, Besely and Black, 2009). Similar to the ways that playwrights, actors and audience members co-construct meaning from a live performance in real time, planning board meetings co-construct democracy, community and civic space as they occur. And, just as COVID-19 transformed live performance from Saturday Night Live to community theater, the pandemic transformed planning board meetings. How planning board meetings were transformed by the shift to online video conferencing, and what this transition means for practitioners, is not yet clear. This study uses Goffman's dramaturgical metaphor to explore how five communities recognized for innovation and leadership in urban planning adapted their planning processes over the course of the pandemic.

Strong Towns is a nongovernment organization that "supports people across the United States and Canada who are advocating for a radically new way of thinking about the way we build our world." The organization awards an annual "Strongest Town" award to communities that are actively working to build resilience through urban design and financial planning. This research examines the experience of adapting to virtual planning meetings through case studies of five recent "Strongest Town" award recipients. Our case studies are built upon video records of planning board meetings before and during the pandemic, and examined through the dramaturgical lens. Put simply, we explore the ways that planning processes in five communities changed throughout the pandemic by paying attention to changes in the ways that Robert's Rules of Order are carried out; planning props such as maps and documents are used; and the move from physical to virtual space alters interactions and relationships. We seek to understand the outcomes of these changes on planning decisions, civic space, community relationships and democracy.

Goffman's dramaturgical lens provides a new angle for exploring the transformations that are occurring in planning practice as a consequence of the pandemic. Art often imitates life, and viewing planning board meetings as performance peels back the curtain on the values and priorities of planning practitioners and community stakeholders, providing an opportunity for critical reflection.

PERFORMING PUBLIC PARTICIPATION SESSION #4: EXPLORING THE POTENTIAL OF PLURIVERSAL PLANNERS TO ADVANCE JUST AND REGENERATIVE FUTURES

Pre-Organized Session 95 - Summary

Session Includes 1696, 1697, 1698, 1699, 1700

WALSH, Elizabeth [University of Denver] elizabeth.walsh@gmail.com, organizer

Our field teaches that planners have an ethical responsibility to “listen to the community,” and solve “community problems” through their participation. Yet professional development generally fails to prepare planners with tools, embodied practices, stories from progressive social movements, and theories of pluriversal planning that would build their capacity to navigate complex power dynamics and address wicked problems. Papers in this session explore paradigm shifts, stories from the field, frameworks, engagement practices, and technologies available to support planners in cultivating the relational, situated awareness and collective power required for public participation to catalyze systems change for just and regenerative development. This panel is part of a series of pre-organized sessions under the heading, Performing Public Participation: Reinvigorating a Critical Research Agenda for Urban Planning and Public Policy. These sessions aim to ‘take-stock’ of significant changes to the theory and practice of public participations and to establish an agenda for research and practice for the middle of the twenty-first century.

Objectives:

- By the end of this session, participants will be able to apply theories, frameworks, methodologies, and practices to their individual scholarship and praxis as agents of systemic change and personal, social, and ecological resilience

RELATIONAL ENGAGEMENTS AND EMBODIMENTS: EXPLORING PLURIVERSALITIES OF COMMUNITY-BASED SCHOLARSHIP IN PLANNING

Abstract ID: 1696

Abstract within Pre-Organized Session 95

NOVOA, Magdalena [University of Illinois at Urbana-Champaign] mnovoa@illinois.edu, presenting author
VASUDEVAN, Raksha [Teachers College, Columbia University] rv2451@tc.columbia.edu, co-author

Pluriversal planning scholarship (PPS) refers to the theoretical and community-based contributions of an evolving stream of critical planning research that embraces multiplicity, coexistence, and situated learning (Vasudevan and Novoa, 2022). Drawing from a literature review conducted between 2019-2020 that assessed 300 articles in top planning journals, we suggested that this group of scholars move beyond traditional conceptions of citizen participation and community engagement that have maintained, and at times reinforced, oppressive planning systems, to re-examine their own ways of being and understanding (ontologies) and ways of knowing (epistemologies) vis a vis community member they work with. To do so, these scholars embrace messy entanglements that develop through complex positionalities, acknowledge the history(ies) of the place(s) they are working in, and use innovative and embodied methodologies that decenter western modes of thinking and being, instead listening and responding to community members to inform the theory and process.

Whereas PPS offers a theoretical framework that reflects the plurality of ways in which critical planning scholarship can reimagine the role and imperative for the planner to learn from and collaborate with engaged urban residents, we found that specific tools and tactics used for engagement were less discussed in the top planning journals. Therefore, over the past year we have reached out to early career and more established scholars to conduct surveys (n=40) and semi-structured interviews (n=20) to examine the following: What is the process of community engagement for pluriversal planning scholars, from initial engagement, to negotiating a realistic project, to building and maintaining relationships? How do these scholars engage in critical reflexivity and positionality while ‘in the field’ and within the university setting? What types of indirect and direct contributions do pluriversal planning scholars offer the communities they work with?

In this paper, we offer three findings for community-based research and praxis. First, the concept of ‘relational

entanglements' usefully describes the ways in which the researcher is constantly engaged in a process of critical reflexivity that acknowledges the multiple and often shifting power dynamics between themselves, community-members, and other state/non-state agents. In other words, through a process of critical and grounded (in time and place) self-reflection, the researcher is able to actively react to the shifting nature of power dynamics between and amongst participants in the service of being responsive to community needs. Second, the iterative work, as well as the direct and indirect contributions that engaged scholars make to the communities they work with not only establishes and builds trust over time, but enables the co-production of knowledge such that theory building itself becomes iterative and responsive. We see a particular potential in this aspect of community engaged work, as it not only reimagines who theorizes but is actually more immediately responsive to and reflective of present-day priorities, social movements, and organizing. Third, from a pedagogy perspective, community engaged scholars are not only providing a space for students to become reflective and active participants in the learning process, but actually become co-producers of knowledge themselves, offering one reimagination of what participatory planning may entail. The constant negotiation of relationships between professor, students, and community members in and of itself teaches students important lessons about the opportunities and limitations of planning practice.

TOWARD THRIVING CITIES: EXPLORING SYNTHESIS AND THE ROLE OF THE PLANNER

Abstract ID: 1697

Abstract within Pre-Organized Session 95

MCSORLEY, Meaghan [Georgia Institute of Technology] meaghanmcs@gmail.com, presenting author
 BOTCHWEY, Nisha [University of Minnesota] botchwey@umn.edu, co-author
 YATES, Josh [Duke University] josh.yates@duke.edu, co-author

One of the central questions of contemporary planning scholarship and pedagogy remains, “how can we enable planners to more securely struggle with the messiness of societal problems?” (Baum, 1996: 134). This is particularly important in the context of participatory planning, where the quality of the outcomes depends so heavily on the planners’ own social, emotional, and relational capacities. There are important, emerging tools and practices planning pedagogy can impart to planning students, equipping them to build and hone these capacities (Lyles and Swearingen White, 2019). Yet, there is also an important perspective from planning theory that suggests that students’ capabilities are derived also from the kinds of theories we share and teach (which is intimately related to the need for and notion of pluriversal planning presented in this pre-organized session). Campbell (2012) argues that we must engage “synthesis” or integration, as well as normative questions about what ought to be done in the face of all this complexity. Friedmann (2000) similarly called for taking a normative stance on the “good city” – rather than continuously producing “rationale” for policy-makers – in his defense of utopian thinking.

This theory paper takes up the scholarship of these theorists and others, arguing that as a discipline, we have an ethical imperative to re-engage synthesis as a central role for and capability of planners (where synthesis is understood both as a skill for integrating ideas across disciplinary boundaries, but also in terms of an integrated mind, body, and heart, after Patrick Geddes definition of the term; see Walsh, 2021). The paper leverages theory and empirical work from discourses both within and beyond planning to demonstrate how planning is already being pushed towards more integrative approaches from many different scholarly fields, and has been from its earliest days as a field. And finally, this paper offers a notion of cities for human thriving as an example of a synthetic approach grounded in the public health, psychology, and planning literatures. By re-engaging synthesis and normative theory-building, the field can help provide future planners with important paradigms which in turn will support them in their participatory endeavors.

VALVERDE MOVEMENT PROJECT: AN INTERSECTIONAL, COMMUNITY-ENGAGED, MULTI-SECTOR APPROACH TO REPARATIVE AND REGENERATIVE PLANNING PRAXIS

Abstract ID: 1698

Abstract within Pre-Organized Session 95

WALSH, Elizabeth [University of Denver] elizabeth.walsh@gmail.com, presenting author
SLABAUGH, Dani [University of Colorado Denver] dani.slabaugh@ucdenver.edu, co-author

In response to the complex social and ecological crises posed by climate change, resilience planning has emerged with multi-sector strategies for mitigation and adaptation. Resilience planning holds promise, yet it is in danger of falling prey to the same myopic professional culture that limited 1970s environmental planning. Climate justice leaders rightly observe that resilience planning must come from the intersectional leadership of communities on the frontlines of climate change who have time, and time again, demonstrated their resilience in the face of adverse social and ecological conditions (Walsh & Wilson, 2020).

Scholar-activists working with communities on the frontlines of intersectional struggles have increasingly been using critical cartographic methods such as counter-mapping and vulnerability mapping. While these cartographic tools are necessary to make oppression and vulnerability to displacement legible, they are insufficient to redress inequities or generate socio-ecological resilience. Since the inception of social vulnerability mapping thirty years ago, researchers have questioned whether the same institutions that created conditions of precarity for marginalized communities can be trusted to use social vulnerability maps to protect people they have made to be vulnerable. Moreover, social vulnerability mapping risks framing marginalized people solely as victims, while methodological constraints have failed to (1) center community knowledge and strengths enabling resilience, (2) identify intersectional oppressions and name them as such, and (3) advance community activism (Jacobs, 2019).

To address this outcome gap, this paper proposes that resilience planners and researchers expand their toolbox with methods based on a radical understanding of the cartographic gaze behind maps, and underlying assumptions about power. Instead of seeing like a State (Scott, 1999), we are called to sense like a sovereign body. Drawing upon Indigenous thought, sovereignty is embodied (Harjo, 2019). The idea of returning to our bodies, our embedded and emplaced lived experiences, and our differences as a source of power and wisdom is core to epistemologies produced at the center of intersectional struggles, though marginal in planning practice (Sandercock, 2004). While counter-mapping practices are essential in identifying drivers of precarity and naming intersectional oppression, sovereign approaches to knowledge production are essential in identifying drivers of vitality, recognizing mutually flourishing relationships, and cultivating resilience in the face of displacement pressures.

Drawing on literature from critical Indigenous studies, Black feminist theory, environmental justice, radical planning, embodied praxis, and regenerative development, we offer a novel conceptual framework for intersectional participatory planning that we call "regenerative mapping." Epistemologically, ontologically, and axiologically, this intersectional approach focuses on naming harm, centering joy, and building on collective strengths. Methodologically, it provides a set of tools and processes – asset mapping, story mapping, promise mapping, and kinship mapping – for planners to unite with counter-mapping.

To illustrate the practical application of these tools in applied radical resilience research, we offer a case study of the Valverde Movement Project (VMP). Supported by the National Science Foundation, VMP is a collaboration between neighborhood leaders, advocacy organizations, university researchers, and city and regional government leaders united in a quest to undo redlining by re-imagining infrastructure investments to advance equitable, community-rooted health and wealth, while simultaneously strengthening strategies to resist displacement threats, e.g. speculative development. In sharing the story of our collaborative work, we will discuss the underlying intersectional

approaches, cartographical methods, and institutional support that have contributed to trusting relationships and ongoing collaboration. We find that by centering community voices and shifting our cartographic gaze from “seeing like a State” to “sensing like a sovereign body,” our diverse team of neighborhood leaders, scholar practitioners, and city planners have been increasingly successful in cultivating relationships that co-produce the knowledge and power required to map our way to geographies of radical resilience.

SUPPORTING LIBERATORY FUTURES THROUGH COMMUNITY DATA PROJECTS

Abstract ID: 1699

Abstract within Pre-Organized Session 95

O'CONNELL, Laura [Georgia Institute of Technology] l.katieoconnell@gatech.edu, presenting author

Lefebvre's right-to-the-city recognizes that control of information is a form of power (Lefebvre, 1968). He argues that a right to information is a critical component of co-created space. In response, many governments and universities construct digital and open data platforms as a mode of data democratization. But a reliance solely on quantitative data fragments the city and its inhabitants, which supports technocratic planning practices and neglects what Lefebvre calls the "human factor." At the same time, Black Geographers demonstrate how quantitative data perpetuates a framework that views Black communities through a lens of deficiency rather than sites of resistance and beauty (McKittrick & Woods, 2007). The combination of fragmentation and a deficiency lens enables the destruction and erasure of communities of color while digital platforms function as a prop to support white supremacist narratives.

To counter this, planners building and relying on digital data platforms need a framework for fostering data democratization and re-imagining geographies. To demonstrate this framework, this paper utilizes a grounded theory approach that relates Lefebvre's concept of the right-to-information with Black Geographers' methodological approaches by using a coproduced community-university digital data project in Atlanta, GA, as a case study. The 8-year project followed participatory action research methods through each iteration of site development. It aimed to ensure all residents could access data so they had the tools to challenge persistent crises, including rapid gentrification. At the same time, the site sought to preserve and share stories as an emancipatory methodology that centralizes memory (Miraftab 2015) and creates "other ways of knowing" (Sandercock 1998). The findings demonstrate the power of digital tools to challenge power dynamics through data ownership and storytelling. We believe this paper is especially salient as planning schools build programs around data analytics in response to our age of Big Data. If sites rely only on positivist measures, they will produce digital data tools that continue to perpetuate white supremacist structures.

POLLUTION, PLASTICS, AND PLANNERS AS AGENTS OF RESISTANCE

Abstract ID: 1700

Abstract within Pre-Organized Session 95

POLLANS, Lily [Hunter College, City University of New York] lily.pollans@hunter.cuny.edu, presenting author

Since anxiety about garbage peaked in the 1980s, urban professionals have paid little attention to it. But this has shifted in recent years. Widely publicized changes in global recycling markets, a deluge of disposables associated with the coronavirus pandemic, and increasing evidence about plastic's pervasiveness—plastic particles and plasticizers have been recorded everywhere from the Arctic to breast milk—has reawakened interest in municipal waste management.

Increasingly, plastics are framed as “pollution” in public discourse. The concept of pollution, as Max Liboiron (2021) has argued, assumes sinks to which polluters have some sort of right. For plastic, those sinks are landfills; air; oceans; our very bodies. Within the U.S. regulatory system, most substances labeled pollutants are regulated through federal policy. Though some constituent chemicals of some plastics are regulated in this way, most plastic product are entirely unregulated at the federal level. City governments—fiscally responsible for the management of all of that plastic after it has been used and disposed—are stepping in.

As of 2021, over 500 U.S. cities had established some kind of plastic reduction regulation (Romer 2021). Some urban plans, like Los Angeles's 2019 Green New Deal, integrate Zero Waste with public health, GHG reduction, and environmental justice. More commonly in urban plans however, waste management is an afterthought if it is included at all. This is not terribly surprising given that many planners still understand municipal waste regulation as a distraction from more significant imperatives, like land use reform (see for example: https://twitter.com/jenny_schuetz/status/1470444280497905665?s=20&t=E5kT9loG8cfTd_WVZTvw4Q).

But, plastics are fossil fuels, and industry increasingly views plastic as the future of the fossil fuel economy (Brigham 2022). Reducing the production and consumption of plastic through municipal regulation is, therefore, essential climate action with key potential for greenhouse gas emissions reduction, climate justice, and ecosystem protection.

This paper is part of larger project tracking the history of municipal plastic regulation. The project will expose how corporate lobbying shaped urban environmental policy, ensuring endless potential for disposable plastics. By connecting the legacies of regulatory experiments from the 1970s with contemporary urban environmental agendas, the project aims to open the door for more effective integration of contemporary urban planning with climate justice through radical municipal waste management.

The paper I will present draws on archival research relating to New York City's ambitious, but ultimately unsuccessful, 1971 plastic tax. It will discuss the origin and intent of the 1971 law, how it related to broader planning priorities at the time, and describe how it failed. Finally, it will use that history to contextualize New York City's current environmental planning efforts. The paper will argue that far from being distractions, municipal efforts to regulate plastic represents one of the few areas of true environmental and economic reform happening at the local scale today. By actively including solid waste management – particularly plastics reduction – into environmental, planners have an opportunity to reshape urban consumption, promote radical resilience, and uplift climate justice.

FUNCTIONAL FLEXIBILITY OF URBAN SPACES IN RESPONSE TO DISRUPTION: BUILDING A CASE FOR NEW MODES OF ADAPTABLE REGULATION

Abstract ID: 1219

Increases in disaster incidence, intensity, and variety – exacerbated by increasing urbanization and the effects of climate change – have highlighted the need for urban spaces and systems to adapt more readily to changing circumstances. While urban systems tend to be configured in ways that prioritize efficiency of function, the narrow focus of this status quo condition can create tradeoffs with regard to resiliency, which generally requires flexibility and adaptability (Elewa 2019). For example, we have observed the emergence of a variety of new spatial modes and functions in response to the COVID-19 pandemic: the increased use of the right-of-way for physically distanced but socially connected dining; group fitness classes conducted on rooftops and in public spaces; increased use of delivery and pick-up services for shopping; and both volunteered and mandated restrictions on spatial occupancy. These improvised examples demonstrate the need for greater flexibility in the use of urban space to respond to disruption as well as the potential benefits that can result from expanding the functional range of urban spaces in terms of supporting cities' social, economic, and public health goals.

Although municipal regulations have some built-in mechanisms that allow for varying degrees of flexibility and predictability (Talen 2012), the transaction costs associated with changing uses within these parameters tend to be expensive and time-consuming. Having the capacity to transition to an alternative functional state more quickly and smoothly could help to increase the adaptability of urban spaces to disruption. To address this need, we ask two primary questions: 1) Do the objectives of existing plans and policies address flexibility in functional use in the right of way, and if so, how? and 2) What are the spatial conditions related to functional flexibility within the right of way? To answer these questions, we develop a Seattle case study focused on food systems uses within the public right of way. The first question is addressed through a content analysis of existing regulatory documents examining four categories of use across spectra of stability/flexibility and realization/anticipation: 1) existing, stable uses regulated by municipal code; 2) temporary, planned uses supported by pilot programs; 3) temporary, unplanned uses that occur during disruptions, and 4) future uses as anticipated in visioning plans. The content analysis is supplemented by interviews with key stakeholders. To address the second question, we conduct a systematic analysis of spatial attributes of the right of way, including existing diversity of uses and presence of food system entities (e.g., farmers markets, restaurants, small-scale grocery stores). Adopting an ecological view of the right of way (Anderson 1978), we also consider the uses that interface with the public right of way, such as small businesses, balconies, and other threshold spaces. The result is a functional inventory of the right of way that documents current uses while providing a framework for the anticipation of future adaptations.

We find that enhancing the adaptive capacity of the right of way could potentially help to smooth response to disruption while also supporting longer-term planning initiatives with broader goals for resilience and sustainability, such as the development of walkable communities and the creation of “15-minute” cities. Specifically, we recognize pilot programs as potential “plan mutations” that have the potential to increase the diversity of use within the right of way with relatively low risk while also recognizing the need for the development of more broadly-scalable use scenarios focused specifically on responding to various kinds of disruption. Through our case study, we illustrate the potential spatial implications of developing such scenarios and provide preliminary recommendations for developing new modes of adaptable regulation for the purposes of responding to disruption.

HUMAN RIGHTS AND CANADIAN CITIES IN PRE-AND POST-CHARTER ERAS

Abstract ID: 1254

Individual Paper Submission

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, presenting author

Human rights are inalienable rights that we each possess by virtue of being human, based on our inherent dignity and equal worth as human beings. These are considered moral rights of the highest order. The Charter of Rights and Freedoms (henceforth, the Charter) guarantees human rights to Canadians. Increasingly, planning issues are being scrutinized from the human rights lens.

Yet, we do not have a systematic understanding of the progression of changes on the human rights front at the city level in Canada. Neither do we know the implications these changes have had on cities and planning at the local level (Agrawal, 2014, 2020). This study conducts a detailed scan of case law and legal jurisprudence going as far back as the conception of the Canadian Confederation in 1867 to fulfill this knowledge gap. The research also involved a systematic review of the existing literature, as well as legislative and policy documents. The analysis is divided into three key time periods in Canadian history of rights: 1. 1867 till the end of the Second World War; 2. 1946 till the creation of the Charter in 1982; and 3. Post-charter 1982- present.

The findings suggest that before the Charter came into being, at the municipal level, discrimination manifested mainly in the form of (a) race-based restrictive covenants; (b) limited or no rights for women or minorities in municipal matters; (c) infringements on freedoms of speech, religion, assembly, or political association; and (d) the imposition of additional municipal taxes and restrictive use of public facilities on people of colour. Some of these issues were challenged in court but with little or no changes in federal or provincial legislation or practice on the ground. Eventually, provincial legislation and statutes outlawed most discriminatory practices. Thereafter, the emergence of the Charter was largely responsible for eliminating many (but not all) longstanding discriminatory practices.

From 1867 until the 1950s, judicial review of municipal bylaws was primarily based on the founding principles of the Canadian Confederation: namely, the supremacy of Parliament and federalism. Court decisions strictly followed principles of federalism as set out in the Constitution, and municipalities played virtually no role in political or legislative affairs for approximately a century following Confederation. The judiciary saw its role as an arbiter of the division of powers when an issue arose. Generally, the courts were limited to deciding “whether the ‘correct’ level of government had acted,” in accordance with the categories of legislative powers set out in Sections 91 and 92 of the British North American Act, and “not whether any level of government could act” (Monahan, Shaw, & Ryan, 2017, p.15). The 1982 amendment to the Constitution and the adoption of the Charter shifted the supremacy of Parliament to the Charter (Richard, 2005) so that Parliament is no longer supreme in its law-making authority.

Since 1982 (but more so in the last decade), the study argues that 1. Canada, as the state, has made strides in safeguarding Canadians’ human rights in cities. 2. It is not just the state, the Canadian judiciary also has a key role in expanding the scope of rights. 3. This is not to say that Canada has now reached a perfect state. Claims and assertions of rights in the city are an ongoing pursuit. And 4. lastly, the idea of human rights varies across the country, particularly between Quebec and the rest of the country, giving rise to tension between individual rights and collective rights (for instance, those of Indigenous peoples). These findings have profound implications on how municipalities craft and revise their policies and bylaws.

ENGAGING OR FURTHER ALIENATING THE SO-CALLED 'UNDESIRABLES': A CRITICAL ASSESSMENT OF NONPROFIT ORGANIZATIONS ROLES IN DOWNTOWN DALLAS PUBLICLY USED SPACES

Abstract ID: 1633

GHAFFARI, Nazanin [University of Texas at Arlington] nazanin.ghaffari@mavs.uta.edu, presenting author

This paper studies downtown Dallas as a sprawled, thriving, neoliberal city that puts urban parks at the focal point of its economic development and branding strategy. It examines the significant role of place-based and mission-based nonprofit and philanthropic organizations, foundations, conservancies, intermediaries, and their many collaborations in shaping the exclusionary nature of the ever-expanding urban center through various partnerships, associations, and affiliations. In other words, it investigates how nonprofit organizations shape the geographies of inclusion and exclusion in downtown Dallas.

The study benefits from the theoretical lenses provided by Lefebvrian sociology and three groups of his interpreters that equate the “right to the city” as claiming social justice (Harvey, 2012; Marcuse, 2009; Mitchell, 2003), spatial justice (Soja, 2010; Dikeç, 2009), and radical urban political justice (Purcell, 2003; Schmidt, 2012). It further relies on the theories discussing the “production of public space,” particularly the domain of planners, designers, and city officials or “conceived space” to further investigate the governance regimes’ structures and strategies and their relations with social inclusion and authentic participation, particularly in signature public spaces. Signature public spaces define the identities of their cities and situate themselves as venues for consumable experiences. They have also become a mission focus for philanthropists and conservancies amid other contemporary urban problems, such as homelessness, food deserts, etc.

I spent four years following critical players and events in downtown Dallas utilizing an intersectional feminist framework. I utilized semi-structured interviews with executive directors or program staff of place-based nonprofit organizations with 501(c)(3) status responsible for the management, activation, programming, or policing of downtown Dallas public spaces, and mission-based nonprofit organizations focusing on downtown communities, people of colors, immigrant and refugees, and homelessness. Investigating these institutional models, including but not limited to business improvement districts, public improvement districts, faith-based organizations, friends of the parks, conservancies, and else elucidates the multiplicity and transitioning governing modes, actors, and relations. It also clarifies the extent to which inclusionary or exclusionary strategies implemented by philanthropic institutions in signature spaces that define the region’s identity reflect the larger JEDIA policies and initiatives in the city, which concerns fell to tokenistic incorporation of aesthetic emplacement and co-optation of narratives and which falls short to commercialized inclusion, rather than authentic inclusion and justice pertaining racialized, gendered, classed, and sexualized struggles.

My Findings indicate simple dichotomies of “public” versus “private,” “for-profit” versus “nonprofit” and “inclusive” versus “exclusive” do not encompass the multi-faceted and multi-layered governance regime structures and employed strategies and the complexity and diversity of experiences in the time-space-event continuum. Thereby, planners should acknowledge nuances and spectrums to accentuate the weight, attitudes, and relations of permanent and temporal actors responsible for decision-making processes and/or street-level bureaucracies. As nonprofit organizations employ securitization, commercialization, and eventization—three exclusionary strategies typically employed by corporations and for-profit entities to choreograph places’ images and dynamics, thereby exclude undesirable users, and uses. Donations from the wealthy often come with strings attached. So, nonprofit organizations constantly “change the narratives” surrounding their exclusionary actions, programs, policies, and strategies, from excluding the “undesirables” to protecting users’ experiences and space image and commercializing urban spaces favoring the upper-middle-class desires to activating neglected spaces and provision of communal spaces.

BUILDING DYNAMIC TRANSDISCIPLINARY KNOWLEDGE AT THE LANDSCAPE LAB: TEST OF AN INTEGRATED PROCESS MODEL FOR PLANNING, DESIGN, AND ECOLOGY

Abstract ID: 1658

Individual Paper Submission

HINNERS, Sarah [University of Utah] sarah.hinners@utah.edu, presenting author
ROTHFEDER, Robin [Colorado State University] robin.rothfeder@colostate.edu, co-author

Frameworks such as Social-Ecological Systems (SES) and Social-Ecological-Technical Systems (SETS) are proposed as essential lenses for effective planning for the complexity of twenty-first-century cities (Guerrero et al 2018, Bixler et al 2019). These frameworks are based on the articulation of interacting complex natural (ecological) systems, social systems, and infrastructural or built systems that are explicitly connected by a defined set of relationships and interactions mediated by design, rules, and norms. In order to conduct planning within such a framework, expert knowledge that is dynamic, not static, is essential both within and across all three subsystems. Dynamic knowledge is knowledge of the system as an evolving, adaptive entity, thus it is generated and maintained by ongoing activities such as experimentation, modeling, monitoring, analyzing and communicating. While planning incorporates data easily, standard planning processes are challenged to incorporate dynamic expert knowledge, especially from distantly-related fields such as the natural sciences.

Previous attempts at integrating expert scientific knowledge into planning have included the articulation of the concept of “designed experiments” (Felson & Pickett 2005) and the sustainability loop (Childers et al 2015). These approaches look for opportunities to integrate scientists, usually ecologists, into a planning or design process. Yet few studies have taken the concept and observed how the integrated process plays out through and post-construction, indeed many studies include only the design phase. Here, we ask: How do integrated processes support ongoing, dynamic knowledge generation and sharing over time in a “living lab” context? Based on interviews with practitioners and academics in the fields of ecology, planning and design, and representing varying degrees of contact and overlap between these fields, we build on existing foundational process models to present a fully integrated process model that includes planning, design, and ecological science. Our model both arises from and gives shape to an ongoing project on the University of Utah campus called the Landscape Lab (constructed in 2020) and is based on a SETS-like conceptualization of the urban system as composed of social, natural and built elements that coevolve and are linked by interactions and information.

The Landscape Lab is simultaneously an experiment in ecological and social revitalization of the site, a demonstration and educational landscape, and an externally-funded research facility focused on ecological stormwater management. Embedded within the design of the landscape are research questions that address ecological and engineering questions about biogeochemical and hydrological processes, social questions about acceptance, perceptions and human-nature relationships, and economic and operational questions about cost, maintenance, and institutional operations and structures. I will present our integrated process model, along with findings from interviews with key participants completed at the initiation of the design process and again post-construction. These interviews explore questions that test the process model: Did participants feel heard as well as informed? Does the project live up to its initial objectives from all perspectives? How do we manage resources and governance going forward? How effectively and by what mechanisms is information and learning shared throughout the planning, design, construction, and post-construction phases?

The findings offer important considerations currently missing from such integrated process models, such as governance, turnover of individual stakeholders, and long-term resource allocation.

THE ROLE OF ORGANISATIONAL ‘STRUCTURES’ IN SHAPING THE INDIVIDUAL ‘AGENCY’ OF PROFESSIONAL PLANNERS

Abstract ID: 1793

Individual Paper Submission

MAIDMENT, Christopher [University of Reading] c.s.maidment@henley.reading.ac.uk, presenting author
 DOBSON, Mark [University of Reading] m.e.dobson@henley.ac.uk, co-author

Overall Aim & Scope

This paper draws on ongoing research that aims to explore the extent to which supportive macro, meso and/or micro-scale organisational arrangements help generate a culture which supports 'effective planning'. The starting hypothesis is that how planning organisations are structured has a significant impact on the ability of the professional planner to undertake what they perceive to be 'effective' planning work, but that there has been little research that addresses this issue.

Significant bodies of work have continued to develop that explore the role of institutional culture at the macro-scale (e.g. Valler & Phelps, 2018; Knieling and Othengrafen, 2015) and individual agency in day-to-day planning practice at the micro-scale (e.g. Murtagh, Odeleye & Maidment, 2019; Inch, 2010), shedding important light on what planners do, and how this is culturally shaped. In contrast, there has been little focus on how the agency of planners might be influenced by the practices and practical arrangements associated with the particular forms and structures of planning organisations; both macro-scale arrangements such as geographical remit and reach, and meso-scale practices such as recruitment arrangements, hierarchical structure, networking opportunities and professional development.

Methodological Approach

The analysis draws on the findings from semi-structured interviews with practitioners from across a range of planning organisations and networks in the UK and Europe, designed to explore how such arrangements shape the space(s) for 'effective' planning. Planning in the UK has tended to operate through far more centralised governance arrangements than in North America and Continental Europe, with local municipalities typically having little autonomy from federal government. However, for this research project, participant organisations were chosen for their diversity of form, with a particular focus on those operating outside of the traditional tiers of the formal UK planning system. This includes private sector consultancies as well as innovative public sector organisations, and professional networks.

Following from this, the focus of the research is not on the quality of the planning work that is being done and the associated spatial outcomes. Instead, the work focuses on the planner themselves, and their ability to work in a way that they consider 'effective', drawing on the normative model of the 'reflective practitioner' (Schön, 1983). A further important aspect of this has been to talk to practitioners who are both more senior and more junior in an organisation's hierarchy, in order to consider whether an organisation's normative ideals and public image are borne out in day-to-day practice.

Contribution to the Field

The paper offers reflections on which organisational factors are most clearly structuring the space for reflective practice within the planning discipline, factors that are derived from a European context but which may be generic to planning organisations globally and which highlight the importance of looking at how planning work is organised. Consequently, the work provides new insights into the intermediary links between the cultures of planning that tend to operate at a federal scale and the day-to-day practices at the micro-scale; both how they are structured by the former and structure the latter, and how they might be normatively organised to shape 'effective' planning practice.

ON VOLUNTARY BARGAINING VS EMINENT DOMAIN: EXPLORING PRACTICAL ALTERNATIVES FOR RESOLVING HOLDOUTS UNDER THE TAKINGS CLAUSE

Abstract ID: 1858

RIDLEY, William [University of Oklahoma] bridley1@cox.net, presenting author

For this study, the primary research question is exploring practical alternatives for resolving holdouts under the Takings Clause, i.e., without requiring direct government intervention (via eminent domain). The body of relevant academic literature identifies three holdout-related externalities that must be fully internalized during public land assembly projects, i.e., to correct/prevent a classic Market Failure in the provision of a Public Good. These are: (1) transactions costs, (2) ownership, and (3) strategic bargaining externalities. [Cooter and Ulen 2004; Merrill 1986; Heller 1998; Posner 2005; Kelly 2006; Miceli and Segerson 1998; et al]. Following the grounded theory research design methodology pioneered by Coase, Cheung, Tabarrok, et al, this study examines three well-documented land assembly cases studies, conducted at the height of the Urban Renewal era: Columbia, MD (1962-65) [James Rouse]; Walt Disneyworld, FL (1963-65) [Walt Disney]; World Trade Center, NYC (1961-63) [Guy Tozzoli]. This study also conducts formal IRB interviews with real estate administrators at public universities across the US, who participated directly in ongoing campus expansion/land assembly negotiations, i.e., at the height of the Kelo controversy (2004-2005). The key finding of this study is discovering that these street-level negotiators universally employed the same basic innovative 4-stage planning/acquisitions/negotiations/bargaining methodology, i.e., enabling them to systematically internalize all three well-defined holdout-related externalities, thus, fully resolve holdouts, without requiring eminent domain. As an original contribution to our knowledge, by providing real-world evidence of such practical alternatives, this study refutes by existence the orthodox US planning/policy assertion, namely, that eminent domain is required for overcoming holdouts, even for strictly private use, under the Takings Clause.

LESSONS FROM A FAILED SMART CITY PROJECT: A CASE STUDY OF SIDEWALK TORONTO

Abstract ID: 1891

Individual Paper Submission

IM, Yirang [Keio Research Institute at SFC] yirang1207@gmail.com, presenting author

In recent years, central and local governments, policy makers, developers and high-tech companies have developed the smart cities to make sustainable city and improve the quality of life for citizens based on Information and Communication Technologies (ICTs) and data-driven approach. While smart cities are expected to make urban transportation efficient, optimize energy use, and provide convenience to citizens, smart city initiatives present blueprints of future cities through advanced technology.

However, even though the smart city initiatives highlight the cutting-edge technology, resident participation, and public-private partnerships are often disregarded. Smart city developments are large scale public-private partnerships projects, and it is important to establish the public-private-civil society governance and consensus processes. Previous studies on smart cities have highlighted the concept of solving problems of the city using advanced technology (Bundgaard & Borrás, 2021; Drapalova & Wegrich, 2020). However, there is a lack of studies that systematically analyzes governance between stakeholders even though governance failure can lead to project failure.

This study is a case study to identify the process and factors that led to the failure of the smart city development process with an example of the "Sidewalk Toronto" project. In 2017, the "Sidewalk Toronto" project promoted by Sidewalk Labs to redevelop Toronto's eastern waterfront area, but the project was withdrawn in 2020. It suffered a conflict with civil society regarding data collection and privacy infringement.

The study applies a modified version of the Institutional Analysis and Development (IAD) framework which has been widely employed in public conflict and governance research (Ostrom, 2010). The IAD framework conceptualizes collective action as a set of action arenas that consists of actors and action situations, thereby enabling us to understand the interactions between activities of the actors and the policy outcomes, especially useful for a collective action, i.e., urban planning (Karnenbeek & Janssen-Jansen, 2018). With the framework, this study analyzes the context, action arena, and interactions of actors to figure the entire process and identify the risk factors of the project that led the failure.

This study can contribute to the literature by examining the risk factors of smart city development process and the choices and interactions of policy actors. Furthermore, institutional settings and the role of both private and public actors for successful governance in smart city development will be suggested from the findings.

THE EVOLUTION OF CONFLICT ENGAGEMENT IN URBAN PLANNING

Abstract ID: 1954

Individual Paper Submission

SENBEL, Maged [University of British Columbia] maged.senbel@ubc.ca, presenting author
BELKADI, Meryem [University of British Columbia] meryem.belkadi@alumni.ubc.ca, co-author

This paper explores different forms of conflict in the processes of urban planning as they appear in the planning literature over the last two decades. We undertake a systematic review of the planning literature as presented in 16 English language academic journals for the period from 2000 to 2021. While much has been written about various kinds of conflict to date no one has taken a holistic look at this body of work to understand how conflict is defined, categorized, analyzed, understood and theorized in the planning literature. Using a conflict engagement approach informed by practitioners of conflict resolution and conflict engagement, we analyse the planning literature to better understand the body of work that deals with conflict and the various mechanisms employed to address it.

A common understanding of conflict engagement is that it has moved from pragmatic to neo-pragmatic approaches and processes. Planning curricula, for example, emphasize a progressive approach to managing and planning disagreements to address underlying social, cultural, ontological and epistemological aspects of urban and regional planning policies and interventions (Healey, 1997). More pragmatic approaches to conflict engagement emphasize the importance of interaction and action-based communication in creating meaning, relationships, and identity (Glenn & Susskind). Our analysis, however, found that pragmatic approaches that favour rational, interest based approaches to conflict resolution have not waned. We found that planners continue to employ a variety of approaches to addressing conflicts depending on the nature of the problem. Instead we find that practitioners and the scholars who write about them employ other categories to decide on where they might fall on the pragmatic to neo-pragmatic spectrum. Conflicts that had a long duration are much more likely to employ neo-pragmatic and arts based approaches to conflict engagement. We present a number of these approaches in the paper and provide planners with ways to use them.

The aim of this work is to help planning scholars and practitioners situate their own conflict cases within an array of conflict types and engagement approaches. They may discover alternative ways of framing their own conflicts and may perhaps discover other ways of categorizing planning issues as being imbedded in conflict.

INTEGRATING ECONOMIC DEVELOPMENT AND TRANSPORTATION IN THE PLANNING PROCESS

Abstract ID: 1977

Individual Paper Submission

DONEGAN, Mary [University of Connecticut] mkdonegan@gmail.com, presenting author

Transportation planners and activists have increasingly sought to shift transportation systems and trips away from automobiles and towards other forms of transport. Such shifts are critical not just for combating climate change but also for addressing both skyrocketing pedestrian and bicyclist fatalities linked to automobile-centric systems and transportation's longstanding environmental, health, and community injustices. Still, transportation planners have struggled to enact this shift; national policy remains autocratic, and state and local budgets and efforts remain overwhelmingly tilted towards personal automobiles as well.

Within this context transportation planners typically frame workers as transportation users; system change focuses on how transportation mode or service shifts might either expand or limit work opportunities and commutes. These are important considerations. Yet missing from this framing is how and the extent to which large-scale transportation shifts might impact the demand for labor, firms, and industries in and related to the transportation sector—and thus the wellbeing of workers and their communities. That is a significant oversight. When taking indirect and induced employment into account, the auto industry accounts for about 1 in 25 jobs in the United States.

This paper first asks questions about policy. How might transportation policies aimed at shifting trips away from automobiles impact workers, firms, and regions? And how do those impacts dovetail with broader patterns in changing inequality, work, and regional fortunes? Building on these questions, the paper turns to planning and policy practice—in particular, underdeveloped links, mismatched processes, and professional barriers between economic development and transportation planning. Drawing on extensive literature in climate, labor, and transportation policy, as well as planning theory and public administration literatures and economic development case studies, this paper ends with three takeaways.

First, progressive labor & industrial development policies that center the needs of workers and their communities must be reframed as preconditional or concomitant policies for multimodal transportation planning and funding. Second, the practice of economic development must change to be more in line with other forms of planning—emphasizing transparency, community participation, and public disclosure. And third, planners must rethink and strengthen ties between economic development and multimodal transportation. While planners are used to the adage “the best transportation plan is a good land use plan,” it could also be true that “the best transportation plan is a good economic development plan.”

ADDRESSING SOCIAL INEQUITIES IN NETWORKS OF COLLABORATION IN FLOOD DISASTER RECOVERY PLANNING: A CASE STUDY IN HOUSTON

Abstract ID: 2030

Individual Paper Submission

ROY, Malini [Texas A&M University] mr956@tamu.edu, presenting author

Floods threaten most coastal communities in the U.S. However, flood impacts are not experienced uniformly by all communities. Socially vulnerable (e.g., low-income, racial minority) neighborhoods have consistently reported experiencing more damage during disasters and faced slower recovery times compared to others in the same community (Van Zandt, 2019). Disparities in impact and recovery are partly due to discriminatory planning (Shi et al., 2016). Traditional government-led planning has failed to meaningfully engage socially vulnerable households and overlooked their recovery needs (Hamideh & Rongerude, 2018). Moreover, engagement processes undertaken in post-disaster time compression have lacked transparency and placated the interests of socially vulnerable households (Olshansky, Hopkins & Johnson, 2012). Marginalization has further reinforced knowledge gaps and power imbalances, thereby diminishing trust in planning processes and reducing coping capacities against flood disasters

among high socially vulnerable households (Van Zandt, 2019).

Past examinations of plans and engagement processes have repeatedly found that high socially vulnerable groups lack voice. However, there is limited guidance on who needs to be targeted to remedy voicelessness in planning for flood risks and *what methods* could be used to identify them. This study seeks to address these gaps by analyzing the network of organizations involved in neighborhood flood recovery activities (e.g., home rebuilding) but marginalized from long-term planning. We asked:

What are the differences in how neighborhood, city, and regional organizations collaborate on flood recovery in low-versus high- socially vulnerable neighborhoods?

- Are there differences in central organizations?
- Are there differences in access to different types and scales of planning organizations?
- Are there differences in the process of collaboration?

This study is the first to use social network analysis (SNA) (Dempwolf & Lyles, 2012) to compare networks of collaborating organizations in high- and low- socially vulnerable neighborhoods. We focus on the City of Houston. Despite Houston's long legacy of systematic discrimination, their recent focus on socially equitable flood recovery makes Houston an ideal case study. We conducted 24 interviews with neighborhood organizations engaged in Hurricane Harvey recovery in the two neighborhoods. Interviewees represented neighborhood planning, civic, non-profits, and faith-based organizations. Combining name-generator and open-ended questions we answered the research questions.

Preliminary analysis of interviews presents new insights on differences in collaboration networks on flood recovery in high- and low- socially vulnerable neighborhoods. In low-socially vulnerable neighborhoods, planning and civic organizations are central to recovery and long-term planning activity; they also foster collaboration with regional planning organizations. In high-socially vulnerable neighborhoods, non-profit and faith-based organizations are central to the recovery network. They carry out short-term disaster recovery activities and advocate for long-term policy changes. Yet the same non-profit and faith-based organizations reported barriers in collaborating with city and regional planning organizations and influencing planning processes. There were also differences in the process of collaboration. Organizations in high socially vulnerable neighborhoods recalled a lengthy process of building trust and demanding transparency in planning. Organizations in low socially vulnerable neighborhoods were able to leverage well-established pre-disaster relationships with planning organizations, exercise more influence, and expedite planning processes.

This suggests that, despite increasing attention to social equity in Houston after Hurricane Harvey, organizations that are knowledgeable of recovery needs in high socially vulnerable neighborhoods continue to feel marginalized from long-term planning. From these findings, we draw recommendations on how different types and scales of planning organizations can better design engagement processes to target marginalized organizations and establish and sustain partnerships with actors in high socially vulnerable neighborhoods. We end by discussing special considerations for planning for social equity in post-disaster time compression.

Track 12 Pre-Organized Session Summaries and Abstracts for the Sessions

PLANNING RESEARCH DOWN UNDER

Pre-Organized Session 60 - Summary

Session Includes 1119, 1328, 1329, 1330

MAGINN, Paul [University of Western Australia] paul.maginn@uwa.edu.au, organizer

This pre-organised session provides a suite of papers analysing a mix of key planning research and policy challenges within metropolitan Australia. Topics to be analysed include: 1. the perennial planning dilemma of providing a diverse and affordable supply of housing for rent and purchase in metropolitan regions; 2. the challenges of fostering and sustaining small-scale manufacturing activity within formal industrial districts and mixed-used industrial precincts in Melbourne; 3. the nature and character of Australian urban planning systems and practices and how they compare with international contexts; and, 4. the impacts of the COVID-19 pandemic on the spatial re-structuring of metropolitan regions as CBDs have been hollowed out and the suburbs have benefitted as a result of working from home and other practices. The session seeks to highlight the condition of planning issues and problems affecting Australian metropolitan regions and serve as a framework to stimulate comparative discussion/debate on the similarities/differences in experience within metropolitan regions in North America.

Objectives:

- Comparative Urban Analysis
- International planning practice

HOW DOES MANUFACTURING SURVIVE IN THE CITY?: A COMPARATIVE STUDY OF URBAN INDUSTRIAL DISTRICTS IN MELBOURNE, AUSTRALIA

Abstract ID: 1119

Abstract within Pre-Organized Session 60

GRODACH, Carl [Monash University] Carl.Grodach@monash.edu, presenting author

Urban industrial land is crucial to a growing set of small urban manufacturers in cities globally. These enterprises typically depend on a central location due to their production requirements yet face displacement pressures due to the redevelopment of industrial areas into mixed-use residential and consumption spaces. Literature has long argued that planned industrial districts are an essential means of retaining the employment and economic benefits that manufacturing firms provide (Chapple, 2014). More recent work finds that while industrial zones at large preserve existing industrial activity, they do not support the attraction of new firms or the growth of existing manufacturing clusters (Davis and Renski, 2020).

However, research has yet to identify if specific urban industrial districts attract new firms or the variation across different manufacturing sectors, which could explain different economic development trajectories. Additionally, studies have rarely examined the potential for alternative industrial zoning mechanisms that mix previously incompatible uses. Recent work argues that the changing nature of manufacturing potentially enables the integration of some production activities with nonindustrial uses, but the outcomes are not well documented (Roost and Jackel, 2021). This question becomes increasingly important as governments continue to rezone traditional industrial preservation zones under growing pressure for new housing and mixed-use development.

This paper relies on structured site analysis and interviews with urban manufacturing enterprises located in formal industrial districts and informal or transitioning mixed-use industrial districts in Melbourne, Australia. The aim is to determine if and how the districts support, grow, or hinder development of different types of manufacturing activity. Results of this on-going project aim to uncover how specific regulatory and built environments play a role in economic clustering patterns. This knowledge may inform planning responses that support urban manufacturing.

COVID (SUB)URBANISMS AND REGIONALISMS: SOCIO-SPATIAL TRENDS, PATTERNS AND POLICY RESPONSES WITHIN METROPOLITAN AUSTRALIA 2020-2022

Abstract ID: 1328

Abstract within Pre-Organized Session 60

MAGINN, Paul [University of Western Australia] paul.maginn@uwa.edu.au, presenting author

The COVID-19 global pandemic has disrupted the normative socio-spatial structure and (sub)urban ways of living, working, moving and consuming within Australia's major metropolitan regions (Maginn & Mortimer, 2020; Mortimer, et al., 2020). Relatedly, the COVID19 pandemic has created the space and opportunity for the emergence of innovative and repressive governance (McGuirk et al., 2020; Acuto, 2020a; 2020b). Much of the academic (and media) focus on the impacts of COVID-19 has been captured by "methodological cityism" (Brenner and Schmid, 2014; Connolly, 2018). That is, the analytical and policy gaze has tended to focus more on the impacts and future role of the CBD (Florida et al., 2021). This is not surprising given the historical and contemporaneous significance of the CBD as the apex activity centre within the constellation of activity centres – capital city; strategic metropolitan, secondary, district, and neighbourhood – that characterise Australia metropolitan regions. The need to socially distance combined with government, corporate and organisational mandates that people work from home (WFH), study from home (SFH) and safeguard at home (SAH) have given rise to a spatial paradox wherein the CBD has become a secondary space, and suburbia has become a primary space. This paper draws on data from Google's Community Mobility Reports and the Australian Bureau of Statistics to ponder the extent of spatial re-ordering within metropolitan Australia by providing an analysis of the impacts of COVID-19 on visitors trends to key spaces – (i) retail/recreation; (ii) transit stations; and (iii) workplaces, plus (iv) time spent in residential spaces at the local government area (LGA) across the five largest state capital cities – Adelaide, Brisbane, Melbourne, Perth, and Sydney – and a select number of major urban areas in regional Australia. The analysis provides insights at a range of temporal scales – yearly, quarterly, monthly and daily – and highlights that the spatial impacts of COVID19 at the inter- and intra-metropolitan level have been far from universal. Furthermore, consideration is also given to the relationship between COVID-19 cases and, population density and socio-economic (dis)advantage at the LGA level (Hamidi et al., 2020; Florida, 2020; Keil, 2020). Ultimately, Central Business Districts have been particularly disrupted by the COVID19 pandemic. This has provoked a range of policy responses in an effort to rejuvenate Australian CBDs.

THE CHALLENGE OF FOSTERING 'DIVERSE' AND AFFORDABLE HOUSING WITHIN METROPOLITAN AUSTRALIA: PERSPECTIVES OF BUILT ENVIRONMENT PROFESSIONALS

Abstract ID: 1329

Abstract within Pre-Organized Session 60

GILBERT, Catherine [University of Sydney] catherine.gilbert@sydney.edu.au, presenting author

Objectives to increase housing diversity are now a common feature of Australian metropolitan strategic planning, as in many other parts of the world. Diverse housing stock, particularly multi-unit and attached housing types are seen as necessary to contain urban sprawl while providing lower cost market offerings in the context of significant housing affordability pressure. However, as in other nations with a tradition of car dependent suburbia, achieving these goals has proven difficult in practice. The stock of Australian housing continues to be dominated by large, detached homes on the urban fringe, and high rise apartments in inner areas, with affordability for renters and first home buyers a persistent challenge. A large body of research points to the role local or municipal planning policies and development control practices can play in maintaining established urban form and preventing market delivery of higher density and more affordable housing types, particularly in established suburbs (e.g. Glaeser and Ward 2009; McGreevy 2018; Whittemore and BenDor 2019). Policy discourse in Australia as in the US and the UK, has also positioned the planning system as a central barrier to diverse and lower cost housing supply. But surprisingly little research has captured the perspectives of planners and built environment professionals themselves on the challenges they face in implementing policy aspirations for greater housing diversity, particularly in middle and outer suburbs. This is surprising given that these professionals operate at the 'frontline' of development control (Clifford 2012) with unique insights on nuanced policy effects.

This paper begins to address this gap by examining the perspectives of planners and other built environment professionals working in three metropolitan regions of Australia. We investigate: (1) the types of 'diverse' housing seen as lacking in the context of different urban and suburban geographies; and (2) the main challenges for developing those housing types, related to the planning system and external to it. We build on recent research which adopts a systems approach to understand patterns of housing production by attending to the institutional actors and processes in which residential development occurs (McKinlay et al. 2021). Data is derived from exploratory interviews and three in depth focus groups conducted in Sydney, Melbourne and Perth, which capture the perspectives of 51 experienced built environment professionals. Interview and focus group transcripts are coded and analysed thematically and we refer to available data on metropolitan region housing markets and planning system outputs in interpreting the qualitative results.

We find that these actors' perceptions of the need for 'diverse' housing extend beyond built form, with built environment professionals in Sydney and Melbourne in particular emphasising the need for models and tenures that can preserve long term affordability, in addition to providing built form diversity in renewing suburbs. In contrast to policy discourse which has focused heavily on the role of local development control in determining housing outcomes, we find that both planners and housing developers alike see factors such as financing requirements, industry capacity, and land markets as critical constraints. Moreover, we find that state-led planning changes to reduce perceived regulatory barriers to housing production (eg. widespread 'upzoning') have perversely limited the tools available to planners to support, incentivise and require mixed tenure projects and development models for longer term affordability, without necessarily increasing new supply. This contributes to the limitations planners already face in fostering diversity within a market-based system of housing production. Overall, the research provides new empirical evidence of the nexus between urban regulation and residential development outcomes within market-based systems, as well as identifying scope for more targeted government interventions.

PLANNING IN AN UNCANNY WORLD: AUSTRALIAN PLANNING IN INTERNATIONAL CONTEXT

Abstract ID: 1330

Abstract within Pre-Organized Session 60

This paper seeks to contribute to the literature on comparative international planning. It considers in what ways Australian urban and regional planning has relevance to conditions and planning responses elsewhere in the world rather than being purely an exceptional case. It draws on contributions in a new edited volume (Phelps, Bush and Hurlimann, 2022) presenting the key discussion points in the introduction to that volume. The thematic basis to this collection draws on literature beyond the extant urban planning literature that does seek to place Australian urban planning in international to present a new analytical synthesis. In particular, it makes use of Gelder and Jacobs' (1995) mobilization of the idea of the uncanny to understand Australian settler society's coming to terms with Indigenous sovereignty. The uncanny is a notion which I believe also helps understand not only the peculiarity of Australian conditions and planning responses but also Australian urban planning's place in the wider world.

Australian urban and regional conditions and their associated planning responses can and often have been seen as unique or exceptional. They are seldom discussed in the same breath as conditions and associated planning systems internationally (although see Huxley and McLoughlin, 1985). Yet, as well as being somewhat different from those elsewhere in the world, Australian urban-regional conditions and planning responses are also somewhat similar. They are uncanny - strange but familiar (Gelder and Jacobs, 1995). Australian urban conditions, and planning policy and practice responses are informally compared and contrasted with those existing internationally. To examine how Australian urban conditions and planning responses are revealing of the uncanny world in which live, I make reference to a trinity of themes. Australian urban conditions and associated planning policies and practices can be seen as exceptional or unique with little relevance to the rest of the world. However, an eclectic mix of urban forms and planning policies and practice responses to these is also apparent in Australia that reflects the exchange of ideas internationally. Then again, Australia is as much of an exemplar – a good, if not the best, reference point - of key urbanization trends as, say, the United States. The latter two Es in particular place Australian urban planning squarely in an international context. If Australian urban planning policy and practice have had limited influence internationally, the partial familiarity of challenges posed by its urban conditions ensure that Australia is a more important global reference point for scholarship and practice than commonly is appreciated.

BEYOND THE LOCAL: A CALL-TO-ARMS FOR PLANNERS TO DRIVE NATIONAL URBAN POLICYMAKING

Abstract ID: 1259

Roundtable

RANDOLPH, Gregory [University of Southern California] grandolp@usc.edu, organizer, moderator
CURRID-HALKETT, Elizabeth [University of Southern California] currid@usc.edu, participant
STORPER, Michael [University of California, Los Angeles] storper@ucla.edu, participant

Planners tend to think and work at the scale of the neighborhood and city. Yet a wider analytical lens, focusing on extra-local forces, is essential to understanding contemporary urban problems (Randolph & Currid-Halkett, 2021). Over the past four decades, globalization and deindustrialization have produced new forms of inequality in our cities and regions—leading to highly polarized labor markets in “superstar cities” and chronic decline and disinvestment in many former industrial hubs (Storper, 2018). These patterns shape the political and policy contexts for economic development, housing, transportation, and many other urban planning domains (Nijman & Wei, 2020). While climate change, financialization, racial inequality, incarceration, and the Covid-19 pandemic all manifest locally in communities and cities, they are challenges that are difficult, if not impossible, to address through local policy alone.

Planning rightly embraces local, community-based action, and many academic planners call attention to systemic roots of local and regional problems. Yet in practice, planning rarely seeks to change extra-local forces through policy activism at higher levels of government. Planning, we argue, has ceded much of this ground to other fields. As a result, planners are largely absent from national policy conversations around issues that directly implicate cities. Not only does this reduce planning to a “fire-fighting” role, reacting to policy decisions from higher levels of authority; it also deprives national urban policymaking of a holistic, place-based approach to human development, where planners have great experience and expertise. This situation is neither an accident nor a strategic misstep by planners; it is the result of decades of federal government disinterest in comprehensive urban and regional policy, abetted by the broader neoliberal retreat of the state. However, recent political realignments, alongside a renewed focus on governance in Washington, D.C., may offer a once-in-a-generation opportunity for planners to reassert themselves in national policymaking. The challenge is a big one, because much of the policy that affects and constrains cities and regions comes from agencies other than the Department of Housing and Urban Development, and the federal government is an extremely complex structure. Moreover, planning departments are no longer turning out large and effective cadres of future national policymakers, implying a major curricular effort.

Against this backdrop, this roundtable discussion will engage its speakers and the audience in the following questions:

- How do we inculcate an appreciation for extra-local forces in planning research, practice and education? How do we inspire urban planning students to act in, but also beyond, the city?
- To what extent are planners at the table in designing national policy solutions to our most difficult urban and regional challenges?
- What are the issues on which the planning field could most effectively assert a more prominent role in national policymaking?

RESEARCH AND DISCUSSION ON THE TEMPORAL AND SPATIAL DIFFERENTIATION OF URBAN-RURAL INCOME DISPARITY BASED ON COUNTY-LEVEL UNITS: A CASE STUDY OF HUBEI PROVINCE, CHINA

Abstract ID: 1009

Individual Paper Submission

QIN, Tian [Shanghai Tongji Urban Planning and Design Institute] qint_initial@126.com, presenting author

Based on the correlation analysis of historical data and GIS analysis, taking county-level administrative regions as the research unit, this paper analyzes the spatial distribution and change characteristics of urban-rural income disparity in Hubei Province, China from 2000 to 2020, as well as the influencing factors of this spatial-temporal differentiation of the disparity. It also discusses the current regional planning and puts forward suggestions on the planning.

The study found that the regional difference of urban-rural income disparity in Hubei province gradually tends to be balanced from 2000 to 2020, but the disparity is still large. That is, the sharing level of urban-rural development achievements is not high. At the provincial level, the urban-rural income disparity presents an obvious gradient in the East, middle and west regions, and the polarization phenomenon tends to intensify. The areas with huge gap between urban and rural areas are concentrated in Western and northeast Hubei. Within each municipal city, the urban-rural income disparity tends to be balanced, and the gap of prefecture-level cities generally ranks first for a long time. The spatial distribution difference of the above urban-rural gap is mainly affected by the congenital landform and location

conditions. In the study period, the spatial-temporal differentiation of urban-rural income disparity are affected by the market economy law, and the city biased policies such as registered residence and land. In order to achieve balanced and sustainable regional development, it is suggested to establish an ecological compensation mechanism and promote regional planning across administrative units.

TVA AND THE GRASS ROOTS AT 75: THE LEGACY OF A PLANNING CLASSIC

Abstract ID: 1081

Individual Paper Submission

FRANK, Kathryn [University of Florida] kifrank@ufl.edu, presenting author
HIBBARD, Michael [University of Oregon] mhibbard@uoregon.edu, primary author

American planning has long struggled with the tensions among technical planning expertise, various demands for public voice, and claims to speak for ‘the public interest’. It continues with the current concern for equity and institutionalized bias. The approaching 75th anniversary of Philip Selznick’s 1949 classic, *TVA and the Grass Roots: A Study in the Sociology of Formal Organization*, is an apt time to revisit his pioneering work exploring those tensions. Our aim is to show the ongoing relevance of Selznick’s perspective through a reflection on what he said, how it was received by contemporaneous observers, and how it connects to rural regional development planning today.

TVA (the Tennessee Valley Authority) was established in 1933 as one of the first efforts to address the catastrophe of the Great Depression. It was a pioneering regional development planning agency, held up as a model for the emerging field. It served as a prototype for international development planning into the 1950s and ‘60s (Gilbert 2015). Selznick found TVA a “shining example” (p. 266) of technical competence. It also held itself up as an exemplar of what TVA director David Lilienthal (1944) called grass roots democracy – citizen participation and democratic planning. However, Selznick found that TVA’s behavior did not reflect that idealized view.

Selznick found that participation was limited to the region’s agricultural elite. Large-scale landowners and supporting organizations such as the Farm Bureau and officials from land grant universities came together in the Tennessee River Improvement Association to press their own local agenda. They constituted what Lilienthal called the grass roots. Vulnerable populations such as Black farmers, small landowners, tenant farmers, and sharecroppers were excluded from participation. TVA’s alignment with the powerful was a defensive posture to avert threats from local elites to TVA’s very survival.

Selznick used the term ‘co-optation’ to characterize this willing collusion in which TVA ceded control of its agricultural program and ignored the needs of the dispossessed.[1] This came to be called ‘elite capture’ as development planning was internationalized (Ansar 2018). Selznick’s study sheds important light on: 1) tensions between expertise and pressure for democratic participation; and 2) the challenge of political power and the realities of multiple publics.

After seven decades, those tensions remain highly relevant and yet under-explored by the planning literature. We use the lens of rural regional development planning and planning more generally to consider those matters. We examine what Selznick wrote and critiques from that time, then explicate recent scholarship to probe their implications for current thinking about equity and institutional bias in planning.

[1] / This is quite different from the current understanding of co-optation that emerged in the 1960s, the struggle for “maximum feasible participation” of the poor and the concern that powerful government and quasi-government agencies would control (co-opt) community groups and set their agendas. Community groups would be depoliticized and in the worst case serve as stooges for a controlling agency (Alinsky 1965).

THE CITY AFTER COVID-19: VULNERABILITY AND URBAN GOVERNANCE IN TORONTO, CHICAGO AND JOHANNESBURG

Abstract ID: 1194

Individual Paper Submission

KEIL, Roger [York University] rkeil@yorku.ca, presenting author

REN, Xuefei [Michigan State University] renxuefe@msu.edu, co-author

HARRISON, Philip [University of Witwatersrand] philip.harrison@wits.ac.za, co-author

This presentation examines the role of municipal institutions and their civil society partners in mobilizing resources to mitigate the impact of COVID-19 and improve health and economic equity. Focusing on Toronto, Chicago and Johannesburg, we will examine how the pandemic exacerbated existing patterns of vulnerability, how municipal institutions have alleviated the devastating consequences of the pandemic, and how their interventions evolve after the acute phase of the pandemic passes. Many programs mobilized for COVID-19 equity response represent dramatic transformations in urban governance, in terms of new partnerships being forged between grassroots organizations, citizens, and municipal authorities. We compare the policies and programs adopted in the three urban regions and explain the differences in their policy choices.

DOES POLYCENTRIC DEVELOPMENT REDUCE REGIONAL ECONOMIC DISPARITIES? A MULTI-SCALE ANALYSIS OF GERMAN REGIONS.

Abstract ID: 1201

Individual Paper Submission

LI, Wenzheng [Cornell University] wl563@cornell.edu, presenting author

SCHMIDT, Stephan [Cornell University] sjs96@cornell.edu, co-author

Understanding and mitigating regional disparities and spatial inequality are of great interest to both researchers and policymakers. Polycentric development has been identified as an effective instrument to lessen regional disparities and facilitate more balanced territorial development and has been articulated as a normative goal by the European Spatial Development Perspective (Veneri and Burgalassi, 2012). The assumption is that a monocentric urban system with a dominant core city would exacerbate spatial inequality, whereas a more polycentric one would lead to convergence within and between regions and produce more equitable and sustainable outcomes (Beijers and Sandberg, 2008).

However, such an assumption lacks robust theoretical underpinning and empirical justification. Theoretically, a polycentric metropolitan region could be an effective tool in reducing regional disparities if the agglomeration benefits are "regionalized" via urban networks such that subcenters could borrow functions and performance due to geographic proximity and functional linkages (Sun et al., 2019). On the empirical side, existing studies primarily address economic disparities in the context of large territorial units (e.g., at the EU or OCED country level) and provide mixed results. Research on the within-country regional scale is scant (Meijers and Sandberg, 2008; Malý, 2016), suggesting that geographic scale is an important consideration in testing the effectiveness of polycentrism at reducing spatial inequalities (Malý, 2016). As a result, no definitive conclusion has been drawn regarding whether polycentric regions account for fewer economic disparities, especially at the regional scale.

This empirical study aims to fill this gap by utilizing the German spatial planning regions (Raumordnungsregionen) and the federal states (Bundesländer) as the appropriate delineations of polycentric urban regions. Morphological polycentricity is measured using the distribution of employment among (sub)centers and functionally through inter-community commuting flows. Regional polycentricity is then associated with the intra-regional disparities measured by six equality metrics – the Gini coefficient, coefficient of variations, the Theil index, and the corresponding population-weighted version of them. Cross-sectional econometric analysis is finally applied to articulate the relationship between polycentricity and regional disparities, controlling for agglomeration factors, regional welfare, globalization, and regional redistribution.

We find that greater regional polycentricity is associated with decreased regional disparities at the scale of the spatial planning region, but this effect is not extended to the larger territorial units, the federal states. The finding suggests that the efficacy of polycentric systems may differ depending on geographical scales. It is possible that agglomeration economics, globalization, and territorial competition may enlarge regional disparities and undermine the effects of polycentricity at the federal state scale. Our results have implications for regional and national level spatial planning policies and contribute to the current debate on territorial cohesion across the EU.

TRANSBOUNDARY URBAN GROWTH ANALYSIS IN TURKEY'S MARMARA REGION USING SLEUTH CELLULAR AUTOMATA AND THE CORINE DATA

Abstract ID: 1270

Individual Paper Submission

CHENG, Tong [New York University Shanghai] tc3532@nyu.edu, presenting author

GUAN, Chenghe [New York University Shanghai] chenghe.guan@nyu.edu, primary author

An increasing body work on urban growth modeling has focused on how regional policies influence future regional urbanization. However, more comparisons are needed on different the impact of different regional policy approaches on regional urbanization patterns. To fill the gap, this paper aims to assess two different regional urban growth policy interventions: the unified policy scenario which assesses a particular urban region as an integrated area and the diversified policy scenario focuses on the subregional variations with distinct urban growth patterns in urban regions. The study area is the Marmara region straddles Europe and Asia across the Sea of Marmara and also the most densely populated and industrialized city region in Turkey. The SLEUTH cellular automata method is applied to provide scenario-based urban growth simulations by using CORINE Land Cover data between 2000 and 2018. The results show that unified regional, diversified policy generate different urban growth patterns for the different subregions. We argue that the combination of unified and diversified policy interventions can lead to the most environmental conscious urban development of a region. We therefore discuss the relevancy of data-driven policy interventions to facilitate regional urbanization for sustainable regional development. In confirmation with previous studies, this paper extends the knowledge on regional urban growth and policy-making challenges by comparing the sensitivity of two distinct policies

BEYOND ADVANTAGE: HOW SILICON VALLEY REMADE MASSACHUSETTS' (SUB)URBAN TECHNOLOGY LANDSCAPE IN ITS OWN IMAGE

Abstract ID: 1360

Individual Paper Submission

PAYNE, William [Rutgers, The State University of New Jersey] will.b.payne@rutgers.edu, presenting author
TARR, Alexander [Worcester State University] atarr@worchester.edu, co-author

It has been over a quarter century since AnnaLee Saxenian demonstrated how the more flexible organizational culture of Silicon Valley enabled Northern California-based firms to outcompete their peers in the suburbs along Massachusetts' Route 128 Corridor (Saxenian 1994). In the intervening years, Silicon Valley has ballooned into a dominant force in the political economy of the United States, and a regional development model for established and aspiring global economic powers alike (Irani 2019).

But what of the sprawling high-technology landscape west of Boston in the intervening years? The initial loss of New England's technology firms did not follow the pattern of stranded fixed capital and economic decimation created by the earlier departure of textile production from the region. Using a combination of archival, visual, and spatial analytic methods, this paper argues that successful hardware-centric Silicon Valley firms expanded back into New England not only because of an ongoing concentration of skilled digital laborers, but to take advantage of the legacy built environment and cultural landscape of suburban technology work.

Drawing on three case studies – Intel's takeover of DEC's former headquarters, Western Digital's rented research and development facility, and Cisco's custom built Boxborough campus, we show that despite, or in part because of, Silicon Valley's turn to producing software, web applications, and multi-sided markets known as "platforms" as major sources of profit, a great deal of capital, labor and space in the Boston metropolitan area is still dedicated to producing the physical and technical systems that digital economies depend upon. At the same time, many of the marquee names from earlier decades of technology investment in New England have been out-competed or acquired by West Coast competitors, and those that remain tend to be either situated lower on the value chain (hardware firms in a tech economy drawing ever-higher valuations from relatively asset-light software startups; see Campbell-Kelly 2003), or are connected to specific regional educational or defense institutions with more fixed ties to place.

We conclude by exploring the last decade in particular, looking at new development of downtown technology campuses in Boston and Cambridge, an inversion of the previous explosion into first the Route 128 and later Interstate 495 (the outer "ring road" of the Boston suburbs) corridors. In doing so, we argue that the regional structure of the digital economy is once again being upended by place-based competition over biotechnology firms, local elites' desire to reproduce what they understand to be a Silicon Valley style 'start-up' economy (whether or not this is always an accurate analysis), and the long cultural move away from the suburban lifestyles of middle-class engineers to younger, wealthier developers' preferences for uniquely urban amenities and spatial arrangements (Stephens et al. 2019).

RURAL PROOFING AND COVID-19: HOW EFFECTIVE DATA COLLECTION CAN IMPACT RURAL PLANNING

Abstract ID: 1553

Individual Paper Submission

DEACON, Leith [University of Guelph] leith.deacon@uoguelph.ca, presenting author

COVID-19 has significantly impacted rural areas and the people who live there causing enormous economic and social disruptions that may have lasting effects on employment, income, and working conditions. While significant research has examined the relationship between COVID-19 and a range of socio-economic factors, the majority of these studies focus on urban centres. Rural and small communities differ from their urban counterparts - their demographics, their sectoral employment trends, and their isolation all require contextually appropriate policies to be developed to ensure that their impacts are effective and reflective of local realities. Rural proofing is a commitment by government to review and examine all public policy to ensure it does not disadvantage rural areas. This presentation uses socio-economic data collected from a quantitative survey (N = 28,000) distributed across nine rural counties in Ontario, Canada to highlight how COVID-19 impacted rural and small communities. Results highlight the need to ensure that adequate inclusion of rural and small communities occur when policies, program, and plans are developed to support the long-term resiliency of these areas. Results can be used to inform and expand the dialogue around small and rural communities, planning, and how effective data collection can, and should, inform rural planning.

DYNAMICS OF URBAN SHRINKAGE: THE GERMAN EXPERIENCE OF INDUSTRIAL REFORM AND URBAN REGROWTH

Abstract ID: 1555

Individual Paper Submission

JEONG, Sangyun [Yonsei University] sangyunjeong@yonsei.ac.kr, presenting author

LIM, Up [Yonsei University] uplim@yonsei.ac.kr, co-author

Backgrounds

Bremerhaven and Rostock are two German cities with strong identities as seaports. They also exemplify extreme cases of industrial reform during the shipyard crisis [Werftenkrise] of the late twentieth century. Bremerhaven, the former FRG (Federal Republic of Germany) city, has suffered from consistent population decline. In contrast, although the population in the former GDR (German Democratic Republic) city of Rostock also shrank after Reunification, it has been growing again since the early 2000s. Urban shrinkage is a dynamic process affected by many factors at different spatial levels (Haase et al., 2014, pp. 1524-1525). Even within one specific national context, each city faced a wide range of varied circumstances. As a result, urban shrinkage must be studied within each locality's specific historical

trajectory and alongside the factors affecting that city (Wiechmann and Pallagst, 2012, p. 278; Haase et al., 2021, pp. 8-9). Furthermore, the history of urban shrinkage itself should be studied by engaging multiple theoretical frameworks concerning multilevel governance, urban regrowth, and more.

Research Approach

Many prominent scholars, including Haase (Haase et al., 2014; Haase et al., 2021), Beauregard (2009), Bernt (2009), Wiechmann and Pallagst (2012), have studied the shrinkage in different national contexts. However, a lack of understanding persists about how local dynamics, comprised of diverse factors and variegated contexts, have guided individual cities to specific, varied, outcomes. This study's aim is to understand how Bremerhaven and Rostock each addressed its population losses and urban decline, the factors driving each city's approach, and the outcomes. This study explores the narratives of shrinkage in both Bremerhaven and Rostock through contrasting analysis, a heuristic model comprised of four main features and the interrelatedness among them: drivers, impact, and responses at the national and local levels. The two cities' population and economic development are explored alongside their planning strategies, both quantitatively and qualitatively.

Findings

The study shows that federally funded projects played a key role in addressing urban problems (e.g., abandoned estates) in both Bremerhaven and Rostock. However, the way in which local actors leveraged both external opportunities (e.g., state funding) and internal resources (e.g., civic leadership) varied. Another difference between two cities was in local actors' understanding on urban revitalization, economic regeneration, and the interplay between them. It was this divergence, both in understanding and in approach, that brought about significantly different results in community engagement and innovation. The study contributes to enhancing our understanding of the local dynamics of urban shrinkage and regrowth, specifically in medium-sized cities under industrial reform. Despite the generalisability being limited to some extent, the paper provides insights to scholars and local actors at different levels dealing with urban decline and 'restructuring'.

THE ROLE OF CO-WORKING SPACES IN SHRINKING CITIES: THE CASE OF SOUTH KOREA

Abstract ID: 1557

Individual Paper Submission

KYUNG, Shinwon [Urban and Community Research Center] swkyung0221@gmail.com, presenting author

In recent years, the rising number of co-working spaces has been an urban phenomenon that reflects the trends in a knowledge-based economy where work can be performed independently. The needs of knowledge-based workers are fulfilled in a community, sharing know-how and skills as well as a physical space. This lays the foundation of a sharing economy. The widespread idea of co-working spaces has brought about successful urban regeneration. Co-working spaces also offer efficient access to whatever the users need, including legal and financial advice. These collaborative spaces contribute to job creation, the reuse of former industrial buildings, the development of creative districts, the transformation of public spaces and the attraction of other types of activities in urban areas.

Coworking spaces have been developed mainly in larger cities and thus little is known about how they work in small and medium size shrinking cities. This paper seeks to address this gap in the literature by exploring what roles co-working spaces can play in such cities with sparse entrepreneurial environments. To answer this question, this paper aims to provide an empirical exploration of the roles of co-working spaces in those cities in South Korea (hereafter Korea) by collecting and analyzing both qualitative and quantitative data.

Korea has seen an increase in the number of shrinking cities, resulting from population loss, economic downturn, employment decline and social problems. The main drivers of shrinkage are structural-demographic shifts, economic restructuring and deindustrialization. These shrinking cities face great difficulties in coping with the process of change. Policy responses have been to promote entrepreneurial environments by creating the hard infrastructure specifically designed to support appropriate soft infrastructure. Developing co-working spaces for young entrepreneurs and highly skilled workers is one of these policy responses.

In order to understand the roles of co-working spaces, a five-month study (October 2021 – February 2022) of co-working practices in twelve small and medium size cities (less than 300,000 population) was conducted using two interrelated methods: 1) an online survey with users of co-working spaces in their 20s and 30s and 2) semi-structured interviews with managing staff of co-working spaces. Based on this study, this paper concludes that co-working spaces in shrinking cities play the following four roles, which were proposed by the study of Nakano et al. (2020): 1) Infrastructure Provider: the quality of the infrastructure, the atmosphere they create and the image they project are important 2) Community Host: they foster social interaction, which is important not only for autonomous professionals and freelancers but also for the existing residents and the (potential) migrants from bigger cities, as they can often experience isolation, lack of social contact and friendship 3) Knowledge Disseminator: they provide training sessions, workshops, lectures and courses, and business tutoring to increase the success and survival rate of businesses in the local area and 4) Local Coupling Point: they provide reference spots where different actors converge to look for specific resources, services and interaction.

Co-working spaces in shrinking cities in Korea are intermediary organizations, which are believed to bring innovation and economic development, in addition to social engagement. Increasing numbers of talented workers are choosing to congregate and co-locate in cores of shrinking cities where co-working spaces are actively playing their roles. The more roles they play, the greater their impact to users, neighborhoods and cities. However, urban policies and regulations in Korea have not clearly defined what co-working spaces are and what roles they play in creating social and economic impact. This lack of policy and legal framework can create uncertainty and discourage initiatives, including the financial and institutional support necessary to sustain the activities of co-working spaces.

THE NEW URBAN REGION: RACE, SOCIOECOLOGY, CLIMATE JUSTICE

Abstract ID: 1655

Individual Paper Submission

GOH, Kian [University of California Los Angeles] kiangoh@ucla.edu, presenting author

The problem of climate change and the interconnected nature of the urban ecological-infrastructure watershed raise critical questions about race, space, socioecological systems, and justice. In and around cities, disparate urban environmental outcomes have long been tied to systemic racism (Pulido 2000; Holifield 2001). More recent efforts to “green” or protect once neglected urban spaces can often displace poor communities of color pushed to vulnerable sites by prior waves of racist and exclusionary urban development (Gould and Lewis 2017; Anguelovski et al. 2019). Such outcomes are set to be exacerbated as climate change becomes more urgent and city and regional governments rush to take action.

How might urban researchers and planners conceive of more racially just and climate just cities? The most promising approaches to resisting both the impacts of climate change and unjust actions in response are those that are politically organized from the viewpoint of systemically marginalized groups (Routledge et al. 2018; Agyeman et al. 2016), crucial when making claims of justice against structural oppression. But such community-based organizing is more often in opposition to large-scale urban environmental initiatives, including climate actions, precisely because of histories of systemically racist and unjust development. Such conflicted claims on space are fights for recognition of communities across multiple sites and temporalities (Goh 2019, 2020a, b). The concept of the region appears to have

potential as the most appropriate scale of inquiry and action to understand and address such conflicting claims. Regional approaches, as such, promise the possibility of larger-scale knowledge and action. But, even as a long-studied topic in planning, it is an ill-defined concept, caught between biophysical understandings of space and vague allusions to a territory larger than the municipal entity.

In this paper, I build a new theory of the urban region. I trace a theoretical pathway from formative ideas of the urban ecological region (MacKaye 1940) through three more recent, distinct concepts – Forman (1990)’s urban ecological science-determined region, Gandy’s (2002) urbanized-natural watershed, and Woods’ (1998) historically and racial power-constructed region – and extend it through to emerging discourses of abolitionist and intersectional climate justice (Ranganathan and Bratman 2019; Amorim-Maia et al. 2022). I take seriously biophysical, material conditions of the urban region as well as historically-specific, temporal, racialized spatial injustices to propose a conceptual framework for a racially just and climate just urban region.

The paper illustrates the concepts through an empirical discussion of the early 21st Century Los Angeles urban region, following flows of water, people, processes of urbanization, and ideologies of urbanism. It shows how a revived and revised regional approach illuminates the interrelationships between historical injustices and present climate change imperatives. The paper concludes with theoretical and methodological research agendas for planning the urban region that conjoin biophysical change with historical sociocultural formations.

UNCOVER DISPARITIES OF COVID-19 OUTBREAKS IN THE U.S. MEGAREGIONS BASED ON CRITICAL SOCIOECONOMIC AND PUBLIC HEALTH INDICATORS

Abstract ID: 1695

Individual Paper Submission

BAI, Shunhua [University of Texas at Austin] shunhua@utexas.edu, presenting author
GUO, Jiani [University of Texas at Austin] jiani_guo@utexas.edu, co-author

The Novel Coronavirus (COVID-19) transmission rate has been found by scientists to surpass any similar disease in history. On January 22nd, 2020, the first Novel Coronavirus Disease (COVID-19) case in the United States was reported in Cook County, Washington. On March 1st, 2020, the reported number of confirmed cases in the U.S. was 53. However, since then, the situation deteriorated so drastically, the pandemic outbreak began to expand from some counties in Washington, New York, and California to other places in the country. By the end of May 2020, over 1.7 million had been infected and more than a hundred thousand people died due to COVID-19 related issues in the U.S.

The proposed study aims to uncover the disparities of early COVID-19 outbreaks by identifying the critical socioeconomic and public health indicators in the U.S. megaregions. In particular, we will categorize the counties based on the population sizes of their affiliated Core-Based Statistical Areas (CBSAs) in order to discuss the indicators in different regional contexts. We will then apply a multilevel mixed-effect modeling approach to the weekly COVID-19 data to answer the following three research questions: RQ1: Did counties in large CBSAs (population > 1 million) experience higher and more rapid COVID-19 outbreaks in the U.S. Megaregions? RQ2: What socioeconomic and public health factors played more important roles in explaining the variations of COVID-19 outbreak for major metropolitan counties vis-à-vis for others? RQ3: How do the disparities vary across different megaregions?

The empirical results in the Northeast Megaregion showed that major metropolitan counties experienced a statistically significantly higher initial outbreak level but the spread speed was the same as their counterparts. The results also showed that socioeconomic characters played a more important role than public health indicators in reducing unexplained variances of outbreaks. Population density, GDP, income inequity, and the proportion of people in poor health were positively related to initial outbreaks. Notably, the proportion of the poor population was negatively associated with the initial outbreak level but positively with the spread speed.

ZHANG, Xuchen [College of Architecture and Urban Planning, Tongji University] 1910230@tongji.edu.cn, presenting author

In the 1990s, Manuel Castells (1996) proposed the theory of Space of Flows, believing that various types of flows have built our society and created a global city network system. Cities cannot exist independently in the network, and are increasingly interfered by flow factors. This theory has changed the research perspective of regional city research, and it has gradually shifted from the static space inside the city to the dynamic connection outside the city.

Guizhou province, which is powerful support for China's western development strategy, is selected as the main research object. From the perspective of Space of Flows, this paper explores the regional city network from population flow connection (physical connection) and economic flow connection (non-physical connection) by mainly using mobile signaling migration data and enterprise big data. The former data can well reflect the temporal and spatial law of crowd flow behavior, to represent the links and dependence of society, business, and travel between cities, and the data was obtained from China Unicom in December 2019. Enterprises are the direct actors of economic links between cities (Taylor and Derudder, 2004), and the analysis method based on enterprise big data is the mainstream method to represent the economic links between cities (Derudder, 2004). Enterprise data was obtained from the database of Chinese industrial and commercial enterprises in December 2018. Firstly, refers to the method of Rozenblat and Pumain (2007) to build a city network model with enterprise ownership and refers to the method of Kai YAO and Xinyi NIU (2015) to build another city network model with population mobility. Secondly, calculate the core measurement indicators including network link degree, centrality degree, etc of the networks to evaluate the characteristics of the network.

The following conclusions can be drawn from this study: 1) The overall pattern of the city network in Guizhou Province presents a multi-level Core-Periphery structure. Within the province, Guiyang, the provincial capital, is the core and other regions are the peripheries, showing the dominant role in the economic links of enterprises in the province; Within the area, a network structure with regional central cities as the core and surrounding cities and towns as the peripheries is mainly formed. At the same time, from the perspective of population flow, it can be found that Guizhou Province presents the characteristics of initial networking. 2) Compared with the higher enterprise network link degree between Guiyang and Zunyi, the link degree of population flow is lower, which shows that Guiyang and Zunyi, as the top two cities in Guizhou Province, have formed a strong economic link, but the actual population flow needs to be strengthened. 3) The network hinterland of Guiyang covers the whole province, but the network hinterland of Zunyi is mainly concentrated in its city and has not had a radiation effect on other areas of the whole province. At the same time, while receiving the radiation of Guiyang, other regional central cities also play a leading role in the surrounding small and medium-sized cities and towns.

With the continuous promotion of regional coordination strategy, the cooperation between cities has been strengthened. As the main platform, megapolitan clusters and metropolitan areas composed of multiple cities and towns gradually replace individual cities to participate in global competition, and their internal will inevitably form a close and reasonable city network. Then, how identifying the city network and related characteristics has become the key point. This study will help to identify and understand the characteristics of city networks from Space of Flows and their importance to regional coordinated development, aiming at providing a reference for relevant similar research

and decision-making.

IDENTIFYING CULTURAL CONNECTEDNESS AT MEGAREGION-LEVEL WITH NETWORK APPROACH: CAN CULTURAL HERITAGE DISTRIBUTIONS REFLECT CULTURAL REGIONS?

Abstract ID: 1804

Individual Paper Submission

YOO, Chisun [Georgia Institute of Technology] cyoo34@gatech.edu, presenting author

ROSS, Catherine [Georgia Institute of Technology] catherine.ross@design.gatech.edu, co-author

Megaregions are interconnected clusters of metropolitan areas and their surrounding hinterlands, linked through physical ties, and shared environmental concerns as well as social, cultural, and economic ties (Ross & Woo, 2011). In the US, federal institutions and multiple state governments address megaregions as an important planning unit. Nevertheless, little attention has been focused on planning for megaregions. One of the major obstacles is identifying, or delineating megaregions. The delineations of megaregions to date have several shortcomings, and in particular, they neglect cultural identity. In the literature, cultural identity is part of the attributes that should help define megaregions. For instance, both Regional Plan Association (2009) and Ross & Woo (2011) included cultural connection as a constituent element of megaregions. While it can be important in understanding the trajectory of functional connectivity and future connectedness of megaregions, cultural connections have been mostly overlooked.

Culture has implications for megaregions from at least three aspects. Cultural similarities provide amalgamation that can serve as the basis for cooperative action (ACIR, 1972). Culture is also one of the elements that comprises regional identity - where regional identity is considered a way to strengthen the regional competitiveness of political regimes. Lastly, culture can be represented by similarities of material objects and other artefacts that are derived from it. These include development patterns, planning frameworks, institutional settings, and landscape. Thus, places that share cultural identity or have cultural connections are likely to have more coherency in the region. In aggregate, we seek to determine how shared cultural identity and connections among places can be a meaningful way of identifying areas that have similar planning characteristics.

Cultural traces “function as connections, tying the meaning of places to the identity of the cultural groups that make them” and “tie cultures and geographies together, influencing the identity of both” (Anderson, 2009: 5). Further, as Weaver & Holtkamp empirically found, “heritage traces play an important role in shaping the geographies of contemporary cultural region” (Weaver & Holtkamp, 2016: 218). This study seeks to determine how cultural traces, such as cultural heritages, can reflect common identities and connections among local areas. The hypothesis is that cultural traces can be considered as nodes that connects different geographies, places, and groups under a common cultural identity.

In this study, we use a network science approach to identify regions that are connected by similar cultural identities in the contiguous US. There are 70,000 registered historic places recorded in the National Archives Catalogue. The records provide information on historic places; including, the place's name, location, areas of significance, and architectural classifications. The study will use architectural classification as a cultural attribute that materializes cultural identity. Using these data, we construct bipartite network that consists of two types of nodes - counties and cultural identity. The presence of cultural heritages in a county will allow the research to define boundaries or edges. The edges will be weighted by proportion of cultural identity reflected by cultural heritages in a particular county. With the constructed network, we will apply community detection algorithms to figure which areas are tightly connected and form cultural regions.

This study contributes to the literature in several ways. First, it uses an empirical approach to delineate cultural regions at the national level, unlike the studies on a particular region. Further, unlike prior studies that predefine regional cultural identities and mapping traces, we conceptualize cultural region as networked areas that share

similar cultural identities. Further we use a relational approach, without predefined culturally predefined regions. Lastly, this study will test the applicability of cultural heritage distribution in identifying cultural regions.

ARE HOUSING NEEDS ASSESSMENTS THE RIGHT AFFORDABLE HOUSING TOOL IN WEAK PLANNING STATES?

Abstract ID: 1903

Individual Paper Submission

MAKAREWICZ, Carrie [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, presenting author
SLABAUGH, Dani [University of Colorado Denver] dani.slabaugh@ucdenver.edu, co-author
SANTOS GRANJA, Laura [University of Colorado Denver] laura.santosgranja@ucdenver.edu, co-author
DESOUZA, Priyanka [University of Colorado Denver] priyanka.desouza@ucdenver.edu, co-author

In response to the housing affordability crisis, this study looks at an alternative approach to the regional housing needs assessment and allocation process in states with weak planning regulations. In weak planning states, like Colorado and 35 others, local planning is optional, making mandatory allocations difficult or impossible to enforce. The study focuses on Metropolitan Denver, CO, a region experiencing a massive housing crisis. Through a forensic mixed-methods analysis, the research attempts to identify the causes and consequences of the crisis, and evaluate a combination of advisory, funding, design, and planning strategies that would result in greater production of market rate and subsidized affordable housing, in the absence of strong planning requirements.

Regional Housing Needs Assessments, or RHNAs, are often identified as a first step in addressing a housing crisis. RHNAs are planning processes to estimate how many housing units each jurisdiction will need given household growth and emerged in the context of residential desegregation efforts in 1968 (Ramsey-Musolf, 2017). By mandating all cities plan for affordable housing to receive federal urban renewal funds, Congress attempted to nudge cities towards desegregation, if not by race, then by class. Since then, RHNAs have largely remained a toothless suggestion (Ramsey-Musolf, 2017). Even in the most progressive “strong planning” areas of the country, however, those cities that do submit a RHNA to HUD rarely meet their housing allocations (Bertrand, 2020). The barriers to affordable housing production are not about identifying the need. They are mostly tied to cost of construction, permitting, zoning, environmental review, but also to local political will of the municipalities, and “not in my backyard” (NIMBY) and racist politics of affluent residents (Forbes, 2007; Karki, 2015).

Across the U.S., other state level policies have also attempted to eliminate barriers to affordable housing. California’s recently passed laws to enforce affordable housing production, and limited its environmental law, CEQA. “Smart growth” policies have also attempted to promote more market affordable housing, but with mixed results. While some have persuaded developers to produce a small share of affordable units, the units rarely provide opportunities for wealth building through ownership. Furthermore, such inclusionary zoning and smart growth efforts have been critiqued for their tendency to catalyze or exacerbate gentrification pressures (Larsen, 2005; Rayle, 2015). These affordability issues are not inherent to denser housing but may be inherent to neoliberal frameworks that tend to frame policies around real estate interests rather than resident needs (Rayle, 2015; Christophers, 2014). The Denver metro area housing crisis reflects aspects of all these challenges.

Through content analysis of 25 local housing plans and local news reports, as well as 20 years of detailed permit data, parcel level data, and zoning, this study evaluates barriers to affordable housing development across the region. Metro Denver’s unhoused population has more than doubled since 2016, and nearly 400,000 households are housing cost burdened. Further, impacts are disproportionate across race and ethnicity, with Black residents four times, and Latinx or Indigenous residents ten times more likely to experience homelessness than White residents.

Through the planning documents analysis, we find that rather than alleviate the affordable housing crisis, planning processes frequently contribute to the problem by discouraging affordable housing, under-estimating housing need, and incentivizing higher-income detached single-family housing.

As the federal government allocates more housing funds than it has in decades, it is crucial cities have funding for community engagement and the necessary planning processes to adopt zoning changes. Funding housing needs assessments is a minor first step. Deep community engagement and technical planning processes will be necessary to change the planning and zoning that heretofore was used to exclude the identified needed housing.

ACCESS TO FOOD AND EMPLOYMENT IN THE TOWN OF TERRY MISSISSIPPI

Abstract ID: 1981

Individual Paper Submission

HOLDEN, Jon-Vincent [Jackson State University] vincesholden@yahoo.com, presenting author

There is a beautiful rural town in Mississippi called Terry in Hinds County. A population of 1,286 people as of 2019. This research is to conduct a survey for the people in town to see the distance that they must travel to work, for social activity, and to get food.

Secondary data already sheds light to the food insecurity aspect of this project. Food insecurity is a pervasive and serious issue facing many countries in the world and the United States is no different. No state is more familiar with hunger than Mississippi. For the past eight years, Mississippi has been the hungriest state in the country according to the CDC (2017) and State of Childhood Obesity (2020). Currently, 20% of the population (600,000 people), in the state that are considered to be in food insecure areas, including 1 in 4 children. The state is estimated to need an additional 300 million more per year to be able to meet the state’s need. Mississippi has 34 of 82 counties having a food insecurity rate higher than 22%.

At the county level, Mississippi also has the highest rates of food insecurity in the nation. Issaquena County has a food insecurity rate of 40%, while Jefferson County has a 36% food insecurity rate. There are more people that are food insecure in Hinds County (61,000) than the entire state of North Dakota (55,000). As is the case with the entire country, food insecurity rates are much higher in Mississippi’s rural areas than they are in urban areas due to the lack of resources to be able to attain food. Rural counties in the South that have a population of 20,000 or more that are not near metropolitan areas have a food insecurity rate of 18%, while urban counties in the Northeast region of the country have only a 10%.

Areas in Mississippi that are without access to food are more likely to be by populated by African Americans, Hispanics, and other ethnic groups. Out of the 670,000 recipients of SNAP in Mississippi, 61% are African American. Of the 63 counties that are considered to be food deserts in Mississippi, 31 of the counties have a population of African Americans of over 40%, with 22% of the counties having a population of 50%.

With information being readily available on food insecurity in the state there is not enough data to show how on average how much this town travels for work. The Average for the county is 23 minutes.

Peter Calthorp (2017) Urban Designer gave a speech, titled “7 principles for building better cities” and listed them as:

1. Preserve
2. Mix
3. Walk
4. Bike
5. Connect
6. Ride-

1. FocusThe purpose of this research to collect data on travel habits of the citizens of Terry Mississippi. Data will be collected using a questionnaire. The survey will be administered to all residents living in Terry over the age of 18 years of age and who voluntarily agree to take the survey.

On average how far do you have to travel for work?

- o. How far do you to travel for food?
1. How far do you have to travel for school?
2. How far do you have to travel for social activity?
3. Can you walk to any of these places from your home?

In closing this research will focus on the traveling time citizens of Terry Mississippi take to purchase food and to work. This data will be collected via survey of willing participants 18 years and older. The goal of this research is to find solutions needed specifically to this area.

ECONOMIC RESILIENCE AND RECOVERY IN THE U.S. GREAT LAKES REGION: A SOCIOECONOMIC AND TRANSPORTATION INFRASTRUCTURE FRAMEWORK

Abstract ID: 2043

Individual Paper Submission

CRUZ-PORTER, Annie [Purdue University] acruzpor@purdue.edu, presenting author
 ROJAS, Lisa [Purdue University] llosadar@purdue.edu, co-author

 ZHALNIN, Andrey [Purdue University] azhlnin@purdue.edu, co-author
 BEN, St Germain [Purdue University] gst@purdue.edu, co-author

The EDA introduced the need to incorporate economic resilience as one of the elements in the Comprehensive Economic Development Strategies (CEDS) process following the Great Recession from December 2007 to June 2009. The Great Recession originated with the crash in housing markets and financial institutions, but unprecedented job losses happened in manufacturing and construction industries (Gallagher, Hoang and Keil 2019). Scholars argue that these industry sectors have yet to recover from the loss of low-skilled jobs, which were ultimately replaced by higher-skilled positions. Many of the displaced workers found themselves having to change industries and/or occupations (Kalleberg and Wachter 2017). Another feature of the Great Recession was that the impacts were disproportionate by gender, educational level, race, ethnicity, and household wealth. Additionally, the effects of the Great Recession were different across geographical regions of the U.S.

As such, this project delved into economic resilience and capacity for recovery of the regions with an emphasis on the regional transportation and infrastructure elements in addition to socioeconomic factors. Resiliency remains an idealized characteristic that regions aspire to achieve and is typically a less common attribute of many regions. The ability to recover from a shock shows the “rebound capacity” of the region, and regions aspire to recover quickly from the economic shocks. The ability to avoid the shock completely shows the “predictive and adaptive capacity” of the region. Such regions develop capacity for risk, vulnerability assessments, and agile strategy building techniques to reconfigure the regional economies. In a real context, regions might have some level of “absorbing, rebounding, and adaptive” traits but only a limited capacity to build economic resilience and steer away from economic shocks. Note that economic recessions or shocks can occur in addition to the structural changes happening in the regional economies. Structural transformation or change represents the long-term movement of production and labor from

agriculture to manufacturing to services experienced in many global and regional economies (Neuss, 2019). Hence, recessionary shocks might cause additional changes to the industrial and occupational compositions of the regions undergoing structural shifts. However, regions usually employ performance measures such as unemployment rate, jobs openings, among others. These metrics remain suitable to capture only the short-term economic recovery, and not suitable to capture structural, social and economic shifts.

This presentation will outline the results of the the significant socioeconomic and physical infrastructure factors that may influence the economic resilience capacity of regions and contribute to the maintenance and expansion of robust regional economies. In particular, the key research questions we examined were as follows: (1) What is the definition of regional economic resilience? (2) What socioeconomic and infrastructure variables are significant contributors to economic resilience? And, (3) What are the major socioeconomic and physical concepts, or combinations of variables, that can advance the economic resilience of a region? The project employs the community capitals framework (Flora & Flora, 2013) and the structural economic concepts to interrogate regional economic resilience. This research offers a data dashboard tool, community insights into the nature of regional economic resiliency, and how resiliency concepts may best be incorporated into a CEDS.

AN ASSESSMENT OF THE LAND USE CHARACTERISTICS IN SHRINKING CITIES; A SPATIO-TEMPORAL SIMULATION AND PREDICTION OF URBAN DECLINE IN SOUTH KOREA

Abstract ID: 2049

Individual Paper Submission

HWANG, Hyerim [Seoul National University] hyerimhwang@snu.ac.kr, presenting author
YOON, Heeyeun [Seoul National University] hyoon@snu.ac.kr, co-author

Urban decline is one of the significant concerns of the urban world because of its continuous expansion from the 1990s and vicious cycle. In 2016, McKinsey Global Institute reported that the population is likely to decline in 17% of large cities in developed regions and 8% of cities worldwide from 2015 to 2025 due to declining fertility rates and urban flight. Until recently, the urban decline was considered as an old-industrialized country phenomenon, but it has become an alarming global problem with no limit to country, region, and culture (Martinez-Fernandez et al., 2017). Unfortunately, despite the continuous urban decline, many cities still chase growth-oriented planning due to the inability to accurately predict future urban decline patterns (Lee & Newman, 2017).

South Korea is no exception. After the exponential state-led urban growth from the '70s, public services and infrastructures have been concentrated in large cities. An imbalance in regional planning resulted in persistent migration into dominating cities, rapid aging of local communities, and diminishing opportunities for economic activities in suburbs, all of which has led urban shrinkage (Joo, 2018). From 2005 to 2015, 74 cities out of 229 have been identified as shrinking cities on the verge of extinction, and 76 have been identified as stagnant cities (Choi & Park, 2020)

The spatial phenomenon of the shrinking cities has long been studied. One of the main veins of those focused on the simulation and the prediction of the spatial extent of the shrinking cities in the future (Lee & Newman, 2017). Shared elements of shrinking cities are: consistent population loss, economic downturn, employment decline, and structural social problems as symptoms of structural crisis. (Martinez-Fernandez, et al. 2017). From a spatial perspective, all these shifts are considered to be reflected in the physical change of land use. Lee & Newman (2017) predicted shrinking cities by seeing changing patterns of vacant land as an indicator. Simulating Land Transportation Model and found out that mobility and the housing market is primary contributing attributes in declining.

While land use has been established and altered by human activities, it has not been widely used for simulating and projecting urban shrinkages. Distance to transportation, vacant lots, elevation, etc. have been mainly used to indicate

the decline areas. However, the driving potentials of these indicators do not fully reflect the interaction between factors and resulting in as low accuracy. A thoughtful understanding of land change patterns and related factors that interact with is a must in future simulation and prediction (Han et al., 2015).

Against this backdrop, the objectives of this study are 1) assessment of land use characteristics of shrinking and non-shrinking cities 2) identifying other variables that jointly explain the urban shrinkage with land use 3) predicting future land-use changes of 2040 with the historic data of population density per grid every five years, the price change of real estate, and the number of employees, from 2005 to 2020. The main data source is Korea census and the Ministry of land infrastructure.

Dyna- CLUE and Markov chain combined model is adopted for this research due to the characteristic of its spatio-temporal approach. Land-use models are optimal tools for analyzing the dynamics of land use. Models such as regression and cellular automata were widely used in previous researches. However, they displayed little relation with human activity-induced socioeconomic factors.

We hypothesize that when the socioeconomic value is incorporated as extra independent indicators, the accuracy and suitability of the shrinkage rate will score higher than just examining patterns of land-use changes

This research will provide the government with a better understanding of urban shrinkage's current status and help them plan sustainable countermeasures.

LONG COVID CENTERS: THE SPATIAL CLUSTER ANALYSIS

Abstract ID: 1842

Poster

THOMAS, Talya [Jackson State University] talya.d.thomas@jsums.edu, presenting author
WU, Conner [Troy University] yuhaowu@troy.edu, co-author

Over 3.2 million Americans are suffering from post-COVID symptoms, medically known as post-acute sequelae SARS-CoV-2 infection (PASC). Numbers of Long Covid (or Covid long-haulers) continue to grow, as approximately 25-35% of all individuals who contract the virus are still persistently ill in the post-acute phase (Long Covid Alliance, 2021). These Covid long-haulers struggle to regain their former level of health and may experience mental and physical impairments that substantially impact their quality of life and their ability to work.

Due to underreporting and underlying health care disparities, Black, Indigenous, and Persons of Color (BIPOC) communities may be disproportionately impacted by the devastation of Long Covid, and more likely to die as a result of their post-COVID symptoms. Women are also disproportionately affected by Long Covid.

In reviewing long covid centers, what strategies and approaches can be taken to ensure the proper placement of these centers when BIPOC communities are affected? We chose Cluster and Outlier Analysis (Anselin Local Moran's I) and Spatially Constrained Multivariate Clustering in the clustering analysis because the former analysis shows the hot and cold spots of Long Covid centers, and the later one presents the spatially contiguous clusters of Long Covid centers

based on a set of feature attribute values and optional cluster size limits.

In this poster, we present several long covid centers that range across the United States that support Long Covid patients. We also explore the idea of how to ensure that BIPOC communities are not disproportionately impacted as we improve the outcomes for all Long Covid sufferers.

NAVIGATING PLANNING THEORIES

Pre-Organized Session 9 - Summary

Session Includes 1046, 1047, 1048, 1049, 1050

DAVOUDI, Simin [Newcastle University] simin.davoudi@newcastle.ac.uk, organizer

A recurring criticism faced by planning scholars is that their paper is 'under-theorized', 'lack theory' or make no 'theoretical contributions'. It appears that critics have a single entity in mind called 'theory' without being explicit about what that 'thing' is which they expect others to attend to. Far from being willful acts of dismissal, their assessments reflect the ambiguities of the concept of 'theory' itself and its contentious nature. Despite centuries of debates in physical, natural and social sciences, there is no commonly agreed view on: 'what is a theory'. This doesn't mean that we should abandon 'theory' from our planning lexicons. Nor does it mean that 'theory' refers to anything and everything. It rather highlights the existence of multiple meanings of 'theory' which remain in competition for legitimacy and dominance in planning literature. The session brings together diverse perspectives to explore different ways of navigating the complex maze of planning theories, unpacking their history, evolution and values, and offering more constructive peer reviews, better engagement with literature, and deeper understandings of planning theories.

Objectives:

- Deeper understandings of planning theories
- Better engagement with planning literature
- More constructive peer reviews

THEORIES OF WRITING AND WRITING PLANNING THEORY

Abstract ID: 1046

Abstract within Pre-Organized Session 9

CHETTIPARAMB, Angeliq [University of Reading] a.chettiparamb@henley.reading.ac.uk, presenting author

In this presentation, I will explore two themes related to the art of writing planning theory and will discuss these with regard to challenges for both making a contribution to planning theory for publication and for teaching planning theory to our students.

The first themes relates to 'freewriting', most famously argued for by Peter Elbow (1973). Students who set out to write an essay/coursework/dissertation are normally advised to prepare an outline structure of their work and to organise their work around this structure. Freewriting argues that often the process of writing is a creative process and as such freewriting without a structure is potentially more innovative. I will examine this debate in the light of writing planning theory.

Second, I will focus on the role of metaphors in writing theory. Metaphors have been argued to be both constructive and destructive in theory construction (Chettiparamb, 2006). I will review these debates and highlight some of the pitfalls and mistakes in using metaphors in theory construction, especially when metaphors are substituted for theory.

I will close by relating the above two themes to the challenge of making a contribution to planning theory for publication as well as the challenge of teaching planning theory to our students.

RE-ORGANIZING PLANNING KNOWLEDGE – TOWARDS A TOPOLOGY OF PLANNING THEORIES

Abstract ID: 1047

Abstract within Pre-Organized Session 9

LEVIN-KEITEL, Meike [TU Dortmund University] meike.levin-keitel@tu-dortmund.de, presenting author

Spatial planning and its understandings are diverse, as are the theoretical perspectives that can be taken on it. Planning theories are not only partially and exemplarily selected in planning sciences, they are also an essentially anarchic undertaking: Criticism of existing approaches and of a missing foundation are more numerous than constructive contributions to further advancement. Theories, no matter how concrete or general, reflect different bodies of knowledge and are based on certain presuppositions and fundamental values (Barker/Kitcher 2014). In planning science, these are rarely made explicit and discussed (Alexander 2016: 94). In general, systematisations of theoretical approaches help to identify and relate essential differences but also commonalities of single theories. However, previous structuring approaches follow historical classifications and changes of planning understandings in time as well as the common distinction between substantive and procedural theories (Allmendinger 2017). This does not do justice to the knowledge inherent in planning theories (Davoudi 2015), nor does it help much in answering important questions and connections, especially to manage manifold challenges in the 21st century. Yet, how to navigate planning theories then?

In a theoretical approach based on philosophy of science, I contribute to a deeper understanding of planning knowledge: a topology of planning theories as re-organisation of planning knowledge. Numerous challenges, be it the impacts of climate change and adaptation and mitigation strategies, or societal polarisation and the question of appropriate decision-making, require a rethinking and reorientation of planning approaches. A first step in this direction is an inventory in which the existing planning knowledge, organised and validated in planning theories, is recorded and systematised. I present a "topology" of planning theories, a systematisation of planning theory approaches that is characterised neither by right nor wrong, but meets the scientific demands of a disciplinary foundation and integrates the collected knowledge from the field of spatial planning. The topology of planning theories is not based on a historical classification of planning theories. Instead of dealing with the genesis of the theories (an important, but also often accomplished procedure), the topology of planning theories deals with their validity. Accordingly, it focuses on the rationale of planning theories and their scientific position and resulting positions and insights. The division of the theories into their specific perspectives on reality(ies), present and future as well as normative orientations, which becomes visible through the topology, is an important part of this. This makes it possible to answer questions such as: Which understanding of planning does e.g. collaborative planning presuppose and which different forms of knowledge does this imply? What does the pragmatic planning approach mean in practice and which forms of knowledge are needed then? The result is a substantiated differentiation of planning theories in research and practice. Accordingly, the topology of planning theories aims at systematising this inherent knowledge and locating it in the field of planning theory. Topology emphasises the systemic nature of this scientific field and the relationship of certain elements to one another, not to be confused with a typology, the aim of which is to distinguish and differentiate individual elements from one another. The topology of planning theories is a logic of the location of theories, their objects of knowledge, ranges, limitations and characteristics. This classification is not linear or even causal; the interactions are more like double images or matching patterns. The special feature of the planning sciences lies in their both present and future-oriented planning knowledge as well as in their strong action orientation towards planning practice in a directly corresponding field of action, spatial planning.

CAN WE DISMANTLE THE MASTER'S HOUSE? REFLECTIONS ON EFFORTS TO UNSETTLE PLANNING THEORY

Abstract ID: 1048

Abstract within Pre-Organized Session 9

RUDDICK, Susan [University of Toronto] sue.ruddick@utoronto.ca, presenting author

What is planning theory? How for that matter do we advance planning theory? Since John Friedmann's publication of *Planning in the Public Domain* in 1987, planning theory has opened the door to reflect on its intellectual lineage, the range of conceptual underpinnings that have shaped traditions in planning. In the current conjuncture, with mounting concerns over the global pandemic, climate crisis, amplified and accelerating social inequities, debates are growing around whether the mainstream planning and its varied epistemological influences will actually accelerate these crises or might contribute to their resolution, or whether it is necessary to "unsettle" planning theory altogether.

In this paper I reflect on a doctoral level graduate course I taught on advanced planning theory. Organized around the intention to unsettle the canon, we revisited the western canon from the perspective of emerging critiques – with particular focus on the ways planning might be understood and reimagined in recognition of its epistemological heritage, rooted in the logics of modernity and intellectual framings of 'northern' theory, and critical re-framings that have emerged both within and from outside of the canon, with particular insights offered by anti-racist, Indigenous, feminist and decolonial perspectives.

Through the course, deploying a range of methods of textual analysis and critique in a close reading, we explored the intellectual heritage of planning theory and its lineages, as well as the possibilities offered by anti-racist, feminist, Indigenous, decolonial and other critical perspectives. We undertook a critical engagement of the western canon and several levels: first in an exploration of its epistemological and ontological grounding assumptions, and core concepts; second in the ways that actually existing planning projects have often wittingly or unwittingly furthered colonial and racist agendas, and finally in ways we might unsettle and rethink the canon through anti-racist, decolonial and alternatives to modernist approaches to planning.

THEORY AS A HINDRANCE TO UNDERSTANDING

Abstract ID: 1049

Abstract within Pre-Organized Session 9

SANYAL, Bish [Massachusetts Institute of Technology] sanyal@mit.edu, presenting author

Inspired by Albert Hirschman's (1971) critique of "paradigms" I will propose that planning theories are paradigms which not only describe how urban policies work (descriptive) but also how good policies should work (normative). In trying to create such holistic explanations which are coherent, theory building often makes broad assumptions about human behavior, organizational settings, and larger political economy, in the process overlooking evidence which does not fit the neatly constructed theories. Yet, it is such "odd evidence" which can open up social inquiry, identifying conditions under which the neatly constructed theoretical propositions do not hold true, thereby expanding our overall understanding of the problem under study. Drawing on a few examples from the fields of international development and planning theory, this paper will argue that paradigms and the theories they are based on can hurt our understanding of problems rather than address them.

CO-CRAFTING THE JUST CITY: LEARNING FROM PRACTICE AND CRITICAL REFLECTION

Abstract ID: 1050

Abstract within Pre-Organized Session 9

THROGMORTON, James [University of Iowa] james-throgmorton@uiowa.edu, presenting author

Urban and spatial planners often serve quite ably in local governments, but they (and the scholars who study and theorize what planners do) rarely govern. Consequently, despite recognizing the unavoidable political aspects of planners' work, planners and scholars of planning often do not understand what it is like to serve as elected officials who are trying to improve the quality of their cities while being immersed in a complex, emotionally-charged, and politically-contentious flow of action. With the notable exception of Louis Albrechts' (2019) *Planners in Politics*, very few planning scholars have treated elected officials as key actors who shape local planning. As Albrechts (p. 263) writes, "political decision-making often seems like a black box to planners." My paper – which summarizes and builds upon my new book, *Co-crafting the Just City* – seeks to shine light into that black box. Narrated from my perspective as a city council member and (for the last four years, as mayor), the book reports how, using democratic processes of governance, the residents and elected leaders of one city in the midwest of the United States (Iowa City, Iowa) tried from 2012 through 2019 to co-craft their city's future while being immersed in a complex and contentious flow of action. In particular, the book seeks to give readers a sense of what democratically-elected city council members and mayors in the United States do and what it feels like to occupy and enact those roles. Second, it seeks to document what happened when council allies and I tried during my terms as mayor from 2016 through 2019 to lead our relatively small city toward becoming a more inclusive, just, and sustainable place; that is, a more "just city." Third, the book endeavors to help readers understand what it feels like to be an urban-planning scholar serving as a council member and mayor, and to share lessons I learned with other scholars, especially those who focus on planning theory. By doing so, it seeks to stimulate creative thought, research, and action about how the crafting of city futures can be improved. And, fourth, the book offers a practical, action-oriented set of ideas about how city futures are being (and can be) shaped. After reporting what I learned with regard to each of these aims, my paper will conclude with some specific observations and recommendations directly related to planning theory, especially with regard to how planning theorists could help local elected officials, their planners, and others co-craft the unfolding of better cities.

Track 13 Roundtables

DECOLONIZING PLANNING "FROM WITHIN" AND "FROM BELOW"

Abstract ID: 1424

Roundtable

MIRAFATAB, Faranak [University of Illinois at Urbana-Champaign] faranak@illinois.edu, moderator
TORRES-CORDERO, Ariam [University of Illinois at Urbana-Champaign] ariamlt2@illinois.edu, participant
LAMBIA-NIEVES, Deepak [University of Puerto Rico] deepak.lambia@upr.edu, participant
SANTIAGO-BARTOLOMEI, Raúl [University of Puerto Rico] raul.santiago@upr.edu, participant
RAYMOND, Elora [Georgia Institute of Technology] elora.raymond@gatech.edu, participant
AIDOO, Fallon Samuels [University of New Orleans] faidoo@uno.edu, participant

Decolonizing planning requires that we take a critical stance against oppressive planning dynamics and structures. It requires prioritizing the historical realities of specific contexts and shifting the ground of knowledge from that of formal professional planning to the practices and spaces of social groups living under oppressive conditions (Miraftab, 2017). This exercise, however, involves considering the co-constitutive relationships between colonial and anti-colonial experimentation, formal and informal planning realities, and invited and invented spaces of action (Huq, 2020; Miraftab, 2020). This roundtable provides a space to discuss these relations and an opportunity to reflect on planning's decolonizing vision and anti-colonial praxis.

In the U.S., while planning is now more than ever being exposed as an instrument of imposition, marginalization, and erasure, planning scholars are increasingly trying insert the experiences of those under active colonization (Barry & Agyeman, 2020). At this juncture, this roundtable will allow participants to discuss the dialectics of (anti)colonial planning from within and from below.

Panelists/Speakers will provide a brief overview of their work and experiences and then engage in discussion by reflecting on the following questions:

- An anti-colonial planning framework requires considering current planning processes within a wider context of institutional planning rooted in exploitation and colonial dispossession (Angotti 2020). In what ways is planning still being complicit in the creation of colonial regimes and practices? What counter-stories and narratives have been erased from bottom-up planning and how might they be recuperated?
- While disasters exacerbate pre-existing conditions of injustice, they also shed light on previously less detected or emerging spaces of anti-colonial praxis. With increasing numbers of disasters due to climate change and social inequalities, how and to what extent might these new realities become catalysts for transforming planning praxis?
- Decolonizing the future requires a combination of critical analysis and imagination. What steps need to be taken in planning to move out of what Fanon describes as "the colonial gaze"?

A PLACE FOR RURAL PLANNING

Abstract ID: 1438

Roundtable

HAMERLINCK, Jeffrey [University of Wyoming] jeff.hamerlinck@uwyo.edu, organizer, moderator

AYAMBIRE, Raphael [University of Waterloo] raayambi@uwaterloo.ca, participant

EPP, Sara [University of Guelph] sepp@uoguelph.ca, participant

FRANK, Kathryn [University of Florida] kifrank@ufl.edu, participant

VOS, Jaap [University of Idaho] jvos@uidaho.edu, participant

This round table session is focused on the cross-cutting topic of "rural planning" as a sub-field of the urban and regional planning discipline and professional field of practice. Rural planning may be described as "the process of planning for rural areas, with a focus on rural issues and from a rural perspective" (Caldwell 2012, p. xvi). While a rural planning tradition has existed for decades in many other parts of the world, rural planning theory, education and practice have evolved much more slowly in North America. Fifty years ago, many governing bodies and planning professionals in the United States and Canada assumed that rural planning practice could easily be derived from standardized urban or regional planning approaches. That viewpoint has slowly changed with rural planning now generally acknowledged as a distinct interdisciplinary field of study and practice emphasizing holistic approaches to understand, value, and support rural places and their residents (Frank and Reiss, 2014). Despite this evolution, contemporary planning continues to have an urban bias that fails to recognize the influence of a unique rural planning culture on planning practice outcomes, nor the linkages and interactions that exist between urban and rural places with regard to wide range of universally critical planning issues (Daniels and Lapping 1996; Hibbard and Frank 2021; Markey et al. 2022). "The urban bias..., while not openly hostile to rural areas, constrains rural planning to urban interests and ways of planning, and one-dimensional views of rural areas" (Hibbard and Frank 2021, p. 8).

In this session, planning scholars from the United States and Canada - building on a similarly themed round table event at the 2014 ACSP Annual Conference - will share their current perspectives on the importance of rural planning, its unique settings and methods, and the need for greater inclusion of rural planning theory and techniques in contemporary planning education and practice. Topics to be addressed include the local and cross-boundary nature of rural social issues and community development challenges, multi-functional land use transition, the culture of rural planning practice, and strategies to improve theory-supported rural planning implementation. An objective of the session is to promote a dialogue around elevating rural planning's presence within the ACSP, including consideration for establishment of an ACSP Rural Planning Working Group and the organization of a rural planning pre-conference symposium at the ACSP 2023 Annual Conference.

From the climate emergency to continued racial injustice to the fracturing of core social institutions to geopolitical tensions and outright wars to a still disruptive pandemic...We are living through tumultuous days. What is the planner to do in the face of despair? How do we live, love, work, teach, theorize when it seems our core values are chronically under threat, our home institutions lack basic resources, and every tidbit of good news is overshadowed by catastrophe? Climate and social justice activists have been increasingly and actively countering dire news with upbeat, anti-doomer messages: there is still so much to save. Is there a lesson here for planners?

This panel dives deep into our collective selves and our collective futures as planning researchers. We have all been trained to identify and interrogate problems—but in our focus on isolating “the problem” do we know how to identify what is good, without reducing, extracting, or ruining it? In the hardest moments, when the problems are so massive, and in societies still hung up about efficiency, metrics, and profits, how do we shift our attention towards the radical abundance and joy of our worlds? Could planning manifest social change by being more fun?

Thinking of bell hooks (2021), who passed away earlier this year, what would it mean for planning--our praxis, the interconnections of work, life, teaching, theoretical engagements --to embrace love, care, and mutuality?

As planning researchers, our role is to ask questions. Hopefully good questions. And then spend sometimes an inordinate time trying to answer those questions. So, this session is an interrogation and commentary - we hope a suitably fun and irreverent one - on planning research and practice, on academia, on the conflicts between our desires and the interventions that drive what remains largely efficiency and profit driven urban development. Like the praxes we embody, the session will be porous. The panelists will each frame and ask a question, to each other and to the audience, to be followed a few minutes of dedicated time for audience members to speak to each other, and then a facilitated conversation among everyone in the room.

ACSP-AESOP SESSION: THEORISING THE FUTURE OF THE 'PROFESSIONAL' PLANNER

Abstract ID: 1807

Roundtable

MAIDMENT, Christopher [University of Reading] c.s.maidment@henley.reading.ac.uk, organizer, moderator
KAZA, Nikhil [University of North Carolina at Chapel Hill] nkaza@unc.edu, participant
CHETTIPARAMB, Angeliq [University of Reading] a.chettiparamb@henley.reading.ac.uk, participant

Proposal for joint ACSP-AESOP special session within the Scholarship on Planning History or Planning Theory track. To be presented at the ACSP 2022 Conference in Toronto and the AESOP 2023 Congress in Lodz.

The aim of this session is to bring together transatlantic perspectives that explicitly focus on the future role of the planner, with a particular focus on how emerging practical and theoretical insights frame the normative role of the planner.

As an academic discipline, planning is thriving, energised by the exploration of new theoretical insights, drawing on, for example, complexity and the post-political, and the urgency of addressing social and environmental crises. Elsewhere, scholarship on the relationship between communities and planning continues to develop, as does work on what planners do in their day-to-day practice.

However, the identity of the profession is at a crossroads. Especially in a neoliberal political paradigm, shaping the context for planning on both sides of the Atlantic to a greater or lesser degree, there has been a move away from thinking of planning as a state led activity, characterised by technocratic and communicative methods. In reality, much of planning is done in conjunction with, or in opposition to the state by private interests. In such a worldview, the role of the planner is much broader and more varied than the conventional understanding of planning as regulation. Planners shop for venues, set agendas, frame issues, participate strategically, influence collective action, champion solutions and lobby for particular regulatory regimes and specific investments. Such roles of planners are under-explored and under-theorised in the literature.

Papers for this special session are encouraged to draw on the diversity of transatlantic experiences, to pinpoint the future role of the planner within a rapidly changing environmental, social and economic context, whether that role is normative or non-existent.

In particular, we are interested in the following questions

- What normative role should the planner play in the post-political context?
- What is the 'expertise' of the planner?
- Should the planner claim more of a leadership role?
- What can we learn from role models in planning about the profession's normative future?

PLANNING, SCHOOL SEGREGATION, AND THE NEIGHBORHOOD UNIT THEORY: THE CASE OF MONTGOMERY, ALABAMA

Abstract ID: 1007

Individual Paper Submission

RETZLAFF, Rebecca [Auburn University] rcr0001@auburn.edu, presenting author

Research Question: How was neighborhood planning used by planners in Montgomery, Alabama to keep schools segregated in the post-Brown v. Board of Education Era?

Background: Clarence Perry developed the neighborhood unit theory in 1929, providing guidelines on how to design a neighborhood, centered on a small school. Perry's ideas gained popularity among social reformers of the 1920s and was used as the basis for the Garden Cities movement. In 1957 planners in Montgomery used the neighborhood unit theory as the basis for planning. Each neighborhood would contain 5,000 people, a school, a playground, public buildings, and shopping. The city also used the neighborhood unit theory in its 1963 plan. In both plans, neighborhoods were also segregated by race.

Approach and Methodology: The method used in this research is archival data analysis of plans in Montgomery and an analysis of school segregation legal cases.

Findings: The research finds a connection between neighborhood planning and school segregation in Montgomery. Planners used the neighborhood unit approach to avoid desegregating schools. In school desegregation court cases, including Carr v. Montgomery, attorneys argued that school segregation was due to personal preferences of people to live near their own race.

Relevance and Implications: The relevance of this research is new insight about the relationship between school segregation and planning in the South during the civil rights era. The research has implications for current planning practice because many schools in Alabama are still segregated.

MASTER-PLANNING NAIROBI? PRETENTION AND PLANNED DEPENDENCY FOR AN ERSTWHILE COLONIAL CAPITAL

Abstract ID: 1010

Individual Paper Submission

NORGAARD, Stefan [Columbia University] spn2121@columbia.edu, presenting author
SCLAR, Elliott [Columbia University] eds2@columbia.edu, co-author

This presentation considers the ruptures and afterlives of top-down midcentury colonial master-planning through a case-study investigation. Nairobi: Master Plan for a Colonial Capital (White et al., 1948) captures the zeitgeist of midcentury-modernist, settler-colonial urban-planning aspiration achieved through what Brooks (2002) calls "centralized rationality." In this research inquiry, we ask: what were the aims and ambitions of the 1948 Plan in Nairobi on its own terms, and how did the planners envision urbanization processes in Nairobi when writing it? What effects has the plan had on form and usage of space in Nairobi? Drawing on a close archival reading of the Plan and its premises alongside a critical reading of relevant urban planning history and theory literature, we find that the Plan

represents an ambitious attempt to order and manage city space while controlling diverse populations. Written by three white South Africans who visited Nairobi only briefly, the Plan promotes proto-apartheid-esque racial separation for colonial Kenya, imbued aesthetically with Garden City and City Beautiful planning principles ill-fit for this context. That the Plan's totalizing vision largely misrepresents the city's political economy and ignores growing decolonization movements and entire population groups reflects the misplaced hubris of planners and British colonial elites (Mitchell, 1988), and reveals midcentury planning as complicit in aspirational processes of racialized empire-building (Chattopadhyay, 2012). Although never implemented, the Plan affected urban development in Nairobi considerably. By studying it, we can further understand how Nairobi was envisioned as a colonial 'outpost,' linking geographies of command-and-control surplus accumulation with hinterland extraction. We also gain a window into late-colonial British imagination in 1948, a moment following victory in World War II yet preceding decolonization movements in Kenya and worldwide. The Nairobi Plan reveals colonial capitalist urbanization's imagined role in producing uneven development, with land-use and master-planning serving as key technologies of governmentality. We conclude by considering contemporary planning in Nairobi, including the Nairobi Metropolitan Region (NMR) 2030 planning competition (Myers, 2015). Contemporary efforts seek to defy these colonial legacies yet remain caught within familiar imaginaries and world systems. Through the case of Nairobi's 1948 Plan, this research helps planning scholars and practitioners understand the ways in which planning has been, and can be, used as a tool for colonial domination and as a technology to encode racialized difference. The work calls for planning practices that are at once more locally situated and in tune with grassroots struggles and vernacular uses of space.

WHAT IS THE MEANING OF EQUITY: AN ANALYSIS OF COMPREHENSIVE PLANS

Abstract ID: 1069

Individual Paper Submission

OGUSKY, Adam [University of Texas at Austin] adam.ogusky@gmail.com, presenting author

Interest in equity in planning scholarship, education, and practice is on a sustained rise. While this trend is reflected in scholarly literature and course syllabi, the manner and extent to which equity is shaping actual planning practice remains poorly understood. Are we planning for equity in contemporary practice? How well and to what extent? What definitions of equity are guiding planning practice, if any? How do planners and communities imagine more equitable cities? In order to begin answering these questions, this research project looks to perhaps the most recognizable product of planning practice: the comprehensive plan. These documents—still central to the planning profession—provide a reasonable proxy for the state of planning practice as well as a window into the profession's overall goals and orientation.

This research is part of a larger project investigating both the quality of comprehensive plans' treatment of equity, as well as the meanings of equity at work in contemporary planning, and their relationship to and dependence upon theories of justice coming from moral and political philosophy.

This paper will focus on the meanings of equity at work in planning discourse as found in contemporary comprehensive plans. Equity in planning remains a deeply fuzzy term, and this research will use theories of justice as a way to make sense of and typologize the meanings of this term found in planning documents. Such theories help to ask how planning documents define (and don't define) both what is being equalized and for whom in the words of the plans. The plan content analysis carried out for this research will also indicate how clearly or vaguely plans are defining equity, how consistent these definitions are, and the extent to which the interventions called for lean towards system change or system maintenance. The ultimate goal of this research is to offer planners both a language and set of concepts to use when thinking about and advocating for approaches to equity, and some reflection on, not just how such approaches differ but also which may be better suited to a planning context.

THE REDEVELOPMENT OF THE NOVA SCOTIA HOME FOR COLORED CHILDREN: A CASE FOR TRAUMA INFORMED URBAN PLANNING PRACTICES

Abstract ID: 1109

Individual Paper Submission

BERGLUND, Lisa [Dalhousie University] lisa.berglund@dal.ca, presenting author

KITSON, Alexandra [Dalhousie University] al405220@dal.ca, co-author

The field of urban planning and its scholarship, while raising awareness of harmful development practices for marginalized groups, has not directly engaged in alternative, trauma-informed planning processes at the municipal level. Trauma is defined as, “Experiences that produce intense emotional pain, fear, or distress, often resulting in long- term physiological and psychosocial consequences” (Bowen & Murshid, 2016, p. 223). Planning scholars have long acknowledged that planning practices that have led to racial segregation, dispossession, and concentrated poverty and that these patterns have contributed to the exposure to trauma for socially and economically marginalized groups (Fullilove 2009). The development of trauma informed professional practice has been a focus of the fields of social work and law, that have a scholarly tradition of acknowledging trauma and providing frameworks for carrying out trauma informed practice. Trauma informed practices promote “emotional health...through empowerment, radical acceptance, creation of safe spaces, advocacy, relationship building, mind/body practices and experiential learning” (Reese, 2020, 2) based on the premise that trauma “alter[s] social networks and reduc[es] community capacity to collectively identify and address its problems and plan for its future” (Weinstein, 2019, 7). Although planning scholars have proposed models like therapeutic planning that may speak to some of the main goals of trauma informed practice (Sandercock and Attili 2014), they are yet undeveloped when it comes to an understanding of how to formalize such approaches within professional practice.

Using the case study of the redevelopment of the Nova Scotia Home for Colored Children in Halifax, Nova Scotia, the site of institutional abuse of African Nova Scotian children that is currently undergoing redevelopment, this paper aims to answer the following: 1) What principles of trauma-informed care are currently being used in this case?, 2) What aspects of the development process are inconsistent with trauma-informed principles? and 3) In what ways can planning practitioners begin to embed trauma-informed ethics into their formal processes? We conducted a content analysis of interviews with project stakeholders (including planners, developers and advocacy organizations), and relevant documents (including development proposals, public meeting minutes, and the provincial Restorative Inquiry into the abuses at the Home). Our analysis showed that a main barrier to carrying out trauma informed practices was a lack of flexibility in formal planning processes and a lack of validation of survivor experiences that were complex and diverse; these tendencies place survivors at risk of further traumatization. In spite of these harmful aspects of formalized processes, planners managed to take their own steps to making processes more trauma informed on their own accord, by developing partnerships with African Nova Scotian advocacy groups, and by incorporating survivor testimony beyond what was required, though on an ad hoc basis. Based on our analysis we make several recommendations for how planners might codify trauma informed practices into formal processes. These include formalizing the involvement of African Nova Scotian advocacy groups, supportive diverse forms of non-hierarchical engagement, self-reflection on the field of planning’s relationship to community trauma, and acknowledging the physical sites of trauma in ways that are respectful of survivor wishes and experiences.

DIGITAL INSURGENCY: DATA PRODUCTION FROM THE GRASSROOTS AS A DECOLONIAL PRACTICE

Abstract ID: 1137

Individual Paper Submission

SUCUPIRA FURTADO, Lara [University of Fortaleza] larasfur@gmail.com, presenting author

DE TOLEDO BASILE, Patricia [Indiana University Bloomington] pdetoled@iu.edu, co-author

COUTINHO-SILVA, Rachel [Pontifical Catholic University of Rio de Janeiro] rachelcms@puc-rio.br, co-author

Frequently, the processes of creation of technical/expert knowledge excludes certain groups of people and perpetuates structures of power, knowledge, and invisibility (Furtado & Renski, 2020). In such a top-down system, information strategically perpetuates colonizing patterns of privilege that suppress subaltern voices. In many ways, digital technologies have been incorporated into contemporary planning as a colonial tool to enforce a neoliberal logic of knowledge and urban development that ties the concept of "smart" or "digital" to economic profit (Caragliu et al., 2013).

As a reaction to that reality, social movements develop decolonial strategies that recognize and undo the hierarchical structures of race, gender, heteropatriarchy, and class that control knowledge, practice, and other structures that are constitutive of global capitalism and Western modernity (Walsh & Mignolo, 2018). This paper presents a framework for digital insurgency through empirical analysis showing how bottom-up processes of data creation can empower disenfranchised citizens to voice their needs in technical and scientific ways.

Through a case study analysis of three examples from the cities of São Paulo, Rio de Janeiro, and Fortaleza in Brazil, we present how social movements meet actionable criteria for digital insurgency. We qualify the initiatives presented here based on three inherent features of insurgency presented by Huq (2020):

- Is the initiative grounded in political society?
- Does the initiative rely on the agency of marginalized social groups?
- Does the initiative have a practical aspect?

We also add our own features to incorporate digital and decolonial concepts:

- Does the initiative apply technological platforms as a source or tool to create or share knowledge (such as podcasts, apps, blogs, social media, maps, etc)?
- Does the initiative create counter-hegemonic narratives?

The Covid-19 in Favelas Unified Dashboard in Rio de Janeiro is a virtual collaborative mapping initiative that produces reports and statistics and helps slums dwellers cope with information invisibility in the context of the pandemic. The Community-led census Um Olhar Sobre o Poço in Fortaleza was developed to account for the real number of homes, and dwellers in an informal community to withstand eviction and use that place-based knowledge to better understand their reality and collective identity. The UNAS Heliópolis organization in São Paulo collected and mapped data about COVID-19 cases and the impacts of the pandemic in their communities, disseminating it through social media accounts while putting forward policy proposals to address such impacts.

In short, digitally insurgent planning uses technology to produce bottom-up knowledge that represents "the other" and applies it to claim urban rights. These digital narratives and products are connected to a larger political and decolonial strategy that is based on action.

The digital scenario allows us to look at the appropriation of a different kind of [virtual] space where we can still

identify decolonial practices that question the legitimacy of the dominant narrative portrayed by a neoliberal State (Walsh & Mignolo, 2018) and insurgent practices that contest who has access to the urban realm (Miraftab, 2009). The conceptual framework helps explain how grassroots production of knowledge can be nested within a larger framework of digital insurgency and decoloniality that incorporates a multiplicity of urban ecosystems to promote social and spatial justice through data creation and sharing.

VAN GINKEL ASSOCIATES: EXTENDED URBANIZATION AT THE CANADIAN CENTRE FOR ARCHITECTURE VGA FONDS

Abstract ID: 1145

Individual Paper Submission

ALTON, Christopher [University of Waterloo] calton@uwaterloo.ca, presenting author

This article advocates for a more complete historiography of planning in the settler-Canadian context where a territorial dialectic becomes the primary lens through which to understand planning history. This argument is unpacked by way of archival research at the Canadian Centre for Architecture. The Van Ginkel and Associates (VGA) fonds contain plans, correspondences, and artefacts from one of Canada's most prolific mid-century planning firms. VGA is most often associated with metropolitan interventions, from Expo '68 to residential masterplans and heritage planning. An investigation into the office as seen from the point of view of oil and gas, however, lends important insight into the complex materialities of modern Canada's preeminent office. A reading of VGA through oil and gas shows a firm engaged at multiple scales where the distances, sporadic settlement, and economic activity introduced by the extractive industries are problems to be solved through infrastructure and the development of a new "north". Leaving Montreal for Hudson Bay and the Mackenzie Valley connects the firm to projects that underscore a belief that Canada's vast geography could be conquered. By looking at their work in the context of petro-flows, this article explores the financing and professional networks that emerge, and reveals through internal documents the material and metabolic knowledges that travel between country and city.

One of VGA's largest consultancy projects was in service of a consortium of oil and gas companies – Arctic Gas Pipeline Ltd, Gulf Oil Imperial Oil, and Shell Canada Ltd – during the political build-up of the McKenzie Valley Pipeline. Their report, "Impact of Development in McKenzie Region" measures the pipeline against obstacles for development. This document is critiqued in the context of associated VGA design projects. In 1971, Northern Airlift sought to first diagram and then implement a new company town model for mining sites in the north, under the axiom "Don't build towns but do transport." Since, Suncor and Syncrude have built airstrips into their site plans, adjacent to the mines themselves. VGA's 1963 Hudson Bay Project is a speculative planning scheme that would see Manitoba as the centre of a new Canadian economy. Transportation and energy corridors would emanate from Churchill to Denver and Rotterdam.

Contending with this body of work demands regional and territorial lenses and a greater sense of design practice's connection to material flows and Indigenous dispossession. Important to this study will be how the office positioned itself inside these complexities. For instance, collection materials for a development in the Burrard Inlet contain one VGA folder simply titled "Indian Problem". A return to the metropolis in the context of VGA's more explicitly extractive consultancies provides then an alternate historiography of the "Man and his world" exposition as one where modernism, metabolism, and settler-colonialism can be more fully articulated within Canadian planning discourse.

"Methodological cityism", is a term used to critique Urban Political Ecology scholarship that demonstrates "an overwhelming analytical and empirical focus on the traditional city to the exclusion of other aspects of contemporary urbanization processes" (Angelo and Wachsmuth, 2015, 16). In order to develop their concept, Angelo and Wachsmuth adopted a Lefebvrian framework in order to "trouble traditional distinctions between urban/rural and society/nature by exploring urbanization as a global process" (Angelo and Wachsmuth, 2015, 16). Canadian professional planning has served to essentialize these dualisms, demonstrated by weighing VGA's public facing projects against their private consultancies. Positioned alongside anti-colonial and anti-extractivist texts, a Lefebvrian

framing opens inquiry across colonial jurisdictions and morphologies, and offers a conceptual window for imagining radically new planning relations and the opportunity to trouble a dominant narrative about professional practice's relation to conditions of "extended" urbanization.

LESSONS FROM THE FEMINIST LENS OF SOCIAL REPRODUCTION THEORY FOR RECONFIGURING PLANNING THEORY AND PRACTICE

Abstract ID: 1176

Individual Paper Submission

ASHTARI, Atyeh [University of Illinois at Urbana Champaign] ashtari2@illinois.edu, presenting author
MIRAFTAB, Faranak [University of Illinois at Urbana-Champaign] faranak@illinois.edu, co-author
HUQ, Efadul [Smith College] ehq@smith.edu, co-author

Looking through the long and contentious history of planning theory, one can see the transformation in the terminology, scope and roles of planning in relation to equity in Global North to address the wicked problems of achieving a just city (Reece 2018). Furthermore, we witness a gradual move from looking for solutions inside to seeking solutions and alternatives outside of the current racial-patriarchal-capitalist structure. In fact, contemporary equity planning theories which originated in the global north, stemmed from Marxist and feminist traditions. Here, we argue that using the feminist theoretical lens of social reproduction could help us in furthering the goals of contemporary equity planning and addressing its contradictions by centering "life-making" and care in planning discourse (Arruzza et al 2019). Briefly speaking, social reproduction is the daily and long-term process of reproducing the means of production and it is the labor power and the social relations that keeps them running and holds them in place (Katz 2017). Social Reproduction Theory (SRT) erases the boundaries between production and reproduction spheres and advocates "an epistemological, ontological, and deeply political way of engaging the world around us" (Winders & Smith, 2019). The studies concerning SRT have usually been somewhat referred to and dismissed as belonging to gender studies and is not usually a part of the active and wide-spread conversations in other academic realms. This has resulted in the limited number of theoretical and empirical research using SRT outside of the feminist community. Promoting more critical engagement between the feminist lens of SRT and planning theory has the potential to transform planning practices in relation to equity.

This much needed intervention is particularly timely and urgent as with the endurance of the current COVID-19 crisis, we are witnessing a resurgence of discussions around equity and redistribution. It's important to mark the moment as COVID-19 has made a few aspects highly visible: a)the essential role of care work and life-making work to the survival of the society, b)the contradictions embedded within the capitalist system which prioritizes profit-making over life-making, c)the potential capacity of the state to use its resources to address and ameliorate the crisis of care if they prioritize life-making, and d)the alternatives imagined by the people through networks of care and mobilizations, such as strikes, mutual aids, food banks, etc. The question is how we use this momentum to work toward possible alternatives and to reconfigure planning practice and theory? We acknowledge the fact that the current dynamics in the global north has been long studied by the global south scholars; who have been using different lenses to make visible the ways the global south population compensate for the shortcomings of their states; where they have not had the option to look to the state for solutions to their life-making struggles. Although, there have been similar struggles for the marginalized people in US, for the first time in recent history, these dynamics are ever more visible. Here, we make an argument to use the insights and strategies from the literature on SRT in order to move towards a kind of planning that centers care and life-making and promotes "planning of care" (Jon 2020). We believe that social reproduction theory as a feminist lens has the ability to promote deep listening, seeing and caring in planning by 1)locating the crises of care at different scales and scope, 2)showing how this crisis is aggravated along the discriminatory lines of gender, race, class, nationality etc., 3)highlighting strategies used by people to demand/address their life-making needs, 4)helping planners frame demands and issues by mobilizing and centering life-making in discourses around planning and construction of policies.

COLONIZING CLIMATES: THE AFRICAN DIASPORA, URBAN PLANNING, AND CLIMATE CHANGE

Abstract ID: 1189

Individual Paper Submission

JACOBS, Fayola [University of Minnesota] fayolaj@umn.edu, presenting author

Each hurricane season, images circle each news cycle of Black people in decimated landscapes across the Caribbean and the US South. This was particularly evident when international attention turned to New Orleans especially, but also greater Louisiana and Mississippi, in the wake of 2005's Hurricane Katrina, to Puerto Rico (at to a lesser extent St. Croix and Dominica) after 2017's Hurricane Maria, and to The Bahamas following Hurricane Dorian. Despite the similarity of images circulated each time, conversations about these three disasters tended only connect them through the lens of climate change, which has been – and is expected to continue – increasing the frequency and intensity of tropical cyclones. Even within the hazard and disaster research field, conversations about these disasters are confined to regional and national borders. Yet we clearly see that African diasporic communities are amongst some of the most vulnerable to the impacts of climate change. Anti-Blackness is a thread that permeates processes of colonization, enslavement, and imperialism throughout the diaspora. Research has argued that these processes are some of the driving forces of climate change and its uneven global impacts. Yet, there are very few conversations about connections between global Black communities and their experiences of environmental disasters, sea level rise, and other climate change impacts. This paper offers suggestions for filling that gap by presenting a theoretical framework for understanding the relationships between global Black communities, anti-Blackness, urban planning, and climate change.

I begin by situating the US South and the Caribbean as Black places, discussing the possibilities that the Black diaspora, as a concept and process, offers us. I move to a brief discussion of European, particularly British, colonization, situating it as a set of macro-urban planning projects, underpinned by global anti-Blackness. Then, I turn to a discussion of climate change's disproportionate impacts on global Black communities, arguing, as have other scholars, that is a fundamental driver of climate change, one that overburdens Black communities in the Caribbean and the southern United States, rendering them vulnerable to climate change impacts. I highlight the limitations in the field of environmental planning, mainly its focus on technocratic solutions to climate change. Finally, I turn to the work of two organizations, one in the Caribbean, one in the US South, that are working on building more just environmental futures for their respective regions. I argue that the work of building these more just environmental planning futures in the US South, the Caribbean, and other places in the African diaspora, can be strengthened by understanding and articulating the connections between global Black communities.

THE SPACE AND TIME FOR PLANNING: A MERGE OF PARADIGMS?

Abstract ID: 1231

Individual Paper Submission

LOPEZ-HUERTAS, Joaquín [University of Utah] joaquin.lopezhuertas@utah.edu, presenting author

Conflicts inside of the planning profession have unveiled a crisis of paradigms (Friedmann, 1989). Despite many efforts of planning theorists to find the next direction, there is still no promising solution. Meanwhile, planning is being taught and practiced in many schools worldwide. In most of them, failing rational and comprehensive planning is the leading concern (Alexander, 1984). In contrast, others focus on a theoretical analysis of the possibilities of diverse new planning methods without choosing a specific one. Scholars perceive that planning must improve with a new paradigm that approaches a better decision-making process (e.g., inclusive or equal) (Healey, 1996). Still, in this pursuit, beliefs and values of previous paradigms tend to be eliminated and the process starts from the beginning again (Alexander, 1984). Maybe the problem is not finding a new paradigm, but perhaps it is finding a separate way to perceive planning from other domains beyond westernized methods (Rahder & Milgrom, 2004). One direction may be the combination of knowledge gathered during several decades of theorists, but this would represent an endless and confusing endeavor. A different approach may be to learn from indigenous and ancestral lessons and understand how that knowledge has persisted until present day (Matunga, 2013). From this perspective, combining present and ancestral knowledge means considering two main scales of planning from a holistic perspective: space and time.

I argue that expanding planning scales would unbind their limitations and provide a re-accommodation of paradigms through an organic and interweaved process. Although this approach does not seem feasible in light of the political rationality that demarcates boundaries in planning, it can be an alternative to recovering its core function. In this document, I explore how to escalate the dimensions of planning in space and time, considering the political barriers from an Indigenous knowledge overview. To answer this question, I divide this document into four sections. In the first section, I describe the limitations of space in planning divided into four dimensions: environmental, economic, social, and political. The second part presents the scale of time and the repercussions of the efficiency trend with bounded rationality. The third section introduces indigenous planning components based on a complex network of worldviews, values, principles, and strategies that advocate for a resilient, coexisting, and inclusive process. The last section examines the relevance of perceiving planning from different eyes by comparing indigenous and non-indigenous views and finding a common ground. In the quest for the most suitable paradigm, theorists with a westernized standpoint reinvent knowledge and neglect previous experiences that could contribute to an improved theory. In the case of indigenous and ancestral views, knowledge changes differently: it does not deny historical experiences but is considered learning that leads to growth. From this view, Indigenous and ancestral planning theory results from a cluster of wisdom gathered over many generations. If conventional planning theory considers this conceptualization of growth through experiences and values instead of reinventing new paradigms, it is possible to improve the planning's direction.

THE SHRINKING CITY IN HISTORICAL PERSPECTIVE: POPULATION AND HOUSEHOLD LOSS IN METRO DETROIT, 1900-2020

Abstract ID: 1273

Individual Paper Submission

COOPER-MCCANN, Patrick [Wayne State University] cooper@wayne.edu, presenting author

Planning research on shrinking cities aims to provide guidance to officials and activists striving to improve quality of life in places experiencing persistent population loss. However, few studies of shrinkage in the United States capture the full history and geography of the phenomenon. For reasons both practical and ideological, researchers often limit the analysis to large cities, or the principal cities in each metropolitan area, using census data that starts in 1970 or later (Ganning and Tighe 2021). However, many cities peaked in population earlier (Beauregard 2009). Furthermore, studies that use lower population thresholds find that many inner-ring suburbs are also losing population (Lee and Leigh 2007; Ribant and Chen 2020; Sarzynski and Vicino 2019). Some shrinking suburbs are grappling with rising poverty rates, physical deterioration, and fiscal distress—the same challenges faced by shrinking central cities (Anacker 2015; Hanlon 2010; Kneebone and Berube 2013; Lucy and Phillips 2000; Orfield 2002).

This paper historicizes the “shrinking city” and puts it in regional context. First I review the literature on metropolitan structure for theoretical insight into the location and causes of shrinkage in the United States Rust Belt over the past century. Then I demonstrate a method for analyzing the history and geography of shrinkage in particular metropolitan areas through a case study of shrinkage in Metro Detroit from 1900 to 2020. I ask: Which parts of the metropolitan area have experienced population and household loss, for how long, and how severely? Using maps and descriptive statistics, I analyze shrinkage within census tracts, county subdivisions, and counties. I hold boundaries constant in order to observe change within the same areas across time, measuring the endurance and severity of shrinkage from the year of its onset (if ever) to 2020. This analysis reveals a continuous pattern of shrinkage since the 1910s, starting in Detroit’s oldest, most industrialized, and overcrowded neighborhoods and spreading by 1930 to encompass high-density industrial suburbs like Hamtramck and Highland Park as well. Since then, the geographic extent of shrinkage has expanded nearly every decade, with all of Metro Detroit’s inner-ring suburbs peaking in population by the year 2000. Shrinkage, therefore, is a century-long trend in the region, and it has never been limited to the central city alone.

Yet while nearly every neighborhood in Detroit and its inner-ring suburbs has experienced multiple decades of population loss, shrinkage is not always severe. In many areas, population loss is primarily driven by the trend of decreasing household size. As a result of this trend, if a neighborhood ceases to add households, its population falls. This requires local governments to right-size services and infrastructure that are scaled to population, such as schools. Some suburbs appear to have adapted successfully, retaining their middle-class status despite gradual population loss. Shrinkage is most severe in neighborhoods with a long industrial history, especially those that are now impoverished and majority Black. In these neighborhoods, which are found in the central city as well as some suburbs, such as Highland Park and River Rouge, population loss from declining household size has been compounded by a loss of demand for housing, which lowers property values and results in housing vacancy and property abandonment. Mitigating further shrinkage in these neighborhoods would require confronting the structural forces that contribute to their stigmatization.

PERIODISING PLANNING HISTORY IN METROPOLITAN REGIONS: AN HISTORICAL-DISCURSIVE-INSTITUTIONALIST APPROACH

Abstract ID: 1316

Individual Paper Submission

GALLAND, Daniel [Aalborg University] dgalland@plan.aau.dk, presenting author
STEAD, Dominic [Aalto University] dominic.stead@aalto.fi, co-author

Comparative historical accounts of the planning and governance of metropolitan development have either tended to focus on broad macro-economic trends or on micro-level changes. In the former, the governance of metropolitan regions is typically studied in the context of globalisation and neoliberalisation processes. In the latter, analyses

typically seek to identify differentiation across a range of case studies. These macro- and micro-level approaches occupy opposite ends of a research spectrum—the former seeking simplification through theoretical generalisation, and the latter underscoring distinctiveness through attention to specific contextual factors. More recently, meso-level approaches have been proposed as a middle ground between macro-level and micro-level analyses. Meso-level perspectives emphasise ‘generalised aspects of concrete empirical realities’, drawing attention to comprehensive, historically informed accounts of distinctive planning phases rooted in heuristic models and periodisation. In these meso-level approaches, heuristics serve as meta-theoretical frameworks for analysing how different categories—and especially the interconnection amongst them—shape the dynamics of spatial development phenomena

Comprehensive meso-level analyses need to account for the conjunctural implications emerging from the interlinkages between thematic categories as they unfold over different time horizons. Here, strategic-relational periodisation comprises a significant means through which change and continuity can be identified and interpreted (Jessop, 2001, 2004). A periodisation focuses on classifying actions, events, and periods into stages in accordance with their conjunctural repercussions (Jessop 2004). The systematic identification of ‘sequential periods of relative continuity and relative discontinuity’ thus contributes to the development of a deeper understanding of change and continuity in metropolitan planning history. Through periodised planning history, international comparative studies can thereby detail the similarities and differences ‘between a global disciplinary history and a geographically and culturally delimited planning system with its distinct historic paths’ (Suitner 2020).

To periodise metropolitan planning history from a comparative perspective, the paper employs the thematic-temporal-phronetic (TtP) heuristic—a meso-level approach developed by Galland & Harrison (2020) for analysing how metropolitan change and continuity unfold within historical eras of capitalist development. The TtP heuristic draws attention to how different thematic (T) categories play out within temporally (t) defined eras, focusing on what is happening, where it is happening, who is involved, how and why. Through phronesis (P), the heuristic then seeks to unveil what is at stake—who stands to gain and lose—whilst reflecting on how relations of power and values are being challenged. Since heuristics demand continual conceptualisation to usefully examine the ‘dynamism of the concrete social world’ (Paasi 2008), emphasis is placed on conceptualising a theoretical content for the dimensions and categories associated with the TtP heuristic applied to the metropolitan context as follows.

First, the thematic dimension builds on concepts from historical institutionalism (Sorensen 2015) and discursive institutionalism (Schmidt 2011), which emphasise the relational character of complex social formations—and the driving forces enabling them to mature or mutate over time—thus aptly facilitating the periodisation of metropolitan change and continuity. The temporal dimension is elaborated by systematically periodising ad hoc historical eras of metropolitan development—employing a bottom-up approach—rather than adhering to generalised eras of capitalist development. This approach offers a more specific and less predefined way of studying the situated dynamics of metropolitan change and continuity, since emphasis is placed on periods of relative continuity and discontinuity and the discursive formations enabled or constrained by the structural, material conditions and policy dilemmas of the time (Davoudi et al 2020). Finally, the phronetic dimension is developed to assess the implications of metropolitan change and continuity by focusing on horizontal interactions (i.e., the interconnections between thematic categories across systematically periodised eras). These interlinkages allow for a more comprehensive and nuanced reading of the complex dynamics brought about by the metropolitan planning-development dialectic and their implications.

THE EVOLVING LANDSCAPE OF EQUITY PLANNING: OPPORTUNITIES FOR INTERVENTION AND CHANGE

Abstract ID: 1318

Individual Paper Submission

GOUGH, Meghan [Virginia Commonwealth University] mzgough@vcu.edu, presenting author

The field of planning has always concerned issues of public health, safety and welfare, and since the late 1960s, equity has also been a key part of its mandate. This paper will consider the institutional and scholarly history of equity planning in the last half century, building on the work of scholars who have examined how and when social movement demands of the 1960s and 1970s were metabolized by planners (Thomas 2019), and the changing relevance of early equity planning concepts in a shifting contemporary context (Lung-Amam et al. 2015). We draw on institutional histories of mainstream planning professional and educational institutions, the histories of equity-oriented splinter groups and sub-fields (Thalbit 1999), and scholarship bridging planning theory, practice and education. We examine the changing relationships between planning institutions and the broader context of social movements, world events, and economic history since 1980.

From this base, we use methods of power and network mapping (Noy 2008), and institutional periodization (Thomas, 2019) for two aims. First, we retroactively characterize and assess the historical trajectories and expanding scope of equity planning since the early 1980s. We look back at the changes in the ways planners have understood what equity planning is, and also trace the shifting institutional systems that lead up to the field's current modes of professional recognition in planning education, and practice. Second, we point to key opportunities for intervention for planners in various spheres of educational, professional, informal and extra-institutional modes of planning. We use this information to work toward a theory of change (Anderson 2018), highlighting opportunities for actors in a range of positions inside and outside traditional planning structures to multiply and extend the field's commitments to and actions toward equity, justice, and social transformation.

HISTORICAL DEVELOPMENT OF GLOBAL URBAN STUDIES AND PLANNING RESEARCH LANDSCAPE FROM 1991 TO 2020

Abstract ID: 1326

Individual Paper Submission

HO, Sam K.S. [The University of Hong Kong] samhks@connect.hku.hk, presenting author
YANG, Tianren [The University of Hong Kong] tianren.yang@hotmail.com, co-author

The global impact of the COVID-19 pandemic, the rapid development of cutting-edge technologies in light of the big data era, and the call for sustainable urban development and conservation are the global urban issues in which new theoretical and practical foundations need to be identified. This is because the real-world research and practice regimes differ from time to time and are subject to contextual diversity. By summarising the developments and patterns in published academic research, a bibliometric analysis could be used to reveal numerous global trends and history for interdisciplinary and multidisciplinary research, and to provide supplementary yet insightful perspectives on research frontiers (Chen, 2006; Liu, Hong and Liu, 2012). In particular, Fang and Ewing (2020) and Sanchez (2020) are pioneers who applied bibliometrics in reviewing the historical development of planning theory and research. Under the US context, the former adopts it to categorise the knowledge domain of urban planning and monitor the overall research landscape of urban planning literature based on the citation profiles of the US urban scholars whereas the latter focuses on identifying prominent topics and research themes for scholarly priorities based on three top planning journals in the US (Fang and Ewing, 2020; Sanchez, 2020).

Building upon the foundation, this study aims to expand the scope to the global context by examining historical records of global urban studies and planning research to identify how the actual research trends and practices differ according to time and place. Using the Web of Science database, we performed a bibliometric analysis of urban

studies and planning research from 1991 to 2020 that was published in the top 30 journals in the field. Our analysis reveals the scientific outputs and prominent research themes by exploring the temporal trends in the titles and keywords of urban studies and planning research, which may be considered a potential guide for future research. China, housing, urban planning, urbanization, governance, sustainability and land use were the most frequently used terms. The US was the largest contributor to global urban studies and planning research as they produced the most independent papers, second in collaborative papers and possess an established environment that allows for collaboration between research institutes and professional practices. The US, the UK, and China were hotspots, with China's contributions increasing drastically in recent years, which confirms the significant position of Chinese urban research and reveals the country's keen interest in housing and sustainability issues in urban studies and planning research. The results were compared with the research themes summarised by various professional planning institutes around the globe, with commonalities and differences being found between the latest research themes in research and practices. This is the first study to quantify global research trends in the overall urban studies and planning research landscape. A comprehensive bibliometric analysis could not only identify the strong points and blind spots of urban studies and planning research but also lay down possible options for the way forward in the continued progression and enhancement of the research and practice knowledge domain (Derudder et al., 2019). Our study serves as an alternative means of identifying the trends in global urban studies and planning research, and it pinpoints the need for further alignment of research focuses between the academic, public and private sectors in order to strengthen the connection between theory and practice.

WALKING AS NOT A JUST GOOD THING: A CRITICAL EXAMINATION INTO THE PRODUCTION OF SPACE, MOBILITY, AND WHAT IT MEANS TO WALK

Abstract ID: 1348

Individual Paper Submission

LEGER, Samantha [University of Waterloo] sjleger@uwaterloo.ca, presenting author

Walkability and complete streets are growing fields of study and practice within urban planning, aimed to increase the desirability and comfort of alternative travel-modes to a car, namely walking and cycling. Although these movements are often framed as a reclamation of streets, the realized impacts on walking behaviour are lesser known (Zavestoki & Agyeman, 2014). There is a need within the planning sphere to critically engage with power and lived experiences of the street and walking to better imagine a just reclamation of the street. In response to this research gap, this work aims to critically assess how efforts to pedestrianize the street (such as walkability and complete streets initiatives) have impacted walking behaviour, and introduces ideas into how the street, and planning more broadly, can be conceptualized to achieve just futures.

To do so, this paper explores a critical history of the street to determine the interrelations between the production of space and mobility, focusing on the street as a produced space. Through a critical assessment of existing literature, the results illuminate that although the dominant mode (from pedestrians, to cyclists, and motorists) has shifted over time, the street has always prioritized the mobility of those with power. This paper traces the history of the street from the early conceptions of 'pedestrianizing' the street for promenading, to the rise of the car and autocentricity, to the modern reclamation of the street through walkability and complete street initiatives. Utilizing the theory of 'imagined mobile subject' (Jensen, 2011), it is argued that throughout each phase of history there has been an ideal image for whom the street has been planned. Even the supposed-transformative practices of walkability and complete streets are implicitly and explicitly affirming unjust power structures, particularly capitalism and neo-liberalism. The argument then turns to focus on how these practices can restrict the right to the city through a social control onto public space which excludes certain identities and bodies (Mitchell, 2003).

After critically interrogating the history of street, the paper further explores the right to the city and its implications on the street through the theory of mobility justice. The limits of the right to the city and more generally 'rights-talk' when discussing mobility is interpreted through the lens of mobility as an embodied practice (Sheller & Urry, 2006), theorizing that walkability is felt not only in one's surrounding built environment but also in one's body. Accordingly, this paper argues that it is through the capabilities approach that the embodied realities of mobility can be integrated into our understandings of the right to the city. As a relatively understudied conception of justice within the planning discipline (Basta, 2016), the capabilities approach offers a bridge for accounting for embodied realities within rights, which could provide a more fulsome response to the unjust power structures that have been historically entrenched, and still remain, within our conception of the street. From the planning perspective, this work is a timely discussion of issues within transportation planning as complete streets and walkability continue to grow in popularity to foster 'liveable cities' (Zavestoki & Agyeman, 2014), without critically engaging with systemic barriers built into our streets and mobility cultures. The paper concludes with recommendations to practicing planners on ways to reconceive the role of planners and planning tools in forming not just complete, but equitable and just streets. This focuses on a two-pronged approach which is first based upon recognizing the ways that power has played onto and within the practice of planning, and secondly critically engaging with the imagined mobile subject which has been entrenched within our plans and policies that imagine the futures of streets.

PLACE-BASED AND ADAPTIVE SUSTAINABILITY: A CASE STUDY OF REGIONAL WATER PLANNING IN TEXAS

Abstract ID: 1358

Individual Paper Submission

RICHTER, Steven [University of Texas at Austin] steven.richter@utexas.edu, presenting author
LIEBERKNECHT, Katherine [University of Texas at Austin] klieberknecht@utexas.edu, co-author

Sustainability is necessarily a flexible concept; however, sustainable planning continues to rely on general principles of “good city form” that are readily coopted by profit-seeking agents (Gunder 2006). Instead, a place-based and adaptive approach is required, as advocated for by the National Research Council's (1999) *Our Common Journey*. Despite the global or regional nature of threats (e.g. climate change), planning problems manifest locally, often in response to a unique set of interactions among a variety of systems (MacGillivray 2015). Moreover, “the pathways...cannot be charted fully in advance. Instead, they will have to be navigated adaptively at many scales and in many places” (NRC 1999, p.3). Place-based planning is receptive to the heterogeneity of local and regional context, processes, and drivers. An adaptive process acknowledges the path forward must be continually re-visited. How might such an approach look in practice?

To demonstrate these concepts, we present a case study of water planning in Texas. The state's rapid growth and proclivity to extreme weather make it a bellwether example for other regions adapting to a changing climate. Moreover, its contemporary water planning legislation is considered to be among the most adaptive and supportive of local and regional water planning in the United States (Dyckman 2016). A review of historic and planned water consumption examines all 25 metros across the state. Historic water use comes from the Texas Water Use Survey while the 2002, 2007, 2012, 2017 and 2022 State Water Plans (SWPs) detail expectations regarding future population growth, water supply, sectoral demand, and supply strategies for meeting future needs.

A review of historic municipal water consumption shows remarkable variability across the state. From 1980 to 2018, Texas experiences a marked decline in municipal water use. The per capita municipal average declines 24% from 180 gallons / day to 137 gallons / day, but individual metro performance varies widely from a 50% decline in Corpus Christi, TX to an 18% increase in Tyler, TX. During this period, water plans show substantive change. Across SWPs, population estimates increase while forecasted water supply and demand decrease. Crucially, future strategies show a marked shift in how to meet future needs. Initially, surface water comprises two-thirds of future strategies. By the 2022 SWP, this drops to one-third, with large increases in water conservation and reuse expanding rapidly. However, these statewide trends mask diversity amongst regional plans. To illuminate how place and adaption intersect, data

traces for five individual metro regions show how local context, new science, and emerging technologies result in unique, place-based outcomes.

The ambiguity of sustainability has contributed to its enduring role in planning (Campbell 2016). This work provides a link between sustainability and planning theory, articulating why conceptual flexibility is not only beneficial but also necessary. Though imperfect, regional water planning in Texas is a concrete example of place-based and adaptive sustainability, providing important lessons for sustainable planning beyond the environmental sector. Assumptions about growth, the role of technology, and human behavior all need continual reexamination. This process plays out differently across diverse contexts, so solutions should not be homogeneous. Place-based and adaptive planning is simpler and less contested in water planning than it would be for transformational land use, housing, transportation, and equity planning. Yet, key takeaways still apply. More than general solutions espousing the need for compact cities, a robust, well-funded planning apparatus is necessary, one that incorporates bottom-up governance as well as top-down financial and technical support. Humility counteracts complexity, empowering local knowledge and opening the door to solutions current conceived as impossible.

URBAN “REVITALIZATION” AND INDIGENOUS-SETTLER RECONCILIATION: (DIS)CONNECTIONS BETWEEN MUNICIPAL REDEVELOPMENT PLANS AND RECONCILIATION STRATEGIES IN FOUR CANADIAN CITIES

Abstract ID: 1391

Individual Paper Submission

ELLIS-YOUNG, Margaret [University of Waterloo] mellisyo@uwaterloo.ca, presenting author

Municipalities in Canada and other settler colonial contexts are currently engaged in seemingly conflicting projects, as they act to transform urban space in the interests of white capital while also placing new emphasis on Indigenous-settler reconciliation (e.g. Porter et al., 2019). Amidst discourses of reconciliation, state-led gentrification processes framed as “revitalization” and “redevelopment” reassert notions of settler possession while attempting to erase or selectively represent Indigenous connections to urban space (e.g. Quizar, 2019; Toews, 2018). These tensions underline the need to examine municipalities’ new urban redevelopment projects in tandem with their co-existing intentions and assertions surrounding Indigenous-settler reconciliation, to identify any (mis)alignments and the implications for settler planning practices. However, studies of planned “revitalization” in settler colonial contexts rarely analyze the transformation of an urban area in relation to processes of reconciliation (see Halpin, 2017 as one exception), particularly in ways that attend to municipalities’ growing engagement therein.

In response, this paper places municipal discourses of urban transformation and reconciliation in dialogue to examine their connections and disconnections. Here, I focus on four gentrifying Canadian cities that have released reconciliation strategies or frameworks in recent years (Montréal, Vancouver, Edmonton, and Regina). In these contexts, I interrogate how the orientations of new and ongoing municipal-led redevelopment or revitalization projects relate to the co-existing municipal reconciliation directions. In doing so, I consider if and how this “dialogue” addresses the power dynamics of settler planning practices, recognizing that state approaches to reconciliation often reproduce settler colonial relations (e.g. Manuel & Derrickson, 2017). The paper draws on a textual analysis of formal documents surrounding the planning projects (consultation presentations and reports, draft plans, final plans), as well as documents associated with the reconciliation strategies and frameworks. I analyze the language, concepts, and objectives within these documents to identify how the planning projects and reconciliation directions are implicitly and explicitly framed, and how these discourses of urban transformation and reconciliation relate to each other.

The paper finds the relationship between municipalities' plans for urban transformation and their reconciliation intentions to be multi-dimensional, with discursive frames and substantive elements that align in some ways while conflicting or remaining disconnected in others. However, the alignments identified in this context are predominantly superficial in terms of their disruption of the settler planning status quo. At the same time, the conflicts and silences between the plans and the reconciliation strategies, and within the planning documents themselves, underline the persistence of colonial power dynamics within state-led redevelopment and revitalization projects. These findings point to the need for settler planning practice to engagement more deeply with questions of Indigenous-settler reconciliation, including and beyond any municipal intentions therein, in framing processes of urban transformation.

TEMPORALITY AND 'BECOMING' IN RURAL ONTARIO: PLANNING COMMUNITIES OF DIVERSITY AND DIFFERENCE OUTSIDE THE COSMOPOLIS

Abstract ID: 1397

Individual Paper Submission

DEAN, Jennifer [University of Waterloo] jennifer.dean@uwaterloo.ca, presenting author

Over the past six decades, the settlement locations of immigrants to North America have primarily been cosmopolitan gateway cities and their surrounding suburbs. However, recent policy initiatives in Canada (e.g., federal *Rural and Northern Immigration Pilot*; *Rural Employment Initiative* in Ontario) have resulted in spatial redistributions of newcomers into smaller cities and rural towns. These changing settlement patterns are deemed necessary to mitigate the economic and social impacts of population decline prevalent in small cities and rural communities, while also addressing the barriers to successful integration facing recent immigrants residing in urban areas. These emergent trends provide new opportunities to explore issues and approaches to planning for diversity and difference outside of major urban areas with particular attention to the importance of temporality of/in the changing settlement and resettlement patterns of newcomers in Canada.

The role of time, temporality and 'timescapes' have received growing attention over the past decade by critical spatial scholars including those in planning (Degen, 2018; Laurian and Inch, 2019) who note: "planning...is a richly, temporal practice which has not yet fully explored the possibilities that could be opened up by adopting explicitly temporal ways of knowing and acting" (Laurian and Inch, 2019, p. 281). This paper heeds the call to more fully explore the importance of temporality in planning through a study of recruitment and resettlement of diverse immigrants into small cities and towns in Ontario, Canada. This mixed methods study draws on survey and interview data from key informants working within rural communities actively recruiting immigrant populations, as well as focus groups and interviews with newcomer populations who have or are in the process of resettling from urban into rural communities. The analysis highlights the contrast between community-based concepts of time and futurity with the personal temporal narratives and utopian visions of immigrants settling within those communities.

More specifically, the findings from staff and elected officials in rural communities illuminate how preoccupations with past timescapes (Degen, 2018) shape their plans for temporal transformations from a shrinking and stagnant community into a vibrant and 'welcoming' one. The temporal sense of 'becoming' (Grosz, 1998) is sought through social and economic policies prioritizing immigrant attraction and retention. From the perspective of immigrant participants, the promise of a previously unrealized utopian future in Canada was a primary driver for their decision to resettle outside of urban areas. Immigrants play with time in order to realize their own desire for socio-spatial belonging and personal 'becoming' (Grosz, 1998) in Canada.

This paper contributes to recent efforts to shed light on the role of time in planning theory as well as explore emergent issues in planning for diversity and difference (Burayidi, 2015; Qadeer, 2016). Specifically, the paper emphasizes the flexible constructions of time- slowing, pausing, speeding, imagining- that were implemented by communities seeking physical and social change towards and/or back to times of growth and vitality, and immigrants striving to settle,

integrate and belong in Canadian society. The paper concludes with a discussion of what the changing settlement patterns of immigrants means for planning communities of diversity and difference outside the cosmopolis.

SURVEYING THE TOPOLOGY OF PLANNING THEORY USING BIBLIOMETRIC ANALYSIS

Abstract ID: 1425

Individual Paper Submission

BOWER, Courtney [Cornell University] courtney.bower@gmail.com, presenting author

A first-year planning graduate student once asked: What are the ten most influential planning theory journal articles? As scholars, we know that this question has no easy answer. Different approaches to planning theory produce different perspectives, reflected in the content and structure of planning theory course syllabi. Planning theory scholars in the Information Age have a new, powerful tool to help planning students grasp the complex, interconnected nature of planning theory thought: network analysis. The Google PageRank algorithm, which undergirds modern internet search engines, uses network analysis to provide a ranked list of results related to a search. Undoubtedly, many students (and scholars) have found it useful to google planning theory. As scholars and educators, we need to go further. This paper presents one approach, which is to construct a network diagram of planning theory thought using publication metadata from Scopus. I call this a survey of the topology of planning theory, which is a recurring theme in scholarly discussions of planning theory (Klosterman, 2011).

My paper shows how network diagrams built using bibliometric tools can be used to help planning theory educators and scholars explore, teach, and understand planning theories. In the paper, I build on the work of Friedmann (1987), who traced the major influences of planning theory stretching back to the 18th century, and successfully diagrammed the influential thinkers, schools of thought, disciplines, and their relationships. Like Friedmann's (1987) terrain of planning thought, bibliometric analysis provides a map of the terrain of planning theory based on publication metadata – a networked map. Bibliometric analysis, constructed from publication metadata, provides a useful method for exploring core themes, papers, researchers, and institutions engaged in planning theory.

This paper is relevant to planning theorists, scholars, and educators for several reasons. Bibliometric analysis provides a unique way to explore core themes in planning theory, understand different planning cultures, and discover trends, old and new, in planning theory. Bibliometric analysis of planning theory citation networks can help to explore questions around the evolving core of planning theory, as discussed in Beard & Basolo (2009). Network analysis of the different scholars, institutions, and countries that produce planning theory can help theorists to understand the different cultures of planning theory (Forsyth, 2012). Last, planning researchers are using bibliometrics to chart trends in planning. Daniel & Pettit (2022) used bibliometric methods to examine the growth of planning decision support systems. Such work provides scholars, educators, and practitioners a valuable window into the growth of a research trend or topic.

While bibliometrics often serves an evaluative function, I eschew this and present several findings from my paper meant to generate dialogue among students, scholars, and educators. I present three conclusions from my work that are therefore tentative, listed below:

- Planning theory operates in a core-periphery dynamic consistent with Bradford's Law and Lotka's Law;
- Planning theory is multi-paradigmatic and bibliometrics can articulate the conceptual networks of the paradigms; and
- Valuable new paradigms, scholars, or institutions in planning theory may be invisible to the wider network if not connected to a key node (i.e. journal, institution, co-author, or well-cited paper). Ultimately, the rapid increase in academic publications and journals makes it paramount to understand where new knowledge is being produced, the many journals planning theory is being published in, and the themes planning theory scholars are engaging with

across time.

INDIGENIZING PLANNING: REFLECTIONS ON HOW COLONIAL PLANNING ENCOUNTERED THE INDIGENOUS CONSCIOUSNESS OF SPACE IN POSTCOLONIAL SRI LANKA

Abstract ID: 1434

Individual Paper Submission

SANGAPALA, Pradeep [University of Alberta] sangapal@ualberta.ca, presenting author

AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author

Our study examines the impact of nationalism, ethnic identities, and religious expressions of space on planning and place-making in postcolonial Ceylon (Sri Lanka since 1972). We investigate the first planned community in independent Sri Lanka, the New Town Plan of Anuradhapura, in 1949, in the context of Sinhala-Buddhist nationalists' conceptualization of their spatial identity. We approach the new Anuradhapura planning project as a ground-up knowledge-building project, demonstrating that planning is a critical instrument that can provide a spatial form to the ideological stances of nationalism.

Anuradhapura is the most-ancient capital city known to have existed on the Lankan territory, established circa 250 BCE. In the late 19th century, the British colonial government in Ceylon adopted Anuradhapura into the colonial administrative discourse by making it a regional capital. At the dawn of the 20th century, the leaders of the rising nationalist movement approached Anuradhapura. For them, it was a sacred space that held the virtues of Buddhism and the glory of their ancestors. Consequently, the nationalists saw the need to define the sacred area by removing the structures that served the daily routines, i.e., 'secular uses' of the inhabitants – schools, markets, shops, and offices – from the sacred site. This spatial separation reflects Buddhist activist beliefs in their authority to control their sacred space by removing the non-Buddhist practices from the site. However, their demand for spatial separation and the stamping of the Sinhala-Buddhist desire was politicized explicitly in the mid-20th century by an influential politician and later Prime Minister S.W.R.D. Bandaranaike (1899 – 1959), whose nascent political movement demanded Ceylon to become a Sinhalese only state. The Anuradhapura new town planning project thus marks the location where the colonial planning discourse met the national consciousness.

The study of Anuradhapura's new plan and the planning process enable us to understand the influencing ideologies such as Sinhalese-Buddhist nationalism, how they were negotiated, and the potential impact of the planning process. Accordingly, we examine the development of this project in the context of Buddhist nationalists' conceptualization of their sacred city. First, we delve into why Anuradhapura became crucial for the Ceylonese Government at the dawn of independence -why Anuradhapura was significant. Then, along with the actors who put up with the new planning scheme, we explore the perspectives that contested the new town's formation in Anuradhapura. Finally, the study demonstrates that Anuradhapura's planning provided a rationale for the nationalists' political claim for space, laying the basis of postcolonial spatial thinking in Ceylon. Furthermore, the study indicates that planning is inherently political that can be a means of liberation or oppression of the spatial expressions of the communities.

We draw on the scholarship on nationalism, colonialism, and postcolonialism, focusing on planning. It contributes to the broader planning scholarship of colonial and postcolonial urban spaces (Beebejaun 2021; Raychaudhuri 2001; King 2009; Perera 2008; Roy and Ong 2011). Methodologically the study consults archival materials such as British colonial administration reports, maps and statics of the colonial government, and correspondence between natives and colonial authority. Also, it rests on two extensive field studies in Anuradhapura in 2017 and 2019.

EXPOSING AND HEALING THE RIFTS: THE POTENTIAL OF POST-COLONIAL PLACEMAKING

Abstract ID: 1443

Individual Paper Submission

NOVACEVSKI, Matt [University of Melbourne] m.novacevski@unimelb.edu.au, presenting author

Planning in settler colonial societies has been critiqued as enabling an extractive and exclusionary approach to place that facilitates a sense of disconnectedness and alienation from landscape. Some would go as far to say that the settler-colonial city has been planned in order to sit "above place" (Davison, 2019), seeing landscape as a passive tabula rasa ripe for exploitation (Potter, 2012). In recent decades, placemaking has gained renewed popularity in Anglophone settler-colonial societies as a means of promoting vitality and a sense of connectedness in cities through interventions made at the fine-grained level. However, ambiguity remains around the aims and nature of placemaking practice. Further, there are enduring research gaps around the nature of placemaking in a settler-colonial context, leaving open questions about whether and how placemaking might seek to address the extractive and exclusionary foundations of settler-colonial planning.

In this paper, I explore the potential of a post-colonial conception of placemaking in the land known as Australia. I do so through my positionality as a second-generation settler of continental European ancestry in a land where First Nations renderings of Country as a nourishing terrain that holds all life endure beneath the concrete of the settler-colonial city (Porter, 2018; Greenaway et al, 2014; Bird Rose, 1996). The research involves autoethnographic field exploration of three placemaking interventions on Bunurong and Wadawurrung Country, in the cities now known as Melbourne (Naarm) and Geelong (Djilang). By uncovering the processes and impacts of placemaking interventions, the research reveals that ways of working are key to the sense of connectedness and community cohesion, which a placemaking intervention can promote. The research brings forward an ethic of practice in placemaking grounded in reciprocity, embodied connectedness and working to support the ability of place to hold life. In this research a "layered invitation" is put forward as a framework that details how placemaking processes can foster a deeper sense of shared dwelling and relationality that works against the grain of exclusionary and extractive planning approaches. The findings contribute to evolving conceptions of the importance and potential of placemaking in settler-colonial societies to foster a post-colonial ethic of care, healing and emergent possibility (Graham, 2008; Jacobs, 1996; Gandhi, 2018; Kimmerer, 2013).

THE PERIPHERY AS A FRONTIER: AUTHORITARIAN ENCLAVES IN RIO DE JANEIRO AND THEIR EFFECTS ON PLANNING.

Abstract ID: 1444

Individual Paper Submission

COLI ROCHA, Priscila [University of California Berkeley] priscila_coli@berkeley.edu, presenting author

This paper will illustrate how milícias are transforming the peripheries of Rio de Janeiro into frontiers of social, political, and economic difference, and analyze how this criminal organization challenges the planning field in this context. In the Global South, the periphery has been an important concept to understand how urbanization unfolded from the 20th Century onwards and to develop planning mechanisms to deal with inequality and segregation (e.g., the Zones of Social Interests). Commonly, peripheries are seen as the outskirts of cities, sites of urban informality, and for the relocation of “unwanted” populations. These conditions contribute to the peripheries’ exclusion but also lead to the formation of hybrid spaces, capable of absorbing tensions inherent in the intersection of substantially different ways of doing things, thus sites of hope, innovation, and agency. However, the involvement of milícias with urbanization in Rio de Janeiro challenges the understanding of the periphery as such.

Milícia is the Brazilian term used to refer to criminal organizations comprised of active and former state security agents, which offer or impose, various services for personal profit. They emerged in the 1990s in the peripheries of Rio de Janeiro, and like other criminal groups—such as drug traffickers—usually control the territory through violence. Territorial control is critical for them because they extract funds from rents and gain electoral power by forming electoral corrals electing themselves or their representatives to public office. Nevertheless, from the 2000s onwards, they became involved with space-making. Recent research shows that milícias already control more than half of Rio’s territory, and construction activity was higher in these areas in the last decade, which shows the scale and pace of this phenomenon.

Space-making by milícias refers to the production of ‘authoritarian enclaves’ (as I call them) that correspond to land occupations done through illegal land seizure and subdivisions for sale. In these enclaves, milícias are the rulers imposing social and behavioral norms, privatizing and monopolizing the provision of public services and infrastructure (e.g., security, water, and electricity), as well as blocking off avenues for political competition. In this context, I argue that Rio’s peripheries should be understood not only as hybrid, hopeful, and innovative spaces but also as frontiers of social, political, and economic difference where regimes of power and capital are in the process of reconfiguring space in their own image. This paper will illustrate the transformation of the periphery into a frontier through the analysis of São Bento, a neighborhood in the metropolitan region of Rio that milícias have urbanized since the beginning of the 21st Century. Additionally, it will discuss the effects of this transformation for the understanding of urbanization in the Global South and the challenges for the planning field in this context. This work counts with: (a) ethnographic material collected between 2019 and 2022, (b) a bibliographic review of the planning literature on peripheries and frontiers, and (c) archival research in local newspapers.

“GROWTH IN ALL DIRECTIONS”: PLANNING THOUGHT AND URBAN EXPANSION IN PRINCE GEORGE FROM 1946 TO 1981

Abstract ID: 1448

Individual Paper Submission

CLAPP, Tara [University of Northern British Columbia] tara.clapp@unbc.ca, presenting author
GROULX, Mark [University of Northern British Columbia] mark.groulx@unbc.ca, primary author
BRYCE, Benjamin [University of British Columbia] ben.bryce@ubc.ca, co-author

The objective of this paper is to contribute to the understanding of the concepts and forces shaping urban planning in cities in Canada's provincial north. Focusing on post war urban development in Prince George British Columbia, we re-examine two dominant planning models that shaped urban development in cities across Canada in the 20th century. More specifically, we situate Howard's Garden City model and Perry's Neighbourhood Unit concept as direct and significant forces behind the urban development patterns that shaped what would become British Columbia's northern capital.

Existing literature links the development of the Grand Trunk Pacific to the City Beautiful movement and offers insights into how these forces contributed to the initial establishment of Prince George as a colonial urban settlement in northern British Columbia (Hodge and Robinson 2001). In this paper, we turn our attention to the topic of urban planning during the significant wave of population growth and urban expansion that occurred in Prince George over a roughly 30-year period following WWII.

We examine the planning literature related to the Garden City and Neighborhood Unit concepts to establish a context for understanding how these planning ideas shaped urban development in northern Canada. This includes examining theoretical and empirical contributions to the planning literature, particularly as they relate to the normative development outcomes sought under each concept, the planning tools used to pursue these goals, and the benefits and points of contention that scholars associate with each concept.

We examine archival evidence in the form of historical planning maps, policy and reports that illustrate how the Garden City and Neighbourhood Unit emerged in urban planning thought in a northern context, and how these concepts shaped physical urban space. Principles drawn from these theories anchored a vision for urban growth as early as 1946 in a plan prepared by the Regional Planning Division of the Bureau of Post-war Rehabilitation and Reconstruction. Their use continued and crystallized in a growth initiative in the mid-1970s that rationalized urban expansion to accommodate a future population that would never come. Using a range of contemporary and retrospective media sources, we also illustrate public sentiment related to planning during this period of notable change.

The present-day consequences of the historical influences we discuss are outside the scope of this paper. However, we acknowledge these influences as an ongoing element shaping the present-day urban challenges in many of Canada's northern cities. Post war urban development and the planning concepts that informed it are an ever-present reality for communities seeking to address urban sustainability and climate resilience, population health and equality, and a growing imperative to contribute to decolonization of urban settlements and planning practice. Our work informs a clearer understanding of how planning ideas helped to define the physical context of settlement within a defining period of urban expansion in Canada's north.

HENRY WRIGHT PLANNING PIONEER

Abstract ID: 1453

Individual Paper Submission

LARSEN, Kristin [University of Florida] klarsen@ufl.edu, presenting author

The years before Henry Wright's partnership with Clarence Stein were among the most productive of his career. Wright adopted an integrative and holistic approach to planning as the profession itself was emerging in the early 20th century. Shortly after earning his architecture degree, he relocated to St. Louis while working with nationally prominent landscape architect George Kessler, bringing him in direct contact with civic leaders agitating for city improvements. Though he continued his design practice, he began reinventing himself as a planner, and his evolution as he grew into the profession can be traced to these early years in St. Louis.

First, he contributed in 1902-03 to Kessler's design of an urban park and boulevard network, which reflected an

understanding of street function, land use adjacencies, and the role and impacts of parks. Wright then advanced his planning expertise by more fully combining social and physical planning as primary researcher and author on a committee report to the 1907 St. Louis Plan, which he parlayed into being the primary author of a 1911 report advocating adoption of a comprehensive city plan. The growing recognition of his planning expertise at the national level combined with his ongoing role in St. Louis led to his appointment as Town Planning Assistant with the Emergency Fleet Corporation in 1918. Following the war, when he returned to St. Louis, Harland Bartholomew, whom Wright helped attract to the city in 1915 to serve as its engineer, chose Wright as the city architect to continue shaping its planning documents. That role concluded shortly before Wright relocated to New York City in 1923 to join Clarence Stein's Architects Associated and the newly formed Regional Planning Association of America (RPAA).

Using primary and secondary sources, including unpublished papers and plans, correspondence, writings, and accounts from the period, this study focuses on critical junctures during Wright's early career to inform our understanding of his planning ethic. It applies an interpretive-historical methodology to contextualize and critique this archival material. Wright distinguished himself as a planning pioneer – contributing to the profession significantly earlier than widely acknowledged or understood. His planning philosophy, matured by his over 20-year career in St. Louis, complemented and enhanced the focus of the RPAA. He contributed an advanced understanding and treatment of site design/engineering, planning, transportation networks, land development, and cost analysis.

Unlike his fellow architects, Wright moved fluidly between the planning, design, and development professions, recasting himself to respond to the context and challenges before him. His projects; site design consulting; public practice, piloted at the local and federal levels; and handful of writings during these early years attest to a philosophy that function, not aesthetics, should guide the architect. For him, a multi-scalar approach was essential – the efficient flow and healthful enjoyment of living spaces determined the layout of an individual unit that became the building block, along with the green and transportation networks, civic spaces, and commercial uses, of the community. This expertise is evident in his collaborations with Stein and other members of the RPAA. Not surprisingly, his resume indicates his position as Town Planner on the landmark projects of Sunnyside Gardens in Queens; Radburn, New Jersey; and Chatham Village in Pittsburgh.

REVIVING THE VISUAL DISPLAY OF PLANNING THOUGHT AND IDEOLOGIES: A CRITICAL REAPPRAISAL OF PLANNING'S VISUAL HISTORY AND THE VALUES EMBEDDED IN TRADITIONAL PLANNING DIAGRAMS

Abstract ID: 1491

Individual Paper Submission

CAMPBELL, Scott [University of Michigan] sdcamp@umich.edu, presenting author

This paper examines the underestimated influence of graphic visualizations in shaping and codifying planning thought. We employ diagrams to reinforce and crystalize planning ideas, and assume they are a neutral mirror of the text. But they often have a life of their own. They frame debates, steer thinking, and tacitly constrain or expand our planning imagination. As a spatial field and as applied social scientists — and as prolific producers and consumers of maps, plans and charts — planners consider themselves as doubly savvy visual thinkers. Yet our field often uncritically views these graphics as unproblematic, passive illustrations of planning ideas.

I explore two arguments: First, diagrams shape our thinking more than we likely admit, and have unintended consequences. The relationship between visual representations and theories (typically in text and narrative format) is two-way and dynamic. We should therefore curate our use of planning's historical diagrams — and draw new diagrams — with as much critical reflection as we choose our words and tabulate our data. Second, if we seek to revitalize planning theory (not just as a specialization within planning, but also as the shared forum where we debate planning-wide values and concepts), then we are well advised to critically also rethink our visuals: to lead this reinvigoration of planning theory with graphical and not just textual arguments.

I revisit the standard portfolio of diagrams in introductory courses and textbooks. (I focus on the visualization of planning ideas, rather than the visualization of plans and related reference or thematic maps, illustrations, photographs, data tables and charts — except when the latter are used to make conceptual arguments.) It's a familiar list: Howard's Garden City (1898); Geddes' "valley section" (1909); Burgess's concentric zones (1925); bid rent curves; HOLC's "redlining" maps (1930s); Corbusier's radiant city (1933); NRPB regional maps (1930s); Isard's regional science hexagons (1956); Interstate highway map (1956); Jean Gottmann's megalopolis (1961); Neil Smith's gentrification "rent-gap" (1979); Friedmann's world city map (1986); DPZ's transect (1997); etc.

This chronology of influential graphics provides only a partial and outdated visual history of planning. What voices and ideas are excluded? These images lean with a deference to clear lines, networks, simplification: modernist infrastructure; idealized visions of efficient mobility; stylized urban economics; aspirational models of "balanced" metropolitan systems — either urban/suburban/rural or the "three Es." This graphical vocabulary fails to engage the breadth and array of planning ideas. Important debates within planning theory (e.g., advocacy & communicative action, postcolonialism, social & environmental justice) frequently lack a visual language to drive our thinking.

Can one conclude that planning has grown less visual over time (GIS notwithstanding) and much of planning theory isn't suitable for graphic argumentation? That debates about power, institutions, governance, racism and gender are most effectively engaged through oral and written rhetoric? (A review of planning theory articles confirms this text-centric focus, whose figures are often wordy, unmemorable tables with detailed taxonomies of concepts, variables and actors.) But though planning continues to expand its disciplinary scope into social concerns, we are a discipline that invariably translates these issues into problems of land, property, boundaries and communities — and the primary language of space is the visual language of maps, plans and diagrams, with either existing, projected or idealized land uses. It is not just the explicitly spatial specializations of land use, urban design and transportation planning, but also planning theory, that needs a robust arsenal of communicative and analytical tools — including visualization.

The goals of this paper are thus to both critique the traditional use of diagrams in planning's intellectual history and promote a more critical and reflective visual thinking in contemporary planning theory.

"What is planning?" is a question regularly contested in planning scholarship (Alexander, 2016; Fischler, 2012). Theorisation usually concerns land-use planning; rarely are other domains of planning used as a departure point. This research examines the question of what planning is by reflecting instead on transport planning — a field whose practice and research alike is often associated with quantitative, techno-rationalist mindsets drawn from statistics and civil engineering.

This research uses a framework drawn from the governmentality scholarship (Dean, 2010). We draw on semi-structured interviews with over forty transport planning actors in the Melbourne (Australia) and Toronto (Canada) regions, in which interviewees were asked, "what is urban transport planning?". These responses are supplemented by transport planning documentation produced between 2000 and 2018.

The findings highlight key features of transport planning, as understood by those who practise, including transport planning's concern with the movement of people (and goods), its use of a central set of technologies, its interest in spatiality and temporality, and its desire to improve. As such, the paper argues that urban transport planning is a contemporary, contingent manifestation of the Foucauldian concept of government — "the conduct of conduct" (Dean,

2010) – focused chiefly on the optimisation of the circulation of the population within a calculable territory.

The contributions of this paper to planning scholarship are twofold. Firstly, the paper offers a development of the conversation about what planning is by applying a novel theoretical framework, governmentality: an approach well suited to engaging the tensions and paradoxes at the heart of planning (Fischler, 2012; Raffnsøe et al., 2016). Secondly, our paper responds to invitations in the literature for further critical research examining how urban transport planning is practised (Marsden & Reardon, 2017). An understanding of what planning is using a governmentality framework will allow for greater engagement in questions of the operation of power in urban and transport policy.

EVOLUTION OF URBAN PLANNING TERMINOLOGY OVER TIME: A BIG DATA EXPLORATION OF WORD USE IN AMERICAN ENGLISH BOOKS

Abstract ID: 1536

Individual Paper Submission

FANG, Kevin [Sonoma State University] kmfang@gmail.com, presenting author

Like any field, urban planning has terminology used to represent the ideas and concepts of the field. Terminology changes over time as ideas appear, fade, and evolve. The emergence of “big data” allows for the study of terminology in ways that are difficult, if not impossible, to do previously. Michel, et al. (2010) discuss the creation of a massive digital “corpus,” or collection of text, containing all the words in over five million digitized books. That corpus is searchable using the Google Books Ngram Viewer.

Michel, et al. describe “high-throughput” quantitative analysis of culture, such as word study through the corpus, as the field of “culturomics.” Since being published, authors in many disciplines have utilized the corpus to explore their sub-cultures, including planning-adjacent fields such as landscape architecture (Antrop and Van Eetvelde, 2017) and environmental, civil, and transportation engineering (Leary, et al., 2011). This study performs a culturomic exploration of urban planning terms and concepts referenced in the American English portion of the Michel, et al. corpus through 2019. Some notable findings include:

References to planning in books peaked in 1974: Terms referring to the field of planning emerged in the dataset around 1900. References to the field grew as a proportion of all words in books from then until 1974, when reference share began dropping precipitously. By this metric, urban planning has become a relatively less prominent feature of societal discourse since the 1970s.

Zoning = planning?: Zoning is by far the most frequently used planning term in books, mentioned more often than the field of planning itself. As of 2019, zoning appears approximately once out of every 2,500 words in the corpus.

Planning ideas go viral and fade, but don't disappear: Some concepts, when new, rapidly increase in popularity. The City Beautiful and Garden City movements rose quickly in the early-1900s, as did urban renewal in the 1950s and 1960s. Frequency of mentions for all these terms eventually greatly decreased, but not entirely. This indicates a level of reflectiveness in planning in that past ideas still get discussed, even those no longer in vogue.

Visualizing book mentions highlights sequential relationship of ideas: Some ideas in planning can arise as a response to previous trends. Graphing book mentions can highlight such relationships. For example, two affordable housing production strategies, inclusionary zoning and density bonuses, emerged in the 1980s. Both appear following a similar sized emergence in mentions of downzoning, a housing constraint, 10 years earlier.

Notable urban figures referenced as much as less famous US presidents: The most frequently mentioned people related to urban planning, such as Lewis Mumford, Robert Moses, and Jane Jacobs have been discussed in books in recent years about as frequently as the least mentioned US presidents, such as Chester A. Arthur and Millard Fillmore.

Overall, while the corpus/nGram viewer is a relatively simple tool, it allows exploration of planning trends in a quantitative way. Graphs based on the data allow for visualizations on the evolution of planning ideas. Additionally, the corpus' scope covering books of all topics allows for the exploration of planning not just within the field itself, but also in comparison to ideas in society as a whole.

HOW THE CATHOLIC CHURCH PLANNED NEIGHBORHOODS MIDST RACIAL AND RELIGIOUS TENSION IN TWENTIETH-CENTURY DETROIT

Abstract ID: 1590

Individual Paper Submission

HWANG, Christine [University of Michigan] ckhwang@umich.edu, presenting author

This paper reinterprets the history of Detroit by examining a powerful institution that planned the city around parish neighborhoods but has nevertheless been neglected by urban planning: the Catholic Church. I investigate how twentieth-century Catholic parish neighborhoods in Detroit paradoxically served as both places of refuge for European Catholic immigrants against a hostile Protestant national landscape and tools for excluding Black migrants arriving from heavily-Protestant regions of the American South. Despite the Catholic Archdiocese's declarations of racial and religious inclusion, Black residents were often, but not always, excluded from parish neighborhood facilities, most notably parochial schools, which was seen by both Catholics and non-Catholics as vehicles for economic mobility. However, other parish neighborhoods created innovative plans that wove the calls for racial integration with collective decision-making and the physical design of shared space.

Rooted in historical research, this paper asks a question vital to contemporary planning: How do planners make decisions when there are multiple, often opposing, perceptions of space, particularly in relation to racial and religious identities? Through analysis of both academic and religious archival sources and oral histories with clergy, parishioners, and parochial school students, this paper finds that while the Catholic Church was an umbrella institution, the strength of the individual parish neighborhood allowed Catholics to determine inclusionary and exclusionary actions on a local scale. Moreover, through digital humanities mapping methodologies, this paper finds that this Catholic concept of space sharply contrasts with Detroit's myriad Protestant denominations that did not define membership by geography but rather through networks of church communities. Through oral histories, I have found that both Black and White Catholics claimed a sense of ownership over the parish and negotiated, on the parish level, actions for or against racial integration. According to former parishioners, these various segmented efforts are often overshadowed by singular monolithic narratives of the Civil Rights movement.

This paper focuses on two scenarios of how parish neighborhoods reacted to religious and racial change and tension. The first scenario investigates how some parishes paradoxically transitioned from places of refuge to tools for exclusion. For example, the parishioners at St. Albertus, the first Polish parish in Detroit, opposed racial integration, using the lack of Polish language skills as the reason. Through demographic analysis and the mapping of buildings over time, I found that these circumstances often led to sudden departure as a parish unit in tandem with the closure of neighborhood facilities. The second scenario examines how Catholic parishes intervened against exclusionary attitudes both within the Catholic Church and as an antidote to exclusionary tools such as redlining and restrictive covenants by setting up parishes as models of integration. During the 1950s, the Archdiocese set up Gesu parish as a model of integration, hosting interfaith meetings and partnering with Black and non-Catholic residents to integrate its parochial school. The strategic placement of community amenities, such as playgrounds, between Black and White neighborhoods sometimes led to interaction and the eventual merging of communities and parish resources.

While much has been written about Detroit's Black-White urban-suburban divide, this project narrows in on how the neighborhood space is tied to both religion and race. In today's cities, where one lives shapes one's ability to access

quality resources and services such as schools, recreational and community space, social services, and health facilities—services that the Catholic Church once provided in neighborhoods across Detroit. By expanding the paradigm of urban planning to include religious institutions, this paper reveals how, by finding tangible ways to enact the call for inclusion, some communities hoped for, imagined, and, in some cases, succeeded in building an alternative future for their neighborhood.

DISASTERS, PLANNING AND COLONIAL EXPERIMENTATION IN PUERTO RICO

Abstract ID: 1605

Individual Paper Submission

LAMBA-NIEVES, Deepak [Center for a New Economy] deepak@grupocne.org, presenting author

As an “unincorporated territory” of the United States, Puerto Rico has endured the imposition of numerous governance experiments, designed and implemented by Federal authorities, that have perpetuated a highly unequal colonial relationship. Previous scholarship (Torruella 2018) has underscored how a handful of legal frameworks, from the Foraker Act of 1900 (which established a civilian colonial government in the island) to the 2016 passing of the Puerto Rico Oversight, Management and Economic Stability Act (PROMESA) (which imposed a control board to address numerous fiscal woes), have been instrumental in helping build and expand colonial rule for over a century. This paper takes these ideas as a point of departure to explore how colonial experimentation has continued throughout the island’s bankruptcy and post disaster process through a series of rules, programs and policies that aim to structurally adjust the local economy and “build back better” the damage caused by a string of storms and earthquakes. Through historical research, it demonstrates how planning, and a distinct planning mentality (Boyer 1997) has played a fundamental role in this long experimental tradition (Hansen 1953, Tugwell 1968). The paper also explains how the simultaneous deployment of austerity initiatives and a massive reconstruction effort— a unique “experiment” with few or no parallels—is generating new planning challenges and increasing vulnerabilities in the midst of mounting disasters. Interestingly, despite the widespread debate and media attention to Puerto Rico’s reconstruction and bankruptcy process, many of these critical planning issues are rendered invisible through the strategic use of technocratic discourse and approaches like “resilience planning” and “risk management” (Vale and Campanella 2005, Roy 2011). Furthermore, the analysis shows how some grassroots communities are responding and collectively building a community-driven recovery infrastructure that hopes to ensure that the historically marginalized and most vulnerable are treated with dignity and are also empowered politically.

THE PROBLEM WITH "WICKED PROBLEMS"

Abstract ID: 1660

Individual Paper Submission

ZIGMUND, Stephen [University of Texas at Austin] stephen.zigmund@utexas.edu, presenting author

Recent urban planning research has resulted in an understanding of cities as complex adaptive systems (Skrimizea et al., 2019). This perspective views cities as “complex interacting systems” which generate “wicked problems” that resist general planning strategies and make the prediction of outcomes impossible (Goodspeed, 2020; Zellner & Campbell, 2015). Accordingly, Goodspeed (2020) argues that the challenges posed by climate change, technological change, and sustainability goals “requires breaking from past planning approaches” (Goodspeed, 2020, p. viii). The traditional – or rational – planning approach ignores the future’s radical uncertainty, and problematically extends current trends using projections or forecasts. This has led, and continues to lead, to serious planning failures (Goodspeed, 2020).

This argument depends on blaming planning’s failures on the rational and systems planners that considered cities as closed systems capable of scientific management. Instead, cities understood as open systems should be viewed as fundamentally unpredictable, and planning must be a collaborative effort to foster better decisions in the face of uncertainty. The dilemmas posed by the uncertainty of planning for open systems are, of course, what Rittel and Webber (1973) famously called “wicked problems”.

Recently, many planners sharing this perspective (see Goodspeed 2020; Zellner & Campbell, 2015) have returned to this – seemingly – devastating critique of rational and systems planning. But, today’s rediscovery of wicked problems begs several questions. First, why now? Second, if the line of critique opened up by the discovery of wicked problems is so devastating, why was it not initially more successful in eliminating rational planning as the dominant approach to planning? The very existence of contemporary critiques of rational planning demonstrates that the approach remains entrenched at the top of the planning discipline. If the initial wicked problems critique was not successful to move planning beyond the rational approach, why not? What are the reasons we think it would be now? In other words, have the conditions under which cities are planned changed to make it more or less likely that the wicked problems paradigm will enable the move beyond the rational planning paradigm?

To address these questions, I offer a reassessment of the original “wicked problems” framework. This study grounds Rittel and Webber’s intervention in the historical context from which it emerged, going beyond “Dilemmas in a General Theory of Planning” (1973), to analyze both Rittel’s and Webber’s work leading up to, and following, their seminal publication. Analysis of lesser-known publications reveals both authors deep commitment to cybernetics as a scientific approach to explain the behavior of urban systems. As a result, and against the grain of dominant understandings, I read Rittel and Webber’s famous intervention as a contribution to the rational or systems planning approach. In this sense, Rittel & Webber (1973) elaborates the kinds of insights cybernetics can offer a rational planning which must exercise some form of urban control despite fundamental uncertainty. I determined that the form of control advocated by both Rittel and Webber involves the substitution of design (especially design of planning process) solutions over state-directed solutions to urban social problems.

Two paradoxes emerge as a result of this reassessment. First, the scope of problems facing cities and society today would seem to demand the kind of large-scale, state-led interventions that the wicked problems framework has discredited. And second, as recent scholarship has demonstrated, this ‘new’ complex systems planning approaches to understanding cities is itself indebted to the scientific insights of cybernetics (Krivý, 2018), an intellectual debt it shares with rational and systems planning. Given these, it is urgent that we critically examine such problematic connections to ‘traditional’, rational planning approaches at the moment of the planning’s supposed break from it.

REGULATION BY DATAFICATION: RELATIONS OF INFRASTRUCTURES AND PLATFORMS IN URBAN MOBILITY

Abstract ID: 1710

Individual Paper Submission

DUNN, Peter [University of Washington] ptdunn@uw.edu, presenting author

Planning practice has a long history of turning to new kinds of data to generate knowledge of the city. In this paper, I examine how data is not just a way to learn about the city, but a means by which the city is ordered and bounded. Drawing from research on the case of “new mobility,” understood broadly as the expansion of digital tools for managing urban transportation, I show that digital architectures have roles in envisioning and regulating the city comparable to those of plans and policies.

New mobility is characterized by partnerships involving local DOTs and transit agencies contracting with mobility service providers, especially ride-hailing and bikeshare companies. The traditional approach to public-private partnerships asks how such profit-driven firms can be regulated so that their innovative products and efficient operations can be channeled towards the public interest that government sets out to protect. However, I argue that this perspective can be enriched by seeing these organizational incentives together with a closer attention to the differences in their tools. Specifically, planners work within an infrastructure paradigm, while many of the new mobility providers are shaped by Silicon Valley’s platform paradigm. The view of public-private partnerships that focuses on distinguishing between investors and citizens fails to capture the differences between the workings of platforms and infrastructures in shaping socio-material relations, a contrast that the datafication of mobility has highlighted.

My analysis of these trends within transportation planning is shaped by STS-informed work on infrastructure studies as well as media studies literature on digital platforms. Infrastructures, including systems like an energy grid or a bus network, are shaped by ideas of distribution and consumption. This leads to regulatory efforts focused on achieving objectives of universal or equitable service provision. Platforms, whether for social media or for transportation, are interested instead in what their participants generate, including web content and personal data. Their development is focused on seeing and capturing such activity, without explicit concern for the end state. Digital data is at the center of this platform, as it allows both visibility and control at scale. For urban mobility, these two paradigms align with two types of regulation. One is the familiar boundaries of policy, which envisions an outcome (e.g., an accessible and equitable bikeshare system) and creates requirements and prohibitions to move various actors towards that goal. The other, newer type of regulation is datafication, by which I mean the rendering of previously informal relations as structured data according to specified rules. Datafication governs how elements connect, and so it begins from a center and works outward. Its interests are in facilitating exchange and increasing legibility.

This study—involving qualitative analyses of data specifications, software development, municipal permits, and policy documents—shows datafication and policy working together in novel ways, both controlling means of connection from the inside and envisioning ends from the outside. While the historical origins of these paradigms in public policy and tech startup culture align them with public and private sector actors, I find that they are increasingly blurred across types of organizations in planning practice. The case of new mobility shows why planning needs to pay attention to the political and regulatory functions of datafication.

THE EVOLUTION OF EMINENT DOMAIN FOR SLUM CLEARANCE: THE ROAD FROM WASHINGTON, D.C.’S ALLEYS TO BERMAN V. PARKER

Abstract ID: 1717

SWOPE, Carolyn [Columbia University] cbs2164@columbia.edu, presenting author

In the 1954 *Berman v. Parker* case, set in Southwest Washington, D.C. (DC), the Supreme Court granted state governments sweeping powers of eminent domain: The constitutional requirement that government acquisition of private property be for “public use” could be met if the legislature could claim any plausible benefit to the public. This landmark case provided the legal scaffolding for midcentury urban renewal – which razed entire neighborhoods, often for privately-run amenities and housing aimed at upper- and middle-income residents, and was dubbed “Negro removal” for the massive and disproportionate displacement of Black communities (Fullilove, 2001). Although this important case has attracted much scholarship, including attention to its historical context (Lavine, 2010), there is little research into the preceding evolution of eminent domain in DC which laid its foundation. The case emerged from a local context of struggles over slum clearance and public housing on increasingly large scales, originating in efforts to eradicate alley communities inhabited by impoverished Black residents. In this paper, I track the step-by-step development towards the expansive powers permitted in *Berman* across DC’s housing and redevelopment agencies, illuminating the gradual transformation to a broad interpretation of “public use.” In particular, I demonstrate the inequitable burden of this interpretation on Black residents from its roots in alley clearance, foreshadowing the racial inequities of urban renewal.

Only twenty years before *Berman*, it was unclear whether the government had the power to exercise eminent domain over slums at all, let alone hand over land for privately-run projects with private use. Slum clearance and corresponding public housing were the key issues around which eminent domain jurisprudence underwent a rapid and striking transformation from requiring that land seized by eminent domain be accessible and usable by the public (Fogelson, 2001; Pritchett, 2003). As eminent domain’s use evolved and expanded across city authorities, the size of the targeted communities and the role of the private sector grew. DC is not merely a representative case, but served as a critical laboratory where novel approaches to eminent domain were tested and tweaked.

This case study not only sheds light on how a permissive interpretation of “public use” evolved to permit large-scale destructive urban renewal programs, but also lays bare the risks linked to it from its origins. I show that surrendering firm guidelines around public access and rights opened the door for subjective preconceptions and private profit-driven interests to suffuse determinations of what constituted “blight” and what subsequent uses of acquired property were appropriate – particularly racialized constructions of property value. Black residents ultimately not only bore disproportionate burdens of displacement, but were also shut out of the benefits of the ostensible public purpose. The central importance of eminent domain as a land use tool for urban planning lends urgency to the need to recognize how the interests and preconceptions of dominant actors have been built into it from its foundation, at the expense of the most marginalized.

IS CLIMATE CHANGE CHANGING PLANNING? THOUGHTS ON THE CURRENT ERA OF CLIMATE CHANGE PLANNING IN THE TORONTO REGION

Abstract ID: 1777

Individual Paper Submission

TAYLOR, Laura [York University] taylorL9@yorku.ca, presenting author

While land-use planning has been integrating climate change issues into theory and practice for some 20 years now, the question arises about whether tackling climate change is actually causing planning to fundamentally change? The answer may be “no” or at least by “not much”. In fact, climate change may have brought back into focus the central conundrums of land-use planning: housing density and neighbourhood design, transportation and mobility, development vs conservation, policy vs implementation, and of course utopianism and the desire to express normative socio-environmental values in shaping the built environment. But the answer may also be “yes” as integrating energy and emissions and other climate-specific matters may be causing major shifts in approach (Bulkeley, 2019). Much of the scholarship on climate planning has focused on defining the problems associated with reducing emissions and adapting to a changing climate, recounting case studies of global best practices, and providing

"how to" guidance (from Davoudi, Crawford, & Mehmood, 2009 to Hurlimann, Moosavi, & Browne, 2021), but less has been about the evolving nature of planning itself.

Based on a review of climate plans, planning policies, and processes in the Toronto region where many communities are leaders in climate action (and where many are not), I consider the tenets of planning and ask whether the climate crisis is changing the planning imagination (Tewdwr-Jones, Phelps, & Freestone, 2014). My focus is on environmental planning, as climate change issues are most often subsumed under "environment", but I am interested broadly in whether and how climate change may be making planners reconsider the fundamentals of planning and design (Jabareen, 2013). I am also interested in how the practice of planning is responding to the challenge of including climate change mitigation and adaptation in policy-making, plan-making, and development approvals processes. Drawing upon interviews with practicing planners in the region, I consider whether they feel their jobs are changing and whether they have the knowledge and skills to deal with climate issues.

PROGRESS, PROFIT AND STATECRAFT: INDUSTRIAL CAPITALISM AS VEHICLE OF PLANNING IN INDIA, CA. 1940

Abstract ID: 1783

Individual Paper Submission

GHATAK, Sridipta [University of California, Irvine] sridipta2016@gmail.com, presenting author

In theories of development, public infrastructure serves as one of the myriad mediums through which the state seeks validation. In the modern period, infrastructure has often served as the symbol of state led progress. Infrastructure is thus a project of endorsement and justification of state's intervention. Infrastructure is also central to the discourse of planning. Needless to say, that infrastructure is thus a contested terrain within which the political economy of development unfolds. This paper argues that it is through this iteration of infrastructure's intricate ways of creation and functioning that private capital begins to accumulate in post-colonial contexts such as India. In doing so, the paper illustrates the historicity of public-private partnership (PPP) projects as it relates to infrastructure planning. The paper traces the history of one of the earliest examples of the Indian PPP model, which has come to dominate planning practice.

The project looks at the discourse of industrial development and planning in late and post-colonial India, investigating the manner in which infrastructure appears as a trope not only for state's validation but also for aggregation of the Indian industrialist class. How are the modernizing technopolitical state and infrastructure entangled? The paper attempts to answer this question by studying closely the iconic Howrah Bridge, a cast iron structure which opened to the public in 1943 forever transforming the urbanscape of the erstwhile British capital in the east, the city of Calcutta. The paper is based on extensive archival research conducted at national at private museums in India and the United Kingdom. Secondary sources obtained at the National Archives of India, the Nehru Memorial Museum and Library, New Delhi, the Tata Steel Archives, Jamshedpur, the Tata Company Archives, Pune, the British Museum and Library, London, and the London Metropolitan Archives, London enrich the findings. The paper benefits from qualitative interviews with current Tata Steel Company employees and archivists at the Tata Company Archives.

The paper highlights the ways in which late colonial strategies negotiated questions of foreign and native enterprise by constructing what would become the largest bridge in India in 1943. In the process, this paper untangles the relationship between private capital and its implications in the institutional development of national planning in post-colonial India by studying the role and activities of the burgeoning industrial capitalist class in India that pioneer the institutionalization of urban planning in early post-colonial India. The Howrah Bridge project allows entrance to the broader realm of public infrastructure and tests the boundary between 'public' and 'private' in development projects.

Along with other engineering consultants the Tata group, a burgeoning industrial giant in the early 1900s took a pioneering role in this project by supplying almost singlehandedly the steel required to construct the bridge. On the one hand, Tata Company's involvement underscores how the corporate house was mediating questions of economic sovereignty parallel to their negotiation with the British colonial market; on the other hand, like other native capitalists of the time, the Tata group was simultaneously deeply implicated in nationalist arguments for sovereignty of the nation-state, involving debates around tariffs, rights recovery and the like.

The history of construction of the Howrah Bridge offers an alternate, albeit subverted history of urban development in which the infrastructural object backgrounds the functioning of capital, thus establishing infrastructure as the fulcrum around which to pivot reading the history of state and capital. The relevance of this finding lies in its methodical unfolding of structural forces that continue to shape the perpetually reinventing system of capitalism shadowing modern planning practices via mechanisms such as the public-private partnership endeavors, which increasingly dominate urban infrastructure development across continents.

LINDA DAVIDOFF: A FEMINIST PLANNER WHO FOUGHT FOR THE PROGRESSIVE CITY

Abstract ID: 1788

Individual Paper Submission

REARDON, Kenneth [University of Massachusetts, Boston] kenneth.reardon@umb.edu, presenting author

While planning scholars have acknowledged the critical contribution early feminist thinkers and activists made to the launch of the urban planning profession in the United States, less attention has been given to feminist contributions to planning scholarship and practice in recent years. One of the most important feminist voices that has been overlooked by contemporary planning historians is Linda Stone Davidoff, a graduate of the Master of Science in Urban and Regional Planning Program at the University of Pennsylvania, who co-authored with her first husband Paul Davidoff, a series of important scholarly articles examining residential segregation in American suburbs.

Linda Davidoff was also a co-founder, along with her husband and Neil Gold, of the Suburban Action Institute which initiated more than two dozen legal suites between 1969 and 1979 to dismantle exclusionary zoning ordinances and building codes which limited access for poor and working-class families to the rapidly expanding economic opportunities in the suburbs. Following her work at Suburban Action Institute, Linda Davidoff serves as the Executive Director of several of New York City's most influential good-government groups, including the: Parks Council, New York League of Conservation Voters, HumanScerve, and the Citizen Union. Among her many accomplishments, were the establishment of the Gotham Gazette, an influential NYC public policy journal and the passage of the 1992 National Voter Registration Act.

Active in electoral politics, Linda Davidoff served as the Campaign Manager for Liz Hotzman's unsuccessful 1990 campaign for the US Senate and Ruth Messinger's unsuccessful 1997 campaign for Mayor of NYC, and was an advisor for Howard Dean's 2004 Presidential campaign. A lifelong advocate of historic preservation, an improved public realm, affordable housing, and mass transit, Linda Davidoff spent the last years of her career organizing a broad-based coalition of citizen groups to challenge Donald Trump's Television City Complex which featured the construction of a series of massive residential/ commercial towers on platforms above Manhattan's Westside rail lines. Through her skillful leadership, the community's proposal for a less dense, mixed use development featuring a considerable portion of permanently affordable housing, significant open space connected to the Hudson River waterfront was negotiated and built.

Several months after her death in 2004, former New York City Parks Commissioner dedicated a lovely greensward sloping towards the Hudson as "Linda's Lawn" in recognition of her tireless efforts to assure NYC's poor and working-class residents easy access to Manhattan's waterfront.

This paper will describe and analyze Linda Stone Davidoff's many contributions, as both a scholar and activist, to

equity-oriented planning. The paper will drawn upon an extensive review of the planning history and practice literature as well as face-to-face interviews with Linda Stone Davidoff's contemporaries carried out by the author as part of The Davidoff Tapes Project (www.pauldavidoff.com)

SIXTY YEARS OF RACIAL EQUITY PLANNING: EVOLUTION OF AN ETHIC

Abstract ID: 1830

Individual Paper Submission

ARROYO, John [University of Oregon] jarroyo@uoregon.edu, presenting author
SANDOVAL, Gerard [University of Oregon] gsando@uoregon.edu, co-author
BERNSTEIN, Joanna [University of Oregon] jbernst3@uoregon.edu, co-author

Debates about race and reparations in America are front and center in the 21st century. From the Black Lives Matter (BLM) movement to the caging of indigenous migrant children from Mexico and Central America to rising Asian American Pacific Islander discrimination due to COVID-19, the urgency for an explicit understanding of what racial equity planning is and examples of how the ethic has evolved could not be more pressing.

At the same time racial equity and social justice are especially crucial components of planning's guiding ethical principles. For example, AICP's recently revised Code of Ethics and Professional Conduct emphasizes "economic, social and racial equity." This increased attention to race highlights the need for a re-emergence of race-specific equity-based planning.

This paper traces the historical evolution of equity – specifically racial equity – through five key planning eras: the Origins of Equity Planning & the Civil Rights Era; Model Cities & Equity Planning; the Evolution of Equity Planning after HOPE XI, the Sustainable Cities Initiative/Obama Regional Grants; and Racial Equity Planning Beyond Reparations. We ask how and why has racial equity planning conceptually evolved in the academic planning literature and in representative racial equity plans, policies, and programs that improve urban environments for communities of color?

We identified a total of 17 geographically dispersed plans explicitly focused on racial equity during a three-phase collection strategy over a span of 61 years (between 1959 and 2020). Several plans are well-known in field (e.g., The Cleveland Policy Plan, 1974) while others are more recent and novel (e.g., City of Evanston Restorative Housing Program, 2021). The initial collection phase bounded specific scholarly planning eras with representative plans created concomitantly or catalyzed by majority events during that period. The second phase of plan collection identified plans in key cities (multiple scales) known for established racial equity commitments from previous strategies. A final phase relied on award winners of APA National Planning Excellence Awards over the last decade, including recipients of the Advancing Diversity and Social Change in Honor of Paul Davidoff, Daniel Burnham Award for a Comprehensive Plan, Planning Excellence Award, and Resilience and Sustainability Award. Plans spanned the U.S. from Puget Sound, WA to Birmingham, AL to New York, NY and featured primary planning functions including housing, transportation, urban design, economic development, and cultural heritage/historic preservation. Finally, we analyzed a twenty-year period of the Planners Network newsletter to uncover details about more radical and rogue forms of racial equity planning across the United States.

Through content analysis of racial equity plans produced by both government, non-government organizations, and private-public partnerships, we highlight the precise ways in which different planning institutions embrace racial equity frameworks. This process allowed us to identify the most significant, and oftentimes, lesser known and under-celebrated racial equity-oriented plans during the turbulent years of the Civil Rights Movement to present day.

This paper provides a conceptual framework of racial equity within planning to help scholars and practitioners foreground the importance of past achievements. Our goal is to inform planning scholars and practitioners of the diverse approaches that racial equity planning encompasses to help develop urban policies. We aim to help planners contextualize the value of a racial equity ethic within historical and contemporary efforts via the changing context of federal planning policies during a highly charged racialized contemporary context. The racial equity plans analyzed inform planners of the diverse approaches that racial equity planning has taken over time and helps them better implement goals that align with their planning agency's mission. Racial equity planning has always been a cornerstone of the field and lessons from literature and related plans merit deeper attention.

APPLYING RESILIENCE THINKING FOR COMPLEX ADAPTIVE SYSTEMS TO POLICY AND PLANNING

Abstract ID: 1840

Individual Paper Submission

SYAL, Shruti [Virginia Commonwealth University] syals@vcu.edu, presenting author
MCCONVILLE, James [Virginia Commonwealth University] mcconville@vcu.edu, co-author

In this integrative review, we present a conceptual framework developed from our synthesis of the body of literature on resilience theory as developed for the study of Complex Adaptive Systems (CASs). We discuss two cases illustrating its application to planning and policy.

Case 1. Learning from pandemics: applying resilience theory to identify priorities for policy and planning (published July 2021)

The COVID-19 pandemic spurred many predictions and prescriptions about the resilience of human settlements, but individual disciplines have different, overlapping conceptualizations of *resilience*, tuned to their examination of specific areas of concern. Since a colossal range of actions and processes at multiple spatiotemporal scales were impacted, cementing our expectation of system-wide disturbances, this interdisciplinary narrative literature review applied resilience theory for CASs as a conceptual framework to identify priority areas for planning/policy transformation. The research was conducted from January–November 2020, involving a review of ~500 articles on the COVID-19 outbreak by authoritative news outlets, and 237 journal articles on disease emergence, local and community transmission, and outbreak.

Examining how shocks like novel disease emerge, why human settlements are vulnerable to them, which stresses exacerbate the impacts of these shocks, and how response diversity and adaptive capacity help buffer those impacts, revealed five planning/policy issues to prioritize. First, since urban settlements and activities facilitate pathogen transmission between species, reducing 'shocks' like zoonotic diseases and climate change requires not just prioritizing urbanization patterns and land use in urban policies for environmental health, but also animal rearing practices and biodiversity maintenance. Second, since disease transmission is linked to not just contact rate but also host susceptibility, reducing vulnerability by improving equity in access to essential infrastructures like housing, water, sanitation, healthy food, green/public spaces, healthcare—that impact human health directly and indirectly—is critical. In its absence, curbing disease transmission requires focusing on contact rate suppression, but doing so brings human activity to a halt, decimating the economy and livelihoods. Third, the persistence of many pathogens or their vectors in environmental media suggests that built environment & public health professionals must address maintenance of environmental quality at various scales. Fourth, there is a need for redundancy, be it in commodity supply chains (like PPE, food) or data management for say, monitoring & enforcement of home quarantines during a pandemic. Fifth, as the Indian state of Kerala illustrates, social adaptive capacity-- which requires investing in social capital (human capital, bonding and bridging relationships), developing

social networks between state and non-state actors (via trust and clear communication, reciprocal and repetitive interactions)--is critical to responding to shocks.

Case 2. Applying CAS theory to holistically study obesity prevention in SNAP (analysis underway)

Public Policy theory, practice, and education center on linear processes, not accommodating the dynamic conditions, processes, and interdependencies that inform agenda setting and policy development. This narrative literature review of ~100 key journal articles discusses an update of public policy theory using the CAS literature, illustrated through a discussion of how to holistically, comprehensively study obesity prevention within SNAP. Obesity is an epidemic, with low-income people using SNAP benefits experiencing high obesity rates. The challenge for policy makers is providing nutritional support adequate to the economic limitations of the SNAP consumer community without incentivizing or supporting behaviors leading to obesity and its manifest negative individual and societal impacts. The contributors to these behaviors are complex, dynamic, and consist of interacting social and ecological variables, but are not studied in an integrated manner. This analysis uses our conceptual framework to identify the many *variables* that will require examination, explain how they are *related* to each other, integrate the *scales* of action and change, and accommodate the timeline of *policy cycles*.

RE:CODE L.A.: UNDERSTANDING THE POLITICS AND PRACTICES OF REZONING THE DEMOCRATIC-CAPITALIST CITY

Abstract ID: 1880

Individual Paper Submission

MAHAFFEY, Nathan [University of California, Irvine] nmahaffe@uci.edu, presenting author

Planning urban development in a democratic city is necessary—and—impossible. Zoning codes are ostensibly meant to regulate development to produce a good city for all, but empirical research explains how it often creates or reinforces a system of social and economic inequality. U.S. zoning evolved from a tool for rational expert decision-making, to a political mechanism used by powerful actors to control development in their interests. Scholars and zoning reform advocates suggest that recent innovations can democratize the process, through flexible tools of negotiation that bring various actors together in shared decision-making. However, political economy literature has extensively critiqued how state planning and zoning work to insulate economic interests from democratic decision-making. More recent literature, on post-politics and the post-democratic city, explains how mechanisms of governance go further to repress, disavow, or foreclose democratic politics. Therefore, what remains important for ongoing analysis is, first, how the production of new zoning tools is shaped by structural forces and various agents, and second, how is implementation of these tools enabling and constraining democratic politics.

This research addresses these issues by analyzing the evolving politics and practices of comprehensive zoning reform in Los Angeles from 2013 to present. The City's project "Re:Code L.A." seeks to modernize the existing code first adopted in 1946. It presents a critical case to study new zoning tools and practices that address the challenge of balancing economic development with democratic decision-making. Los Angeles is a complex and diverse city with a history of urban development influenced by powerful political forces. Specifically, the Downtown communities of Chinatown, Little Tokyo, and Skid Row have been historically marginalized by land use and zoning changes. As a result, these communities developed robust community planning coalitions of their own. Therefore, this case study opens a unique window to examine how new zoning tools and planning practices intersect with power and politics through urban governance.

This in-depth case study links the two overlapping processes of the creation of the new citywide zoning 'framework,' and its first implementation in the Downtown planning area, to answer the following research questions: (1) How have urban regimes influenced the shaping of the new zoning framework? (2) How are new planning tools used to

negotiate conflicting interests in Downtown Los Angeles? Qualitative methods are used to collect multiple types that answer these research questions. Archival research including project documents, correspondence, and planning drafts are used to construct a narrative of the chronological development and path dependency of the new zoning framework. Indirect observation of planning videos and visual analysis of planning presentations are used to examine how language and visual materials are used to make claims, exert influence, and justify decision making. Semi-structured interviews conducted with city planners, expert advisors, community coalitions, and other downtown interest groups are used to collect concrete information about the planning process, subjects' perceptions and beliefs about the project, and identify public debates from different perspectives.

DIVERSE EPISTEMOLOGIES AND PLANNING

Abstract ID: 1940

Individual Paper Submission

WICKLAND, Teo [Brown University] teo@ucla.edu, presenting author

Why do urban and regional planning efforts so often fail to achieve their goals of justice, inclusion and sustainability? Why do even participatory planning processes frequently disregard the perspectives, priorities, hopes and dreams of diverse groups? I argue, these failures stem in part from planning's canonical epistemologies, or ways of knowing. Professional planners are trained to think within the constraints of these canons. When soliciting outside input, planners identify stakeholders and interpret their contributions by way of these standard epistemologies. They thus ignore many stakeholders' different ways of knowing and imagining, and thereby limit the scope of the possible to that which can be envisioned through a standard lens.

In response to this issue, I trace the origins of planning's dominant epistemologies to modern science. I place this genealogy in the broader context of modernity/coloniality, and show how planning's canonical ways of knowing systematically reproduce inequality. Second, I offer a brief but multi-disciplinary review of scholarly literature on diverse epistemologies. This review provides a sense of the diverse ways of thinking, knowing and imagining which have always existed in the world, and which planning could nurture rather than suppress. Third, I explore ways in which planning could cultivate diverse epistemologies through three case studies, focused respectively on: planning scholarship; planning education; and planning practice. These three case studies illustrate specific ways in which planners can diversify their own epistemologies, while also supporting varied epistemologies among fellow teachers, students, researchers, practitioners and stakeholders.

Key findings

-Planning's traditional ways of knowing are based on the universalization of specific privileged perspectives as "objective," and the marginalization of disfavored perspectives as "subjective."

-Planning's dominant epistemologies, cast as "objectivity," systematically reproduce uneven outcomes which disadvantage disfavored groups while blinding planners to a vast universe of alternative futures.

-Enlarging the canon will not be sufficient to ensure equity and inclusion; rather, planning must develop a framework which continually supports diverse epistemologies from diverse sources.

-Diversifying planning's epistemologies will require deliberate efforts by planning researchers and instructors; conference organizers and journal editors; and planning practitioners.

-Specific planning interventions might include: greater transdisciplinarity; centering marginalized perspectives; creative methods; integration of spirituality, emotion, and storytelling; radical experimentation; and continual reflexivity.

REFUGEE, AGENCY, CITY

Abstract ID: 1962

Individual Paper Submission

MAANI, Sara [University of Illinois at Chicago] sara.maani@gmail.com, presenting author

This paper is a part of my PhD dissertation titled 'Refugee, Agency, City,' which grew out of an ethnography conducted in Milan, Italy, motivated by a search for collective claim making projects of refugees in the years following Europe's 2015 so-called refugee crisis.

The paper engages with critical governance theories and critical urban theories, particularly the question of scale ((Davies, 2011; Jessop, 1997, 2016; Brenner, 2019), at the intersection with social movements' scholarship , particularly with regard to self-organizing ((Tilly and Tarrow, 2015; Martinez et al., 2019; Swyngedouw, 2018; Amendola et al., 2020), and critical migration studies, with particular attention to the question of agency (Walia, 2021; Mezzadra and Neilson, 2013; De Genova, 2013, 2017). I engage with these scholarships in order to situate self-organizing practices for migrants' protagonism within governance frame, with the aim to examine the capabilities, limits, and potentials of self-organizing for migrants' protagonism.

Through the deployment of Gramscian interpretations of governance, I develop a relational ontology and a multi-scalar methodology, in order to grasp some aspects of how the tensions and contradictions among multiple governance types at work by multiple actors in multiple scales construct the panorama of urban refugee governance in a dialectical relationship. Asserting that the relationship between coercion and consent is inherently dialectical, I discuss instances of governance by hegemony, governance by exclusion, and counter-hegemonic governance within refugee governance.

In refugee governance, the state, including the national, subnational and supranational ones, deploy multiple types of governance, such as governance by hegemony and governance by exclusion. Referring to state's governance by hegemony, the third sector, once sought to intermediate the relationship between civil society and state by an ethos of democratization through participation, revealed its coercive aspects in a continuum from hegemonic leadership towards domination in managerialist, and hierarchical processes in refugee governance. At the same time, it was a carrier for mobilizing the forces of civil society for solidarity with migrants to be channeled in the structures for civil society-state partnership in refugee management on a local scale through assistentialist and humanitarianist techniques. At its own turn, it had become the shadow of coercive power of the state, and in dialectical relationship with instances of the states' migration governance by exclusion, such as governance through campization, ghettoization, and the detention and deportation regimes.

Given the structural conditions, if we consider the social movements as the counter-power to the state power, for the specific positioning they have in relation to the state on one hand, and with migrants on the other hand, they are building other multiple types of governance simultaneously. In their relation to the state, they try to build counter-hegemonic governance, while in the internal dynamics in the encounter with migrants, they examine the opportunity to build a governance based on affective trust. By articulating social movements' counter-hegemonic governance in solidarity with migrants, the paper hopes to speak to the urban social movements which care for organizing and solidarity with migrants within and against the asymmetric power relations in the field of migration.

SOCIAL JUSTICE AND THE IMMIGRANT CITY

Abstract ID: 2008

Individual Paper Submission

DEFILIPPIS, James [Rutgers, The State University of New Jersey] jdefilip@rutgers.edu, presenting author

The theme of social justice has long occupied planning theorists, and urban theorists more generally. Fainstein (2010), for instance, argues for making justice, and its components, the central criteria for the evaluation of plans, policies, and even cities. And the AICP's Code of Ethics has social justice in several points among planners' foundational "principles to which we aspire." But while the concept of justice is widely used, it also inspires widespread disagreement. Furthermore, it is a concept that has often struggled with questions of migration and immigration. As Fraser (2009) has argued, social contract theories of justice from Hobbes onwards have had to erase questions of "the who" in justice, in order to focus on "the what" of justice. Those theories have done so by either assuming that "the who" is a closed and bounded political community, or by advocating for such closure. John Rawls, perhaps the most prominent liberal moral philosopher of the last 50 years has said he assumes, "a closed system; there are no significant relations to other societies, and no one enters from without for all are born into it to lead a complete life" (Rawls, 1999, p. 323). Alternatively, communitarians such as Walzer (1983) and Miller (2016) have advocated for limited immigration to protect the coherence of the political community. Such views of both immigrants and of the political community are problematic because they are disconnected from the world that we have (which has large numbers of trans-national migrants, and the presence of such migrants does not prevent societies from debating questions of justice), and essentializes identities in ways that are both theoretically problematic and empirically unjustified.

Alternative frameworks for thinking through justice and immigrant societies have certainly been proposed, and most influential in planning has been Iris Marion Young's work. Young begins her magisterial book *Justice and the Politics of Difference* with the completely justified observation that, "theories of justice have operated with a social ontology that has no room for a concept of social groups" (1990, p. 1). In contrast, Young and others have argued for the primacy of social groups in understanding social justice. In so doing, however, they are themselves engaging in a form of essentializing differences between groups.

In this talk I will argue against the tendencies to both universalize the meanings of justice, and essentialize the meanings of group identity. I do this in several ways. First, following Sen (2009), I argue that having a complete understanding of "what is justice?" is neither necessary nor doable in dealing with injustices. Instead, we should think of justice as "practical reason" as we debate what is to be done and what is just. Second, I borrow from those theorizing racial formations and ethnic constructions, to build an understanding that the meanings of immigrants' ethnic identities are socially and politically constructed. They do not exist a priori, but emerge contextually. Third, I borrow from Dewey a recognition that the public itself is a processual realm, rather than a static thing. A public that is ever forming is an explicit rejection of fixed identities, and allows those identities to contextually emerge in the process of public making.

These writers' works come together to offer planning theory a way to think about urban social justice without resorting to either frameworks that require a closed political community or those that foreground and essentialize differences between groups.

MONETARY SANCTIONS AND THE HISTORY OF DRIVER'S LICENSE POLICY

Abstract ID: 2017

Individual Paper Submission

PINSKI, Miriam [University of California, Los Angeles] mpinski@ucla.edu, presenting author

A driver's license serves two broad purposes: primarily, as a tool to filter and enforce who is eligible to drive legally, and secondarily as a general form of official identification. Over the course of the twentieth century, people increasingly needed to drive. The more essential a driver's license was for daily life, the more effective the threat of a suspension could be. Over the same period, however, California judges had largely determined that driving was not a fundamental right but a privilege. Court arguments that suspensions for nonpayment discriminated against people with low-incomes and were not reasonably related to road safety fell on deaf ears. Legislators could safely use suspension statutes to pursue a range of policy aims increasingly divorced from transportation concerns. With the advent of database sharing and tracking technology, state agencies were better able to enforce suspension statutes. Suspensions quickly became an easy tool legislators could use to enforce monetary sanctions associated with welfare and drug policies. Federally-backed child support delinquency suspension legislation in the early 1990s marked the beginning of a slew of non-driving-related suspension statutes in California. Drivers could lose their license for skipping school, graffiti, using a firearm, or engaging in prostitution. And it was not just technology that enabled the state to treat suspensions as a form of monetary sanction at a large scale. The playing field of auto interests had changed. When failure-to-pay suspensions were once again contested in the courts in the 2010s, the auto interests that had advocated for driver's license suspensions in the early auto era were for the most part absent. Auto clubs and insurance groups that had lobbied on behalf of suspension statutes were no longer pursuing this strategy, and in their place was a small group of civil rights legal advocates more connected with broader criminal justice issues than road safety.

When a driver loses their driver's license, they not only lose their right to drive legally, but also risk their livelihoods, ability to participate in elections, and easy access to various public institutions and services. Existing studies show that non-white drivers and drivers in low-income neighborhoods are more likely to be stopped by law enforcement, and more likely to have their license suspended (Bender et al., 2015; Joyce et al., 2020). The purpose of this study is to answer the questions: 1) how did our current licensure regime come to be; and 2) how does license policy compound existing income and race/ethnicity-based disparities in accessibility? To understand how non-transportation policies about driver's licensing have changed over time, and if race/ethnicity is implicated in these changes, I review state legislative records, law review articles, and newspaper articles from newspapers in California that relate to licenses beginning in 1905, when California cities first adopted driver's license statutes until present day. I supplement my analysis of historical newspapers, statutes and court records with a descriptive analysis of California Department of Motor Vehicle data on suspensions for failure-to-appear in court, failure-to-pay fines and fees, and child support delinquency from 2013 to 2019.

This study adds to the literature on monetary sanctions, impediments to mobility, and racial profiling in law enforcement (Garrett & Wagner, 2009; U.S. Department of Justice, 2015). It also highlights the ways states such as California use driver's licenses for purposes other than driving and, in so doing, disenfranchise minority populations. In some states, again like California, these types of policies have reform efforts. This study, therefore, informs current policy debates on license suspension reform.

FROM WALL-TO-WALL BROADLOOM TO ROCK CLIMBING WALLS: THE PRODUCTION OF HIGH-RISE LIFESTYLE ACROSS PLANNING AND MEDIA ARCHIVES

Abstract ID: 2028

Individual Paper Submission

PERROTT, Katherine [University of Waterloo, School of Planning] kperrott@gmail.com, presenting author
LEHRER, Ute [York University] lehrer@yorku.ca, co-author

Across North America, planners and urban designers call for densifying housing, revitalizing downtowns and retrofitting suburbs (e.g. Dunham-Jones & Williamson 2011). The City of Toronto has over seventy years of experience in producing density through high-rise buildings, first through a rapid expansion of suburban rental apartments in the 1960s and later in waves of downtown condominium development (Relph 2014; Boudreau, Keil & Young 2009). Against the backdrop of valorized low-rise suburban expansion, Toronto planners and developers in the post-war decades worked to produce a desirable image of high-rise forms and apartment living. In doing so, they facilitated a lasting framework for public and private investments across the regional landscape.

Research on high-rise lifestyle has largely focused on the recent condo boom (Kern 2010; Lehrer 2012). Less attention has been paid to the historical role of rental buildings and the first condos, which through their advertising strategies shaped enduring expectations about urban ways of life. We ask: How have the advertised lifestyle features and amenities in Toronto's high-rise buildings changed or remained the same over time? What factors explain these continuities and divergences?

Toronto's planners were instrumental in zoning high-rise apartment clusters long before "density nodes" or "compact city" were trending. Planners clearly shape the built environment, but what roles have they played in producing spatial meaning? The role that developers and their advertising agencies play in lifestyle is explicit; we argue that planners too are agents of lifestyle. Planning reports are not just technical documents, but cultural artefacts in the archive of the city. Planners' visions retold in the news media alongside apartment building advertisements produce an image of high-rise living.

Our focus is on a sample of apartment building advertisements in a major daily newspaper, The Toronto Star, at intervals between 1961 and 2011. We compare the historical trends to contemporary advertisements in Condo Life magazine and developer websites. We examine these trends alongside a close reading of key planning documents and shifts in the broader context, building a political economy analysis of the densifying built environment.

From the historical ads for modern and luxurious apartments with wall-to-wall broadloom carpeting to contemporary condos boasting rock climbing walls, pet spas and celebrity-designed interiors, this paper offers an analytical guide through the city's high-rise archives. Toronto is a global influencer of high-rise condo culture. The city has much to reveal about lessons learned through decades of densification and the pursuit of the good life at the complex intersection of planning-for-the-public-good and real-estate-capitalism.

ASSEMBLING FOR JUSTICE? INFRASTRUCTURAL POLITICS IN TWO TEXAS CITIES

Abstract ID: 2046

Individual Paper Submission

NOSTIKASARI, Dian [Drake University] dian.nostikasari@drake.edu, presenting author
FOSTER, Nicole [Northland College] nfoster@northland.edu, co-author

The racialized and politicized development of the US highway system is intertwined with the displacement of working-class, black and brown communities, and the fracturing of their connections to land, homes, and businesses. While both elites and ordinary residents shape transportation policies, the lack of means and know-how to challenge eminent highways constructions often render community needs and struggles invisible (Biles and Rose, 2020). More recently, however, challenges to transportation projects illustrate how the inclusion of non-human elements--technology, buildings, streets, and property--assembles a politics around infrastructure projects enabling the reconstruction of citizens as political actors in asserting their rights over contested transportation space (Shelton, 2017). However, critical theorists have challenged assemblage theory for inadequately addressing structural causes of injustice (Brenner et al., 2011). Despite the emergence of alternative assemblages shaping the future of highway projects (Khalaj et.al., 2020), the question remains whether highway removal subsequently reconnects fragmented neighborhoods and promotes racial equity.

Drawing on assemblage theory, we use a case study approach to trace the networks engaged with highway oppositions in Dallas and Houston (TX) to evaluate their social justice potential. We seek to articulate who, how and what these projects assemble to understand whether the question of highway oppositions--both removal and expansion--may lead to just outcomes. For each case study, we ask the following questions: 1) What is being assembled through political mobilizations focused on infrastructure? 2) How do assemblages develop and change over time? 3) What does the assemblage produce in terms of strategies for achieving social justice? The mobilization of actors, data, media and narratives aimed at highway removal in Dallas illustrates how projects may claim equity outcomes but will likely still benefit capitalist development over local communities. In Houston, an assemblage centered on mapping residents' displacements and environmental justice offer alternatives for just outcomes.

The planning profession and planning theory have been compared to the ‘magpie’ (Sandercock, 2000; Barry et al, 2018). Similarly, students of planning theory could be likened to magpies, gathering the shiny objects of planning theory (shiny as judged from their own perspectives) and building them into their own nests of research and self-development. In fact, the shiny objects presented as planning theory have been in continual flux. John Friedman’s (1988) diagramming of two centuries of planning theory sheds much light on canonical texts. Since then there has been much debate as to how to characterize the corpus of theory and its relationship to planning practice. A growing

number of scholars have challenged planning theory to embrace lessons from Indigenous feminist praxis (Dorries & Harjo, 2020), engage in insurgent practices and imagine alternative futures (Miraftab, 2019), reflect Black spatial imaginaries (Poe, 2021), rethink biased measures of vulnerability (Jacobs, 2019), contemplate post-humanism and the relationships between society and nature (Jon, 2020), and incorporate the ethics of planning with things (Beauregard, 2012). Meanwhile, challenges to positivism, theories of communicative action and power, collaboration and complexity, and debates over agency versus structure endure as key themes and debates. Planning theory remains a contested terrain, easily challenged as too rooted in Global North sources and discourses. Scholars such as Vanessa Watson (2002, 2009) advocate for incorporating viewpoints from the Global South when theorizing about the city and planning practices, arguing that not every theory is universally applicable. Vasudevan & Novo (2021) invite reconceptualizing planning as a pluriversal field that makes space for multiple ways of being and producing knowledge.

While planning theory is often oriented toward textual analysis, this poster provides a set of graphical representations of the personal intellectual journeys, fruitful tensions, contributions and limitations to the research endeavors, practices, and lives of doctoral and master's students in the fields of city and regional planning, regional science, and anthropology and who came from a variety of educational and professional backgrounds, nationalities, ethnic identities, and research interests. In a doctoral level Advanced Planning Theory Seminar, students and instructor set out to explore the boundaries, edges, lineages, canons, imaginaries, master signifiers, actors, networks, and assemblages of planning theory. What can observations of emerging planning scholars tell us about the field of planning theory? This poster is a reflection on that question, focusing on the presentation and analysis of diagrams that reflect the intellectual journeys, queries, and positionalities. The title of the poster is based on both distinct and repeated metaphors explored in widely divergent ways in student-crafted diagrams.

The poster affords educators the opportunity to reflect on the pedagogy of planning theory. In preparation for teaching the course, the instructor reviewed the syllabi from her own doctoral educational experiences and compared them to more recent versions of syllabi from planning theory courses. In addition, she reviewed a scan of planning syllabi performed by a PhD student a few years prior. After the seminar began, she was further informed by a bibliometric analysis of planning theory conducted by one of the students in the seminar (Bower, 2021). After the seminar, a more systematic review of planning theory syllabi was conducted. This poster introduces a graphical depiction of the content of planning theories from this scan of syllabi.

Please note: this poster is derived from the diagrams and writings of 12 students and one instructor. Only eight names could be included in an ACSP abstract. The poster will list the names of all co-authors.

LIVED EXPERIENCES AND PERSPECTIVES OF STAKEHOLDERS IN DISABILITY AND TRANSPORTATION

Pre-Organized Session 39 - Summary

Session Includes 1576, 1577, 1578, 1631

KWON, Jamie [Rutgers University] jk1639@scarletmail.rutgers.edu, organizer

Many of the 43 million people with disabilities in the U.S. experience transportation challenges that hinder their ability to fully participate in society. People with disabilities face various types of challenges in traveling, from accessing public transit services to using ride-hailing services and purchasing a wheelchair-accessible vehicle. To better serve the transportation needs of people with disabilities, federal and local government, ride-hailing services, and transportation agencies need innovative, inclusive solutions. This session brings together a group of emerging scholars to explore the barriers to transportation faced by people with disabilities and potential avenues to increase access. Through qualitative methods, the papers highlight the lived experiences of people with disabilities navigating built environments and transportation and the perspectives of other stakeholders, including app-based ride-hailing drivers and vehicle modification experts.

Objectives:

- Understand the lived experience of people with disabilities experiencing transportation barriers and navigating such challenges
- Learn from the perspectives of service providers how to better meet the transportation needs of people with disabilities in planning practices and policies

FIRST AND LAST MILE ACCESSIBILITY: THE EXPERIENCES OF PEOPLE WITH DISABILITIES USING PUBLIC TRANSIT IN AUSTIN AND SEATTLE

Abstract ID: 1576

Abstract within Pre-Organized Session 39

LEVINE, Kaylyn [University of Texas at Austin] kaylyn.levine@utexas.edu, presenting author

In transportation planning practice and research, disability is largely mistreated and oversimplified (Terashima & Clark, 2021). People with disabilities account for 26 percent of adults in the U.S., but experience disparate travel outcomes compared to the rest of the population because they are underrepresented in the transportation planning process (CDC, 2019). While the Americans with Disabilities Act (ADA) of 1990 was a significant step in the right direction towards inclusion and accessibility to public entities, institutional barriers, and built environment challenges, the social exclusion of people with disabilities continue to exist (Eisenberg & Maisel, 2021). Even though public agencies build new infrastructure in compliance with the ADA guidelines, these minimum standards are not adequate for barrier-free travel including first and last mile travel to public transit stops.

Public transit systems connect people to opportunities using space-efficient and relatively affordable modes, providing low-cost mobility for those who cannot or do not want to drive. However, the decision for a potential transit rider to use the system depends on their conception of the local built environment and their capacity to actually reach a transit stop along the first and last mile. The perceived quality of built-environment features is amplified for people with disabilities, and urban residents report more severe disabilities when the urban built environment is unfavorable (Rosso et al., 2011). In addition, people with disabilities face insecurity, exclusion, and ultimately travel less because of the social conditions they experience in public spaces (Iudici et al., 2017).

This research evaluates first and last mile access to transit for people with disabilities through semi-structured interviews with transit riders in Austin, TX and Seattle, WA. My primary research question is: how do the current perceived social and built environments influence access to transit along the first and last mile for people with disabilities? The purpose of the study is to provide practitioners and policymakers guidelines regarding meaningful

public engagement regarding access to public transit for people with disabilities. I ensured diversity of the sample by engaging participants with different types of disability, culture, gender, sexual orientation, race, age, level of activism, and education. Interview questions are centered on self-identification, lived realities, critical perceptions of accessibility, and reimagining the built and social environments to improve transportation and disability justice. By having interviewees self-identify and describe their ideal travel conditions, I challenge established transportation planning norms, categories, and stigmas about disability and other identities. I argue that the absence or limited inclusion of lived experiences along the first and last mile for people with disabilities in traditional transportation planning has exacerbated existing inequalities in transit access. Interview findings reveal how social attitudes, interactions with other pedestrians, and feelings of safety and security influence accessibility and perceived access to transit.

ACCESSIBLE PUBLIC TRANSIT FOR PEOPLE WITH DISABILITIES THROUGH THE LENS OF LIFE-SPACE MOBILITY

Abstract ID: 1577

Abstract within Pre-Organized Session 39

KIM, Ja Young [University of Utah] jaykim37@gmail.com, presenting author
BARTHOLOMEW, Keith [University of Utah] bartholomew@arch.utah.edu, co-author
CHANDRASEKHAR, Divya [University of Utah] D.Chandrasekhar@utah.edu, co-author

According to 2016 Behavioral Risk Factor Surveillance System (BRFSS) survey, one in four noninstitutionalized adults in the U.S. lives with one or more types of disability (Okoro et al., 2018). Persons with disabilities face greater transportation barriers to move around, which results in fewer day-to-day travel because of disabilities (Brumbaugh, 2018). The Americans with Disability Act (ADA) promotes the inclusion of people with disabilities in every aspect of life, including transit accessibility, which is one of the basic needs to ensure everyone’s access to essential goods, services, employment, and social participation.

This study uses an interdisciplinary lens to explore the connection between the built environment and mobility in the needs of people with disabilities. First informed by gerontologists, life-space mobility measures a broad scope of mobility experienced in different spatial locations in daily lives (Peel et al., 2005). For people with disabilities, the scope of a journey isn’t simply from the trip origin to the destination, and this relates to the first mile/last mile discussion. Through the lens of life-space framework, the authors address the gaps between the needs of transit users and the current transportation planning practices of service providers by exploring collected data from semi-structured interviews, focus groups, and citizen advisory group meetings.

Although it is evident that transit authorities focus on what is in their jurisdiction, transit users with disabilities are concerned about the whole system. It’s from one’s home to the destination, from trip planning to interpersonal connections/communications with drivers and the transit system, and from personal considerations to broader themes. The unmet needs can address a new perspective of transit planning for people with disabilities and accessibility justice for all.

VEHICLE MODIFICATION FOR PEOPLE WITH DISABILITIES: CHALLENGES AND STRATEGIES

Abstract ID: 1578

Abstract within Pre-Organized Session 39

KWON, Jamie [Rutgers University] jk1639@scarletmail.rutgers.edu, presenting author

Some people with mobility disabilities can modify a vehicle with ramps and hand controls to enable them to drive independently or ride as a passenger more conveniently. Previous research has shown that driving a modified vehicle is associated with higher chances of being employed, spending more time outside socializing, and participating in more recreational activities (Darcy and Burke, 2018; Mtetwa et al., 2016; Tsai et al., 2014). Yet, vehicle modification can be cost-prohibitive (Remillard et al., 2022); people with spinal cord injuries—the most common disability among disabled drivers—spend on average \$6,500 USD and up to \$65,000 USD to modify a vehicle.

Beyond these cost figures, we know little about the experience of purchasing a modified vehicle in the United States. To my knowledge, there is no qualitative data on experiences of people with disabilities purchasing a modified vehicle in the U.S. context. While a few scholars have studied challenges in purchasing a modified vehicle in New Zealand (Woodbury, 2013), Australia (Darcy and Burke, 2018), and South Africa (Mtetwa et al., 2016), these studies have not explored how people with disabilities navigate the many financial and administrative hurdles of finding, financing, and purchasing a modified vehicle. Thus, additional research in the U.S. context is necessary to understand the challenges people with disabilities face in the vehicle modification process and what strategies do they employ to procure a modified vehicle.

To fill this gap, I interviewed 25 people with spinal cord injuries. I recruited participants through the Christopher and Dana Reeve Foundation, a national non-profit organization dedicated to the well-being of people with spinal cord injuries. I conducted in-depth interviews with individuals who own modified vehicles and those who wish to own a modified vehicle. For the latter, I ask what has kept the interviewees from getting a modified vehicle. When interviewing respondents with modified vehicles, I focus more on how the interviewees have overcome challenges to make a purchase.

My research reveals that many people with spinal cord injuries in my sample found it difficult to afford a modified vehicle and that the limited market for vehicle modification complicated their search process. To overcome these barriers, most interviewees received public or private financial assistance, such as vehicle modification grants offered by state vocational rehabilitation centers. Some took out vehicle loans and around half of the interviewees used their employment income. Many purchased used vehicles, but this choice was severely restricted by some grant agencies and occasionally led to problems with reliability.

In addition, I conducted interviews with five vehicle modification experts (e.g., state vocational rehabilitation center supervisors and vendors) to assess their view on the financial and informational resources available for vehicle modification. My interviews with vehicle modification experts suggest that eligibility criteria for vehicle modification subsidies vary heavily across states.

Based on my findings, I suggest three recommendations for increasing access to modified vehicles for people with disabilities: revising the vehicle modification grant programs offered by state vocational rehabilitation centers; making information on state vehicle modification programs more accessible online; and considering federal or state loan programs for modified vehicles.

Finally, by positioning people with disabilities as active agents in navigating transportation challenges rather than passive recipients of policy intervention, my research illustrates the importance of involving people with disabilities in the planning process.

DRIVING WHEELCHAIR USERS ON THE UBER AND LYFT APP: DRIVERS' EXPERIENCE AND PERSPECTIVE

Abstract ID: 1631

Abstract within Pre-Organized Session 39

GEBRESSELASSIE, Mahtot [Carnegie Mellon University] gmahtot@vt.edu, presenting author

Uber and Lyft have become ubiquitous and important players in the transportation landscape. They are lauded for bringing innovative technology solutions to transportation (Jin, et al., 2018) and even filling transportation gaps for people with disabilities (Brewer, et al., 2019). The companies' reputation, however, is tarnished regarding service for riders in wheelchairs. Some of the problems identified pertain to driver practice and behavior, such as service denial, driver refusal to assist with wheelchairs and helping riders transfer into vehicles, and lack of proper training (Gebresselassie, 2021; San Francisco Municipal Transportation Agency, Taxis and Accessible Services Division, 2019). Complaints and lawsuits in relation to wheelchair accessible service attempt to hold the companies accountable. The response from Uber and Lyft has been to cite their non-discrimination policies and consequences for drivers who do not comply with policies (Perry, 2018).

The perspective of drivers regarding service to disabled riders is not represented in the literature except in a few studies. There is little known about the Uber and Lyft drivers (Berliner & Tal, 2018; Brewer et al., 2019), much less about drivers in relation to wheelchair accessibility. This research fills the gap in focusing on the perspective of drivers by taking a case study of transportation service hailed through these apps in Washington, DC. It investigates the problems identified in literature such as ride declines and poor service as highlighted in Francisco Municipal Transportation Agency, Taxis and Accessible Services Division (2019) and Gebresselassie (2020). Semi-structured interview with 12 drivers on the apps was conducted to understand drivers' perceptions and experiences and how these relate to the service they provide to wheelchair users. The interview questions focused on the drivers' experiences interacting with wheelchair users in relation to the themes highlighted in literature, for instance service refusal. Drivers who did not have experience providing service to wheelchair users were also interviewed to understand how they perceive providing service to wheelchair users and how that may translate into their practices and behavior. Both groups - drivers with and without experience - were asked questions about their perception of providing service to wheelchair users compared to serving non-wheelchair users.

The findings indicate that some drivers perceive and experience transporting wheelchair users as markedly different from the service to non-wheelchair users due to the extra time and labor required to stow a wheelchair and assist the rider transfer into the vehicle. For some, this makes the service "above and beyond" as described by one driver, requiring extra compensation. For others, the process of assisting wheelchair users can be stressful since extended pickup time may delay traffic or subject them to possible accidents in dangerous locations. While none of the drivers interviewed reported refusing a ride to wheelchair users, they perceive ride refusals to possibly stem from uncompensated extra time and labor required in transporting wheelchair users and perceptions of liability of injuring them in the process of assisting them. One possible solution to tackle discrimination against wheelchair users is to use the app technology to keep a record of ride requests by wheelchair users who volunteer to disclose disability status and incentivize drivers for completed rides.

The purpose of the study is to create better knowledge of wheelchair in/accessibility of transportation service hailed through Uber and Lyft by engaging the direct service providers. This helps to understand what is currently working and what the problems are from their point of view. The study also informs app-design based solutions and policymaking to overcome problems of accessibility where they exist and help in making transportation options accessible to all in current options and their future iterations.

FINDING RESEARCH QUESTIONS WORTH ANSWERING IN TRANSPORTATION PLANNING

Abstract ID: 1519

Roundtable

SALON, Deborah [Arizona State University] Deborah.Salon@asu.edu, organizer, moderator
KRIZEK, Kevin [University of Colorado Boulder] kjkrizek@gmail.com, participant
GIULIANO, Genevieve [University of Southern California] giuliano@usc.edu, participant
BROWN, Anne [University of Oregon] abrown33@uoregon.edu, participant
KING, David [Arizona State University] david.a.king@asu.edu, participant

Many academics complain that the pressure to publish more and more has led to a proliferation of mediocre research (Sarewitz, 2016), a lack of relevance of academic research for today's world (e.g. Jaschik, 2021), and a pattern of incremental rather than transformational science (Sverdlov, 2018). The proposed ACSP roundtable session aims to inspire and help transportation planning researchers at all levels "up their game" with research that is attuned to the pressing problems of today's world, asks questions that we do not already know the answers to, and sometimes moves beyond the incremental science model. We aim to accomplish this with a 2-part session.

First, we will have a short (~15-20 minutes) roundtable discussion by leading transportation planning scholars to set the stage and begin a conversation that identifies key challenges in transportation planning and discusses how to craft research questions that speak to those challenges. This will be followed by a technology-enhanced, full-participation brainstorming session to generate research questions and jumpstart new collaborations among all in attendance.

We hope you will join us!

TO ADVOCATE OR NOT: EXPLORING THE PROMISE AND PERILS OF EVANGELISM AMONG TRANSPORTATION PLANNING PROFESSORS

Abstract ID: 1715

Roundtable

RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, moderator

KLEIN, Nicholas [Cornell University] njk8@cornell.edu, participant

FAN, Yingling [University of Minnesota] yingling@umn.edu, participant

MANVILLE, Michael [University of California Los Angeles] mmanvill@ucla.edu, participant

What should transportation planning professors do when an idea is widely shared among our colleagues and our students but is not embraced by the public or experts from other disciplines? In this roundtable, we invite participants and audience members to explore this question together. We will discuss the following questions: When is advocacy appropriate? For which topics and in which settings? How should we balance the risks of advocacy with a sense of professional obligation to champion our values? If we decide that advocacy is indeed appropriate, how should we approach it and how do we make sure our own institutional structures recognize and reward advocacy? Finally, what does our stance on advocacy mean for pedagogy?

Two policy positions that are emblematic of the gap between the views of the transportation planning professoriate and the public are congestion mitigation and parking (Ralph et. al. 2022). While the public broadly supports building our way out of congestion, either via additional road or transit capacity, transportation planning professors tend to favor congestion pricing. With parking, transportation planning professors favor eliminating parking minimums while the public favors parking requirements.

In assessing the suitability of advocacy, it might seem most appropriate to be evangelical in cases where our professional expertise and training lead us to have systematically different knowledge than the lay public. For instance, whereas planning students near universally understand induced demand, the idea is widely misunderstood by the public. While debates about the role of advocacy are difficult enough when it comes to factual knowledge, they are thornier still when considering differences in beliefs, preferences, and values. Should planning professors become evangelical about our interpretation of planning history or our views?

In making these decisions, we must be clear-headed about the potential risks of embracing advocacy. What unintended consequences might materialize? What will it take to maintain our scholarly credibility and fend off claims of undue bias? Could a shift to advocacy draw greater scrutiny to our departments, bringing the culture wars to our doorstep?

Despite these risks, some may argue that those of us in the academy have an obligation to advocate much more actively. Grant-funded nonprofits and consulting firms are unlikely to aggressively question the status quo because their funding would likely dry up. Who else has the expertise, the manpower, and the stable funding base to bring about meaningful reforms?

If we are to become evangelical, how should we go about it? What approaches would be most effective? Some of us already take to Twitter and the op-ed pages. Others join planning commissions and lobby our local, state, and national representatives. What other venues should we use to make our individual and collective voices heard? Can our research inform our advocacy to identify ways to improve our outreach?

How can our institutions begin to formally recognize and reward advocacy? There is a sense that advocacy is undervalued in most corners of the academy, which leads many junior scholars to make the reasonable choice to put off advocacy until tenure. If we want more scholars to pursue advocacy, how do we reform our institutional structures?

Finally, if and how should our advocacy inform our pedagogy? Is it sufficient for our students to simply practice communicating core planning ideas or should we require them to get involved in planning disputes as advocates? Should we direct our students to work locally to remove minimum parking requirements, modify traffic impact analysis, and oppose road widenings? What additional skills and training will they need to do so effectively and how can we provide it?

HETEROGENEOUS NONLINEAR RELATIONSHIPS BETWEEN BUILT ENVIRONMENT ATTRIBUTES AND VMT IN SUBURBAN AND URBAN AREAS

Abstract ID: 4

Individual Paper Submission

CAO, Xinyu [University of Minnesota] Cao@umn.edu, presenting author
TAO, Tao [University of Minnesota] taotao@umn.edu, co-author

Limited developable lands and high development costs in urban areas have been pushing new residential development to suburban areas (Levitt & Eng, 2021). Because suburbanites tend to drive longer than urban residents, designing effective built environment interventions to reduce suburbanites’ auto use is key to sustainable transportation. The literature on the built environment and auto use sheds light on the issue. There are, however, two research gaps. First, few studies focus on the relationships between built environment attributes and auto use in suburban areas. Previous studies often examine the whole metropolitan area or compare traditional and suburban neighborhoods in the same region, and conclude that neo-traditional neighborhood design helps mitigate auto use. However, the results derived from these studies and associated planning implications may not be applicable to suburban areas. Several studies have shown the heterogeneous effects of the built environment across their study areas (Elldér et al., 2020; Salon, 2015). Second, previous studies often apply (generalized) linear models, which may bias the true relationships between built environment attributes and auto use. Recent studies have shown that the relationships are irregularly nonlinear (Ding et al., 2018). Linear models may not fit these nonlinear relationships well and hence underestimate the efficacy of using built environment interventions to alter travel behavior (Wu et al., 2019).

Using household travel survey data from the Twin Cities area, USA, we applied the gradient boosting decision tree method to address two research questions: Is the built environment equally important to predicting vehicle miles traveled (VMT) in urban and suburban areas? How do the relationships between built environment attributes and VMT in suburban areas differ from those in urban areas? Results showed that built environment attributes in suburban areas collectively have a smaller contribution to predicting VMT than those in urban areas. By relaxing the linear assumption, we found that population density, land use entropy, and transit stop density, important to VMT in urban areas, have trivial influences on VMT in suburban areas. By contrast, promoting job accessibility and intersection density in suburban areas seems promising to mitigate auto use.

This study contributes twofold to the literature. First, it shows that the nonlinear relationships between built environment attributes and VMT are prevalent and differ between urban and suburban areas, which informs the research design of future studies on the relationships. Second, the results suggest that policy makers should ponder built environment interventions for reducing auto use in suburban areas. Policies that work in urban areas, such as population densification and land use diversification, might not be effective at all in suburban areas.

ASSESSING THE SEVERITY OF TRAFFIC CRASHES IN ABU DHABI: A MACHINE LEARNING APPROACH

Abstract ID: 1005

Individual Paper Submission

MAGHELAL, Praveen [Rabdan Academy] pmaghelal@ra.ac.ae, presenting author

ALI, Abdulrahim Haroun [Khalifa University] 100052927@ku.ac.ae, co-author

AZAR, Elie [Khalifa University] elie.azar@ku.ac.ae, co-author

The World Health Organization identifies road traffic injuries as a global health problem as traffic crashes are predicted to become the seventh leading cause of death by 2030, especially among youth aged between 15-29 years of age (WHO, 2018). The 2018 Global Status Report on Road Safety identifies that the traffic death in the Eastern-Mediterranean region reached 18 deaths per 100,000 population, the third-highest in the world after Africa (26.2 per 100,000) and South-east Asia (20.7 per 100,000) (WHO, 2018).

Previous studies either were not comprehensive with the use of indicators (Alikhani et al., 2013) or those with more comprehensive approach did not include characteristics of initiator and victim to examine the severity of accidents (De Ona et al., 2013). Also, the middle-eastern region has remained outside the purview of recent studies using the ML approaches to predict severity of accidents except for a few (Jamal et al., 2020) focusing in Saudi Arabia. This is one of the first studies predicting the severity of crashes among the drivers in the United Arab Emirates. Traffic Accident Data from the Abu Dhabi Police were analyzed using an artificial intelligence approach for the severity of accidents measured as Mild, Moderate, Severe and Fatal. About 11,400 observations for 2014-2017 were accessed. Indicators of individual characteristics, vehicular characteristics, behavioral characteristics, and accident characteristics were analyzed for their importance using several machine learning algorithms, including gradient boosting (GB), support vector machines (SVM), and random forest (RF). The chosen techniques are well documented in the literature with proven predictive abilities for classification problems (Lin et al., 2021). Each model is tuned using a random search using 1000 iterations. Random search does not test all hyperparameter combinations but rather randomly selects a defined number of hyperparameter combinations, hence it is typically less expensive while producing competitive results (Probst et al., 2019). The models are evaluated using two performance metrics, accuracy and F1-scores.

Results indicate no case of overfitting of the data. The RF outperformed both the GB and the SVM approaches with the confusion matrix of RF reporting a better prediction for all the four classes of severity of accident. The feature importance values report that the age of car, age of the injured, and the age of the initiator have the highest effect on severity. Vehicle and road characteristics such as vehicle class, accident type, lighting are slightly associated with the severity. Consistent with other studies, gender was the least important predictor of severity.

The implications are directed towards the Abu Dhabi Department of Municipalities and Transport (AD-DMT) that provide crucial insight for road safety policies and appropriate countermeasures to mitigate the occurrence and severity of crashes.

IMPACTS OF ACTIVE TRANSPORTATION PLANS ON BUILT ENVIRONMENT AND TRAVEL BEHAVIOR: A LONGITUDINAL ASSESSMENT OF THE SAN FRANCISCO BAY AREA

Abstract ID: 1008

Individual Paper Submission

LI, Meiqing [University of California Berkeley] meiqing@berkeley.edu, presenting author

Following the global climate movement, cities around the world have adopted climate action plans and other forms of sustainable plans that promote active transportation (i.e., walking and cycling). Although previous studies have evaluated the impacts of active transportation policies, they possess several limitations including inconsistent measures, a lack of ideal research design to evaluate before-and-after treatment effects, and failure to control other factors such as policy context, culture, custom and habit that tend to influence the magnitude of impacts (Pucher et al., 2010). Moreover, few studies have examined the causal impacts of plans (Millard-Ball, 2013), specifically what gets implemented as the outcome of such plans.

This study adopts a mixed method approach to investigate the impacts of various levels of active transportation plans on the actual built environment and pedestrian infrastructure changes, as well as their influence on regional level travel patterns in the San Francisco Bay Area for the past decade. Using a novel historical dataset of pedestrian infrastructure generated from Google Street View images (Li et al., 2022), along with multiple years' of household travel surveys (e.g., CHTS, NHTS, and app-based survey), this study aims to address some limitations of previous studies evaluating the effectiveness of active transportation programs and policies systemically. Comparing cases from other geographic areas, future studies can potentially identify divergent policy impacts and implications of active transportation plans in different contexts.

STUDY ON ROAD NETWORK CHARACTERISTICS AND RESILIENCE MEASUREMENT OF FIVE NEW TOWNS IN SHANGHAI

Abstract ID: 1017

Individual Paper Submission

REN, Jie [College of Architecture and Urban Planning, Tongji University] renjie_cathy@163.com, presenting author
WANG, Qixuan [College of Architecture and Urban Planning, Tongji University] wqx3@qq.com, co-author
LI, Zihao [College of Architecture and Urban Planning, Tongji University] zihaolee@tongji.edu.cn, co-author

Since the new century, as one of the biggest cities in China, Shanghai has been trying to solve the problem of "big-city disease" through the construction of new towns. During the 14th Five Year Plan period, building "independent and comprehensive node cities" is the core goal of Shanghai new town construction. Considering that building a resilient road network is of great significance to improve the independence and integrity of the functions of the new city, this paper analyzes the structural characteristics of the road networks of five new towns in Shanghai, and measures their resilience level under "random failure" and "deliberate attack", using complex network method. The results show that: (1) the road networks of the five new towns in Shanghai can better absorb the impact of "random failure", while they are vulnerable to "deliberate attack"; (2) the road networks of Fengxian and Jiading with moderate density and complete hierarchy have higher resilience level, while the road networks of Nanhui and Songjiang with low density and poor homogeneity have lower resilience level; (3) the highly "efficient" road network in the daily situation does not always highly "resilient" in the disturbance scenario. Based on the analysis above, the following suggestions are put forward to improve the resilience of road network in five new towns in Shanghai: (1) incorporate the resilience index into the relevant planning of the transportation system and try to find the balance between "efficiency" and "resilience" to improve the comprehensive service level of the road system under both daily and disturbance scenarios; (2) improve the integrity of road hierarchy system on the basis of considering the impact of

density, spatial form and hierarchical structure of road network, so as to comprehensively improve the resilience of road network in ensuring "spatial accessibility" and supporting "efficient flow" under disturbance scenarios; (3) promote the renewal of road network and reasonably change the road width and land use types on both sides, based on the analysis of its current service capability and desired one according to the relationship of road topology and residents' mobility characteristics, so as to better serve the residents' life in Shanghai new towns.

ASSESSING THE AVAILABILITY OF ALTERNATIVE TRANSPORTATION SERVICES FOR OLDER ADULTS BY AGE GROUP: A CASE STUDY OF FLORIDA

Abstract ID: 1032

Individual Paper Submission

NOH, Soowoong [University of Florida] nswscott@gmail.com, presenting author

Background and Objective:

As drivers age, the needs for alternative transportation services become critical to ensure their safe mobility for a lifetime. The expected growth of the older population makes it even more imperative that a widely available network of alternative transportation services is developed, and advocacy efforts are made to improve the safety, access, and mobility of older adults. To inform policies and provide appropriate transportation services other than private vehicles for older adults, this study aims to quantify and visualize spatial gaps between the availability of alternative transportation services and the distribution of older adults' population by age group (i.e., age between 65 and 74, between 75 and 84, and above 85) instead of one group of older adults which represent typically age above 65.

Methods:

Using Florida as a case study, the study mapped the distribution of older adults' population by age group against the availability of alternative transportation services in census block group level. First, this study sought to consider the spatial service area of each alternative transportation service and aggregated the number of available services into census block group level using Find-a-Ride Florida database, which provides available transportation options for older adults hosted in Florida Department of Transportation. After creating the availability GIS layer, Cluster and Outlier Analysis was used to find statistically significant clustered areas with lower values (lower transportation availability), while excluding spatial outliers. Next, this study identified areas with highly clustered older adult populations by age group in the same geographic level. Finally, the spatial gaps were determined by overlapping areas which have both lower transportation availability and concentrated older adults' populations by age group.

Results:

The results revealed the spatial pattern of alternative transportation service-deficient areas with the amount of affected older adult population by the group. Regardless age group distribution, the majority gap areas were observed to be Central Florida as well as part of South-West and East coastal areas. The number of older adults reside in the gap areas were 509,317 (21.9% of total 2,321,394 people), 303,138 (22.6% of total 1,339,375 people), 91,789 (5.9% of total 544,659 people) for older adults age between 65 and 74, between 75 and 84, and 85 above respectively.

Contribution and Conclusion:

While most transportation related studies for older adults looked at the older adults as a single group of 65 or older with bigger analysis units, this approach examined older adults in three age groups with a finer resolution. Through using Florida as a case study, this paper shows that these visualized and quantified outputs would be useful not only

in providing spatial information, but also in providing a valuable framework and information to urban and transportation professionals as well as relevant stakeholders to better resolve mutual challenges.

DOUBLE DISADVANTAGES FOR OLDER ADULTS DURING THE PANDEMIC: WHEN THE “TRANSPORT DISADVANTAGED” MEETS THE “DIGITAL DIVIDE”

Abstract ID: 1036

Individual Paper Submission

LI, Shengxiao [University of Pennsylvania] lsx@design.upenn.edu, presenting author

Older adults face more travel and technology usage difficulties during the pandemic than young people. While they face more health risks during the pandemic and are not encouraged to increase out-of-home activities, they also suffer from the “digital divide”. Though many studies have examined the travel behavior and technology usage changes during the pandemic (Hara & Yamaguchi, 2021; Jiao & Azimian, 2021; Palm et al., 2021; Salon et al., 2021), studies focusing on older adults remain rare. Given the disproportional challenge of out-of-home activity reduction and the prevalent “digital divide” among older adults, examining the technology usage and travel behavior for different activities among older adults during the pandemic is critical. How did older adults adjust their daily routines during the COVID-19? How did their daily technology usage change compared to the pre-COVID? What factors are related to these changes? Are these changes temporary due to the pandemic, or will they create a “new normal” in travel behavior and technology usage among older adults? Answering these questions help planners and social service providers understand older adults’ travel and technology needs during and after the pandemic and develop paths towards age-friendly transportation systems and communities. This study uses a survey on 2,510 older adults in the US to investigate their travel behavior and technology usage changes during the pandemic and the factors related to these changes. Results of the study show that age adds to the transport disadvantage and “digital divide” during the pandemic. Additionally, females, those without college degrees, and those with medical conditions are more likely to reduce daily trips during the pandemic. The increase in technology usage happens among male respondents, those with college degrees, and those who had experiences using the technology before the pandemic. However, the increases in technology usage, especially for social and healthcare activities, occur among people of color and those who experienced job loss and health declines during the pandemic. The study also shows that while some changes during the pandemic, such as the increase of online social activities and meal delivery and decreased driving trips, are temporary and might reduce after the pandemic, some other changes, including the increase in active travel and declines in public transit and ride-hailing, and the increased usage of some technology platforms, such as online shopping and e-banking, tend to continue in many older adults’ post-pandemic life.

The implementation of pop-up infrastructure to support active transportation – such as temporary road closures, non-permanent bike lanes, or timebound pedestrian streets – occurred in diverse environments during the COVID-19 pandemic. Such initiatives provided necessary space for outdoor recreation and allowed for social distancing. While these initiatives were often celebrated by active transportation advocates, there remains much to be learned regarding the effect of pop-up infrastructure on active transportation use during the pandemic and into the post pandemic period. In this paper, we utilize the example of one major roadway closure – Martin Luther King Drive (MLK) in Philadelphia – to investigate how bikeshare use may have altered in response to this pop-up infrastructure intervention. Much research has explored how bikeshare – one of the more popular, and municipally supported active transport modes – use patterns changed during the pandemic, but few studies have explicitly investigated the relationship between pop-up infrastructure and bikeshare use. We employ a quasi-experimental approach that measures the effect of MLK's closure and subsequent reopening on average daily bike share trip durations. We define a “treatment group” as those stations immediately proximate to MLK, and a “control” group as those stations close-by, but not as easily accessible to the closed roadway. We employ a difference-in-difference estimator using time series data to highlight the effect of: 1) the road closure, 2) the road's reopening, and 3) the addition to MLK of new cyclist-serving infrastructure on bikeshare trip duration. While both the treatment and control group stations experienced increases in average trip durations following the closure of MLK to automobiles, the effect for nearby stations was substantively higher. This finding suggests that, even in the pandemic environment, where bikeshare trip durations increased overall, the pop-up infrastructure had an additive effect on the general positive trend. Perhaps most interesting, the different effect on trip durations for treatment as compared to control stations has held into the period following MLK's reopening. This finding suggests that either 1) the impact of the pop-up infrastructure spurred long term behavioral changes for users at nearby stations, 2) that newly added supportive and permanent infrastructure for cyclists on MLK helped sustain changes made during the pop-up period, or 3) some combination of both user behavior and infrastructure investment has yielded a sustained positive effect. We employ an instrumental variable approach to explore these different implications and discuss the results of these implications for policy. Regardless of the exact drivers of the sustained changes in bikeshare use, our results signal that the positive impact of pop-up infrastructure can live past its lifetime on roadways and yield beneficial impacts for active transport users going into the future.

COLOR LINES IN TRANSIT: RACE AND THE IMPLEMENTATION GAP IN ACCESS TO RAIL

Abstract ID: 1090

Individual Paper Submission

LOWE, Kate [University of Illinois Chicago] katelowe@uic.edu, presenting author

BENJAMIN, Andrea [The University of Oklahoma] andrea.benjamin@ou.edu, co-author

RECKHOW, Sarah [Michigan State University] reckhow@msu.edu, co-author

New transit development has the potential to better connect disadvantaged communities to job opportunities, civic participation, health care and key amenities. However, local financial dynamics can be more significant in winning federal rail grants than project benefits (Lowe, 2013), and elite-led coalitions can be critical for rail implementation (Lowe, Reckhow & Gainsborough, 2016), given the various hurdles, from regulatory to financial, that projects face. This presentation will discuss the relationship between implementation of rail transit projects—done by sub-national units of government—and who benefits by race, uncovering the consequences of existing federal policies and norms for financing and building urban rail. While we recognize the potential of bus rapid transit for delivering speed benefits, we focus on rail investments, as in the United States these currently are the projects that tend to offer more notable speed improvements.

Our preliminary research is based on document review of the 34 urban rail projects under environmental review during the Obama administration. It suggests that the details and mechanisms vary, but that the race of residents (based on environmental impact statements mostly using a binary of white, non-Latinx and “minority”) along a proposed corridor is associated with differential implementation, despite federal mandates for equity in transit service. Drawing on growth machine literature (Molotch, 1976) and emerging planning literature on racial capitalism (Dantzer, 2021), we hypothesize that racialized inequities, local government fiscal capacity, and growth machine coalitions interact to shape unequal implementation. Our next phase of research includes a temporally expanded national dataset and preliminary GIS analysis with paired case studies in Baltimore compared with suburban DC in Maryland and Los Angeles compared with Denver.

HAS THE CONSTRUCTION OF THE MINNEAPOLIS BLUE LINE INDUCED GENTRIFICATION? A DEMOGRAPHIC ANALYSIS OF NEIGHBORHOODS ALONG THE BLUE LINE CORRIDOR

Abstract ID: 1095

Individual Paper Submission

ZEHNDER, John [Minnesota State University, Mankato] john.zehnder37@gmail.com, presenting author
FRICANO, Russell [Minnesota State University, Mankato] russell.fricano@mnsu.edu, primary author

An evaluation of the social impacts of Transit Oriented Development (TODs) presents a paradox. TODs were initially considered a way to provide public transit and employment access to low-income households. However, concern has also been expressed about the potential of TODs to introduce gentrification, primarily in terms of higher housing prices and displacement of low-income households. Other research suggests that gentrification is more a result of development attributes and associated land use planning policies rather than TODs. The gentrification process has appeared highly variable across studies, with cities demonstrating differing patterns and studies employing disparate methodologies. This study seeks to clarify the process in Minneapolis along the Blue Line light rail corridor, where relatively few quantitative studies exist. In a longitudinal analysis, this research examines changes in demographic and housing data in equivalent transit corridors before and after construction of the Metro Blue Line. Findings for the decade of construction suggest that light rail has contributed significantly to an increase in the population with higher education, but not other indicators of gentrification including rising home values or household incomes.

ASSESSING ECONOMIC IMPACT OF DISASTER-INDUCED TRANSPORTATION DISRUPTIONS USING A UNIVERSITY-COMMUNITY PARTNERSHIP FRAMEWORK

Abstract ID: 1097

Individual Paper Submission

CHANDRASEKHAR, Divya [University of Utah] D.Chandrasekhar@utah.edu, presenting author

KIM, Sua [University of Utah] sua.kim@utah.edu, co-author

Transportation systems play a critical role in maintaining supply chains for effective post-disaster recovery. Modeling the potential economic impact of transportation-related disruptions, therefore, is an important step to promoting pre-event communitywide recovery and resilience planning. While the supply chain analysis is quite common in the field of business administration, it is highly “firm-focused”, that is, focused on improving specific business practices develop novel techniques to model supply. These studies typically either examine supply chains at the firm-level, or examine supply chain disruption management within the firm, or model supply chain linkages between the firm and its counterparts including through transportation systems. This high focus on firm-level action diminishes the utility of this research for planners and policymakers who must conceptualize supply chains within the broader economic context and whose interventions are policy-based, applied area-wide, and largely strategic given financial constraints. Importantly, most such studies use complex stochastic models that are cost prohibitive and overly sophisticated for use by public sector entities with limited resources. What is needed instead are low-cost, public use methodologies to assess regional level economic impacts of disasters.

The objective of this study is to develop a collaborative university-community partnership framework to analyze the economic impact of post-earthquake transportation disruptions. The study is based on the 2019 scenario of a M7.0 earthquake occurring in Salt Lake City segment of Utah’s Wasatch Fault system. A 2015 earthquake scenario report estimated that the six-county Wasatch Front region is extremely earthquake-prone and that a M7.0 earthquake could result in short-term economic loss of \$33 billion. While such earthquake scenario reports are helpful to generate broad-stroke disaster impact assessments, they do not provide enough nuanced or finer grain insights into indirect impacts on the economy. This in turn limits the ability of governments to estimate ROIs on pre-disaster mitigation investment decisions or to promote mitigation thinking in the business community most at risk. This study fills this gap by developing a standard framework that local communities can use to estimate economic impact of disaster-induced transportation disruptions.

This study combines road damage and functionality estimates produced by Hazus, a software commonly used to estimate damage in disaster scenarios, with travel demand modeling (TDM) to calculate estimated truck travel delays. These delays were then annualized based on the Hazus and TDM results and run through REMI PI+, a software used to forecast regional economic, population and labor market impacts. The study found that the Wasatch Front can expect \$5.3 billion of damage due to intermediate supply chain disruptions in the event of an M7.0 earthquake in the SLC Segment of the Wasatch Fault, and that the top 10 worst-affected industrial sectors comprise approx. 70% of Utah’s economy. Importantly, the study demonstrates how to bring a set of public sector actors (namely, emergency management departments, metropolitan planning organizations, port authorities, and university research centers) and tools they already use (namely, HAZUS, travel demand modeling and REMI+) to provide planning support for disaster planning that may otherwise be inaccessible to policymakers. This novel but inexpensive framework can be replicated in other at-risk communities that also wish to build disaster resilience proactively.

PLANNING PUBLIC ELECTRIC VEHICLE CHARGING STATIONS FOR EQUITABLE ACCESS AND IMPROVED CURB PRODUCTIVITY

Abstract ID: 1099

Individual Paper Submission

WANG, Yan [University of Florida] yanw@ufl.edu, presenting author

GUO, Ziyi [University of Florida] ziyiguo@ufl.edu, co-author

Studies have shown that curbside Electric Vehicle (EV) energy supply will bring great benefits for raising EV usage by reduced range anxiety, companying with additional privilege in reduced transportation-related greenhouse gas emissions, maximized public investment, and advanced public initiatives (Hall & Lutsey, 2017). Public charging stations at urban center curbs can serve many user cohorts and especially benefit apartment and condo dwellers without home charging access. However, they are still sparsely implemented at urban center curbs, unlike ones installed in private or semi-public parking spots. Although the relatively low-level EV penetration currently represents the most significant barrier to wider deployment of EV charging infrastructure in the U.S., the market penetration of EVs is projected to increase under the recently outlined target of 50% EV sales share in 2030 (The White House, 2021). Additionally, the existing usage of public EV charging stations is insufficient in general and uneven across different locations (Marmaras et al., 2017) with low curb productivity.

In the meantime, emerging mobility-on-demand services keep burgeoning and increasing the demand for curbside space, especially in urban centers due to more pick-up and drop-off activities (Wang et al., 2022). Local municipalities have started to invest in public charging stations on curbsides closed to apartments and condo communities to provide charging accessibility for their residents. They have been hindered from purchasing EVs due to the lack of available public charger (Nazari-Heris et al., 2022). Without proper locational planning and curb use regulations, the urban center curbs could become more burdened, less productive, and with decreased access to the charging stations.

Thus, the research aimed at allocating the EV charging station at urban center curbs for more equitable access and maximizing curb productivity under scenarios of different regulation policies. The paper integrates data-driven optimization and scenario planning based on human behavioral data and employs a survey outcome on the perceptions of potential EV users. We pilot the City of Gainesville, FL, and expect findings from three aspects. First, it helps in understanding the perception and potential behavior of PEV user's residing in apartments and condo dwells in terms of implementing curbside charging stations. Second, it identifies productive curbside spaces and regulation strategies for PEV charging station planning. Lastly, it projected future impact over the next few decades considering the dynamic demands for public EV charging networks and illustrates the co-use of the stations for mobility-on-demand services.

The research addresses the research needs of preparing smart curb environments for the emerging vehicle technologies and mobility services in cities. It innovates data-driven infrastructure planning methods and management strategies for better coordinating the curbside environments, vehicles, and humans. This scenario-based modelling contributes to planning research by including human perceptual attributes, considering the demand of current under-served communities and potential users of PEVs. By optimizing the productivity of curbside charging stations while considering equity, this study suggests planning practices with productive strategies when facilitating equitable access and encouraging EV uptake in the group of apartment and condo dwellers.

A. KALANTARI, Hannah [University of Utah] hannah.abdollahzadehkalantari@utah.edu, co-author

Since a two-mile streetcar (S-Line) in Salt Lake City and South Salt Lake, Utah, started operating in December 2013, the surrounding neighborhoods have experienced noticeable growth, having more than 1,000 new residential units and over two million square feet of redevelopment. Despite these changes, no systematic evaluation of the S-Line corridor has been completed to date. While transit systems are often associated with a reduction in traffic congestion, energy consumption (Park & Sener, 2019), and improvement of air quality (Guo et al., 2020), there are also challenges found, such as increased rents (Nelson, 2017), additional trips (Cox et al., 2017), and new parking demands (Wai et al., 2017). Thus, to help shape future transportation policies and create a sustainable transit corridor, we aim to analyze the impact of the S-Line and associated rezonings on land development and traffic along the streetcar corridor.

We employ a quasi-experimental research design and data before and after the S-Line operation to examine changes in the S-Line corridor in terms of land use, property values, trip generation, parking demand, vehicle and pedestrian traffic volumes, traffic safety, energy consumption, and gas emission. The S-Line corridor was defined as the half-mile north and south of the S-Line in Utah. We collected (1) land use and parking volume data from time-series Google maps, Salt Lake County Tax Assessors parcel-level database, and field observations, (2) data on vehicle volumes, transit ridership, pedestrian usage, and crashes from the Utah Transit Agency, Utah Department of Transportation, and field observations, and (3) energy and emission reduction estimates from the metrics developed by the U.S. Environmental Protection Agency. Besides the analyses of the quantifiable changes, we also interviewed developers who have either already built projects along the S-line or are in the process of doing so. The interviews were used to understand the driving forces of redevelopments along the corridor and to enrich our interpretation of the land use and traffic changes.

Some of the key findings of this study are as follows: In the past ten years, 9% of the S-line corridor land experienced a physical change that increased the property value by about \$ 1 billion. Parking demand has risen slightly, managed by different user groups sharing parking facilities and utilizing structured parking spaces. The closest parallel artery (one block distance away from the S-line) showed a 7% increase in the vehicle traffic volume and a 42% rise in pedestrian trips, while the total ridership of S-line and buses operated within the S-line corridor remained steady. Further, crash rates of the S-line corridor were decreased by 17%. As a result of analyzing the wide range of datasets, we concluded that the S-Line operation brought a significant amount of economic development to the nearby neighborhoods while creating safer and pedestrian-friendly environments. However, as the streetcar corridor is expected to continue experiencing land use changes due to the presence of the S-line and potential line extension in the future, further investigations are necessary to evaluate its long-term impact on the local communities.

There is demand in the planning and policy formulation communities for accurate tools that predict the effects of a transit improvement like a new rail line. Other states, regional and local organizations such as State Departments of Transportation and Metropolitan Planning Organizations, public health organizations, transit agencies, and city and county planning commissions are also eager to have reliable evidence of transit's effects on congestion and abutting development. Our work will provide the Utah Transit Authority and other transit operators across the country with information on the possible benefits of the streetcar and the observed impact on local communities.

“WAKING THE SLEEPING GIANT”: TRIBAL COMMUNITIES AND EQUITABLE PARTICIPATION IN THE AVIATION PLANNING PROCESS

Abstract ID: 1113

Individual Paper Submission

MCNAIR, Amber [The Ohio State University] woodburnmcnair.1@osu.edu, presenting author

In March 2022, the Federal Aviation Administration (FAA) hosted the first symposium on Tribal Aviation. Featured speaker and Department of Transportation Assistant Secretary for Tribal Affairs, Arlando Teller, remarked that aviation infrastructure was a “sleeping giant” in Tribal communities. The years of the COVID pandemic highlighted the importance of airport access for life-saving medical care. However, it also highlighted gaps to airport access and challenges in the airport planning process across Indian Country. Given that both scholarship and practice has long neglected to center the aviation planning context for Tribal communities, there remains much opportunity for preliminary explorations on whether and how to leverage this “sleeping giant” for the protection, advancement, and benefit of Tribal communities.

This research aims to document the barriers for Tribal governments to participate in American federal aviation planning processes and contextualizes the impact of airport access (or lack of) on Tribal communities. To examine barriers and impacts, this work evaluates Tribal airport development case studies, constructs maps of the Indian Country aviation network, and analyzes interviews with relevant leaders within the FAA and within the self-governed and sovereign lands of Native American tribes. To the greatest extent possible, this work aims to center voices and experiences of Tribal leaders using their responses to digital surveys and semi-structured interviews. The data collection effort includes targeted outreach to a sample of the Tribal leaders listed in the Bureau of Indian Affairs’ (BIA) Tribal Leaders Directory. While this research does not contain human subjects, there are additional cultural sensitivities and governance protocols to honor when pursuing research collaborations with Tribal governments. This work adheres to the advice provided by the Policy Research Center of the National Congress of American Indians (NCAI) as well as the pillars for community-based participatory research identified in Lucero et al. (2019), which was prepared in collaboration with NCAI.

The preliminary results of this research identify suggest that the barriers for Tribal nations to participate in American federal aviation planning process include: maintaining sovereignty, managing the Tribal land base, securing financial and knowledge capital, lacking political recognition and inclusion, and experiencing epistemic injustices. For example, the rules, procedures, and grant assurances associated with federal aviation programs can conflict with a Tribal government’s commitment to protect their sovereignty. This barrier is closely linked to the specific challenges in Tribal communities that do not have a land base. Additionally, there are challenges related to the protection of sacred sites, wherein Tribal knowledge holders guard precise location information. This Tribal practice can be met with variations of ignorance and hostility since it conflicts with the precision-mapping approaches used by aviation planners. Regarding the impact of airport access for Tribal nations, preliminary results suggest a few core themes: local tourism, advocacy and governance, fishing, and emergency health care access. For example, Albuquerque International Sunport Airport in New Mexico is significant in providing intrastate connectivity to the state capital, which is significant to the political and legislative activity of the more than twenty sovereign Tribal nations within New Mexico.

The results of this work will enhance information sharing and knowledge capital across Tribal communities, produce recommendations on how the FAA can enhance equitable participation in the aviation planning process, and draw connections to prior planning scholarship on the political significance of Tribal planning as a means of self-determination.

SURVEY OF SOCIAL MEDIA USE BY TRANSIT RIDERS DURING THE COVID-19 PANDEMIC

Abstract ID: 1123

Individual Paper Submission

BARCHERS, Camille [University of Massachusetts Amherst] cbarchers@umass.edu, presenting author

ZHANG, Wenwen [Rutgers University] wenwen.zhang@ejb.rutgers.edu, co-author

SMITH-COLIN, Janille [Southern Methodist University] jsmithcolin@mail.smu.edu, co-author

Social media (e.g., Facebook, Instagram, Twitter), has proven to be a powerful platform to provide essential information especially during times of disruption and disaster for transit providers. Public transit agencies are increasingly using social media platforms to communicate with riders. These platforms provide a cost-effective, reliable, and timely mechanism for sharing information with passengers and other travelers (Chan and Shofer, 2014; Cottrill et al., 2017; Schweitzer, 2014;).

This research examines how transit riders accessed transit information using social media before and during the COVID-19 pandemic in an effort to understand what types of information were being accessed, and to inform transit agency efforts to expand the use of social media as a communication tool with riders. Given the growing trend of public service agencies using social media platforms for communication, the rise of social media users looking to platforms to access news, and breaking news especially, and the long-standing disruption COVID-19 caused to transit agency providers and services, this work is critically important to identify if and how transit riders who use social media are different from the general public and the extent to which transit agencies should tailor communication strategies and platforms based on the way in which users reported accessing information during the pandemic.

We surveyed transit riders in three metropolitan areas, Boston, MA, New Jersey, and Dallas, Texas, to understand how the COVID-19 pandemic affected transit information retrieval. We analyzed 1,173 valid survey responses from February 2021- to May 2021. Survey respondents were asked to report their use of social media, including platform, frequency, and types of transit related information they accessed, before and during COVID-19.

Previous work does not describe how the characteristics of transit riders using social media differ from the average social media user. This work identifies the key characteristics of social media users that are interacting with transit agencies and differentiates the type of information these users/riders seek. While it is widely documented and known which demographic groups in America use social media platforms and for what purposes, this work presents an even more nuanced approach to identifying who is using social media to gather transit-specific information and what types of transit-specific information they are looking for. This work can inform transportation planners and transit agencies on how to use Twitter to effectively communicate with riders to improve public perception of health and safety as it relates to transit ridership during a public health crisis.

A LOCUS OF WICKED PROBLEMS: (RE)DEVELOPING INTERSTATE 35 IN AUSTIN, TEXAS

Abstract ID: 1127

Individual Paper Submission

GRIFFIN, Greg [University of Texas at San Antonio] gregpgriffin@utexas.edu, presenting author

This case study interrogates organizational communication of historical and emerging projects on the Interstate 35 corridor in Austin, Texas, using a framework of Critical Realism. This north-south corridor was widened into an inter-regional highway and later became one of the first post-WWII interstates. Since 1928, the route has separated racist zoning policies, and their impacts on underrepresented communities exacerbated as the present decades-old, fully congested, double-decked interstate highway. This study shows how the interstate stands as an obdurate structure, both in the physical sense of community disruptor and separator and as a manifestation of implicit racism and disconnection, with multiple competing visions for its future. Variations of preservation, demolition, and expansion are all on the table in this long-term planning process, with decisions riding on agency budgets, forecasts, and public opinion. This study shows how traffic engineers have used traffic forecasting as a version of quantitative storytelling, iteratively showing increases in future traffic demand when the facility has long stood at capacity. In opposition, local communities have upped their storytelling through digital media and moving film. I show the counter-stories of the government agency “My 35” vision of mobility through added capacity against the local “Our Future 35” approach of access by re-stitching Austin’s communities. Still emerging, this case shows the power of storytelling from both quantitative and qualitative bases. This study shows how quantitative tools still result in stories—different approaches towards transport truths.

A DRIVING BURDEN: ANALYZING THE GENDER DIVISION OF CHAUFFEURING CHILDREN TO AND FROM SCHOOL

Abstract ID: 1130

Individual Paper Submission

SPERONI, Samuel [University of California Los Angeles] ssperoni@ucla.edu, presenting author

More than half of trips to and from school among K-12 students in the U.S. are taken in private vehicles, a share that has increased dramatically over the past half-century. Of these, the vast majority are driven by parents, usually women.

The gender gap in household responsibilities is clearly established in the literature; women typically perform twice the household duties as their male partners. And travel behaviors to and from school are understood, but not across different household structures.

In this study, I hypothesize that women bear the burden in school chauffeuring trips, and that job traits like employment status, work schedule, and telecommuting can help to explain how households make this decision among

male and female adults. I draw on the 2017 National Household Travel Survey to first investigate school trip travel mode choice across household structures. I then examine two-gender two-adult households to analyze the gender division of school chauffeuring trips. This culminates in a pair of binary logistic regressions that explain what factors are associated with one gender of adult driving over the other.

I find that children from two-gender two-adult households are more likely to travel between home and school in a private automobile (53% of trips) than children from other household types (44%). Of the former, female adults bear a substantially greater burden than male adults, serving as the chauffer on two-thirds of all school trips. Women are significantly more likely to drive if the trip occurs in the afternoon (odds ratio 1.37) as compared with the morning, if the child is female (OR 1.17), if only the male adult works (OR 2.49), if only the female adult (OR 1.82) or both adults (OR 1.37) telecommute, and if the male adult is in his 30s. Conversely, men are significantly more likely to drive if the trip occurs in the morning (OR 1.37), if only the male adult telecommutes (OR 2.02), if both adults have a flexible work schedule (OR 1.23), if the male adult has a bachelor's degree (OR 1.39), if both adults are immigrants (OR 1.45), and if the female adult is 50 years old or older (OR 1.27). Notably, trip distance, income, child age, and race are all not significant.

As the share of school trips conducted in private vehicles appears poised to continue increasing, planners and policymakers should turn their attention to how they might provide relief for adult women in the school trip chauffeuring burden. Policies to increase the provision of school bus service, incentivize and streamline the formation of carpools, and promote active transportation could all help to reduce the burden on adult women. Workplace policies to increase telecommuting among men with childcare responsibilities could also help to increase their participation in chauffeuring children to and from school.

PREDICTORS OF TECHNOLOGY ADOPTION BY TRANSIT AGENCIES: THE CASE OF GENERAL TRANSIT FEED SPECIFICATION DATA

Abstract ID: 1157

Individual Paper Submission

VOULGARIS, Carole [Harvard University] cvoulgaris@gsd.harvard.edu, presenting author
BEGWANI, Charuvi [Harvard University] charuvibegwani@gsd.harvard.edu, co-author

The development and widespread adoption of the general transit feed specification (GTFS) data format for transit route and schedule data has transformed the way travelers plan transit trips (McHugh 2013). In the fifteen years since this data standard was initially introduced, most –but not all–transit agencies have begun publishing their route and schedule information in this format. What might explain a transit agency's decision about whether and when to adopt a new data format and publish open data? Rogers' (2003) work on diffusion of innovation highlights several characteristics of individuals that correlate with being early adopters of new technologies, including social status, social mobility, wealth, and social connectedness. The applicability of these results to institutions is neither obvious nor well-established (Dedehayir et al. 2017). Little prior research has been done on the determinants of GTFS adoption. In one such study focusing on California, Frick et al. (2020) found that small transit agencies (reduced reporters) and rural transit agencies were less likely to have published GTFS feeds. Studies on the adoption of other technologies may be informative in identifying agency characteristics that are generally associated with openness to innovation. Iseki et al. (2007) have found that early adopters of smart cards for fare payment tended to be those with greater funding availability and those with established relationships with other transit agencies.

We identified 498 transit agencies in the United States that were providing scheduled transit service in 2006, when the GTFS data standard was initially published. Drawing on three sources of archived GTFS feeds (OpenMobilityData, GTFS Data Exchange, and transitland), we identified the earliest published GTFS feed for each agency, if any. We used the publication date of the earliest available feed for each agency to estimate the length of time it took for each

agency to adopt the GTFS data standard. We estimated a Cox proportional hazards model to determine how geographic and agency characteristics correlate with time between the availability of the GTFS data standard and its adoption by a given agency. We find that smaller agencies and those in closer geographic proximity to Portland (where the standard was initially developed) are more likely to have been early adopters of this technology.

The results of this analysis can inform efforts by state- and national-level agencies seeking to encourage innovation by identifying agencies most likely to be open to adopting new technology. It can also help local agencies identify peers who are likely to have experience with innovation and experimentation.

PLANNING FOR SUSTAINABLE TRAVEL IN IMMIGRANT COMMUNITIES: THE CASE OF TURKISH IMMIGRANTS IN VIENNA, AUSTRIA

Abstract ID: 1170

Individual Paper Submission

TEOMAN, Denis Can [Virginia Tech] dteoman@vt.edu, presenting author

BUEHLER, Ralph [Virginia Polytechnic Institute and State University] ralphbu@vt.edu, co-author

Immigrants' travel behavior has increasingly received scholarly attention in North America and more recently in Europe as well. Overall, immigrants in North America tend to ride public transit more and also bicycle more compared to the native born, especially in the first ten years of their stay. In Europe, similar trends can be observed in regards to higher public transit usage of immigrants. However, in contrast to immigrants in North America, immigrants in Europe tend to bicycle less compared to non-immigrants.

Literature has shown that throughout various central and western European countries, Turkish immigrants' travel behavior deviates significantly from other immigrants' travel behavior. Turkish immigrants tend to drive much more in daily life compared to not only other immigrant groups but also non-immigrants. There are two counter-intuitive factors which make the research intriguing: 1. The majority of Turkish immigrants live in inner city, dense neighborhoods with extensive public transit offerings. 2. Turkish immigrants often have lower incomes compared to other immigrant groups in Europe (given the higher costs of buying and maintaining a car in most European countries, this is an interesting factor).

The case study city, Vienna, Austria has been ranked among the world's most livable cities by several different quality of life indices. Vienna's affordable and equitable health care system, extensive public transportation system and a large and equitable supply of public housing have been noted as the largest contributing factors to Vienna's high life quality. Several studies have identified public transport in Vienna as exemplary in Europe based on its geographic coverage, cost, and ridership levels.

This paper will use a mixed-methods approach to analyze and understand the motivations of Turkish immigrants to rely more on cars compared to other (immigrant) groups. First a large dataset provided by Statistik Austria is used to statistically capture the differences in travel mode usages among Turkish, non-Turkish and non-immigrant groups through regression analysis. The results of these analyses show that even after controlling for various socio-economic, demographic and land-use variables, Turkish immigrants odds of driving daily and regularly (several times a week) are about 3.5 times compared to other immigrant groups and to non-immigrants.

In addition to the quantitative analysis, qualitative interviews with Turkish immigrants and non-immigrants in

Vienna were/are being conducted. The interview revolves around the questions, what motivates immigrants to drive and what are the underlying causes for the dominance of driving and cars in the Turkish community in DC. The results of the interviews conducted so far displays that Turkish immigrants view the car as a symbol of freedom much more extensively compared to their non-immigrant counterparts and immigrants from other countries. The car was described by Turkish immigrants as the symbol of being a successful immigrant who achieved their socio economic dreams and goals.

This paper contributes to research in that it includes a qualitative perspective which helps understanding cultural and social aspects of mode choice, which cannot be solely and exclusively captured through quantitative statistical analysis. Cities with high immigrant populations planning for green and sustainable travel have to understand that the logic of taking various travel modes can differ between immigrant groups and between immigrants and non-immigrants. Cultural and social factors can play large roles in travel behavior, such as different attitudes towards cars, the role of gender in traveling and the importance of ethnic specific resources and and networks (Blumenberg 2009, Tal 2010).

A LATENT CLASS ANALYSIS APPROACH TO UNDERSTAND RIDERS' ADOPTION OF ON-DEMAND MOBILITY SERVICES AS FIRST-MILE/LAST-MILE SOLUTIONS TO TRANSIT

Abstract ID: 1172

Individual Paper Submission

SHEN, Qing [University of Washington Seattle] qs@uw.edu, presenting author

WANG, Yiyuan [University of Washington Seattle] yiyuanw@uw.edu, co-author

App-based shared mobility (including ride-hailing, ride-splitting, car-sharing, bike-sharing, micro-transit, etc.) has quickly emerged in recent years and is believed to offer great convenience and flexibility to travelers. One potential direction that app-based shared mobility can contribute to a more efficient and sustainable urban transportation in the United States is to complement traditional public transit, which has long been struggling with providing services at an adequate level of frequency, coverage, and service quality (Manville, Taylor, and Blumenberg 2018). Transit agencies in the United States have thus started to explore ways to incentivize on-demand shared mobility services to supplement existing fixed-route transit in the forms of first-mile/last-mile solutions, guaranteed ride home, or even replacements for low-efficiency transit services. And many of these pilots received funding support from the Federal Department of Transportation (Rodriguez 2020).

However, the exact impacts of incentivizing on-demand shared mobility on rider's travel behavior remain largely unknown. Recent evidence suggested incentivizing app-based services may benefit primarily high-income commuters instead of low-income ones (Shen, Wang, and Gifford 2021). Given the nature of transit as a public mobility service and the strong equity emphasis of many pilots (Gifford, Chazanow, and Hallenbeck 2021; Miller et al. 2021; Martin et al. 2021), policy-makers need to know how riders of different socio-economic statuses adopt the pilot services and whether on-demand services can fill in the mobility gaps for those who need it most. This study aims to fill the research gaps as one of the first studies examining transit agencies' on-demand mobility pilots using rigorous analytical methods. Specifically, the study aims to answer the following questions:

- 1) Are there distinct patterns in the adoption and usage of on-demand mobility services among riders?
- 2) Can these distinct differences be explained by riders' socio-demographic statuses and built environment characteristics?
- 3) Learning from the answers to the above two questions, what should transit agencies consider when designing and implementing similar mobility pilots in the future?

We use Via to Transit, a pilot launched in the Seattle region in the U.S. as a case study. Via to Transit allows people

located within specified service areas to request rides to/from one of five transit hubs using on-demand Via services, and only pay for the costs of standard transit fares. It generated a rich set of trip data (N = 229,133) and rider survey data (N = 1,273). This study employs latent class analysis, a statistical modeling technique that can systematically identify qualitatively different subgroups that share certain commonalities within a population. The latent class analysis answers the first question by grouping Via rider survey respondents into heterogeneous classes that are not easily identifiable from the data. Then it addresses the second question by modeling the latent class membership with various socio-demographic and built environment characteristics. Based on these results, we derive policy recommendations for transit agencies to better tailor future mobility policy innovations to specific rider groups, which addresses the third research question.

THE ROLE OF DISSONANCE IN TRAVEL BEHAVIOR OF TRANSIT-ORIENTED DEVELOPMENT (TOD) RESIDENTS

Abstract ID: 1173

Individual Paper Submission

DILL, Jennifer [Portland State University] jdill@pdx.edu, presenting author

A growing body of travel behavior research has explored the role of attitudes as an explanatory variable, sometimes as a control for self-selection. Most studies find that attitudes are significant predictors of mode choice. What has not been explored as much is dissonance -- how well people's attitudes or preferences match their housing locations as well as travel behavior. De Vos and Singleton (2020) review the concept of cognitive dissonance applied to travel behavior. They explain that dissonance between attitudes and behavior leads to discomfort, which can then lead to a person changing their behavior and/or their attitudes. A few studies have explored dissonance among residents of transit-oriented developments. A study in Brisbane, Australia found that 53% of TOD residents were travel consonant, meaning they have positive attitudes towards transit. About one-third of those commuted by transit, a rate about double that of TOD residents with negative attitudes (dissonants) (Kamrussaman et al, 2015). Cao (2015) found that urban residents with positive transit attitudes (consonants) were most likely to commute by transit, followed by pro-transit suburban residents (dissonants), urban residents with negative transit attitudes (dissonants), and suburban residents with negative transit attitudes (consonants).

The objective of this paper is to understand the role dissonance (and consonance) play in the travel behavior of TOD residents. The data are from surveys of 1,543 residents living in 24 different TODs in the Portland, OR region. Most of the TODs are located near light rail or streetcar stations, though some are along high frequency bus lines. The paper first develops different measures of dissonance using travel attitudes (pro-transit or not), importance of transit access in home location choice, current transit use, and transit use at previous residence. Nearly half (48%) of the residents are consonant with positive transit attitudes and a housing preference to be near transit and 22% are consonant with negative or neutral transit attitudes and a low preference to live near transit. These groups were the most and least likely, respectively, to use transit for either commuting or other purposes. The remaining 30% are dissonant. Of those that had negative/neutral transit attitudes but preferred to live near transit (22% of the sample), 19% said they were using transit a lot more than their previous residence, through another 17% said they were using transit a lot less now. The paper uses separate binary and multinomial logit models to explain factors contributing to dissonance and how dissonance and other factors predict travel behavior. Control variables include demographics, work location

characteristics (proximity to transit and parking costs), built environment characteristics (land use diversity, street connectivity), proximity to bus and rail transit, and regional accessibility. The findings reveal that dissonants with negative transit attitudes or weak transit access preferences are less likely to use transit, but that parking pricing at work can counteract that relationship for commuting behavior.

INFORMAL SHARING OF AUTOMOBILES BETWEEN AND WITHIN HOUSEHOLDS

Abstract ID: 1174

Individual Paper Submission

PAUL, Julene [UCLA] julenepaul@ucla.edu, presenting author

Sharing is a fundamental human behavior. Social scientists from fields as diverse as economics and anthropology recognize that humans have long collaborated to share resources and that these practices have great social, cultural, and economic importance. In the U.S., people frequently drive alone in private vehicles, and this imposes high internal costs on the individual (in terms of out-of-pocket costs and risk of injury) and on society (via air pollution, congestion, and collision rates) (Becker et al., 2012). As a result, many transportation planners have sought to reduce single-occupancy vehicle (SOV) use – via shared travel or otherwise – and to thus address environmental and economic challenges (Cohen & Kietzmann, 2014). Yet in most of the U.S., the reach of public transit systems is limited. Further, survey data indicate that a sizeable proportion of U.S. residents who do not own cars take many of their trips in automobiles anyway (Blumenberg & Thomas, 2014).

In this paper, I analyze the practice of informal automobile sharing and its role in increasing mobility for people experiencing transportation disadvantage. I use statistical methods to model National Household Travel Survey (NHTS) data collected in 2017, modeling mode choice as an expression of rational choice and thus a proxy for the utility it offers travelers. In my definition of informal auto sharing, I include three categories: (1) automobile borrowing, (2) carpooling with individuals outside of the respondents' household, and (3) carpooling with other household members. While all these behaviors involve the shared use of a private vehicle, they offer distinct advantages over other forms of mobility. I also test for associations between personal/household socioeconomic factors and the built environment context and automobile sharing.

In measuring sharing behaviors, I also test for differences between disadvantaged and non-disadvantaged travelers. Preliminary analyses of the NHTS data suggest that automobile sharing behaviors do differ by disadvantage status. For example, in terms of trips taken by auto-less people, those taken by people living in households with incomes below \$25,000 are 1.5 times as likely to be taken via carpool, as compared with non-low-income auto-less people. I also analyze the association between trip purpose and sharing outcomes – specifically examining relationships between automobile sharing and travel for non-commute activities, including by transportation disadvantage. Findings from the sharing literature also suggest that sharing behaviors are specific to social situations (Price, 1975), so I test whether this holds true in the travel context. As one example, I identify differences in the purposes of trips served by carpooling with household members versus non-household members.

This research fills an important gap in knowledge about informal shared vehicle travel behavior. Informal automobile-sharing likely serves different needs than the more-often-studied formal shared mobility options. These differences may be especially critical for disadvantaged travelers – including those who do not own automobiles, cannot drive, and/or reside in rural environments. Understanding how informal sharing benefits disadvantaged travelers can enhance policies to address inequity in transportation and to enhance traveler mobility.

AN ALTERNATIVE EXPLANATION FOR SHORT COMMUTES AMONG LOW-WAGE WORKERS

Abstract ID: 1193

Individual Paper Submission

KIM, Youjin B [University of California Irvine] youjinbk@uci.edu, presenting author

Studies have consistently shown that low-wage workers have, on average, shorter commutes (Blumenberg & King, 2019). This fits the neoclassical urban economists' framework that low-wage workers choose shorter commutes because longer commutes are too costly (Glaeser et al, 2008). In this paper, I propose an alternative, structural explanation for shorter commutes among low-wage workers. I hypothesize that commute lengths are associated with the spatial distribution of jobs, which varies by industry and wages. That is, low-wage jobs, including those in retail and personal care services are spatially dispersed throughout cities and therefore, low-wage workers are more likely to have short commutes. On the other hand, higher-wage jobs, particularly those in the finance, insurance, and real estate (FIRE) industries, benefit from agglomeration and are more likely to be spatially clustered (Sassen, 2005). Thus, higher-wage workers are more likely to have longer commutes.

I estimate commute times for individuals living in the Los Angeles Urbanized Area using American Community Survey (ACS) 1-year data in multivariate regression models. The main explanatory variable is a continuous measure of spatial deconcentration of the industry that the individual is employed in. Control variables include wages, gender, household composition, and race or ethnicity. I expect the measure of spatial deconcentration to have a larger coefficient than wages, which means that spatial concentration of employment is a greater predictor of commute patterns than wages. In addition, while labor markets are segmented socially and spatially (i.e., low-wage jobs are spatially dispersed and higher-wage jobs are spatially concentrated), some low-wage jobs are also spatially concentrated, e.g., manufacturing, and workers in those sectors are predicted to have longer commutes, despite their lower wages.

As an initial analysis, I used publicly available LEHD data at the census block level to calculate measures of employment deconcentration by 20 industry categories for the Los Angeles Urbanized Area (Hipp et al, 2020). As expected, accommodation and food services, other services (except public administration), and retail trade – jobs associated with low-wages and low employment security -- are very deconcentrated. Public administration, utilities, and information are highly concentrated and associated with higher wages or high employment security.

Then, I compared the spatial deconcentration measure with the average commute times of workers in each of the 20 industries. I found a generally positive relationship between employment concentration and average commute time. In other words, workers employed in spatially concentrated industries are more likely to have longer commutes than workers employed in spatially dispersed industries.

Low-wage workers' short commutes to spatially dispersed jobs have several implications for planning and policy. First, efforts to reduce commute lengths and greenhouse gas emissions, including increasing jobs-housing balance, must consider these policies' potentially disparate impacts on workers by wages, particularly if low-wage workers already have shorter commutes and greater jobs-housing balance (Blumenberg & King 2021). Second, public transportation is often prioritized in times and spaces where ridership is concentrated, or 9-5 schedules to central cities, which benefit higher-wage workers (Hu & Schneider, 2017). However, a more equitable transportation policy and planning needs to take into account the spatially dispersed employment patterns of low-wage workers, who are more dependent on public transportation, as well as their part-time or shift schedules, which are outside the 9-5 peak hours.

EXPLORING NONLINEAR BUILT ENVIRONMENT EFFECTS ON DRIVING WITH A MIXED-METHODS APPROACH

Abstract ID: 1209

Individual Paper Submission

TAO, Tao [University of Minnesota] taotao@umn.edu, presenting author

NÆSS, Petter [Norwegian University of Life Sciences] petter.nass@nmbu.no, co-author

Auto dependence has caused many problems for society, such as traffic congestion, air pollution, and obesity. To address these issues, policymakers have been interested in using built environment policies to rein in driving as many studies have shown the connections between built environment attributes and auto use (Ewing & Cervero, 2010). While most of these studies assume that the relationships between built environment attributes and driving are linear or generalized linear, some scholars stated that these relationships should be characterized as nonlinear and threshold ones (Boarnet, 2017; Van Wee & Handy, 2016). In the recent five years, a growing number of studies have started to apply machine learning approaches to examine the nonlinear and threshold relationships between built environment attributes and driving (Ding et al., 2018; Wang & Wang, 2021). These studies, however, lack causal explanations of the nonlinear relationships.

Using a mixed-methods approach to analyze the travel survey data from a small city in Norway, Stavanger, this study examined the causal explanations of the nonlinear and threshold influence of built environment attributes on people's driving-related travel behavior, including weekly driving distance, car commuting frequency, and car ownership. The travel survey data from Stavanger contain both questionnaire surveys and interviews. With the questionnaire survey data, we applied the quantitative machine learning approach to estimate the nonlinear relationships between built environment attributes and driving-related travel behavior. With the interview data, we applied the qualitative analysis method to extract people's transport rationales about their activity location and mode choices. We, then, used these transport rationales to explain the causal mechanism of the nonlinear and threshold relationships generated by the quantitative approach.

Our results showed that transport rationales for choosing activity locations and travel modes, along with configurations of the jobs and other facilities, provide causal explanations for the nonlinear and threshold effects of built environment attributes on people's driving-related behavior. In addition, most of the built environment attributes (e.g., distance to local and second-order centers and density variables) in Stavanger and Oslo, a large city, have similar nonlinear effects on driving-related behavior. Therefore, built environment policies that work for Oslo, such as compact and concentrated development, may also work for Stavanger. Planners should prioritize these planning policies in the areas closer to the activity centers in Stavanger.

This study contributes twofold to the literature. First, to our best knowledge, this is the first study that uses both qualitative interview analysis and quantitative machine learning approach to examine the nonlinear influence of the built environment on travel behavior. Second, the results confirmed that the nonlinear built environment effects on driving are similar in both small- and large-city contexts and provided great insights into planning policy applications.

EXPOSING FREEWAY INEQUALITIES IN PASADENA AND PACOIMA

Abstract ID: 1210

Individual Paper Submission

RAMIREZ, Andres [University of California Los Angeles] andres@plane-site.com, presenting author
LOUKAITOU-SIDERIS, Anastasia [University of California Los Angeles] sideris@ucla.edu, primary author
PROUSSALOGLOU, Manos [University of California Los Angeles] mproussalo@gmail.com, co-author

Central theme

Often celebrated as extraordinary accomplishments of modernity and transportation planning, US freeways have come under scrutiny during our era of racial reckoning. When freeways were superimposed on cities, policy makers overlooked their effects on neighborhoods, businesses, and residents. Freeway burden was not equally distributed throughout metropolitan areas as predominantly minority neighborhoods had to bear a disproportionate cost.

As the epitome of car culture, Southern California has built a significant amount of freeways, outpacing other regions in the country. In this study, we focus on the minority neighborhoods of Pasadena and Pacoima, which have experienced the superimposition of the Foothill Freeway (Pasadena) and the Foothill, Golden State, and Simi freeways (Pacoima). We ask the following:

Research Questions:

What are the short and long-term impacts of these freeways superimposed on these two neighborhoods? How inclusive was the planning process? Why were these routes chosen over others?

Research Approach:

We employed archival research and interviews to link initial conditions to outcomes. For each case study, we drew from primary and secondary sources. We searched for newspaper articles in archival databases (Proquest, California Digital Newspaper Collection, Newspapers.com, Archive.org). Using particular keywords for the timeframe 1950-1980, we identified approximately 140 relevant newspaper articles published in ten different local newspapers. We complemented our archival research with primary sources--planning documents, professional studies, maps and correspondence associated with the Pasadena General Plan of 1962, and Community Development Plans for Arleta-Pacoima (1973-74). Census data helped us analyze changes in the neighborhoods' demographic composition over time. For each case study, we also consulted with local historians, librarians, staff from local nonprofits, and also interviewed a dozen residents who had experienced the construction of the freeways firsthand.

Major Findings:

Our review of archival documents and oral histories offered a glimpse into thriving minority neighborhoods in Pasadena and Pacoima that were decimated by freeway infrastructure, with their residents disenfranchised from planning processes. Planning and transportation authorities deliberately routed the freeways through these neighborhoods, ignoring alternative routes through adjacent areas inhabited by wealthier, primarily white residents. The particular routes chosen displaced more households than the alternative routes would have. Routing decisions were shaped by prominent voices from wealthier, white communities, but also by a deafening silence from minority residents, who did not have a seat at the table. While massive investment in these freeway projects arguably benefited the entire region, their construction placed disproportionate burdens on the residents of these minority neighborhoods. Demolition and displacement were the visible and immediate effects of the freeways. Other long-term effects – toxic pollution, noise, economic decline and stigmatization– affected those residents whose homes or stores might have been spared. Several decades later, these traces of environmental degradation and social inequity persist in both neighborhoods till today.

Relevance and Implications

As policy makers and municipal agencies confront a history of transportation injustice, civic movements are demanding that cities tear down existing freeways. Planners should address public concerns about transportation equity and restorative justice, assessing the kinds of impacts and disparities that freeways still have on minority neighborhoods and communities, and finding ways to respond to them.

INFLUENCE OF NEIGHBORHOOD WALKABILITY ON OLDER ADULTS' WALKING TRIPS: DOES INCOME MATTER?

Abstract ID: 1213

Individual Paper Submission

KWON, Kihyun [The Ohio State University] kwon.485@buckeyemail.osu.edu, presenting author

AKAR, Gulsah [Georgia Institute of Technology] gulsah.akar@design.gatech.edu, co-author

Aging population is a global phenomenon that is on the rise. As people get older, their declining physical conditions and worsening socio-economic characteristics make their willingness to travel decrease, and this results in reduced activity participation (Hjorthol et al., 2010; Yuan et al., 2019; Cheng et al., 2019). Many empirical studies argue that older adults make fewer trips and travel shorter distances than younger adults (Böcker et al., 2017; Yuan et al., 2019). Although the U.S. CDC recommends having at least 30 minutes of physical activity on five or more days per week (CDC, 2020), it is difficult for older adults to adopt vigorous activity programs, such as gym-based exercises (Wang and Lee, 2010). Several studies find that walking is preferred and recommended among older adults as a moderate and habitual physical activity (Negal et al., 2008; Weng et al., 2019).

Built environment plays a crucial role in shaping travel patterns, including individuals' walking outcomes (Ewing and Cervero, 2010; Cao et al., 2010; Cheng et al., 2019). Older adults generally spend more time home and are more susceptible to environmental constraints (Wang and Lee, 2010). Therefore, neighborhood-level built environment characteristics at residential locations are expected to have a larger influence on older adults' walking decisions as compared to their counterparts (Zhang et al., 2014; Böcker et al., 2017). However, most empirical studies on walking behavior have focused on the general population, even though older adults account for a growing share of the U.S. population (Cao et al., 2010). In this context, this study is concerned with older adults' walking outcomes.

Existing studies have shown that the influence of neighborhood-level built environment on walking may vary across different socio-demographic and economic groups (Ewing and Cervero, 2001; Manaugh and El-Geneidy, 2011; Chia et al., 2016; Cheng et al., 2019). Older adults are more likely to face decreased incomes due to retirement, which many constrain their mobility (Giesel and Köhler, 2015; Srinivasan et al., 2020). However, there are not many empirical studies investigating older adults' walking trips considering different income levels. Within this consideration, this study explores how neighborhood walkability effects older adults' walking trips, considering different household income levels.

This study mainly utilizes the detailed individual-level data from the 2017 National Household Travel Survey-California Add-on (2017 NHTS-CA). We first identify neighborhood walkability based on neighborhood-built environment attributes and access to urban amenities using K-means clustering algorithm. Neighborhoods are classified into three groups based on their walkability: low, medium and highly walkable neighborhoods. We then employ negative binomial regression models to examine whether these neighborhood typologies are associated with older adults' walking trip frequencies across different income levels.

Key findings from our empirical analyses are as follows. First, older adults with physical disabilities tend to have fewer walk trips as compared to those without disabilities. Second, subjective health conditions are critical for older adults' walking trips. Third, older adults in low-income household tend to have more walk trips than those in high-income households. Fourth, after controlling for various other factors, older adults living in more walkable neighborhoods are more likely to have outdoor walking than others. Fifth, walkable neighborhoods are more likely to be associated with older adults' walking trips in wealthier households. The findings of this study suggest enhancing neighborhood walkability is a promising strategy for promoting outdoor walking trips for older adults.

REPORTS FROM THE BATTLE FOR THE CURB: USING SOCIAL MEDIA TO UNDERSTAND CHALLENGES FACED BY URBAN DELIVERY DRIVERS

Abstract ID: 1227

Individual Paper Submission

IACOBUCCI, Evan [University of North Carolina at Chapel Hill] evaniacobucci@gmail.com, presenting author
MCDONALD, Noreen [University of North Carolina at Chapel Hill] noreen@unc.edu, co-author
EDWARDS, Charles [University of North Carolina at Chapel Hill] chwedwards@gmail.com, co-author
STEINER, Ruth [University of Florida] rsteiner@ufl.edu, co-author

Freight delivery vehicles often find themselves in competition with other road users for curb space. When space is not available adjacent the delivery destination, drivers must resort to alternatives, e.g., waiting for a space to become available, cruising the area to find a spot further from the delivery point, or parking illegally. These issues are of interest to planners and logistics providers alike, primarily for their undesirable impacts on safety, congestion, and shipping costs.

The urgency of these issues has accelerated in recent years, largely due to the emergence and continued growth of rapid-delivery online retail (e.g., Amazon) as well as the onset of the COVID-19 pandemic, which intensified the adoption of such services. Between 2019 and 2020, as the pandemic encouraged people to stay at home and have goods delivered, the volume of small parcels delivered in the United States rose from around 14.7 billion to 20.2 billion. This continuing and rapid acceleration in parcel delivery volume promises to add stress to an already competitive battle for the curb.

While freight vehicles increasingly are forced to park illegally in space-constrained areas in order to make deliveries, communities have often lagged behind in planning for solutions. Moreover, as the volume of last mile deliveries continues to expand, so has the volume of freight-related crashes resulting in injuries or fatalities, outpacing the rate of such incidents in non-freight-related traffic. From the perspective of the logistics industry, these issues often represent inefficiencies that interfere with the distribution of goods and increase costs.

Curb management policies and freight providers' practices alike will need to adapt in the face of this changing landscape, and their success will be contingent on understanding how these problems are unfolding at the curb. While several studies have begun to quantify the problems presented by curb conflicts surrounding delivery vehicles, especially unauthorized parking behavior, fewer have specifically examined these issues through the lens of driver behavior. With notable exceptions, driver viewpoints are often missing from the literature, but are critical to understand since they are the ones operating where planning policies "hit the road". Moreover, to our knowledge, few studies have examined small parcel drivers specifically. To gain on-the-ground insight into the battle for the curb, what issues drivers face, and the circumstances that inform their parking choices and related behaviors, we use data from the online social content sharing platform Reddit to examine driver perceptions and behavior.

Specifically, we pose the following research question(s):

1. What are some key challenges delivery drivers encounter when delivering in urban areas?
2. What strategies do drivers employ when parking their vehicles to make deliveries?

3. What reasons do drivers cite for engaging in unauthorized or questionable parking practices?

By using content analysis techniques to analyze online conversations between drivers, we find that parking is among the largest challenges drivers face while delivering in urban areas, largely because parking difficulties extend the time required to complete many routes. While drivers in our sample prefer to park in authorized spaces, employing various strategies to do so, they generally accept the practice of unauthorized parking to complete their routes. Often, they do so due to lack of available parking, but also for safety and/or expedience. Moreover, drivers reported that parking enforcement personnel rarely issued tickets or other reprimands, acknowledging that for delivery vehicles, unauthorized parking is often necessary. Finally, drivers also described concerns surrounding interactions with other road users while making deliveries, especially in terms of conflict and safety.

UNDERSTANDING INTENTIONS TO USE ON-DEMAND AUTOMATED VEHICLES IN CANADIAN CENSUS METROPOLITAN AREAS

Abstract ID: 1235

Individual Paper Submission

HAMIDITEHRANI, Samira [McMaster University] hamidits@mcmaster.ca, presenting author
SCOTT, Darren M. [McMaster University] scottdm@mcmaster.ca, co-author
SWEET, Matthias [Toronto Metropolitan University] matthiassweet@ryerson.ca, co-author

The combination of on-demand mobility tools and automated vehicles (AVs) as an emerging travel mode, could have abundant short-term and long-term implications on built environments and travel behavior. Understanding factors affecting people's intent towards using and paying for on-demand AVs, which contain shared automated vehicles (SAVs) and pooled automated vehicles (PooledAVs), can help predict their possible implications, as well as explore the characteristics of prospective consumers of such mobility tools. There are several studies, where the acceptability and acceptance of AVs have been assessed within various geographic context. These studies have applied human behavior and technology acceptance theories to explore factors affecting intention to use AVs, where the Technology Acceptance Model (TAM), the Theory of Planned Behavior (TPB), the Unified Theory of Acceptance and Use of Technology (UTAUT I & UTAUT II), Theory of Reasoned Action (TRA), and Diffusion of Innovation (DoI) theory were found to be the most frequently adopted theories (Rahman et al., 2017; Nordhoff et al., 2018). Although many studies have attempted to explain the variance of behavioral intent to use on-demand AVs through either affective or instrumental motivations employed within these theories, a consensus model has not yet been obtained and the significant factors explaining the behavioral intent are yet inconsistent and conflicting throughout the literature (Haboucha et al., 2017; Krueger et al., 2016; Sweet & Laidlaw, 2020).

Better understanding factors influencing behavioral intent to use on-demand AVs is critical for planning practice to shape AV technologies towards a socially desirable future. Towards that end, this study investigates the influence of affective motivations on intention to use SAVs and PooledAVs, based on an extended TPB model. Alongside the employed attitudinal factors (attribute towards a behavior, subjective norms, perceived behavioral control, trust, and eco-friendliness), the impact of sociodemographic characteristics, current travel behavior, and geographic context are highlighted. This study uses data from a national survey (N= 5,002) administered in October and November 2021 across six Canadian Census Metropolitan Areas (CMAs): Toronto, Vancouver, Ottawa, Montreal, Calgary, and Hamilton.

Through descriptive and inferential statistics, and a multivariate ordered model, the impacts of affective motivations,

travel behavior, sociodemographic characteristic, and geographic context are investigated. Results indicate that geographic context plays an important role in explaining the future market of on-demand AVs, where people living in congested areas such as downtown Toronto are more likely to use such mobility tools. Affective motivations such as attributes towards a behavior, eco-friendliness, and trust are highly significant, while perceived behavioral control and subjective norms are found to be insignificant in explaining the variance of intent to use on-demand AVs. Sociodemographic characteristics matter in explaining the variance of behavioral intention to use on-demand AVs, where young, full-time male employed, and highly educated people are more likely to use on-demand AVs on a regular basis. Respondents' current travel behavior characteristics are also important. Individuals using ride-hailing services and public transit currently are more inclined to use SAVs and PooledAVs, while people who regularly commute by a privately owned vehicle are more interested in SAVs rather than PooledAVs. The findings of this study could help researchers and manufacturers predict the future market of an unprecedented mobility tool. Additionally, the results of this study provide insight into the pathways by which policy makers can manage the advent of on-demand AVs in transportation policies.

LOCAL GOVERNMENTS' DEMAND FOR VMT AND TRAVEL DATA

Abstract ID: 1236

Individual Paper Submission

BAEK, So-Ra [California State Polytechnic University, Pomona] sbaek@cpp.edu, presenting author
KIM, Dohyung [California State Polytechnic University, Pomona] dohyungkim@cpp.edu, co-author

Several studies emphasized the coordination of land use and transportation planning across levels of governments and examined the effectiveness of such coordination on VMT reduction (Lovejoy et al., 2013; Salon et al., 2012; Salon, 2014). In the case of California, any government agencies are mandated to replace level of service (LOS) with vehicle miles traveled (VMT) as the basis for mitigating transportation impacts. Given these circumstances, local governments now have a greater need of local VMT data than ever before to make sure their land use decisions would not hinder regional planning efforts to meet VMT/GHG emission reduction goals. However, the institutional structures and roles of MPOs and local governments become a barrier to the coordination. While local governments tend to rely on MPOs to access VMT data, they confront the challenge of acquiring appropriate transportation data that quantifies VMT in smaller geographies. With advances in technologies with big data and artificial intelligence (AI), new sources of travel data are rapidly emerging. Recent studies looked at ways to estimate local road's VMT more accurately by using GPS vehicle trajectory data (Klatko et al., 2017) or more sophisticated statistical tools, such as interpolation methods (Nasri et al., 2019). However, local jurisdictions' accessibility to such datasets/methods is still unknown.

In this paper, we aim to answer these questions; which travel datasets do local governments in California commonly need?; and what are specific planning activities for which they utilize such travel data? Through a survey that targets local governments in California, we aim to understand the state-of-the-practice of local jurisdictions with and demand for VMT data. The results will allow us to identify the void of transportation data demanded by local governments and planning activities and processes impacted by the void.

Understanding the current state of the practice at local governments on VMT estimation and the effectiveness of local policies on regional VMT reduction will help local governments prioritize strategies that significantly reduce VMT and GHG emissions. If VMT estimation at the local level is more accessible and become more readily available, it would

favor infill development and denser urban development in existing urbanized areas.

EXPLORING THE NEIGHBORHOOD-LEVEL FACTORS ASSOCIATED WITH COLLISIONS BETWEEN FREIGHT TRUCKS AND BICYCLES

Abstract ID: 1241

Individual Paper Submission

SHIN, Eun Jin [Sungkyunkwan University] eunjinshinync@gmail.com, presenting author

Although there is growing evidence that collisions between freight trucks and bicycles are far more likely to be fatal than other types of traffic accidents, little is known about the neighborhoods wherein trucks tend to collide with bicyclists and the characteristics of these neighborhoods. Previous studies have primarily conducted micro-level analyses to identify person- or crash-related factors that predict truck–bicycle crashes, but they provide limited insight on how infrastructure and land use planning can address this emerging traffic safety issue. To overcome this limitation, this study examines the spatial distribution of collisions involving trucks and bicycles at the neighborhood level and analyzes the factors influencing this distribution. The selected geographical area of study is Seoul, South Korea, where the number of collisions between trucks and bicycles has recently skyrocketed. Using various spatial regression models that can overcome the limitations of standard regression models, this study compares how neighborhood characteristics that predict truck–bicycle crashes differ from those that predict other types of crashes.

The results consistently show that collisions between trucks and bicycles tend to significantly increase in areas located near freight-related facilities, like other types of freight-related traffic accidents. However, unlike other freight-related traffic accidents, truck–bicycle collisions are less likely to occur in neighborhoods with more highways or near major intersections. Instead, trucks tend to hit bicyclists in areas with higher densities of arterial roads or narrower local streets. The results also indicate that neighborhoods with a higher frequency of truck–bicycle collisions differ significantly from those with more passenger-car–bicycle collisions. These results suggest that planning interventions designed to improve road safety should be tailored to the types of vehicles involved in crashes. Specifically, the factors found to be associated with truck–bicycle collisions in this study will help planners develop measures to reduce such collisions and alleviate the adverse impacts of increasing freight movements on local communities.

THE EFFECTS OF IMPLEMENTING DOCKLESS SCOOTER PROGRAM ON DOCKED BIKESHARE RIDERSHIP IN COMMUNITIES OF CONCERN: A TALE OF THREE CITIES

Abstract ID: 1243

Individual Paper Submission

MENG, Sian [University of Oregon] sianm@uoregon.edu, presenting author
BROWN, Anne [University of Oregon] abrown33@uoregon.edu, co-author

E-scooter systems have proliferated in the US over the past five years. Many cities that launched dockless e-scooter programs already had a docked bikeshare system. Previous studies explore the interactions between docked and dockless micromobility based on cross-sectional design and comparisons of service geographies (Meng & Brown, 2021; Qian, Jaller, & Niemeier, 2020) or travel patterns (McKenzie, 2019; Younes, Zou, Wu, & Baiocchi, 2020). However, limited research examines the direct complementary/substitution effects of dockless e-scooter systems on existing docked bikeshare trips (Li, Zhang, Ding, Ren, & Practice, 2019; Yang et al., 2021). In this study, we examine the implementation of pilot e-scooter programs in three cities as quasi-natural experiments to examine how e-scooter sharing influences the number of docked bikeshare trips.

This study asks three questions: 1) How does the implementation of dockless e-scooter programs influence docked bikeshare trip making? 2) Do the influences of dockless scooter programs on docked bikeshare vary across communities with different socio-economic characteristics? And 3) What are the equity implications of the impacts of the dockless system on docked bikeshare? To answer these three research questions, we collected the bikeshare data before/after implementing e-scooter sharing programs from three cities where the operational area of e-scooter is only overlaid with partial docked bikeshare stations, including Boston, MA, Chicago, IL, and San Francisco, CA. We will first utilize the difference in differences (DID) model based on propensity scoring matching (PSM) to examine the effects of e-scooter sharing on the overall docked bikeshare ridership. Then, we explore how e-scooter systems affect the use of docked bikeshare by members and casual users; during peak and non-peak periods; and on weekdays and weekends. Additionally, we replicate these analyses by sampling docked stations in communities of concern (defined by Qian et al. (2020)) in the three study cities.

Findings from this study contribute to the existing literature on the relationship between different micromobility systems in three key ways. First, a quasi-natural experiment design allows us to estimate the causal effects of dockless e-scooter sharing on the ridership of docked bikeshare. Specifically, we will use the PSM to alleviate the selection bias resulting from the designation of the e-scooter operational area. Second, we utilize docked bikeshare data from three cities, exceeding the sample size of previous studies. Thus, the results are more generalizable. Third, we examine the heterogeneous treatment effects, emphasizing bikeshare stations in communities of concern where individuals might rely more on active transportation than the general population. Finally, a better understanding of the relationship between these two systems could contribute to the policy-making process so that the local government could issue targeting policies to improve the overall micromobility.

CYCLING THROUGH THE COVID PANDEMIC TO A MORE SUSTAINABLE TRANSPORT FUTURE: EVIDENCE FROM CASE STUDIES OF 15 CITIES IN EUROPE AND NORTH AMERICA

Abstract ID: 1244

Individual Paper Submission

BUEHLER, Ralph [Virginia Polytechnic Institute and State University] ralphbu@vt.edu, presenting author
PUCHER, John [Rutgers University] john.pucher@gmail.com, co-author

The COVID pandemic has changed travel habits in countries and cities around the globe. During the first year of the pandemic, many countries and cities reported strong increases in bicycling and sales of bicycles. Many jurisdictions responded to the COVID pandemic by providing additional space for cyclists through pop-up bike lanes and residential streets closed to motor vehicle traffic. Some cities reported declines in bicycling—mainly in places that formerly had a high share of bicycling commuters among their cyclists. Stay at home orders and remote working and learning reduced commuting and with it bike commuting as well.

In this paper, we focus on trends in Western Europe and North America and are asking two questions: first, what are the trends in bicycling during 2021 and how do they compare to 2020 and 2019? Second, how did the COVID pandemic affect bicycling and bike planning in cities in Europe, the United States, and Canada? To answer the first question we reviewed the emerging literature and analyzed available data from bicycle counters aggregated to the national level for the USA, Canada, Belgium, France, Germany, Austria, Sweden, UK, Ireland, Italy, Spain, and Portugal. This is an extension of our previous research on the initial impact of COVID-19 on bicycling. Impacts of COVID-19 on bicycling and bike planning varied by jurisdiction. We conducted case studies of 15 cities in the US, Canada, Germany, France, Belgium, and Spain to analyze trends in bicycling and bike planning connecting the time before the pandemic with trends during the pandemic and plans for the future. Data for the case studies originate from zoom conversations and email-exchanges with bike planners, academics, and cycling advocates from each city. In addition, we analyzed data and planning documents provided directly by our local contacts. In addition, we relied on internet research and media reports about cycling, trends, plans, and policies in each city.

Analysis of national level aggregate counter data reveals that virtually all countries saw increases in cycling between 2019 and 2021. Growth in cycling was concentrated on weekends, while several countries saw declines in cycling on weekdays between 2019 and 2021. Remote working and learning reduced the number of cycling commutes. Comparisons of cycling levels by month show great variability over time with sharp declines in cycling levels during lockdowns and stay at home orders. In general, however, monthly cycling levels in 2020 were higher than in 2019. While cycling levels in 2021 were still higher than in 2019, they were generally lower than in 2020.

Our case study analysis of 15 cities in Europe and North America shows that virtually all European cities saw increases in cycling during the COVID pandemic. By contrast, many case study cities in the US and Canada saw declines in cycling. One explanation is the strong commute orientation of cycling in our North American case study cities.

City responses to COVID varied. Some cities, like Paris and Brussels built many pop-up bike lanes to facilitate cycling and close gaps in their bikeway networks. Other cities only implemented a limited number or did not implement any pro-bicycling measure in response to COVID. However, all cities continued to implement bicycling friendly measures, such as bike lanes, protected, bike lanes, increased bike parking, greater funding, or increased staff for bicycling. Cities like Paris, Brussels, Munich, Berlin, and Freiburg had passed very ambitious plans for bicycle promotion just prior to the COVID pandemic and implemented many bike-friendly policies during the years of the pandemic. Overall, conditions for bicycling are better in our case study cities in 2022 compared to 2019.

DOES CONTEXT SHAPE PREFERENCE? A LONGITUDINAL EXAMINATION OF THE RELATIONSHIPS AMONG ATTITUDES, THE BUILT ENVIRONMENT AND TRAVEL BEHAVIOR

Abstract ID: 1247

Individual Paper Submission

RAHMAN, Mashrur [University of Texas at Austin] mashrur@utexas.edu, presenting author
SCIARA, Gian-Claudia [University of Texas at Austin] sciara@utexas.edu, co-author

The role of travel related attitudes in the connection between the built environment and travel behavior has received substantive attention in planning discourse. Travel attitudes directly influence travel behavior and indirectly through residential location choice (referred to as residential self-selection) (Cao, Mokhtarian and Handy, 2009). However, social psychology theories suggest that a person's attitude can change over time due to many influences, including newly acquired information, observations of other people, and one's own experiences of attitude-relevant behavior

(Eagly and Chaiken, 1993; Kroesen, Handy and Chorus, 2017).

Empirical models generally use cross sectional data and assume that attitudes are time invariant and exogenous to the built environment and travel behavior. This study utilizes longitudinal panel data and examines the potential for a reverse relationship. More specifically, it poses questions about attitudinal and behavioral changes. For instance, do individuals' travel attitudes (TA) change over time? If so, what drives this change in attitudes? Does one's exposure to a built environment (BE) and (one's experience of) newly adopted travel behavior (TB) trigger these changes?

To answer these questions, this study uses three waves of the Netherlands Mobility Panel (known as MPN) Data (2014, 2016, 2018). The reciprocal relationships among the built environment characteristics (BE), attitudes towards bicycle (TA) and frequency of using bicycle (TB) are examined using a Random Intercept Cross-Lagged Panel Model (RI-CLPM) within Structural Equation Modeling (SEM) framework. Total 2,405 respondents were included in the analysis who completed all three waves of the survey. The model includes BE, TA and TB at three time points as endogenous variables, and socio-demographics as exogenous variables. The RI-CLPM specification examines to what extent the BE and TB at earlier time points explain TA changes over time.

Different model specifications are tested and compared through the process of backward elimination. The final model gives a satisfactory fit. The results show that autoregressive parameters (which represent stability over time) are strong. That means, indicators (BE, TB, TA) of earlier time points are good predictors of their counterparts in later time points. Most importantly, the cross-lagged parameters (which represent the reciprocal effect over time) indicates that both the BE and TB variables show strong reverse causality effects. In other words, one's BE characteristics (activity density) and frequency of bicycle use at an earlier time point significantly explains one's bicycle attitude at later time. Time-lagged effects of BE and TB on TA are stronger than vice versa. For example, the effect of one's earlier bicycle use on one's current bicycle attitude is stronger than the effect of one's earlier attitudes toward cycling on one's current bicycle use. These findings provide support for the theory that people adjust their travel attitudes based on their experience of BE characteristics and particular mode of travel.

The findings of this study underscore the importance of considering the more expansive and long-term impacts of BE policies on sustainable travel outcomes. If planners can provide socially desirable built environment alternatives at affordable prices, then preferences for these alternatives are likely to be cultivated and maintained over time.

URBAN FORM AND TRANSPORTATION TAXES

Abstract ID: 1249

Individual Paper Submission

MILLARD-BALL, Adam [University of California Los Angeles] adammb@ucla.edu, presenting author
KAPSHIKAR, Purva [University of California Los Angeles] pkkapshikar@g.ucla.edu, co-author

Urban planners tend to emphasize land use planning measures such as compact development to address the negative impacts of car travel. Economists, in contrast, tend to favor price-based approaches such as higher gasoline and carbon taxes. While price-based approaches are normally more efficient and would soften consumer demand for lower-density, car-oriented housing, economists tend to sidestep the question of where taxes come from. There is no benevolent social planner who sets taxes on gasoline, carbon, and congestion at the socially efficient level. Rather, such taxes are determined by elected officials in federal, state, and local government, or by voters directly through referenda and ballot initiatives.

In this paper, we highlight one synergy between pricing and regulation that emerges from the political economy of transportation taxes. Specifically, we hypothesize that voters will be more willing to increase gasoline and carbon taxes in compact, walkable neighborhoods that are well served by transit. To the extent that land use regulation promotes less car-oriented development, taxes on car travel become more feasible.

We examine the impact of five measures of urban form – residential density, job density, jobs-housing balance, road

network density, and transit frequency – on support for two California ballot measures that would have repealed carbon pricing and gasoline tax increases that had been enacted by the state legislature. We pay particular attention to separating out the impact of urban form from that of ideology, given the confounding influence of liberal voters tending to cluster in larger, denser cities. Specifically, we model the impact of urban form variables on support for each of the two ballot measures, after controlling in various ways for vote share in the Governor's race and on separate tax-related ballot measures.

We find ideology is the primary determinant of support for taxes for transportation taxes. However, residential density, employment density, and transit frequency—but not jobs-housing balance or road density—are also useful predictors of support. For example, moving from the 1st percentile of residential density to the 99th percentile increases support for gasoline tax increases from 57% to 60%, holding our ideological measures at their statewide means. For transit frequency, the effect of a shift from the 1st to the 99th percentile is an increase in support from 56% to 60%. In a closely divided election, therefore, land use patterns can determine the success of a referendum on transportation taxes.

Much has been written about how auto-oriented urban form locks in car dependency through path dependencies in land use patterns. From a political economy perspective, such land use patterns may also lock in cheap driving, or at least make it more difficult to price roads and gasoline correctly. The literature already shows how higher gasoline taxes lead to more compact development. Here, we demonstrate that the relationship is two-way: compact development can also lead to a small increase in voter support for increased taxes on driving. While our results are limited to two California referenda, it is reasonable to infer that the effect also exists where taxes are determined legislatively rather than through referenda. To some extent, council members and other elected officials respond to the preferences of their constituents.

Our results also imply that the voluminous research on land use and transportation underestimates the long-run impacts of compact development on driving. Such studies are typically unable to capture the indirect effect of compact development on increasing political support for taxes on driving.

ANALYZING THE USE AND IMPACTS OF OAKLAND SLOW STREETS AND EQUITY IMPLICATIONS BEYOND COVID-19

Abstract ID: 1250

Individual Paper Submission

DOUGLAS, Gordon [San José State University] gordon.douglas@sjsu.edu, presenting author
MOORE, David [San José State University] dgmoore099@gmail.com, co-author

This paper presents the results of a mixed-methods study of the Oakland Slow Streets program. An official response to the Covid-19 pandemic in 2020, the program used signs and temporary barricades to limit thru-traffic on 21 miles of city streets in order to create more and safer space for walking, cycling, and outdoor recreation. The research team, led by a faculty member and graduate student researcher and working in consultation with the City of Oakland Department of Transportation (OakDOT), collected data throughout the summer of 2021 seven designated Slow Streets plus one cross street and one 'control' street for each – a total of 21 street segments representing conditions in seven different neighborhoods across Oakland. Data collection comprised in-person passerby counts for each segment on eight separate dates, as well as logging ESRI here.com traffic speeds for each segment at a total of 204 different times (three times a day for 68 days). Researchers also recorded local street and environmental conditions and other observations in field notes and photographs. The data represent a variety of times of day and days of the week for each segment during May, June, and July 2021.

By analyzing how Slow Streets were used in seven different neighborhoods, the research sought to understand where the streets functioned as intended, where they did not, and the equity implications of differences observed across geographic and socioeconomic lines. Overall, we do not find evidence that Slow Streets designations alone caused reduced through-traffic, reduced speeds, or increased pedestrian and bicycle uses in a reliable or generalizable sense. In certain cases, observed Slow Streets did clearly carry less car traffic or more bicycle/pedestrian use than one or both of their nearby comparison streets, and in at least one case the Slow Street was clearly embraced by the local community and used as planners intended; in others the Slow Street was no different than its neighbors. Where differences were found between a Slow Street and its respective comparison streets, preexisting street conditions or other locally-specific variables seem likely to explain it as much as the Slow Street designation itself.

Drawing on these findings, the study identifies local conditions that seem likely to make Slow Street treatments more or less successful. However, acknowledging that all neighborhoods deserve safer streets and greater outdoor recreational opportunities, we argue that the answer must be better community outreach both before and after the program's rollout to ensure that areas not predisposed to make full use of Slow Streets can have the opportunity to do so. Finally, as Oakland formally ends its pandemic-era Slow Streets program and considers ways it might employ similar street treatments in the future, the study offers some thoughts on the potential for rapid, low-cost bike and pedestrian street safety improvements going forward.

ANALYZING THE RELATIONSHIP BETWEEN URBAN HEAT ISLANDS AND TRANSIT-ORIENTED DEVELOPMENTS: A CASE OF EDMONTON, CANADA

Abstract ID: 1255

Individual Paper Submission

LOTFI, Ghazal [University of Alberta] lotfi@ualberta.ca, presenting author
 AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, primary author
 WELEGEDARA, Nilusha [University of Alberta] yalingas@ualberta.ca, co-author

Transit-oriented developments (TODs), as a smart growth policy, have gained popularity as an approach to combatting the adverse effects of urban sprawl. TODs provide environmental benefits by reducing GHG emissions (Ali et al., 2021; Gao et al., 2022), as well as offers some economic and social benefits (Nahlik & Chester, 2014). However, little or no research exists regarding their impact on the urban heat stress/exposure. This study aims to fill this gap in the literature by analyzing the relationship between the concept of TOD and the urban heat island effect (UHI), an environmental phenomenon that leads to extreme hot spots in urban areas. More specifically, this study strives to answer the following questions: (1) Do TODs in a winter city such as Edmonton experience the UHI effect? (2) How did the UHI effect in TODs change temporally? (3) What factors mainly contribute to the UHI effect of TODs?

We used Landsat 5 and 8 satellite images from 2010 to 2020 that were acquired during the summer to generate land surface temperatures (LST) and UHI maps. We studied the UHI changes in TOD areas (400m area around selected LRT stations) compared to surrounding non-TOD areas (that have a similar area as TOD areas) to understand the effect of TOD on UHI development. Our results show that UHIs have significantly increased in the TOD areas over the last decade. Furthermore, TOD areas experienced a higher UHI effect compared to non-TOD areas, due to the differences in land use and land cover between the two areas. Although non-TOD areas also experienced an increase in temperature over the years, the rate of increase in land surface temperature (LST) and UHI effect was higher in TODs. Our findings suggest that when developing and designing new TODs, policies and development guidelines should aim to mitigate the UHI effect by preserving or increasing the natural landscapes, particularly vegetation.

Our findings have significant implications for the field of urban planning, as they call into question TODs as a sustainable planning tool. Although TODs can generate environmental benefits by decreasing city residents' use of their personal vehicles, thereby reducing GHG emissions, our study shows that they experience a higher heat island intensity if enough vegetation cover and high albedo surfaces are provided. The outcomes of this study will help policy-makers, planners, and developers to address and mitigate UHI effects when developing new TODs.

EQUITABLE TRANSIT-ORIENTED DEVELOPMENT? INSIGHTS FROM 19 CITIES IN SOUTHERN CALIFORNIA

Abstract ID: 1271

Individual Paper Submission

SONG, Qi [University of California Irvine] songq3@uci.edu, presenting author

Transit-oriented development (TOD) has gained increasing popularity to encourage sustainable development and realize its environmental, economic, and social benefits. However, social equity has historically played a minor role in TODs than stimulating economic growth and reducing greenhouse gas emissions (Guthrie, 2018). The social equity implications of TOD are the product of both market forces and public sector actions. As private developers play an increasingly significant role in facilitating TODs, it is critical to examine the responses of public sectors in promoting TODs, especially in achieving equitable TODs, which are underrepresented in the literature. Furthermore, there have been growing concerns about gentrification and displacement induced by market-driven TODs in recent decades. Indeed, the variation in the findings across different metropolitan regions highlights the importance of regional context and local government policies in achieving equitable development in transit-served neighborhoods. However, the extent to which TODs promote equitable developments in specific local and regional contexts is yet to be explored.

In light of these concerns and gaps, this study examines the extent to which local governments in the Southern California region promote equitable development in TODs through development regulations and policies. It uses a multiple-case study approach, following the guidelines suggested by Yin (2018). It studies 19 rail-based TOD specific plans—development regulations and policies that apply to transit-adjacent areas within cities to implement goals and objectives included in the cities' general plans and facilitate developments around transit stations. These specific plans are adopted by 19 incorporated cities in the Southern California region to promote TODs. Next, the study uses the equity-oriented criteria proposed by the American Planning Association (2019) and the operationally defined criteria included in the LEED-ND (Leadership in Energy and Environmental Design for Neighborhood Development) rating system, as the analytical framework, to determine whether and to what extent these targeted TOD specific plans address the selected criteria that evaluate both the general quality and equity-focused quality of TOD plans (Garde, 2017; Loh & Kim, 2021).

The findings show that local governments in the Southern California region facilitate equitable TODs in different approaches. However, equity is not a guiding principle in local TOD planning since the majority of specific plans do not mention equity or identify underserved areas or populations. In addition, providing affordable housing units and increasing the share of land for multifamily housing near transit stations are two common strategies adopted by cities to facilitate equitable TODs. However, there is considerable variation in the extent to which local governments adopt these two strategies.

Further, the study also uses one-way analyses of variance (ANOVA) to determine whether the extent to which local governments support equitable features of TODs is associated with the characteristics of cities and transit stations. The findings show that cities with lower median household income, a larger concentration of non-white populations, and higher population density are more likely to facilitate equitable development in TODs to a greater extent.

Overall, the study emphasizes the necessity of examining TOD regulations and policies with a focus on social equity. The findings of this study could provide insights into the strengths and weaknesses of existing policies in facilitating

equitable TODs and possibly explain the variation among different municipalities in the same region. Other metropolitan regions and cities promoting TODs would benefit from the evaluative methods and findings of this research to achieve more equitable TODs.

COMMUNITY-DESIGNED PARTICIPATION: LESSONS FOR EQUITABLE ENGAGEMENT IN TRANSPORTATION PLANNING

Abstract ID: 1272

Individual Paper Submission

LINOVSKI, Orly [University of Manitoba] orly.linovski@umanitoba.ca, presenting author

BAKER, Dwayne [Queen's College] Dwayne.Baker@qc.cuny.edu, co-author

Despite long-standing directives for public consultation in transportation policy, formal processes often follow the “decide, announce, defend” model, giving the perception of participation with little community control over decision-making (Bickerstaff, Tolley, & Walker, 2002). Recent examinations of meaningful public engagement in transportation planning note the importance of providing resources and increasing the capacity of community-based organizations (Karner and Marcantonio, 2018). However, even with substantial community capacity, the structure of formal public processes can work to limit inclusive engagement (McAndrews and Marcus, 2015). While transportation planning that incorporates community knowledge and lived experiences has the potential to improve equity outcomes, there is little known about the potential to bridge community-led and formal processes.

This research is based on a participatory action research project undertaken by a partnership of academics and advocacy groups in Ottawa, Ontario. This work draws on a co-created public survey (n = 600), and content analyses of city-led engagement process to understand how equity concerns can be better integrated into transportation planning processes. We address the following research questions: (1) How do community-led processes assess transportation equity values and priorities? How does this differ from agency-developed engagement? (2) What are the barriers and opportunities to integrating community-derived equity goals in formal planning processes?

Our findings explore the differences in community- and agency-led processes as they relate to representation, conceptualizations of equity, and implications for equitable engagement and planning. On basic measures of representativeness, agency-led engagement did not adequately reflect the diversity of the community, and rarely presented disaggregated data for analysis. We found that legally-mandated consultations did not address issues of critical importance to community members, such as safety and affordability, and were based in a very narrow framing of equity as “fairness”, irrespective of race, Indigeneity, gender, disability or other identity. We also found that community-members are reluctant to participate in agency-led engagement because of the belief that that there would be little impact on the decision-making process. Overall, community-led engagement processes can address critical questions about the values that should shape equitable transportation investments and better reflect the needs of equity-deserving groups, which were largely elided in formal agency engagement. Given the critical need to incorporate different types of knowledge and lived experiences in transportation planning (Lowe, 2020), this research points to the role that community-led processes can take in framing high-level equity values and priorities.

EXPLORING THE “PUBLIC TRANSIT DESERT” CONCEPT THROUGH MEASURING THE GAPS BETWEEN SUPPLY AND DEMAND OF PUBLIC TRANSIT SERVICE IN DALLAS

Abstract ID: 1279

Individual Paper Submission

SHARIFIASL, Seyedsheil [University of Texas at Arlington] Sharifiasl.soheil@gmail.com, presenting author

For decades, suburban development has been a dominant growth pattern in most North American cities. This form of urban growth which is low-density, noncontiguous and highly automobile dependent is considered as unsustainable and unjust in many transportation related aspects (Bengston et al., 2004). This type of development has mostly paved the roads for seamless movement of private cars and driving is believed to be highly related to climate change, global warming, air pollution, dependence on fossil fuels, and traffic congestion. As a result, most of the low-income families and the underserved population without cars suffer from the lack of multimodal mobility options and reduced accessibility to various opportunities (Cervero, 2020). This is a substantial social equity issue since the United States Supreme Court considers the right to travel and mobility as a fundamental right for everyone guaranteed by the 14th Amendment to the U.S. Constitution (Jiao & Dillivan, 2013; Sanchez & Brenman, 2008). A natural response of planners to the needs of those groups is to promote public transit services that provide an acceptable level of accessibility and achieve transportation sustainability and equity (Murray & Wu, 2003). However, numerous studies show that public transit in the US has been highly underutilized. According to the American Community Survey (ACS), public transportation commuters constituted about 5 percent of all workers in the United States in 2019, and about 45% of Americans have no access to public transportation (Hughes-Cromwick & Dickens, 2019)

While most of the existing studies on this issue have focused on the underlying reasons of public transit underutilization, such as built environment characteristics or socio-economic factors, few attempts have tried to identify where the need for public transit is truly located in urban areas and what factors defines public transit-dependent populations.

Borrowing the concept of “public transit desert” from “food desert” utilized in many public health researches (Clarke et al., 2002; Jiao & Dillivan, 2013), this study’s objective is evaluate public transit performance through measuring and visualizing the gaps between supply and demand in public transit through methods using different categories of data such as socio-economic factors (age, poverty status, vehicle ownership and disability status) for demand as well as built environment walkability factors (sidewalk length, intersection density) and characteristics of public transit service (transit stops service area, capacity of fleet, frequency of service) for supply (Seyrfar et al., 2021). In this study the mismatch between supply and demand are depicted on a GIS-based platform. Census tracts are employed as the geographic unit for analysis. The City of Dallas and its peripheral areas are selected as the empirical case with the data collected from 2020 US Census and General Transit Feed Specifications (GTFS) of Dallas Area Rapid Transit (DART). The remaining data are calculated in ArcGIS environment using transportation network datasets obtained from Dallas-Fort Worth MPO (NCTCOG).

While DART has the longest light rail service in the US (93 miles), serious gaps between supply and demand are expected to be identified in this area, especially in the Southern and Western parts. The results of this study highlights the needs of underserved population and contributes to creation of equitable and sustainable transportation systems. This mismatch measurement can be applied to any context where public transit planners are willing to extend the service or optimize it for better accommodation of public transit-dependent population. Using these results, planners would be able to create more equitable transportation services with increased efficiency.

DESIGNING PANDEMIC RESILIENT CITIES: EXPLORING THE IMPACTS OF THE BUILT ENVIRONMENT ON INFECTION RISK PERCEPTION AND SUBJECTIVE WELL-BEING

Abstract ID: 1283

Individual Paper Submission

OZBILEN, Basar [The Ohio State University] ozbilen.1@osu.edu, presenting author

AKAR, Gulsah [Georgia Institute of Technology] gulsah.akar@design.gatech.edu, co-author

The COVID-19 outbreak caused enormous global challenges, namely millions of hospitalizations and deaths, interruption of global supply chains, business bankruptcies, and overwhelmed health systems (Budd & Ison, 2020; Thoradeniya & Jayasinghe, 2021). These challenges resulted in significant disruptions to individuals' daily activities and travel frequencies worldwide (Budd & Ison, 2020). As a response to these new challenges posed by the pandemic, various local governments around the world introduced open street policies to create safe urban environments and promote non-motorized transportation (NACTO (National Association of City Transportation Officials), 2020). They redistributed the street space to promote physical activity and non-motorized travel while meeting the social distancing requirements. Although the statistics showed significant increases in walking and bicycling trips during the pandemic, we have limited knowledge about the associations between built environment characteristics, COVID-19 infection risk perception while traveling, and subjective well-being.

This study assesses the impacts of the built environment on subjective well-being and infection risk perception while traveling during the pandemic. It uses data collected from the residents of Columbus, OH, through a multi-wave survey conducted at different time points during the COVID-19 outbreak. Survey responses were collected through mailed surveys and the Qualtrics Online Panel, an online sample recruitment service. The surveys included questions about infection risk perceptions associated with COVID-19 regarding different transportation modes, subjective well-being, overall travel satisfaction, pro-environmental identity, and personal and household characteristics.

To explore the impacts of built environment characteristics, we merged the survey responses with the United States Environmental Protection Agency (U.S. EPA)'s Smart Location Database (SLD). SLD is a nationwide geographic data resource for measuring location efficiency, and it includes more than 90 attributes summarizing characteristics such as household and employment density, diversity of land use, design of the built environment, access to destinations, and transit accessibility (for details see Chapman et al., 2021). The database is developed in a way that it can reflect the five D-variables that are described in the literature (Ewing & Cervero, 2010).

The final study sample included 1,171 respondents. We employed a structural equation modeling approach to explore the associations between residential neighborhood characteristics, individuals' subjective well-being, and perceived infection risk while using non-motorized modes and shared micromobility. The findings show that those living in more compact, accessible, and walkable neighborhoods are less likely to perceive active travel and shared micromobility as risky in terms of COVID-19 infection. Our results also show that built environment characteristics have an indirect positive effect on the subjective well-being of individuals. The findings of our study demonstrate that built environment interventions can help promote physical activity and support the mental health of individuals at this critical time. Our study also indicates that designing compact, diverse, walkable, and accessible neighborhoods will be a crucial element of pandemic resilient cities in the post-COVID-19 era.

MOBILITY JUSTICE IN RURAL CALIFORNIA: EXAMINING TRANSPORTATION BARRIERS AND ADAPTATIONS IN CARLESS HOUSEHOLDS

Abstract ID: 1286

Individual Paper Submission

BARAJAS, Jesus [University of California Davis] jmbarajas@ucdavis.edu, presenting author

WANG, Weijing [University of California Davis] weijingw@ucdavis.edu, co-author

Car access is a practical necessity in rural areas because of the long travel distances required to meet essential needs. Households without a private vehicle, or who own fewer vehicles than adults, tend to make fewer trips and travel a shorter distance daily, and the trips they do make tend to be individually longer and take more time (Mitra & Saphores, 2020, Blumenberg et al., 2020). Yet 4.5 percent of rural households across the U.S. did not own a car in 2017. While this is a smaller share than in urban and suburban areas, lack of car access can still result in reduced out-of-home activities such as medical appointments and jobs, and a greater likelihood of social isolation for rural residents (Delbosc & Currie, 2011; Morris et al., 2020). Residents of rural areas are also underserved by alternative modes, such as public transit, and tend to be socioeconomically disadvantaged in other ways, with higher rates of poverty, for example. However, certain households without vehicles have adapted to carlessness, achieving mobility without resorting to the purchase of vehicles. Mexican immigrants, for example, rely on social networks to get rides and to borrow and share vehicles (Lovejoy & Handy, 2011). Similarly, in those households with fewer than one car per driver, there may be significant negotiation among household members to ensure adequate mobility for daily needs (Blumenberg et al., 2020). While there has been previous research on barriers to transportation access and adaptations in rural communities in the United States, much of this work focuses specifically on access to healthcare or on the broad conditions and policy approaches related to travel challenges outside urban areas. This mixed-methods study sheds new light on rural carlessness, focusing on three research questions: (1) What is the scope and scale of rural car access in California?, (2) What burdens do carless rural households face with respect to mobility and access?, and (3) How do rural households adapt to the lack of a household vehicle to meet their transportation needs?

The quantitative component of this work uses the US Census Public Use Microdata Sample (PUMS) to describe and compare household and individual characteristics by household car availability. Sociodemographic disparities by car access are evident in rural California. Carless households earn substantially lower incomes, are more likely to be Black, immigrants, and have a mobility limitation compared to their car-owning peers. Owning no household vehicles, carless rural residents rely more on alternative modes but are also constrained by poor services. About 8% of carless residents in rural areas commute by bus or bicycle, compared to 1% of their rural peers with at least one car per adult and more than 30% of their carless peers in non-rural areas.

The qualitative component of the research will share insights from interviews with about 50 residents of California's San Joaquin Valley, a region that contains a disproportionate share of disadvantaged rural communities and carless residents. Semi-structured interviews will focus on travel burdens, adaptations to carlessness, and potential policy responses to increasing access in rural areas. Findings from the research will be relevant for policymakers in California and beyond focused meeting vehicle miles traveled (VMT) reduction goals and ensuring that the proliferation of new mobility options and vehicle electrification reaches rural areas in an equitable manner.

FEASIBILITY OF BIKESHARE ON A UNIVERSITY CAMPUS: INSIGHTS FROM WESTFIELD STATE UNIVERSITY

Abstract ID: 1291

Individual Paper Submission

NEOG, Dristi [Westfield State University] neog.dristi@gmail.com, presenting author

MCHATTON, Jonathan [Springfield Area Transit Company] jonathan.mchatton@gmail.com, co-author

Bicycling, a non-motorized and sustainable urban transportation option, is expected to see increased use in a post-pandemic world (Beuhler and Pucher 2021; Chardon 2019; Mason et. al. 2015). Bikeshare programs, which provide bikes to the public for short-term use with a time-based charge, allow public access to bicycling. They offer communities and users alike a flexible mobility option that can have positive impacts on public health, air quality, traffic congestion, and increased access to other transportation options (Mason et. al. 2015). Bikeshare programs have become popular and have spread across North America and a few of these programs exist on university campuses, albeit with mixed results. Bikeshare has the potential to succeed at universities given the concentration of people, and could address the challenges of moving people across campus efficiently and alleviate parking and other transportation problems. Some researchers have investigated feasibility and barriers to bikeshare on campuses (Agarwal and North 2012; Kellstedt et. al. 2019), but more research is needed.

This study examines the feasibility of a bikeshare program at Westfield State University in Westfield, Massachusetts to extend this understanding. It reports the insights from a survey that was used to collect the perception, preference, and interest for bike share amongst students, faculty, and staff. Out of 729 respondents, 475 (65%) stated that they will use bikeshare if it were available, citing increased mobility, exercise, and time savings over other options. Safety concerns and means of payment came up most often as concerns. This indicates that while there is demand for and interest in bikeshare, the aforementioned concerns should be addressed by bikeshare providers to ensure success. Findings from the study can inform such providers and university decision makers, as well as researchers and practitioners with interest in the subject, providing them with yet another opportunity to understand the possibilities and challenges to bikeshare on a university campus.

HOW BUSES ALLEVIATE UNEMPLOYMENT AND POVERTY: LESSONS FROM A NATURAL EXPERIMENT IN CLAYTON, GA.

Abstract ID: 1300

Individual Paper Submission

LI, Fei [Georgia State University] feili@gsu.edu, presenting author

WYCZALKOWSKI, Chris [MARTA] cwyczalkowski1@gsu.edu, co-author

Lack of access to jobs, and the subsequent unemployment or underemployment, can be a major driver of urban and suburban poverty. In most American cities, public transit has a much smaller mode share than automobiles in commuting. Nevertheless, those who ride transit to work are disproportionately minority, lower-paid workers who are more susceptible to poverty and unemployment. Access to public transportation (or lack thereof), therefore, could have an important role in expanding access to jobs and alleviating poverty (Sanchez, 2008).

The importance of public transportation for disadvantaged riders has been further demonstrated during the COVID-19 pandemic, when white, higher-income riders avoid traveling by transit, and Black, Hispanic, and low-income riders made up an even greater share of the remaining transit ridership. The suspension, reduction, and disruption of transit services many cities experienced during the pandemic have had a disproportionate impact on these transit

dependent riders. In Atlanta, for example, the Metropolitan Atlanta Rapid Transit Authority (MARTA) suspended 70 of its 110 bus routes from April 2020 through April 2021 as part of its initial pandemic response and then substantially reduced service frequency since December 2021 due to staffing shortages. These service cuts leave many neighborhoods without bus access and aggravate the transportation barriers facing disadvantaged individuals.

Many studies have explored the linkage between public transportation and economic outcomes (Pasha et al., 2020; Sanchez, 1999; 2008; Sari, 2015), though few examined the impacts of losing existing transit services on unemployment and poverty. The COVID-19 pandemic and its devastating social, economic, and public health impacts on vulnerable communities call for better understanding of, and policy strategies for, the implications of disruptions in various essential services, including public transportation. Evaluating the economic impacts of transit disruptions during the pandemic or similar disasters, however, can be methodologically challenging due to the numerous confounding factors also caused by or related to the disaster itself.

This study tackles this problem using a natural experiment in Clayton, a suburban county in Georgia bordering the City of Atlanta. The county's local bus services were terminated in 2010 and reinstated in 2015, allowing us to evaluate the impacts of losing bus access by comparing affected census tracts with adjacent neighborhoods that did not experience similar disruptions in transit services. Using a difference-in-difference approach, we find that the termination of bus services in the five-year period was associated with significant increases in poverty and unemployment rates in affected areas. Our findings suggest both the spatial mismatch hypothesis, which predicts the reduction in transit access can lead to reductions in job accessibility and employment, and the residential sorting hypothesis, which states that poor households gravitate toward neighborhoods with better transit access, could be at play. Overall, disruptions in bus transit could have significant adverse impacts on neighborhood economic outcomes. In the face of the COVID-19 pandemic, more effort is needed to provide alternative transportation and poverty relief for vulnerable communities affected by transit disruptions and service cuts.

BROWN, Melissa [University of Washington] mbrown24@uw.edu, co-author
CAI, Mingming [University of Washington] mmcai@uw.edu, co-author

The COVID-19 pandemic severely disrupted public transit services, which provided, and will continue to provide, a critical lifeline for many essential workers. As more and more institutions start to resume their in-person operations, it is necessary to understand how the pandemic affected essential workers' commute and what it will take to ensure an effective and equitable recovery of transportation services. Such knowledge will also be essential for achieving the long-term resilience of urban transportation systems. Because survey-based studies often failed to capture the nuances in essential workers' changing commuting challenges and perceptions and the complicated mechanisms for travel behavioral adaptations, in the summer of 2021, we conducted semi-structured focus group discussions with 21 essential workers who are employees of the University of Washington. The discussion questions were designed to examine the reasons for and effects of essential workers' commute mode shifts during the pandemic and explore promising approaches for post-pandemic recovery of public transportation. We used NVivo 12 Pro to conduct a thematic analysis of the transcribed data and examined patterns of commute mode change with respect to participants' attributes, including job type, home location, and gender. The thematic analysis identified 16 themes structured into three main periods: pre-pandemic, pandemic, and post-pandemic. The themes helped gain important

insights into the challenges, benefits, and contributing factors associated with different commute mode choices before and during the pandemic and revealed characteristics of post-pandemic commute expectations and desirable travel demand management policies.

The results showed that most participants commuted by transit before the pandemic because of its accessibility, affordability and enhanced value of travel time. At the beginning of the pandemic, however, most participants switched away from transit, and the majority drove alone to work, mainly because public transportation made them feel unsafe from pandemic infections and transit services became less frequent and unreliable. In the meantime, most participants found driving more advantageous, especially with subsidized parking which made this faster and safer alternative also affordable. Most participants indicated that price would be the main determining factor in their post-pandemic commute mode choice. They believed that providing frequent transit service, complemented by reliable transit information through smartphone apps and a free or heavily subsidized transit pass, would be sufficient to recover transit demand in the post-pandemic period. Future research should look into actual changes in post-pandemic commute and transit ridership and develop innovative transit services and TDM policies to safeguard transportation equity for essential workers during both normal times and major crises.

THE DEMOGRAPHICS AND CONTRIBUTING FACTORS OF CAR CRASHES DURING THE ILLINOIS STAY AT HOME ORDER OF 2020

Abstract ID: 1319

Individual Paper Submission

EDWARDS, Mickey [University of Illinois Springfield] edwardhj@mail.uc.edu, presenting author

The 2020 COVID-19 public health emergency and subsequent stay at home orders upended the transportation behavior of travelers across all modes. Among motorists, those who ventured out were more likely to be injured in a crash while under stay at home orders than when compared to the previously prevailing conditions, despite a significant reduction in traffic (Liao & Lowry, 2021; Doucette et al., 2021). Several contributing factors for the increase in vehicular violence have been put forth and studied, chief among them is the perception that decreased traffic congestion induced widespread speeding (Lee et al., 2020). Yet this study finds other factors may have been at work contributing to the unprecedented rise in motor vehicle crash injuries. For example, during the Illinois stay at home order of 2020 there was a 2.4 fold increase in the proportion of personal injury crashes involving an impaired driver when compared to the previous four years. In another display of increased risky behavior by motorists, the proportion of unprotected travelers (no seatbelt, no child restraint, or un-helmeted motorcyclist) increased by a factor of 1.5 when compared to the previous four years. Yet the incidence of crash injuries were not evenly distributed across all communities. The average poverty rate of the home zip code of injured motorists increased by a factor of 1.4 to nearly 15% when compared to the previous four years; implying members of impoverished communities were more likely to get injured in crashes during the Illinois stay at home order. Motorists not only got injured at a higher rate in 2020, they also got more severely injured. The proportion of serious injuries among Black motorists increased by nearly 26%, while the increase among Whites was roughly half that much. The increase in serious injuries also correlates with 43% increase in hospital charges compared to the previous four years. Still, findings suggest gender may be a better predictor than race of who was injured in a motor vehicle crash. Results imply both Black and White women fared better than their male counterparts during Illinois' stay at home order, with White women experiencing an 8% drop in crash injuries – the best overall. While Black and White males fared worse with a 5% and 8% increase in crash injuries, respectively.

The stay at home orders of 2020 laid the groundwork for the greatest natural experiment in a generation and provides for a tragic yet remarkable tranche of transportation behavior data. This paper draws upon that natural experiment through uncommon access to five years of crash and hospital data from Illinois' Departments of Transportation and Public Health. We ask and answer: what were the significant contributing factors to the increase in crashes and injuries in 2020, and who was most affected? Advanced data linkage methodology and software are used along with difference-in-differences statistical methods and logistic regression to conduct analyses and reach conclusions.

Findings have implications for policy and rulemaking under public emergency impositions, road safety interventions, identification of at-risk communities, and the allocation of public funds for mitigation efforts.

DIFFERENT CHARACTERISTICS OF BUS AND SUBWAY RIDERSHIP IN CALIFORNIA – LINKS BETWEEN RACE, INCOME, WORK STATUS, AND WALKABILITY

Abstract ID: 1324

Individual Paper Submission

PAE, Gilsu [The Ohio State University] pae.23@osu.edu, presenting author

Despite the massive subsidy on public transit to reduce the adverse outcomes of auto-dependency and improve equitable mobility, per-capita transit use remains constant (Taylor, Miller, Iseki, & Fink, 2009). Many scholars focus on the determinants of transit ridership. Various factors can influence transit ridership, such as fares, level of service, station accessibility, and safety. Specifically, previous studies found that public transit use is significantly influenced by socioeconomic factors, such as car ownership, incomes, and population densities (Buehler & Pucher, 2012). The characteristics of subway commuters are different from those of bus commuters (Lee, Wohar, & Uhm, 2016). Walkability is highly associated with public transit use (Barnes, Winters, Ste-Marie, McKay, & Ashe, 2016). These factors are so correlated that the relationships between these factors are less well understood (Taylor & Fink, 2013). Within this consideration, this study explores the difference in transit ridership of buses and subways, focusing on race, income, car ownership, work status, and walkability.

This study uses the California add-on survey of the 2017 National Household Travel Survey (NHTS) and Smart Location Database Version 3.0. These data sets provide extensive information on socioeconomic factors, travel patterns, transit availability, and home locations of the residents in the US, as well as the walkability index of a census block group. The final analysis sample consists of 11,018 individuals aged over 18. The respondents in the original data set are excluded if they live in areas where public transit is not available by using the Geographic Information System (GIS). The walkability index of the Smart Location Database is combined with the individual-level data of NHTS with a GIS function of spatial join. After that, the present study uses a multilevel mixed-effects logistic regression. Specifically, a three-level random-intercept model is used with a household nested within metropolitan statistical areas (sampling strata). The dependent variables are bus and subway usage, and the independent variables consist of two groups: 1) socioeconomic factors and walkability, and 2) various interaction terms between car ownership, household income, and work status.

The multilevel logistic regression models show that the random effects of households are statistically significant ($p < 0.001$). In the first estimation model analyzing the bus usage, the African American has higher odds of using buses than the white race. The respondents with lower household incomes have higher odds of using buses. Higher walkability is positively associated with bus usage. Interestingly, work status is not associated with bus usage, and the relationship between household vehicle ownership and bus usage depends on household income. In the second estimation model analyzing the subway usage, race, household income, and walkability are not statistically significant, unlike bus usage ($p > 0.1$). In addition, respondents who have jobs have higher odds of using subways. These multilevel regression models reveal that household characteristics significantly influence individuals' transit use, and the characteristics of bus users substantially differ from those of subway users. The bus may be the last resort for the mobility of marginalized socioeconomic groups, and the subway may be optional mobility means for commuting in the US. What makes the significant difference in bus and subway ridership? Public transit scholars need to further explore the underlying factors that create such differences. A deeper understanding of the discrepancy will help establish more effective programs for increasing public transit use.

TRANSIT USE DURING THE COVID-19 PANDEMIC: EVIDENCE FROM NJ, DALLAS, TEXAS, AND BOSTON, MASSACHUSETTS METROPOLITAN AREAS

Abstract ID: 1338

Individual Paper Submission

SMITH-COLIN, Janille [Southern Methodist University] jsmithcolin@mail.smu.edu, presenting author
 BARCHERS, Camille [University of Massachusetts Amherst] cbarchers@umass.edu, co-author
 ZHANG, Wenwen [Rutgers University] wenwen.zhang@ejb.rutgers.edu, co-author

The COVID-19 pandemic has significantly reduced transit ridership in the past two years (Transit App and APTA, 2020). Reduced ridership has led to reduced revenue. Reduced revenue and increased operation costs have combined to make transit service less accessible. Examining transit mode choice behaviors during the pandemic can provide insights on how to effectively regain transit ridership to help restore the system. This study aims to answer three critical questions related to transit mode choice behavior: (1) how has transit mode choice changed among different types of transit riders? (2) what key factors are associated with the mode choice change? and (3) what are the top reasons for reducing/stopping using transit?

To address the above research questions, we designed an online survey, which was administered by Qualtrics online panel (February 2021- to May 2021) to collect 1,173 representative responses from three study areas, i.e., New Jersey, Dallas TX, and Boston metropolitan areas. The three study areas have dramatically different types of existing transit infrastructure and travel culture. The survey targets transit riders before and during the pandemic. The collected samples have representative age and gender distributions and slightly biased income (skewed towards lower income population) and race distributions (under sampled Hispanic population, likely because the survey is English only). Overall, the survey results show the number of active transit riders declined significantly during the pandemic across the three study areas. Among all regions, NJ metropolitan area witnessed the most significant decline (43%), followed by Boston metro (39%) and Dallas metro (34%). For riders who stopped or decreased using transit services, the top reported reasons were “I no longer feel necessary to make the trip” and “I no longer feel comfortable sharing space with strangers”.

In the survey, we also asked respondents to recall a typical transit trip before the pandemic to understand changes in transit mode choices behavior during the pandemic. For the particular trip, the survey collects trip characteristics, such as trip length, trip purpose, fare, specific transit modes, and access modes. In addition, we also collected riders' socioeconomic and demographic attributes and attitudinal questions towards the pandemic and COVID-19 vaccinations. Finally, we asked respondents to make discrete choices based on various scenarios, such as population vaccination level or changes in fares. We found that the decline in transit use is not evenly distributed among various transit modes. For all regions, the decline is the most significant for light rail, subways, and express trains, likely because most of these riders could work from home during the pandemic. Meanwhile, the demand for local city bus systems and paratransit systems declined less, likely because travel demands for these riders are less flexible when compared with other transit riders. Additionally, we developed discrete choice models to understand the correlation between transit mode choice behaviors and key trip attributes, socioeconomic, and attitudinal variables. Preliminary results show that high-income and transit-dependent (e.g., disabled and those without vehicle ownership) riders were more likely to stop using transit during the pandemic. The decision to ride transit again is also sensitive to the overall population vaccination rates, changes in service schedule (e.g., start and ending time and frequency). This finding is also consistent with results from a recent national survey (He et al., 2022). This study highlights the heterogeneity in the change of transit mode choices during the pandemic; low-income and transit dependent riders are more seriously affected by the decline in services. The results also suggest that riders are not sensitive to COVID-management strategies (e.g., air filtering changes, social distancing) and more sensitive to vaccination rates and service frequency.

EVALUATING THE EFFECTIVENESS OF URBAN SPEED CAMERAS IN A PERIOD OF DRAMATIC TRAFFIC CHANGE

Abstract ID: 1352

Individual Paper Submission

GUERRA, Erick [University of Pennsylvania] erickg@design.upenn.edu, presenting author
CHRISTOPHER, Puchalsky [City of Philadelphia] christopher.puchalsky@phila.gov, co-author

Speed cameras were installed along segments of Roosevelt Boulevard in June 2020. Two years earlier, the Pennsylvania legislature had approved the camera installation in light of high fatality rates and requests from City officials. In the previous 5 years, the Boulevard had accounted for 14% of the City of Philadelphia's total traffic fatalities. The twelve-lane at grade highway frequently makes lists of the most dangerous intersections and roadways in the country, a particularly egregious statistics since Philadelphia has only about half the national traffic fatality rate. Just three months earlier, Covid-19-related shutdowns dramatically influenced the geography of travel and traffic safety. Collision rates and traffic fatalities skyrocketed throughout the city, likely a result of a combination of decreased congestion, increased drunk driving, and decreased traffic enforcement in the wake of protests against the murder of George Floyd and for police reform.

This paper examines the effectiveness of the Roosevelt Boulevard using a differences-in-differences approach with a negative binomial estimator. Selection of control segments is of utmost importance given the dramatic changes in crashes and fatalities over the time period of study, using PennDOT reported collision data from 2018 through 2020 and preliminary Police Department data on fatalities from 2018 to 2021, we find generally consistent magnitudes of reduction across a variety of controls. Compared to the rest of Philadelphia, other untreated segments of Roosevelt Boulevard, and other major arterials, we find a 30% to 50% reduction in reported crashes and traffic fatalities. Despite the short timeframe (just 6 months of data after camera installation), the difference in report collisions is statistically different from zero with a high degree of confidence. The decrease in traffic fatalities would occur randomly about 1 in 7 times generating random study and will require additional years of data to confirm. Our best current estimate is that the speed cameras prevented 200 reported collisions over 7 months and 8 traffic fatalities over 19 months. The PennDOT estimated economic cost of such crashes over a year is approximately \$55 million, substantially higher than the roughly \$20 million in revenues generated by the speed cameras. We recommend the continuation of the Boulevard speed cameras, the increased use of speed cameras throughout the state, and a liberalizing of state laws that prevent municipalities from deploying automated speed enforcement without state legislation.

THE CLEAR ZONE ABROAD: AN INTERNATIONAL COMPARISON OF ROADSIDE TREE POLICY

WHITE, Ellen Oettinger [Rutgers, The State University of New Jersey] eo.white@rutgers.edu, presenting author
NOLAND, Robert [Rutgers, The State University of New Jersey] rnoland@rutgers.edu, co-author

In this study, we compare the roadside tree policies of four countries: the United States, Germany, Sweden, and the United Kingdom.

In the United States, roadside design guidelines require a “clear zone” adjacent to the roadbed, kept clear of fixed objects such as trees. In practice since the 1960s, the clear zone is often designed as a 30-foot dimension. Some state highway agencies have begun clearing trees across the entire right-of-way, hundreds of feet from the roadbed, using the clear zone and roadside safety as justification (Hurt, 2018). Despite the widespread use of the clear zone, traffic fatalities resulting from collisions with trees account for about 10% of annual traffic fatalities in the United States. Tree removal alone does not eliminate roadside crash risk, and these practices ignore other causes of tree crashes, such as excessive speed and intoxication (Wolf and Bratton, 2006). Despite this mixed record, large-scale roadside tree removal is becoming more common across the United States.

Other countries preserve their roadside trees, prioritizing environmental values, scenic quality, and other functions of the roadside over the perceived safety of a clear roadside (Antonson, 2014). Yet many have far lower traffic fatality rates than the US, which ranks 64th worldwide, with 12.4 fatalities per 100,000 population (WHO, 2020).

In this research, we ask: how does US roadside tree policy compare to that of other countries? How do other countries use policy and design guidelines to balance traffic safety and roadside tree management?

We selected countries that meet the following criteria: robust environmental laws, very low traffic fatality rate (lowest 20 worldwide), variation in road contexts (urban and rural roads), similar motorization rate to the United States, and history of transport systems comparison with the United States. The resulting list—Germany, Sweden, and the United Kingdom—are all in Europe, which has the most countries with low traffic fatality rates and a variety of similar contexts to the United States. For instance, Hong Kong and Singapore both have very low fatality rates, but have few roads that would compare with the United States’ rural highways.

To investigate roadside design policy in these countries, we take a two-pronged approach. We first review roadside design guidance, roadside tree protections, and environmental planning regulations relating to transportation. Next, we interview practitioners. Using a semi-structured interview protocol, we interview a mix of scholars and practitioners (<5) in each country. The goals of these interviews are to clarify any issues from the document review; understand the policy and implementation context of the documents, and gather historical data on how and why the policies were developed.

Results are intended to illuminate alternative approaches to large-scale tree removal with a stated goal of improved road safety. For example, the German state of Mecklenburg reduced tree collision fatalities by 75% between 1991 and 2007 using multiple approaches, including speed reduction and measures to reduce risk exposure (Pradines, 2012). Findings can be utilized by both state highway agencies and the Federal Highway Administration, which is currently updating its roadside tree management guidance and best practices for training and distribution to state highway agencies.

For the wider transportation planning context, results are anticipated to contribute to the current reckoning with and reevaluation of historical engineering practices in the field.

ACCESSIBLE TAXI TRAVEL EXPERIENCES OF INDIVIDUALS LIVING WITH DISABILITY IN TORONTO, CANADA

Abstract ID: 1355

Individual Paper Submission

COMEAU, Élyse [University of Toronto] elyse.comeau@mail.utoronto.ca, presenting author

KELLY, Siobhan [University of Toronto] siobhan.kelly@mail.utoronto.ca, co-author

ROSS, Timothy [University of Toronto and Bloorview Research Institute] tross@hollandbloorview.ca, co-author

Having reliable access to transport is crucial to people's abilities to participate in everyday activities, engage in diverse and meaningful events, and to enjoy their quality of life. Unfortunately, some individuals with disabilities continue to encounter marginalizing barriers across transport modes, including accessible taxi services. While the literature identifies an array of transport-related barriers and offers various insights into how people with disabilities experience different transport modes, remarkably little scholarly attention has been given to understanding how they use and experience accessible taxis. This is troubling given that accessible taxis are integral to many paratransit services that are relied upon by some people with disabilities. For example, in Canada, paratransit agencies such as the Toronto Transit Commission's (TTC) Wheel-Trans agency contract out subsidized trips to accessible taxi service providers as part of their service. In this paper, we present qualitative findings from a study focused on understanding how individuals with disabilities experience accessible taxi services in Toronto, Canada. The study was guided by the research question, "what issues are people with disabilities experiencing when using accessible taxis?"

Study findings are based on an analysis of 590 customer complaint reports and 494 incident reports that a local accessible taxi brokerage provided to the research team. The reports emerged from trips that occurred between January 2014 and June 2021. Report contents were analyzed and thematically coded (Braun & Clarke, 2006) using NVivo 12 Pro. To unpack customers' embodied experiences of disability, a critical disability studies perspective anchored by phenomenological (Titchkosky, 2011) and critical ableism studies (CAS) (Goodley, 2014) was adopted. The use of phenomenological and CAS perspectives in our analyses of customer complaints and incidents data helped with uncovering the various dimensions and nuances of navigating transport barriers and the ways in which ableism normalizes such barriers and allows them to persist.

Findings suggest that the most prominent challenges encountered by customers using accessible taxi services include dealing with service quality issues (e.g., lacking communications between drivers and customers, inadequate assistance during transitions), safety fears (e.g., unsafe driving, improper securement of mobility devices), and overcoming difficulties with taxi service operations (e.g., inflexible trip modification policies, unexpected ride sharing). Informed by the accessibility and equity issues experienced by accessible taxi customers, we identify several recommendations for accessible taxi service providers, including but not limited to door-to-door service training, improvements to customer intake processes, and driver sensitivity training.

This study's contributions to planning scholarship are three-fold. First, it addresses the disconcerting knowledge gap concerning how people with disabilities use and experience accessible taxi services (Young & Farber, 2020) by providing fine-grained knowledge about the lived experiences and challenges encountered by customers living with disability. Secondly, this research will assist accessible taxi service providers in developing a policy dialogue aimed at advancing safer and more inclusive services for people with disabilities (Lister & Dhunpath, 2016). Finally, given that accessible taxi services play a key role in the provision of paratransit services and thus enabling transport and mobility for people with disabilities, this research will help municipal/regional paratransit agencies to identify issues and question what they require of accessible taxi service providers. In broader terms, this research prompts questions about normalized ableism within a transport service that is aimed toward serving people with disabilities and thus encourages transport planning scholars and practitioners to question the obscured presence of ableism in their work and the service designs for different transport modes. The paper encourages transport planning scholars and practitioners to meaningfully engage individuals with disabilities in the planning, design, and evaluation of accessible taxi and paratransit services.

CAN HIGH-SPEED RAIL FACILITATE SUSTAINABLE URBAN LAND USE?

Abstract ID: 1356

Individual Paper Submission

YU, Meng [The Ohio State University] yu.3066@osu.edu, presenting author

The integration of transportation infrastructure development with the land towards a diversified and intensified use has become a practical approach to improving land use efficiency while achieving sustainability. As a rapidly growing sector in China, transportation has been extensively promoted in terms of productivity and efficiency driven by policy support and technology innovations. In particular, high-speed rail (HSR), as an efficient surface transportation mode, has generated significant cohesion in urban land use through enhancing spatial connections and substitution in travel behavior in short and medium trips. Given China's dual land ownership system, which urban land is owned by the state while rural land is owned by farmer collectives, the free flow of population remains limited between regions and between urban and rural areas despite rapid urbanization because of the economic growth model, which is enabled by land finance and land financialisation, incentivize local governments to emphasis on the investment in urban land while relatively ignoring migrations' needs in public goods and services. HSR, as a mediator, has accelerated the process of urbanization through suburban development leveraged by building new HSR stations, housing prices appreciation spillover through accommodating growing population, which as a result, widen the urban-rural gap of GDP per capita between regions instead of promoting convergence of inter-regional economic development.

As an essential aspect of land use sustainable development, compact, contiguous and connected urban land use contributes to reducing energy consumption and emission. How mega transportation system like HSR can facilitate sustainable land use through population mobility between regions and between urban and rural areas remains unexamined in literature, since HSR's impact on land use in terms of accessibility at different scales have been more discussed than the sense of supply and demand. To fill the research gap, this study innovatively adopts scenarios analysis to test the hypothesis, that is, if the land use quota can follow the population flow and freely convert from rural to urban mediated by HSR, then a population density-driven land use demand, which the land use quota from the population outflow area will decrease with the inflow area will increase, may alleviate the distortions in practice between the unbalanced land supply and demand. This research is motivated by the policy framework Opinions on Improving the Systems and Mechanisms for Market-based Allocation of Factors of Production, issued by the State Council in 2020. For the factor of land, the establishment and improvement of an integrated urban and rural land use market are highlighted. Hence, this research argues that with quota transfer together with free population flow, inefficient land development in population outflow areas would be moderated if local fiscal revenue could be funded through quota transfer and re-fill into cities needed together with free population flow.

The study will examine the following two research questions using the two-stage least squares (2SLS) method and panel data consisting of the city-level land transaction and rural-urban population flow information for 2013 – 2019. Firstly, to what extent the urban sprawl financed by land development through HSR's construction in different cities may influence the population flow from rural to urban. Secondly, whether the expansive urban land development and land transaction price would be moderated by supplementing the land quota infilled by migrant farmers. The study will help understand HSR's positive impact on land use redistribution empowered by free population flow between rural and urban. The research finding will provide planning implications for the pro-equity development in urban land use practice and policy.

IS PUBLIC TRANSIT RECOVERING FROM COVID-19? EARLY EVIDENCE FROM A SAMPLE OF CANADIANS

Abstract ID: 1371

Individual Paper Submission

SCOTT, Darren [McMaster University] scottdm@mcmaster.ca, presenting author

SWEET, Matthias [Toronto Metropolitan University] matthiassweet@ryerson.ca, co-author

The COVID-19 pandemic has had a profound impact on the daily lives of Canadians. A direct consequence of the public health measures imposed was a rapid decline public transit ridership (Dachis and Godin, 2021). Today, as Canada's pandemic response shifts toward "learning to live with the virus," questions about the future of public transit remain, especially whether it will recover to pre-pandemic levels. The answer to this depends on three underlying questions. Who will use the service? How much will it be used? What purposes will it be used for?

While several studies have been published concerning the impact of COVID-19 on public transit, none have sought to address the issue of whether public transit ridership will recover, and consequently the questions posed above. The studies are largely of an aggregate nature focusing on collective behavior – ridership decline during the pandemic. For example, Liu et al. (2020) modeled daily ridership decline for 113 county-level transit systems in the United States. Qi et al. (In Press) modeled year-on-year monthly ridership reduction rates for 20 metropolitan regions in the United States. The authors conclude by stating that a limitation of their study is that the data were collected at an aggregate metropolitan level, making it difficult to understand the impacts of socioeconomic factors on ridership, and that disaggregated data need to be collected to examine such factors.

This study is among the first to address the issue of whether public transit ridership is on track to recover to pre-pandemic levels. The study uses data from the Future Mobility in Canada survey, which was administered in October and November 2021 to Canadians between the ages of 18 and 75 residing in six major metropolitan regions. The survey collected information on weekly public transit usage frequency (ordinal variable) by purpose both before the pandemic and at the time the survey was completed. October and November 2021 was characterized as a period of "opening up" prior to detecting the first cases of the Omicron variant in late November. As such, comparing public transit usage using the survey data offers important insights into its recovery.

The survey also includes information on respondents' individual and household characteristics, residential location, workplace location for those who work, telework practices over time for workers, mobility tools, travel behavior attitudes, and travel behavior by mode. Following a descriptive analysis of the data, bivariate ordered probit models are estimated separately for workers and non-workers by trip purpose. Through the descriptive and inferential analyses, the three questions posed above are answered. In turn, the findings from this study offer valuable insights into the future of public transit in Canada and how its recovery may differ geographically across the country given the inherent differences of metropolitan regions (Simeus-Kabo et al., 2021). These findings will be of interest to both academics and practitioners alike who seek to understand the evolution of mobility in a post-COVID-19 world, and how policy can guide successful outcomes.

The Covid-19 pandemic has highlighted the precarity of urban society, creating questions around both potential long-term opportunities and challenges for cities (van Wee & Witlox, 2021). For transportation planners, two significant

questions emerge from this disruption. First, to what extent is work-from-home likely to continue in the future? And second, what might work-from-home mean for the urban geography of cities, work, and commercial real estate – especially in downtowns? This study focuses on these questions by using survey data gathered in the fall of 2021 (N=5,002) to explore potential future work-from-home scenarios and to estimate what these may mean for the geography of work. Prime downtown real estate in major Canadian cities is comprised of office tenants and service industries supporting those tenants, so understanding the broader implications of work-from-home on land markets is critical for planners keen on protecting important urban nodes of economic production.

While neither work-from-home (telework) nor the technologies which support it are new, the Covid-19 pandemic accelerated the adoption of work-from-home business models. With a public health emergency necessitating broad quarantining, many employees were exogenously spurred to adopt virtual collaboration technologies while teleworking (Kalter, Geurs, & Wismans, 2021). Despite industry-variant permeation of technology-enabled work-from-home practices (Barbour, Menon, & Mannering, 2021), its accelerated introduction may have long-lasting impacts on the future of work and real estate. Survey findings suggest significant telework-induced future changes in travel behavior (Currie, Jain, & Aston, 2021) and simulation-based studies have highlighted dramatic potential real estate impacts on cities (Delventhal, Kwon, & Parkhomenko, 2022), but little research has estimated land use impacts based on empirical survey-based evidence on telework (a gap addressed by this study).

This study employs survey data collected in six major Canadian metropolitan areas (collectively half of Canada's population): Toronto, Montreal, Vancouver, Calgary, Ottawa, and Hamilton. Survey data based on ordinal frequencies measures respondent telework practices before and during the pandemic, including prospective future telework practices. The survey includes information on individuals' existing places of work, residence, household characteristics, individual and sociodemographic characteristics, and travel behavior. Inferential models are developed which are used to develop work-from-home scenarios which are allocated spatially based on respondents' locations of work. Using scenario logic loosely rooted in base economic theory, commercial real estate vulnerability and opportunity are mapped based on alternative industry-specific scenarios. Results are interpreted considering potential rent impacts, potential need/opportunity to reconfigure commercial office use models, and spillover impacts throughout the metropolitan land markets.

While results should be interpreted as upper bounds with respect to the potential future impacts of work-from-home on commercial real estate and the geography of work, findings suggest that impacts will be unequal and are likely to disrupt the accumulation of agglomeration economies and their broader social benefits.

A RIDE-HAIL OF TWO CITIES: EXAMINING THE FACTORS ASSOCIATED WITH RIDE-HAIL USE IN DHAKA, BANGLADESH AND LOS ANGELES, USA

Abstract ID: 1406

Individual Paper Submission

TAYLOR, Brian D. [University of California Los Angeles] btaylor@g.ucla.edu, presenting author
SIDDIQ, Fariba [University of California Los Angeles] fsiddiq@ucla.edu, primary author

Ride-hail has grown rapidly in both developed and developing countries. Given their novelty and rapid expansion, these services are affecting cities and travel in them in myriad and often unexpected ways (Alemi et al., 2018; Rayle et al., 2016). There has been considerable academic study of these services, including the factors influencing travelers' use of ride-hailing, patterns of ride-hail trip-making, and the effects of ride-hailing on traffic congestion, curb space and parking, public transit, labor, and the environment (Tirachini, 2019). However, there has been little cross-country comparative study of its use.

The basic technology and business model of ride-hail vary little from place to place. Available drivers with vehicles and customers wanting a ride to a destination are matched via apps on mobile devices by the ride-hail company, which recruits and regulates drivers and customers, sets and collects the fare, and takes a cut. However, the travel modes operated, the regulation of ride-hail, and the environments within which ride-hail operates vary enormously from the leafy suburbs of Silicon Valley to the packed streets of Lagos to gleaming towers of Hong Kong (Tirachini, 2019).

Because the economic, cultural, and regulatory environments for ride-hail vary so substantially from place to place, it is important to understand how ride-hail use varies across these contexts. Therefore, we examine ride-hail use in two enormous and enormously different cities: Dhaka, Bangladesh and Los Angeles, United States. We ask: How do the factors associated with ride-hail use differ across these two places, and how are they similar? To answer these questions, we surveyed travelers in both places using quota sampling. To ensure internal validity, we employed the exact same survey design, sampling, and data collection methods in both cities. The survey was administered using a semi-structured questionnaire that posed the same questions to all respondents, though in Bengali and English in Dhaka and English and Spanish in Los Angeles.

Given the profound differences between Dhaka and Los Angeles, perhaps the most significant finding is the striking similarities in the factors associated with ride-hail use in the two cities. With respect to their differences, we find that women and those with very low levels of education are more likely to use ride-hail in Los Angeles than in Dhaka, and that middle-aged travelers are more likely to use ride-hail in Dhaka than in Los Angeles. But aside from these, there are many more similarities. Across both regions, we find that older, grade-school educated, lower-income, and technology averse travelers are all statistically significantly less likely to use ride-hail, all else equal. In addition, despite the very different levels of vehicle ownership between the two cities, access to autos is negatively related to ride-hail use in both places.

We conclude that, when it comes to ride-hail users and use, Dhaka and Los Angeles share more than they differ. The research offers insights to both planning scholars and practitioners concerned with the rise of ride-hail and its implications for mobility, equity, and the environment.

WHY IS "INDUCED DEMAND" MISSING FROM TRANSPORTATION ENGINEERING CLASSROOMS? (AND WHY SHOULD PLANNING PROFESSORS CARE?)

Abstract ID: 1414

Individual Paper Submission

RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, presenting author
WHITE, Ellen Oettinger [Rutgers, the State University of New Jersey] eo.white@rutgers.edu, co-author

Transportation engineers often justify new roadway investments by how much time drivers will save and by how much air pollution will improve by smoothing stop-and-go traffic. But planners have long known that any improvement in travel speed from new capacity will quickly be eaten up as drivers converge from other routes and other times of day. What is more, the wider roadway encourages more driving (and hence more pollution) as people switch from other modes, make trips they previously avoided, and make longer trips on the newly free-flowing lanes. This concept, known as induced demand, is well-established and empirically validated.

The idea is also transformative; once we understand induced demand, the logical foundations of transportation policy become unstable. We can no longer justify road widening projects by their ability to improve travel speeds or reduce air pollution because these benefits will be short-lived. Yet, as Noland and Lem (2004) explain, engineers “have been reluctant to accept this conclusion.” As of 2022, roadway projects are still justified by promises to improve travel times, induced demand has yet to be incorporated into federally required environmental reviews, and urban Interstates are being widened across the country.

Engineers may be reluctant to embrace induced demand and a wholesale reframing of transportation policy for many reasons. The spigot of federal money for road projects would likely turn from a torrent to a trickle and engineers would likely have to cede power to other stakeholders—and their priorities—when setting transportation policies.

In this work, we focus on a complementary explanation: some engineers may not fully understand induced demand. After all, the idea is somewhat counterintuitive and is difficult to prove because we cannot directly observe the counterfactual (i.e., what would have happened if we had not widened the roadway?). A recent survey of students enrolled in transportation courses comports with the hypothesis that knowledge is a factor. While planning students near universally understood induced demand, engineering students were relatively less familiar with the concept (93% vs. 58%).

Why are engineering students so much less likely to understand induced demand? To explore these issues, we conducted a systematic review of seven transportation engineering textbooks. We find that nascent engineers could be forgiven for their confusion because engineering textbooks have a mixed record when it comes to congestion. Just one of the textbooks offered an unambiguous description of induced demand. The others either contradicted themselves, were unclear, or did not mention the idea at all. These textbooks also send mixed messages about the nature of demand—sometimes indicating that it is fixed and other times indicating that it can and should be managed.

Because instructors can augment textbooks with their own materials, we conducted interviews with faculty who teach transportation engineering classes. Our interviews reveal remarkable variation in engineering instruction. Some professors featured induced demand as a central theme, whereas many others omitted the idea entirely. These distinctions often fell along generational lines with junior professors more likely to teach induced demand than their more senior peers. In exploring the rationales for their pedagogical decisions, some professors were adamant that induced demand had no place in the engineering classroom. More often, professors expressed a desire to incorporate induced demand, but lacked the time or expertise to develop new teaching materials or felt there was insufficient class time to dedicate to the topic.

It is important for planning professors to recognize the omission of induced demand from many engineering classrooms and to prepare their students to anticipate and prepare for interdisciplinary disagreements about congestion. Planning professors could also take steps to bridge the interdisciplinary divide by sharing course materials.

PAN, Qisheng [University of Texas at Arlington] qisheng.pan@uta.edu, co-author

The domination of cars in the U.S. has resulted in car-oriented urban landscapes during the past decades. Car dependency has been criticized as an unsustainable and inequitable transportation mode due to traffic congestion, air pollution, energy shortage, economic burden, safety, and public health-related issues (McNeil, 2011; Gehrke et al., 2020; Winters et al., 2013). On the other hand, bicycle/biking is considered an alternative to cars as it is economically accessible to more people and can help ease the many issues associated with car dependency. Better than pedestrians, cyclists can access a broader type of destinations, travel faster, and carry loads more easily (McNeil, 2011; Winters et

al., 2013). Despite the benefits of bicycles and the urgency to allow multi-modal transportation options, there is a lack of cases that apply the newly proposed planning paradigm of nature-based solutions from the socio-ecological perspective (Rosa et al., 2021; Xiang, 2021) to expand city bike network planning.

Nature-based solutions (NBS) are introduced as resource-efficient and cost-effective approaches to respond to various ecological and social challenges, such as climate change, air pollution, and social and economic inequalities. Therefore, this study aims to apply the socio-ecological framework to bike network planning in searching for a nature-based green infrastructure for the city of Arlington, TX -a self-proclaimed “American Dream City” characterized by entertainment and education and entrepreneurial opportunities yet lacks traditional public transit. The primary purpose of this study is to understand how the bike network planning in Arlington, TX supports the goals of social and environmental equity and sustainability under a nature-inspired ecosystem-based framework. Specifically, the study attempts to answer the following research questions:

1. To what extent do Arlington's existing and planned bike routes facilitate the connections between residential and significant destinations within Arlington?
2. How well does Arlington's bike network fulfill its equity goals and serve people with different social, racial, and economic conditions?

We achieve this objective by first establishing measurements and criteria according to the socio-ecological framework and conducting spatial inquiries and assessments along the dimensions established in the first step. We finally propose a nature-inspired and ecological-based bicycle network plan based on the analysis results. Hence, this study incorporates a comprehensive methodological approach to evaluate how and to what extent various categories of critical destinations in Arlington are accessible through its bike network plan and if the bike network plan in Arlington serves its vulnerable population equitably and conveniently. Our findings indicate that many critical destinations in the city are not accessible via the existing bike network. While implementing the planned bike routes will increase the accessibility rates, some destinations, such as top employers in the city, will still suffer from limited access to the bike network. Our results also show that the bike network in Arlington does not provide equitable access to its socially, racially, and economically underserved population.

The history of socio-ecological practice demonstrates large quantities of nature-inspired green infrastructure projects; however, many of these projects have not been documented. Therefore, their impacts on cities and citizens have not been quantified. Accordingly, we contribute to the existing scholarship by offering a real-world demonstration of bicycle network planning as a nature-based solution to address equity and sustainability issues in transportation. Therefore, in its application, the results of this study could be used to identify the least benefited locations and inform policies on developing equitable service for vulnerable populations through bike network planning.

NO MORE SPEED TRAPS AND TICKET QUOTAS: CAN A NEW FRAME REDUCE OPPOSITION TO AUTOMATED SPEED ENFORCEMENT?

Abstract ID: 1417

Individual Paper Submission

JOHNSON-RODRIGUEZ, Angela [Rutgers, the State University of New Jersey] angelaj136@gmail.com, presenting author

RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, primary author

BARAJAS, Jesus [University of California Davis] jmbarajas@ucdavis.edu, co-author
DELBOSC, Alexa [Monash University] alexa.delbosc@monash.edu, co-author
MUIR, Carlyn [Monash University] carlyn.muir@monash.edu, co-author

Traffic safety cameras offer proven countermeasures for improving road safety and are increasingly seen as a way to minimizing interpersonal racial bias in policing. But despite their promise, automated enforcement is rare in the United States and many states have banned speed cameras or severely limited their use. Underlying these bans is the widespread perception that automated enforcement is unpopular and politically contentious, primarily due to concerns that cameras are merely a tool to raise revenue.

In our paper, we draw on the literature about traffic enforcement and a survey experiment to make five arguments about revenue and traffic safety cameras. First, we draw on a purpose-built survey of the U.S. public to demonstrate that the public is concerned about revenue from traffic tickets more broadly, not just those from cameras. Second, we draw on existing literature to demonstrate that these concerns about revenue are well founded; many cities do use traffic citations as a revenue generation tool.

Third, we argue that shifting away from traditional enforcement to automated traffic cameras could directly address the public's reasonable concerns about revenue generation. With automated enforcement, cities and police departments cannot ramp up ticketing to meet revenue needs because the cameras are already operated 24 hours a day. This is a somewhat counterintuitive re-framing, it characterizes cameras not as revenue generation tools, but rather as tools to prevent revenue generation.

Fourth, we explore whether this reframing can increase public support for cameras. We conducted a survey experiment where we randomly assigned respondents to read one of two short messages about a proposed automated enforcement program. The treatment message differed from the control message in one respect: it presented cameras as a tool to prevent enforcement blitzes and ticket quotas. Respondents who encountered the treatment message were far more supportive of automated enforcement than those in the control group.

Fifth, we acknowledge that the proposed reframing must be accompanied by larger institutional changes to program operation, contracts, and the use of revenue. We draw on the literature to discuss these issues and make recommendations for effective and just camera programs.

This work lies at the intersection of public opinion, traffic safety, municipal finance, and racial justice. Grappling with the role of enforcement should be a priority for planners and policy makers.

EXPLORING THE ENVIRONMENTAL AND SOCIAL SUSTAINABILITY IN THE TRAVEL BEHAVIOUR PATTERNS OF YOUNG ADULTS

Abstract ID: 1418

Individual Paper Submission

HASEEB, Attiya [Toronto Metropolitan University] attiya.haseeb@ryerson.ca, presenting author
MITRA, Raktim [Toronto Metropolitan University] raktim.mitra@ryerson.ca, co-author

Central Theme: Travel behaviour of young adults from generations Y and Z is arguably environmentally sustainable as they drive less and use environmentally friendly transportation modes like walking, cycling and transit (Grimsrud & El-geneidy, 2014; McDonald, 2015). However, it is debatable whether the use of sustainable transportation modes contributes to improved social sustainability (Boschmann & Kwan, 2008; Lucas, 2012). The risk of transportation-

related social exclusion among young adults, due to their sustainable travel choices and lower car-reliance, remains less explored. We address this important research gap by focusing on the travel behaviour of Canadian post-secondary students, and examine two research questions: 1) What is the association between post-secondary students' transportation mode choice patterns and their activity participation patterns?, and 2) what are the key socio-economic and built environment features that explain environmental and social sustainability of travel patterns?.

Methods: This research was carried out in the Greater Toronto and Hamilton Area (GTHA), Canada, using one-day travel diary data (n=3,918) collected from students of ten universities and community colleges. Several measures of social exclusion were estimated, including total number of activities participated, area covered per activity and time spent travelling per activity. The area covered per activity was calculated by dividing the total daily activity space, calculated using a minimum convex polygons approach, with the number of places visited by a student. Mode choice patterns were estimated based on a latent class analysis (LCA) of data on short-term and long-term travel choices. A total of ten built environment features were measured at the residential locations of students and reduced into four "factors", namely: 1) street connectivity, 2) population density, 3) land use mix, and 4) parks and open spaces, through principal component analysis (PCA) and factor analysis. Multiple linear regression models were run to examine the association between students' activity participation patterns, and transportation mode choice patterns, with various socio-demographic characteristics and built environment factors included as co-variables.

Results: Post-secondary students were grouped into five transportation mode choice patterns based on LCA results, namely- Automobile Dependents (13.3%), Transit Dependents (35.2%), Cyclists (6.2%), Pedestrians (19.9%), and Multimodals (25.4%). "Transit dependent" students, who constitute more than a third of our sample, are more likely to have lower activity participation compared to "automobile dependents", while "multimodal" students participate in more activities. All the users of sustainable transportation modes, particularly "transit dependents" and "cyclists", spend much longer time than automobile dependents to reach an activity. Students who attend downtown university or college campuses participate in more activities, and travel less per activity compared to those in suburban campuses. Students who reside in higher population density areas cover smaller area and spend less time to participate in an activity.

Conclusion: Transportation mode choice patterns for the majority of the post-secondary students in the GTHA can be considered environmentally sustainable. However, those who are dependent on transit may face social exclusion due to lack of activity participation, and hence, their travel behaviour may not be socially sustainable. Future public transportation planning and policy should be focused on addressing the travel needs of the young adults who reside in less dense areas with limited transportation opportunities and inefficient public transit.

PLANNING CAR-LITE NEIGHBORHOODS: COORDINATING ACCESSIBILITY IMPROVEMENTS WITH HOUSING POLICIES

Abstract ID: 1430

Individual Paper Submission

BASU, Rounaq [Massachusetts Institute of Technology] rounaq@mit.edu, presenting author

FERREIRA, Joseph [Massachusetts Institute of Technology] jf@mit.edu, co-author

Emerging mobilities like automated vehicles, mobility-on-demand, and micromobility are motivating discussions on the future of cities. Domain experts agree that there is great uncertainty about their net effects on cities. While short-term travel time and cost savings are possible, the induced travel demand will likely cancel out those benefits in the long-term. There is less uncertainty and more agreement about accessibility benefits, which can increase worker welfare but might also result in larger travel distances and urban sprawl. Several megacities are actively planning 'car-lite' strategies to reduce private car ownership and use with the help of these emerging mobilities (and supporting transportation and land use policies). Car-lite policies are likely to be first piloted at a neighborhood scale instead of

the entire city because it stands to reason that planning agencies will test out the policy in a limited capacity first before rolling it out to their entire jurisdiction. How will such pilots impact neighborhoods? Will they be successful in reducing vehicle ownership and use? To what extent will they induce undesirable but consequential side-effects such as gentrification?

This study attempts to address these questions using SimMobility - a state-of-the-art agent-based land-use transportation interaction (LUTI) microsimulation model. We use the Long-Term (LT) component that involves the creation of a synthetic population, followed by household-level residential location and mobility holdings choices, and individual-level job location choices, at the temporal scale of days to years. This study uses the SimMobility calibration for the city-state of Singapore, which makes for a particularly interesting study area for testing housing and mobility policies owing to the tightly regulated markets. We construct car-lite policies that improve accessibility locally in selected neighborhoods as a representation of the localized impacts of emerging mobilities. Various scenarios are designed based on hypotheses about market responses to car-lite policies – (a) baseline (no reaction), (b) minimal effect (awareness only), (c) increase in buyer valuations, and (d) increase in both buyer and seller valuations.

Last year, we reported that the increased accessibility from the car-lite pilot did make most neighborhoods significantly more vehicle-free. However, the in-mover households were found to be comparatively higher-income than both the households they displaced as well as the original study area population. The vision of a car-lite community is adversely impacted in such circumstances where higher-income households, who are more likely to have private mobility holdings, refuse to reduce their mobility holdings after outbidding lower-income households for housing in the study area. Thus, the gentrification side-effect significantly reduces the potential vehicle-free gains from the car-lite policy. In certain neighborhoods, as much as 90% of the expected reduction in vehicle ownership can be offset by the housing market-driven effect. These neighborhoods turn out to be only marginally more vehicle-free than they were initially without the car-lite pilot.

This year, we shortlist four neighborhoods based on how the accessibility improvements affected them, and test whether and how integrated housing policies (such as new public housing and car-restricted housing) can mitigate the gentrification side-effects while maximizing car-free gains. We examine various offerings of new public housing, both at market-rate and mixed-rate (some market-rate and some affordable), with several mixes of different unit sizes. We also examine car-restricted housing supply, both with and without discounts to offset the inconvenience of the vehicle ownership restriction. Our results suggest that both policies can be successful in achieving the intended objectives. Additionally, they distribute accessibility benefits among a wider range of households, while increasing consumer surplus for all neighborhood residents. By making these neighborhoods differentially attractive to lower-income vehicle-free households, car-lite gains can be significantly increased.

USING BIKE SHARE GPS ROUTE DATA TO QUANTIFY INDUCED-DEMAND EFFECTS OF SEPARATED CYCLING INFRASTRUCTURE IN HAMILTON, ONTARIO

Abstract ID: 1449

Individual Paper Submission

VAN VEGHEL, Daniel [McMaster University] vanveghd@mcmaster.ca, presenting author
SCOTT, Darren [McMaster University] scottdm@mcmaster.ca, co-author

Cycling is seen as an increasingly healthy and sustainable modal choice for urban residents. This, coupled with the growing shift in both policy and practice to an urban planning paradigm promoting density and sustainability, has led to increasing investment in both ‘hard’ and ‘soft’ interventions into transportation networks. Included in these interventions are the developments of Bike Share Systems (BSSs), as well as dedicated, separated, cycling infrastructure. With real and perceived safety having been identified as a major barrier to cycling for most individuals, separated infrastructure has been found to reduce this barrier, thus theoretically making cycling more appealing (Bateman et al., 2021). Many studies have sought to analyze dedicated cycling infrastructure’s impact on ridership levels and have shown distinct correlations between them. However, proving causality has been identified as a major barrier to cycling induced demand research (Krizek et al., 2009). Most studies seeking to prove this causality have used methodologies ranging from stated-preference surveys, which are limited by the need for hypothetical scenarios or participant recall. Others have been limited to cross-sectional data for analysis. Finally, revealed-preference studies on induced demand have largely relied on single-intervention case studies and artificially generated routes, rather than fully longitudinal and empirical route data. We have identified a need in the literature for an empirical, larger-scale analysis of dedicated, separated, cycling infrastructure’s impact on inducing bike share demand, accounting for real and perceived cyclist safety variables.

Data for over 800 GPS-equipped bike share bicycles in Hamilton were collected over a period of a year in 2020 and 2021, and were map-matched and enhanced with additional route information, using Dalumpines & Scott’s (2018) GIS-Based Episode Reconstruction Toolkit. These routes represented the actual trips Hamilton Bike Share users took over the study period. Several intervention sites, whose entire constructions happened within the study period, have been identified – with several months of data before, during, and after the intervention. Finally, additional route characteristics were used in the analysis, including their Level of Traffic Stress (LTS) (Mekuria et al., (2012), which was weighted for each route link using a methodology developed by Ubhi and Scott (2021). These variables allowed for quantitative examination of perceived route safety over time, as the interventions changed network links’ LTS values.

The primary goals of the project are to determine the specific impacts of dedicated, separated, cycling infrastructure, and perceived safety – as measured through a Weighted LTS classification system – on Hamilton Bike Share ridership. This is accomplished by modelling the induced bike share user demand (new or diverted trips) on specific routes containing infrastructure interventions over the study period. The project seeks to fill a gap in the literature using revealed-preference, empirical route data, as well as broadening the analysis from a single-intervention case study, such as that done by Karpinski et al. (2021). While focussing specifically on bike share ridership, the study serves as a methodological foundation for further study on a wider range of cyclists.

Movements such as Vision Zero and Safe Systems call for the transportation profession to be centered on the safety needs of “vulnerable users,” or those persons most likely to be injured or killed in a traffic collision. Given the fragility of the human body, this has become largely synonymous with pedestrians, and has resulted in the assertion that investments in pedestrian infrastructure will necessarily enhance safety. Yet this assumes that risk factors are

consistent across different population segments. This study applied negative binomial regressions to understand the environmental risk factors for the population as a whole, as well as for lower- and higher-income areas specifically. It finds notable differences in the environmental risk factors for lower-income and higher-income areas. Indeed, many of the types of interventions proposed under Vision Zero-type programs would be expected to have little, if any, effect on addressing pedestrian crash risk in more affluent areas, a finding that may help explain why Vision Zero programs in the United States have largely failed to reduce traffic-related deaths and injuries. Beyond differences in environmental risk factors, higher concentrations of black residents in lower-income areas significantly increased overall pedestrian crash risk, beyond the risk already associated with income. Considered as a whole, these findings suggest that the definition of vulnerability, as it relates to road safety, needs to be understood not simply as a function of a human body's physical tolerance for trauma, but also an outcome of broader disparities associated with race and income.

MILLER, Harvey [The Ohio State University] miller.81@osu.edu, co-author

Road crashes in metropolitan areas are challenging to prevent because they stem from the interactions of drivers and other system users in intricate built environments. Recent theories indicate that features of the built environment may induce unsafe driving by shaping users' expectations and behaviors. The concept of self-explaining roads refers to a tendency of drivers to be guided by road design, which users perceive as indicating a particular type of road, or the appropriate way to drive (Theeuwes 2021). Additionally the theory of safe systems incorporates this concept, further arguing that because the built environment creates scripts that shape driver errors, the context of driver errors should be considered foremost (Dumbaugh et al. 2020). In practice, the policy framework of Vision Zero implements such a systems perspective on road safety that seeks solutions that accommodate rather than attempt to correct human fault (Belin et al. 2012). Finally, the mixture of elements in view to the driver may influence psychological state or behavior, such as street trees being associated with reduced speed (Naderi et al. 2008).

Research on the role of environmental design features has been limited by the availability of comprehensive data on the characteristics of street spaces and scalable methods for analyzing that data. Our current knowledge is thus strongest in understanding how adjacent land uses influence crash frequency by creating conflicts of use, and in understanding the effectiveness of specific street designs in reducing conflicts in high crash areas. There is less understanding of how the complete characteristics of the street spaces visible to drivers influence urban road safety outcomes, including non-road and natural elements such as buildings and sky whose visibility is directly influenced by road design. To address this limitation this paper presents analyses using automatically-segmented street view imagery in order to consider the relationship of street space elements with crash frequency. In particular, we ask firstly, how do specific elements of street spaces visible to drivers influence crash frequency on road segments? And secondly, can these street spaces be categorized into types on the basis of these elements to better understand their influence on crash frequency?

We conduct this study using data from Columbus, Ohio, USA, where severe and fatal crashes have been a persistent problem. The number of these crashes in Columbus excluding highways has been steady in recent years, ranging between 353 and 370 each year from 2016 to 2019 according to a Vision Zero Action Plan. Furthermore of 225 traffic fatalities that occurred between 2015 and 2019, nearly one third were pedestrians. We present results from three negative binomial regression models on crash frequency. A base model shows how road network, land use, and area characteristics affect crash frequency on Columbus road segments. We augment this base model by adding independent variables for the most prevalent individual objects identified by our street view image segmentation. A third model replaces these individual object variables with street space types created through a cluster analysis. Based on these results, we argue that the visual similarity of metropolitan non-highway roads with highways in terms of

their street spaces, makes them more dangerous because it encourages higher speed driving in locations where more complex conditions exist, including the presence of pedestrians. We also recommend a greater role for automatically-segmented street image data in traffic safety practice.

COLLINS, Jacob [University of Southern California] jmcollin@usc.edu, co-author

The relationship between travel behavior and sociodemographics is well known. Low-income, minority individuals are likely to travel shorter distances and take fewer trips than those with higher incomes (Blumenberg and Agrawal, 2014). Additionally, although car ownership in the U.S. is almost universal, disparities in ownership are prevalent by race and income, with low-income, Black, and Latino households being more likely to not have a vehicle than high-income and white households (Methipara, 2014, Brown, 2018). As new mobility services emerge and the landscape of travel begins to shift with technology, there are many questions to be addressed on how these new services and technologies may affect travel behavior among low-income communities of color as well as who will benefit from them. The purpose of this analysis is to examine if and how new mobility solutions can be implemented in low-income communities of color to improve mobility access.

We begin by analyzing how travel in a low-income community differs from travel in higher-income communities. We are interested in both behavior and perceptions with respect to travel frequency, destination choice, trip scheduling, mode, trip chaining, and last-mile access to transit. We use southeast Los Angeles (SELA) as our case study area. Per the 2019 American Community Survey, 89 percent of SELA residents identify as Hispanic or Latino, compared to 48 percent of Los Angeles county. The median household income for SELA residents is also substantially lower than Los Angeles county (\$40,306 versus \$61,213).

We use anonymized mobile phone big data from Safegraph and the California Household Travel Survey (CHTS) from 2012. Safegraph data gives cellphone traces over time and space by census block group. Destinations are classified as points of interest (POIs). The Safegraph data gives us detailed information on specific destinations residents of the SELA region are traveling to, informing potential destinations for a pilot ride-matching service. The CHTS is a statewide travel diary containing person, household, vehicle, and locational data of all travel behavior on a particular day. We use CHTS to examine individual behavior and compare travel behavior of SELA residents to the rest of Los Angeles county.

In order to develop ride-match concepts that respond to community needs, our research includes a collaboration with the South East Los Angeles Collaborative, an umbrella non-profit organization representing the community and dedicated to improving its health and welfare. The SELAC is assisting with ground-truthing our findings, connecting us with stakeholders, and conducting focus groups to obtain detailed, qualitative information on community perceptions and preferences.

We found 64,000 distinct POI locations traveled to by residents of the SELA area using Safegraph. Our analysis shows a large share of trips remain within the SELA area, and there are obvious clusters of destinations. These clusters are consistent with locations of shopping centers, medical centers, and major employers. Our findings from CHTS show that trip duration and trip distance for trips originating in SELA are not statistically different from that of Los Angeles County. There are, however, statistically significant differences in household vehicle availability and the

number of trips per person per day, which are both lower for the SELA region than that of Los Angeles County. People in SELA also tend to travel earlier in the morning and later in the evening compared to Los Angeles County. Our next steps are to identify potential locations for a ride-matching pilot and design the pilot based on both travel patterns and focus group results. We use the results to inform how new mobility and ride-matching can be implemented in the SELA region to better meet the unique travel needs of that region's residents.

Late shift workers constitute 17% of the urbanized labour force in the United States (APTA, 2019) while making up 15% of the labour force in Canada (Wong et al., 2011). These workers are more likely to be socio-economically disadvantaged compared to other workers (Saenz, 2008), despite shift work including a range of higher income professions in technology and medicine. A significant amount of research contours the adverse health effects of working overnight (Neil-Sztramko et al., 2014), including an increased risk of causing a vehicle accident (Lee et al., 2016). Emerging research suggests that shift workers experience lower transit accessibility (Chandra et al., 2017; Lee et al., 2018). This study presents an exploratory analysis of evening and night shift commuting and the impact of shift work on commuters' time constraints in Canada. We ask four questions:

1. Where do evening and night shift workers live and work?
2. How do they commute to work, and what transportation resources are available to them?
3. How does working late shifts impact travel behaviour patterns throughout the day?
4. How does working late shifts impact individuals' perceived time stress and subjective wellbeing?

We explore our first two questions through visualizations and analysis of the confidential microdata from the Canadian Census accessed through Statistics Canada. We answer our second two questions through statistical analysis of the Time Use component of the Canadian General Social Survey.

Preliminary results suggest that people working nights experience higher levels of time stress compared to 9-5 workers, where time stress is defined using the time crunch index (Beaujot and Andersen, 2007). These results stem from night shift workers being more likely to cut back on sleep when they run out of time, not from issues with commuting. The effect of working evening shifts, in contrast, is insignificant. Late shift workers are clustered geographically within metropolitan areas, but the nature of the clustering varies by region.

PLANNING FOR SUCCESS: THE ROLE OF PLANNING AND POLICY IN THE SUCCESS OF SECOND-WAVE MODERN-ERA STREETCARS IN THE UNITED STATES

Abstract ID: 1501

Individual Paper Submission

MENDEZ, Joel [University of Kansas] JMendez2@ku.edu, presenting author
BROWN, Jeffrey [Florida State University] jrbrown3@fsu.edu, co-author

In recent years, the streetcar has experienced a remarkable renaissance in the United States. Several cities have invested millions of dollars bringing this transportation technology back to the streets where it had once served. Investment has been so prevalent that modern streetcar systems can now be found in more than a dozen cities throughout the United States. Unfortunately, most of these systems are underperforming due to poor ridership attainment. Regardless of the performance of these systems, the resurgence of streetcars in the United States has continued as numerous cities are actively investing in this mode of transportation. In this study we explore the planning processes in select well and poor performing systems to identify elements which may have contributed to their respective performance outcomes. To do this we rely on data from interviews with individuals who were intimately involved in the development of select streetcar systems. This data was supplemented with that obtained from a review of relevant documents. We find variation in the perceived purpose of streetcars by actors intimately involved in system development efforts across cases. This variation had an impact on the array of policies developed and planning decisions made. This saw the development of robust policies meant to maximize the economic development impact of a streetcar while those which most directly impacted system performance were commonly underdeveloped. Recommendations highlight the importance of establishing a cohesive vision at project inception and the need for specific supporting policies and planning considerations in order to attain positive performance outcomes.

PERCEIVED ATTRACTIVENESS OF POLYCENTRIC URBAN CENTERS AND SHOPPING AND LEISURE TRAVEL IN SINGAPORE: A STUDY IN THE POST-COVID PERIOD

Abstract ID: 1508

Individual Paper Submission

HOU, Yuting [The Hong Kong Polytechnic University] houyuting86@gmail.com, presenting author

Since the 1990s, Singapore has adopted a polycentric urban development strategy to decentralize the functions of city center to a hierarchy of secondary commercial centers and reduce demands for long-distance travel. This study aims to assess how successful the planned commercial centers in Singapore are from the viewpoints of local residents and workers.

The impacts of urban form on travel and activity pattern, including the influence of metropolitan-wide polycentric spatial structure (e.g., Naess, 2011; Hou, 2019) and neighborhood-scale built environment characteristics (e.g., Figueroa et al., 2014), have been widely examined in previous empirical studies. Except for objective (e.g., GIS-based) measures of the built environment, recent studies have also found that people’s subjective evaluation of the neighborhood built environment may exert different impacts on their engagement of physical activities (e.g., Nyunt et al., 2015). There are, however, only a few studies examined people’s perceptions of metropolitan-wide commercial/activity centers and their impacts on activities (e.g., Weltevreden & Rietbergen, 2006). Most of empirical studies also focus on the travel-urban form links from residents’ perspectives instead of workers’ perspectives. Focusing on the post-COVID era, this study explores three key questions: 1) How local residents and workers evaluate

the attractiveness of the commercial centers? 2) Is the perceived attractiveness of centers associated with their actual built environment features? 3) How do the subjective evaluations of centers influence individual shopping and leisure travel and activity patterns?

This study is based on a survey of 2000 adults in Singapore conducted in February-March, 2021. Shopping and leisure activities are differentiated by home-based and workplace-based travel and internet-based online activities. Questions on the perceived attractiveness of commercial centers include the centers' historical ambience, the availability and quality of shopping, dining, cultural, entertainment facilities, the presence of greenery, as well as the transport accessibility of the centers (Weltevreden & Rietbergen, 2006). Correlation analysis is applied to explore the associations between the perceived attractiveness of the centers and the actual corresponding built environment characteristics of the centers. Probit and ordered probit models are applied to model the impacts of respondents' subjective evaluation of the centers on their travel and alternative online choices for shopping and leisure purposes, including trip frequency and destination choices, while controlling for the impacts of objective built environment measures.

The preliminary results indicate that perceived attractiveness of centers is weakly correlated with the actual availability of facilities/infrastructure or the accessibility of the centers. There is no evidence that respondents' perceptions of centers decrease as the distance between the centers and their residence or workplace increases. Subjective evaluation of recreational/entertainment facilities available at the centers is found to be positively associated with individual overall trip frequency for grocery shopping purposes while increasing the chances of incorporating the centers into residents' and workers' destination choices sets for non-grocery shopping trips and leisure trips, respectively. Positive evaluation of centers' shopping facilities may also increase residents' and workers' chances of including the centers into their grocery shopping destination choice sets. Moreover, positive feedbacks of centers' public facilities for social gatherings are found to be positively associated with individual trip frequency for non-grocery shopping purposes while decreasing the frequency of internet-based leisure/entertainment activities.

The results would provide useful insights on the polycentric urban development strategy in high-density cities to spur discussions on how these cities could be further restructured and transformed to better satisfy individual non-work travel needs and enhance their overall wellbeing. Planned commercial centers can play important roles in people's daily lives in the post-COVID period of Singapore. Policy and planning interventions to improve the centers' images may be another way to enhance people's engagement in travel and activities.

WE SHALL RISE FROM THE ASHES: ANALYSIS OF NEW STREETCAR CONSTRUCTION IN 3 DECLINING CITIES, 2011 - 2020

Abstract ID: 1522

Individual Paper Submission

PFAFF, Robert [Cleveland State University] r.w.pfaff@csuohio.edu, presenting author

Recent trends in public transportation planning have favored the building of streetcars in downtown urban cores as a type of economic redevelopment tool. Rarely do these new short transit lines actually serve a transportation need (Fisher, 2022, Lowe and Grengs, 2018, Culver 2017). The effects of this development activity are exacerbated in cities experiencing widespread urban decline and population loss. While the economic benefit may be high for fixed-rail investment adjacent to private property, city residents are not receiving an effective transportation mode. A survey of 25 streetcar projects built since 2000 show an average of only 7.9 miles of new track construction. Recent projects in

declining cities like Detroit, Milwaukee, and Cincinnati show even less construction, averaging only 3.13 miles across the 3 new projects.

The context of this development is important to transportation planners. Although these projects are not aimed at alleviating issues of racial inequity, they have an outsized negative impact on racial populations in cities with high concentrations of Black residents, and with a history of systemic racial violence, segregation, and exclusion (Brand et. al. 2020). All three cities above have a deep history as part of the racialized rustbelt. They experienced a rise in African American migrants throughout the first half of the 20th century as part of the great migration. The dual sting of redlining and white flight blocked would-be Black homeowners from buying into the housing market at the same pace as white residents, and active forms of violent intimidation held the color line between the increasingly Black city and the surrounding lily-white suburbs. Short construction that does not bridge the transportation gap across cities and regions only serves to exacerbate existing racial divides (Pfaff, 2021). According to segregation dissimilarity index, Detroit is the most segregated city in the US, with Milwaukee ranking fifth most segregated. Cincinnati ranks at 26th, with about half the dissimilarity score to Milwaukee, but still categorized as "highly segregated" (Berkley.edu, 2021)

This paper analyzes the new streetcar development projects happening in three downtown rustbelt cities in the Midwest. This case study includes the cities of Detroit, Milwaukee, and Cincinnati, which all experienced significant periods of urban decline, and have a high percentage of Black residents in the 2020 US census. All three cities opened new streetcar lines in the past 10 years, with extensive state, local, and federal funding to fund each ~\$140 million dollar project. I analyze population data at the census tract level across the geographic area covered by the new streetcar construction, and compare demographic changes between the 2010 and 2020 decennial data. These changes are analyzed relative to larger demographic shifts over all census tracts in each city. My findings demonstrate that there was a significant population decline of % black residents in the downtown census tracts where streetcars were built across all three cities, with Detroit experiencing the most severe 46% drop in %Black population. Although this is not a causal link to transportation planning, I argue that transportation investment spurred private development and real estate speculation has since had an outsized impact on vulnerable Black city residents who ultimately experienced displacement. The findings of this study are important to transportation planners, practitioners, and the wider field of Urban Planning to be mindful of when building projects in urban environments to be sensitive to the legacies of systemic racism and disinvestment so that we may build more equitable cities.

TRAVEL BEHAVIORS OF SCHOOL-AGED CHILDREN: EVALUATING THE EFFECTS OF FLORIDA'S SAFE ROUTES TO SCHOOL PROGRAM IN THE LOCAL CONTEXT

Abstract ID: 1524

Individual Paper Submission

STEINER, Ruth [University of Florida] rsteiner@ufl.edu, presenting author

YANG, Xinyuan [University of Florida] poppyyang@ufl.edu, co-author

GUO, Rui [University of Florida] rui.guo@ufl.edu, co-author

SOUICY, Andre [University of Florida] andre.soucy@ufl.edu, co-author

In July 2005, the Safe Routes to School (SRTS) program, as part of the Safe, Accountable, Flexible, Efficient Transportation Equity Act: A Legacy for Users (SAFETEA-LU), was adopted. The program objectives are to support safe walking and bicycling, and to promote active commuting among schoolchildren. Florida and New York introduced the first U.S. SRTS programs in 1997 (Stewart, 2011). In 2012, the SRTS program was combined with

other walking and bicycling programs into the Transportation Alternatives Program (TAP), and SRTS projects are no longer completely federally funded. Nevertheless, the Florida Department of Transportation (FDOT) has maintained its commitment to continue funding SRTS projects.

A number of recent studies have shown that SRTS programs increase active commuting to and from school among youth (McDonald, Steiner, Lee, Rhoulac Smith, Zhu, & Yang, 2014; Stewart, Moudon, & Claybrooke, 2014). This effect has attracted special attention in Florida, where the physical activity level of youth is still lower than the national average (Centers for Disease Control and Prevention, 2014). Meanwhile, evidence is mixed regarding the impacts of SRTS programs in reducing pedestrian and bicyclist injuries and improving traffic safety for school-age children (Burbidge, 2020; DiMaggio, Frangos, & Li, 2016). However, safety concerns, together with the built environment exert a great impact on active travel-related decisions.

In this study, we aim to evaluate the effectiveness of Florida's investment in the SRTS program after many years of implementation. This study investigates multiple aspects of the program implementation and further examines the extent to which program objectives are achieved, specifically regarding changes in travel modes, in varied local contexts.

A cluster analysis is first conducted to identify the groupings of the local environment based on the walkability and safety level captured by the number of non-motorist crashes around schools during school years. We then include schools with and without SRTS interventions between 2007 and 2020. Multivariate regression modeling is conducted to test the effect of SRTS programs on travel behaviors, regardless of the differences in efforts, in different local contexts, after controlling for school types, neighborhood socioeconomic characteristics, and survey design. Finally, the impact of intervention types and years active in the program are included and examined in additional models.

SRTS programs are expected to increase active commuting among schoolchildren. However, impacts may vary by local contexts and the nature of treatments. The results may show that certain combinations of treatments are more effective in some scenarios than others.

This study will examine how effective Florida's SRTS programs are in promoting active commuting to and from schools in distinctive local contexts. For planning practice in Florida, certain types of SRTS efforts should be prioritized depending on the schools, the built environment, local limitations and needs.

CHILD CARE ACCESS AND CHILD CARE TRAVEL – WHAT'S THE RELATIONSHIP?

Abstract ID: 1525

Individual Paper Submission

WANDER, Madeline [University of California Los Angeles] mwander@ucla.edu, presenting author
BLUMENBERG, Evelyn [University of California Los Angeles] eblumenb@ucla.edu, primary author

Without access to affordable child care, working outside of the home is difficult or, in many cases, impossible. The need for child care is particularly pressing for mothers who continue to bear disproportionate responsibility for the care of their children. Child care has long been in short supply, a shortage that became even more acute during the COVID-19 crisis. The availability of child care varies across neighborhoods by income, race, and ethnicity, potentially influencing labor market participation, particularly for women.

In this study, we hypothesize that the relative supply of child care is associated with higher rates of child care use and—for parents who use child care—shorter-distance travel. To test these relationships, we draw on confidential data

from the most recent (2017) National Household Travel Survey California Add-On, a sample of 26,095 households. The confidential version of these data include detailed information on trip destinations (location name, latitude, longitude). Child care trips are not easily identifiable in the survey data, one of our initial findings. To identify child care trips, we match potential child care destinations to confidential data from the California Department of Social Services containing the location of all child care centers in California. We also use the child care dataset to develop a distance-weighted measure of child care access: estimated child care capacity weighted by the potential demand for child care (the number of young children in the census tract). We then develop statistical models to predict (a) the likelihood of making a child care trip and (b) child care trip distance (from home), controlling for other factors.

There is a substantial body of scholarship on commute travel, job access, and employment. In contrast, there is very little research on child care travel, access, and use. For most women with children, employment is predicated not only on their relative access to jobs but on their ability to easily access child care. An adequate supply of child care influences parents' ability to select into child care that best meets their needs. This finding underscores the importance of planning and policy interventions in three areas: improved data collection (on child care use and travel), public investments in child care (particularly in neighborhoods with the largest child care supply gaps), and transportation services and interventions to help families overcome spatial barriers to child care access.

Walk accessibility has long been studied in transportation and urban planning literature. A classical walk accessibility measurement considers locations of various destinations of interest, pedestrian road network, the natural impedance against walking (e.g., elevation, temperature, and precipitation), and friendliness of built environment for pedestrians (e.g., road connectivity, tree canopy, and pedestrian facilities) (Kuzmyak et al., 2014). Due to a distaste for walking long time/distance, an empirically derived decay function is typically applied to further confine the reachable limit for a typical pedestrian (Kuzmyak et al., 2014). However, measuring walk accessibility is a tricky business: Not only is it difficult for planners to obtain high-resolution geospatial data of natural and built environment features (Ewing & Handy, 2009), especially in a suburban environment, but also it requires empirical evidence of the connections between the various factors for/against walking and the number of destinations reachable within a reasonable time threshold.

In this study, we propose a level of traffic stress (LTS) evaluation framework that refines the measurement of walk accessibility. We design two sets of LTS grading criteria that apply to evaluate walking conditions along street segments and across intersections. Unlike the existing LTS-type methods that focus on existence of sidewalk and traffic volume/speed (Rodriguez-Valencia et al., 2022), our LTS grading criteria aim to approximate the actual impact of sidewalk and intersection conditions, as well as traffic signal delays, on walking speed. We manually identify street segment features and intersection features on arterial roads at the Maryland Transit Authority's Purple Line (currently under construction and projected to start operation in 2026) station areas based on Google Street View and field observations. We then code a LTS network based on the LTS grading criteria. We evaluate walk accessibility on

both a stress-free baseline and the LTS baseline pedestrian networks with Purple Line coded into the transit network. Average walk time to station, walk accessibility to employment, and transit accessibility to employment (with walk connections) are compared between the two baselines to identify accessibility gaps. In addition, we calculate walk accessibility for an improved scenario based on the proposed facility upgrades by two counties home to the Purple Line corridor, such as reduced traffic speed limit, speed enforcement, widen/buffered sidewalk, and high visibility crosswalk.

We run accessibility analyses using Cube Access, a GIS-based software package with a detailed all-street multimodal network, census block level employment and socio-demographic data, and an array of points of interest (POIs). The empirical results underscore a significant difference in the number of walk reachable jobs/ walk time to a Purple Line station between the two baselines. In particular, our LTS method is able to account for the critical impedance caused by auto-oriented intersection design. Moreover, we weight walk accessibility results by equity metrics, such as percentage adult poverty population at the census block level. The weighted results indicate that walk and transit accessibility are worse in areas of high poverty concentration. The equity implications of our analysis point to the urgent need to address walk accessibility gaps in socially disadvantaged, auto-centric suburban communities, where a significant subpopulation's mobility relies on public transit.

Our study contributes to both planning research on walk accessibility and planning practice on pedestrian facility gaps and improvements in suburban America. We argue that the suburban arterial road network historically favors car mobility. The traditional walk accessibility measurement may not accurately reflect the hostile built environment for pedestrians. Without revamping the auto-oriented street and intersection design, we are unlikely to observe noticeable improvements. Our LTS grading framework provides new ideas for transportation planners and practitioners to re-evaluate the suburban pedestrian network.

CHANGES IN PEOPLE'S MOBILITIES DUE TO THE COVID-19 PANDEMIC: FOCUSING ON THE EFFECTS OF NETWORK CAPITAL

Abstract ID: 1569

Individual Paper Submission

CHUNG, I Re [Seoul National University] ire.chung@snu.ac.kr, presenting author

PARK, In Kwon [Seoul National University] parkik@snu.ac.kr, co-author

The outbreak of the COVID-19 pandemic is causing significant changes in the lifestyles of urban residents (Fatmi, 2020). Commuting to work has been considerably replaced by teleworking, while in-person classes have been shifted to online and virtual classes during this COVID-19 pandemic. The government-imposed social distancing measures have restricted the number of people allowed to attend private gatherings. These unprecedented changes in people's daily lives also led to dramatic changes in their mobilities, which not only refer to the physical movement of human beings, but also cover a broad spectrum of social aspects (Kaufmann et al., 2004; Sheller & Urry, 2006; Urry, 2007). The mobilities literature suggests that network capital, the capability of mobility, is inherent at the individual and regional levels, and it affects physical and non-physical mobility. Given that the pandemic has reduced people's physical movement and face-to-face activities while promoting non-face-to-face interactions in online spaces, it is difficult to determine whether this pandemic has worsened their mobility. In this context, this study analyzes the effects of network capital on the changes in people's mobilities before and after the COVID-19 pandemic, and investigates how this has affected the changes in their quality of life.

For this study, we conducted an online survey of 1,007 adults aged 19 to 99 living in South Korea to measure the degree of network capital in both offline and online interactions and the changes in their mobilities as well as changes in their quality of life in real and virtual spaces before and after the COVID-19 pandemic. The key factors for offline network capital at the individual level include personal physical capability, capability for the use of transportation,

and offline social capital, while online network capital involves digital literacy, capability for the ownership of ICT devices, and online social capital. In addition, the network capital factors in common consist of flexibility in time and income. Moreover, for the network capital at the regional level, the availability of transportation infrastructure, accessibility of facilities, and availability of telecommunication infrastructure are included, along with other regional variables, such as economic power and level of social mix. We set up a model to analyze the effects of these factors on the changes in individual mobility both in real and virtual spaces and their quality of life before and after the pandemic and examine their causal relations by using multilevel structural equation modeling.

The findings will be as follows. First, the lower the offline network capital at the individual level, the lower the physical mobility in real spaces, which will ultimately negatively affect their quality of life. In particular, there will be a noticeable decline in the physical mobility of the elderly group, whose offline network capital tends to be low in general. Second, the higher the online network capital at the individual level, the greater the virtual mobility, which will have a positive effect on their quality of life. Specifically, the virtual mobility of young adults with a high level of online network capital will increase substantially, while there will be no significant difference in their quality of life as this effect offsets the decrease in physical mobility caused by the pandemic. Third, the poorer the regional level of offline and online network capital, the lower the physical mobility as well as the virtual mobility of local residents, which will further deteriorate their quality of life. The findings suggest that we should strengthen socially underprivileged people's capabilities for mobility by not only improving their physical mobility and access to means of transportation and facilities, but also increasing their network capital in virtual spaces.

GIVE ME AN INTERESTING PLACE TO WALK: MIXED-METHODS EVIDENCE OF HOW URBAN WALKERS PREFER PERCEPTUALLY ENGAGING STREETSCAPES

Abstract ID: 1575

Individual Paper Submission

HARVEY, Chester [University of California Berkeley] chesterharvey@gmail.com, presenting author

Walkability analyses have traditionally focused on built environmental factors that influence the practicality of walking, such as sidewalk availability and destination accessibility (Shields et al., 2021). While undoubtedly important, these factors fail to represent psychological influences that may substantially mediate whether people perceive places as walkable and ultimately decide to walk there. Urban designers have long argued that streetscapes affect walking enjoyability, and research from the field of environmental psychology describes how spaces that are more information-rich and legible may be preferred because they afford natural tendencies toward understanding and exploration (Ewing & Handy, 2009; Kaplan & Kaplan, 1989). Nonetheless, there remains a dearth of empirical research unpacking how streetscapes are evaluated by pedestrians and influence walking behavior.

My doctoral dissertation targeted this empirical gap with three studies examining relationships between streetscapes and pedestrian preferences using methods ranging from field interviews to physiological sensing and route choice modeling. This paper describes a simple but important thread that connects findings from each of these studies: streetscapes that were preferable for walking tended to offer more opportunities for perceptual engagement. Less favorable streetscapes, by contrast, tended to be comparatively dull or vacant, offering little for passersby to perceive and understand. While bolstering walkability through more engaging streetscapes is a notably ambiguous recommendation—it might involve inserting any number of features that range enormously in scale and purview, including windows, architectural details, trees, planters, more buildings, smaller setbacks, or land use shifts—it reinforces the importance of a simple need: an interesting place to walk.

The first of these studies used semi-structured walking interviews to investigate how walkers without expertise in planning and design observed streetscapes and incorporated them into evaluations of walkability. While subjects were universally aware of features that composed streetscapes, such as buildings, trees, storefronts, and other land uses, they were bifurcated about which types of streetscapes they preferred. Some favored those representing quintessential walkable urbanism—street-facing storefronts along the sidewalk—while others preferred more natural, park-like frontages. Both, however, emphasized that their preferred streetscapes were visually engaging and examined their features in notable detail. Contrastingly, subjects tended to describe less-preferred streetscapes as bland or boring

and paid little attention to their subtleties. Engagement was a clear marker of streetscape preference, even as preferred streetscapes varied between subjects.

In a parallel study, I used physiological sensing to further examine this engagement-preference relationship. The same subjects who participated in walking interviews wore a wrist-mounted sensor that measured electrodermal activity (EDA), an indicator of emotional activation or excitement. Subjects tended to be more activated, an indicator that they were engaging with perceptual stimuli, alongside streetscapes they preferred. Conversely, they tended to be less activated, consistent with boredom, along streetscapes they disliked.

In the final study, I investigated revealed preferences for streetscape characteristics using route choice models. The study compared GPS-tracked walking routes from a travel study in San Francisco against algorithmically derived alternatives. Streetscape characteristics were measured throughout the city based on spatial datasets, then summarized along observed and alternative routes. Models indicated preference for routes more continuously lined with buildings and with smaller setbacks, more storefronts, and more tree canopy, characteristics that likely promote perceptual engagement by providing more complex and accessible visual surroundings. These results show that streetscapes may measurably shape walking behavior and that perceptual engagement may be a key mechanism driving these decisions.

While it is unsurprising that walkers preferred streetscapes with which they could perceptually engage, it is notable that these studies consistently indicated preference for more engagement with streetscapes rather than less, reinforcing the importance of streetscapes for walkability planning.

MOBILITY DISSONANCE: DAILY TRAVEL, ENVIRONMENTAL EXPOSURES, AND WELLBEING IN DELHI

Abstract ID: 1580

Individual Paper Submission

MONDSCHIEIN, Andrew [University of Virginia] asm7v@virginia.edu, presenting author

Despite the rapid pace of change and investment, most Delhi, India residents continue to struggle to get where they need to go (Dasgupta, 2015). During travel, residents are directly exposed to the urban environment, with its air pollution, noise, and natural and built features that vary significantly in their quality and maintenance (Patsarika et al., 2018). Delhi planners' goals of accessibility and sustainability depend on minimizing adoption of auto travel in favor of rail transit, buses, bicycling, and walking, but the perceived oppressiveness of the urban environment encourages auto usage (Mauro and Hellebrandt, 2016). Environmental exposures during travel are likely borne most heavily by people with limited resources, often living in neighborhoods with informally planned and incomplete infrastructures. Therefore, impacts on wellbeing are likely to be distributed inequitably across neighborhoods and communities. The literature on travel and environment often frames mobility, and walking in particular, as a “dosage” mechanism for receiving the benefits or disbenefits of environmental exposure (Ettema and Smajic, 2015). However, there is little investigation of how exposures, or perceptions of exposure, may result in variations in travel behavior and mode choice. Therefore, this research investigates the relationship between environmental exposure and two related outcomes: daily travel and subjective wellbeing. Does exposure to negative environmental conditions shape the choice to travel by non-auto modes? Additionally, does exposure during daily travel have a significant effect on subjective wellbeing, and if so, how are those effects distributed across travelers?

These questions are addressed through a survey of two Delhi neighborhoods with distinct environmental contexts. The survey of one thousand adults focuses on neighborhoods – Bhalswa Dairy and Batla House – with primarily low-income populations that have traditionally received little positive attention or investment from authorities. Both neighborhoods are sites of informal housing and transportation infrastructure. Batla House is subject to typical Delhi stressors including noise and air pollution, while Bhalswa Dairy also faces exposure to features including polluted water bodies and a large landfill. Constructs measured in the survey include daily travel, perceptions of the urban environment, and subjective wellbeing in addition to demographic characteristics. Travel patterns and wellbeing are

examined across neighborhoods, identifying variability in mode choice across neighborhoods as it covaries with perceived environmental quality. Mode choice modelling examines the effect of neighborhood and perceived exposures, controlling for other factors. The results show that for residents of both neighborhoods, perceptions of exposure are associated with significantly different travel choices. Notably, effects on subjective wellbeing are not explained by travel mode alone, but by the interaction of travel mode and perceptions of environmental quality. Given this result, I propose the concept of “mobility dissonance” for framing future research. Mobility dissonance occurs when individuals must travel in environments that they perceive as being unhealthful or oppressive, reducing subjective wellbeing and propelling individuals to reduce dissonance by either altering their behavior or perceptions. The findings underscore that the development of a sustainable, equitable transportation system in Delhi and other developing cities cannot focus solely on investments in large-scale, regional networks, but must also address local infrastructure and environmental conditions that significantly determine the choice to travel inside or outside of a car. In particular, the research contributes to a conceptualization of travel behavior and outcomes that account for experiential dimensions of travel that complement standard models of destination accessibility.

QUANTIFYING THE IMPACT OF BUILT ENVIRONMENT ON URBAN CONGESTION: A MULTI-CITY STUDY

Abstract ID: 1581

Individual Paper Submission

HU, Yijia [The University of Hong Kong] yijiahu@connect.hku.hk, presenting author
ZHAO, Zhan [The University of Hong Kong] zhanzhao@hku.hk, co-author

With increasing urban populations and limited road resources, traffic congestion has become a severe issue, resulting in tremendous economic losses, air pollution, and deteriorated public health. The impact of urban built environment on traffic congestion has been illustrated in many previous studies. To better design future smart and sustainable cities, it is essential to quantifying the relationship between the urban built environment and traffic congestion patterns. Prior studies related to this topic are largely constrained by the availability and granularity of the data. Conventional traffic congestion data sources are spatially sparse and vary drastically across cities, making it difficult to zoom into the road segment level. Previous studies seldom incorporated fine-scale environment differences in different cities, which may not be generalizable to different settings and fail to get conclusive results. Another key challenge lies in the lack of comprehensive methods to quantify street network structures, particularly at the road segment level. To address these issues, this study explores the applicability of several large-scale open data sources, such as OpenStreetMap (OSM), Uber movement, and LandScan, to describe the built environment and measure traffic congestion across different cities at the road segment level. To automate the OSM data retrieval process, we use OSMnx, an open-source Python package that provides researchers with an easy and programmable way to acquire and analyze large amounts of street network data. The built environment features are divided into five categories (i.e., street network, facilities, land use, population, and geolocation) as independent variables, including several unique features defined in this research (e.g., road angle, degree difference). Traffic congestion is estimated by Uber Movement, which provides traffic speed data on many car-accessible roadways in different cities at different time periods, by calculating the congestion ratio. In this project, we focus on six major global cities: Kyiv (Ukraine), London (UK), New York (US), San Francisco (US), Sao Paulo (Brazil), and Seattle (US). The reason for choosing these cities is that their speed data is available in the Uber movement. In addition, after merging speed data and street network data obtained from OSM, these cities still have a sufficient sample size. To quantify the built environment’s impact on traffic congestion patterns across different cities at the road segment level, we apply regression, and machine learning models to uncover linear and nonlinear relationships between different factors and interpret the model with factors’ relative importance through partial dependence plots with the representation of variables’ range and distribution. The results from six cities around the world show that selected characteristics can explain approximately 22% -38% of the traffic congestion, and the impact of different feature types on traffic congestion varies. Most of these attributes exhibit consistent effects across other cities. The newly proposed metrics in this study showed a high significance in the results. These findings can help identify congested road segments and provide important insights regarding how to design street networks to minimize traffic congestion. Our

research shows the great potential of leveraging the emerging open data to address traditional urban problems. These data allow for a larger amount of intra-city traffic data and make multi-city comparisons possible, suggesting a new approach for studying related traffic problems. The model proposed in this study quantifies the relationship between the built environment and traffic congestion, allowing a general estimation of potential congestion areas in cities in the absence of traffic data or the early stages of road planning. In addition, in selecting built environment features, we define some new features of the road network structure (e.g., degree difference), which are found to be significant in congestion prediction and can provide fresh ideas for future research.

ACTIVITY-TRAVEL ATTITUDES AND INTENTIONS AMONG DIFFERENT COMMUNITIES FOLLOWING COVID-19

Abstract ID: 1585

Individual Paper Submission

CHEN, Kanglin [University of Florida] kanglinchen@ufl.edu, presenting author
STEINER, Ruth [University of Florida] rsteiner@ufl.edu, co-author

COVID-19 has triggered a high intensity of public fear which impedes individuals' activity-travel behaviors. We discuss activity and travel together according to the activity-based models that travel demand is derived from people's daily activity patterns. Prior research has demonstrated fear can significantly impact people's choices in travel activities and destinations (Kang et al, 2012). However, compared with studies about individuals' risk perceptions during natural hazards, the theoretical and empirical bases for public psychology regarding social disasters are not many. Moreover, different communities differ in activity-travel intentions and behaviors. Many researchers have claimed that individuals' perceived severity (i.e., the degree to which individuals are concerned about the consequences of contracting COVID-19) increase with age. Conversely, perceived vulnerability (i.e., the probability of contracting COVID-19) is higher in the youth than older groups (Pasion et al., 2020; Bruine de Bruin, 2021). Zheng et al. (2021) conclude that individuals' fear of travel is mainly triggered by their perceived severity/vulnerability rather than the actual COVID-19 severity. Overall, COVID-19 provides an opportunity to investigate what the psychological reasons are behind public's behavioral changes and unveil different communities' activity-travel attitudes and intentions following social disasters.

Based on the Theory of Planned Behavior (TPB) and the Protection Motivation Theory (PMT), the research goal is to investigate how attitudes, subjective norms, and perceived behavioral control are correlated with individuals' activity-travel intentions among communities that feature different socio-economic status (including age and gender), individual medical conditions, and exposure to interventions and information. There are two research questions specifically: 1) What kinds of perceived severity/vulnerability, attitudes, and activity-travel intentions are held by communities with different characteristics? 2) How are attitudes, subjective norms, and perceived behavior control correlated with individuals' activity-travel intentions?

The research surveys samples in four Florida counties that rank top five based on their largest changes in travel/staying home among 67 Florida counties, by comparing daily mobility data of 2021 to that of 2019 from the Bureau of Transportation Statistics (BTS) (2021). The four counties include the Orange County (-13.2% in travel per capita), Sumter County (+17.9% in travel per capita), Gulf County (-24.0% in population staying home), and Osceola County (+22.3% in population staying home), respectively. These results are obtained from the authors' other paper which was presented in ACSP 2021 and is under review for publishing. Noticeably, the Sumter County also has a highest ratio of older adults over 65 years old among all the US counties. We plan to conduct the survey in summer 2022 and analyze the data using Structural Equation Modeling.

This research has two unique features compared to studies of its kind and thus contribute twofold to the literature. Firstly, the research fills the gap that not much is known about different communities' disaster psychologies toward COVID-19. Specifically, most other studies do not include perceived severity/vulnerability from the PMT. Meanwhile, they often collect general demographics about respondents but do not target COVID-19 vulnerable features. Moreover, the groupings of the features' indicators do not align with those of CDC which shows COVID-19 deaths correspondingly to individual groups. Secondly, the survey of this research focuses on the period from August 2021 to

February 2022, during which the US and Florida show a quite stable travel trend lower than that of 2019 based on the data from BTS (2022). In fact, the trend of the US has stayed almost consistent since around April 2021 (BTS, 2022). Therefore, the findings of this research show public's activity-travel psychology based on the adjusted travel trend that has lasted and may still sustain for a time.

RIDING TRANSIT TO PARKS AND TRAILS: OPPORTUNITIES, BARRIERS, AND IMPLICATIONS FOR TRANSIT AGENCIES

Abstract ID: 1598

Individual Paper Submission

RIGOLON, Alessandro [University of Utah] alessandro.rigolon@utah.edu, presenting author

BENSON, Jenna [University of Utah] jenna.benson@utah.edu, co-author

PARK, Keunhyun [University of British Columbia] keun.park@ubc.ca, co-author

CHOI, Dong-ah [University of Utah] dongah.choi@utah.edu, co-author

Introduction. Regional open spaces – such as large parks and trail systems – provide numerous benefits to human health, community wellbeing, and ecosystem services. Yet white and higher-income people have better walking access to regional open spaces than groups experiencing marginalization (Park et al., 2021). Further, many national parks and forests have experienced increased traffic congestion due to the rising popularity of outdoor recreation, with negative impacts on visitor experience and environmental quality (National Park Service, 2020). To address these two issues, transit agencies, public land managers, and nonprofits in the U.S. have established numerous transit-to-parks (T2P) initiatives, including some to connect low-income communities of color to regional open spaces via transit.

Research to date on T2P experiences is limited and has not focused on groups experiencing marginalization (Wilson et al., 2018). Building on recent mobility justice research (Coren et al., 2022; Lubitow et al., 2020), in this qualitative study we examine the experiences of riders using T2P services in Utah's Wasatch Front.

Research questions. How do people describe their experiences of transit-to-parks services, and what are some of the barriers to using transit to reach regional open spaces? What are the values and motivations that encourage people to ride transit to regional open spaces? What transit improvements would encourage people to ride transit to regional open spaces? Using an environmental justice lens, we explore how answers to these questions vary by the demographics of respondents, namely race/ethnicity, gender, and physical abilities.

Methods. The Wasatch Front, the largest metropolitan area in Utah, includes numerous natural areas, and its transit agencies have offered some T2P services in recent years. For this study, we recruited 25 residents of the Wasatch Front who are regular transit riders and have some experience riding transit to regional open spaces. Our sample includes significant variations in race/ethnicity, gender, and physical abilities. We conducted interviews with these transit riders over Zoom or the phone, with questions focusing on their T2P experience, their motivations to use such services, and possible service improvements. We analyzed the interview transcripts using constant comparative analysis.

Results. We find that reaching regional open spaces via transit can be quite difficult for many users despite a few targeted initiatives and the region's proximity to natural amenities. Barriers included difficult or dangerous last-mile connections to access trailheads from transit stops, lack of information about parks and hikes reachable via transit, and infrequent weekend service. People of color, women, and people with physical disabilities face particularly large barriers, including, respectively, distance to regional open space and racial discrimination, safety concerns, and lack of adequate ADA service in routes reaching parks or trails. Among the positive T2P experiences, respondents

described social interactions while riding transit, which contributed to a sense of adventure and learning about parks and trails. Further, values and motivations to use T2P services include environmental reasons, the convenience of not having to park one's car at overcrowded trailheads, and the cheap cost of riding transit. Also, to improve the use of T2P services, respondents suggested that transit agencies and public land managers should address the aforementioned barriers, conduct marketing campaigns targeted to different demographic groups, create weekend shuttle services to popular parks and trailheads, and partner with organizations seeking to increase diversity in outdoor recreation (e.g., Latino Outdoors).

Implications. Our results suggest the advantages of a holistic approach to planning T2P initiatives, with significant partnership opportunities between transit and public lands agencies. Specifically, planners could integrate changes to transit service (e.g., shuttles), improvements to bike/pedestrian infrastructure near parks and trailheads, informational campaigns, and outreach and programming with groups experiencing marginalization.

CAN FLEXRIDE MILWAUKEE MICROTRANSIT SERVICE HELP SOLVE THE SPATIAL MISMATCH?

Abstract ID: 1600

Individual Paper Submission

HU, Lingqian [University of Wisconsin Milwaukee] hul@uwm.edu, presenting author
SCHNEIDER, Robert [University of Wisconsin Milwaukee] rjschnei@uwm.edu, co-author
CANCEL MARTINEZ, Yaidi [University of Wisconsin-Milwaukee] ycmartin@uwm.edu, co-author

The Milwaukee region suffers significantly from spatial mismatch: residential segregation limits the housing mobility of minority groups and consequently reduces their access to suburbanized jobs (Kain, 1968). Improving transportation service is often regarded as a feasible solution to address the spatial mismatch problem (Fan, 2012), especially with the potential of new and emerging mobility technologies (Palm et al., 2021). In this context, we experimented with a new microtransit service that aims to address the spatial mismatch in the Milwaukee region, by connecting job-poor neighborhoods in the City of Milwaukee with job-rich employment areas in surrounding suburban communities. Reflecting on our experience, we ask the following question: can a new microtransit service help mitigate the impact of spatial mismatch on members of Milwaukee's inner-city labor force?

Our pilot microtransit service is called FlexRide Milwaukee and is funded by a grant from the National Science Foundation (Award ID: 2133337). The pilot period is February-October 2022. Collaboration across organizations and political jurisdictions has been central to implementing FlexRide Milwaukee. Our core project team is composed of researchers from the University of Wisconsin-Milwaukee (UWM) and practitioners from the Southeastern Wisconsin Regional Planning Commission (SEWRPC). Other project partners include workforce development agencies, business organizations, local governments, and community-based organizations. The service itself is managed by a for-profit company using shared vehicles and a ride-matching app. UWM leads the research activities and documents discussion and decision-making during the whole process.

Our exploratory research approach involves qualitative analysis of organizational coordination, user perceptions of the service, and early user experiences. While FlexRide Milwaukee benefits from multi-organizational collaboration and considerable political and community support, we are finding notable barriers that need to be addressed for this new service to be sustainable in Milwaukee and transferable to other regions. These barriers include: labor market conditions (e.g., the great resignation, safety concerns during COVID), institutional barriers (e.g., to arrange voucher purchases for unbanked participants), employer needs and constraints, service provider limitations, user

understanding of the service, and research needs and regulations.

This experiment accumulates knowledge for implementing a new, innovative transportation service to solve the spatial mismatch problem. This knowledge can inform the design, marketing, operation, and management of new mobility services in other metropolitan regions to improve social justice by leveraging emerging mobility technologies.

AN EFFICIENT APPROACH TO ROUTE CHOICE FOR EVACUATION PLANNING OF PERSONS WITH DISABILITIES

Abstract ID: 1614

Individual Paper Submission

MEMON, Abdul Wasay [Dalhousie University] ab215959@dal.ca, presenting author

HABIB, Muhammad Ahsanul [Dalhousie University] ahsan.habib@dal.ca, co-author

Evacuating persons with disabilities (PWDs) from disaster-prone areas in large numbers can be a challenge with many operational components in egress. Evacuation procedures often omit targeted responses for the preparedness of carless and mobility-limited residents, including a disproportionate share of PWDs. It appears that one of the biggest issues with the evacuation of PWDs is a lack of appropriate planning to determine how the shelters should be allocated to PWDs, the necessity to utilize emergency vehicles more efficiently, and ensuring that emergency routes are properly implemented to avoid traffic congestion in the network. Studies on PWDs tend to focus on localized, small-scale strategies, such as the evacuation of buildings or small facilities. As a result, there is a gap in the knowledge and practical application of mass evacuation at a city or regional scale, including identifying appropriate shelters, allocating vehicles, and planning emergency routes all at the same time. This study presents a framework for finding optimal emergency evacuation routes, particularly for the evacuation planning of PWDs. The proposed approach is capable of selecting optimal alternative evacuation routes effectively and objectively. The route choice model is developed by studying alternative evacuation routes within the Halifax peninsula using a combined Entropy Weight-TOPSIS hybrid approach, to conduct multicriteria-based emergency evacuation route analysis. The advantage of the Entropy Weight method is that it considers information entropy to measure a certain factor's discreteness. On the other hand, the TOPSIS method reflects on Euclidean distance to determine the relative proximity of an alternative to the optimal solution. The entropy weight method is used to determine the weight of each factor influencing emergency evacuation route choices, and the TOPSIS method is tasked to compare and evaluate alternatives to identify the optimal evacuation route. This study considers traffic and road condition related factors of emergency evacuation route choices for six distinct routes, within the proposed multicriteria problem-solving framework. Factors include Traffic Volume, Traffic Capacity, Congestion, Travel Speed, Lane Width, Road Condition, Incident Probability, and Total Milage. The data was collected from the Dalhousie Transportation Collaboratory (DalTRAC) and HRM open data sources. The results demonstrate best-to-worst ranked evacuation routes and confirm that the proposed method is scientific and accurate for the multi-criteria analysis of the emergency evacuation route selection for PWDs. The top three best-ranked routes will be considered for evacuation purposes. The proposed solution will help policymakers and emergency professionals to develop proactive evacuation plans and accommodate the special requirements for the evacuation of PWDs.

Urban transportation is experiencing rapid changes with the growing popularity of new micromobility options. Within this mix of new modes, pedestrians and other non-motorists face substantial and growing risks on streets where the majority of roads cater to drivers and automobiles. Experimentation is needed to identify workable solutions. Installation of temporary demonstration street projects as a way to address safety issues is a growing trend in urban planning. Working with the coastal town of Asbury Park, NJ, USA, a temporary (pop-up) bicycle lane in a high traffic intersection, was analyzed for improvements for safety. Safety is very subjective and can be measured in different ways: by surveying road users directly, by using sensors to measure stress and cognitive workload, or by measuring the passing distance, number of swerving maneuvers, or near-miss indicators.

Past studies have traditionally focused on just one of these methods at a time. Surveys have the benefit of capturing a diverse range of road users but are prone to recall bias. Reviewing video footage from drones or traffic cameras can be helpful in capturing interactions between more than two modes. It allows researchers to observe safety factors such as use of bicycle lane or use of helmet by a micromobility user but leaves the perception of safety/near-misses in the hands of the researchers. Biometric sensors can measure cognitive workload and stress levels from recruited participants. A recent study combined observation and surveying, and highlights the subjectivity of safety and near-misses as they found that participants reported feeling afraid in just 10% of close passes.

The intersection is situated two blocks away from the beach and three blocks from downtown. The two streets currently each have one lane going in each direction (two lanes for each street). The intersection is particularly hazardous due to its wide turn angle for drivers coming from downtown traveling towards the beach. Motor vehicles often do not slow down sufficiently when turning right.

A mixture of methods is needed in order to capture the subjectivity of safety for a user and to make useful policy recommendations. In our study, we employ (1) an intercept survey, (2) biometric sensors, and (3) traffic camera video and drone footage. The intercept survey collects demographic information and safety perception from road users passing by. Biometric sensors are placed on a bicycle and e-scooter users before and after the implementation of the bike lane to see whether the same users feel less cognitive workload once a bike lane is available. The traffic camera footage is collected for two weeks prior to the introduction of the protected bike lane and for two weeks after. The footage provides valuable information on traffic mode interactions, speeding, and possible unsafe situations such as running a red light, speeding, or not yielding to pedestrians.

From the survey results, non-motorists report that they feel safer with the new bicycle lane present. From the biometric sensors, the participants report less cognitive workload while the bike lane is present. From the traffic camera footage, we find that motor vehicles are more likely to come to a complete stop before making a right turn at a red light, that they are less likely to speed through the intersection, and that they are less likely to run a red light. Bicycles and e-scooters have fewer swerving and hard braking incidents with the bicycle lane present.

Safety is improved by slowing down traffic and separating micromobility users from drivers and pedestrians. Overall, the protected bicycle lane intersection is beneficial for non-motorists. Researchers and planners should work together to conduct naturalistic studies by way of tactical urbanism.

THE CONTESTED CURB: METERS, MOBILITY AND MANAGEMENT

Abstract ID: 1620

Individual Paper Submission

WOUDSMA, Clarence [University of Waterloo] cwoudsma@uwaterloo.ca, presenting author

ATTEMA, David [University of Waterloo] d2attema@uwaterloo.ca, co-author

The curb is arguably the most contested space in the city as the interface between the transport system (mobility) and the urban environment (access) it shapes and serves. Traditional piecemeal approaches to managing the curb have focused on either parking, transit, pedestrians, or perhaps loading zones/taxi stands in commercial areas. They have also suffered from a lack of adequate data, assessment methods, and the challenge of coordination within and between public/private interests. Today, there is a widely recognized intensification and diversification of demands on the curb from ride hailing, e-commerce, food delivery, active transportation, and micro-mobility. Future curb demands will include delivery robotics, a variety of autonomous vehicles and evolving activity patterns across the socio-economic and urban form spectrum. For example, every major city in Canada is working on reducing automobile dependence and emphasizing mobility alternatives through investments in active transportation infrastructure that often intensify curb conflicts. The central questions explored in this paper are what are the options for managing the curb, the characteristics of these options and their effectiveness? Our approach to addressing these questions involves first a systematic review of literature and practice reports to enumerate curbside management practices and their characteristics. The second phase involves the development of a qualitative assessment framework for evaluating curbside management drawn from the literature base; a framework that includes dimensions related to type (e.g., program, pricing tool, regulation, education campaign), cost, user impacts and trade offs, stakeholder engagement, internal coordination, data, technology, and street functionality. Lastly, the utility of the framework and level of engagement in curbside management is analyzed through a case study application to a variety of Canadian cities in differing urban contexts. The findings indicate the majority of cities employ elements of traditional curbside management approaches that include parking regulations, loading zones, and transit bays for example. Only the City of Toronto has begun the adoption of a comprehensive curbside management strategy that incorporates consideration of the diversity of users and stakeholders. A number of cities have policy commitments to pursue new approaches to curbside management but have yet to implement many of the best practices identified in other jurisdictions. The evaluation framework allows cities a basic starting point for considering evolving curbside demands and management approaches. However, it is clear that the growth and diversity of demands on the curb and the volume of voices debating curb space use and rights has outstripped the efforts of municipalities to manage effectively. This work builds on the emerging urban planning literature around curbside management, providing an example application of an evaluation framework and highlights the need for significant work to be done as the curb is an essential consideration in pressing global challenges like the climate emergency.

CONCERNS FOR BUYING A USED ELECTRIC VEHICLE: AN ONLINE REVIEW ANALYSIS USING NATURAL LANGUAGE PROCESSING

Abstract ID: 1623

Individual Paper Submission

LOH, Wei San [Rutgers, The State University of New Jersey] weisan.loh@rutgers.edu, presenting author

With the growing popularity of electric vehicles to combat climate change, research studies have conducted surveys or focus groups to understand factors that affect consumers' decisions to purchase an EV. However, none specifically looked at barriers consumers may have in buying a second-hand EV, which has a more attractive price point for lower-income households. In this study, I examine the circumstances surrounding used EVs that the existing or potential owners have through social media. I focus on used EVs instead of new EVs under the assumption that used EVs are more affordable for low- and moderate-income households. I leverage social media to capture concerns about used EVs as a proxy to understand the barriers that may prevent low-income households from adopting used EVs in the future. I use the latent Dirichlet allocation topic modeling method to identify relevant topics from texts obtained via social media. Understanding concerns surrounding used EVs may help policymakers roll out EV-related policies more effectively for lower-income households, improving their accessibility to EVs.

CHARACTERIZING THE ACTIVITY SPACES OF VULNERABLE TRANSIT RIDERS USING TOUCHLESS PAYMENT VALIDATORS

Abstract ID: 1625

Individual Paper Submission

HILDE, Thomas [Cleveland State University] t.hilde@csuohio.edu, presenting author
SIMONS, Robert [Cleveland State University] r.simons@csuohio.edu, primary author
OWUSU-AGYEMANG, Samuel [Cleveland State University] s.owusuagyemang@vikes.csuohio.edu, co-author
HENNING, Mark [Cleveland State University] m.d.henning@csuohio.edu, co-author
CONRAD, Katherine [Ohio Transit Risk Pool] katherinec@otrp.org, co-author

The recent development of touchless payment systems for public transit has allowed detailed analysis of travel patterns. Research is increasingly making use of individual-level tracking data to analyze the travel behaviors and activity patterns of vulnerable transit users, often using an activity space-based approach (e.g., Morency et al., 2011). Activity space refers to “the local area that is composed of locations people have direct contact with during their daily activities,” and has been used as an indicator to measure transport disadvantage (Zhang et al., 2021, Kamruzzaman et al., 2016). This paper extends the activity space framework to three metropolitan areas in Ohio, where we examine the activity space characteristics and geographies of different groups of vulnerable transit riders.

Our dataset includes 214 EZfare accounts, which follow over 15,000 validator readings over a 5-month period for transit riders in Cincinnati, Cleveland, and Akron. These data are connected to a demographic survey, allowing trip patterns to be examined in subgroups based on income, banked status, disabilities, gender, race/ethnicity, vehicle access, and other measures of vulnerability. We utilize GIS maps and associated tables to report on mean travel frequencies and indicators characterizing the mean shape and spatial extent of activity space confidence ellipses for each subgroup of transit riders.

We find that less vulnerable transit riders (e.g., higher-income, banked, vehicle-owning) have larger and more linear activity spaces than vulnerable riders, indicating a greater emphasis on transit use for commuting between home and work via suburban park-n-rides. Vulnerable subgroups' activity spaces, on the other hand, are relatively smaller and more circular, indicating a greater emphasis on localized travel to a wider variety of locations. By examining four transit providers across three metropolitan areas, we report on the important role of geographic context in shaping measures of activity space.

Our findings provide important insights for equitable transit planning and service provision, because significant

differences in activity space characteristics between transit user groups reflect different needs for using and accessing urban space. The activity space characteristics of vulnerable groups could potentially inform more equitable transit route alignment, headways, and pricing. Additionally, this study adds to the growing body of research demonstrating the use of individual-level tracking data to better understand travel behavior.

ZHANG, Wenwen [Rutgers, The State University of New Jersey] wenwen.zhang@ejb.rutgers.edu, co-author

One of the largest disruptions precipitated by the onset of the COVID-19 pandemic in early 2020—at least for those whose jobs allowed it—was the near instantaneous shift to working from home. A comprehensive Chicago-area study found that while 15% of respondents worked from home five days a week or more before the pandemic and nearly half—48%—did so during the pandemic (Shamshiripour et al., 2020). Among highly educated, higher-income respondents in the United States, uptake was even higher (Conway et al., 2020).

Remote work, which some saw as a temporary measure to get through the pandemic, has now become a subject of debate, as the working world looks to determine a new “normal”. Will people gradually make their way back into physical offices? Will remote work become the norm for certain types of workers? Or will a hybrid system emerge as default? Early estimates suggested enduring changes. Salon et al. (2021) estimated that the proportion of workers expecting to work from home at least a few times per week was twice of that before the pandemic, increasing from 13% to 26%. Conway et al. estimated 62% of a higher-education, higher-income sample would work from home at least a few days per month, compared to 40% before the pandemic. These figures, however, reflect predictions from non-representative samples prior to deployment of COVID-19 vaccines.

As COVID-19 has become more manageable and many people have resumed in-person activities in several spheres of life, questions have emerged: Will people continue working from home? Why or why not? The answers largely depend on a) whether employers provide the opportunity to work from home (i.e., supply-side factors), and b) whether workers want to work from home (i.e., demand-side factors) (Handy & Mokhtarian, 1996).

We investigate these issues using two cross-sectional waves of a population-representative survey taken in New Jersey, with the first wave (n=1,419) administered between November 30th, 2020, and February 25, 2021 and the second wave (n=1,032) administered between December 1, 2021 and February 22, 2022.

We address the following questions:

- How prevalent was working from home, both early in the pandemic and as it has eased?
- How do demographic factors like age, gender, and race affect home-based work behavior and anticipation?
- How much do people anticipate working from home after COVID-19 is no longer a threat?
- What factors are associated with anticipated working from home in the future? We find across both survey waves that while fewer people anticipate working from home after the pandemic, approximately one third of respondents anticipate working from home regularly (at least a few times a week) indefinitely, compared to 15-20% who did before the pandemic. Moreover, the chief reason for ceasing working from home was that employers would not allow it (~75% across both waves) as opposed to respondents not wanting to (~20% across both waves). Crucially, the desire to continue working from home in the second wave was not correlated with perceived risk from COVID-19, indicating people wished to work from home for other reasons. Key demographic factors, especially educational attainment and income, were associated with increased propensity to work from home, largely through the types of employment

associated with these factors allowing for working from home.

These results carry implications for the future of work and travel. For one, high demand for working from home may pressure employers to adapt, increasingly accommodating employees who wish to do so. Additionally, the projected continuation of working from home at least some of the time suggests continued disruption of traditional commuting patterns and may result in a flattening of historical commuting peaks and reducing pollution.

HAVE THE GENDER GAP AND PARENTHOOD PENALTY IN BUSINESS MOBILITY NARROWED SINCE 2001? LESSONS FROM THREE PREVIOUS U.S. NATIONAL HOUSEHOLD TRAVEL SURVEYS

Abstract ID: 1652

Individual Paper Submission

MATSUO, Miwa [Kobe University] mmatsuo@rieb.kobe-u.ac.jp, presenting author
GAYDARSKA, Hristina [Kyoto University] doc14001@grips.ac.jp, co-author

The recent COVID pandemic has accelerated the digital substitution of business travel, but what does it mean for the gender gap in business mobility? This study examines the U.S. National Household Travel Survey (NHTS) data to assess whether the gender gap and parenthood penalty in business mobility has narrowed since 2001.

Despite significant progress toward female participation in the labor market, women are still significantly underrepresented in business travel (Aguilera, 2008). The primary reason for the gender gap in business mobility may be the gender gap in career opportunities. The time shortage caused by child-rearing duties often discourages or makes it challenging for women to choose or promote to jobs with higher-level of responsibilities (Gustafson, 2006). As business travel goes hand-in-hand with prestigious jobs, workers with care responsibilities often hesitate or fail to take such positions (Magnusson, 2010).

While literature reports the persistent gender gap and parenthood penalties in business mobility, technologies may have narrowed them. Specifically, information and communication technologies (ICT) may have reduced business travel needs through virtual substitution of business travel. Although physical presence remains vital in various personal relationships, ICT has replaced many in-person interactions with virtual ones, even before the COVID pandemic (Faulconbridge et al., 2009). For instance, virtual meeting tools have become more convenient and natural to be a close substitute for in-person meetings. Online customer-relation management tools and inside salesforce have been widely accepted, replacing door-to-door outside sales. In addition, automated data sharing has proliferated to reduce the need for data collection and information sharing trips. As a result, by 2017, the average American worker traveled much less frequently and fewer miles than in 2001 (McGuckin and Fucci, 2018). Such declining trends in business travel may have contributed to improving work-life balance, particularly for workers with care responsibilities.

Our paper employs the Probit model to investigate whether occupational categories and ICT familiarity affect the gender gap and parenthood penalty in business mobility. We also test the model for business travel with different travel mile thresholds to see whether the gap is more significant for long-distance travel. Our analysis finds narrowing gender gaps and parenthood penalties in business mobility, with some variety by occupation and internet familiarity. Specifically, parenting activities had a strikingly negative impact on female sales and service workers' long-distance business travel in 2001. The gender gap and parenthood disadvantage seem to have narrowed in 2009 and 2017, as male sales and service workers with and without children reduced their travel likelihood. Yet, a significant parenthood penalty remained for female sales and service workers for long-distance business travel (50+ miles per day). The gender gap and parenthood penalties for professional and managerial workers were narrower than those for sales and

service workers in 2001. However, professional and managerial mothers remained much less likely to travel 30+ miles than their male counterparts even in 2017. ICT familiarity basically narrowed the gender gap among workers without small children, suggesting that ICT has complementary effects on business travel. Yet, among sales and service workers with children, it widened the gender gap in the travel likelihood in 2001 and 2009, suggesting that ICT may have been used for substituting business travel.

PREPARING FOR ON-DEMAND RIDE HAILING AS PUBLICLY-SUBSIDIZED MOBILITY: HOW DO PROGRAM DESIGN AND NEIGHBORHOOD CONTEXT AFFECT UPTAKE?

Abstract ID: 1667

Individual Paper Submission

BENAROYA, Anne [Toronto Metropolitan University] anne.benaroya@ryerson.ca, presenting author

SWEET, Matthias [Toronto Metropolitan University] matthiassweet@ryerson.ca, co-author

MITRA, Raktim [Toronto Metropolitan University] raktim.mitra@ryerson.ca, co-author

The rapid and widespread adoption of ride-hailing services provided by Transportation Network Companies (TNCs) since 2009 provides new challenges and opportunities for transportation policy (Tiranchini 2019, Thomas et al., 2021). Partnerships between TNCs, transportation planners, and transit agencies offer new opportunities to provide on-demand transit options with the potential to improve service to vulnerable users – even in low-density areas (Schwierterman et al., 2018), Curtis et al. 2019, Lucken et al. 2019). Despite this optimism, how does the design of a mobility program involving a TNC-public sector partnership affect uptake? And what neighborhood factors may influence on-demand ride hailing ridership? Assessing such programs is critical towards improving their efficacy (Schwierterman et al., 2018, Curtis et al. Lucken et al. Thomas et al. 2021).

This paper examines a case study of such a partnership between Uber and the low-density rural Town of Innisfil, Ontario. Known as Innisfil Transit, the partnership provides subsidized ride-hailing trips to all Innisfil residents as an alternative to traditional fixed-route transit. Over the course of the study period from 2016 to 2020, the Innisfil Transit program underwent multiple policy changes including adding additional fixed-fare destinations and implementing a 30-trip per month limit for users.

The purpose of this paper is to first investigate the impact of the subsidized ride-hailing program on ride-hailing use and uptake, and to determine how it differs from non-subsidized ride-hailing. Second, this paper aims to identify the spatial and temporal ridership patterns of ride-hailing use and uptake in a low-density rural area, and what impacts policy changes have on these patterns.

Using a combination of descriptive statistics and inferential models (both cross sectional and panel), this study explores the predictors of zonal on-demand ride-hailing ridership and growth during the study period as a function of neighborhood-level and policy-related control variables. Our models reviewed subsidized ride-hailing, non-subsidized ride hailing, and total ride-hailing trip generation to estimate links between the Innisfil Transit program and non-subsidized ride hailing. We found that both Uber and Innisfil Transit trips increased drastically over the study period, with the total ridership increasing from only 22 trips made in September 2016 to over 23,700 in January 2020, before decreasing to approximately 21,300 in the final month of the dataset (February 2020). When it was implemented in May 2017, Innisfil Transit trips surpassed Uber trips for the duration of the dataset, however the difference between the subsidized and unsubsidized trips decreased as time went on.

Results indicate that while the introduction of Innisfil Transit initially decreased Uber trips (implying substitution), this impact was not long lasting. Evidence indicates that policy decisions impact both overall ridership and growth over time. The presence of a fixed-fare destination in a given zone incentivized trip generation. The imposition of a 30-trip limit per month across all Innisfil neighborhoods successfully decreased subsidized ridership and may have shifted some Innisfil Transit users towards non-subsidized Uber services. As found in other studies, both population density and the proportion of young adults in an area were critical neighborhood factors which shaped ridership.

Results weakly suggest that subsidized ride hailing may be more prominently used by low-income households than non-subsidized ride hailing. In sum, these findings have important implications for municipalities and transit agencies considering partnerships with TNCs to deliver subsidized ride hailing services.

Transportation planners and policy makers in Madison, Wisconsin have long struggled with designing an accessible and efficient public bus transportation system within an “isthmus city” characterized by geographic unevenness—i.e., a central area squeezed between two urban lakes where service is concentrated and a larger urban expanse that fans out in either direction where service provision is inherently challenging. The difficulties associated with distributing transportation service across Madison’s unique geographical landscape are magnified by historical patterns of discrimination in housing and employment as well as more contemporary gentrification pressures along the central core that (re)shape the demographic landscape in ways that intersect with the transportation system. Together, these forces have helped to produce distinct areas in the near urban periphery where limited transportation access and reduced efficiency are disproportionately experienced by the city’s lower income, non-white, and more transportation dependent populations.

In order to uncover the experience of transit riders from these specific communities, we conducted 40 semi-structured, in-depth interviews with riders about their experience with the transportation system and how it impacted their daily lives. Results from our qualitative analysis show that riders often characterize their interaction with the system in terms of conflict. For example, important themes that have emerged from the interviews show that struggles with bus frequency and transfers impact finances, employment, and housing. The riders we interviewed also expressed discomfort with conditions on the bus and particularly with other riders and drivers. Importantly, we also find that tensions with the existing system are translated into apprehensiveness with emerging plans to reorganize the existing system around a future bus rapid transit line.

Drawing on a right to the city framework, we compare our findings from riders with the results of a parallel set of interviews with stakeholders. Results show a distinct divergence between the themes generated from riders and the ways stakeholders describe the challenges to the existing system and their arguments for improvement. Along the lines of this framework, we argue that the conflict narrative reflecting the experience of riders facing accessibility and efficiency challenges should be interpreted as a call for greater participation in transportation planning and a “demand...[for] a transformed and renewed access to urban life.”

EFFECTS OF PARENTAL ATTITUDES AND BEHAVIOR ON CHILDREN'S WALKING BEHAVIOR: A PANEL STUDY APPROACH

Abstract ID: 1672

Individual Paper Submission

KIM, Kyuri [Portland State University] kyuri@pdx.edu, presenting author
DILL, Jennifer [Portland State University] jdill@pdx.edu, co-author

Understanding children's walking behavior is important because of the various health benefits and the likely influence on active lifestyle throughout their later lives. Various built environmental factors, including land-use types and their diversity, sidewalk connectivity, and distance to destinations may affect children's walking behavior (Mitra, 2013). However, children's active travel behavior can vary in neighborhoods with similar built environmental contexts. This may be because their parents' attitudes and perceptions about the neighborhood, especially safety, can affect their children's walking behavior (Foster et al., 2014). Additionally, parental behavior can affect children's physical activity (Liszewska et al., 2018).

The purposes of our study are as follows: (1) how parents' attitudes about neighborhood safety, and parents' walking behavior, affect children's walking behavior; (2) whether the relationship between children and parental walking behavior and attitudes are consistent between time periods and whether there is a causal relationship in a longitudinal context; and (3) what factors affect changes in attitudes or behavior over time.

This study uses two-wave panel data (over 2 years) for 335 households with children aged 5 to 17 in Portland, Oregon. In addition to walking behavior (measured using GPS and accelerometers), variables include the children's attitudes about walking and barriers to walking, parents' attitudes about their children's safety while walking, and demographics. Our analysis includes latent variables and cross-lagged panel models (CLPM), which utilize data of two or more time waves to investigate causality among latent variables (Thøgersen, 2006). Two variables which affect children's walking are parents' walking behavior and their attitude toward the safety of their children's walking. While parent's walking significantly affects children's walking in both time waves, their attitude toward the safety of children's walking, which is measured by traffic safety and stranger awareness, was only significant in the second wave. This indicates that parents who walk more may consistently induce children to walk more. Furthermore, parents' attitude toward their children's safe walking affect children's walking behavior when they are getting older. Children's attitude toward weather as a barrier did not affect their walking behavior in both time waves.

Our analysis also examines changes in attitudes and behavior over the two-year time period. Overall, children's attitudes towards walking got slightly more negative, particularly for walking to school. Factors that were correlated with changes in their attitudes include age, parental attitudes about their children's safety while walking, and parent's attitudes about their own walking. In both analyses, built environment features did not play a large role, though the variation in the sample was limited.

Overall, the findings point to the importance of parental attitudes and perceptions, as well as their behavior, in influencing children's walking attitudes and behavior. There is a need to understand how to create neighborhoods where parents feel safe allowing their children to walk independently.

WHAT DOES RESEARCH ON TRANSIT PRICING TELL US ABOUT FARE FREE TRANSIT?

Abstract ID: 1680

Individual Paper Submission

KING, Hannah [University of California Los Angeles] hking@g.ucla.edu, presenting author
TAYLOR, Brian [University of California Los Angeles] btaylor@ucla.edu, co-author

Two years into the COVID-10 pandemic, transit patronage in most of the U.S., is a fraction of its historical trend. Transit riders are now required to wear masks, and a variety of steps by transit operators to reduce the public health risks associated with transit use have become commonplace. Like transit operators nationwide, operators in Los Angeles, most notably Los Angeles Metro, have also experimented with “fare-free” transit as a way to reduce the risks of spreading COVID-19.

Transit operators have historically been reluctant to adopt innovative fare policy due to equity concerns, a firmly-established history (in the United States) of flat-rate transit fares, and risk-averse transit management (Yoh, et al., 2010). “Flat” fares may seem equitable at first blush but charge different travelers the same price for trips of different lengths, modes, and time of day, effectively cross-subsidizing longer, more expensive-to-provide trips with revenues from shorter, less-expensive-to-provide trips (Nuworsoo, et al., 2009). Given that higher-income transit users tend to take longer trips than lower-income users, and are more likely to travel in peak periods and directions as well, flat fares cross-subsidize the better-off by the less well-off, on average. Fare schedules that charge different fares to different user groups based on ability to pay can help mitigate vertical equity concerns, while distance-based fares that vary by trip distance and/or time-of-day do a better job of matching the price charged for transit service to the cost of serving that trip (Farber, et al., 2014). The complexity of calculating marginal costs of serving specific transit trips has historically been magnified by a lack of individual transit user travel data. This situation is changing. Although operators expressed interest in experimenting with fare-free transit before the current pandemic as a response to longstanding structural issues stemming from over-reliance on flat fares, it took the unforeseen exigencies of COVID-19 to incentivize rapid widespread experimentation in fare policy. Coupled with reduced patronage, however, experiments in fare-free transit have exacerbated long term declines in the share of transit agency costs covered by fare revenues.

In this paper, we review the current state of what scholars and practitioners have learned about free- and reduced-fare programs and use it to design an evaluation framework for such programs. We review free- and reduced-fare policies currently being explored or implemented by transit agencies nationally, with a focus on Southern California. We identify the characteristics of transit agencies that are currently exploring or implementing innovative policies. We evaluate the success of agencies in generating revenues and addressing equity concerns. We specifically examine fare-free transit compared with those that vary based on time, distance, and customer type. Given that eliminating payments also eliminates the need for fare enforcement, what does the net fiscal and equity impacts of free fare policies tend to be? What are the opportunity costs? In short, we are interested in understanding, based on current practice and research, the future of transit fare policy.

We contribute to existing literature by summarizing the current landscape of innovative transit fare policy and analyzing these policies through a theoretical framework based on recent and emerging data. The results of our analysis will be used to shape our future work on the fiscal and performance implications of innovative fare policies for specific agencies. By better understanding how emerging technology can help to match the marginal costs of serving different traveler and trip types, our findings can help ensure that fare policies are equitable but also economical. In doing so, we endeavor to provide actionable guidance for transit agencies as they move toward fare policy reform in the wake of COVID-19.

IF YOU ZONE IT, WHO WILL COME, AND HOW WILL THEY TRAVEL? THE EFFECTS OF RELAXED ZONING REGULATIONS ON TRAVEL BEHAVIOR

Abstract ID: 1687

Individual Paper Submission

BHAGAT-CONWAY, Matthew [University of North Carolina at Chapel Hill] mwbc@unc.edu, presenting author

Urban areas across the United States are facing a housing affordability crisis. One approach some cities and states have taken is to reduce or eliminate single-family zoning. Single-family zoning prevents the construction of more-affordable apartments in vast swaths of the American urban landscape. This policy shift has already occurred in a number of states and cities, and is under discussion in others (Infranca, 2019). Independent of any effects on housing affordability, changes to land use policy may have effects on transport. In this work, I evaluate these effects using a microsimulation framework.

For land use policies to affect transport, they need to affect land use, so I first build an economic model to simulate where development in metropolitan Los Angeles would occur if single-family zoning were removed. This model evaluates the profitability of redeveloping existing single-family homes and single-family-zoned vacant lots into small multifamily structures, and the likelihood that a property will be sold to a developer in the five-year time frame of the model.

Transport outcomes vary depending on which households live in which parts of the region, so I use an equilibrium sorting model to forecast how residents will re-sort across the region in response to the land use changes induced by new land-use policies. This adds an equilibrium price adjustment step as well as fixed effects to control for unobserved heterogeneity to the common multinomial logit model used for residential location models. This model also jointly forecasts how many vehicles each household will choose to own. This type of model is generally used for valuation of amenities (Bayer et al., 2004; Tra, 2007); to my knowledge, this is the first time it has been applied to a residential location choice in the context of a change to housing supply.

Finally, I apply an activity-based travel demand microsimulation model (Association of Metropolitan Planning Organizations, 2020) to forecast the changes in transport associated with the forecast changes from the previous models.

All in all, this dissertation forecasts extremely minor changes in travel outcomes due to a blanket elimination of single-family zoning. That said, due to financial and time limitations, the travel demand model was only used to evaluate a single scenario. It is possible that other scenarios that target development to more-accessible areas, rather than the blanket upzoning combined with a booming economy simulated here, would have more effects on transport. That said, the lack of a large transport effect is not necessarily bad news for policies to support housing development; while transport outcomes did not improve significantly in this model, they also did not worsen significantly. If changes to zoning codes are justified on affordability or equity grounds, a lack of transport impacts does not undermine these policies.

This analysis also demonstrates that redevelopment is highly volatile, with slight differences in assumptions resulting in massive differences in where it is profitable to build. This volatility makes any evaluations of the effects of changes to land use policy quite uncertain.

During major disruptions such as the COVID-19 pandemic, essential workers, defined as employees who must continue to make frequent commute trips, play a critical role in maintaining the basic function of society. It is therefore vital for transportation planners and policymakers to ensure that adequate mobility services are provided to meet the travel needs of this group of workers. To better understand their mobility barriers and inform future decision making, this research aims at answering the following questions:

- (1) How did essential workers commute before and during the COVID-19 pandemic?
- (2) What are the key explanatory factors of essential workers' mode choice before and during COVID-19?
- (3) How can transportation planners and policymakers effectively support essential workers' commute in the future?

This research examines essential workers of the University of Washington in Seattle using data from the Transportation Needs Assessment Survey, which was conducted by the university's Transportation Services in Autumn 2020. We use descriptive analysis and multinomial logistic regression, which includes sociodemographic and home location characteristics as explanatory variables, to model the mode choice of essential workers before and during the pandemic. We also investigate essential workers' reasons for mode choice and prospective on commuting for the recovery phase.

The results show that, first, over 60% of pre-pandemic public transit riders switched to other modes, especially driving alone. Almost all of the essential workers who drove alone, biked, or walked before the pandemic continued to do so during the pandemic. Second, the shift to driving alone was most pronounced among essential workers with higher incomes, whereas public transit remains as the primary mode choice of lower-income groups. As travel distance increases, the probability of choosing driving alone over public transit also goes up, although the relationship is not linear. We do not find consistently significant associations between mode choice and other sociodemographic variables. Finally, our analysis indicates that when the pandemic is under control, most essential workers hope to return to their pre-pandemic commute trip frequency and mode choice. Transportation planners and policymakers can facilitate recovery of public transit services and encourage biking and walking through planning and policy innovations.

PANDEMIC-TIME STREET REALLOCATION IN THREE LARGE CANADIAN URBAN CENTRES- AN EXPLORATION OF USAGE AND PUBLIC SUPPORT

Abstract ID: 1709

LATANVILLE, Remington [Toronto Metropolitan University] remington.latanville@ryerson.ca, presenting author
MITRA, Raktim [Toronto Metropolitan University] raktim.mitra@ryerson.ca, primary author
HESS, Paul [University of Toronto] hess@geog.utoronto.ca, co-author

Central Theme: The ongoing COVID-19 pandemic has presented an opportunity for municipalities across the Western world to implement active transportation infrastructure with unprecedented speed and political will (Combs & Pedro, 2021). In many cities, existing street space was reallocated to welcome walking, cycling and outdoor social gathering, while maintaining public health guidelines related to physical distancing. These street reallocation initiatives saw significant initial use and support (Buehler & Pucher, 2021; Shirgaokar et al., 2021). While most of these measures are labeled “temporary”, wide public use and support in early years of implementation may lead to political and policy support leading to their permanency, which is a desirable outcome for active transportation advocates. However, these street reallocation measures may not have benefited all population groups equally (Fischer & Winters, 2020). Within this context, we focus on the use of and support for two specific types of street reallocation in the largest urban centres in Canada, namely- temporary bike lanes and lane closures (i.e., closing traffic lanes to automobiles and allowing active transportation and recreation in that space). Two research questions are examined: 1) who are using reallocated bike lanes and lane closures more often during the pandemic?; and 2) what is the level of support toward the future maintenance and enhancement of these street reallocation initiatives?

Method: We conducted a population-representative online survey of 2,078 adults in City of Toronto, City of Montreal and Vancouver region, which are the three largest urban centres in Canada. Data collection took place in July 2021, or about 15 months into the pandemic, when all three regions were in the “stage 3” of their economic reopening, meaning that indoor activities were allowed at limited capacity, but larger outdoor gathering were allowed. The survey respondents self-reported their frequency of using bike lanes and lane closures, and also their support toward longer term maintenance and enhancement. Multinomial logistic regression models were estimated to identify the correlates of using and supporting street reallocations measures.

Results: Nearly half of all respondents used a bike lane or lane closure at least once during the first year of the pandemic, and between 40% (lane closure) and 42% (bike lane) supported their maintenance and enhancement post-pandemic. The results from the multinomial logistic regression models suggests that older, educated, and higher-income individuals, and those with fewer cars, are more likely to use and support bike lanes and lane closures. Local neighbourhood environment (dwelling density and the presence of pre-pandemic cycling facilities) was not associated with either use or support, but accessibility to, and accessibility offered by, pandemic-time bike lanes and lane closures, were important. All else being equal, there was significant regional variation in use and support.

Conclusion: Our findings show that pandemic-time street reallocations have attracted a lot of use and support, which varied across regions and based on local accessibility to these facilities. There are significant social inequalities in usage and support. Future research should explore the spatial and social equity in street reallocation planning more closely.

A “BIKE SYSTEM FOR ALL” IN SILICON VALLEY: A DATA-DRIVEN ANALYSIS OF THE FACTORS THAT LEAD TO SUCCESS

Abstract ID: 1711

Individual Paper Submission

ZANDIATASHBAR, Ahoura [San Jose State University] ahoura.zandiatashbar@sjsu.edu, presenting author
NIXON, Hilary [Mineta Transportation Institute] hilary.nixon@sjsu.edu, co-author
ALBRECHT, Jochen [Hunter College] jochen.albrecht@sjsu.edu, co-author

San José, California—the capital of Silicon Valley and one of the most diverse cities in the U.S.—has the potential to be a cyclist's paradise. However, despite a bike-friendly climate and topography, the average resident wastes 81 hours annually commuting by car, representing a \$2.7B loss in productivity for the region according to the 2019 Silicon Valley Index. In 2020, San José launched the Better Bike Plan 2025 with the goal to become “one of the most bike-friendly communities in North America.” This new plan builds on the City's first bike plan adopted in 2009, and envisions a 557-mile network of all-ages-and-abilities bikeways that will support a 20% bicycle mode split by 2050.

Through advanced mapping and modeling, this research evaluates the factors that contribute to a city-wide bike network that is truly “built for all.” The evaluation approach follows three steps. First, using a granular bike network dataset, network analysis, levels of traffic stress (LTS) classes, and residents' socioeconomic (SES) characteristics in the vicinity of the network, we first identify bike desert in the City of San José and use that to assess whether and to what extent San José has succeeded in achieving an equitable infrastructure distribution. Second, using resident and cyclists' SES characteristics (obtained from StreetLigth data), we assess whether the availability of infrastructure alone could attract riders from underserved communities. Finally, we combine datasets on cyclists' SES attributes, bikeway classes with different street designs, built environment factors e.g. trails and safety features, and other factors to quantify their impact on increasing the share of cyclists from underserved communities and provide empirical evidence for building a system that works for all.

TRENDS IN TRAVEL DEMAND OF RIDESOURCING DURING THE PANDEMIC AND FACTORS OF LAND USE: A TIME-SERIES CLUSTERING ANALYSIS ON CHICAGO DATA

Abstract ID: 1712

Individual Paper Submission

WANG, Sicheng [Michigan State University] wangsic4@msu.edu, presenting author
HUANG, Xiao [University of Arkansas] xho10@uark.edu, co-author
SHEN, Qing [University of Washington] qs@uw.edu, co-author

The pandemic caused by SARS-CoV-2 has disrupted urban transportation systems and transformed people's travel behavior in the United States since its first outbreak in early 2020. The literature suggests that people's mobility patterns and home-dwelling times have changed across neighborhoods with different sociodemographic characteristics (Huang et al., 2020; 2022). Public transit ridership has significantly declined in many regions of the country (Liu et al., 2020; Schwarts, 2020; Wilbur et al., 2020). Transportation mode choice has been shifted as people are hesitant to use transit (Park et al., 2021). Ridesourcing services, an emerging mobility form that had rapidly grown for nearly ten years, have also been dramatically hit by the pandemic. Evidence indicates that ridesourcing trips have notably dropped, and most users have reduced their usage during the pandemic (Alsaleh & Farooq, 2022; Loa et al., 2021).

After two years of the first SARS-CoV-2 outbreak, American society has gradually returned to normality. Most people have been back to the office and school; indoor social distancing and face masks are no longer required. However, little is known about the future of ridesourcing in the post-pandemic era. Are ridesourcing travel demands recovering to the pre-pandemic level? Are there different trends in the use of ridesourcing across areas with different land use and sociodemographic characteristics? This study addresses these questions by exploring 12-month ridesourcing trip-making data in Chicago. Pickups and drop-offs of ridesourcing trips are aggregated on a 7-day moving average in each Census tract. The pre-pandemic baseline is derived from the data between January 8 to 31, 2020. The time series starts on February 1, 2020, and ends on December 9, 2020, when U.S. Food and Drug Administration approved Pfizer–BioNTech vaccine. Therefore, each Census tract generates a time series with 313 observations. We apply

Laplacian Eigenmaps to implement manifold learning for all tracts' time series. This approach reduces the dimensions of the time-series features. Then, we use Gaussian Mixture Model to cluster the time-series features. The results suggest that all Census tracts can be clustered into four distinct categories. Only one cluster has observed a substantial recovery in the use of ridesourcing. We further estimate Heckman selection model to examine the land use and socioeconomic demographic factors associated with the likelihood of each cluster. The results suggest that the level of resourcing's recovery is significantly associated with the percentages of residential and commercial land use in the Census tracts. The odds of being in each cluster are also related to median household income and the percentage of racial and ethnic minorities.

The findings of this study reveal that the pandemic will have a long-term disruptive impact on the use of ridesourcing services even though U.S. society is returning to normality. Commercial zones and wealthier neighborhoods will observe a faster recovery compared to the rest of the city. Residential-dominant areas, on the other hand, have a slower recovery rate of ridesourcing use. The results shed light on a better understanding of the travel behavior transitioning for new mobilities in the post-pandemic era.

THE PROBLEM HAS EXISTED OVER ENDLESS YEARS: RACIALIZED DIFFERENCE IN COMMUTING, 1980--2019

Abstract ID: 1723

Black workers in 2019 spent 22.4 more minutes per week commuting than did White workers—a decline from the 50.3 minute difference in 1980, but a significant difference nonetheless. We study this pair of facts by asking a pair of questions: What are the social processes that cause Black workers to spend more time commuting today? How did these processes evolve and what factors explain the partial persistence of longer commutes among Black workers? We call these longer commutes the racialized difference in commute times, to capture the role of social forces that differently shape Black workers' opportunities and outcomes, both in commuting and in the underlying factors that shape commute times.

We use data from the US Census and the American Community Survey to study the evolution of racialized difference in commuting. We investigate individual-level processes (such as the travel mode used for commuting), neighborhood-level processes (such as the degree of segregation and its relationship to job access), and city-level processes (such as the distribution of Black and White workers across cities). All three scales are relevant for addressing different aspects of our two questions.

Between 1980 and 2019, two factors account for the majority of the racialized difference in commuting: Black workers are more likely to commute by transit, which is relatively slow, and are more likely to live in cities that have long average commutes. Income differences do not explain the racialized difference. In fact, higher incomes are associated with longer commute times. Nonetheless, the racialized difference is largest among low income workers.

The share of Black workers commuting by car increased substantially during the last few decades. Changes to travel mode account for nearly a quarter of the total decline in racialized difference in commute times. On the other hand, the effect of city of residence is just as large today as it was in 1980. A smaller fraction of the change over time is

accounted for by changing economic characteristics: Black workers increasingly hold economic characteristics— income, occupation, and industry—that are associated with relatively short commutes. However, more than half of the decline in the racialized difference does not flow through individual-level channels that we can observe.

We lastly explore the role of spatial stratification within cities and show that it can account for differing persistence in the racialized difference in commute time across cities. In cities that are large, expensive, segregated, and congested or transit-dependent, car use does not guarantee short commutes for Black workers. These city attributes are associated with a larger and more persistent racialized difference in commute times. Cities that grew more expensive, more segregated, or more transit dependent—or, correspondingly, that had less freeway investment—saw smaller declines in racialized difference. At the same time, among drivers in small or mid-sized cities, the racialized difference has essentially disappeared—gains that appear more difficult to obtain in spatially stratified cities. Spatial stratification poses a roadblock to further declines in racialized difference in commute time.

EARLY RETURNS ON CALIFORNIA’S EFFORTS TO SWAP LOS FOR VMT IN PROJECT-LEVEL ENVIRONMENTAL REVIEW

Abstract ID: 1725

Individual Paper Submission

VOLKER, Jamey [University of California, Davis] jvolker@ucdavis.edu, presenting author

HOSSEINZADE, Reyhane [University of California, Davis] rhosseinzade@ucdavis.edu, co-author

Automobile level of service (LOS) has been the most commonly used metric of transportation system performance in the United States since it was introduced in the 1965 Highway Capacity Manual. However, as transportation and land use planning agencies focus more on reducing car dependence and greenhouse gas emissions, they are increasingly reconsidering how they use LOS. California kickstarted the most sweeping changes to date when it enacted Senate Bill (SB) 743 in 2013, which directed the Governor’s Office of Planning and Research to revise the guidelines that dictate how transportation impacts are assessed under the state’s project-level environmental review law. In December 2018, the state officially replaced LOS with VMT as the principal measure of transportation impacts under the California Environmental Quality Act (CEQA). Local governments were required to start using a VMT-based standard by July 1, 2020.

A survey of local planners in California before the LOS-to-VMT shift found that most viewed VMT as an appropriate metric to measure the transportation-related environmental impacts from land use projects (Volker, Kaylor, & Lee, 2019). However, nearly 25% of respondents indicated that switching from LOS to VMT would not be appropriate in their jurisdiction, citing a lack of resources, a lack of information on VMT metrics, a continued need to use LOS to address congestion impacts, and/or a disproportionate burden on rural and suburban areas. These types of concerns were compounded by the lack of established practice on VMT analysis prior to the LOS-to-VMT transition.

In this study, we comprehensively assess how local governments have responded in the nearly two years since they were required to start using a VMT-based standard for analyzing transportation-related impacts in CEQA analyses of land use projects. We cataloged the responses to SB 743 of each of California’s 539 cities and counties, including their VMT impact thresholds, estimation methods, mitigation methods, and monitoring plans. We paired our document review and web searches with emails, phone calls, and virtual interviews with staff and consultants for dozens of jurisdictions.

We found that nearly 40% of cities and counties have adopted or are in the process of adopting a VMT-based impact threshold governing the environmental analyses for future projects. The remaining jurisdictions either use a case-by-case approach, do not believe any projects in their jurisdiction would trigger a significant VMT impact, or provided no response. Most of the adopting jurisdictions use two tiers of thresholds: screening and numeric. Projects that do not meet the screening thresholds (intended to streamline environmental review for low-VMT projects) are subjected to a full VMT impact analysis to see if they meet numeric VMT thresholds (mostly set at 15% below a measure of baseline VMT in the area). Most adopting jurisdictions also provide guidance on VMT mitigation for projects that exceed the numeric thresholds, but a recurring theme we heard is that there is not enough empirical evidence on VMT mitigation

or enough local government resources to monitor the efficacy of mitigation measures after implementation. In addition, suburban and rural jurisdictions expressed concern about not being able to fully mitigate the VMT impacts with local measures, which has spurred interest in regional mitigation exchanges or banks.

We also found that nearly every jurisdiction retained LOS standards; they just enforce them outside of the CEQA process. That could make it harder to achieve SB 743's goals of promoting development in low-VMT urban areas. Even low-VMT projects could still be required to study and mitigate their congestion impacts as part of the development review process outside of CEQA. The consensus feedback we received was that the LOS-to-VMT shift has not yet streamlined development in urban areas much.

HEALTHY BUT DANGEROUS: HOW DO PEOPLE VALUE THE BENEFITS AND RISKS OF WALKING?

Abstract ID: 1741

Individual Paper Submission

YANG, Yicong [University of Wisconsin-Madison] yicong.yang@wisc.edu, presenting author

Research and planning tools have accounted for the combined effects of health benefits and risks on active transportation (Peng et al., 2021; Tainio et al., 2016). However, there is a lack of understanding of individual attitudes, values, and behavioral preferences toward health and active travel. While active transportation such as walking and bicycling has the benefits of increasing physical activity and reducing carbon emissions, people who walk or bike also face health risks such as exposure to air pollution and traffic injuries (Jacobsen et al., 2009).

This study examines the public's willingness to trade off health for a change in the environmental risk when making walking decisions. Two dimensions of walking (walking for transportation, walking for leisure or exercise) are examined. The study applies a discrete choice experiment (DCE) to analyze walking preferences under nine different environmental scenarios, where the scenarios are designed as a combination of four health-related issues that encompass the benefits and risks, as well as convenience and comfort aspects of walking: air quality, traffic safety, physical activity, and climate.

Results from a stated preference survey of 3,000 random U.S. adults find that travel time and air quality are top concerns in walking for transportation and walking for leisure or exercise, respectively. Comfort temperature is a significant factor influencing the willingness to walk in both transportation and leisure or exercise situations. We also find evidence that individual awareness of health and environmental issues is poorly correlated with their behavioral preferences when faced with these issues.

This study improves our understanding of how the public's travel habits and experience, environment perceptions, and demographics shape their behavioral preferences toward walking. It calls for continued efforts to evaluate the links between public health and active transportation from a behavioral perspective.

USE OF PARCEL LOCKERS AND TRAVEL BEHAVIOR

Abstract ID: 1743

Individual Paper Submission

HA, Jaehyun [University of Southern California] jaehyunh@usc.edu, presenting author
GIULIANO, Genevieve [University of Southern California] giuliano@usc.edu, co-author
BINDER, Robert [University of Southern California] rbinder@usc.edu, co-author
HOLMES, Andrea [University of Southern California] holmesa@usc.edu, co-author

The rise of online shopping has increased last-mile freight movement. To reduce the cost associated with last-mile delivery, retailers such as Amazon and Walmart provide parcel locker systems. E-commerce retailers reduce costs by consolidating deliveries, while consumers may receive their parcels faster in a secure location (Lachapelle et al., 2018; Lachapelle & Jean-Germain, 2019; Schaefer & Figliozzi, 2021). Last-mile delivery has become a major concern in urban planning due to its impacts on local congestion, air emissions and noise. If consumers are willing to use parcel lockers, local delivery miles should decrease. However, the savings in vehicle miles traveled depends on how locker users pick up parcels. The few existing studies of parcel locker users were conducted in European cities (Liu et al., 2019; Mommens et al., 2021). US cities have different spatial and transport structures, limiting the transferability of these studies. We examine parcel locker use in the second largest US metropolitan area, Los Angeles.

The effectiveness of parcel lockers in reducing truck and passenger vehicle miles traveled depend on two factors: frequency of parcel locker uses and mode of transport for picking up the parcels. We focus our research on two research questions. First, who uses lockers regularly and why? Second, how do frequent users pickup parcels? Are pickup stops made by walking, other non-motorized mode, or driving? Are pickup stops part of trip chains?

We conducted an online survey of 400 people who indicated that they used parcel lockers at least once within the past four weeks. Our survey respondents were drawn from the Los Angeles-Long Beach-Anaheim, CA Metropolitan Statistical Area. The survey was conducted through Qualtrics, an online survey platform, from January to March 2022 by sharing the link via QR code in person and circulating the link to an online audience panel. The survey included questions about their most recent experience using a parcel locker, basic information about the parcel(s) they received, online shopping behavior, pick-up trip related attributes, and their socio-demographic information. After removing invalid survey responses, we developed a regression model on the frequency of parcel locker use, whether the users chained their pick-up trip, and which mode they used for their trip to the parcel locker.

Among those who had used a locker at least once in the past four weeks, 18.0 percent responded that they use the locker for all their online purchases. Frequent parcel locker use is associated with middle income level, relatively lower education level, younger consumers, and White or non-Hispanic race/ethnicity. Frequency is also associated with full-time employment, suggesting that parcel locker pickup may be more convenient as a trip on the way home, or that pickup is an alternative when no one is at home for a residential delivery. Parcel locker use is more likely among frequent online shoppers. The top reasons for using lockers are convenience and package security, followed by personal security and fast shipping.

The most frequent mode used for pickups is driving, followed by walking and transit. About 49.3% of pickups are part of trip chains. Younger (under 45) consumers, those with higher education levels, and those employed are associated with more sustainable travel behavior outcomes (i.e. chain pick-up trips, use active modes and transit). Neighborhood attributes such as density, transit access, and walkability were also associated with chaining pick-up trips and using modes other than automobiles. Our results offer some insights on the potential of parcel lockers to reduce VMT and associated environmental impacts. Next steps include presenting results of formal models of locker use frequency and pickup mode choice, as well as estimating VMT reductions associated with locker use.

AN INTERNATIONAL COMPARISON OF THE ROLE OF FORMAL VS. INFORMAL INSTITUTIONS IN MULTI-AGENCY TRANSIT COORDINATION: EXAMINING GERMANY, ISRAEL AND THE US

Abstract ID: 1748

Individual Paper Submission

WEINREICH, David [Technion-Israel Institute of Technology] david.weinre@campus.technion.ac.il, presenting author

MARTENS, Karel [Technion-Israel Institute of Technology] cjcm martens@gmail.com, co-author

Though public transport and infrastructure are an essential backbone to any urban structure, land use, and solutions to global warming, there is surprisingly little written about the governance of public transit systems, particularly international comparative work. This lack of knowledge could lead to inefficient use of funds when building new infrastructure, with unsatisfactory results—for example, multiple ticketing systems, poorly timed transfers, and services that don't go where people live. (As an example of poor coordination, the Chicago El does not serve any of the city's major train stations, as they were historically operated by different organizations). This qualitative case study analysis compares transit governance in two cities in Germany, two in Israel and two in the US, chosen for the fragmentation of their political and funding systems, and differing levels of government at which decisions are made. Germany was chosen for its use of regional transit management corporations to overcome local fragmentation. Israel was chosen for its high degree of top-down funding and political decision making. And the US was chosen for its high localization of decision making. For each case, we use a combination of annual reports, policy documents, tax collection information, fare information and interviews, in order to understand the role of formal institutions in coordinating ticketing, schedules and stop location across multiple jurisdictions in a single region. We compare this with the role played by informal coordination—i.e. norms that facilitate cross-agency collaboration. In doing so, we understand how different models for overcoming fragmentation can have an impact on service outcomes like accessibility and coverage, making it possible to better understand the institutional framework that may facilitate or hinder cross-agency coordination.

EXPLORING SPATIAL ASSOCIATIONS BETWEEN NEAR-MISS AND POLICE-REPORTED CRASHES: THE HEINRICH LAW IN TRAFFIC SAFETY

Abstract ID: 1749

Individual Paper Submission

KIM, Sungyop [University of Missouri-Kansas City] kims@umkc.edu, presenting author

PARK, Jong-Il [Korea Research Institute for Human Settlements] jipark@krihs.re.kr, primary author
KIM, Joon-Ki [Korea Research Institute for Human Settlements] kimjoonki@krihs.re.kr, co-author

This research explores the spatial association between police-reported crashes and near-miss crashes experienced by road users using the network cross K-function method and GIS. A way to reduce traffic fatalities is to identify crash hotspots and implement targeted safety improvements at the hotspots. However, police-reported crash data tend to underreport minor or no injury crashes, and collecting a sufficient number of crashes to identify crash hotspots often requires an extended time. Thus, several studies have suggested using near-miss crash data, if available, in addition to police-reported crash data to develop safety improvement measures. Near-miss crashes can provide information that police-reported crash data do not provide. Road users involved in near-miss crashes can provide detailed information without fear of legal consequences and unknown contributing factors.

A total of 888 near-miss crashes from a field survey conducted in a district of Seoul, South Korea, were analyzed and compared to 3,856 police-reported crashes in the study area. The district has various land uses, including residential and commercial areas and open spaces, and a mix of different functional classifications. The results show that minor and severe police-reported crashes have statistically significant spatial associations on street networks and near-miss and police-reported crashes also have the associations. Thus, the Heinrich's law, which postulates police-reported minor and severe crashes and near-miss crashes may share underlying locational factors, has merit to apply in traffic safety. In particular, vehicle-to-vehicle crashes on collector and local roads and pedestrian crashes on local roads show significant spatial associations with close proximity. These findings indicate that road users' near-miss crash experience reflecting local knowledge can supplement police-reported traffic crashes in identifying crash hotspots in road networks and facilitate the development of safety improvement measures and strategies.

PATHWAYS TO CAR OWNERSHIP FOR LOWER-INCOME HOUSEHOLDS IN THE U.S.

Abstract ID: 1751

Individual Paper Submission

KLEIN, Nicholas [Cornell University] njk8@cornell.edu, presenting author

BASU, Rounaq [MIT] rounaq@mit.edu, co-author

SMART, Mike [Rutgers, The State University of New Jersey] mike.smart@rutgers.edu, co-author

Car ownership is a double-edged sword for low- and moderate-income households in the United States. Owning or having regular access to a car is essential for daily mobility and economic security throughout most of the U.S. As a result, 94% of all households own at least one car, truck, or van. Low- and moderate-income households, who also own cars at high rates, spend a large portion of their income owning, operating, and maintaining cars. Meanwhile, Americans' automobile debt has never been greater: Americans had \$1.3 trillion in outstanding motor vehicle loans at the end of 2021, second only to household mortgages and student loans in total debt.

We know little about how lower-income households acquire cars despite decades of research on the relationship between car ownership and demographics, the built environment, and residential relocations. Broad-brush statistics about aggregate car ownership and financial trends offer limited insights into the experiences of low- and moderate-income households. These households finance new and used cars through traditional channels, but also secure vehicles from other avenues such as gifts from friends and family, buying cars from individuals selling cars online via Facebook Marketplace and Craigslist, car auctions, etc.

We use a web-based opt-in survey of 1,000 U.S. residents in Spring 2022 to ask how low- and moderate-income households acquired cars and how these different pathways affect their lives. We restricted our sample to 25- to 85-year-olds with household incomes of less than \$40,000 who have owned a car in their adult lives.

Although most respondents obtained their cars from new and used car dealers, over 40% obtained their cars from informal purchases, gifts, and moving in with someone who has a car. Respondents who did not get their cars from

dealers were more likely to be transitioning from not having a car. Additionally, most obtained older cars, paid less for them, and were more likely to pay in cash. We also observe significant sociodemographic differences between the different pathways and their reasons for obtaining a car. Finally, we examine the effects of acquiring a car on respondents' lives. Across the five different pathways, respondents overwhelmingly reported positive effects on quality of life and felt that getting the car was worth it. However, those who obtained used cars from dealers or received the car as a gift were more likely to experience financial hardships associated with the car.

PLANNING LIMITS: UNCONSTRAINED TRANSPORTATION PLANS IN AN ERA OF CLIMATE CONSTRAINTS

Abstract ID: 1762

Individual Paper Submission

DEAKIN, Elizabeth [University of California Berkeley] edeakin@berkeley.edu, presenting author

Federal law and regulations require states to prepare long-range (20+ yr.) transportation plans that establish the framework for making transportation investment decisions and aim to meet social, economic and environmental goals. Statewide transportation plans must be coordinated with regional transportation plans and programs developed by metropolitan transportation organizations (MPOs) and are expected to reflect the views of local elected officials and the public. However, while shorter-range transportation improvement programs (TIPs), which list the projects to be funded, are required to reflect the funding that is reasonably anticipated to be available for implementation, long range transportation plans can be fiscally unconstrained.

This paper draws upon a study of California's transportation plans and programs (Caltrans, 2021) to examine the impacts of unconstrained long range transportation planning in the context of substantial state mandates for reducing climate change impacts, improving equity, and meeting other social and environmental goals (Deakin, Chow, and Son, 2021; Barbour and Deakin, 2012). The analysis is framed in the classic literature on implementation (e.g., Pressman and Wildavsky, 1986) as well as contemporary work on integrated transport (e.g., Givoni and Banister, 2010) and is based on a wide-ranging literature review and a close reading of planning and programming documents, augmented by over 80 interviews with academics, practitioners, and other stakeholders.

While each state has adapted the transportation planning process to its own circumstances, California's experience offers a valuable window into the challenges posed in actually implementing long range plans. The California transportation plans have been developed in a context of anticipated growth in population and the economy (despite recent COVID-related setbacks), and achievement of the state's ambitions for emissions reductions, equity improvements, and better balanced mode choices will require large-scale, concerted effort. While new transportation options, from high-speed rail to bike sharing, are being added to California's transportation systems, and transportation technologies continue to move toward electrification and automation, investments in highway expansions continue and, in some cases, these highway projects, while locally popular, appear to work counter to statewide environmental and equity goals. Also, the state's long range plan, like those of its MPOs, depends on technological change and pricing reforms to achieve most of the goals. These elements are part of the unconstrained elements of the plan and their achievement depends on numerous corporate and individual actions beyond the scope of authority of transportation agencies in addition to those that government could initiate. The aspirations of the plan are proving difficult to map to implementation actions even for the near term.

The paper recommends including a fiscally and legally constrained alternative along with the more aspirational unconstrained proposals, to illustrate the gap between intentions and capacities.

'COVID LANES' IN CONTEXT: SPATIAL, DESIGN, AND NETWORK CHARACTERISTICS OF PARIS'S PANDEMIC BIKE RESPONSE

Abstract ID: 1766

Individual Paper Submission

MORAN, Marcel [University of California Berkeley] moranm@berkeley.edu, presenting author

Many cities responded to the COVID-19 pandemic by erecting new bike lanes, but there has been little scrutiny of where these lanes are being installed, how they relate to pre-COVID networks, what street uses they replaced, and their design characteristics (such as their level of physical protection and bi-directionality). This study pursues these questions in the context of Paris, France, a city currently in the midst of a large-scale transformation of its streets. Paris bypassed standard-construction processes to rapidly expand its bike-lane network amidst the pandemic. This study analyses these new lanes in terms of their design, spatial footprint, and relationship to the pre-COVID network. Municipal data, street imagery, and in-person observations demonstrate that Paris's new 'pop-up' lanes are a higher share bi-directional than the pre-COVID network (49% vs. 39%), a higher share more protected (77% vs. 73%), and average a higher number of interconnections, all attributes crucial to increasing ridership. These 47 new kilometers connect the city's peripheral ring to its inner core, primarily represent new lanes as opposed to upgrades of existing lanes (66% vs. 33%), and replace both traffic lanes and on-street parking. Overall, accelerating the rollout of these lanes and using alternative-barrier materials (staggered concrete blocks and plastic posts) did not sacrifice design, spatial, or network characteristics in comparison to pre-pandemic lanes. It also serves as an example of how other cities can rapidly re-allocate street space to more sustainable travel, and/or speed the installation of existing bike plans rather than proceeding via a more incremental and delayed approach. Future research must consider if and how these lanes transition from temporary to permanent status, and what planners (in Paris and elsewhere) learned from this pandemic-era program that can inform long-term bike planning.

DIAGNOSING PEDESTRIAN AND BICYCLIST SAFETY: ANALYSIS OF EXPOSURES TO RISK AND ASSOCIATED ENVIRONMENT WITH LOCATION BASED SERVICE DATA

Abstract ID: 1773

Individual Paper Submission

NAM, Yunwoo [University of Nebraska Lincoln] yname2@unl.edu, presenting author

Walking and biking have gained increased popularity due to the benefits of physical activity, health, psychological well-being, leisure, and improved environmental quality. Walking and biking can be facilitated or constrained by the physical form of communities in general as well as transportation system in particular. Therefore the development of walkable and bikeable environment is one effective way to encourage active living and healthy community. Increasingly, local governments are considering how community design and transportation system will impact residents' active and healthy life style.

Along with these benefits of walking and biking, safety concerns have also been the focus of much attention. The higher risk of death and serious injury when crashes involve pedestrians or bicyclists increases the need to be proactive in reducing these risks.

Biking and walking flows are essential components in safety analysis. To design appropriate policy solutions, information about the pattern, intensity, and volume of events that could result in safety issues is critically important, as exposures and flows of walking and biking are highly associated with risks. Therefore a variety of pedestrian and bicycle exposure measures have been suggested but they are inconsistent and limited, and there is no widely accepted approach. In addition, the lack of walking and biking activity data available at a finer spatial resolution has been a major challenge in the safety research. However, recent studies have identified the potential for safety modeling given the recent advancement of ICT (Information and Communication Technology) coupled with geospatial technology introduced emerging data sources, including apps featuring LBS (Location-Based Service) through wi-fi, bluetooth, and smartphones. LBS data, such as that produced by StreetLight, have significantly improved in the last few years to be accurate enough for reliable use in modeling and planning work. The increased sample size, geographic coverage, and temporal coverage of LBS data could allow for volume-based modeling. To solve a variety of safety challenges, this research develops an innovative approach with emerging data sources of Location Based Service information.

The motivation of the research is to enhance pedestrian and bicyclist safety with emerging active travel data. The objective of the research is to develop a reliable methodology for measuring pedestrian and bicyclist exposure and analyzing associated risks, which planners and designers can utilize to inform smarter decisions, making safer communities. To accomplish research objectives, the research develops a GIS model (coupled with statistical modeling) that estimates and displays pedestrian and bicyclist risk exposure at a street segment level. In doing so, the research utilizes location based service data processed by StreetLight. The output of processing is hotspot mapping, with which planners and designers can identify and prioritize risk locations. The research analyzes spatial variation and temporal variation of pedestrian and bicyclist exposure and associated risks across a region. Most literature assumes that higher movement volume is associated with higher crashes. However, some locations have lower movement volumes but higher crashes, as location specific features of physical and social environments are also associated with potential risk. The research also analyzes built environment features and design elements at higher risk locations. The study area will be communities in Lincoln, NE.

The research contributes to the methodological improvement in transportation safety planning, and to the knowledge of the human-environment interactions. From planning practice side, the research outcome can be utilized by transportation planners and urban designers to identify and prioritize locations of higher risks where safety improvements would be most effective. This enhances local government's ability to proactively address safety issues.

COMMUTING BY PUBLIC TRANSPORT: INFRASTRUCTURE, FRICTIONS AND AGENCY IN INDIAN CITIES

Abstract ID: 1776

Individual Paper Submission

JOSEPH, Yogi [Concordia University] yogiy2j@gmail.com, presenting author

Public transport infrastructure and associated technologies are central to the daily commuting experience. Following the mobility turn, transport infrastructure has received scholarly attention not only as an enabler of movement, but also as venues for affective experiences and identity formation (Aldred, 2013; Edensor, 2004; Sheller & Urry, 2006). These alternative readings of infrastructure are contingent on the design of transport spaces and technology choices

determined by complex techno-managerial planning processes (Siemiatycki, 2006). How are everyday commuting experiences affected by planning decisions? How do these experiences contribute to the formation, sustenance and deepening of commuter identities on public transport? Using ethnographic methods including interviews, ride-alongs and participant observation, I examine bus rapid transit and metrorail infrastructures in Indian cities of Ahmedabad and Kochi, documenting commuting experiences mediated by technologies associated with transport infrastructure. By drawing on commuters' accounts, I argue that planning decisions play a major role in determining how commuters navigate their way on and around transport infrastructure. While technologies are meant to smoothen existing frictions, they also engender new frictions, unforeseen by planners, creating opportunities for commuters to exercise their agency and avoid the deleterious effects of such frictions. In this process, they create embodied practices that offer planners clues to manage the challenge of creating inclusive transport infrastructure. This research adds to the growing body of work that looks at transport infrastructures from a qualitative lens, encouraging an understanding of mobile bodies steeped in the dynamicity of transport spaces as much as the rich and diverse narratives resulting from an ethnographic approach to mobile situations.

DECLINING TRANSIT RIDERSHIP IN MID-SIZED CITIES: ARE PEOPLE BETTER OFF?

Abstract ID: 1786

Individual Paper Submission

MERCK, Amanda [University of Illinois Urbana-Champaign] merck2@illinois.edu, presenting author
 BRAUN, Lindsay [University of Illinois Urbana-Champaign] lmbraun@illinois.edu, co-author
 BARAJAS, Jesus [University of California Davis] jmbarajas@ucdavis.edu, co-author

Numerous studies have explored the internal factors (i.e. service speed, reliability, and fares) and external factors (i.e. population and employment density, demographics, car ownership, gas prices, and telework) associated with transit use to understand declining ridership (Boisjoly, et.al., 2018; Grisby et al., 2018; NASEM, 2022). However, most of this research has examined transit ridership trends in large metro areas; thus, the determinants of ridership decline in mid-sized cities are not well understood. Moreover, most of this research has failed to consider whether those who changed modes are better off in terms of social, economic, or health outcomes.

An area that has been largely understudied are the consequences of transportation insecurity. Transportation insecurity occurs when a person cannot regularly move from place to place in a safe and timely manner because they lack the resources they need for transportation (Gould-Werth, Griffin, and Murphy, 2018). This type of insecurity plays an important role in the ability to maintain employment, access necessary resources, and build health and wealth. However, historic urban planning and decision-making processes have left low-income communities and communities of color with substantially less benefit and substantially higher burdens from transportation investment. These processes have led to inaccessible, inadequate, unaffordable, unreliable, or unsafe transportation, thus transportation insecurity. People may therefore arrive late to their destinations, skip trips altogether, or forego spending on essentials. The consequences of transportation insecurity may include getting fired, losing wages, or foregoing food or medications. These consequences can threaten self-sufficiency and exacerbate existing inequities in social, economic, and health outcomes.

The purpose of this study is to examine the relationship between transportation insecurity, transit ridership, and neighborhood characteristics in mid-sized cities. The research draws from a new household survey conducted in seven Illinois MSAs located outside the Chicago region, each of which have one or more transit agencies that serve at least 1.5 million passengers annually. The survey was administered by mail in April 2021 to a stratified random sample of 80,000 potential transit riders, defined as households who live within one-half mile of fixed-route transit service, across the seven MSAs. The survey asked questions about travel frequency, transit use, and two questions about transportation insecurity. Survey responses were combined with geocoded data on the built environment and location affordability from the Center for Neighborhood Technology.

Preliminary analysis shows that more people in mid-sized cities who rode the bus in March 2020 experienced consequences of transportation insecurity than people who did not ride the bus during that time, with 26% of riders

experiencing transportation insecurity compared to 7% of non-riders. Transportation insecurity is even higher among people who quit riding the bus sometime in the five years prior to COVID-19, with 34% of previous riders experiencing transportation insecurity compared to 6.2% of non-riders. Although, vehicle ownership was lower among people who rode the bus in March 2020, they are similarly as likely as people who don't ride the bus to be severely transportation cost-burdened, meaning they are spending more than 24% of their annual income on transportation.

This study will offer new insights into the social and economic consequences of inadequate transportation in mid-sized cities. Primary data collection on the consequences of transportation insecurity will help us draw new conclusions that are unavailable in studies that focus on internal and external factors of transit ridership. We expect the study to contribute to a greater understanding of the determinants of transit ridership, as well as a greater understanding of transportation as a social determinant of health. The findings can inform transit and land use strategies to be centered on improving transportation security, rather than simply increasing ridership.

DEVELOPING BUS RAPID TRANSIT (BRT) STATION AREAS WITHIN FREIGHT RAIL CORRIDORS: PERCEPTIONS AND REALITY

Abstract ID: 1794

Individual Paper Submission

BAKER, Dwayne [Queens College CUNY] dwaybake@gmail.com, presenting author
LINOVSKI, Orly [University of Manitoba] orly.linovski@umanitoba.ca, co-author

Bus Rapid Transit (BRT) has been gaining popularity worldwide over the past few decades. This is largely due to it offering similar mobility benefits as rail rapid transit but with a less hefty price tag (Cain and Flynn, 2013). In addition to the mobility benefits BRT provides, research also suggests that BRT – especially BRT with exclusive, bus-only transitways – can induce developments surrounding transit stations, in-line with transit-oriented development (TOD) (Cervero and Dai, 2014).

With creating a new, large-scale infrastructure project like a BRT system or single corridors, acquiring the necessary land remains an issue. On the one hand, building BRT in built-up areas can be costly – in terms of money and time. On the other hand, building BRT in undeveloped areas may be less costly in these same regards, but with limited ready-ridership potential. Still, building BRT in undeveloped areas can allow planners and developers open areas to develop around BRT stations. When developing in undeveloped areas, cities have often chosen to develop over former industrial freight rail corridors [see Pittsburgh for example (Perk and Catala, 2009)] or alongside in-use freight rail corridors as is the case for Winnipeg, Manitoba, Canada. Indeed, Winnipeg presents an ideal case to highlight development potential surrounding BRT station areas due to its recently completed Southwest Transitway BRT corridor and it being in the midst of planning for additional corridors alongside freight rail corridors.

Still, the development potential surrounding such BRT station areas remains. This research thus asks: 1) How do planners and developers view the development potential of BRT station areas alongside in-use freight rail corridors? And, 2) how do developments in BRT station areas compare to Winnipeg's non-station area developments? To answer

the first question, this research uses surveys focusing on Winnipeg planners and developers. For the second question, this research uses spatial regressions to understand the likelihood of new developments to be located in BRT station areas compared to a) non-station areas and b) areas at greater distances from the city center.

Survey findings reveal that planners and developers positively view developing in Winnipeg's BRT station areas. Planners also revealed that zoning restrictions are one of the biggest hurdles to BRT station area developments in Winnipeg. However, recent residential developments are more likely to be located in areas farther away from the city center and in single-family zoned areas than in BRT station areas. In this regard, results suggest a disconnect between what is said by planners and developers and what actually gets developed. Although, current zoning may restrict planners and developers from actually implementing the developments they want.

Nevertheless, the main contribution of this research is that it identifies the positive views planners and developers hold regarding developing in BRT station areas within in-use freight rail corridors. As cities, and especially North American cities with long-standing rail corridors, continue to implement or consider BRT, our results reveal the potential for BRT corridors to spur development in areas long overlooked.

EMPLOYMENT CONCENTRATION, DISPERSION, AND THE CHANGING COMMUTE IN THE SAN FRANCISCO BAY AREA

Abstract ID: 1800

Individual Paper Submission

BLUMENBERG, Evelyn [University of California Los Angeles] eblumenb@ucla.edu, presenting author
SPERONI, Samuel [University of California, Los Angeles] ssperoni@ucla.edu, co-author

Concern for increasing commute distances has grown across California and especially in the San Francisco Bay Area, a problem that has garnered national attention. The popular press has drawn attention to households who relocate to California's Central Valley in search of affordable housing, trading cheaper housing costs for longer -distance commutes to jobs in San Francisco.

Most scholars agree that lengthening commutes are a concerning trend with detrimental consequences for the environment, traffic congestion, work outcomes, and household well-being. There are numerous studies on commuting behavior in the San Francisco Bay Area, many focused on the impact of job decentralization in the 1990s. Changes in this region—specifically rapid job growth and escalating housing prices—underscore the need for additional research on this topic.

In this study, we hypothesize that commute distance in the nine-county San Francisco Bay Area has increased over time, largely due to two factors: the continued dispersion of jobs to outlying areas and the effect of limited housing supply on the viability of residential selection near downtown job centers. We draw on data from the 2002 and 2015 Longitudinal Employer-Household Dynamics (LEHD) Origin-Destination Employment Statistics (LODES). We predict commute distance as a function of workplace characteristics, including employment location, a weighted measure of the ratio of jobs to residents, and other workplace-area variables (e.g. percent young workers, job type concentration, proximity to rail, urban neighborhood location).

We find that commute distance in the Bay Area increased modestly—about 3.5 percent—from 2002 to 2015. The factors that explained commute distance remained relatively stable over this period. Commute distances were shorter in the two major job centers (downtown San Francisco and San Jose) but grew substantially with distance to the regions' other job centers. The ratio of jobs to residents was positively—albeit weakly—associated with commute distance. While mean commute distance did not increase as much as expected, total commute miles grew by 19 percent, from 57.8 million one-way miles in 2002 to 68.7 million miles in 2015.

Interventions—such as increasing the supply of housing—may have a small negative effect on commute distance, particularly in downtown neighborhoods where commute distances are relatively short. The growth in total commute

miles, however, is largely due to rapid job growth. Policies to improve transit and better manage driving can help ease the difficulty of traveling into increasingly congested areas.

Major events are a significant source of traffic congestion, especially in large metropolitan areas. This paper examines strategies to better manage special event traffic using a case study of football games played at the Los Angeles Memorial Coliseum, a venue located near downtown Los Angeles with a capacity of about 80,000. From 2016 to 2020, two teams played home games at the Coliseum, the Los Angeles Rams and the University of Southern California Trojans. These events take place in an area that already has a high level of recurrent congestion. In previous work we examined the traffic impacts of game days on both the highway and arterial systems. We found highway impacts extend up to 10 miles away from the venue, while arterial impacts are more concentrated in both space and time. In this paper we address mitigation: how can major events be better managed to reduce congestion and the associated pollution and GHG emissions

Using the macrosimulation model PTV-VISUM we simulated the impact of three traffic mitigation scenarios on the main freeways approaching the venue site. The scenarios include spreading arrivals over a longer time period and increasing the share of arrivals by transit. The transit scenarios include increasing the number of buses to accommodate the new demand. We also examine mitigation strategies on the local arterials surrounding the venue using the microsimulation model PTV-VISSIM. In this case the problem is queuing at parking lots which cause backups on the nearby streets. Again we apply arrival smoothing and shifts in transit share.

Our simulation results show that strategies for better management of major event traffic depend on the characteristics of the attendees, and in particular on arrival patterns. USC game arrivals are spread across many hours, hence simply adjusting arrival times does not reduce congestion. A better strategy for USC games is to greatly increase transit use. In contrast, Rams attendees tend to arrive within 1-2 hours of the game, generating a surge of demand that propagates through the network and increases in magnitude as it converges on the Coliseum area. In this case peak spreading makes sense.

The final section of the paper discusses policies and strategies to increase transit use, reduce queuing and searching for parking, and spreading arrivals for Rams games. We put forward five packages of policy recommendations to reduce traffic impacts: staggering arrival and departure times; communicating game day traffic; improving parking; increasing transit availability; and managing ride-hail and increasing car sharing. These proposals either make intuitive sense, draw on lessons from elsewhere, or reflect findings from behavioral science.

The spread of COVID-19 to California in early 2020 led to a series of policies that curbed the spread of the disease but reduced economic activity and travel. The pandemic has exposed disparities built into commute patterns. While many people were able to switch to telecommuting, workers especially in the health and construction industries, continued to commute daily (Lou et al., 2020). Many of these workers are lower-income and lack reliable transportation options (Hu and Chen, 2021). There has been speculation that low-income and nonwhite workers have been less able to shift to remote work and are more often considered essential workers (Brough et al., 2020). At the same time, these same workers are more likely to be mobility disadvantaged.

This study examines how advantaged and disadvantaged populations in the large, atomized megaregion that spans the San Francisco Bay Area east to California's Central Valley and Sierra Nevada Foothills navigate their commute during the COVID-19 pandemic using StreetLight and ACS data. This study answers the following questions: 1) How does traffic volume change before, during, and after COVID-19? 2) Which type of worker is more likely to commute during COVID-19? Who takes the risk of being exposed and bears the burden of commuting during the pandemic? 3) How have different types of workers adapted their commute through different stages of the pandemic? Does it vary by industry and income level? This research fills the gap in measuring the change in commute patterns during the pandemic, which is highly relevant to research and policymaking.

We run a ZCTA-level regression analysis across the Central Valley and the Bay Area using the StreetLight data that includes up-to-date traffic volume, travel distance, and travel duration, complementing with pre-COVID demographic characteristics from the 2015–2019 ACS data. The empirical results show that, during the pre-COVID period, ZCTAs with higher median household income produce a higher number of commute trips. During COVID, commute trips in ZCTAs with the highest median income decreased the most, while commute trips in ZCTAs with the lowest income decreased the least. In the post-COVID period, commute trips in lower-income ZCTAs recovered more than in higher-income ZCTAs. When looking at the difference between industries, we found that primary and secondary industries generate the least commutes in the pre-COVID period, but most of them remain during the COVID period. The commute volume of service occupation dropped the most during the COVID period and bounced back the most during the post-COVID period. For commute distance, the overall distribution of the traffic remains parallel to the pre-COVID period. However, during the post-COVID period, commute trips with longer distances seem to recover the most, and commute trips with shorter distances recover the least.

BEYOND CONGESTION: USING SYSTEMS ARCHETYPES TO EXPLORE SAFETY IMPLICATIONS OF CONVENTIONAL TRAFFIC IMPACT ANALYSES

Abstract ID: 1821

Individual Paper Submission

COMBS, Tabitha [University of North Carolina at Chapel Hill] tacombs@email.unc.edu, presenting author

KUMFER, Wesley [University of North Carolina] kumfer@hsrc.unc.edu, co-author

Traffic impact analysis (TIA) is an important piece of how our transportation system is planned, designed, and built. Cities and states use TIAs to assess how road users use the transportation system and then predict how the system will operate if transportation patterns change through the addition of new buildings within an area or new capacity added to the roadway. Many local and state governments view the TIA process as a critical means of generating needed infrastructure improvements, and its use has become ubiquitous among Departments of Transportation across the US. Thus, TIA often exerts a powerful influence on urban land use and transportation systems.

However, reliance on the conventional approach to TIA, particularly in urban contexts, has been criticized for over-predicting automobile traffic and prioritizing congestion relief at the expense of other travel modes. Furthermore, little attention has been paid in research or in current practice to TIA's direct impacts on road user safety or its potential role in shaping safe transportation and land use systems. This lack of attention is surprising, given research into the relationships between increased traffic volumes and speeds—outcomes directly related to congestion mitigation practices—and declining safety for road users.

This research interrogates this paradox through analysis of interviews and focus groups with planners, engineers, and developers involved with local TIA practices in 4 states in the US southeast. Based on prior research that suggests concerns over road user safety are superseded and/or subsumed by concerns over congestion mitigation in contemporary TIA practice, we focus on two research questions: how is road user safety accounted for in contemporary TIA practices, and what are the barriers to elevating road user safety as a central outcome of the development review process?

Approach and methods

The research team conducted structured interviews and focus groups with 54 transportation professionals (municipal planning staff, consultants, and developers) in Maryland, North Carolina, Virginia, and Florida. Data collection focused on eliciting perspectives on the role and limitations of TIA practices in influencing roadway safety. We used grounded theory analysis of interview and focus group data to explore transportation professionals' responses to questions on road safety. Following methods advanced by Yearworth and White (2013), we used our findings from the grounded theory analysis to construct a causal loop diagram that allowed us to visualize interactions between components of the TIA/traffic safety system.

Findings

Our analyses suggest that contemporary TIA procedures often seek the goal of mitigating traffic congestion, yet end up creating conditions under which congestion resumes and road user safety deteriorates over time. Based on the evident structure of the TIA/traffic safety system, we identified that transportation professionals were leaning into two system archetypes: "Seeking the Wrong Goal" and the "Fixes that Fail."

Relevance and implications

This research shows a clear gap in the guidance on relationships between land development and road safety, and identifies feedback loops within contemporary TIA practice that can undermine road user safety. By interrogating these feedbacks, practitioners and researchers can uncover and dismantle barriers to safer land development patterns. Given the complexities, ubiquity, and 'messiness' of contemporary TIA practices, there are no elegant solutions to centering safety yet. Increasing awareness among practitioners of the traps of "seeking the wrong goal" or "fixes that fail" would represent a substantial step toward development review practices with outcomes that balance safety, congestion, and development.

Future research should build upon these findings through development of impact assessment procedures that center road user safety and conducting longitudinal studies of safety implication of development patterns shaped by contemporary vs. safety-oriented TIA procedures.

AN ETHNOGRAPHY OF TRANSIT THROUGH THE LENS OF PUBLIC SPACE THEORY IN LOS ANGELES

Abstract ID: 1832

Individual Paper Submission

BINDER, Robert [University of Southern California] rbinder@usc.edu, presenting author
GIULIANO, Genevieve [University of Southern California] giuliano@usc.edu, co-author

Public transit is meant to provide basic mobility for the transportation of the disadvantaged and to serve broader social and environmental goals in the metropolitan areas of the United States. It is thus a means to achieve the objectives of the community and urban planners, alike. Public transit is also often considered to have external or hard to quantify benefits that add value beyond the service provided and the passengers attracted—for example, functioning in a way that is like public space.

William H. Whyte presented us with details of the way public space in New York City functioned daily, as he described the social interactions (both said and unsaid) that occurred between people in space. He witnessed that individuals' behavior will often follow the form of peers around them (Whyte, 1980). Further, the concepts of 'copresence' and 'unfocused interactions' describe the types of social interactions in public space outside of those one would expect such as physical touch and conversation (Goffman, 2008). It is argued that public space should be designed around the everyday activities that include working, commuting, walking, shopping, eating food; that the concept of "everyday space" can function as a connective tissue that binds the daily lives of people together by fostering new forms of social interaction and potentially taking society closer to physical and social equality (Bravo & Crawford, 2014). Few examples, however, have attempted to theorize that public transit acts as another form of public space.

The purpose of our research was to show how the functions of and interactions within public space may also occur on public transit, and thus, that public transit functions like a public space. Further, we examine how the interactions happening within transit vehicles in Los Angeles may provide a social value that is not yet being considered. The nature of the way public transit operates, "with people from diverse backgrounds constantly entering and exiting, sitting and standing, facing one another, and shifting and bracing their bodies," riders are "bound to come into visual or physical contact with others... The transit vehicle, then, presents people with a unique space for practicing being a stranger in the city (Ocejo & Tonnelat, 2014)." With this research, we seek to understand the value of social interactions for users of public transit within a transit vehicle and answer the research question—does public transit act as a mechanism or tool for social mixing?

We used a mixed methods approach that included participant observation (ethnography), demographic and socioeconomic analysis for key transit routes, and collection of field data related to interactions and typologies of riders. Building from previous examples of ethnographic work that looked for a greater understanding of the interactions within public space, we considered the unobtrusive moments and social interactions that occur while riding transit along corridors that extend through and across the geographic boundaries of diverse populations.

This research is part of a dissertation with the working title, "Brushing Shoulders: In-Transit Social Interactions and Intersecting Identities in Los Angeles, Chicago, and Detroit." The findings to date include preliminary observations of key interactions along LA Metro's Route 16, the Purple/Expo Lines, and a major regional bus route in Metro Detroit. There are common 'typologies' of the interactions that happen along a particular route between riders and between the riders and the participant observer, themselves.

A discussion of the relationship between public space and public transit (as well as the social interactions within them), preliminary results from the first two sets of route observations, and key reflections and conclusions of these observations will be included in the final paper.

ADDRESSING DELAYS AT AT-GRADE RAIL CROSSINGS IN DISADVANTAGED COMMUNITIES

Abstract ID: 1837

Individual Paper Submission

KAWAMURA, Kazuya [University of Illinois Chicago] kazuya@uic.edu, presenting author

The objectives of this study are to analyze the extent of network-wide delays caused by at-grade highway-rail crossings that affect disadvantaged communities disproportionately in industrial cities such as Chicago, and examine the effectiveness of mitigation measures that do not involve grade-separation, which is both expensive and undesirable from the community's perspective due to the massive structure that can form a physical barrier.

Recent studies that examined the spatial distribution of the impacts of freight transportation in urban areas (Yuan & Wang, 2021, Yang et al, 2021) have found that disadvantaged communities tend to experience disproportional burden. However, these and also similar studies mostly focus on environmental impacts and also accidents associated with truck traffic. In some urban areas that have substantial freight rail infrastructure, at-grade road-rail crossings are major source of congestion. For example, there are nearly 2,000 at-grade rail crossings in the Chicago urban area. Gates at rail crossings can close for an extended period of time, often lasting 20 minutes or more depending on the length and the speed of the freight train, causing network-wide extreme congestion. Residents and businesses near the rail crossings experience recurring yet unpredictable congestion that can disrupt their daily activities. An analysis by the CMAP shows that rail crossings with highest delays are concentrated in communities with low income (CMAP, Accessed Jan 12, 2022).

The focus of this study were two communities in the south suburbs of Chicago, Dolton and Riverdale. These two communities with rich industrial heritage are also some of the poorest. Median incomes in Dolton and Riverdale are \$50,237 and \$38,355, respectively (median income for the Chicago MSA is \$74,621). Approximately 24% of the residents in those communities live in poverty. There are a total of 11 at-grade rail crossings in the two communities that see a total of over 400 freight trains per day. There is a part of Dolton, called "the triangle" that is surrounded by multiple train tracks. For the residents of the triangle it is nearly impossible to plan their day due to the unpredictable nature of rail-crossings. Stakeholders in the study area attest that rail-crossings make it difficult to report to schools and jobs on time.

Using the trip table provided by CMAP and also traffic volumes and gate-down event frequencies and durations at the 11 rail-crossings, obtained from the recordings, we constructed a model that estimates travel route choices that are made during a trip. This type of model is called dynamic traffic assignment (Rakha, 2014).

Our simulation revealed that travelers in Dolton and Riverdale experience far greater delay than average commuters. On a per trip basis, the rail crossings multiplied the average delay by anywhere between two to twelvefold. It should be noted that the traditional method to estimate delays at rail-crossing would severely underestimate the impacts since only the delays at the rail-crossings are analyzed and the spatial and temporal "spill-over" effects are mostly ignored.

The analysis of mitigation measures showed that providing up-to-date traffic information to the travelers, especially using mobile devices, to disseminate near real-time information frequently, can reduce the delay associated with rail crossings considerably as long as information is updated every 20 minutes or less.

There are many communities like the ones studied here that have suffered extreme levels of congestion due to rail crossings for many decades. While typical solution to address rail crossing delay is grade separation, this study shows

real-time dissemination of information about gate-down events has a potential to be an effective non-physical solution.

PLANNING FOR SHARED AUTONOMOUS VEHICLE OPERATIONS: AN INTEGRATED TRAFFIC MICROSIMULATION MODELLING APPROACH

Abstract ID: 1843

Individual Paper Submission

HABIB, Ahsan [Dalhousie University] ahsan.habib@dal.ca, presenting author

ALAM, MD Jahed [Dalhousie University] jahed.alam@dal.ca, co-author

SHAHRIER, Hasan [Dalhousie University] hasan.shahrier@dal.ca, co-author

Technological advancement in the transport industry shows tremendous promise for shared autonomous vehicles that will yield a paradigm shift in mobility planning. It is anticipated that AVs will take a form of shared mobility and will be bundled into a form of 'mobility-as-a-service (MaaS)'. Several research explored the potential of AVs within the MaaS framework and highlighted the needs of related regulatory and operational schemes (1). Existing research in autonomous vehicles predominantly focuses on technologies. Some studies examined the potential impacts and benefits of shared mobility services, including private vehicle ownership reduction (2), improved fuel efficiency, and increased social and environmental sustainability (3). However, operation planning is necessary to benefit from door-to-door AV services and reduce detrimental effects such as congestion on the urban network (4,5). This study presents a comprehensive framework of operational planning for shared autonomous vehicle (SAV) in Halifax, Canada. The objectives of this study include: (a) to predict market infiltration of AVs following a Bass Diffusion modeling approach, (b) to develop an advanced SAV operation model to allocate SAVs to commute trips using the rate of adoption informed by the Bass Diffusion model, and (c) to develop a traffic microsimulation model to assign mixed HV and SAV trips in the network for the evaluation of impacts. In this study, the adoption of SAVs is explored using two market concepts including a conservative market with a smaller fleet of SAVs (Market Type-1) and an aggressive market with a larger fleet of SAVs (Market Type-2) for the Halifax region. A rule-based algorithm is coded within a MATLAB platform for AV allocations for morning trips. A traffic microsimulation model that follows a dynamic traffic assignment process is utilized to test shared AV operations in the network. Based on the results obtained from the adoption model, the study yields a fleet of 900 SAVs in relation to the consumer's interest to adopt (Market Type-1). The study also assumes a second scenario of 1800 SAVs based on a Market Type-2 that considers private companies to adopt AVs in Halifax. The SAVs assignment reveals that a fleet based on a conservative market penetration can only serve 82% of travel demand. While the second fleet, based on an aggressive market infiltration, serves 100% of the demand. The results from simulation suggest that SAV operation is likely to increase the traveled distance by 1% and 4% for both fleet sizes, respectively. The number of unoccupied trips also increases by 2% and 8% in case of both fleets, respectively. The results of this study provide critical insights for developing policies to accommodate AV adoptions and handle AV operation challenges within the transportation system.

Central Planning Issue

Marginalized groups in the U.S. face disproportionately high rates of pedestrian and bicycle crashes (Governors Highway Safety Association, 2021) and disproportionately low access to safe pedestrian and bicycle infrastructure (Rigolon et al., 2018). Recognizing these patterns, the American Association of State Highway Officials recently included racial and socioeconomic disparities in safety as one of the six highest-priority research needs pertaining to active transportation in the U.S. Past research has considered how inequitable infrastructure access is associated with crash disparities (Barajas, 2018), but limited work has examined equity in what happens after a crash occurs—that is, in how planners respond to crashes through interventions such as crosswalk improvements and bike lane investments (Rebentisch et al., 2019). Do the nature and timing of these responses vary in privileged vs. marginalized neighborhoods? Given that planning for active transportation safety in the U.S. remains largely reactive to documented crashes (Ferenchak & Marshall, 2019), this is a critical consideration for social equity.

Research Questions

In this analysis, we examine longitudinal data on pedestrian and bicycle crashes and infrastructure investments to address the following research questions (RQs):

- RQ1: Are there disparities in pedestrian and bicycle crash rates across sociodemographic groups?

- RQ2: Are there disparities in whether (and when) infrastructure interventions are made following pedestrian or bicycle crashes in neighborhoods of varying sociodemographic composition?

Methods

We address these questions using data from Los Angeles, CA. For crashes, we use the Berkeley SafeTREC Transportation Injury Mapping System to record the location of pedestrian and bicycle crashes (fatal and injury-only) between 2010 and 2019. For infrastructure, we use spatial data on crosswalk and bicycle infrastructure installations, by year, from the City of Los Angeles GeoHub data platform. For sociodemographic characteristics, we measure various indicators of race and socioeconomic status at the block group level using data from the American Community Survey.

We first use descriptive and regression analyses to estimate associations between pedestrian and bicycle crash rates and area-level sociodemographic characteristics (RQ1). We then use a combination of logistic, count, and hurdle models to examine how area-level sociodemographic characteristics are associated with (a) crash incidence and (b) the likelihood of an infrastructure change (e.g., new or improved crosswalk, new or improved bike lane) taking place after a crash occurs (RQ2). Work currently in progress is refining the unit of analysis, translating this aggregate research to the intersection level.

Findings

From the above sources, our 10-year data set includes 27,726 pedestrian crashes, 20,915 bicycle crashes, 21,475 crosswalk legs, and 1,252 miles of bicycle infrastructure across approximately 2,800 block groups in Los Angeles. Although the analysis is in progress, preliminary findings suggest that pedestrian and bicycle crash rates are disproportionately high in block groups with higher proportions of people of color and lower median incomes. Interestingly, preliminary results also suggest that crosswalk improvements are more likely to be made after crashes that occur in marginalized block groups; this finding will be further explored in the disaggregate, intersection-level analysis, as will the distribution of bicycle infrastructure interventions following bicycle crashes. Overall, we expect to find that post-crash infrastructure interventions are more likely to be made (and made more quickly) in areas

characterized by greater sociodemographic privilege.

Planning Implications

This analysis examines social equity in pedestrian and bicycle safety and in how planners respond to crashes in different types of neighborhoods. The results will contribute to a research need of critical national significance, revealing ways in which planners' responses to pedestrian and bicycle crashes can advance equity in safety outcomes for marginalized groups.

RENAMING AND REMOVAL OF HARMFUL NAMES AND MONUMENTS ON STATE TRANSPORTATION RIGHT OF WAY

Abstract ID: 1852

Individual Paper Submission

MUNOZ, Jasmin [University of California, Berkeley] jasminmunoz_2@berkeley.edu, presenting author
SON, Daisy [University of California, Berkeley] daisyson@berkeley.edu, co-author
DEAKIN, Elizabeth [University of California Berkeley] edeakin@berkeley.edu, co-author

This paper reports the results of a national survey of Departments of Transportation to identify the processes through which they name and rename facilities and monuments on land under their control. Examples also are drawn from other public agencies and the spaces they oversee, including parks and schools.

Many place names, facilities, and monuments in the US and other countries have slurs in their formal or informal titles. In addition, some place names and facilities celebrate people or organizations that have a racist or derogatory past. In some cases, the discriminatory views of these individuals or groups, or the harmful nature of the slurs, were either unknown at their inception or were seen as unimportant and overlooked. In other cases, the naming was intended to assert dominance over people of color, women, or particular ethnic or religious groups. Today, there is broad recognition that the individuals, groups, and notions that are celebrated in public space are not just incidental, but purposeful reflections of societal values.

The objectives of this study were (1) to identify policies and practices that can be used to identify place names that have a derogatory or racist linkages and (2) to make recommendations on a process for renaming or removal of such harmful names or monuments. To carry out the study, the authors conducted a literature review to identify published articles, news reports, investigatory reports, and databases on the issue, with a focus on how public agencies have been handling it. The authors further investigated practices in California, consulting with state agency officials and stakeholder groups to discuss the issues raised in naming and renaming facilities and monuments. A survey of state DOTs then was designed and implemented using a combination of online and telephone contacts to collect information on current practices, challenges, and accomplishments. Additional surveys were carried out with educational institutions and parks departments that had had recent experience with naming or renaming.

Key findings were that while names and monuments are receiving growing attention nationwide, a minority of state DOTs have had direct experience with the issue. Many state DOTs rely on legally established rules for the formal naming of facilities and do not get involved with informal names (for example, when a state highway has an official number but locally is called by another name.) Several survey respondents noted that even informal signs and tributes along state highways can become controversial, for example, when family or friends place memorials to crash victims along the highway. Nearly all state agencies depend on concerned residents to initiate a review of a name or monument, and none reported having an official state list of problem names, though several state DOTs were aware of lists created by the Department of Interior, the Southern Poverty Law Center, and other public and private

entities. Several states have established committees that are responsible for making determinations about names and monuments, while others defer to legislative committees or require legislative endorsement before action is taken. A key issue raised by survey respondents is what to do about names that are offensive to some groups but celebrated by others, or those that honor individuals whose lives were exemplary in some ways but highly problematic in others.

The paper concludes with recommendations on best practices including stakeholder engagement and proactive policies.

PRICED OUT OF SAFETY: WHEN ADVANCED DRIVER ASSISTANCE SYSTEMS ARE A LUXURY INSTEAD OF THE STANDARD

Abstract ID: 1855

Individual Paper Submission

GODDARD, Tara [Texas A&M University] goddard@tamu.edu, presenting author
MCDONALD, Anthony [Texas A & M University] mcdonald@tamu.edu, co-author
WEI, Ran [Texas A&M University] rw422@tamu.edu, co-author
BATRA, Divij [Texas A&M University] divij.bat@tamu.edu, co-author

Automated vehicle technologies vary from simple alerts to partially automated driving tasks that are increasingly available in today's vehicles. Advanced driver assistance systems (ADAS) seek to alert a driver to critical events (e.g., forward collision warning) or even intervene (e.g., emergency braking, lane-keeping steering) to prevent crashes. These technologies, however, are not available equally across the passenger vehicle fleet (Voelk, 2020). Despite evidence for safety, only automatic emergency braking has recently received regulatory attention as a mandated technology. Instead, ADAS is named, packaged, and offered differently by each manufacturer, often billed as a driver convenience or luxury item rather than a potentially lifesaving one.

Safety-related technologies like forward collision warning systems and blind spot detection are highly effective when used properly (Cicchino, 2017) and are important for safety for both occupants and non-occupants like pedestrians and bicyclists (Combs et al., 2019). Considering the relative newness of these technologies, many used vehicles do not have ADAS. People with lower incomes, needing the car for access to services and upward economic mobility, are more likely to buy these used, "risky" older vehicles (Klein, 2020). Even in used cars equipped with one or more of these systems, information about and trust in ADAS is lower in used car buyers (Reagan et al., 2022). Combined with ADAS only being available on more expensive trim packages of new cars, lower income consumers are literally priced out of safety technologies sold as luxury items. Even consumers who might be able to afford the additional expense to opt into these technologies may choose not to, if those technologies are seen as a luxury rather than a necessity or are packaged with unwanted upgrades, thus limiting their widespread consumer use.

In this research, we conducted an inventory of the top selling models of the ten largest automakers in the US, Japan, and Europe to determine the availability of ADAS by vehicle type, model, and trim package. Our findings about the complex, varying, and often confusing ways that manufacturers package and price these safety technologies provides insight into what role disparities in the availability of ADAS across the vehicle fleet may play in safety. For example, we found that safety technologies are less likely to be available on the lower-cost trim packages of larger vehicles in particular, despite the greater danger these vehicles represent to pedestrians and bicyclists. We also examined how manufacturers market these technologies to consumers. Thematic analysis and visual discourse analysis revealed explicit and implicit themes around luxury, power, family, convenience, techno-optimism, and status as often (or more) as safety.

There are multiple implications for these findings relevant to planning. As cities and towns consider "smart and connected" infrastructure, it is important to understand just who is able or incentivized to opt into the smart and

connectable technologies that can help realize goals around safety and mobility. Addressing the alarming increase in traffic deaths, particularly of pedestrians, requires understanding how potentially life-saving technologies are marketed and sold. In the currently unregulated, unstandardized world of advanced driver assistance systems, access to safety is currently unequal and inequitable.

PEDESTRIAN OBSTACLES AND STATION AREA CONNECTEDNESS: AN OPEN DATA APPROACH

Abstract ID: 1859

Individual Paper Submission

PILGRAM, Clemens [University of Southern California] pilgram@usc.edu, presenting author

WEST, Sarah [Macalester College] wests@macalester.edu, co-author

New public transit lines will attract riders when the net costs of riding the rail are lower than the net costs of using alternate modes. Station area characteristics can increase or decrease the costs of riding rail, relative to driving or taking other modes. Existing literature finds that land uses surrounding stations affect ridership, however, these studies may gloss over the fact that that specific obstacles may have more powerful effects than station area averages. A busy right-of-way or the presence of railroad tracks or industrial areas close to a station may deter ridership to a greater degree, for example, than an overall lack of land use diversity. Similarly, systematic measures of pedestrian quality are often focused on availability of retail destinations (as is the case with WalkScore and similar indices), or involve large amounts of data collection (as is the case with the Irvine-Minnesota Inventory / “IMI”) (Day et al., 2006; WalkScore.com, 2020).

This paper focuses on those characteristics that create obstacles to riders who are traversing areas between stations and other destinations, with the aim of providing researchers and planners with a tool that can be used to generate an obstacle score for any existing or potential station area. We propose and demonstrate a novel method of measuring pedestrian quality for trips to a specific destination - as is the case in the last-mile problem – that relies solely on input datasets readily available for any location in the United States (and with close substitutes available elsewhere). Specifically, we rely on General Land Use Survey data as well as on street network information from OpenStreetMap (Boeing, 2017). In our method, we generate walking routes from stations to nearby destinations based on network distance using OpenStreetMap, and calculate the distribution of land uses inside the areas immediately surrounding those walks. We measure obstacles by their numerical counts, their intensity and extent, and by their spatial concentration close to both immediate station areas and destinations within one mile street-grid and pathway distance from stations. In particular, we focus on the presence of land uses for which we posit that they pose a disutility to pedestrians, such as major highways or industrial tracts, and suggest that a greater share of such land uses in a station approach's viewshed may reduce attractiveness of walking to that station, holding equal actual distance to the station. Lastly, we demonstrate that this method can capture cross-sectional differences in pedestrian quality between station areas in Minneapolis, Minnesota, that line up with our own subjective understanding of the area.

FUTURE EQUITY IMPACT OF THE SEPULVEDA TRANSIT CORRIDOR PROJECT IN LOS ANGELES

Abstract ID: 1876

Individual Paper Submission

CHOI, Eun Jun [University of Southern California] eunjunch@usc.edu, presenting author

Los Angeles has been committed to improving its public transportation network, including an aggressive expansion of light rail, subways, and buses. The Sepulveda Corridor project along the Santa Monica Mountains is a new transit service designed to link the San Fernando Valley and the city's Westside, following along the path of one of the most heavily traveled highways in the nation. The two regions along the planned transit corridor differ significantly in terms of employment density and vehicle ownership. The Valley has lower job densities and fewer households with vehicles than the Westside (Metro, 2019). This indicates that the new transit line could increase job accessibility for Valley residents who are more likely to use public transit to commute to other areas. Employers on the Westside would have a larger employee pool.

This paper evaluates the equity impact of the new transit line focusing on job access by identifying the changes in job accessibility for different socio-demographic and economic groups in terms of age, income, and race. We answer the following questions: (1) how the Sepulveda transit line would change the spatial pattern of accessibility to jobs, (2) how the changes in accessibility to employment opportunities differ between socioeconomic groups, and (3) whether the new transit line project can contribute to enhancing transit equity in the Valley and the Westside of the Los Angeles County. This study conducted an isochrone analysis by creating a General Transit Feed Specification (GTFS) for the Sepulveda transit corridor project based on its planned station, route, and speed. With GTFS data for the current transit networks and road networks, we constructed two network datasets for before and after building the new transit line to compare the impact of the new line. Next, we measured changes in accessibility by using the Longitudinal Employer-Household Dynamics (LEHD) data to identify the sociodemographic attributes of residents as well as jobs. Our accessibility measure is the number of employment opportunities (i.e. all jobs, low-income jobs, and high-income jobs) that are reachable within 60 minutes. We examined the changes in accessibility for different population groups (i.e. age, income, and race) in census tracts located within 1km of the new transit stations.

We find that the number of jobs reachable within 60 minutes would increase by up to 70 percent in the Valley regions, while it would increase by only 15 percent in the Westside. This result implies that the new transit project will enhance job accessibility throughout the region, especially in the Valley area with low job densities. However, the results show that the impact of the new transit network is the largest for high-income workers and the White population in the Valley area. L.A. Metro is studying several alternatives, and we suggest that this accessibility analysis can inform the equity aspects of the Sepulveda corridor project.

YUN, Tian [Guangzhou University] 549447124@qq.com, co-author

Metro (subway) systems are crucial for supporting human movement in cities. Yet, their construction can be contentious because, like other development, the process may entail demolition of historic buildings, displacement of people, and competition with local interests. These social costs of constructing transportation infrastructure, especially when they pertain to hard-to-quantify lived experience, memories, and social networks, are often overlooked in transportation planning (Gans, 1982; Choi, 2016; Rayle, 2015).

In this paper, we aim to examine the social impact of demolishing a historic street for a new metro station in Guangzhou, China (pop. 15 million). The demolition plan would remove a block of dense, historic infrastructures, three residential buildings, and fifty-eight businesses. We frame the conflict between constructing the metro station and preserving the streetscape as competing interests between local government's priority to facilitate spatial connectivity and locals' priority to maintain a place for social interaction and memories. The two research questions at heart are 1) how might demolition impact locals' and frequent visitors' place attachments and social ties to the street, and 2) whether the locals perceive the issues differently than the metro company with a competing narrative of connectivity. The goal is to articulate the perspectives of those who may be opposed to the development.

For the first question, we collected daily life activities and memories of visitors and those who live in the area. We designed a spatially embedded GIS survey through the Maptionnaire platform, and asked respondents to mark places that they visit, and to comment on the trip purpose, trip companions. Survey respondents shared concrete memories, how the demolition would impact their personal lives, and suggestions of alternative places to visit if the street is demolished.

For the second question, we asked survey respondents which metro stations they frequent and analyzed whether the newly planned metro line would shorten their travel route and/or provide new access points. We also interviewed seven stakeholders including a department head at Guangzhou Metro, property owners, business owners, a staff worker, and a local tour guide, on their perceptions of the issues.

Our survey results (with 221 respondents) show that while some disagreed, many provided evidence that they have come to these businesses with friends, families, and romantic partners. These businesses create and maintain memories and local experience, and if displaced, are difficult to find alternatives. Our analyses also reveal a discrepancy between the metro company's justification of the metro station from a system perspective and individuals' perception based on their lived experience.

Our findings elevate the voices of the locals through data collection and visualizations and provide a case to critically examine spatial vs. social connectivity tradeoffs. Our mixed methods approach can be a tool for planners and citizens who are looking to capture the positive and negative impacts of constructing transit infrastructure. Furthermore, our work has inspired a local activist group to form around this issue. Future collaboration between the researchers and local activists may involve documenting oral histories, sharing our work to the public, and submitting reports to the local planning authority.

EVERYDAY TRAVEL EXPERIENCES OF PEOPLE WITH DISABILITY: HOW TRANSPORTATION INFRASTRUCTURE FAILS THE DISABLED

Abstract ID: 1890

Individual Paper Submission

WAGNER, Molly [University of Colorado Denver] molly.wagner@ucdenver.edu, presenting author
SHIRGAOKAR, Manish [University of Colorado Denver] manish.shirgaokar@ucdenver.edu, co-author
MARSHALL, Wesley [University of Colorado Denver] wesley.marshall@ucdenver.edu, co-author

Some stakeholders would argue that things have improved in over three decades since the creation of the Americans with Disabilities Act (ADA). Within the transportation sector, various actors such as transit agencies and planning organizations have tried to support the travel needs of people with disabilities (PWDs). Though progress has been made, many aspects of the current system limit PWDs from traveling safely and efficiently. Though a literature is emerging in planning which focuses on PWDs (Biglieri 2021; Cochran 2020; Kwon and Akar 2022; Mogaji and Nguyen 2021; Ravensbergen et al. 2021), exploration of how infrastructure fails individuals with different disabilities is limited. We ask: how are the daily travel experiences of people with different disabilities impacted by incomplete infrastructures?

We conducted semi-structured 60-minute online interviews during 2021-22 with 28 people who self-identified as having a disability to understand what infrastructure limits mobility, when, and how. The interviewee group was relatively diverse based on disability status, use of mobility device/s, and gender. To understand the challenges that public sector organizations face with providing for the needs of PWDs, we also conducted interviews with professionals who supply and maintain transportation facilities and services.

Thematic and content analysis revealed how multiple factors, including design features, changes in uses, and public sector communications act together to diminish the quality of mobility options for PWDs. Notably, the impact of these variables varied across different types of disabilities. When working to create a transportation network that is universally accessible, it is critical for transportation professionals to consider the unique design needs of individuals with different types of disabilities.

Interviews with participants revealed multiple intersecting themes about infrastructure features and conditions that impact everyday travel.

- Sidewalk condition: Sidewalk gaps, uneven sidewalks, and inconsistent curb cuts created physical and safety barriers to travel.
- Paratransit: Frustration with paratransit logistics and scheduling, including needing to book rides 24-hours in advance. 20-minute trips often turned into multiple-hour events. Paratransit remained a last-ditch effort providing for no spontaneity. The approval process for paratransit use remains humiliating.
- Construction and temporary route closures: Difficult to navigate sidewalk closures. Not easy for blind individuals to simply cross a street and continue. Many needed to relearn whole routes because of construction projects.
- Public transit facility design: Need clearer and up-to-date audio announcements on board buses/trains and at transit stops. Deaf individuals had a hard time communicating with transit operators. Better design using ASL translation is recommended. Blind persons need a better system to identify bus stop locations, including consistent design and RFID technology at bus stops.
- Communications through transit agencies: Route change information was not easily accessible. Improving real-time data, engaging PWDs before changes are finalized, and improving audio/ASL communication at stations, stops, and on-board vehicles are needed. Lack of communication led to distrust in transit, especially after PWDs missed important appointments due to transit failure.
- Intersection design: Curb cuts and tactile paving along with a preference for perpendicular curb ramps aligned with crosswalks remain important. Consistent auditory signals and verbal announcements for the street having the pedestrian right-of-way preferred over a beep or no auditory cues. Roundabouts present significant challenges to navigate, particularly for blind persons.
- Street furniture and other barriers: Outdoor dining, especially during COVID-19, created barriers for movement. PWDs forced to alternate between sidewalks and streets. Suggested use of parking areas for outdoor public spaces over sidewalks. Micromobility devices create significant barriers on sidewalks and near bus stops.
- Parking: ADA parking limited and often far away from building entrances. Illegally parked vehicles or dumpsters parked on ADA parking spots limit supply.

TRANSPORT EQUITY: EVERYDAY TRAVEL EXPERIENCES IMMIGRANT COMMUNITIES IN AUCKLAND, NEW ZEALAND

Abstract ID: 1895

Individual Paper Submission

MUHAMMAD, Imran [Massey University] i.muhammad@massey.ac.nz, presenting author

There are emerging academic literature and policy papers engaging justice, equity and inclusiveness in transport planning. The inclusive transport system is achieved when all people can participate in society through access to social and economic opportunities. Making the transport system inclusive is a fundamental challenge in Auckland, where population and ethnic diversity is rapidly growing. Transport planning policies can benefit from Mobilities theories which focus on subjective factors (everyday experiences, cultural values, the structure of feelings, perceptions and biases) that are the basis for travel by the ethnic population in Auckland. This paper investigates immigrants' perceptions and the need for public transport in Auckland. The objectives of this research are twofold: (1) identify new factors that would increase public transport patronage in Auckland, and (2) examine the extent to which public transport usage is contingent upon socio-cultural values. This paper particularly explores and compares the everyday experiences of public transport in Auckland by immigrants originally from China, the Middle East and the Indian sub-continent. Adopting a qualitative approach, community groups from these ethnicities were approached for detailed interviews and focus group discussion. The perspective of Chinese communities was obtained through Chinese social media analysis. The key findings reveal that all three communities want better convenience and reliability of public transport on off-peak travel. However, they have differences in the status of people using public transport and the status of trains over buses. The findings highlight opportunities to incorporate immigrants' aspirations of affordable fares, greater time savings, improved convenience and a positive image of the public transport in Auckland. Research suggests that public transport infrastructure and service design must recognise a people-centred approach and cultural sensitivities relative to a particular community. Overall, this research comments on the need for public transport planning to recognise how different ethnic groups respond to specific modes of transportation in distinctive socially determined ways.

THE INDEPENDENT AND COMBINED INFLUENCE OF LOCAL-ACCESSIBILITY, METROPOLITAN-ACCESSIBILITY, AND BUS-CONNECTIVITY ON STATION BOARDINGS: IMPLICATIONS FOR LOWER-INCOME AND IMMIGRANT PATRONS IN LOS ANGELES

Abstract ID: 1896

Individual Paper Submission

RAMOS SANTIAGO, Luis Enrique [Clemson University] eramoss@clemson.edu, presenting author

Direct-demand models (DDMs) are increasingly used for a diversity of transit research and practice purposes. DDMs help in identifying key ridership determinants along a variety of explanatory vectors, predict boardings for sketch planning, and explore a variety of policy issues. Predictors typically include vectors of data such as: land-use and urban design attributes at various geographical scales; socio-economic characteristics of residents; transit service

quality; multimodal transit integration and network topology; among others. Yet only a few station-level DDM studies have explored the use of composite indicators of metropolitan accessibility as a key predictor of ridership. Furthermore, to this author's knowledge no study has explored potential interactions with local-level accessibility and other predictors typically included in rapid-transit DDM models. This study explores these possibilities and uses Los Angeles (LA) rapid-transit system as a representative case study of a multimodal network that operates in a polycentric, or as some urban geographers would argue, dispersed agglomeration. Because more than one third of rapid transit users in LA are lower-income working patrons, and many of these are likely of recent immigration status it is important to understand which types of accessibility might affect this set of users. Multi-level generalized linear models were implemented where key predictors, including stations' metropolitan-accessibility composite indicator; stations' local-accessibility composite indicator; and a bus-connectivity indicator are regressed onto station-level average weekday boardings. Rapid transit stations boarding data and patrons socio-economic and ethnic status is drawn from Los Angeles' LA Metro Bus and Rail On-board Survey (2012). Other sources of data are LA Metro stations' WalkScore® ranks; US Census ACS and LEHD databases for population and employment levels; and LA multi-agency GTFS files. These latter files were used for service levels calculations and development of the travel time impedance matrix, where data was processed with Transit Network tools in ArcGIS Pro (v.2.X). Results indicate that independently a station's nodal metropolitan-accessibility is significant at a 95% confidence level with a moderate effect and with modest improvement in model fit. A station's local-accessibility, operationalized with a WalkScore® rank, has a strong effect at the 99% confidence level and registers a strong interaction with the metropolitan-accessibility index at a 99% confidence level. Bus connectivity at station-level and stations' metropolitan accessibility also report a highly significant interaction at a 99% confidence level and bus-connectivity registers the largest main effect. Notable improvements in model fit and explanatory power are also noted. The aforementioned interactions produce better model fits as per AIC and BIC statistics, likelihood-ratio tests, and pseudo-R² as compared to the base model. In sum, transit stations' multi-scalar and multi-modal accessibility attributes, and their interactions are significant predictors of aggregate travel behavior in LA's rapid-transit network. It appears that for the working lower-income set of users, many of which are likely of recent immigrant status, are highly sensitive to rapid-transit stations' bus-connectivity levels and metropolitan accessibility levels. Land-use and transit planners, and TOD studies would benefit from including stations' metropolitan and local composite indicators of accessibility, bus-connectivity and relevant interactions in their modeling and analyses; and from conducting spatial analyses of the distribution of these accessibility benefits across socio-economic and ethnic groups in order to better understand the equity dimensions of TOD and metropolitan transit investments. The necessary data for developing accessibility composite indicators and bus-connectivity is readily available, and existing GIS/GTFS transit analysis tools only require moderate skill levels for the development of realistic calculations of transit time or distance impedance matrices. Likewise, basic spatial, socio-economic, land-use, and build-environment data is becoming more readily accessible for developing multi-scale station indicators of accessibility and equity assessments.

THE STORY OF VEHICLE ABUNDANCE: A MODEL OF VEHICLE OWNERSHIP IN DAVIS, CA

Abstract ID: 1900

Individual Paper Submission

HOSSEINZADE, Rey [University of California Davis] rhosseinzade@ucdavis.edu, presenting author

JAIN, Aakansha [University of California Davis] akjain@ucdavis.edu, co-author

FITCH, Dillon [University of California Davis] dtfitch@ucdavis.edu, co-author

Car ownership models can play a critical role in understanding the travel behavior of people and households. It can also inform policy makers in understanding the purchase decisions and factors influencing the selection of vehicle models. Car ownership models play a significant role in transportation planning and transport modeling systems. Almost all transportation analyses would include this variable as an input since it impacts mode choice, trip frequency, travel time and route choice, trip tours, etc. (Liu, 2014). It is known that modeling car ownership has been

an interest of private organizations for a long time. Public agencies have also paid attention to this factor's importance in managing policies related to environmental and transit issues. Although car ownership models are not usually a part of classical transportation demand modeling, a model or sub-model of car ownership is frequently used to determine the vehicle mile traveled in the generation and distribution system (Jong 2004). Many studies are dedicated to car ownership models, emphasizing the distance traveled by vehicles and households. Still, various car ownership models are developed for different purposes with different audiences that might benefit from a distinctive aspect of car ownership, such as oil companies, car manufacturers, investment decision-makers, national, regional, and local governments (De Borger 2016, Jong 2004).

From the perspective of City of Davis which is a pedestrian and bike friendly city, studying vehicle ownership models can help understand if built environment or proximity to destinations play any critical role in influencing car ownership behavior. In this context the main question that this study will try to answer is, “what are the factors that impact the level of car ownership in Davis households?” Hence, our dependent variable of interest is “household vehicle ownership levels.” We look into the factors such as income, number of workers, rented housing, bus access and household size as key independent variables. We use Davis resident household travel survey data, a subset of the 2018 Sacramento Area Council Of Government (SACOG) household travel survey. The data subset contains household characteristics, socio-demographics and trip-level information of 289 households with 612 persons and associated 17,139 trips.

We ran two models including simple MNL and Ordered Logit model. We used Apollo package in R to run the models. The result of the models showed that the ordered logit model was performing better regarding the prediction of household car ownership level. In the same direction of the hypothesis of this study, household size and number of workers had positive impact on the level of car ownership. The effect of other modes use were not significant same as having geographical access to bus access in the ordered model but they were all significant in the simple MNL. However, renting the home associated with a negative and statistically significant effect on car ownership. Although the access and use of other modes were not significant in the ordered model, the results should be reconsidered using another dataset with larger observations since the used dataset had only 289 households which might constraint the models results. We recommend comparing the result of this study with another city in the region to better understand the patterns of impacting factors on car ownership levels.

SQUEEZED BY TIME: HOW MOTHERS PERFORM CAREGIVING TRIPS

Abstract ID: 1904

Individual Paper Submission

HAN, Soojung [Cornell University] sh935@cornell.edu, presenting author

Non-work trips performed by women are estimated to take up a large portion of daily travel time in United States, and women's trips are more likely to be caregiving activities. Caregivers are also more likely to perform “trip-chaining,” multi-purpose trips which involve various destinations and modes of travel (Hanson, 1980). Their trips are shorter than the average commute, cover a polygonal spatial pattern around home, and are likely to involve public transit (Madariaga, 2013).

There is little research about how mothers build up capability to manage, shape, and control time to perform caregiving trips. Such control of temporality is crucial in caregivers' travel, as they are required to be at the designated spot at the right moment (e.g., supper time, picking up and dropping off children). Time management may be more difficult with intersected vulnerabilities – for instance, carless mothers are more often exposed to involuntary and unexpected waiting hours such as places like bus stop.

To examine the temporality of caregiving trips performed by mothers, I draw on interviews with mothers from diverse

backgrounds. My interviews focus on key life events before, during and after pregnancy. Applying Lanzendorf's (2003) mobility biographies approach, I analyze how their mobility practices and time management have changed with motherhood. I also draw on Burrell's (2020) concept of the "half-built assemblage." By utilizing this approach, I will examine how mothers' mobility is often "half-built and indefinitely delayed" by care labor over time. I explore how mothers build capability to negotiate given circumstances and actors "in time."

My research provides offers an alternative viewpoint for transportation literature that focused more on cross-sectional data and lacked longitudinal perspectives, especially on women and their mobility of care.

HOW GREENWAY EXPOSURE REDUCES BODY WEIGHT: A NATURAL EXPERIMENT IN CHINA

Abstract ID: 1908

Individual Paper Submission

HE, Dongsheng [The University of Hong Kong] hedsh3@connect.hku.hk, presenting author

The prevalence of overweight and obesity has gradually evolved into a global epidemic and threatens public health. A growing body of evidence, mainly cross-sectional rather than longitudinal, suggests that proximity to greenspaces is associated with a lower probability of being overweight or obese. However, causal evidence on this topic is limited, especially in developing countries. Although several recent natural experiment studies assessed the health benefit of green space, greenways in earlier studies were typically only a few kilometers in length, and some cumulative benefits of greenspace were not apparent or not detected. To address these issues, the present study investigated the effects of a large-scale greenspace on changes in body weight outcomes using a natural experiment approach. Two-wave survey data on 1,020 adults were examined before and after the creation of East Lake greenway (with 120 km length) in Wuhan, China. Participants were split into a treatment and a control group based on a 2 km threshold distance from housing estates to the greenway. Difference-in-difference estimations and structural equation models were used to estimate the effects and pathways between the greenway intervention and BMI changes. This study assessed 1) to what extent peoples' body mass index (BMI) changed following a greenway intervention, and 2) potential gender disparities in both direct effects and underlying mediating pathways linking greenway exposure and BMI changes. The results showed that both men and women in the treatment group experienced a minor BMI reduction, while the BMI increased in the control group. We also found distinct mediating mechanisms across gender. Changes in moderate to vigorous physical activity mediated the association between the greenway intervention and a reduction in BMI among men, while mental health changes mediated the association for women. Our findings provide rigorous evidence that exposure to greenway diminishes body weight and strengthen the rationale for green infrastructure investments to enhance public health in high-density cities.

HIGHWAYS AND THE DANGER ZONE. POLICY AND POLITICS OF HIGHWAY EXPANSIONS DURING A CLIMATE CRISIS

Abstract ID: 1913

Individual Paper Submission

LEE, Amy [University of California, Davis] aelee@ucdavis.edu, presenting author

HANDY, Susan [University of California, Davis] slhandy@ucdavis.edu, co-author

In August 2021 – while heat waves, hurricanes, floods, and wildfires battered people around the globe – the International Panel on Climate Change (IPCC) released the Sixth Assessment Report outlining and updating the physical science understanding of climate systems. The UN Secretary General António Guterres called its findings a “code red for humanity” (1). In February 2022 the IPCC released Part II of the Sixth Assessment Report, which assessed the deleterious human and environmental impacts that we can expect from climate change. Secretary General Guterres commented: “Nearly half of humanity is living in the danger zone – now” (2). And throughout that winter and spring, the state transportation commission in California – a forerunner in climate policy – held its annual meetings about how to spend nearly \$1 billion of the state’s core transportation funds this year. Over 40% of funds – the plurality – are slated for new highway capacity, transportation infrastructure that will increase likely greenhouse gases by inducing new vehicle use.

Decisionmakers, planners, and engineers continue to expand roadway capacity despite decades of research showing that increasing highway capacity severs communities and induces more driving and freight traffic, causing local air pollution and global climate impacts and negating any initial congestion relief in the long run (3). Why, then, do policymakers continue to expand highways when they perpetually fail to reduce congestion and contravene other policy goals? Who is influential in driving and opposing these capacity projects, and what factors motivate their advocacy?

This study investigates these questions of policy beliefs, power, and governance around several proposed highway expansion projects in California. Through interviews and a survey of policymakers, planners, engineers, agency staff, and advocates, we explore the factors that motivate policy actors to spend billions of dollars and significant political capital on highway expansions. We identify the problems that policy actors are trying to solve with new road capacity and the policy beliefs that motivate the consideration of and advocacy for various solutions. Further, we shed light on the circumstances in cases where community-based coalitions have been successful in halting or delaying highway expansion projects.

Motivations and coalitions structures will vary by project and metro region, though we hypothesize that the ever-elusive “congestion relief” is a powerful factor that motivates people to support highway expansions and that information about or understanding of induced travel is likely low. The transportation policy literature often ignores questions of political context and governance, but “it is important to know the ‘who, what and why’ of influence in a policy sphere in order to understand the potential barriers and opportunities for policy change” (4).

SOCIAL EQUITY, BLIND SPOTS, AND ISSUES OF DATA REPRESENTATION: EVIDENCE FROM IMPACTS OF BOGOTA'S URBAN GONDOLA ON JOB ACCESSIBILITY

Abstract ID: 1915

Individual Paper Submission

SANTANA PALACIOS, Manuel [McGill University] manuel.santana@berkeley.edu, presenting author

Frequently interconnected with urban mass transit and built in geographically marginalized low-income areas, urban gondolas can make it easier for the poor to access urban amenities and job markets. This accessibility advantage provided by such transport innovation is that, like under- or above-ground urban rail systems, they can bypass traffic congestion, thus enabling significant reductions in travel times. The most recent urban gondola, TransMilenio, opened in Bogotá in December 2018. Using TransMiCable as a case study, this paper highlights the virtues and challenges of employing accessibility as a transportation investment performance measure.

The growing popularity of urban gondolas in Latin America has also been accompanied by inconsistent figures of who benefits from such investments. One year before TransMiCable opened to the public, the city's administration indicated that "travel times between Portal Tunal [the BRT-Gondola transfer terminal] and Mirador-Paraiso station will be reduced from one hour to 13 minutes (Alcaldía Mayor de Bogotá, 2017, p. 4). Planning documents often refer to beneficiaries from the project, the nearly 670,000 low-income inhabitants who residents of the district of Ciudad Bolívar, where TransMiCable is located (Alcaldía Mayor de Bogotá, 2017). Nevertheless, according to the city's BRT agency, "TransMiCable is the system that improves the mobility in Ciudad Bolívar and is the mobility option for about 80.000 inhabitants that live in the project surroundings."

The inconsistent figures on who benefits from investments in cable-propelled transit lines in peripheral areas are also used by some critics that deem these projects as not a fair use of scarce public resources because they cost a lot and benefit a few. Brand and Davila (2011) question whether Medellín's first gondola was a worthy investment given its modest impact. Based on official survey data, the authors argue that journeys on Medellín's MetroCable represent only ten percent of all long-distance journeys in the project's direct area of influence. This view is consistent with some local planners' opinions and public opinions expressed on social media outlets like Twitter.

Lack of a well-accepted and consistent method to assess how and who may benefit from these infrastructure investments muddles transport planning processes. Moreover, the reliance on simplistic and dated approaches to identify who benefits from investments in public transportation may also prevent planners from fully seeing the advantages to incorporate other essential elements into the assessment, including land uses, which accessibility constructs account for. A wealth of scholarship highlights, at least from a more theoretical standpoint, the need to adopt accessibility in transportation planning practice.

But would estimating the distributive effects of TransMiCable on job accessibility provide substantially different figures regarding who benefits from the project? What potential data representation issues do planners face when adopting accessibility impact assessments in their toolboxes? To answer these questions, I employ urban data analytic tools to produce multiple spatial and comparative analyses of the distribution of job accessibility enabled by TransMiCable. I show that the positive accessibility effects go well beyond this delimitation, spilling over to low- and middle-class neighborhoods in other parts of the region, challenging classical views of who benefits, and opening data representation challenges I also discuss.

Improving transport accessibility for people with disabilities is of crucial importance as they are more likely to encounter transport-related exclusions (Lucas, 2012). Previous studies have shown that people with disabilities encounter difficulties when travelling by public/para-transit. They may experience barriers such as inoperable boarding facilities, attitudinal barriers among drivers, failure to clear wheelchair securement zones, etc. (Bezyak et al., 2017). Without improved public transit services and policies to remove travel barriers for people with disabilities, these people continue to lack full access to public transportation.

Further, research suggests that people with disabilities facing travel barriers are at greater risk of being socially excluded, which may negatively influence their health, well-being, education, and employment outcomes (Lindsay, 2020; Lucas, 2012). For example, Grisé et al. (2019) found that in Montreal, Canada, wheelchair users have access to

only 46% of the jobs by public transit compared to the general population. It indicates an urgent need to provide accessible transportation for people with disabilities to overcome social exclusion.

However, we know little about the travel patterns of people with disabilities. People with disabilities are often excluded from the discussion of transportation design and travel surveys (Oliver, 2013). Their travel needs are often ignored in planning: research found that in many circumstances, disability was seen as a personal problem to be overcome rather than social or environmental barriers (Oliver, 2013). In addition, it remains unclear whether existing para-transit services serve different neighbourhoods and travellers without discrimination. Research on the equity of accessible transit will be valuable as we guide urban policy in narrowing the mobility gap and promoting social inclusion.

This study aims to investigate how accessible taxis are being used by people with disabilities in Toronto, Canada. We analyze operational data from a fully accessible taxi brokerage operating under contract with Wheel-Trans, the City of Toronto's para-transit service. The dataset records over 1 million accessible taxi trips from June 2018 to June 2021. The main research questions are: (a) When and where are accessible taxi trips occurring in Toronto? (b) What are the main trip purposes? (c) What factors influence the travel experiences?

To achieve our objectives, we first use descriptive analyses to reveal the distribution of trip origins, destinations, and departure times. It shows that accessible taxi trips dropped dramatically after the breakout of the COVID-19 pandemic. When the lockdown ended, trips have been slowly recovered. As for trip purposes, about 30% of the trip destinations were health services. People with disabilities mainly use accessible taxi services in the morning and afternoon. We then present a multilevel regression model to investigate the factors that influence travel experiences. The results show that neighbourhood-level factors such as average income, population density, unemployment rate, and rate of the visible minority have significant effects on in-vehicle times and wait times. The multilevel model also shows the spatial differences in travel experiences: neighbourhoods in the urban fringe have longer in-vehicle times than neighbourhoods in downtown areas, after controlling for other factors.

The findings will contribute to current academic debates on accessibility, equity, and inclusion issues. Findings may affect the lives of people with disabilities by helping accessible taxi service providers create much-needed policy dialogue and improve their services. This study is also expected to inform broader demand-responsive transit policy and regulation and help identify issues and interventions to improve the transport, mobility, and quality of life of people who may suffer transport poverty.

Active transportation can play an important role in promoting more physically active and positive public health outcomes. While walking and biking provide significant physical health benefits, their share remains low. As a new form of micro-mobility service, shared E-scooter can enhance the suite of options available in cities to promote active transportation and fill in the gaps when walking or biking are not preferred due to various circumstances. Although E-scooters show potential as a mode of transportation, it is not clear yet whether individuals will adopt it for everyday use, especially in the COVID-19 pandemic. This study aims to analyze the usage frequency of shared E-scooter in Chicago during the COVID-19 pandemic. We designed a comprehensive survey to understand the characteristics of

shared E-scooter users in Chicago and the benefits of promoting shared E-scooters in the region. This online survey launched in the Chicago region from October to December 2020 and collected a rich data set that includes the residents' socio-demographic details and the frequency of shared E-scooter use. To characterize the frequency, we used an ordered probit structure. Our findings show that being man, low income, Millennial and Generation Z, or having no vehicle are associated with the higher frequency of shared E-scooter use. Moreover, we found that living in a block group, where the multimodal network density or aggregate frequency of transit services is higher, might lead people to become more frequent users of shared E-scooters.

CRABGRASS CONFINEMENT: TRANSPORTATION ACCESSIBILITY CHALLENGES OF SUBURBAN POVERTY

Abstract ID: 1933

Individual Paper Submission

PAN, Alexandra [University of California Berkeley] alexpan33@berkeley.edu, presenting author

While the suburbs in the U.S. have historically been the haven of high-income, white households, in recent years, poverty rates are rising more quickly in suburban areas than in central cities. In 1977, 62% of poor households lived in metropolitan areas but by 2012, the share of low-income households in the suburbs was nearly 50% [1,2]. The rise of suburban poverty has three primary drivers: 1) long-term suburban residents impacted by the 2008 economic recession; 2) movers from urban to suburban areas; and 3) immigrants from outside the U.S [3].

Compared to cities, suburbs are lower density and have fewer public transit options, presenting accessibility challenges to low-income households. Researchers found that commute distances for low-wage workers have increased because of suburbanization [4]. However, suburbanization does not only affect access to jobs, but also access to other key destinations, such as healthcare services, grocery stores, and recreational spaces.

This research targets gaps in the literature by posing the following research questions:

1. How do low-income households trade-off housing affordability and transportation accessibility?
2. What are the spatial and temporal characteristics of trips taken by low-income suburban residents?
3. What transportation options are most effective to address accessibility gaps?

To explore these research questions, we use a mixed-methods approach combining geospatial analysis with a survey of over 200 low-income suburban residents, in-depth interviews (n=30) and ethnographic shadowing (n=10). Our primary study sites are suburban regions of the San Francisco Bay Area (e.g., Richmond, Antioch, Pittsburg, Concord). We find that the majority of survey respondents have moved more than once in the past five years, and approximately one-third of respondents moved from an urban area (e.g., San Francisco, Oakland). Common reasons for moving include wanting cheaper or better quality housing and home ownership. Low-income households are more likely to prioritize safety, cheaper housing, and accessibility to key destinations over proximity to friends, family, or community and proximity to work.

Our qualitative data from interviews and ethnographic shadowing reveal novel insights on the unique accessibility challenges of low-income suburban households in their own words. Many respondents endure long commutes because they were unable to find suitable housing closer to their workplace. Furthermore, respondents often rely on driving personal vehicles, yet struggle with high fuel prices and costs of car maintenance, insurance, and registration. For one respondent, lack of transportation options in their area meant that they had to walk over two miles to meet an Uber driver after their car broke down. These findings from our research point at an important and growing

population of low-income suburban residents who must make a difficult trade-off between housing costs and transportation accessibility. In suburban areas where housing costs are lower and housing quality is higher, research participants reported challenges with traveling to key destinations, including grocery stores, doctor's offices, and religious services. With the fastest growth of households under the poverty line occurring in suburban areas, it is imperative that researchers study the transportation impacts of suburbanization for low-income households and provide alternatives to enhance accessibility.

CAUSAL EFFECTS OF MOBILITY INTERVENTION POLICIES ON INTRACITY FLOWS DURING THE COVID-19 PANDEMIC: THE MODERATING ROLE OF ZONAL LOCATIONS IN THE TRANSPORTATION NETWORKS

Abstract ID: 1943

Individual Paper Submission

NIU, Caicheng [School of Urban Planning & Design Peking University Shenzhen Graduate School]

niucc@stu.pku.edu.cn, presenting author

ZHANG, Wenjia [School of Urban Planning & Design, Peking University Shenzhen Graduate School]

wenjiazhang@pku.edu.cn, co-author

Transport networks play a crucial role in mobility flow changes and the transmission of pandemics. Understanding the moderating effects of urban transport networks on mobility intervention policies is valuable for informing public health interventions and surveillance and for built resilient places and transport systems. However, most of the current studies on COVID-19 transmission focus only on the impact of mobility restriction policies on intercity flows and the role of transport networks between cities, overlooking intracity flows and transport networks within cities.

In this study, we develop a quasi-experimental design by employing an interrupted time series (ITS) analysis to estimate the causal effects of travel restriction and restoration policies on human flows in 491 neighborhoods (i.e., traffic analysis zones, TAZs) in Shenzhen, China, with a focus on the role of urban transport networks during the COVID-19 pandemic. We trace the changes in intracity flows before and after the outbreak of COVID-19 for a long time series from December 2019 to February 2020 in Shenzhen, China, on the basis of anonymized mobile phone trajectory data with fine-grained resolution in space and time. Specifically, we address two questions: (1) What are the causal impact levels and trends of mobility intervention policies on the number of intracity flows? (2) How do the positions of neighborhoods in varying intracity transport networks moderate the causal effects of mobility intervention policies on intracity flows?

The results show that the highest-level emergency response and the two relaxing mobility orders implemented were effective in reducing and resuming daily intracity flows in Shenzhen. The lockdown intervention caused an abrupt drop of 4,563 trips and a gradually enlarging effect, with a downward change trend of 34 trips per day. Moreover, the effectiveness of the second return-to-work order (RtW2) was found to be clearly larger than that of the first return-to-work order (RtW1) as a mobility restoration strategy. In addition, we found that the causal effects of mobility intervention policies are heterogeneous across zonal locations in varying urban transport networks. The declining effect of health emergency response and rebounding effect of RtW2 are considerably large in better-connected neighborhoods with metro transit and road networks, as well as in those close to the airport, indicating that these areas were more adaptive to the interventions. These findings provide new insights into the identification of pandemic-vulnerable hotspots in the transport network inside the city, as well as of crucial neighborhoods with increased adaptability to mobility interventions during the onset and decline of COVID-19.

BRAUN, Lindsay Maurer [University of Illinois at Urbana Champaign] lmbraun@illinois.edu, co-author

Connected and Autonomous Vehicles (CAVs) are expected to create a paradigm shift in mobility and transportation. Many studies showcase the ability of CAVs in providing safer roads, reducing congestion, controlling emissions and VMT accumulations, and providing accessibility to a wider audience. Many studies are pushing for a shared-mobility future to sustain the promised benefits of CAVs (Gurumurthy et al., 2019). Shared mobility includes both: shared forms of fleet ownership and shared forms of vehicle ridership. Since the adoption rates and varied usages of these modes by the different demographics (Fleming, 2018) and spatial locations will drastically change, so will the equity landscape. Therefore, the question that begs itself: how do CAVs redefine transportation equity?

Equity implications in transportation studies, specifically in CAVs, are still vaguely studied and assessed. For example, ridership of public transportation might decrease drastically when shared CAVs are highly adopted and widespread. This could lead to the obsolescence of public transportation which has consequential impacts on equity (Soteropoulos et al., 2019). Given that CAVs are a technological advancement with various environmental, social, and economic impacts, necessitates a reassessment of transportation equity and the different factors that come into play.

Litman, (2022) defines transportation equity as the fair or just distribution of transportation costs and benefits among members of society and identifies two methods for analyzing transportation equity: the horizontal and the vertical. Horizontal equity is concerned with a fair share of resources and external costs. Vertical equity is concerned with inclusivity, affordability, and social justice. Traditionally, many studies and metrics have been developed to assist in measuring and identifying transportation equity or transportation justice (Chakraborty, 2006). These measures are in fact used to identify the sources of these inequities such as lack of accessibility to jobs or public transportation, or more intrinsic factors related to the socioeconomics and demographics of a spatial area. However, these methods lack the sociotechnical variations and challenges that come with CAVs. This includes changes in property prices and uses, loss of jobs, limited access to internet, affordability of shared CAVs, and increased sprawl.

In this study we develop a theoretical framework that identifies the various environmental, social, and economic implications of CAVs on transportation equity. In the first part, using an equity lens, we assess existing work on the expected impacts of CAVs with regards to safety, emissions, VMTs, congestion, urban form and land use, accessibility, and economic shifts. In the second part, we conduct semi-formal interviews with experts and disadvantaged groups to evaluate and scrutinize these impacts accordingly. We expect our framework to provide a better understanding of the extent to which we understand the equity implications of CAVs. We also expect to shed light on the relationship between the benefits and externalities that CAVs bring to mobility and transportation. The key benefit of this work is to assist researchers, planners, practitioners, and decisionmakers to rethink equity and justice metrics and methods which lead to an equitable CAV future.

PROBABILITY OF TRANSIT-INDUCED GENTRIFICATION AND ITS DETERMINANTS

Abstract ID: 1956

Individual Paper Submission

LINDSEY, Greg [University of Minnesota] linds301@umn.edu, presenting author
 QI, Yunlei [Sun Yat-sen University] yunleiqi@umn.edu, primary author

Problem, research strategy, and findings: Since the 1990s, the extension of rapid transit lines—both rail and buses—in some U.S. cities/metros has been accompanied with the concerns as about Transit-Induced Gentrification (TIG). Research has documented the occurrence of TIG in some but not all cities/metros. Theory suggests differences in outcomes could be associated with the characteristics of cities/metros and of neighborhoods in the transit corridors. This article presents estimates of the likelihood of TIG in 36 MSAs nationwide that have extended new transit lines from 2000 to 2009. Three different rule-based methods are used to define the occurrence of TIG. MSA and neighborhood characteristics are then examined for their impacts on the probability of TIG using Hierarchical Linear Regression (HLR) models.

We show the likelihood of TIG depends partly on how TIG is defined. Three rule-based definitions of TIG give different levels of probability—about two thirds, around but below half, and around two fifths among the adjacent, gentrifiable neighborhoods, respectively, but reveal consistent patterns across transit modes. Specifically, greater percentages of gentrified neighborhoods are shown around rails stations than around BRT stops, and are shown in the long-term than in the short-term. Useful finding from the HLR models include: 1) MSAs with greater populations, lower unemployment rates, and lower proportions of employees in manufacturing, of college-educated residents, and of white residents may have higher probabilities of TIG; and 2) neighborhoods with shorter distance to freeways, lower station density, higher housing density, higher poverty rates, and higher proportions of families with no children, as well as neighborhoods with lower proportions of females, of employees in manufacturing, and of college-educated residents also may have higher probability of TIG.

Takeaway for practice: The findings of this study help planners and policymakers better understand TIG. For example, compared to rail transit, BRT is less likely to induce gentrification, and thus could help sustain the transit service to the most vulnerable. The identification of neighborhoods with higher probability of TIG will enable planners and policymakers to target policies like affordable housing and rent ceilings to assist the most vulnerable areas and residents. In addition, the use of different definitions and measures of TIG results in substantial differences in the percentages of neighborhoods classified as experiencing gentrification and in identification of different factors that affect the probability of TIG. These findings can be interpreted as evidence that planners and policymakers need to involve stakeholders, especially the low-income and people of color who are more vulnerable to gentrification, in their deliberations over definitions of TIG and when establishing anti-gentrification policies.

MEASURING TRANSIT EQUITY FOR ON-DEMAND TRANSIT SERVICES

Abstract ID: 1959

Individual Paper Submission

HWANG, Uijeong [Georgia Institute of Technology] uhwang3@gatech.edu, presenting author

LIEU, Seung Jae [Georgia Institute of Technology] lsj97@gatech.edu, co-author

GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

Many transit authorities in the U.S. are embracing on-demand public transit service for its potential as a viable mobility option that provides first- and last-mile connectivity, particularly in low-density neighborhoods. On-demand public transit is also believed to be beneficial to transit equity since it provides the public transit option for low-income residents living in neighborhoods that have been historically underserved by the conventional transit system. However, little suggests empirical evidence on how this new form of transit system can contribute to advancing equity.

This study examines the effect of on-demand transit service from the equity perspective. The analysis is based on On-demand Multimodal Transit System (ODMTS) which is developed by the Georgia Tech research team and is now being piloted in Atlanta in collaboration with Metropolitan Atlanta Rapid Transit Authority (MARTA). In the ODMTS, on-demand micro-transit serves the first- and last-mile trips and the trip in-between is served by high-occupancy transit (i.e., bus and subway). By comparing the ODMTS and the existing MARTA transit system, this study assesses how much the new system can contribute to the equitable distribution of transit service throughout the entire study area as well as the transit accessibility by neighborhoods.

The analysis mainly consists of two parts: (1) measuring accessibility and (2) measuring equity. This approach is needed as transportation equity is primarily measured in terms of accessibility – the extent to which the transportation system allows people to get to their desired destinations quickly and comfortably. Measuring the accessibility of public transit requires consideration for not only the extent of the service network but also the frequency and reliability of the service to reflect its schedule-dependent characteristics. Thus, this study first measures travel times between every Block Group pair in 5-minute intervals, which is done by trip simulations for each mode. Based on the travel time as well as the travel demand of each pair (e.g., number of commuting trips), we calculate an accessibility index at the Block Group level. Then, the accessibility index is used as a basis for evaluating how well the service caters to neighborhoods that need it most: the transit service demand will be measured by various socioeconomic variables, including vehicle ownership, income, and race. The estimated equity impacts of on-demand transit can then be compared with conventional transit systems to determine whether the new system advances transportation equity beyond conventional fixed-route transit systems.

The analysis shows that not only the ODMTS offers better transit accessibility in most neighborhoods but also the accessibility is improved in a way that it relatively better matches the transit service demands of neighborhoods in the ODMTS compared to the conventional transit system. The findings suggest that transit authorities can better foster an inclusive mobility environment by integrating the on-demand transit service into the conventional public transit infrastructure.

CHALLENGES IN LOCAL CLIMATE ACTION PLANNING AND IMPLEMENTATION IN TRANSPORTATION AND LAND USE IN JAPAN

Abstract ID: 1968

Individual Paper Submission

ISEKI, Hiroyuki [University of Maryland College Park] hiseki@umd.edu, presenting author

All countries face the impacts of global warming and climate change on the environment, communities, and human health. Given the substantial amount of evidence for a strong consistent relationship between cumulative greenhouse gases (GHGs) emissions and global temperature change, many countries have set policies to reduce the amount of GHGs in the future. Climate change, however, poses substantial challenges for the effective implementation of these policies and countermeasures. Carbon emission reduction and climate impacts adaptation require actions from the international level to the local level in terms of the geographic scale and the level of government. Here the implementation theory poses questions regarding the implementation of meta-policies, the effectiveness of top-down and bottom-up approaches, and coordination, cooperation, and consistency between different levels of government. Inquiries on cross-sectoral coordination follow these questions as climate actions affect various economic and social activities, which cannot be categorized merely into one sector.

This study examines local climate action planning and implementation of national carbon reduction goals in Japan, focusing on the transportation and land use sectors. It addresses the following three main questions in the case of Japan, with an emphasis on coordination, cooperation, and consistency between different levels and sectors of governments, particularly regarding transportation and land use planning essential to reduce automobile trips and distance traveled. First, whether or not and how climate change policies at the higher level are translated into planning and implementation at the local level? Second, what approaches effectively implement national-level policies at the local level? Third, what are hurdles in the implementation of national-level policies at the local level?

The study analyzes the responses to two original surveys on approximately 100 local governments, which were conducted for a seven-month period in 2021. The two surveys were designed based on the initial findings from two interviews with two members of two national agencies and several planners of two local governments in Japan. The first original survey was sent to a unit that prepares local action plans. The second survey was sent to one of the transportation-related units, which is considered most relevant to climate action planning by each local government. The analysis of survey responses was supplemented by inquiries and interviews with multiple departments, divisions, and sections of six local governments and reports obtained from the Ministry of Environment in Japan and local governments.

The current status of climate action planning at the local level in the field of transportation and land use does not translate the national policies on climate change into plans, measures, and actions, which are expected with a certain level of certainty to have significant effects on the GHGs emissions reduction. The analysis indicates (a) lack of clear concrete instructions for effective local actions, (b) lack of funding for implementation, (c) lack of consideration of the transportation and land use connection, and (d) lack of coordination between the departments and sections at the local government, which at least partially derives from the siloization at the national level. In addition, the limited levels of coordination and cooperation result in a lack of local and regional climate actions that effectively reduce GHGs emissions in the field of transportation and land use. As a result, while most local governments prepare local action plans to meet procedural requirements, the efficacy of implemented actions remains unclear.

This study contributes to the literature on climate action planning in the transportation and land use sectors and more broadly to the literature on transportation and environmental planning, which requires more proactive planning than treating environmental impacts as outcomes of transportation planning and projects.

Globally, transit programs are linked to a range of positive outcomes for the communities in which they are located. Outcomes include improved health and greater economic security, not to mention benefits to the environment. This trend is evident within communities located in Indian Country, a term defined by the National Congress of American Indians that refers to places occupied by the tribal nations and includes reservation and trust lands, but also other lands occupied and defined by the presence of tribal peoples. Much of Indian Country is located in rural areas of the United States and is characterized by low population densities. Transit programs in such areas can provide critical services to those without access to automobiles. Yet only 27% of the federally recognized tribes in the U.S. operate transit systems. Increasing the number of tribes with transit systems has the potential to improve the quality of life of both tribal and non-tribal living in Indian Country and in adjacent areas.

Using semi-structured interviews, this research sought to identify the barriers and facilitators to the creation, maintenance, and growth of tribal transit. Forty-seven tribal transit programs within in a 9-state area (Colorado, Idaho, Montana, North Dakota, Oregon, South Dakota, Utah, Washington, and Wyoming) were identified and the staff members from these programs were recruited for participation in the study. Findings are based on feedback from 15 participants collected in 10 interview sessions totaling 11 hours. Interviews were conducted and recorded via Zoom teleconferencing software between August 2020 and March 2021.

Participants noted that reliable access to funding was essential to creating, maintaining, and growing tribal transit programs. Yet it is the partnerships with local, state, and federal agencies along with sharing of information resources by peer agencies that allow tribal services to thrive. The success of tribal transit programs may be in part due to the ability of transit staff to navigate and create networks of “people as infrastructure” as discussed and defined by Simone.

THE RESILIENCE OF TRANSIT-DEPENDENT COMMUNITIES DURING COVID-19 IN THE BOSTON METROPOLITAN AREA

Abstract ID: 1984

Individual Paper Submission

SUN, Yan [Tufts University] Yan.Sun@tufts.edu, presenting author
 JIANG, Shan [Tufts University] shan.jiang@tufts.edu, primary author

Over the past few decades, transportation systems have become increasingly complex and interdependent with other infrastructures, making them vulnerable to disruptions and challenging to recover from (Zhou et al., 2019). Therefore, incorporating aspects of resilience into system planning and operations has gained widespread attention as climate instability and security threats increase. However, public transportation has experienced severe disruption during a pandemic - from partial closures and service reductions to complete network shutdowns. It resulted in less reliable transportation systems, limiting individuals' access to destinations (Vodopivec and Miller-Hooks, 2019).

The mitigation and shock recovery potential of spatial mobility - through accessibility-based geographic connectivity and spatial openness - has been used to establish links between land use and regional activity and transportation improvements (Östh et al., 2018). While some studies have examined the spatial equity of individual accessibility, few have examined the resilience of communities and transit services in COVID-19 or how the pandemics have influenced transit accessibility.

To bridge these gaps in the literature, we focus on the vitality of transit stations in the Boston metropolitan area pre- and during- the pandemic. We measure the built environment and demographic characteristics of different neighborhoods, particularly those with transit stations, and quantify their resilience in the pandemic by measuring accessibility. With data including POI foot-traffic patterns and a data mining framework for clustering analysis of POI access within a 15-minute walkable area in the Boston metropolitan area, we explore the change of daily activities around transit stations, linking the temporal and spatial dimensions.

We found that transit ridership and the number of POI visits within a 15-minute walk of transit stations in the Boston metropolitan area decreased significantly. Both the built environment and social demographic factors played a role in the vitality around transit stations. Different combinations of POI types played a different role in transit station vitality. Finally, we provide policy recommendations and call for cities to take planning actions to mitigate the pandemic's erosion of people's accessibility, design and expand shared transit systems more equitably, and prioritize accessibility improvements.

Walk Score has been widely used for evaluating the accessibility of a location to walkable amenities, and many studies validate the measurement of Walk Score by examining its associations with walkable environmental attributes (Carr, Dunsiger, & Marcus, 2010; Duncan et al., 2011). Nevertheless, the Walk Score might be a surrogate indicator of the density of a neighborhood, which can only show the convenience of utilitarian walking rather than recreational walking (Hall & Ram, 2018). During the Covid lockdown, walking and running near the home may be attractive to people for increasing their physical activity (Hargreaves et al., 2021). Also, evidence shows that people replace utilitarian walking with recreational walking in high-income areas (Hunter et al., 2021). How people perceive and evaluate a walkable environment may also change due to the Covid-related disruptions. Thus, it is necessary to examine how subjective walkability aligns with objective Walk Score after the outbreak of Covid-19.

This study examines the divergence between subjective walkability and objective Walk Score by asking two research questions. First, where are the gaps between subjective walkability and objective Walk Score in the Eugene-Springfield metropolitan area? And second, what are the associations between individual characteristics,

neighborhood environmental factors, and the divergence between walkability and Walk Score? We conducted an online survey with a sample frame including residents in the Eugene-Springfield area and retrieved the Walk Score for the nearest intersection to each participant's home. We identified the walkability and Walk Score cluster by univariate Local Moran's I analysis and conducted a bivariate local Moran's I analysis to compare subjective walkability to Walk Score. Based on the results of spatial autocorrelation analysis, we used multilevel regression models to control the neighborhood-level variance and examine how individual- and neighborhood-level factors relate to the divergence between walkability and Walk Score. Additionally, we replicated the statistical analyses to explore the divergence between Bikeability and Bike Score.

Bivariate Local Moran's I analysis shows that some participants in the suburbs of Eugene-Springfield tend to overestimate both walkability and bikeability, with the Walk Score and Bike Score of their neighbors as references. By contrast, some participants in the high-density environment (e.g., downtown and university campus) underestimate the walkability. Regression analysis reveals that population density, beliefs in environmental policies, and the proportion of elderly and zero-car households are negatively related to the divergence between walkability and Walk Score, while median year structure built is positively associated with the gap. The mismatch suggests that planners and policymakers applying Walk Score should consider the spatial mismatch and incorporate more indicators to assess walkability comprehensively.

BLOCKCHAIN AND DISTRIBUTED AUTONOMOUS COMMUNITY ECOSYSTEMS: OPPORTUNITIES TO DEMOCRATIZE FINANCE AND DELIVERY OF TRANSPORT, HOUSING, URBAN GREENING AND COMMUNITY INFRASTRUCTURE

Abstract ID: 1991

Individual Paper Submission

RIGGS, William [University of San Francisco] william.riggs@usfca.edu, presenting author

Many global cities face transportation infrastructure that reinvestments, housing shortages and insufficient capacity to provide municipal services. Yet at the same time there is little opportunity for individual citizens to be empowered and express ownership of their own environments (Levinson, 2010; Wilker et al., 2016)—despite that many neighborhoods and local organizations have the potential to function as evolved forms of distributed autonomous organizations (DOAs) and to self-fund / create the things that they need or desire (Economist, 2022; Riggs et al., 2022).

In this light this paper evaluated a climate-oriented autonomous community ecosystem (ACE) to think about how to citizens and organizations can create change in their own streets and infrastructure using blockchain and decentralized finance. It builds on specifications for using blockchain and distributed organizations (Porkodi & Kesavaraja, 2021; Riggs et al., 2022) and evaluated a case study in East Oakland which used a decentralized rights management platform to encourage tree planting and carbon sequestration for urban street greening. Over 200 trees have planted by residents in this neighborhood using this decentralized blockchain platform.

The research finds that this kind of has the potential for quantifying citizen-based improvement of transportation infrastructure that has climate benefit. The technology has potential to enable new forms of exchange for transport and housing infrastructure, energy and many other functions that happen at the neighborhood level. Ultimately a future platform could provide this ecosystems and builds on the process flows defined herein with simple ways of

creating local economies, facilitating transactions, issuing rights and contracts and building—leading to a smarter and more transparent ways of building and running cities.

FUNCTIONAL AND AESTHETIC COSTS OF E-SCOOTERS: INSIGHTS FROM A STATED PREFERENCE EXPERIMENT ON NEIGHBORHOOD CHOICE

Abstract ID: 1192

Poster

NING, Siman [University of Washington] ningsiman@hotmail.com, presenting author
MACKENZIE, Don [University of Washington] dwhm@uw.edu, co-author

As scooters become part of the streetscape in cities, they may impose both functional and aesthetic costs on other street users and residents. We are curious what characteristics of an e-scooter deployment may impact the attractiveness of street, measured by residents' willingness to live in a particular neighborhood. We used a stated preference survey to test respondents' choice by varying the number of scooters, color of scooters, location of parking, scooter organization, and monthly rent or mortgage payment. The results suggest that level of messiness is the most important aesthetic factor for scooter parking management across all neighborhood types. The sensitivity to number of scooters is highest in low density neighborhoods and lowest in high density neighborhoods. People in different neighborhood types have different preferred parking locations, but all prefer scooters not to be on the sidewalk. The study implies that scooter management team may customize parking objectives according to neighborhood types.

AGING AND SEA LEVEL RISE: EXPLORING FUTURE ELDERLY POPULATION'S ACCESSIBILITY TO ESSENTIAL SERVICES IN HONOLULU, HAWAII

Abstract ID: 1462

Poster

LIU, Dingyi [University of Hawaii at Manoa] dingyi@hawaii.edu, presenting author
SHEN, Suwan [University of Hawaii at Manoa] suwans@hawaii.edu, co-author

Demographic studies have shown two trends: (1) elderly population is growing as a consequence of longer life expectancy (United Nations, 2020); (2) population in low elevation coastal zones will significantly increase (Neumann, 2015). One of the potential risks of living in low elevation coastal zones is the projected sea level rise. As sea level rises, more and more frequent flooding can cause disruptions and damage to the roadways in coastal areas (Shen and Kim, 2020; Lu and Peng, 2011). Seniors could be especially vulnerable to such disruptions given their need for emergency services, which could also increase because of the adverse impacts climate change has on health (Liu and Eagles, 2012). This study aims to investigate the impacts of sea-level rise on the aging population's accessibility to essential services and its implication for long term adaptation planning using Honolulu, Hawaii as a case study. Using Cohort Change Ratio (CCR), the study projects the elderly population in each Traffic Analysis Zones (TAZs) in future decades. Road segments and essential facilities (grocery stores, police stations, fire stations, and hospitals and clinics) at risk under different sea-level rise scenarios (1.1 feet, 2.0 feet, and 3.2 feet) are identified. Network connectivities from each TAZs to nearest essential services are analyzed. The results show that while the physical impacts on infrastructures are mild, some vulnerable communities' access to essential services will be greatly affected even under 1.1 feet sea-level rise scenarios. Especially some areas with a high projected density of the elderly population will be cut off to essential services due to transportation bottlenecks. For the rest of the population, sea level rise could significantly reduce the number of people with timely access to essential services. The results not only urge transportation network planners to take actions to make sure transportation connectivities to vulnerable elder population at-risk are protected, but also suggest that over the long term land use planning would be one of a key factors to adapt to climate change. These findings have broad implications for other coastal locations with similar development and growth patterns, and the methodology used could be easily adapted to be used in a variety of other metropolitan areas across the country to conduct similar vulnerability analyses to aid in adaptation planning in practice.

DISABILITY, TRAVELING, ACCESS TO OPPORTUNITIES: THE ROLE OF ECONOMIC RESOURCES

Abstract ID: 1632

Poster

KWON, Jamie [Rutgers University] jk1639@scarletmail.rutgers.edu, presenting author
RALPH, Kelcie [Rutgers, The State University of New Jersey] kelcie.ralph@ejb.rutgers.edu, co-author

Of the 43 million people with disabilities in the U.S., roughly one-third stay home on any given day (Henly and Brucker 2019). By contrast, just 13 percent of people without disabilities typically stay home. This gap in travel behavior between people with and without disabilities is often translated into limited access to out-of-home activities among people with disabilities (Páez and Farber, 2012). In investigating the transportation challenges faced by people with disabilities, most studies have focused on physical barriers, such as lack of wheelchair-accessible ramps or lifts at public transit stops (Grisé et al., 2019). A related strand of research shows that low-income households encounter

financial barriers to transportation that can restrict their access to opportunities (Morris et al., 2020). These findings are relevant in the study of disability and travel because working-age people with disabilities in the U.S. are twice as likely to be unemployed or in poverty than those without disabilities.

In this work, we explore how economic marginalization among people with disabilities may exacerbate physical barriers. For example, many wheelchair users can drive independently with a modified vehicle (e.g., with ramps, hand controls, etc.), yet modified vehicles are incredibly expensive (on average \$6,500 USD and up to \$65,000 USD) and are thus out of reach for many. Economic insecurity can compound disability. A wheelchair user with resources could purchase a modified vehicle and enjoy remarkable access to opportunities, but one without resources would have to rely on public transit or family and friends, thereby constraining their access. Thus, we argue that more research needs to explicitly examine the role of economic resources in widening or closing the gap in travel between people with and without disabilities.

Using the nationwide time-use diaries from the American Time Use Survey from 2008 to 2020, we examine five “disability gaps” in travel outcomes. We compare the travel patterns of people with and without disabilities ages between 18 and 64 based on five measures: the likelihood of 1) traveling, 2) using a car, or 3) driving on the survey day, 4) the total number of trips on the survey day, and 5) a relatively new measure of access known as the travel time price (minutes spent traveling divided by minutes engaging in out-of-home activities, where a lower value indicates greater access) (Chen and Mokhtarian, 2006).

If economic resources are indeed compounding physical barriers, we would expect larger disability gaps for individuals with low incomes and narrower gaps for those with high incomes. Similar patterns should emerge for other economic indicators like employment status and educational attainment. Likewise, marginalized racial and gender identities are likely to widen the disability gap. Based on the analysis, we find strong evidence that economic disparities do reinforce physical barriers to travel. These patterns tend to hold when disaggregating the results by an individual’s specific type of disability (mobility, vision, hearing, and cognitive disability).

Our research illustrates how disability, economic disadvantage, and traveling influence one another. We draw on our findings to suggest how supportive economic policies can complement the existing Americans with Disabilities Act of 1990, which focuses on removing physical barriers to transportation such as installing curb ramps at public transit stops.

TRIP GENERATION FOR MID-LONG-DISTANCE TRAVEL IN THE U.S. MEGAREGIONS

Abstract ID: 1740

Poster

LI, Yang [The University of Texas at Austin] yangli19@utexas.edu, presenting author

ZHANG, Ming [University of Texas at Austin] zhangm@austin.utexas.edu, primary author

The U.S. transportation statistics show that long-distance travel (>50 miles one-way) took up less than one percent of total personal trips but accounted for more than a quarter of the total personal miles traveled (PMT). The large PMT share of long-distance travel attracts widespread research interest concerning transportation-related GHG emissions. This study focuses on a submarket of long-distance travel with trips in the distance range of 50 to 600 miles one-way, hence mid-long-distance (MLD) travel. MLD travel has about three-quarters of all long-distance travel. It takes place increasingly between cities in megaregions (a megaregion comprises multiple interconnected metropolitan areas and their interdependent rural hinterlands). Nevertheless, MLD travel has not been investigated adequately due to the

lack of data and surveys targeting this market segment. As personal travel range grows beyond individual metropolitan areas, so must the research efforts to better understand megaregional travel behavior. Specifically, this study examines trip generation behavior for MLD travel in the U.S. megaregions. The study derives an MLD data set of 82,357 observations from eight national travel surveys. The data set is then combined with a passively collected big data set from SafeGraph. Personal trip rates will be regressed against a set of socioeconomic and spatial variables and calibrated to the SafeGraph data set. Weekly and seasonal trip generation patterns will be examined to gain insights into trip generation behavior beyond the daily-travel analysis framework that has been prevailingly adopted for metropolitan transportation planning. The study's findings will help develop trip generation models targeting mid-long-distance travel, shed light on weekly and seasonal trip generation patterns, and inform transportation investments and policy deliberations on megaregional transportation planning.

EVALUATING THE EFFECTIVENESS OF EXISTING INFRASTRUCTURE FOR SEA LEVEL RISE FOR THE VULNERABLE POPULATION IN NORFOLK, VIRGINIA

Abstract ID: 1834

Poster

PARK, Gina [Cornell University] yp394@cornell.edu, presenting author

Climate change and sea level rise pose great risks on the population living in coastal area. Although many mitigation strategies exist through the forms of infrastructure such as sea walls and levees (Sun, Chow, and Madanat 2021), a limited amount of studies is available that is investigating the effectiveness of such mitigation strategies, particularly for the vulnerable communities who are minority groups of people below the poverty line (Martinich et al. 2013).

The focus area of this study is Norfolk and Hampton Roads in Virginia. This study takes a mixed-method approach. First, using the data from FEMA's flood risk maps and ACS 5YR estimates in 2010 and 2020, the geographic gaps are identified between the protection areas of existing sea walls and the location of the impacted vulnerable communities from the sea level rise risks.

The research conducts a series of spatial analysis such as overlaying the layers of flood map, sea walls map, and vulnerable population map by using ArcGIS Pro. Throughout the decade, did the spatial pattern of the vulnerable populations change? Did the spatial coverage of flood zones expand? Did performance of existing sea walls increase by covering a wider range of the vulnerable population locations? Where are the potential locations in need of more infrastructure? Then, the analysis is expanded to incorporating an association with the port. Does installed infrastructure serve for the local population or industry purposes?

Finally, local needs for new infrastructure are identified by cross-checking these findings using a survey questionnaire. The surveys are electronically distributed to the local community groups. While the risk perceptions might not match with the estimated risks (Hutton and Allen 2021), the research findings could then be useful to bridge such a gap between perception and risks.

The objective of this study is to make a policy recommendation for infrastructure investment that better meet the local needs. Maps are to be used to demonstrate how equity-centered climate mitigation/adaptation strategies can improve.

FITCH, Dillon [University of California at Davis] dtfitc@ucdavis.edu, co-author

HANDY, Susan [University of California at Davis] slhandy@ucdavis.edu, co-author

Many cities around the world have embraced bike-share systems in the last decade as an important mobility option that can help cities to achieve sustainability goals (Fishman et al., 2013; National Association of City Transportation Officials, 2020). Bike-share systems can also play a role in supporting rather than competing with transit by providing an option for the first or last leg of the transit trip (Mohiuddin, 2021; Oeschger et al., 2020; Shaheen & Chan, 2016). However, growing bike share demand while providing adequate access to the service for transport disadvantaged groups is a challenge for them. A necessary, although not sufficient, condition for bike-share to provide equity benefits is if the service is available to segments of the population who struggle to afford transportation and who cannot own or use a personal car.

In this study, our research question is "how can a city grow bike-share demand while addressing social equity?". We use both statistical modeling and market segmentation approaches to answer the question. We analyzed the influence of socio-demographic and other travel and mode-related factors on the initial adoption and continuous use of the service. We also segmented bike-share users based on their socio-demographics and mode use behavior, attitude towards different travel modes and their surrounding environment for biking, concern regarding different aspects of travel, and perception towards the bike-share service. The data for this analysis come from household and bike-share user surveys in the Sacramento region.

Our statistical modeling shows that although low-income individuals and students are less likely to use bike-share, they use it more frequently compared to others when they do use it. Individuals who regularly use multiple modes of travel also use the service frequently. The results indicate that the initial adoption of the service by the transport disadvantaged groups can play a vital role in the continuous frequent use of the service.

Our market segmentation of bike-share users shows that the use of the service is primarily driven by the need for transportation rather than attitudes regarding different modes and perceptions of bike-share. More positive perceptions of bike-share are weakly associated with more frequent use of the service. Rather, we found that low-income and zero-car individuals are using the service frequently for both commuting and a variety of non-commuting purposes even though that segment has a less positive attitude towards biking and a less positive perception of different service-related aspects of the bike-share system compared to others. Our market segmentation also shows occasional users of the bike-share service are mainly those with higher incomes and individuals who have access to a personal car. We found a market segment that consists of non- and infrequent-personal bike users who mostly have low incomes and no access to a personal car; however, that segment is using the bike-share service at a greater rate for different purposes compared to regular bicyclists. This suggests that bike-share may fill an important travel gap and act as an important lever for increasing bike travel for some users.

Our results suggest that if low-income individuals, students, and multi-modal travelers make up a higher share of the bike-share user base, greater environmental sustainability benefits would be achieved. These findings suggest that increases in demand and social equity can be achieved simultaneously, counter to the common strategy of concentrating bike-share service in areas with higher incomes to maximize demand. We provide six strategies for targeting different market segments for getting new users as well as increasing use by existing users. The findings from this study can be useful in efforts to achieve social equity in bike-share service operations.

XU, Xiaomeng [University of Waterloo] x283xu@uwaterloo.ca, presenting author
CASELLO, Jeff [University of Waterloo] jcasello@uwaterloo.ca, co-author

The continuous increase of planning interventions and investments in the transport system to promote healthy, sustainable, and inclusive communities requires municipalities and planning agencies to obtain better tools, more clear and comprehensive travel data (Dean, et al., 2020). While motorized travel among people of color and immigrant groups is well defined and represented in transportation planning strategies, marginalized groups who rely on alternative modes (including carpools, transit, walking, and cycling) remain understudied (Smart, 2015). Traditional data collection and survey techniques rely heavily on respondents' memory which causes a high response burden. Beyond the challenges of high labor costs in traditional travel survey methods, a recent study in Portland-area finds that marginalized groups also face barriers of personal privacy concerns (Lubitow et al., 2019). Portland's study finds that one-day travel data is not able to fully capture the travel behaviors of the marginalized groups included in their study. In addition, walking trips and activities, specifically, are underreported and less frequently represented in conventional travel surveys. Novel data collection methods such as smartphone-based efforts including smartphone-based GPS, Bluetooth, and Wi-Fi detection have been explored to collect better quality of travel data. However, there is substantial evidence that high non-response rates have long been a challenge to obtain quality data on walking trips (Harding et al., 2018). Thus, transportation planners and researchers are eager to obtain more inclusive and comprehensive travel data to evaluate the related interventions and policies.

This study presents the result of a travel data collection survey done in the Region of Waterloo-area that includes both GPS trajectory data passively gathered from smartphones and socio-economic information collected from an online survey. This study aims to capture the short walking trips and improve the response rate by reducing the response burden of the respondents. The effort includes multi-day smartphone-based GPS travel data collection (covering two weekdays and two weekends) to capture an individual's entire travel patterns. This study concludes that comprehensive multi-day travel data can capture an individual's habit-related travel behavior such as walking route choice and pedestrian activity destinations. Short walking trips can be more easily captured by using a smartphone-based passive data collection method. The community-based recruitment method, privacy protection techniques in travel survey design, and clear user interface app design can improve the response rate of all respondent groups. The passive data collection method can be applied to different cities and communities to gather more complete and comprehensive travel data, especially the short walking trips. With these comprehensive travel data, investments and policies toward inclusive and multimodal transportation systems can be better evaluated.

UNDERSTANDING CHANGES IN COMMUTING TO CAMPUS AMID AND AFTER COVID-19: INSIGHTS FROM THE 2019 THROUGH 2021 UC DAVIS CAMPUS TRAVEL SURVEY

Abstract ID: 1935

Poster

MILLER, Ryan [University of California, Davis] rgmiller@ucdavis.edu, presenting author

JAIN, Aakansha [University of California, Davis] akjain@ucdavis.edu, co-author

As the pandemic phase of COVID-19 continues to recede in North America, researchers are beginning to better understand the pandemic's long-term effects on travel behavior and associated impacts on transportation networks. Less well understood is how pandemic-driven changes in travel mode and frequency affect employer-based efforts at transportation demand management aimed at reducing VMT and meeting climate goals. The transportation management department of our university funds an annual survey of staff, faculty, and students who regularly commute to the main campus in order to better understand transportation demand and influence its transportation demand management including parking policies, transit subsidies, and provision of bicycling infrastructure. This survey, conducted annually for over ten years, now includes rich information on travel for 2019, 2020, and 2021, spanning the timeframe before, during, and after the shift to remote campus operations amid the pandemic. Taken together, these datasets offer a rich understanding at how the pandemic influenced rates of driving, cycling, and public transit utilization in one of the most cycling-friendly locations in the United States.

Emerging survey data (Buehler & Pucher, 2021; Schaefer et al., 2021) shows that the COVID-19 pandemic had led to increases in rates of both cycling and single-occupant car commuting, and decreases in public transit use. Pre-pandemic commuting patterns at other universities has found a tendency toward car commuting even in locations with robust transit and non-motorized travel opportunities (Eluru et al., 2012). Our survey data allows for an understanding of how COVID-related changes in travel are mirrored (or not) in the context of a large university employer. Preliminary findings show that while the rate of car commuting to our campus increased dramatically during the 2020 schoolyear, rates of cycling remained high even as public transportation use cratered. More recent data from the 2021 schoolyear indicate that while public transportation use has recovered somewhat, rates of car commuting remain far above their pre-pandemic levels.

If campuses around the world hope to meet their ambitious carbon pollution reduction goals, the cumulative effects of staff, faculty, and students travelling to campus cannot be ignored. While the rapid adoption of remote work has presented an opportunity to reduce commute frequency for some, the sustained rise in the share of commute trips made by car is concerning for our post-pandemic future. Through analysis of the travel behavior of our campus community before, during, and after COVID-related shutdowns, we hope to provide insight for managing transportation demand at other large campuses and employers who can affect policies that support cycling, transit, and non-motorized commute choices.

IMPACTS OF DEMAND RESPONSIVE TRANSPORT (DRT) SERVICES ON TRAFFIC CRASHES – A CASE STUDY OF AUSTIN, TX

Abstract ID: 1946

Poster

ARIF KHAN, Muhammad [University of Texas at Arlington] muhammad.khan10@mavs.uta.edu, presenting author

ETMINANI-GHASRODASHTI, Roya [University of Texas at Arlington] roya.etminani@uta.edu, co-author

PAN, Qisheng [University of Texas at Arlington] qisheng.pan@uta.edu, co-author

Demand responsive transport (DRT) services use real-time data to provide ridesharing options to their users, who share their trips with similar origins and destinations and improve their trip reliability by reducing travel time and costs. DRT services are widely popular in the United States and many other countries around the world. Due to the advancement in technology, especially the increasing access to the internet, DRT services rapidly grew in the past and are projected to continue the uptrend in the near future. These services offer a large number of affordable trips to their riders on a daily basis and thus make a sizable share of traffic on the roads. The impacts of ridesharing services on travel patterns, congestion, and the environment have been extensively analyzed in empirical studies. However, their effect on traffic crashes has gained little attention, if not none. The existing literature on the safety impacts of various transportation services mainly focused on the impacts of availability of a service such as the ridesharing services in an area; however, we argue that the existence of a ridesharing service may not guarantee either a positive or a negative impact on traffic crashes. Rather it is the actual rate of usage of a service that has the potential to make a significant difference.

This study intends to investigate the impacts of ridesharing services on traffic crashes and injuries. We use data from RideAustin, a ridesharing service operated in Austin, TX, as our case study. We use the difference-in-difference approach to examine how the rates of ridership for RideAustin affect traffic crashes in the city at the Census block group level while controlling for sociodemographic and built-environment characteristics. In this study, we obtained data from two main sources, (1) trip level data from RideAustin, which contains the details of about 1.5 million trips from 2016 to 2017, (2) traffic crash and injury data from the Texas Department of Transportation (TXDOT)'s Crash Record Information System (CRIS) database in the period of 2012-2020 with about 373,000 crashes.

The results of our difference-in-difference models show that there is no statistically significant difference in the number of traffic crashes in the block groups with very low ridership of RideAustin, while significant and negative impacts of the service on traffic crashes are found in the block groups with high ridership rates. These findings will help to achieve a better understanding of the safety impacts of DRT services, thus enabling transportation planners and stakeholders to make appropriate policies and decisions to reduce the number of crashes in urban areas.

URBAN DESIGN IN THE STREET: AN EXPLORATION OF STREET DESIGN AND ENGAGING THE STREET AS A PUBLIC SPACE

Pre-Organized Session 13 - Summary

Session Includes 1339, 1340, 1341, 1342, 1343

GREGG, Kelly [University at Buffalo, SUNY] kgregg@buffalo.edu, organizer

In 2005 Michael Hebbert highlighted the need for urban design practice and scholarship to critically challenge street design and engage what has historically been the territory of engineering. While there have been noteworthy gains in street design since, the last few years have been exceptionally productive. This is especially true with the coronavirus pandemic upending our understandings and uses of streets and the processes behind implementation (Gregg, Hess, Brody & James, 2022; Mehta, 2020). This session brings together research that engages street and parking design from an urban design and public space perspective. Counter to the traffic engineering approach that typically prioritizes the efficiency of automobile movement and parking, street design from an urban design approach recognizes and promotes a broader spectrum of goals and opportunities for the use of the public street right-of-way. This perspective prioritizes the use of automobile oriented space for pedestrians, cyclists, and social engagement. Each paper in this session highlights the overlapping ideas of urban design and the exploration streets and parking areas as a public space.

Objectives:

- To engage and understand a variety of perspectives about streets as public spaces.

PARKING LOTS AS 'THIRD SPACES' – EXAMINING CULTURAL PLACEMAKING IN EMPLOYMENT LANDS IN THE GREATER TORONTO AREA

Abstract ID: 1339

Abstract within Pre-Organized Session 13

MANDHAN, Sneha [University of Toronto] sneha.mandhan@daniels.utoronto.ca, presenting author

HESS, Paul [University of Toronto] hess@geog.utoronto.ca, co-author

PIPER, Michael [University of Toronto] michael.piper@daniels.utoronto.ca, co-author

Large swaths of suburban lands in the Greater Toronto Area (GTA) consist of banal low-rise office buildings, warehouses, and strip malls surrounded by expansive parking lots. These lands are zoned for light-industrial and commercial uses – colloquially termed 'employment lands.' Upon a closer look, these seemingly dull spaces are home to some of the most vibrant ethno-cultural spaces within the GTA. Due to the lack of formal public spaces within urban cores that support and accommodate immigrant cultural practices, and the increasing unaffordability of land coupled with zoning regulations, 'ethnic entrepreneurs' have set up businesses in these employment lands which are now home to clusters of parking lots surrounded by ethnic restaurants, attire shops, faith-based spaces, and event spaces – all important places of gathering, shopping, and celebration for immigrant communities (Basu & Fiedler, 2017; Zhuang, 2019). With arterials streets devoted to fast-moving traffic, these parking lots become sites of extended 'third spaces' that might take place on the streets and sidewalks of more central, urban districts, especially for immigrant communities. They promote interaction and contribute to a sense of 'belonging', provide opportunities for leisure and joy, facilitate individual and collective expression, and point to a form of everyday resistance to the expectations of assimilation into the local dominant culture through the claiming of space (Main & Sandoval, 2015; Rishbeth & Powell, 2013; Yuen & Johnson, 2017; Zhuang, 2019).

Despite these sites being integral to the cultural lives of immigrant communities, they are either unacknowledged or unwelcomed as important parts of employment areas by planners. They also remain under-researched. This paper focuses on identifying the critical role that these parking lots play as public spaces that support the socio-cultural lives of immigrant communities. It asks: How do immigrant communities participate in formal and informal place-making practices in employment lands in the GTA, and how do these practices differ from the formal conceptions of these spaces by urban planners? We address these questions through a series of mixed methods, including: 1) semi-structured interviews with business owners in employment lands to understand the barriers and benefits of locating their businesses in these areas and how they use parking lot spaces for various spillover activities, 2) interviews with

urban planners involved in the creation and revision of zoning policies affecting employment lands to understand their conception of these spaces, 3) site-observations of these spaces during various festivals to observe place-making practices, and 4) discourse analysis of planning regulations affecting these parking lots to understand any formal restrictions on the uses of these lots. Initial findings indicate that during festivals and other celebrations, the parking lots serve as sites for spillover activities – they are places where restaurants set up tents to sell sweets, where visitors mingle, shop, and eat, and where the processional elements of festivals leading up to faith-based spaces take place. However, planning regulations do not yet identify these places as important sites for cultural place-making – per zoning regulations, these sites purely serve the commercial and light-industrial needs of urban populations. Through focusing on acts of place-making by immigrant communities, this paper aims to recognize and learn from community-based place-making knowledge and thus, produce inspiration for postcolonial, formal spatial planning and design practices. By exploring how ethnic businesses and communities informally adapt parking lot spaces during celebrations, this paper aims to contribute to the scholarly literature on ethnic place-making and multicultural planning by decentering the colonial narratives around cultural heritage and planning and providing recommendations that focus on designing and planning for cultural activities of minority ethno-cultural groups within the GTA.

STREET TRANSFORMATION AND THE CHALLENGE OF PUBLICNESS

Abstract ID: 1340

Abstract within Pre-Organized Session 13

MEHTA, Vikas [University of Cincinnati] mehtava@ucmail.uc.edu, presenting author

The transformation of public space, because of the pandemic, is glaringly visible in cities. There is perhaps no better place to experience this transformation than on public streets, especially main streets and others with adjoining commercial uses. During the pandemic, several cities transformed their streets to become more pedestrian-friendly by embracing numerous approaches, such as slow streets, shared streets, play streets, and the like (Mehta, 2021). Many are continuing to keep the makeshift modifications or make them permanent. These transformations of streets have been done by altering the many different parts of the street. Most notable are on-street parking spaces or space on sidewalks converted to streateries or other sitting space, widening of sidewalks, slowing streets with raised crosswalks, speedbumps and other means, and in some cases closing the street to all motorized vehicles. Transformations also include new or additional bike lanes, bike parking, and other bike infrastructure. Viewed collectively, these changes can be understood as favoring the street to the pedestrian public, bicyclists, and people using non-motorized modes. However, when examined in detail these changes can reveal if the transformations favor certain publics over others. In this paper, we closely examine the transformation of all the streets in Over-The-Rhine neighborhood in Cincinnati, OH to assess the changes in publicness from the time before the pandemic to the present.

The substantive transformation within a short time provides researchers with unique opportunities for a longitudinal study. To document the changes to the publicness of the streets we created a detailed taxonomy. We documented all the non-residential streets in Over-The-Rhine before the pandemic and twice during the pandemic – summer 2020 when temporary changes were made, and finally in the summer and fall of 2021 when most of the changes were made permanent. We conducted systematic walk-throughs to document the physical conditions and the modifications made over these three times. We recorded the modifications using Google Maps and by taking photographs of each instance of modification.

A total of 63 different modifications were made to the streets of Over-The-Rhine. We systematically categorized these into the following based on the changing publicness of the street.

- Limited public space to more public space (e.g. street changed to slow street)
- Limited public space to more public space (e.g. vehicular lane to bike lane)
- Ticketed public space to public space (e.g. parking spot/s to parklet or linear park)
- Public space to ticketed public space (e.g. sidewalk space to restaurant seating)
- Ticketed public space to ticketed public space (e.g. parking spot/s to restaurant seating)
- Limited public space to ticketed public space (e.g. vehicular street changed to full street for restaurant seating)

We found that except for the raised crosswalks, four widened sidewalks with public benches and four pedestrian-only streets, all other locations cater to an aesthetic, expect a certain decorum, and require the purchase of food, a majority of which falls under high-end dining often requiring reservations. Our detailed findings suggest that although the streets of Over-The-Rhine have been transformed to become pedestrian-friendly and lively, there is a distinct loss of publicness. Although the pre-pandemic streets were not as friendly to pedestrians the public realm was more public (Madanipour, 1996) and open to people of all socio-economic status and outlooks.

Streets are the last remaining open public spaces where a diversity of people, actions, and identities—what Davis (1990, 231) calls “democratic admixture”—are represented. The pandemic transformations are collectively altering the public realm, particularly in neighborhoods where changes are concentrated. Planners, policy makers and urban designers must be innovative in making these changes such that public space continues to belong to the multiple publics within the city.

THE FUTURE OF COVID-19-INTIATED STREET TRANSFORMATIONS: THE DESIGN, EQUITY, AND PUBLIC SPACE IMPLICATIONS OF STREET CAFÉ PROGRAMS

Abstract ID: 1341

Abstract within Pre-Organized Session 13

HESS, Paul [University of Toronto] hess@geog.utoronto.ca, presenting author

GREGG, Kelly [University at Buffalo, The State University of New York] kgregg@buffalo.edu, co-author

BRODY, Jason [Hunter College] jasonsbrody@gmail.com, co-author

Using case studies in five North American cities, this paper examines street café programs implemented during COVID-19 that reallocate street space from parking and vehicle use into restaurant zones. The paper explores: the design of interventions; the institutional processes and goals of programs and how they are evolving; the debates for their continuance or permanence; and the kinds of social equity concerns they raise including the urban social geography of where they occur and the publicness of the streets on which they are located.

Street cafés implemented during the COVID-19 pandemic represent an acceleration of the types of public street transformations reallocating space for motor vehicles into new spaces for use by pedestrians and cyclists that have been taking place in North American cities across at least two decades (Hess, Gregg, and Whitney, 2019). These strategies were quickly adapted, extended, and expanded with the pandemic as an emergency response to the need for physical distancing, and they potentially have far reaching impacts on public space (Honey-Rosés et al., n.d.). In some ways, COVID-related transformations reversed conventional understandings of public space as fostering social gathering (Gregg, et al., in-press). Instead, program goals were to allow essential workers to avoid transit, to create opportunities for socially distanced outdoor recreation, and to support the economic activity of restaurants. Implementation, however, has been very rapid and without the planning, public engagement, and permitting processes that were conventional before the pandemic. Now, two years since the beginning of the pandemic, cities have been reassessing these street interventions. Some cities are no longer pursuing them (Schmidt, 2022), and others are moving towards making what had been largely ad hoc, emergency installations into permanent ones.

This paper focuses on street cafés as one of the most profound pandemic-related transformations of urban public streets, with some cities allowing thousands of cafés where they would not have previously been allowed. These cafés have been popular but have also generated controversy in terms of their impacts on parking, street use, and surrounding neighborhood quality of life. To explore their implications, the research develops case studies in five cities chosen for their different geographic and institutional contexts: Seattle, Los Angeles, Chicago, Toronto, and New York. All have robust street café programs that have either been made permanent or are in the process of being so.

Methods include a policy review, key informant interviews with elected officials, municipal planners, local business

groups, and design and consulting firms. Where possible, local neighborhood associations are also being consulted. Initial findings include that the cities first used different approaches that are now converging. Toronto, for example, rapidly developed a program using controlled, tactical implementations, creating seasonal cafés with light materials, but New York's program was far less codified and controlled, creating substantial, year-round, enclosed "COVID-sheds." As the programs move toward permanence, Toronto is requiring up-graded designs and materials, and New York is requiring much more controlled, open-air cafés more like Toronto's. Equity issues vary substantially across cities. For example, Los Angeles engaged community organizations to promote installations in more marginalized areas, but Seattle worked through business improvement associations, creating large differentials in capacity. While initially a response to economically support restaurants and their workers, the longer-term goals and purposes of the programs are not fully articulated, and whether they may represent a new kind of privatization of public streets has received little discussion. Although representing a substantial change to public street design and the use of public space, these ongoing issues are linked to how programs were initiated as part of an emergency response and were not part of a considered planning process.

FRESNO'S FULTON STREET – FROM A PEDESTRIAN MALL TO A COMPLETE STREET: A CRITICAL ANALYSIS OF HOW FEDERAL FUNDING DRIVES STREET DESIGN AND URBAN DESIGN DECISIONS

Abstract ID: 1342

Abstract within Pre-Organized Session 13

GREGG, Kelly [University at Buffalo] kgregg@buffalo.edu, presenting author
 AMOS, David [Cal Poly, San Luis Obispo] daveamos@calpoly.edu, co-author

Fresno's Fulton Street Pedestrian Mall, like many post-war pedestrian malls from the twentieth century, struggled to maintain a lively retail environment. The pedestrian mall was plagued with high ground floor vacancy rates long before the street was redesigned. In the fall of 2017, the street redesign was completed and the long standing and originally award-winning pedestrian mall was reopened to automobile traffic. The plans for redesigning the street conceptually aligned with a complete streets strategy and the implementation was funded by a federal US Department of Transportation TIGER Grant. Broadly aligning with the complete streets concept of safely accommodating all modes and users of the street right-of-way, the TIGER Grant mandated that the street redesign also include automobile traffic (Sheehan, 2016). The city and downtown boosters touted that the street redesign as the cornerstone for the renaissance of downtown Fresno (Rodriguez-Delgado, 2017). This celebration and heightened expectation was not unlike the original opening of the pedestrian mall in 1964 (Wall, 2005). Just as federal urban renewal dollars favored building pedestrian mall projects in the post-war (Gruen, 1966), the federal TIGER grant used to renovate Fulton Street favored a complete street design concept. However, just as the pedestrian mall did not fully deliver the revitalized retail environment that was hoped for in the 1960s, the contemporary complete street redesign, at-least initially, has not realized impacts that were expected for the Fulton Street redesign.

Using Fresno's Fulton Street as a case study, this research critically questions the role of federal funding in shaping and driving street and urban design decisions in the US and the limitations of this funding to fully address the needs. These projects are multi-dimensional and complex however, we question the influence and impacts of federal funding in driving planning and design decisions. These findings can be applicable to other cities that are exploring the use of federal funds for project development. Our initial expert interviews, archival research, and policy analysis suggests the expectations of the street redesign were much more than what has been currently realized with the complete street redesign. There has also been a misalignment with the funding and the needs as there have been ongoing challenges with attracting ground floor tenants specifically on Fulton Street and with reinvestment by the building owners. This leads to questions about the impact and efficacy of the street design and if it can meet the intended

outcomes.

'SLOW YOUR ROLL': AN EQUITY-BASED ANALYSIS OF TORONTO AND LOS ANGELES' SLOW STREET PROGRAMS

Abstract ID: 1343

Abstract within Pre-Organized Session 13

BARBACUTA, Demetra [University of Toronto] demetra.barbacuta@mail.utoronto.ca, presenting author
HESS, Paul [University of Toronto] hess@geog.utoronto.ca, co-author

Using Toronto and Los Angeles (LA) as case studies, this paper examines 'slow street' programs implemented during the COVID-19 pandemic ("the pandemic"), which transformed sections of streets into shared spaces for motor vehicles, pedestrians, cyclists, and all other users of the space. This paper aims to explore both cities' 'slow street' programs, including how they defined, considered, and implemented equity and ultimately, how their experiences are being incorporated into future street design and planning.

With the introduction of physical distancing measures and altered mobility during the pandemic, street design became a part of the frontline response. The lull in motor vehicle traffic presented an increased demand for active transportation (Federation of Canadian Municipalities, 2020) with cities realizing that the pandemic could permanently change street design and provide the foundation for recovery for several years (NACTO, 2020). As a result, partial street closures (including 'slow streets') that supported walking and cycling accounted for 11% of policies and programs that responded to this altered mobility (Combs & Pardo, 2021). However, as slow streets were implemented rapidly and bypassed traditional community engagement consultation processes, concerns emerged as to whether they negatively impacted community trust and mimicked racist urban planning practices of the past (Thomas, 2020). Equity concerns were thus at the forefront of 'slow street' programs as marginalized communities often felt ignored as cities carried out these programs. As the pandemic has shifted perceptions about streets, it has presented a critical chance to evaluate 'slow streets' and observe how equity can be further embedded into street design.

Methods used in this paper include a literature review of previous street design initiatives pre- and post-COVID-19, a document analysis of city-published documents, key informant interviews with municipal planners, and mapping slow street implementations against neighbourhood social data using GIS. The initial findings paint a picture of a street design initiative that struggled to find its footing. 'Slow streets' in the two cities drew upon similar, existing street design concepts (e.g., shared spaces, woonerfs, traffic calming, and complete streets), but Toronto and LA's 'slow street' programs had different goals, geared towards creating mobility and access and creating recreational space, respectively. They were truly a pandemic initiative but do present lessons about street design in the face of emergency or piloting. Toronto's 'slow street' program has since ended but lives on in the form of active transportation, complete street, and traffic calming programs; LA's program is moving into a second phase but has since been viewed as a primer to test traffic calming countermeasures.

While both cities used very similar equity indicators (identified as access to green space, population density, and median household income), racial equity – which can be a large source of tension – was ignored. Additionally, 'slow streets' were typically pushed towards local streets rather than arterial streets, raising the question of whether these programs reached their intended purpose and targeted population. The experiences of these programs demonstrated that community engagement plays a large role in ensuring equity and while 'slow streets' were pandemic initiatives, the experience points toward the need to build relationships on the ground to build resiliency based on community need.

TRANSCENDING PUBLIC-PRIVATE BOUNDARIES: THE DUALITY OF DISCRETIONARY DESIGN REVIEW

Abstract ID: 1053

Individual Paper Submission

RICHARDSON, Robert [The University of Glasgow] R.Richardson.1@research.gla.ac.uk, presenting author

National planning policy in Scotland increasingly embraces the potential of urban design for shaping wider environmental, health, social, and economic outcomes. However, delivering design aspirations has proven challenging for local planning authorities within an austerity-hit and increasingly privatised discretionary planning system. West Dunbartonshire Council, a small local authority within a post-industrial area bordering Glasgow, has responded with a strategic investment in its 'design governance' capacity. This includes establishing a discretionary design review panel, called the Place and Design Panel, which advises on early development and policy proposals. The Place and Design Panel's voluntary membership is drawn from public and private actors working across the built environment professions, and the Panel particularly mobilises market-oriented skills and networks to influence design proposals. It therefore utilises the blurred public-private boundaries that characterise the field of urban design, where private consultants routinely work for planning authorities and private developers simultaneously. While the Place and Design Panel enhances West Dunbartonshire Council's capacity to influence urban design outcomes, an increasing reliance on private actors raises critical questions over the balance of power within local 'design governance'. This paper therefore addresses two research questions: 1) How can Scottish local planning authorities influence the urban design quality of new development? 2) How are the relationships between public and private actors shaping the local delivery of urban design?

This paper presents research from a collaborative ESRC doctoral studentship, based on a case study of 'design governance' in West Dunbartonshire. Data collection was conducted firstly through 42 semi-structured interviews, with stakeholders including public and private sector planners, volunteer members of the Place and Design Panel, developers, private consultants, and local politicians. Interviews were fully transcribed and coded, and a thematic analysis was carried out. This was supplemented with archival work using documents including planning records and committee reports, and local and national policy.

Drawing on Lipsky's conceptualisation of 'street-level bureaucracy', this paper argues that voluntary members of West Dunbartonshire Council's Place and Design Panel are novel stakeholders with significant discretion over the delivery of local authority urban design services. The Panellists often hold private motivations which transcend public-private distinctions, and their growing influence reflects a broader valorisation of private sector expertise within planning in the UK. This increasingly blurred public-private boundary is reshaping interpretations of key planning values, including notions of 'good design' and how it may serve the 'public interest', in line with the viability-driven priorities of private developers. However, the paper also identifies that West Dunbartonshire Council has harnessed market-oriented skills and networks to its advantage through the soft power exercised by its Place and Design Panel, demonstrating an inherent duality within discretionary design review practices.

This paper's findings reveal the significance of market networks to the negotiation of urban design within Scotland's discretionary planning system, where micro-level relationships between local authority planners and private consultants are deepening. Greater understanding is needed of how key planning and design values are being renegotiated alongside a growing emphasis on private sector capacity, particularly as private consultants work for local authorities and private developers simultaneously. As the role of the state within 'design governance' in the UK continues to evolve under forces of neoliberalisation and privatisation, interest in entrepreneurial governance

practices such as discretionary design review panels is likely to grow. Their informality compared to conventional subcontracting practices means further research should focus on how they influence design decisions, and whose interests are served. The duality that characterises discretionary design review panels means that while they are attractive to resource-starved local authorities, their impact on the long-term balance of power between actors within the planning system may be significant.

THE JUST PARK: PROGRAMMING PUBLIC SPACES FOR HEALING AND RECUPERATION

Abstract ID: 1091

Individual Paper Submission

YERENA, Anaïd [University of Washington Tacoma] yerena@uw.edu, presenting author
CASAS, Rubén [University of Washington Tacoma] rcasas@uw.edu, co-author

The early days of the pandemic highlighted the historical and enduring roles of parks and public spaces within urban landscapes (Honey-Rosés et al., 2020; Yerena & Casas, 2021). Likewise, parks have also played a vital role in the creation and maintenance of democratic societies (Rosenfield 1989). Separate strands of interdisciplinary scholarship (i.e., sociology, planning, urban design, landscape architecture, anthropology, rhetoric, public health) have borne these assertions out. In this project, we seek to bring these strands together in arguing that, as we move further into the 21st century, well-designed and intentionally programmed parks can be more effectively leveraged to promote a comprehensive urban sustainability.

Parks that promote a comprehensive urban sustainability are parks that offer sites of recreation and which promote health and wellbeing—and which also show up as sites for connection, inclusion, and social healing. Per Cranz (1989), “each historical model [for parks] is intended to solve a specific social problem...as societal problems evolve, the purpose of parks will evolve, and their design will be adjusted.” For Cranz, we are at the cusp of introducing a sixth model following the “sustainable park.”

Here we attempt to articulate and propose a sixth model for urban parks, one which goes beyond promoting sustainability in the face of climate change to one that fosters healing and recuperation among individuals and communities who have borne the brunt of injustice in its multiple forms. The sixth model centers environmental justice and equity in recognition that parks are and always have been social and political constructs that reflect and shape social values. Thus, the social problems cities face now can be partly solved through better designed parks that are continuously programmed to promote social change. We argue that existing and proposed urban parks in the U.S. have a vital role to play in the remedies cities are seeking as they continue to face complex and interrelated challenges related to public health, the ongoing legacies of racism, and the destructive impacts of neoliberalization.

Our arguments premise research conducted in Tacoma, Washington, in 2020–2021. Tacoma residents are meant to enjoy nearly three acres of public land set aside as parks—69 of them. Focusing on residents in Tacoma’s Central District (TCD), we conducted 45 site-based site surveys of seven parks (located within TCD) between November of 2020 and March of 2021 and 350 online surveys of TCD neighbors to understand if, when, and how residents used their neighborhood parks. From this research, we created a matrix that points to five potential functions that modern parks could play in the urban landscape; the design qualities they must prioritize; functions they will serve; and the kinds of activities they will support. This park description, the sixth model of parks, is what we term the just park.

Parks designed to meet these functions will satisfy the social, recuperative, and recreational needs of residents for whom city and urban life is isolating and marked by various exclusions.

CREATIVE SOCIAL ENGAGEMENT DURING THE COVID PANDEMIC: THE RELATIONSHIP BETWEEN THE NEIGHBORHOOD BUILT ENVIRONMENT, SOCIAL CONTEXT, AND RESIDENT CREATIVE PRACTICES IN PHOENIX, AZ

Abstract ID: 1105

Individual Paper Submission

SAADAOU, Rababe [Arizona State University] rsaadaou@asu.edu, presenting author
 EHLENZ, Meagan [Arizona State University] meagan.ehlenz@asu.edu, co-author
 PFEIFFER, Deirdre [Arizona State University] deirdre.pfeiffer@asu.edu, co-author
 JAMME, Hue-Tam [Arizona State University] hue-tam.jamme@asu.edu, co-author

The COVID-19 pandemic's stay-at-home orders and school/business shutdowns constricted people's behaviors and social interactions, elevating the role of the neighborhood in social life (Mehta, 2020). Neighborhood transportation infrastructure, including streets, sidewalks, and driveways, provided opportunities for new forms of social and creative engagement (Braus & Morton, 2020; Russell & Stenning, 2020). Adults and children used these spaces to cope with the pandemic and its disruptions through chalk drawings, messages, yards signs, and rock art. There are links between neighborhood built environment and creative social engagement. Existing literature suggests that some neighborhood built environments may better cultivate conditions needed for residents' creative expression of concerns, interests, and experiences. Little is known, however, about the variation in creative social engagement across diverse demographic, geographic, and built environment contexts.

Our research helps to fill this gap by examining how the neighborhood built environment and social context influence people's engagement in formal and informal creative expression prior to and during the COVID-19 pandemic. In particular, we use thematic, spatial, and multivariate regression analyses to explore (1) how the use of the neighborhood public realm for creative social engagement differed among three neighborhoods in the city of Phoenix with distinct demographic, housing market, and transportation conditions, (2) how the contextual differences of these neighborhoods shaped the presence, extent, and kinds of creative social engagement across the pre-pandemic and pandemic periods, and (3) the implications of these trends for residents' wellbeing and planning practice.

We expect that the design of neighborhood transportation infrastructure may shape creative social engagement. Some potentially influential factors include the presence, size, and connectivity of streets, sidewalks, and driveways. For instance, large sidewalks and/or driveways and less connective streets designs (e.g., cul de sac) may provide opportunities for engagement and encourage creative expression. Neighborhoods' social context may also shape residents' creative social engagement. Demographics and cultural conditions may result in differences in sense of control and ownership of transportation infrastructure, levels of activism, and objective and perceived vulnerabilities associated with creative social engagement. In addition, neighborhood institutions may shape creative social engagement as they may dictate the design and management of neighborhood public spaces, including streets, sidewalks, and driveways. These built and social dimensions of neighborhoods may interact to shape neighborhood cohesiveness and identity and thus help residents stay connected and engaged, especially during a period of crisis.

Overall, this research helps expand existing theories on the relationships between the neighborhood built environment and social context and creative social engagement during a global pandemic. Our findings offer insights to planners and decision makers on how to cultivate opportunities for creative expression, social cohesiveness, and identity formation across diverse neighborhoods.

THE IMPACT OF THE BUILT ENVIRONMENT ON HUMAN MOBILITY PATTERNS DURING COVID-19: A STUDY OF NEW YORK CITY'S OPEN STREETS PROGRAM

Abstract ID: 1207

Individual Paper Submission

RONG, Helena [Columbia University] hhr2112@columbia.edu, presenting author
FREEMAN, Lance [University of Pennsylvania] lancefre@design.upenn.edu, co-author

Planners, policy-makers and traffic engineers have long attempted to fashion the built environment to facilitate specific modes of transportation. In the early 20th century this meant reshaping the built environment to accommodate automobiles and other motorized transportation. More recently, as the pitfalls of an auto-centric built environment have become apparent, there has been a shift towards creating and fostering other modes of transportation, including walking. Walking does not create traffic congestion, contributes little to one's carbon footprint, and can contribute to an active and more healthful lifestyle.

For the aforementioned reasons, planners have explored shaping and reshaping the built environment to make it less auto-centric. Many cities have added bike lanes, built traffic-calming infrastructure, and worked to promote active travel as a way of mitigating the harms associated with an auto-centric built environment. Neo-traditional design, New Urbanism, and other initiatives are but a few of the efforts that evidence this shift. Encouraging walking can be done through a variety of means including public education campaigns, disincentives to driving, and building or retrofitting the built environment to be more pedestrian-friendly. This last course of action assumes that walking is contingent upon characteristics of the built environment. Thus, the question is to what extent does the built environment influence walking or more specifically, within the range of possible or plausible built environments, how much variability in walking is likely to occur?

In 2020, the Covid-19 pandemic that swept across the world has left detrimental effects on humanity. In response, cities around the world were forced into lockdowns, adapted to remote work, and enforced social distancing policies to curb the spread of the pandemic. In the wake of this global health crisis, the role of the built environment becomes increasingly important to facilitate these response measures. In New York City, policies such as the Open Streets Program (OSP) were adopted to provide space for safe social distancing practice and promote outdoor activities. Although the OSP has been largely supported by receiving communities, majority of the participating streets have stopped operating by October 2021.

This paper examines the relationship between the built environment – in particular, having more public spaces that support walking and outdoor activity – and foot-traffic mobility patterns in the case of New York City. It is guided by the research question: How do features of the built environment affect human mobility patterns during Covid-19? How effective are planning initiatives such as the Open Streets Program in New York City that are aimed at creating more space for active travel? A limitation in past research on walkability has been the issue of self-selection of residents into neighborhoods. To answer these research questions, we present an innovative use of instrumental variable design to isolate the exogenous effect of the built environment. In the first stage of the 2SLS, the listed streets are used to predict the treatment variable, which are active streets that have put up barricades to close the streets for pedestrian use. We then estimate a difference-in-differences model that compares the change in foot traffic to public points-of-interests (POI) in neighborhoods that are part of the Open Streets Program with those that are not “before and after” the start of the city-wide program.

This research can make a meaningful contribution by informing urban design practices through empirical evidence and providing actionable policy suggestions for urban design in building more resilient, sustainable, and inclusive cities. It also builds on previous work to use fine-grained location-based mobile data to analyze the effects of physical space on human behavior and health in the context of built environment design discussions for a post-Covid world.

RE-DESIGNING SUBURBIA WITH NATURE: EVALUATING GREEN SPACE CHANGES IN SPRAWL RETROFITTING PROJECTS IN THE U.S.

Abstract ID: 1230

Individual Paper Submission

PARK, Keunhyun [University of British Columbia] keun.park@ubc.ca, presenting author

Literature shows that urban sprawl causes negative outcomes for public health, society, the economy, and the environment. Recent efforts to fix those problems, often labelled as sprawl retrofitting, focus on increasing density, adding different land uses and diverse housing options, and improving walkability and environmental amenity. Preserving the natural environment and providing more green spaces are integral for sprawl retrofitting projects to achieve their goals. Nature in suburbia can provide environmental (e.g., biodiversity, air purification, water and climate regulation), socioeconomic (e.g., community events, place of cultural heritage, property value premiums) and physical and mental health benefits. But lacking in the literature is empirical evidence about if the recent projects have achieved their “regreening” goals. Some studies even show a significant loss of green space during suburban densification.

This quasi-experimental study evaluates green space changes in 68 sprawl retrofitting projects in the U.S. completed between 2001 and 2016. We compiled the project lists from two websites—Traditional Neighborhood Development and Congress of New Urbanism—and relevant literature. The difference-in-differences analysis compares multiple green space measures, including changes in total green space, green space by types, percentage of impervious area, and park area, to those in nearby neighbourhoods. We collect green space data from NLCD (30-meter resolution), NAIP (1-meter resolution), and ParkServe® (park shapefiles). Control groups are adjacent areas within 0.5-mile of the project boundary. A regression model explains the relationships between green space changes and project and neighbourhood characteristics, including project size, previous uses (e.g., residential, retail, business/industrial, public), location, years since completion, and sociodemographic attributes. The secondary data is being collected, and we plan to finish the data analysis in the summer of 2022.

We expect to find more decrease (or less increase) in green space and impervious areas and more increase in park areas in sprawl retrofitting sites compared with adjacent areas. We also expect that green space increased more in larger projects, more affluent and advantaged neighbourhoods, and areas that are further from CBD.

As a result, we share the typology and design principles of re-designing suburbia with nature. Key principles include: 1) Ensure the quality and quality of urban nature after development, 2) Focus on walkability, 3) Enhance place attachment and attractiveness, 4) Provide inclusive public spaces, 5) Increase local and regional connectivity of green space, 6) Promote environmental performance, and 7) Apply ecological design principles for biodiversity. This study evaluates the efficacy of the regreening strategies in sprawl retrofitting. Our findings call for more dedicated and coordinated efforts to provide socially and ecologically functioning green spaces when retrofitting suburbia.

THE ROLE OF GREEN INFRASTRUCTURE IN ENHANCING MICROCLIMATE CONDITIONS: A CASE STUDY OF A LOW-RISE NEIGHBORHOOD IN ABU DHABI

Abstract ID: 1239

Individual Paper Submission

ABU ALLI, Mahmoud [University of Waterloo, School of Planning] mabuali@uwaterloo.ca, presenting author
QIAN, Zhu [University of Waterloo] z3qian@uwaterloo.ca, co-author

This study focuses on the assessment and utilization of using local nature-based solutions (NbS) to enhance microclimate in neighborhood streets and the public realm in desert areas, taking Abu Dhabi, United Arab Emirates as a case study. Despite the numerous studies supporting the importance of urban landscaping using NbS, a clear design approach to demonstrate how a landscape can lessen ambient air temperature is yet to be established. Additionally, there is still a need to specify which type of tree or which design intervention is necessary to improve the urban thermal environment. Studies that have considered vegetation have highlighted the need of studying different tree species planted in streets and public open spaces and on the importance of considering tree density and their proximity, surface materials, pavements, streets, and buildings in microclimate calculations (De Abreu-Harbich et al., 2015; Aboelata & Sodoudi, 2020; Taleb & Abu-Hijleh, 2013). In this study, two methods are used, namely an on-site measurement using citizen science (volunteers who collect and/or process data in a scientific enquiry), and a numerical simulation model in the ENVI-met software. As part of a collaboration between Earthwatch (an Environmental Nonprofit Organization), HSBC and Khalifa University, a group of sixty employees from HSBC were selected as citizen scientists to collect meteorological and site data in Zaafranah, a low-density residential neighborhood with an area of 0.7 km² located in Abu Dhabi Island. Citizen scientists were first trained in a series of workshops on climate issues and data collection. The data includes the physical characteristics of trees such as tree height, crown width (crown spread/diameter), trunk height, and air temperature around trees. Data collection was carried out using photography, the Fulcrum mobile application (for geolocating and recording data of existing trees), Nikon Forestry pro Laser Rangefinder (for measuring dimensions of trees), and Testo-410 (for measuring temperature/humidity/windspeed). Data sets were then employed in ENVI-met; a three-dimensional non-hydrostatic model that simulates microscale interactions between urban surfaces, vegetation, and the atmosphere. It allows analysis of the effects of small-scale changes in urban design (e.g., trees, backyard greening, new building configurations) on microclimate under different mesoscale conditions. Three models/components are incorporated within the ENVI-met to carry out numerical simulations, namely atmospheric model, vegetation model and soil model. The data collected with citizen science had a positive impact on the input quality of the models. This was achieved by the citizen science contribution in gathering a larger dataset of air temperature and tree dimensions/locations which allowed the achievement of reliable input data by preserving consistent data values and using them in the models while eliminating the less accurate values. Moreover, this research utilizes a design-based approach focused on urban trees as NbS to propose landscaping types and layouts in low-rise residential urban areas. The research has three main aims: first, identify among the three locally available trees (Poinciana, Ghaf, and Temple trees) the species that provide the best outdoor air temperature reductions in a low-rise residential neighborhood. Second, identify the vegetation density represented by the minimum distance between trees to achieve the largest outdoor air temperature reductions. ANOVA analysis is carried out to examine the statistical significance between the trees regarding their air temperature reductions. Additionally, third, to prove the feasibility and improve the research by combining empirical data collection using citizen science with desk-based microclimate modeling. It also provides additional insights to the existing literature by considering three aspects of landscaping design: (i) size and types of trees, (ii) spacing between trees, and (iii) local landscaping regulations. Although this research contemplated particular settings, its findings are applicable to a diversity of nations, particularly those with comparable environmental and social conditions to the UAE.

DO URBAN FORM CHARACTERISTICS PERPETUATE DISPARITIES IN POI-BASED MOBILITY CHANGES DURING COVID-19? A STUDY IN FULTON COUNTY, UNITED STATES

Abstract ID: 1305

Individual Paper Submission

Urban form has long been identified as a key factor in shaping how we travel (Mouratidis et al., 2019). During COVID-19, nearly all neighborhoods in the United States showed a sharp decrease in urban traffic of all kinds (Gao et al., 2020; Google, 2020). As existing literature primarily investigated the socio-economic inequality in neighborhood's resilience to mobility change (Chang et al., 2021), the impact of the built environment is often understudied. Thus, in this paper, we seek to fill this gap by exploring the associations between urban morphological characteristics of the built environment and changes in the population's mobility pattern incurred by COVID-19 after controlling for socio-economic and demographic variables. More importantly, by providing quantitative evidence on whether and how urban form is related to such disparity, a protective effect of urban form on population mobility during a public health crisis can be argued and further interpreted.

Mobility data was obtained from SafeGraph's (2022) raw sampled cellular data of nearly 1.9M home-to-POI trips from 2019-2021 in Fulton County, Georgia. We further extracted mobility pattern metrics of each census tract by constructing aggregated statistics such as weighted average travel distance and total trips per person. Descriptive statistics indicate a 49.8% decline in annual total trips per person across the county. Due to measures taken to contain the spread, trips to specific destinations show an even larger decline, such as green space and restaurants. Although the overall average travel distance did not change much, geographic disparities show that urban tracts made longer trips to more destinations further away while their suburban counterparts cut down the travel distance instead.

Then, using Fulton Government's tax parcel, Microsoft building footprint, and Georgia DOT's Street network data, we proposed a multi-dimensional framework to quantify and assess urban form characteristics in areas of Density, Connectivity, Diversity, and Centering. The selection of variables is based on existing literature (Clifton et al., 2008; Song et al., 2013) and expert consensus. Further we performed factor analysis to reduce fifteen variables to 4 factors, each of which represents one field of urban form metrics and in total explains 75.1% of the total variance. Density and connectivity variables are highly correlated, and thus are integrated into a single factor.

Finally, we deployed OLS and spatial lag regression models to predict mobility pattern statistics by urban form factors, socio-economic status, and COVID trend variables. Spatial models are used primarily for mitigating the spatial autocorrelation effect, detected with Moran's I statistics on multiple dependent variables. With an overall R^2 around 0.4-0.6, results of the regression models show that greater density, connectivity, and diversity factors are highly associated with a fewer decline in total trips and a larger increase in average travel distance. Although it is debatable whether a longer average distance essentially represents higher capability of travelling, evidence clearly shows that living in more compact built environment leads to fewer constraints on population-level mobility during COVID-19, compared to the widespread, single land-use suburb. Potential interpretations on areas of the impact include more exposure to walking/biking infrastructure, access to public transit, and proximity to destinations. We expected a higher prediction accuracy if the short-term temporal dynamics can be better modelled with the availability of longitudinal census-tract-level COVID data such as cases or hospitality. Nevertheless, intended to be catalytic, these findings will further inspire future studies into the causality structure of urban form's behavioral impact on travel during uncertain times, and can be used by urban designers and planners to target specific areas of urban development to promote a more resilient and equitable mobility network.

STRATEGIC PRINCIPLES FOR URBAN MICRO-REGENERATION: A MULTIPLE CASE STUDY ANALYSIS OF URBAN ACUPUNCTURE PRACTICES

Abstract ID: 1310

Individual Paper Submission

XUEYAN, Bai [College of Architecture, Southeast University, China] baixueyan@seu.edu.cn, presenting author

In recent years, compared with the large-scale, capital-intensive urban regeneration models, a small-scale, incremental micro-regeneration (urban acupuncture), has shown its potential in fostering urban resilience and inclusiveness in the face of environmental, socioeconomic, and political uncertainty. However, recent studies reveal a deep-rooted division on micro-regeneration, which surfaces as a set of dichotomies that question whether urban micro-regeneration should be based on: (1) technology-led or culture-led strategy; (2) top-down or bottom-up approach; (3) mono-dimensional or integrated intervention logic ; (4) strategic planning or tactical action. These dichotomies generate a critical knowledge gap because they suggest divergent hypotheses on what principles need to be considered when implementing strategies for enabling urban micro-regeneration development. This paper starts filling such a gap by reporting on the findings of a multiple case study analysis which is conducted on Shanghai's best urban acupuncture practices from 2018 to 2022. In meeting the aim, This paper builds on previous research by proposing a theoretical framework that combines urban resilience agenda, micro-urbanism theory, and famous urban acupuncture cases from different regions of the world. Then, to test the validity of the hypotheses emerging from each dichotomy, it analyzes 14 urban acupuncture projects which have been awarded best practices by Shanghai Municipal Government.

This paper address, first, to advance this burgeoning field, more empirical case study is needed. Especially we need to focus on how urban micro-regeneration treats "urban" as an economic and social network that drives the key process of innovation, and how urban design can act as an efficient tool for promoting endogenous development by establishing proper connections between different networks and nodes in the city. Secondly, This paper formulates a set of strategic principles that cities should take into consideration to successfully design and implement urban micro-regeneration strategies: (1) take holistic strategy: Combine with smart city development, urban micro-regeneration should build an open collaboration network to accommodate as many actors as possible from governments, communities, markets, and professional institutions; (2) combine top-down (government-ed) and bottom-up (community-driven); (3) adopt an integrated intervention logic by setting local office and neighborhood planners as agents of the state; (4) build an activism strategic framework to integrate independent and decentralized acupuncture projects.

The results of this empirical analysis offer a series of critical insights into what strategic principles drive micro-regeneration development in China and generate scientific knowledge which helps to overcome the dichotomous nature of urban acupuncture research. And This paper also concludes with a discussion of how the urban micro-regeneration might serve as a boundary object, and also point out that the lack of a quantitative index system to measure the effectiveness of urban acupuncture projects may hinder micro-regeneration from playing a more stable guiding role in urban regeneration public policy.

PLANNING FOR THE POST-COVID WATERFRONT RETAIL DEVELOPMENT: A TYPOMORPHOLOGY OF GLOBAL WATERFRONT SHOPPING CENTRES

Abstract ID: 1320

Individual Paper Submission

RAO, Fujie [School of Design, Shanghai Jiao Tong University] raofujie@gmail.com, presenting author
LIU, Ruoxin [School of Design, Shanghai Jiao Tong University] lois_xin@sjtu.edu.cn, co-author

Shopping centre development has acted as a key force stimulating waterfront regeneration in cities worldwide since the late 20th century, attracting investment, facilitating nearby real estate development, and fostering vivid walking space and urban experience. The ongoing Covid-19 pandemic rendered enclosed city space vulnerable to the spread of the disease while highlighting the value of open urban space such as the waterfront (Florida et al., 2021). In this way, waterfront shopping centre development would likely see a rise in the post-Covid era.

Existing studies investigated the type, planning, finance, and socioeconomic impact of waterfront regeneration (Dovey, 2005; Gordon, 1997; Hoyle, 2000), with a focus on the Global North practice from the late 1980s to 2000s. Recent studies have examined the types and urban capacities of emerging shopping morphologies (Rao & Dovey, 2021). However, no systematic research of the morphological typology, genealogy, and urbanity of contemporary waterfront shopping centres has been conducted. Therefore, Our research goals are threefold: to identify the key

morphological types of current waterfront shopping centres, to explore the evolution of these key retail types, and to interrogate the degree to which emerging waterfront shopping centres enhance or reduce urban public life.

We applied a typomorphology of waterfront shopping centres around the globe. Our examples embody 27 shopping centres in 21 cities with a broad global spread, and the number of examples is expanding. Typomorphology conceives the type as a 'diagram' or 'pattern' that shows how some places work in general without suppressing their difference, instead of an 'archetype' or 'prototype'. We mapped shopping centres by extracting anchor or general 'shops', vehicular or pedestrian traffic 'flows', and car, pedestrian, and green 'space' from satellite images centred on shopping morphologies at the walkable scale of one-by-one square kilometre. We identified the morphological types of shopping centres, using the latest retail typomorphology by Rao and Dovey (2021).

The preliminary analysis reveals three basic spatial relations of the shopping centre to the waterfront: parallel to the waterfront (e.g., Brookfield Place in New York City), perpendicular to the waterfront (e.g., Harbour City in Hong Kong), and occupying the waterway (e.g., Canary Wharf in London). Many examples of shopping centres embody mixed shopping-water spatial relations, being more geared to the main street morphology than those with a single shopping-water relation. This said, mall-becoming-street mutants are the dominant source of the street/urban experience in the examples of waterfront shopping centres. Shopping centres occupying the waterway pose a greater challenge to the public control of shopping space compared to the other two shopping-water relations. More results and discussion would arise from further mapping and analysis. The findings could inspire a range of spatial strategies for the Post-Covid waterfront retail development, with particular implications for retail planning to tackle more sophisticated privatisation of waterfront.

INCLUSIVENESS, THE URBAN NIGHT AND URBAN DESIGN PROPOSALS IN FOUR ENGLISH TOWNS

Abstract ID: 1357

Individual Paper Submission

ROBERTS, Marion [University of Westminster] m.roberts@westminster.ac.uk, presenting author

This paper reports selected findings from a research project that brings insights from studies of the urban night into contemporary urban design theory and practice. The objective is to explore inclusion and exclusion in contemporary urban design proposals for small and medium sized towns in England through the prism of research on the urban night. Night studies has emerged as a topic as scholars, practitioners and politicians have responded to the growth of nightlife, combined with a recognition of the significance of the night-time economy (Nofre and Eldridge 2018). Interest has expanded to include other aspects of place and movement in the hours of darkness, such as ecology, lighting and night working (Shaw 2018).

Night studies scholarship reports that the night (defined in the UK as from 6pm to 6 am) occupies a substantially different time/space to the hours of daylight. Changes may occur in land-uses, activities, atmosphere and intensity, perceptions of built form, patterns of movement and in connectivity for pedestrians, cyclists and public transport users. By contrast, a literature review of urban design sources found that national design guidance makes little reference to the night as a different time/space and where it does, relies on a restricted range of stereotypes. Illustrations typically show urban scenes in bright sunlight.

The project takes four case study towns in England, Middlesbrough, Stockport, Harlow and Bicester, where the UK government is sponsoring new development. The research questions are: how does an urban design analysis of the town at night differ from the daytime? Have 'visions' for the urban night been incorporated into the proposals for new development, either through regeneration or substantial urban extensions? How inclusive are these proposals and do they respond to the diversity of the projected inhabitants and visitors and their needs?

The case study investigations have been carried out with mixed methods combining primary and secondary sources. The urban design analysis has been carried out with maps, diagrams and direct observation and the policy scrutiny includes interviews with officials and stakeholders to supplement examination of policy documents, web sources, 'grey literature' and other information.

At local level, the case study towns are expanding the night-time economy 'offer' in their centres. Each town differs with regard to their specific historical circumstances and objectives but has to operate within a common national policy framework that requires an increase in housing. The pandemic has accelerated a decline in retailing, opening opportunities to substitute leisure, entertainment, hospitality and cultural uses. The studied proposals vary from being bold and experimental aiming to attract and support a wide range of activities and diverse communities to more cautious and restrictive propositions targeted at a white, middle-income demographic. A comparison of centres is presented with regard to their relative inclusiveness.

Beyond nightlife, significant numbers of people work at night, in a diverse range of occupations (Kolioulis et al 2021). There is also a social infrastructure that is non-commercial. The urban design analysis extends beyond the town centre to capture a more holistic view of place and movement at night, presenting constraints and opportunities for residents and workers.

These findings provide further substance to Dovey's (2016) theoretical approach that unsettles static concepts of place. They extend the literature on planning the night-time city (Publica 2020). Highlighting omissions in design guidance is relevant to policy makers. An example of good practice in creating an inclusive proposition for the night-time economy is identified. The final argument is that expanding the design process to take a holistic approach to place and movement after dark across an entire town opens up more possibilities for sustainable and inclusive planning and urban design.

"WALK YOUR WHEELS IN THE DISMOUNT ZONE": COMPARING HOSTILE PUBLIC SPACE DESIGNS AGAINST AND JUST PUBLIC SPACE PROPOSITIONS FOR SKATEBOARDERS ON UNIVERSITY CAMPUSES IN THE UNITED STATES, UNITED KINGDOM, AND AUSTRALIA

Abstract ID: 1411

Individual Paper Submission

GIAMARINO, Christopher [UCLA Urban Planning] cgiamarino@g.ucla.edu, presenting author

O'CONNOR, Paul [Exeter University] oconnorpaulj@gmail.com, co-author

WILLING, Indigo [Griffith University] indigowilling@gmail.com, co-author

When a college student who skateboards approaches the entrance of the University of California, Los Angeles (UCLA), a sign greets them: "Walk your wheels in the dismount zone." As the student pedestrianizes their trip through UCLA's public spaces, they notice hostile architectural objects like skate stoppers or planters that eliminate their ability to transport themselves and recreate. Hostile designs are processes, practices, and outcomes that exclude certain user groups and their activities in the public realm through regulatory and architectural strategies (Rosenberger, 2020). Both understudied and undertheorized in planning scholarship, we assess how exclusionary designs in publicly funded and managed places affect their social, political, and architectural qualities as well as a person's right to the city (Lefebvre, 1991). Urban design processes, practices, and outcomes that implicitly or explicitly target groups for exclusion produce socio-spatial injustices that should be addressed to reimagine public spaces as sites of social and political inclusivity (Mitchell, 2003). We have two research questions. First, what do hostile designs look like at each campus and how do they function to target skateboarders socially and spatially? Second, why do universities contain hostile architecture and how do college skateboarders contend with it? We answer our research questions through an interdisciplinary approach that employs photographic cataloging of hostile designs and semi-structured conversations with college skateboarders. We compare their experiences with and contestations of exclusionary designs at UCLA in Los Angeles, California, USA, the University of Exeter in Exeter, England, UK, and Griffith University in South East

Queensland, Australia. Our approach borrows from UCLA's Urban Humanities Initiative, which fuses cultural readings of space with critiques of how places are designed. Our qualitative study is collaborative, exploratory, and iterative. Due to our positionalities as skateboarding academics who work and skate on our respective campuses, we include our personal experiences and observations to supplement photographic and conversational data. We structure our comparative analysis using Setha Low and Kurt Iveson's (2016) evaluative framework of five propositions for more just urban public spaces. These propositions include distributive justice (i.e., how material affordances are distributed), recognitional justice (i.e., how different cultural identities and practices are accepted), interactional justice (i.e., how skateboarders are welcomed in the production and consumption of built form), procedural justice (i.e., how skateboarders are represented in decision-making processes that influence public space design), and ethic of care (i.e., how skateboarders steward public space to coexist with others). Through thick descriptions of photographs, conversations with college skateboarders, and our experiential observations, we find that universities arbitrarily criminalize skateboarding and rely on nearby public spaces like plazas and skateparks to provide more inclusionary landscapes for play. Examples of hostile designs are similar across campus contexts and include restrictive signage, objects like metal brackets on handrails and benches, and campus security. In all three contexts, the way that skateboarders are targeted for exclusion violates all propositions in our just public space design framework. Despite regulatory and architectural hostility, skaters identify spatial and temporal gaps that allow them to skate on campus during weekends. Our findings reveal that publicly-funded universities mirror privately-owned public spaces through regulatory and architectural exclusion. We argue that academic institutions should include skateboarders into their urban design processes and practices to produce more just public space outcomes. We recommend the creation of on-campus skate clubs to destigmatize the activity, collaborative programming to permit skateboarding during non-school hours, and architectural interventions like angle iron on concrete ledges to curb minor property damage. We advocate for more grounded research on hostile designs so that cities can provide public spaces that are socially and spatially just.

FROM TACTICAL URBANISM TO COMMUNICATION BY DOING: STREET VENDING AND INFORMAL PLACEMAKING DURING THE COVID-19 PANDEMIC IN QUEENS, NEW YORK CITY

Abstract ID: 1452

Individual Paper Submission

DEVLIN, Ryan [Columbia University] rtd2101@columbia.edu, presenting author

Tactical urbanism is a planning approach that values direct, reversible, tactical interventions into public space as a way to start conversations over use and form (Lydon and Garcia, 2015). It asks planners to test physical interventions directly through processes of “creating”, “probing” and “exploring” (Wohl 2018). This paper argues that, although tactical urbanism represents a welcome turn toward more community engaged placemaking processes, it still centers the planner as initial actant, as the subject of verbs like “probing” and “exploring” and “creating”. Using the example of public plazas repurposed into vending markets during the COVID-19 pandemic in New York, this paper will make a case for a more radical tactical urbanism, one that views informal actions of marginalized groups as a first, legitimate word in an ongoing conversation about the use of public space. By seeing informal actions of marginalized groups as a form of communication by doing, planners can facilitate the opening of “invented spaces of citizenship” (Miraftab 2009).

During the COVID-19 pandemic many people in New York lost their jobs. A number of them, particularly undocumented immigrants ineligible for federal relief, turned to street vending to make ends meet. City officials reduced enforcement of vending regulations at the height of the pandemic, allowing vendors to congregate in plazas in immigrant neighborhoods across the city. During the pandemic conceptual and literal space was opened for experiments in public space management, as city officials largely left it to vendors to design, organize and manage the new informal vendor markets. Through interviews with vendors, city officials, and neighborhood residents, this paper will seek to understand how vendors devised and executed informal public space management strategies and will ask what can be learned from their bottom-up planning and design experiments. As the pandemic begins to recede, the city has moved to enforce regulations again, and windows for creative placemaking are beginning to close. Through in-depth discussions with management officials, this paper will also seek to draw lessons about the key challenges to flexible, tactical placemaking. Initial findings point towards a new approach to planning, one where planners, designers, and public space managers work to set frameworks and loose parameters within which actors can innovate

and create public space themselves. This has the potential to enable forms of insurgent citizenship (Holston 2008), as otherwise excluded groups show, through practice, what they need the city to be and to become.

CHILDREN'S SENSE OF LOCAL BELONGING AND PERCEPTIONS OF SAFETY IN A MULTICULTURAL APARTMENT NEIGHBOURHOOD: THE CASE OF THORNCLIFFE PARK, TORONTO

Abstract ID: 1461

Individual Paper Submission

SHADKAM, Anahita [University of Waterloo] anahita.shadkam@uwaterloo.ca, presenting author

People occupy a space, use it in a certain way, add meanings and values to that space, and make it a "place" for them. This is a process known as "placemaking", which is closely tied to the creation of a "sense of belonging" (Den Besten, 2010). These are well-studied concepts in many fields of study including urban design and planning. However, when it comes to placemaking and creating a sense of belonging within the urban public realm, a significant portion of the body of the literature focuses on adults and fails to address how children perceive and attach meanings to their local environment. This may partly be related to the common, and mostly North American, misbelief of "children do not 'belong' to urban spaces" (Horschelmann & Van Blerk, 2012).

A significant portion of children's placemaking opportunities relates to their outdoor play experiences. Previous research demonstrates that children's play experiences are not limited to what happens in the playgrounds; they play everywhere and under any circumstances (Hanssen, 2019). On the one hand, there is growing attention towards the importance of active free play in child-friendly planning research and practices. On the other hand, concerns around children's safety within the urban public realm remain a preventive factor in their active presence outdoors (Horschelmann & Van Blerk, 2012). It is apparent that if children are allowed and feel safe appearing in the urban public realm, their chances of placemaking increase, and so does their sense of local belonging.

Drawing on a case study neighbourhood in the city of Toronto, the main question of this research is "what are the correlations between the physiographic space (i.e., neighbourhood layout), chances of placemaking and levels of belonging, and children's overall perceptions of safety?" The answer to this question will inform future planning and design projects aiming for the creation of child-friendly spaces in dense urban neighbourhoods. Although minimum design standards are required, the child-friendliness of a neighbourhood should also be assessed by how effectively the neighbourhood environment is being used and loved by children. It is particularly crucial to understand children's processes of placemaking when it comes to dense urban areas with limited playspaces.

This article explores levels of local belonging and safety perceptions for children residing in Thorncliffe Park, a multicultural, high-density neighbourhood in the inner suburbs of Toronto. Thorncliffe Park has the highest population of children under 14 (27%) as compared to the city-wide percentage (15%) (Agrawal & Rutgers, 2014). In this study, the entire neighbourhood and its immediate surrounding are considered as children's realm of outdoor activities. Using systematic observations, questionnaires, and one-on-one interviews, an average day in the lives of children ages 5 – 13 (approximately) is carefully studied and popular public spaces are identified. The questions regarding safety and sense of belonging are either directly asked through questionnaires or investigated through observations and discussions with children during the interviews.

Collected data reveals that greater play opportunities and walkability of everyday destinations result in higher chances of placemaking and having a stronger sense of belonging to the local community among children. Moreover, a stronger sense of belonging to the local community improves children's perceptions of safety and the overall quality of their social presence in their neighbourhood. Therefore, a dynamic cycle exists between feelings of safety and belonging that is closely related to the frequency and quality of children's presence in the urban public realm.

THE POST-PANDEMIC "DONUT EFFECT": PLANNING OPPORTUNITIES AND CHALLENGES

Abstract ID: 1586

Individual Paper Submission

ADIKESAVAN, Manju [The Graduate Center, City University of New York] madikesavan@gradcenter.cuny.edu, presenting author

The traditional '9 to 5' office-based work clustered in downtowns and commercial business districts is evolving into distributed arrangements such as hybrid (a combination of office-based and off-site) and remote (fully off-site) work conducted at variable times of day and night and from diverse settings such as homes, co-working spaces, third places (e.g. coffee shops, parks, and public spaces), and spaces of movement (e.g., trains, buses, etc.). Distributed working, slowly but steadily growing since the 1980s, has intensified in the wake of the lockdowns and social distancing measures implemented to contain the COVID-19 pandemic. Before the pandemic, approximately 5% of US employees worked from home, and during the nationwide lockdown at the peak of the pandemic, about 50% of U.S. employees worked fully remotely. In the post-pandemic future, it is estimated that roughly 20 to 25 percent of the U.S. workforce engaged in office-based information and knowledge work will work away from the office up to two days a week.

This paper examines the planning and policymaking opportunities and challenges of the "donut effect", the flight of hybrid and remote workers to the suburbs and the hollowing out of major city centers by the intensification of distributed working (Ramani and Bloom, 2021). Distributed working marked by people working from home, in a coworking location, a café, on the train, or in a public park heralds the post-functionalist city where work-life boundaries have blurred, different functions co-exist in the same space, and unprecedented functions are subjectively and contingently ascribed to settings. This mingling of work and other activities has unsettled contemporary urban environments structured around a fixed time and place for work, regular journey-to-work patterns, and the segregation of land use. Residential suburbs are experiencing a demand for work, service, and recreational amenities previously found in commercial business districts. Conversely retail and small businesses are dwindling amidst vacant offices in city centers. Cities such as New York and London are considering converting vacant offices and hotels into housing for creating post-functional, mixed-use, live-work-play city centers. Might this open the path to similar urbanist practices and potentially advance sustainable development goals? This paper explores the outlook for post-functional planning in three parts.

Part 1 is a historic examination of North American and global planning practices for managing the built form and land use and mobility patterns of post-functional neighborhoods, cities, and metropolitan regions to identify the key topics and issues associated with implementing post-functional planning practices such as form-based code, live/work zoning, neighborhood amenities for home-based working, and building codes permitting co-working spaces within apartments and designated workspaces in homes. Part 2 uses data from the U.S. Census and Bureau of Labor Statistics and corporate and housing real estate market analysis to identify the U.S. regions that are experiencing the donut effect and most likely to benefit from post-functional planning at the metropolitan, city, and neighborhood levels. The final Part 3 presents a case study of the New York metropolitan region that examines the metropolitan, city, and neighborhood-level measures underway to alleviate the donut effect, assesses the outlook for post-functional live-work communities in the region, documents the lessons learned, and outlines directions for future research.

INFORMAL PUBLIC SPACES: A SPATIAL ETHNOGRAPHY OF URBAN INFORMALITY IN CENTRAL KOLKATA, INDIA

Abstract ID: 1603

Individual Paper Submission

MAHATO, Binita [Auburn University] bzm0054@auburn.edu, presenting author

Urban informality, characterized by unregulated informal activities and the production of space, symbolizes the urbanization patterns of contemporary urban India. The rising number of migrant populations in Indian cities leads to informal modes of income, like hawking, vending, or begging, and dwelling on the streets, sidewalks, and other public plazas and squares, increasing contestation over the use of public spaces. While such informal spaces, populations, and activities coexist with the rest of the society in tacit ways, very little is known about the production and reproduction of informal spaces. This study explores such spatial practices of urban informality by investigating how informal public spaces are produced, used, and managed through spatial ethnography in central Kolkata, India. This study encompasses two major research questions – i) what are the spatial practices of urban informality? And ii) what are the meanings and values of the informal public spaces to the informal populations? Although informal public spaces are used both for earning livelihood or dwelling, the focus of the study is the informal practices that occur in public spaces, such as streets, sidewalks, and public squares, excluding larger informal settlements such as slums. The impetus for this study is to promote the symbiotic coexistence of the formal and informal worlds for better planning, design, management, and policy implications of public spaces in India.

Kolkata is one of the most populated cities in India, which suffers greatly from public space contestations due to a huge percentage of migrant populations, powerful and vocal hawkers' unions, and decreasing open public space. This in-depth spatial ethnography of urban informality uses the Environment Behavior Study methods, including spatial surveys, direct observations, and interviews, to illustrate life in informal public spaces. The study yields three things – i) a taxonomy of informal public spaces – classification based on type, use, and location through systematic spatial surveys and walkthroughs of major informal public spaces in central Kolkata; ii) spatial mapping of urban informality and its spatial practices – illustrations of the design, plan, and spatial and temporal activities through maps, photos, and sketches of identified types of informal public spaces, and iii) oral histories – verbal and illustrative stories of contestations and challenges faced by the informal populations.

Discourse on urban informality is increasingly focusing on its spatial aspects. This study on urban informality contributes to the literature by providing spatial perspectives on the coexistence of the formal and the informal in terms of activities, legitimacy, regulation, institutionalization, and production of space; and the interaction between the formal and the informal through everyday resistance, survival strategy, conflict and resolution, and contesting rights over public space. Both coexistence and interaction have spatial implications resulting from contacts and overlaps of the formal and the informal. However, “by viewing informality as the ‘other’ and through the lens of the formal, we cannot fathom and appreciate these processes and the benefits they entail” (Mehta 2019, 239). Thus, this study perceives urban informality as the standard and new lens of understanding public space and social life in megacities, like Kolkata, in the Global South.

SOCIAL AND PHYSICAL PLAY AFFORDANCES IN NEIGHBORHOODS OF KOLKATA, INDIA

Abstract ID: 1619

Individual Paper Submission

ROY, Arindam [University of Cincinnati] arindam.daap@gmail.com, presenting author

In the Global South, the outdoor spaces for children play have been severely restricted due to rapid urbanization and densification of urban areas. The increasing degree of urbanization has negative impacts on the independent mobility of children (Kytta 2004). With the lack of urban policies for children, the contemporary children's outdoor play spaces have been limited to private gardens, front yards, public spaces, and small patches of land in the urban context that are constantly being contested. However, very few studies focus on children's play behavior, especially in the countries of the Global South. India possesses unique socio-cultural issues of the multifaceted segmented society, the emerging middle-class of consumer citizenship, and the nuclear families directing all their resources and ambitions towards the upper social mobility of their children. The paper answers the research question of how the perceived, actualized, and shaped affordances vary with changing urban setting in Kolkata, India. As of Census 2011 the city of Kolkata had a population of 4.5 million, with a density of 24,306 person per square kilometer, and only 5% of open space.

Through behavioral observations of ten play sites and interviews with 30 children (aged 7 – 13), this paper finds insight into the state of play in Kolkata. A morphological analysis of three neighborhoods (in older and newer parts of the city) and an analysis of the play behavior yields empirical knowledge about how children utilize the informal streets, temporary shops, wide-sidewalks, construction sites, and festive-structures to enhance their play in otherwise limited open spaces of a metropolitan area. In terms of play typologies, a number of formal, informal, adventurous, and imaginative forms of play were observed. Analyzing the neighborhoods in light of Gibson's (1979) theory of affordances (social and physical attributes that support play typologies), natural elements, as well as installed equipment, were found to offer opportunities for shaped affordances. A number of shaped affordances were observed based on the design of boundary walls or fences of the play spaces. The incline surfaces on the ground, sloped roofs of semi-permanent shops, and slides were found to provide shaped affordances for playing alone, climbing, and creative, competitive games. Swings or benches were also found to support multiple play type opportunities, as well as spaces of social interaction among children and teenagers. However, affordances of hiding were found to be very limited both through observations and interviews unless there were temporary festive structures present in or near the play spaces. Dynamic elements like loose bricks or stones, leaves, and inedible fruits lying on the ground were utilized by children in different ways to create new imaginative play typologies or to support other forms of traditional play. Though traffic, in general, was found to be an issue for independent children's mobility, in narrow traditional streets without sidewalks, street play was observed in abundance.

Negative affordances were found both in elements of urban design as well as in the socio-cultural context of the city. Interviews revealed the unwritten play restrictions in the neighborhood, power dynamics among various gender groups, arbitrary laws imposed by the adults of the society for their benefit, and the lack of awareness among parents about the importance of play in a child's life. The study also outlines the challenges of observations and interviews in a developing country where parents are overprotective about their children. The findings of the study will inform the urban planners and designers in India about incorporating policy guidelines for raising awareness about the importance of play in children, and will help in formulating design guidelines for neighborhoods and their play spaces to create a more children-friendly environment.

A NEW URBAN DESIGN FRAMEWORK OF INFORMAL DEVELOPMENT STAGES IDS: EXPLORING SELF-BUILD AND GROWTH IN INFORMAL SETTLEMENTS

SAMPER, Jota [University of Colorado Boulder] jota@colorado.edu, presenting author

A recurrent framework for defining informal settlements (IS) is in the singular goal of reaching formality. As such, development agencies define "Slums" as areas that "lack" expected features of the formal city (access to potable, water, sewer, land titles). Forcing the lack of (formality) framework overlooks the processes that make these urban forms and communities who live there different from traditional western perspectives of city-making and urban design. Informal settlements are the most common form of urbanization on the planet, accounting for one-third of the total urban form. By the mid-twenty-first century, up to three billion people will live in informal urban environments. However, we lack a consistent mapping method to pinpoint where that informality is located or how it expands. Despite a reported decrease in the relative proportion of the population living in informal settlements, "the absolute number of urban residents who live in slums continued to grow" The current scale of poverty on the planet has overwhelmed the capacity of the formal market to incorporate the masses of impoverished settlers arriving at urban centers all over the world.

The informal settlements' most salient morphological features are communities' self-build processes and the areas' constant growth. These features then permit the identification, mapping, and creation of geometrical models that ultimately help scholars predict informal settlements' growth. Part of the challenge of an accurate definition of informal settlements is limiting our understanding to a set of fixed characteristics regarding an urban form, which in reality is in constant flux. In this approach to understanding informal settlements, a key outcome is modeling and predicting "growth and consolidation" as a linear process. Understanding the linearity of the growth process in informal settlements is crucial to forecasting settlements' future. This predictability is critical to set up procedures and policies to design better outcomes.

New mapping tools and techniques offer insight into the second feature, which is the creation of predictive models to simulate the housing pattern of informal settlements' growth. Scholars found that informal settlements present robust configurational patterns. Urban patterns identification makes it possible to create descriptive geometric models for informal settlements and map slum geometry regarding how urban growth changes in shape and size over time. The further development of these models will permit the creation of predictions of how an informal settlement will change. Current literature on informal settlements mainly supports the idea that informal development follows a prescriptive series of stages.

Beyond recognizing stages of growth, these earlier studies tell us little about each step's particular defining characteristics. We applied Retroactive Mapping (RM) to understand these morphological changes for this research. The creation of these RM permits identifying inflection points in the evolving nature of that neighborhood. RM allows building a much more detailed picture of each of these stages. This research applies this process to settlements in Medellin, Colombia, and studies the morphological changes using RM and the lives of informal settlement dwellers over the entire timeframe through personal interviews. By merging both, a more detailed picture emerges, three stages of development as thresholds of densification that determine patterns of urban form. Furthermore, the underlying assumption is that urban form changes affect how the social networks inside these spaces respond to such variations. The Informal Development Stages (IDS) are (A) Foundation, (B) Infill, and (C) Consolidation. This framework understands urban growth as a relationship between population growth and building growth that can be separated into three unique linear stages: Foundation, Infill, and Consolidation. Each stage's characteristics set up opportunities for research and urban design in these urban forms.

URBAN SOUND DESIGN: A REVIEW AND ANALYSIS OF CURRENT NOISE REDUCTION TECHNOLOGIES USING LANDSCAPE MATERIALS.

Abstract ID: 1888

Individual Paper Submission

LIANG, Hanbing [University of Wisconsin-Madison] hliang8@wisc.edu, presenting author

This study explores the acoustical properties of landscape elements and their potential utility in noise reduction and soundscape enhancement in outdoor environments. Traditionally, environmental sound is often managed in terms of noise pollution. Common sources of noise pollution in urban environments include road traffic, railway, aircraft, construction, and animals, among others. The adverse impacts of noise pollution to human health have been well researched and documented. In 2011, it was estimated by the World Health Organization that “one million healthy lives were lost due to the burden of disease from traffic noise pollution alone in Western Europe” (World Health Organization, 2011). This measure is likely to be an underestimate if additional environmental noise sources are included (Hammer, et al., 2018). However, approaches to noise mitigation have been relatively limited in comparison to other environmental pollutants. In recent years, the concept of soundscape, which focuses on creating pleasant acoustical environments, is gaining attention. In addition to reducing noise, soundscape also recognizes the positive aspects of different sounds that exist in our environment that contributes to improved quality of life and urban experiences (Cerwén, 2016).

Landscape elements and green infrastructure are necessary ingredients in building healthy and sustainable environments. If properly designed, landscapes not only provide aesthetic value, they also contribute to minimizing environmental problems such as urban heat island effect, stormwater runoff, soil degradation, air and water pollution. However, the use of landscape elements in association with sound has not been fully explored.

This research explores and evaluates innovative strategies of integrating landscape elements in reducing noise and creating pleasant soundscapes that can be applied to both urban and rural environments (Bengtsson, Klaeboe, & Nilsson, 2015). Findings from the analysis recommend integration of emerging technologies in urban sound design and planning, beyond the use of traditional noise barrier.

JOURNEY INTO NIGHT: URBAN DESIGN, METROPOLITAN GOVERNANCE AND THE NOCTURNALIZATION OF WORK

Abstract ID: 1921

Individual Paper Submission

STERN, Justin [Yale-NUS College] justindstern@gmail.com, presenting author

Today, cities are no longer constrained by local time zones. For millions of people in the Philippines, the work day now happens at night, due to changing patterns of labor caused by globalization. What are the local, design and planning-based implications of this nocturnalization of work?

In recent years, the urban night has received renewed attention in planning scholarship. This includes explorations of night mayors as a new form of urban governance (Seijas & Gelders, 2021), the temporal expansion of urban life under conditions of late capitalism and ‘planetary urbanization’ (Shaw, 2018), and the supposed conflicts between the ‘twenty-four hour city’ and urban social order (Roberts & Eldridge, 2009). Much of this work builds off of previous scholarship on earlier historical moments which coincided with the expansion of the nighttime economy due to changing economic conditions and technological innovations (Melbin, 1978). This paper builds off of this growing body of scholarship to look specifically at increased nighttime employment in ‘white-collar’ industries located primarily in central business districts.

I focus in particular on the expansion of the Business Process Outsourcing (BPO) industry in the Philippines. BPO refers to the subcontracting of different aspects of business operations to a third party. This includes accounting, advertising, animation, health insurance claims processing, human resources, and, in particular, customer service contact centers or “call centers.” Over the previous decade, the Philippines has emerged as a global hub for the BPO sector. Today, the industry is estimated to directly employ over 1.3 million people across the country, the vast majority of whom work throughout the evening to service clients located in Europe and North America. In business districts throughout the Philippines, the socio-temporal, spatial and regulatory climate of the night have been altered to accommodate the needs of American corporations and consumers. In Metropolitan Manila in particular, entire urban districts function primarily on an American time zone, due to the clustering of the BPO industry.

The paper draws on over one year of field research conducted in the Philippines. I focus in particular on the Philippines’ largest metropolitan area, Manila, in addition to two mid-sized cities, Bacolod and Iloilo. I adopt a mixed methods approach, which includes spatial analysis, observational analysis, industry analysis and semi-structured interviews with business leaders, politicians, urban planners and night-time office workers. Through this analysis, I draw attention to how the nocturnalization of work has led to unique planning challenges, ranging from increased petty crime to the challenge of providing affordable and reliable public transportation during the evening and early morning hours. I also show how the expansion of nighttime employment in ‘white-collar’ industries is driving a new type of urban agglomeration, one in which issues of time – and the specific time zone(s) served – shape the organization of physical space, and influence urban design and planning practices. The paper concludes with a more generalizable discussion on the nocturnalization of work and its sociospatial implications.

NEIGHBORHOOD WALKING DURING COVID LOCKDOWN - UNDERSTAND THE INTERACTING EFFECTS OF ENVIRONMENTAL AND ATTITUDINAL FACTORS

Abstract ID: 1972

Individual Paper Submission

YANG, Yizhao [University of Oregon] yizhao@uoregon.edu, presenting author

LEWIS, Rebecca [University of Oregon] rlewis9@uoregon.edu, co-author

MENG, Sian [University of Oregon] sianm@uoregon.edu, co-author

Maintaining an appropriate level of physical activities is essential to human health. Americans’ physical activities come from several behavioral domains, including household responsibilities, work tasks, transport-related movements, and leisure-time activities. Correspondingly, those physical activities are realized in different settings, including one’s residence, place of work, free public space and facilities, and paid sites and facilities (Kajosaari and Laatikainen, 2020). The goal to increase Americans’ physical activities thus requires a two-pronged approach – 1. integrating physical activities in the various behavior domains and 2. enhancing the supportive properties of those behavior settings. The former relies on boosting individual’s willingness to undertake physical activities while the latter addresses environmental determinants underlying people’s behaviors. Effective intervention strategies need to be based on a good understanding of both internal (cognitive/psychological) and external (environmental) factors’ behavioral impacts. Unfortunately, comprehensive research is still limited on these factors’ effects on physical activities in different settings. A bias toward an environment-oriented approach is apparent in the healthy-place-by-design strategies currently pursued in urban planning and urban design fields (Wang et al., 2016).

Walking is the most popular way for US adults to achieve the suggested level of aerobic physical activities (CDC, 2012). Neighborhood, a loosely defined area surrounding a residential unit, provides a setting accessible to a wide range of demographic groups and for both utilitarian and leisure purposes. Neighborhoods became an even more important setting for physical activities during the 2020 COVID-19 lockdown period because of the reduced availability of many physical activity settings (e.g., gyms and parks) and the restriction imposed on people’s physical movement. Studies have shown that the COVID-19 lockdown had differential impacts on walking for utilitarian purposes versus for leisure, with the former witnessing a significant decline while the latter much less of a drop or even an increase. These differential impacts were further compounded by neighborhood sociodemographic and

environmental characteristics (Hunter et al., 2021).

The significant behavioral disruption induced by the COVID-19 lockdown presents an opportunity to study the combined effects of environmental and cognitive/psychological factors on people's walking behavior in a particular setting, the neighborhood. This paper presents a study of neighborhood walking behavior of residents in Eugene-Springfield Metropolitan Region (OR) during the 2020 COVID lockdown period. It uses data from a community survey and interviews to examine factors affecting neighborhood walking patterns based on a comprehensive social-ecological framework and via structural equation model (SEM)-based path analysis. This study also explores new environment-behavior relationships arising from the lockdown context due to changes in people's perceptions and attitudes. Preliminary results show that several built environment characteristics (e.g., density, access to retail stores, and presence of parks) typically associated with neighborhood walkability exhibited atypical effects on lockdown-period neighborhood walking behavior and those effects seem dependent on individuals' awareness of their neighborhood conditions and their attitude toward walking. Overall, COVID-19 lockdown allowed people to gain a greater level of appreciation of walking in one's neighborhood and that positive attitudinal change had increased people's willingness to overcome some environmental barriers to walking.

Knowledge and insights gained from this project will contribute to our ability to design more effective strategies for healthy-place-by-design through policies and programs involving interventions in both environmental and psychological dimensions.

NOCTURNAL URBAN HEAT ISLAND, OUTDOOR THERMAL COMFORT, AND URBAN STREET DESIGN: A BIG DATA APPROACH USING URBAN IOT WEATHER SENSOR

Abstract ID: 2050

Individual Paper Submission

JANG, Seonju [Texas A&M University] s.jang@tamu.edu, presenting author
BAE, Jinhyun [Texas A&M University] jinhyun2009@tamu.edu, co-author
KIM, YouJoung [Texas A&M University] kyj0244k@tamu.edu, co-author

Due to global warming and rapid urbanization, the frequency and intensity of extreme heat events have caused significant thermal discomfort to residents. Particularly for pedestrians, excessive heat stress has been reported as a critical barrier to walking activity. To improve outdoor thermal comfort, the daytime cooling effects of urban street design have been a major concern. Street-scale factors have been explored in terms of geometry, greenery, and building materials (Andreou, 2013; Kong et al., 2017; Kim et al., 2021), and the impact of urban morphology, layout, and the ground surface has been examined at the block-scale (Jamei et al. 2016; Lin et al. 2017). Despite their key role in mitigating urban heat conditions, only a few studies addressed the impact of urban street design on nighttime urban heat island and its association with outdoor thermal comfort.

This study explores the relationship between nighttime urban heat island and street thermal comfort. The 24-hour spatial-temporal patterns of street thermal comfort are evaluated using the COMFA model at the city scale. Urban street design that determines the difference in street thermal comfort between the daytime and nighttime is investigated. Particular attention is given to comparing the day and nighttime cooling effects of microscale street morphological and vegetated features: SVFs, HW ratio, width, direction, elevation, greenery, and block density. In addition, we explore what design features and how they affect the intensity and duration of the nighttime urban heat island. Lastly, the combined effects of design features with proximity to water bodies (i.e., river) and large green patches (i.e., mountain) are further analyzed to identify their synergies and mitigations in cooling the nighttime urban heat island.

A spatial panel regression model is adopted to estimate the street design impact on nighttime thermal comfort. Seoul, South Korea is selected considering the availability of big data on city-wide microclimate measurement and the severity of tropical night phenomena causing public health issues. Microclimate conditions at the pedestrian level are acquired from Seoul Metropolitan City, which has been collected by over 2,000 urban Internet of Things (IoT) sensors for 24-hours. MODIS and Sentinel 2 remote sensing images are collected to measure the nighttime urban heat island (land surface temperature, LST) and street greenery density (normalized vegetation index, NDVI), respectively. Street's geometrical features are measured using geospatial datasets obtained from The Korea Ministry of Land, Infrastructure, and Transport of South Korea. The nighttime COMFA energy budget model is applied to estimate human outdoor thermal comfort using microclimate variables and Sky View Factor (SVF). The SVF is an urban morphological indicator of solar access reaching to the ground and quantified using the numerical simulation tool of Urban Multi-scale Environmental Predictor (UMEP).

The pilot study results indicated that urban street geometry and greenery significantly affect the nighttime outdoor thermal comfort. We found that, for both day and nighttime, the degree of cooling effects largely depended on the size of vegetated patches. Its cooling effect on outdoor thermal comfort was boosted when its proximity to the Han River and mountains increased but was limited to within 500 meters. In terms of the street geometry, the higher SVFs and lower H/W ratio urban streets had, the higher thermal stress pedestrian had during the daytime. Meanwhile, during the nighttime, higher block densities and wider street width had larger cooling effects with improved outdoor thermal comfort. Our study findings would provide guidelines and implications on the microclimatic urban street design of how to maximize the cooling effects during the nighttime.

A STUDY ON KOREAN AGE-FRIENDLY LIVING ENVIRONMENT FEATURES THROUGH A SURVEY OF KOREAN SENIORS' PERCEPTION AND SATISFACTION WITH HOUSING AND COMMUNITY FACILITIES

Abstract ID: 1474

Poster

HAN, Seungyeon [Architecture & Urban Research Institute, S. Korea] syhan@auri.re.kr, presenting author
KO, Youngho [Architecture & Urban Research Institute] yhko@auri.re.kr, co-author

In Korea, the share of the elderly population out of the total population is expected to rise from 13.8% in 2017 to 20.3% in 2025, and 46.5% in 2067. This means that the elderly aged over 65 will be the major residents of cities. Hence, it is necessary to transform local facilities and housing into age-friendly architecture so that the elderly can lead a daily life without inconveniences. In particular, as housing is the most fundamental space in our daily life, it is important to build a space reflecting the characteristics of the aged. However, there is a lack of evidence showing specifically which parts of the current architecture are not age-friendly. This research investigated elements in homes and community facilities that give the elderly troubles in order to identify features of Korean age-friendly housing and facilities. Based on research results, this poster suggested ways of institutional improvement to create age-friendly architectural space.

To collect data, a face-to-face survey was conducted from June to July 2021 for 1,500 Koreans aged 55 to 85. Samples were organized by considering the number of senior residents and sex ratio in 16 cities/provinces.

This research derived four characteristics of age-friendly architecture. First, a bathroom in a home was found to be the most inconvenient space for the elderly where a fall occurs often. A fall was, in many cases, associated with slippery surfaces, steep slopes, and dim lighting. Second, it was found that Korean seniors (25.2%) tolerate discomfort as they do not know the costs and methods of improving housing. Third, local community facilities often used by the elderly (98.5%) were small commercial facilities. The differing use of community facilities by age group was most prominent in cultural facilities. The younger seniors prefer movie theaters while the older people favored cultural centers mostly. Fourth, about 70% of respondents desired to continue to reside in present dwellings. 50% said that even when they cannot move well, they wanted to live in their current homes with visiting care. That is, they preferred “aging in place” to keep familiar space and existing social networks.

This research derived institutional improvements in three areas to convert Korean housing and community facilities to age-friendly spaces and environments. First, it is necessary to consider changes in the promotion and eligibility of housing renovation support projects currently underway at national and local government levels. Most of the survey respondents said that they did not remodel homes to install handrails and threshold ramps either because they did not feel they are significantly inconvenient or due to financial burden. Therefore, education and promotion are advisable to allow the elderly to recognize the necessity and importance of preventing safety incidents inside residences. In addition, eligibility for government support needs to be expanded to address the level of inconvenience instead of the income level of project beneficiaries. Second, although there is a regulation regarding buildings with mandatory barrier-free designs, the scope of the regulation is limited. Thus, extending the range of buildings subject to regulation needs to be considered. The elderly found steps, sloped roads, and entrance thresholds before main entrances of commercial, medical and sports facilities the most inconvenient. Third, it is advisable to upgrade this study’s investigation to a state-led one. This poster suggests that before policies for the elderly are implemented, it is important to continue finding problems by identifying and preventing difficulties of the aged in daily lives so that they can enjoy aging in place.

STREETSCAPES AS A PART OF SERVICESCAPES: HOW CAN WALKABLE STREETSCAPES MAKE LOCAL BUSINESS MORE ATTRACTIVE?

Abstract ID: 1512

Poster

KOO, Bon Woo [Georgia Institute of Technology] bkoo34@gatech.edu, presenting author
 HWANG, Uijeong [Georgia Institute of Technology] uhwang3@gatech.edu, co-author
 GUHATHAKURTA, Subhrajit [Georgia Institute of Technology] subhro.guha@design.gatech.edu, co-author

Background: Walkable streetscapes and attractive local businesses have a reciprocal relationship. On the one hand, attractive local businesses can make cities more walkable by providing destinations to walk to. On the other hand, past studies characterized walkability by operationalizing accessibility (i.e., proximity and connectivity to various destinations) and argued that accessibility can support local businesses by attracting more customers.

What is much less discussed in the literature is how walkable streetscapes in microscale (i.e., the urban design characteristics, pedestrian infrastructures, and their quality in each street segment) may contribute to local business. Walkable streetscapes can contribute to the quality of walking experience by providing crime safety, traffic safety, and pleasurable aesthetics. Some argue that various components of walkable streetscapes can collectively contribute to place-making and be conceived as a part of the retail habitat, which then positively influences the consumers’ experience. In other words, walkable streetscapes can be part of Servicescapes – physical settings and environments that affect customers’ inference of the service quality and overall satisfaction. There is a plethora of research on the cognitive and behavioral impacts of indoor servicescapes, which can be controlled by the service organizations. The surrounding street environment, however, has been far less discussed yet is also of great import in the creation of the place-identity.

Objective: This study attempts to fill this gap by examining the relationship between customer satisfaction from Yelp

and walkable streetscapes measured from street view images, adjusting for store-specific characteristics, neighborhood-specific socioeconomic characteristics, and accessibility aspects of walkability.

Methods: Yelp rating scores for cafes, restaurants, and bars (1 being the worst; 5 being the best; 0.5 increments) were collected through API as the proxy of customer satisfaction (dependent variables). The accessibility aspect of walkability was characterized by Walk Score, distance from the city center, and population and employment density. The quality of streetscapes was measured using computer vision and Google Street View images, including traffic safety features on sidewalks (sidewalk buffers, maintenance quality of sidewalks, and bike lanes), traffic safety features at intersections (walk signals, curb ramps, and crosswalks), and crime safety (graffiti, streetlights, rundown buildings), and pleurability (building-to-street ratio, greenness, seating). The proportion of the minority population and median household income were collected as controls. Multiple linear regression models were employed to examine the correlates of Yelp rating scores.

Results: The model showed that Walk Score and population and employment density showed negative associations with Yelp rating. Distance from the city center was the only accessibility measure that showed a positive association with customer satisfaction. After adjusting for covariates, traffic safety features on sidewalks (i.e., traffic safety on sidewalks) and building-to-street ratio and greenness (pleurability) were positively associated with consumer satisfaction.

Findings: This study shows walkable streetscapes can support local businesses by providing a favorable environment that can add to customer satisfaction, even after controlling for the commonly used walkability measures. This study adds to the literature by demonstrating that walkable streetscapes in microscale can provide economic benefits that are distinct from those of accessibility-based walkable measures.

A STUDY ON KOREAN AGE-FRIENDLY URBAN ENVIRONMENT FEATURES THROUGH A SURVEY OF KOREAN SENIORS' PERCEPTION AND SATISFACTION WITH OUTDOOR SPACES AND FACILITIES

Abstract ID: 1518

Poster

CHOI, Gayoon [Architecture & Urban Research Institute, South Korea] gychoi@auri.re.kr, presenting author
KO, Youngho [Architecture & Urban Research Institute] ykho@auri.re.kr, co-author

Korea is expected to reach a higher level of aging than Japan or Western advanced countries in the early 2040s. In comparison to the rapid aging in Korea, there is a lack of response to creating age-friendly urban environments for Korean seniors. The first task to prepare Korean age-friendly cities must start with understanding the current state of responding to the super-aged society in Korea. Even though the National Survey of Senior Citizens in Korea has been conducted, the National Survey neglects actual usage and satisfaction of the elderly in the daily living facilities and places.

The purpose of this study is, therefore, to figure out how Korean urban environments prepare for the super-aged society through a survey on the perception and satisfaction of the elderly in the urban environment. The questionnaire items were drawn from the WHO Age-Friendly Cities Guide (WHO, 2007) and organized the final questionnaire items after collecting opinions from experts and practitioners. The final 76 questions related to the urban environment for Korean seniors were classified into external space and facilities, public transportation and facilities, and residential environment. The subjects of this survey were Korean seniors aged 55-84 years who have lived in the survey area (16 cities/provinces) for more than 3 years. This survey was conducted from July 23 to August 30, 2020, and a total of 1,604 elderly people responded to the survey.

The main findings are as follows. First, it was found that the pedestrian road is the most inconvenient and also the most possible place to experience a fall for Korean seniors (22.6%). It was also found that many Korean seniors (30.6%) had to go down the vehicle road instead of the pedestrian path due to illegally occupied objects such as signboards and cars. It is necessary to create a safe walking environment for Korean seniors by improving the quality of the pedestrian road, separating the walking area, and removing obstacles in the walking area. Second, it was found that there were not enough facilities and places for the elderly (25.9%) to take a break while walking. Because it is difficult for the elderly to walk long distances, it is necessary to expand resting facilities around the pedestrian road. Along with the quantitative expansion of resting facilities, the armrests and backrests need to be installed to reflect the physical characteristics of the elderly. Third, this study found that securing the crossing time was necessary to consider the walking speed of the elderly for safe walking and crossing. The elderly (13.6%) felt uncomfortable because they did not have enough time to crosswalk, and the extension of the traffic light time as an improvement point for the crosswalk showed the highest response rate. Fourth, the facilities that Korean seniors need the most within walking distance were found to be high in the order of sports facilities (29.8%), welfare facilities (24.3%), and medical facilities (18.3%). Finally, as a result of the survey on the intention to continue living in the current community, it was found that the intention to continue living in the same community was very high overall (90.0%), although there were differences by region. This suggests that efforts should be made to create an age-friendly urban environment in which the elderly can live for a long time without difficulties in the area where they have lived.

This survey study is meaningful in that it suggested a direction for improving accessibility, safety, and convenience for elderly people through major facilities and places to construct an age-friendly urban environment, such as pedestrian paths, parks, crosswalks, public toilets, rest/convenience facilities, and public transportation facilities.

SEEING STREETSCAPE AS SOCIAL INFRASTRUCTURE: A PARADIGMATIC CASE STUDY OF HORNSBERGS STRAND, STOCKHOLM

Abstract ID: 1551

Poster

JING, Jing [KTH Royal Institute of Technology] jing.jing@abe.kth.se, presenting author

Streets are an integral component of neighborhoods where people spend time every day (Mehta, 2013). Streetscapes refer to the design and conditions of roadways that impact street users and local residents. "Streetscapes are an important component of the public realm (public spaces where people interact), which help defines a community's aesthetic quality, identity, economic activity, health, social cohesion and opportunity, not just its mobility" (Victoria Transport Policy Institute, 2018). The physical and visual experience of the streetscapes influences the interactions and activities people can and do have in public space (De Vries, 2013). Robert Putman argues that social capital is a geographic concept since the relationships of people are shaped by the places in which they live. This conception lends support to an environmental argument from which Klinenberg's (2018) construct of social infrastructure stems. He argues that social infrastructure determines social capital. Although there is extensive literature on the socio-economic value of social capital, as well as its impact on health and well-being (eg. Spokane, et al. 2007), the linkage between urban design and planning and social infrastructure that builds social capital is under-explained. The present study addresses this gap by exploring how urban design enables streetscapes as social infrastructure.

The overall aim of the study is to investigate attractive urban neighborhoods undergoing densification to explore how urban design can enable streetscapes to deliver social and health benefits. More specifically, the study aims to improve understanding of how the design, management and use of streetscapes can impact the probability of social interactions and social support. The study employs a paradigmatic case study placing a case alongside a phenomenon and charting the elements of that case to elucidate the phenomenon to which it belongs. The chosen case study is the street Hornsbergs Strand, located at the waterfront in a relatively newly built dense neighborhood Hornsberg in Stockholm's inner city area. It was selected for its seemingly controversial qualities – "attractive" and "overcrowding". A mixed-methods, including literature review, document analysis, participatory observations and semi-structured expert interviews were conducted, incorporating spatial and temporal aspects. Thematic analysis was performed to analyze the data. The findings highlight the potential of urban design and planning to unlock streetscapes' potential to serve as social infrastructure, considering of both spatial and temporal aspects, to deliver social and health benefits by

facilitating more social interactions and greater social support. The implications for public policy, urban development and investment in social infrastructure employing place strategies and design interventions are discussed.

USING WALK AUDIT AS A TOOL OF CITIZEN ENGAGEMENT AND COMMUNITY-BASED SERVICE LEARNING: A CASE STUDY OF LOCAL GRASSROOTS INITIATIVE IN ARLINGTON, TX

Abstract ID: 1638

HARMJANZ, Anna Laura [The University of Texas at Arlington] annalaura.harmjanz@mavs.uta.edu, presenting author

PHAM, Tony [The University of Texas at Arlington] ttp1362@mavs.uta.edu, co-author

HE, Qian [The University of Texas at Arlington] heqian077@gmail.com, primary author

From citizen participation to citizen empowerment (Arnstein, 1967; Rocha, 1997), planning theory recognizes the importance of public engagement in urban planning practice and education, and calls for creating the capacity of engaging in the process (Nussbaum, 2013). This is especially important while the planning paradigm shifts from the rational technician to the communicative action and interactive practice in planning (Innes, 1995). More than ever, planning practice is witnessing the impact of citizen-empowered participation as well the outcome of citizen capacity building through community development projects.

This research poster provides a case study of how a student-led grassroots organization has successfully embedded citizen engagement and service learning into the local urban planning agenda through walk audit activities. A walk audit is an activity in which a team, or an individual, intentionally observes the surrounding environment in a participatory way and evaluates the condition of the walkability of the examined area. In this case, the walk audit project was a result of collaborative planning activity between the local grassroots organization, Walkable Arlington, the neighborhood association (Heart of Arlington Neighborhood Association, HANA), city council members, as well as the urban planning classroom at the University of Texas at Arlington.

In this study, we examine the initiation, process, outcome, implementation, and implication of the walk audit projects conducted from Summer 2021 to Spring 2022. Using the ArcGIS survey tool ("Survey123") and field notes, different groups of citizens and students were led by the walk audit guide to walk around multiple neighborhoods in Arlington, TX. The goal of these walk audit projects is to observe the pedestrian and walkability-related built environment and to document the observational outcome. Based on the mini-ethnography studies in the walk audit, the organization then led the citizens and students to create a final Walk Audit Report to share with the Arlington City Council and the University of Texas at Arlington. The reports present the findings upon environmental assessments and generate actionable items for the agencies, including actions requested for the short term, mid-term, and long term. As an outcome of the walk audit projects, the City of Arlington has added multiple walkability enhancement plans in response to the advocacy of the walk audit projects by the end of March 2022, including the 2022 Nathan Lowe & Downtown Sidewalk Improvements project which provides \$900,000 funding support for the sidewalk replacement and construction projects in Downtown Arlington.
