

Book of Accepted Abstracts

**ACSP 2022
Annual Conference**

This book includes the abstracts accepted for presentation at the 2022 Annual Conference. This book was completed and posted to www.acsp.org 06/14/22.

Notes about this Book

This book includes only the abstracts accepted for presentation at the 2022 Annual Conference. This book was completed and posted to www.acsp.org on June 14, 2022.

Abstract ID

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number authors should reference to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

Session Proposal ID

Organizers of groups of authors intending to submit as a pre-organized session used the abstract submission system to provide an overview or intent of the session, the name of a proposed discussant, and the authors and paper titles of those confirmed to be part of the session. The system assigned a proposal number to the grouping of these abstracts. This number stays with the session throughout the conference. When scrolling through this book and through each track, you'll find the pre-organized session proposals. Each proposal will indicate which of the abstracts in the track belong to that session. Immediately following the pre-organized session proposal are all of the numerically ordered accepted abstracts within that session. The abstract itself will also reference if it is related to a pre-organized session.

Indexes Available

Separate indexes for Author Name and Keywords reference the Abstract ID #. These indexes can be found at the end of this book.

Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract, then sorted numerically by abstract ID.

- 1) Pre-organized Session Summaries –the overview describes the intent of the session and lists the abstract ID numbers for the included abstracts.
- 2) Abstracts with the pre-organized sessions
- 3) Roundtables
- 4) Individual Paper abstracts
- 5) Posters

Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For papers (individual paper abstracts, and abstracts within pre-organized sessions) and poster abstracts** - Authors of abstracts in this book and in the final program will be indicated as presenting, primary, or co-authors of the paper. The presenting author is always listed first. No more than eight authors for one paper are included.

- **Roundtables** will have a moderator and participants. The names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will have an organizer included with the summary abstract.

Multiple Program Placement Policy

Multiple abstract submissions on behalf of one author will be reviewed and may possibly be accepted and included in this book. However, more than one presentation of a paper and more than one appearance as a roundtable participant during the conference will not be allowed on the final schedule of presentations. It is, however, possible to present both a poster and a paper, if both proposals are accepted.

Participants on the final program will be limited to:

- one presentation of a paper whether in a formed paper session, or involved in a pre-organized paper session;
- one placement on a roundtable;
- one placement as a discussant of a paper session; and
- one placement in the poster session.

These roles are not interchangeable. If you have more than one submitted paper abstract accepted and are invited to participate on more than one accepted roundtable, in fairness to everyone, we will ask you to limit your participation.

Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the text within the abstracts will not be edited. This book is edited only for formatting consistency. We do understand the importance of names; that paper titles change as time goes on; and authors are added or dropped. In these instances, any necessary changes for the final program should be sent to abstracts@acsp.org.

Searching this PDF

This document will be nearly 850 pages including the Author Index and Keyword Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard Ctrl F.

- Search by Abstract ID: Type the words *Abstract ID*: with one space followed by the number. If you try to search for just the number, you'll likely find it in many of the bibliographical references provided by authors. Sample search: "Abstract ID: 12"
- To scan an entire track, use the word *Track followed by a track number 1-16*. Sample: "Track 14". This will bring you to the beginning of the abstracts for that track.
- To get to the Author Index, search for *Author Index*
- To search by keyword, search for *Keyword* and then scroll alphabetically.

SOCIAL MEDIA BOTS: FRIEND OR FOE OF URBAN PLANNING?

Abstract ID: 1103

Roundtable

HOLLANDER, Justin [Tufts University] justin.hollander@tufts.edu, organizer, moderator
HARTT, Maxwell [Queen's University] m.hartt@queensu.ca, participant
LAURIAN, Lucie [University of Iowa] lucie-laurian@uiowa.edu, participant
WEBB, Brian [Cardiff University] webbb1@cardiff.ac.uk, participant
BARCHERS, Camille [University of Massachusetts Amherst] cbarchers@umass.edu, participant
REGAN, Wes [University of British Columbia] wesregan@student.ubc.ca, participant
SITU, Minyu [University of Texas, Austin] minyusitu@utexas.edu, participant

The rapid growth and massive uptake of social media has resulted in a surge in public interest and capacity to engage with others around key urban planning topics. Due to the low cost and high potential engagement, planners and policymakers have been quick to open electronic channels of participation to inform the decision-making process. In doing so, an opportunity for subversion from groups with alternate and possibly nefarious interests has been created. Some scholars have found that automated social media accounts have been used to further inflate the voice, and therefore influence, of subversive groups in the land development and planning process. While scholars have begun to examine how tech-savvy social media users are manipulating political discourse through the medium of Facebook and Twitter, little attention in the planning research community has considered the risks and potential benefits of these bots. This panel will debate the risks that social media manipulation and the use of bots and other forms of artificial intelligence to community engagement processes.

Planning scholars have looked to internet-enabled communities to foster better discussions and debates around community visioning and planning. Research has focused around ways that the political processes of shaping places can benefit from online community engagement and dialogue, extending the work of communicative planning scholars like Forrester (1999) and Innes and Booher (2000). While the movement of community planning processes onto online platforms has largely occurred as prophesized, the risks of such a move have largely overlooked the influence of social media manipulation, NIMBY movements and discourse around local real estate development and planning issues. In this panel, we will grapple with the costs and benefits of this bot-tainted social media engagement and chart a research agenda for planning scholars.

PLATFORM URBANISM: GROUNDING TECHNOLOGY IN PRACTICE TO UNDERSTAND ITS IMPACTS ON PLANNING PRACTICE

Abstract ID: 1122

Roundtable

VERNOOY, Madison [Toronto Metropolitan University] madison.vernooy@ryerson.ca, moderator
ROBINSON, Pamela [Toronto Metropolitan University] pamela.robinson@ryerson.ca, participant
BRAIL, Shauna [University of Toronto Mississauga] shauna.brail@utoronto.ca, participant
DONALD, Betsy [Queens University] betsy.donald@queensu.ca, participant
WACHSMUTH, David [McGill University] david.wachsmuth@mcgill.ca, participant

This roundtable gathers planning researchers whose study of platform urbanism (Barns, 2019) and the digital platform economy has resulted in case studies of platform uses in practice. There is significant and impactful scholarship about platform urbanism and its social, political and economic implications and impacts. There are opportunities for positive change in terms of new service provision, innovation, economic development and changes to urban pattern and form but we also see examples of legislative and jurisdictional friction, economic precarity, and changes to resident-city hall relationships (Brail, 2020; Donald et. al, 2021; Johnson et. al, 2020; Leszczynski, 2019; Robinson & Biggar, 2021; Sadowski, 2020; Srnicek, 2017; and Wachsmuth & Weiser, 2018). As planning researchers, we engage in research and practice which reveal the nuances of what happens when urban technology platforms are deployed in real places with real people.

This interactive roundtable will explore the following questions with the participants sharing their research findings about the use of short term accommodations, ride hailing and active transportation. The transactions enabled by digital platforms and the data they gather have had measurable impacts on housing availability, public and private transit services, and bicycle and pedestrian infrastructure in communities across North America.

- Urban platform providers contend that they produce positive change. What kinds of evidence, if any, has your research produced that verifies these claims? Do you see variation based on jurisdiction and or urban pattern/form?

- Platform firms often herald disruption as a positive outcome. What examples of disruption did you find in your research? Was it durable or episodic? Did the changes disproportionately benefit or harm particular community members? How did local governments respond?

- What are the implications of platform urbanism for planning research and practice?

- How ready are we as a profession and a community of researchers for an expansion of platform urbanism? In what ways should planning education, practice and research respond?

Throughout the roundtable audience members will also be invited to participate.

MEASURING EQUITY IN URBAN DEVELOPMENT

Abstract ID: 1154

Roundtable

WILLIAMS, Sarah [Massachusetts Institute of Technology] sew@mit.edu, organizer, moderator
ELLEN, Ingrid [New York University] ingrid.ellen@nyu.edu, participant
HERBERT, Chris [Harvard University] chris_herbert@harvard.edu, participant
NOVAK, Alison [Google] alison.novak@gmail.com, participant
KOLLAR, Justin [Massachusetts Institute of Technology] jkollar@mit.edu, participant

Local governments, community organizations, and other stakeholders involved in urban development have become increasingly interested in promoting equity in urban development. However, one major challenge common to many

equitable development initiatives is measurement. Emerging approaches that intend to promote equity and positive social impact using top-down methods of analysis have raised important questions of accountability and community involvement. For example, the U.S. Department of the Treasury's Opportunity Zone program has sought to draw private investment into marginalized communities. However, opportunity zone investments are made with little regulation or measurement for how investments would or should benefit local communities. The result, according to a report by the Urban Institute, was that most opportunity zone investments benefitted large real estate projects with questionable impacts on local businesses and residents (Theodos, González-Hermoso, and Meixell 2020). In the real estate sector, the emergence of self-reported environmental, social, and governance (ESG) reporting is a promising trend for companies to disclose their societal values to socially- and environmentally-conscious investors, but leaves much room for improvement. Hence, although limited, research on equitable approaches to real estate development has emerged (Urban Land Institute 2020), complimenting and extending equitable development guidelines targeting the public sector (Eley 2017; HUD 2016).

Developing a metric to understand equity in urban development is not new, but previous attempts struggle to collect the right data, quantify the results to make them transparent to their users allowing them to ground truth them and opening that data up for anyone to use through visualization or the provision of raw data. It is essential that planets create ways that this might be done through news tools, but the tools are not all with need, we need systems in place that begin the dialog these tools provide and accountability structures that hold real estate developers accountable for any social impact metrics they create over time. It's not only tools that help us create action with data but it is the teams who use the tools and disseminate the results which will give a metric in Real Estate Development Impact.

Yet, deciding what to measure is difficult given a diversity of stakeholder interests, variation in local government capacity to carry out policy, and the costs associated with monitoring—not to mention the added complexity given the uneven legacy of urban development. Evaluating the impact, benefits, and burdens experienced by a community can also be contentious as using such methods can lead to a disproportionate investment towards what is or can be measured at the expense of what is not or cannot be measured. Deciding how to measure is just as important as defining what should be measured—suggesting community involvement and the inclusion of qualitative criteria in addition to quantitative metrics. The promise and prospects for measuring equity in urban development certainly merit further discussion: How should such approaches to equitable development, including involvement of or leadership by the real estate sector, ensure accountability and transparency? How might we ensure that long-term costs and public access to data are manageable? How do we define the 'community' for which equity is made a priority? Finally, how might we go about implementing an alternative approach to top-down initiatives?

PLANNING FOR DIGITALLY-ENABLED CITIES AND INFRASTRUCTURES

Abstract ID: 1435
Roundtable

LASSITER, Allison [University of Pennsylvania] alass@design.upenn.edu, organizer, moderator
BEN-JOSEPH, Eran [Massachusetts Institute of Technology] ebj@mit.edu, participant
CLAYTON, Paige [Georgia Institute of Technology] paigeclayton@gatech.edu, participant

WILSON, Bev [University of Virginia] bw6xs@virginia.edu, participant

As digital technologies proliferate in the city, many planning curricula have responded with expanded course offerings in spatial data analysis and advanced analytics. Engaging with digital technologies could be interpreted more broadly than data, however. An example from practice is New York City's Internet Master Plan (Mayor's Office of the Chief Technology Officer, 2020), a sociotechnical document that includes subjects like the social consequences of the digital divide, coordination with private property owners, and developing public-private partnerships. The plan is complemented with adjacent programming, such as delivering connected devices to elderly residents and upgrading

Wi-Fi at community learning centers. Other cities, like Austin and Seattle, are similarly creating plans to define and facilitate working toward digital equity. Planners are taking many other approaches toward civic technology, too, such as: planning for smart grids and microgrids to enable rapid integration of decentralized energy sources; developing smart mobility and micromobility to improve last-mile service; deploying civic technologies that build community cohesion.

A substantial challenge to creating these digitally-enabled futures, however, is uptake and implementation by city governments. There is a persistent gap between those who develop and sell new civic tech and the needs and motivations of the people in government seeking to address different urban problems. David and McNutt (2019) discuss the gap between technology creation and implementation, suggesting that it can be bridged by urban planners. They write that new technologies will be invented by scientists and engineers, but the deployment of and access to these technologies will require plans to be written and implemented: "...we will require a group of people who have the skills that are needed to create this exciting future...We wonder if this group of professionals really exists and, if not, what we need to do to train them." (David and McNutt, 2019, 1). Already, planners are being called upon to guide implementation of new, federal broadband rules under the National Telecommunications and Information Administration (Pasi, 2022) and it is possible planners could continue to expand their role in facilitating the uptake and implementation of civic tech.

In this roundtable, we discuss how planners are teaching civic technology, beyond data analytics. We discuss how concepts that support digitally-enabled cities are being brought into existing courses, how we interact with other disciplines (e.g., computer science, electrical and systems engineering), and the development of new coursework. We ask if there are opportunities for planning curricula to narrow gaps between technology development, private interests, and the needs of city governments. In addition, we discuss the potential utility and boundaries of a new "technology planning" specialization and how this would differ from more established specializations. While JPER editors (Andrews et al., 2020) previously noted that planners have not yet participated in much of the broader discourse around smart cities, Brinkley and Hoch (2021) suggest that continued innovation and diversity of specializations is essential to the discipline's ongoing resilience.

This is the second in a proposed two-part roundtable on technology, planning, and data science. The first is organized by Prof. Adam Millard-Ball.

ROUNDTABLE DISCUSSION: URBAN DATA SCIENCE IN PLANNING

Abstract ID: 1779

Roundtable

YE, Xinyue [Texas A&M University] xinyue.ye@gmail.com, organizer, moderator
SANCHEZ, Thomas [Virginia Polytechnic Institute and State University] sanchez@vt.edu, participant
LI, Wei [Texas A&M University] wli@tamu.edu, participant

Urban communities in the 21st Century have increasingly transitioned into complex systems and systems-of-systems, consisting of many dynamically interdependent human, environmental, and technical systems. Simultaneously, advances in Information Communication Technology have been accompanied by social innovations, which continues to drive the techno-centric versus human-centric debates. Rapid growth in urbanization and intensive urban-rural interaction enables massive flows of virtual and physical elements. At the same time, an increasing number of extreme weather-driven urban hazards are a significant source of biodiversity loss, social disruption, and economic disparity, threatening the United Nations' 17 Sustainable Development Goals. This is an opportune time to explore how Urban Data Science should function and thrive in the context of planning, and vice versa, through a roundtable

discussion of planning researchers.

Track 1 Individual Paper Submissions

FORECASTING XIONG'AN NEW AREA 2035: A SCENARIO MODELING APPROACH

Abstract ID: 1012

Individual Paper Submission

XU, Boqian [University of Pennsylvania] boqianx@gmail.com, presenting author

In 2017, China's central government announced the plan of building Xiong'an as the 19th National New Area to relocate nonessential industries out of the over-occupied Beijing center city. This new town designation brought uncertainties to the 1770km² land and the vulnerable ecosystem around Baiyangdian, the largest inland lake in North China and the center of Xiong'an's political boundary. While the local planning institute released an ambitious environmental plan in 2018, scholars and practitioners expressed concerns about the potential drastic land cover changes and the conventional spatial planning approach's competency in balancing urban development and ecological preservation. What would/should Xiong'an's land cover change? And how could planners improve the conventional linear spatial planning workflow to further incorporate ecological thinking and preserve Xiong'an's vulnerable ecosystem? This exploratory and methodological research forecasts Xiong'an land cover with multiple land change models and proposes a scenario modeling approach to enhance the current spatial planning method. It delineates four potential scenarios in 2035: business-as-usual (reduced-form model), last-gen (reduced-form model), 2018-plan (empirical model), and next-gen (rule-based model). Results show that urban land would substantially increase if Xiong'an follows the development paths of either itself in the 2000s or the other new town precedents. Though the existing comprehensive plan exhibits an idealistic future land cover pattern, minimizing ecological footprint based on spatial rules is a more pragmatic scenario to protect the ecosystem. Furthermore, this research introduces a workflow revision by incorporating predictive and prescriptive scenario models into the conventional linear workflow. It recommends that designers engage with land change modeling techniques to produce scenarios as reference maps to draft spatial plans. It extends the academic discourse about Xiong'an's potential impact on the ecosystem by simulating its growth pattern with land change models. Moreover, the proposed scenario modeling approach can contribute to spatial planning practices beyond Xiong'an and China's new towns if practitioners advance workflow and skillsets responding to the global ecological preservation agenda.

USING NATURAL LANGUAGE PROCESSING TO READ PLANS: A CASE STUDY OF THE 100 RESILIENT CITIES NETWORK

Abstract ID: 1014

Individual Paper Submission

FU, Xinyu [University of Waikato] xinyuf@waikato.ac.nz, presenting author

LI, Chaosu [The Hong Kong University of Science and Technology (Guangzhou)] chaosuli@ust.hk, co-author

ZHAI, Wei [Hong Kong Baptist University] weizhai@hkbu.edu.hk, co-author

Planners need to read plans to learn and adapt current practice (Ryan, 2011). planners may struggle to find time to read and study lengthy planning documents, especially in emerging areas such as climate change and urban resilience. Recently, natural language processing (NLP) has shown promise in processing big textual data (Brinkley and Stahmer, 2021; Han et al., 2021). We asked whether planners could use NLP techniques to more efficiently extract useful and reliable information from planning documents. To answer this question, we first used topic modeling, which is an NLP technique, to analyze 78 resilience plans from the 100 Resilient Cities Network, and compared the results with those from the traditional content analysis method in order to examine how well topic modeling performs. We found that results generated from topic modeling coincided to a large extent (80%) with those from the conventional content analysis approach. Topic modeling was generally effective and efficient in extracting the main information of plans, whereas the content analysis approach could find more in-depth details but at the expense of considerable time and effort. We further propose a transferrable model for cutting-edge planners to more efficiently read and study a large collection of plans using machine learning. In summary, NLP represents a valuable addition to the planner's toolbox. Topic modeling coupled with other NLP techniques can help planners to effectively discover key topics in plans, identify planning priorities and plans of specific emphasis, and find relevant policies.

MOVING FROM PANDEMIC ADAPTATION TO A MAINSTREAM METHOD: LESSONS FROM AN EXPERIMENT IN REMOTE PHOTOVOICE IN ONE SETTLEMENT IN ACCRA, GHANA

Abstract ID: 1035

Individual Paper Submission

NORONHA, Kimberly [University of Pennsylvania] knoronha@upenn.edu, presenting author

QUARTEY, Nii Kwartelai [Independent Researcher] niikwartelai79@gmail.com, co-author

The COVID-19 pandemic disrupted lives and research. For our research question, "how does participants' relationship with the state define their lived experience of informality?", participant observation was the ideal methodological fit. However, this was rendered impossible during the pandemic, and we had to adapt from in-person to a remote method. This paper discusses our experience adapting from participant observation to remote photovoice over the last eighteen months in Ga-Mashie, Accra, Ghana, making the case for adding this to the researchers' and practitioners' toolbox post-pandemic.

Our adaptation needed to consider a remote mode, long-term participant engagement, and an exploratory research question. The pandemic forced us to maintain physical distance, which we bridged with smartphones. Travel restrictions did not allow pre-scheduled travel or neatly defined timelines. Other non-pandemic limitations still held: Our research participants are women in communities traditionally distrustful of researchers, often technologically disempowered, and whose participation meant time away from their livelihoods. These limitations and requirements called for adapting the traditional photovoice process to consider limitations of distance, fluid timelines, building

trust, and empowering participants technologically while working around their routines. All this needed to be done while getting us as close as possible to the data that participant observation could generate.

While photovoice has long been used in public health research, its adaptation to planning has been relatively limited and recent. Methodologically, photovoice empowers the marginalised, both, in society and in research. As such, it is also suited to planning's endeavour towards community, equity, and empowerment. Traditionally, photovoice researchers solicit participants, train them to use cameras, and engage them over sessions to take photographs. Based on the research question and context, participants then reflect on selected photographs. Researchers schedule reflection sessions quickly after participants take the pictures to facilitate recall. Reflections are usually tailored around the SHOWeD method asking participants to reflect on what they see, relating it to their lives and the research question.

We adapted our methodology in two ways. First, we looked to photovoice to compensate for the loss of in-person participant observation. Second, we adapted photovoice from an in-person to a remote method, using smartphones for both photography and communication. Our adaptation uses what we call a staccato engagement i.e., curating a long-term dialogue with short bursts of engagement. This was particularly useful when engaging participants who work informally with fluid schedules and varying comfort levels with technology. We worked around their schedules, recording life and its pandemic interruptions. We dynamically co-developed this process with participants who used their phone's voice recorder to reflect as they took photographs, providing us with rich real-time qualitative observations. This was particularly useful because we could not convene reflection interviews immediately after participants took photographs, as in traditional photovoice.

We see the usefulness of this method to planners looking to engage marginalised voices, particularly in the global south. By its very nature, photovoice allows insurgent voices to emerge in the research process. Community engagement is often solicited through focused group discussions requiring skilled facilitators to ensure all representation in the discussions. This is not a guarantee, and planners find it difficult to give voice to the marginalised. One critical advantage was the privileging of the participants' perspective rather than just the researcher's through remote photovoice. Additionally, this adaptation allowed for a staccato engagement with participants, particularly where people don't have regular working hours. Our experience holds that remote photovoice specifically allows researchers and planners to target both, marginalized communities, and the marginalized voices within those communities. Thus, it is uniquely placed to be a methodology for equity and advocacy planning.

WHERE DO PEOPLE MEET? TIME-SERIES CLUSTERING FOR SOCIAL INTERACTION LEVELS IN DAILY-LIFE SPACES DURING THE COVID-19 PANDEMIC

Abstract ID: 1065

Individual Paper Submission

LU, Yougeng [University of Southern California] yougengl@usc.edu, presenting author
GIULIANO, Genevieve [University of Southern California] giuliano@usc.edu, co-author

The persistence of spatial segregation with respect to income and race is well documented. However, assessment of spatial segregation in daily activities is challenging due to the limited availability of human movement data. With the ubiquitous availability of mobile phones and location-based service applications, human movement data has become widely available. It is now possible to explore spatial interactions and assess the extent of social segregation in daily activity spaces. Using Los Angeles County as our case study, we perform a temporal analysis by conducting K-means time-series clustering using mobile phone data to examine social interaction levels among various sociodemographic

groups during the COVID-19 pandemic. Selected sociodemographic variables are assessed among the identified time-series clusters. We find a strong association between sociodemographic characteristics and social interaction levels, potentially leading to disparate exposures to the risk from COVID-19. Socially disadvantaged populations tend to be more segregated from other groups in daily activities, and the COVID-19 pandemic increased the disparity. Low-income and ethnic minority populations became more isolated from whites and the more economically affluent during the COVID-19 pandemic. Policies that aim to encourage social interactions and mitigate segregation effectively should further consider people's sociodemographic variables and relevant neighborhood characteristics.

Many older cities confront the problem of long-term declines in population and economic activity in certain neighborhoods which have resulted in blighted conditions that make conventional revitalization initiatives based on increased residential and commercial development unlikely to succeed. Planning scholars have developed a theory of smart shrinkage in which emphasis is placed on non-residential land uses that can maintain and improve quality of life while positioning some land for future growth-oriented activities. Smart shrinkage research and practice involves application of methods from information technology and decision science to identify vacant and abandoned parcels for acquisition and redevelopment for alternative uses in such a way as to meet multiple social and economic goals while respecting myriad resource constraints. This presentation addresses the following questions: How do planning practitioners conceptualize the problem of smart shrinkage? In what ways do the decision processes they apply in practice diverge from the theory of decision modeling? How can planners make most appropriate use of information and decision sciences to develop sustainable and politically-feasible strategies for smart decline?

In this presentation, we will describe a new approach to citizen-engaged, community-focused planning methods and technologies for cities and regions facing decline, disinvestment, shrinkage, and social and physical distress. The presentation will discuss our research into the benefits and costs of a wide range of analytic approaches for designing policy and planning interventions for shrinking cities and distressed communities. These include collaborative planning, social media, civic technology, game design, analytics, decision modeling and decision support, and spatial analysis. We will present case studies of three US cities addressing shrinkage and decline, with a focus on issues of social justice, democratization of knowledge, and local empowerment.

We employed a rigorous case study methodology to examine three cities: Fall River (MA), Baltimore (MD), and Flint (MI). We drew on Yin (2018) where we employed multiple research methodologies to achieve triangulation around key concepts and ideas: interviews with at least two officials in each city, review of the extant literature on each city, and review of contemporary policy/planning issues and initiatives in newspapers and policy reports.

Our findings suggest a planning approach that puts community engagement and empowerment at the center, combined with data and technology innovations. We argue that decisions informed by qualitative and quantitative data and analytic methods, implemented through accessible and affordable technologies, and based on notions of human dignity, local impact and social justice, can enable residents to play a leading role in the positive transformation of shrinking cities and distressed communities. We reflect on the applicability of our US-focused

research program to other locales facing shrinking cities and economic decline.

Walkability indices, which comprise walking-related neighborhood environmental features, are widely used in numerous empirical studies and practical fields. However, a few researchers have pointed out its validation that partially reflects perceived walkability. Several studies have contended that lacking design-related features, which are mainly a micro-scale element, is the primary culprit in this issue. Although the important role of micro-level features in walking behavior has been theoretically established, verification of their significance in perceived walkability is scarce due to the absence of available data sources and methodologies. To fill this gap, we develop a new walkability index using Google Street View and semantic segmentation. The index captures micro-level features based on the Urban Design Qualities protocol. This study investigates the limitations of the conventional walkability indices by focusing on the lack of micro-level features. The outperformance validation tests confirm that the new index is superior to the conventional walkability indices in terms of reflecting perceived walkability. Overall, the new index provides urban planners and analysts with an improved metric to capture micro- and macro-level built environmental features for planning research and practice. This research indicates the need for new walkability indices that include micro-level features to clarify the influence of walkability on various urban outcomes.

SMART CITIES IN THE LONG TWENTY-FIRST CENTURY

POTTER, James [Korea University] cuzpotter@korea.ac.kr, presenting author

This paper builds on Arrighi's analysis of systemic cycles of accumulation to position smart cities within the emerging cycle. He originally posited that the evolution of the world capitalist system on an ever wider geographical base has passed through four systemic cycles of accumulation in which capitalist and territorialist actors organized and reorganized themselves to overcome the limitations of the previous cycle. While capitalists employ territory only to the extent that it increases capital accumulation, territorialists employ capital only as a means to expanding territory. He also demonstrates that historic phases of world capitalism have alternated through extensive phases in which the territory encompassed by the system was expanded and intensive phases in which the system became deeper and more intricately structured.

Drawing on Zuboff (2020), this paper claims that the emerging systemic cycle of accumulation centers on surveillance capitalism, a strategy of capital accumulation that relies on maximal extraction of behavioral surplus to generate and exploit predictive behavior and typified by the large internet platform firms (e.g., Meta and Alphabet). The paper first argues that these firms have built on the transnational strategies of the US-led phase of accumulation to supersede the US regime through a new fusion of the territorial and capitalist logics of power. As firms, these platforms clearly embody the capitalist logic of power in which territory serves simply to expand profits. In keeping with Arrighi's implication that the new systemic cycle of accumulation will be extensive, the firms of surveillance capitalism strive to expand their access to new territory on the global scale to maximize behavioral surplus and thus capital accumulation: our inner lives and behaviors. They defend this new territory with their own cyber and physical security. To the extent that the old form of territory remains relevant, the platform firms adopt the practices of the earliest world capitalists, the Genoese, by partnering with a large territorial state (chiefly the US and China) for war-making. However, the territorial logic of power is also embodied in these firms, as they employ their capital with the goal of expanding their territory and capturing more behavioral surplus.

The paper's second argument is that the platform firms' territorial expansion is taking increasing physical form, specifically urban form. The insistent drive to capture ever more behavioral surplus has induced platform firms to continuously encroach upon and stitch together our physical spaces by collecting data from cell phone sensors, virtual reality goggles, and smart TV scans of our living spaces, by building spatial and behavioral maps with home security systems, and ultimately by constructing smart cities designed to capture our every move and gesture. Smart cities are a territorial gold mine for surveillance capitalists, as their systems of management allow for both the extraction of behavioral surplus and the management of consumer behavior. As this nearly closes the loop between information and control, smart cities internalize governance or state-making costs, enabling platform firms to supersede the US cycle of accumulation.

INFORMATION PROPAGATION ON CYBER, RELATIONAL AND PHYSICAL SPACES ABOUT COVID-19 VACCINES: USING SOCIAL MEDIA AND SPATIAL FRAMEWORK

Abstract ID: 1160
Individual Paper Submission

YIN, Fuzhen [University at Buffalo, The State University of New York] fuzhenyi@buffalo.edu, presenting author
CROOKS, Andrew [University at Buffalo, The State University of New York] atcrooks@buffalo.edu, co-author
YIN, Li [University at Buffalo, The State University of New York] liyin@buffalo.edu, co-author

The advent of social media has extended human communication and interactions from a pure physical space to that of a relational and cyber context. This shift has been further intensified by the Covid-19 pandemic. During the early stages of the pandemic, while preventative measures such as social distancing and lockdowns reduced physical

activities and contacts, they also increased people's use of social media to obtain health information and to communicate with their family and friends while being physically apart.

Despite the benefits of social media including its ability to efficiently reach a large population during a crisis, there are considerable public health concerns raised by the spread of online anti-vaccine messaging (Puri et al., 2020). Studies have found polarized vaccination debates on social media (Yuan et al., 2019), suggesting the lack of interactions between pro and anti-vaccine users. Such polarization has the potential to strengthen the ideological isolation of anti-vaccine users, fuel vaccine hesitancy and lead to a dramatic increase in disease outbreak probabilities. However, it is unclear whether such polarization applies to the Covid-19 vaccines debates on social media.

Coinciding with the lack of studies on Covid-19 vaccines polarization is that of studies on how information and different opinions (i.e., pro and anti-vaccine) were propagated across spaces. While researchers have found connections between local events and the messages trending on social media (Gunaratne et al., 2019). However, few studies investigated how local information or opinions were propagated from offline to online, from physical to cyber.

To fill the gaps mentioned above, our study employed the recently proposed “space-place (splatial)” framework to investigate the Covid-19 vaccines debates on social media (Shaw & Sui, 2020). The novelty of this splatial framework lies in the fact that it provides a new way to capture and analyze human interactions across multiple spaces. In addition to the cyber and physical spaces, this splatial framework adds the concept of relational space that infers networks between objects based on their relations and has the potential to bridge the cyber and physical gap (Croitoru et al., 2015). Using New York State (NYS) as a case study, we employed several analytical approaches. We collected tweets related to Covid-19 vaccines from December 2020 to August 2021 to represent the cyber, relational, and physical spaces. Support vector machine was used to perform sentiment analysis of tweets. Louvain algorithm was applied for detecting communities in tweet-reply networks. Geosocial networks were constructed to analyze the hybrid space systems, i.e., the cyber-relational and the relational-physical systems.

Our findings are interesting in the sense that we did not observe the phenomenon of polarization which is common in vaccination debates. In the Covid-19 vaccines discourse, pro-vaccine users dominated the discussion in large communities while anti-vaccine users are fragmented in these communities. Our results also provide a nuanced view of the information propagation mechanism across physical, relational, and cyber spaces. Large communities on social media consisted of users from all three spaces and had a group of users whose locations were anchored in a particular region in NYS, such as New York City, Western New York, or Western Finger Lakes. This suggests that some users were bounded by physical boundaries while participating in the online vaccination debates. We also observed the intense interactions between the physical-relational and relational-cyber spaces indicating the role of relational space in propagating information between cyber and physical spaces. As an early attempt to apply the splatial framework for studying a real-world event (i.e., the vaccination debate), our approaches can be applied to studying human dynamics across a hybrid of spaces.

EXAMINING THE IMPACTS OF LAND USE ON AIR QUALITY IN CHICAGO: APPLICATION OF STREET VIEW IMAGERY AND HYPERLOCAL URBAN CLIMATE SENSING

Abstract ID: 1191

Individual Paper Submission

CHOI, Seung Jun [The University of Texas at Austin] jun.choi@utexas.edu, presenting author
WANG, Huihai [The University of Texas at Austin] hw9998@utexas.edu, co-author
JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, primary author
FARAHI, Arya [The University of Texas at Austin] arya.farahi@austin.utexas.edu, co-author

Poor air quality is an environmental hazard susceptible to climate change. If the future climate becomes more stagnant with higher water evaporation and ozone background decrease, it weakens the circulation (Jacob and Winner, 2009). With the rising threat of climate change, the risk of health burdens pertinent to air pollution is augmenting. Air pollution imposes significant adverse health effects, including respiratory, cardiovascular diseases, and cancer. Cities worldwide began installing hyperlocal urban climate sensors to monitor air quality concurrently and combat the crisis. Taking the city of Chicago, USA, as a case, this study explored the recently deployed Project Eclipse sensors led by Microsoft research teams. The device follows EPA's air quality standards and reads the hyperlocal air quality index.

Using Project Eclipse's hyperlocal urban climate sensing data, we reviewed the air quality status in Chicago in August 2021. Then, this study measured the land use impacts on air quality. The conventional way of extracting land use features used land use cover maps or LandSat satellite images (Heald and Spracklen, 2015). We introduced the application of street view imagery for land use feature extraction. Unlike land use inventory maps or satellite images with static two-dimensions, street view images provide urban landscape information in multi diagonal directions. It subdivides the land use information into more detailed categories, such as office buildings, gas stations, campuses, and bus stations, by looking in more than one direction (Zhou et al., 2018). The use of street view images can offer more detailed landscape information. However, computation studies with conventional land use factors and applying them to examine the land use effects on air quality remains unexplored.

This research provided framework for using street view imagery and urban climate sensing data. The source of street view imagery is Google Street View images. Three fundamental questions arise. How can we extract landscape features from street view images? Do they share similar or dissimilar aspects? If so, what are the differences with conventional typologies in extracting landscape features? This study introduced a ResNet50 that classifies images into pre-trained 365 categories of scenes and decomposition process in GIS. Landscape impacts on air quality were measured by looking at feature explanation powers through modeling ensemble regression models. Models went through a parameter optimization process. After the computation of models, this study calculated the SHAPley Additive exPlanations (SHAP) value as the means to evaluate the feature explanations (Lundberg and Lee, 2017). Applying the idea of game theory to machine learning, during SHAP value calculation set of input features or models in an ensemble are players, the gain of the prediction can be represented as the payoff (Rozemberczki et al., 2022). It helps us get either positive or negative relations of feature explanatory powers pertinent to the dependent.

Our analysis results revealed that several regions of Chicago are suffering spatiotemporal hazardous air conditions refer to health warning of emergency conditions. The landscape features from street view imagery share similar aspects compared with land use features from inventory maps or satellite images. It seems specific urban landscape settings contribute to retaining relatively cleaner air than other parts of Chicago. And land use effects on air quality are not static; instead, they vary temporally. Overall, urban greenness-related factors contribute to retaining cleaner air quality even in temporal terms. Our model defined meteorological conditions like temperature, humidity, energy emission, and intensity as negatively impacting air quality. Future environmental studies can utilize the introduced typologies. Policymakers and agencies can use the result to examine Chicago's air quality standards.

PARCEL-LEVEL PREDICTION OF FUTURE LAND-USE CHANGES USING A MACHINE LEARNING BASED DYNAMIC SPATIOTEMPORAL MODELING

Abstract ID: 1264

Individual Paper Submission

TEPE, Emre [University of Florida] emretepe@ufl.edu, presenting author

Rural and urban areas have been formed over time as a result of human activities and natural events. Some of these changes in lands are irreversible, such as conversion of agricultural lands to residential areas. Once the fertile soils are removed from the ground as a result of the conversion, the same land cannot be reused for agricultural purposes in the future. Therefore, predicting future land use changes at fine geographical units is essential for practitioners and policy makers, because such predictions provide vital information about the potential land development dynamics. Land Use Change (LUC) models are commonly preferred to predict future land developments. These methods reveal complex relationships in land developments which are important for predicting future conditions. Modeling land use changes involves methodological and computational challenges. Complexities in urban systems require researchers to incorporate such complex relationships in their models, while increasing data sizes introduces computational challenges. Machine Learning and AI algorithms such as Random Forest (RF) and Artificial Neural Network (ANN) offer computationally feasible approaches to large scale LUC models while accounting for complex non-linear relationships (Kim et al., 2022; Ron-Ferguson et al., 2021; Soares-Filho et al., 2013; Talukdar et al., 2021; Zhai et al., 2020).

The main goal of this study is to introduce a dynamic LUC modeling framework for predicting future land developments without requiring manually modifying the covariate matrix using Machine Learning and Deep Learning algorithms, such as RF and ANN approaches. Once a LUC model is developed, the covariate matrix generally needs to be designed by experts to predict future land developments. Such a requirement limits implementation opportunities of LUC models to predict future land use changes. To mitigate this issue, our modeling framework utilizes spatial and temporal dependencies to improve prediction accuracy.

In this research, the introduced modeling framework is applied to Florida Parcel Database, provided by UF GeoPlan Center. The statewide parcel database consists of approximately 9 million unique parcels and contains information about parcel geometry, actual construction years of buildings, land uses, sale records, and the number of buildings. Using the actual construction year information, historical conditions of land development are generated, and important parcel and neighborhood characteristics are retrieved from the data set. Historical records can be traced back to 1650, where the most recent year is 2019. In this study, we focus on the period between 1900 and 2019. Future land use changes are estimated based on RF- and ANN-based LUC models. We train all our models using UF HiPerGator 3.0 supercomputer. Further, model trainings are substantially accelerated utilizing GPU parallel processing. Using the modeling framework, future land use changes at the parcel level are predicted for every 5 years until the target year of 2070.

SANCHEZ, Thomas [Virginia Polytechnic Institute and State University] sanchez@vt.edu, presenting author
GORDNER, Trey [Virginia Polytechnic Institute and State University] gg3@vt.edu, co-author
SHUMWAY, Hannah [ESRI] hannahshumway17@gmail.com, co-author

Over the past several decades, urban planning has considered a variety of advanced analysis methods with greater and lesser degrees of adoption. Geographic Information Systems (GIS) is probably the most notable, with others such as database management systems (DBMS), decision support systems (DSS), planning support systems (PSS), and expert systems (ES), having mixed levels of recognition and acceptance (Kontokosta, 2018). The adoption of GIS, some will argue, has been primarily related to its cartographic capabilities and less for the sophisticated spatial analysis techniques. Advances in information technologies have moved very slowly in the field of urban planning while revolutionizing other domains, such as consumer goods and services. Baidu, Amazon, Netflix, Google, and other companies have invested significantly in these technologies to gain insights into consumer behavior and characteristics and improve supply chains and distribution. Likewise, urban planners should capitalize on these technologies to gain new insights into and efficiencies for the communities they serve.

This is an opportune time for planners to reconsider the application of AI-related methods given vast increases in data availability, increased processing speeds, and increased popularity and accessibility of AI. Research on these topics by urban planning scholars has been increasing over the past few years, however, there is little evidence to suggest that the results are making it into the hands of professional planners (Batty, 2018, 2021). Some academics propose that planners shorten the time frames at which they plan to better overlap with such advances in cybernetics and urban operations research (Batty, 2021). Others contend that planners should use the ubiquity of data and advances in computing to enhance redistributive justice in information resources and procedural justice in decision-making among marginalized communities (Boeing et al, 2021).

A first step is to understand the current level of familiarity that planners have with AI, along with their attitudes and perspectives about how these new technologies may affect the planning profession. This paper reports the results of a national survey of American Planning Association (APA) members about their knowledge, experience, and opinions about AI to help better understand the level of readiness regarding this newest phase of innovation adoption. Insights from the survey also help to identify the directions for application development as well as the helping to identify where planners feel least comfortable with certain aspects of AI for planning. The results suggesting that professional planners have low levels of familiarity and direct experience with AI as related to plan-making processes are not surprising, and also point to important educational and upskilling needs for urban planners.

FAIRNESS-ENHANCING SPATIO-TEMPORAL DEMAND PREDICTION FOR RIDE-HAILING SERVICES

Abstract ID: 1297

Individual Paper Submission

ZHENG, Yunhan [Massachusetts Institute of Technology] yunhan@mit.edu, presenting author

WANG, Shenhao [Massachusetts Institute of Technology] shenhao@mit.edu, co-author

ZHAO, Jinhua [Massachusetts Institute of Technology] jinhua@mit.edu, co-author

Computational fairness has become an increasingly important issue for the emerging mobility technology in future smart cities (Zheng et al., 2021). In recent years, researchers have developed a series of data-driven approaches for short-term ride-hailing demand forecasting (Guo and Zhang, 2020; Ke et al., 2017). However, the existing literature has several limitations: (1) most previous studies evaluate the performance of the demand predictions by the average prediction accuracy across the whole study region, while research into the disparity of predictive performance between the disadvantaged and privileged areas is very scarce (Yan and Howe, 2021). (2) most previous models do not consider the socioeconomic and demographic information of the areas when making travel demand predictions. However, failure to account for the heterogeneity of these spatio-temporal dependencies can lead to biased modeling results.

To overcome these limitations, this paper proposes a novel strategy to improve prediction fairness while retaining

high prediction accuracy. This strategy is comprised of a new deep learning model, named the spatially adaptive network (SA-Net), and a bias-mitigation regularization method, to achieve the fairness-aware travel demand predictions. We later evaluate the utility of our approach by performing experiments on the Chicago TNC dataset. The contributions of this paper can be summarized as follows:

1. We propose a new model (SA-Net) that can address prediction disparity by effectively incorporating the local socioeconomic and demographic information into the prediction process. It captures the spatial variations by adopting location-specific modification to the standard spatially-invariant convolutional filters. The experimental results show that the SA-Net increases the prediction accuracy for both disadvantaged and privileged groups, with the accuracy gain for the disadvantaged group being larger. Compared with the state-of-the-art predictive model Conv-LSTM Net, the SA-Net reduces the Mean Absolute Error (MAE) by 6.6% and 0.5% for the black and non-black populations, respectively.
2. We propose the fairness metric as the mean percentage error gap (MPE Gap) which measures the gap of mean percentage prediction error between the disadvantaged and privileged groups. We find that previous solutions to spatio-temporal travel demand prediction problems were tend to underestimate demand for the low-demand regions. This is because high errors in low-demand areas will significantly impact MAPE, thus optimizing MAPE would likely underestimate demand in these areas.
3. To tackle the abovementioned prediction disparity issue, we develop a bias-mitigation regularization method that allows the network to learn fair predictions by bringing down the MPE Gap between the two groups. The experimental results show that combining the SA-Net and the bias mitigation regularization, the MPE gap between the low-income and high-income groups drops from 0.127 to 0.059. We plot the distributions of the mean percentage errors across space, and find that the new algorithm has disentangled the correlation between the sensitive attribute (e.g. race, income) and the MPE. These results demonstrate the effectiveness of our algorithm.

Overall, we argue that the prediction bias issue revealed in this work should attract the attention of the researchers and policy makers, since if the travel demand in the disadvantaged neighborhoods is systematically underpredicted, we may fail to provide enough TNC services to these communities, and the limited services will in turn lead to further decrease of the ridership, which constitutes a negative feedback loop. Based on our study, we argue that the TNC companies should scrutinize the fairness dimension of their demand forecasting tools, and take actions to address the demand forecasting biases if they exist. The transportation authority should consider the abovementioned fairness aspects when evaluating the impacts of TNC services on urban transportation, and regulate or tax the TNC companies if they fail to meet the fairness requirement.

EXPLORING THE TIME-OF-DAY VARIATION OF URBAN PARK VISITS DERIVED FROM MOBILE PHONE DATA: A CASE STUDY OF TEN COMPREHENSIVE PARKS IN TOKYO

Abstract ID: 1302

Individual Paper Submission

REN, Xiyuan [New York University] xr2006@nyu.edu, presenting author

GUAN, Chenghe [New York University Shanghai] chenghe.guan@nyu.edu, primary author

With appealing green spaces and low cost to use, urban parks are valuable resources for physical activity (PA) and offer multiple benefits to the quality of life in the metropolis. However, planning urban parks ignoring residents' park-visiting habits can also bring negative impacts such as accessibility inequity, service disparity, and gentrification^[1]. Despite a growing literature base focusing on the spatiotemporal features of urban park visits with geo-location big data^[2-4], the time-of-day variation of park visits is relatively understudied: the association between time-of-day park-visiting patterns and park spatial/cultural characteristics, as well as its political implications, remain unclear.

Based on a case study of ten comprehensive parks in Tokyo, our study aims to answer the following questions: (1) How spatial and cultural characteristics of urban parks are interlinked to TFCs derived from mobile phone data? (2) Whether there exist obvious TVPs on weekdays/weekends, in different seasons, and among urban parks in Tokyo? (3) What is the political implication of associations among TVPs, park catchment area, and park activity duration? We proposed an algorithm to calculate the time-of-day (e.g., 10:00 a.m.-10:30 a.m.) park visitor density using a geotagged mobile phone dataset collected from January to December 2011. We then constructed the variation index (VI, the ratio of time-period visitor density and the average visitor density among time periods) and plotted the time-of-day fluctuation curves (TFCs, a series of 26 VIs from 7:00 a.m. to 20:00 p.m. with a 30-minute's interval). TFCs on eight typical days (spring weekday, summer weekday, autumn weekday, winter weekday, spring weekend, summer weekend, autumn weekend, winter weekend) were plotted separately. Finally, we put 80 TFCs into the K-Means algorithm and linked the identified time-of-day visiting patterns (TVPs) to park characteristics collected through field observations and online sources.

We found that time-of-day park visits were closely related to park characteristics, including neighborhoods nearby, buildings and facilities inside the park, and notable cultural events. For instance, Spring Blossom Picnic (an outdoor event in Japanese culture) significantly increased visitor density during the midday of spring weekend, especially for parks with large lawns and cherry blossoms. Parks with child's playgrounds and surrounded by residential areas had more park visits from midday to afternoon on weekends, probably due to family activities. The location of park cases and their TFCs can be found on the online map:

https://xr2006.github.io/sample/Tokyo%20Parks/Tokyo_park_presentation.html. Moreover, five time-of-day visiting patterns (TVPs) were identified based on the K-Means algorithm: (1) TVP 1 had a considerable peak from midday to afternoon, indicating a huge visitor flow brought by notable social events; (2) TVP 2 had a medium peak from morning to evening, indicating a high park-visiting level throughout the day; (3) TVP 3 had a small peak in the midday, indicating an increase of park visits early in the day while dropped quickly after that; (4) TVP 4 had a small peak in the afternoon, indicating an increase of park visits later in the day; (5) TVP 5 was below the average level from morning to evening, indicating a low park-visiting level throughout the day.

Our findings provide new perspectives for urban park planning and design. Firstly, time-of-day park visits can be measured using a mobile-phone-based approach, which logically aligns with field counting while saving human labor. Secondly, TVPs identified by our study can serve as activity-based park categories complementary to conventional ones identified using park sizes and functions. Finally, the urban park management should consider the association among typical days, characteristics of parks, and actual park visits to respond to dynamic park visit patterns beyond generic guidelines.

CLASSIFYING RETAIL CENTERS USING URBAN MOBILITY DATA IN SEOUL

Abstract ID: 1308

Individual Paper Submission

CHOI, Junyong [KAIST] wnsdyd@kaist.ac.kr, presenting author
KIM, Youngchul [KAIST] youngchulkim@kaist.ac.kr, primary author
PARK, Minju [Hannam University] parkmj@hnu.kr, co-author

Retail centers are rapidly changing due to technological and social developments. Online sales changed retail environment all over the world. Its effects, however, are different: some traditional retail areas are declining while other areas are gaining attentions again. To understand these differences, planners, scholars and retail researchers have defined and classified retail centers based on conventional retail characteristics such as retail type, size, function, and revenue (Dolega et al., 2021) while ignoring customers behaviors.

Recently, thanks to rapid development of location-based services (LBS), Information and Communication Technology (ICT), and mobile devices, we can track human movements in a city. Relevant studies analyzing human movements have revealed urban contexts behind those urban morphologies. In particular, recent studies used human movement data to better understand retail centers (D'Silva et al., 2018; Mumford et al., 2021, Philp et al., 2022). D'Silva et al. (2018) analyzed retail business survival using urban mobility data and Mumford et al. (2021) and Philp et al. (2022) classified UK retail centers based on customer movement patterns using footfall data. However, previous studies usually focused on customer volumes in human movement patterns to analyze retail centers. Since human movement patterns contains valuable information such as where they come and go, it is necessary to improve a method to consider such movement information for better classifying retail centers.

In this study, we consider spatio-temporal aspects of urban movements and retail area features for the retail center classification using a month period of taxi dataset, April, 2018 in Seoul, South Korea. Taxi ridership dataset is useful to approximate urban movements as taxis are not limited to their origin and destinations compared to public transportations and therefore it can be used to proxy urban movements in and out to retail centers. For the spatio-temporal aspects of customer movements, we include average distance traveled, number of visits (volume per area), space diversity (measuring people come and go from diverse neighborhoods), time diversity (measuring people come and go the retail area in even time periods), weekday-weekend volume ratio, and origin-destination volume ratio. We include commercial area features such as area, minimum distance to urban center, retail category diversity. All commercial area features are aggregated by each commercial area. We utilize 253 retail cores provided Seoul metropolitan government. Then we apply cluster analysis to group retail centers that share similar features.

We find four distinct clusters namely 1: retail cores around residential areas, 2: new retail cores, 3: retail cores around university campus, and 4: conventional retail cores. The four clusters have different characteristics. For example, passenger volumes, weekend weekday volume ratio, and origin and destination volume ratio are higher in cluster 1 and 3. Average travel distance are getting longer for cluster 1 to 4. On the other hand, cluster 1 showed the highest time diversity which means passengers go to the cluster 1 in even time periods. Cluster 1 shows the longest distance to the urban cores compared to other three clusters. Cluster 4 showed the lowest retail category diversity.

The preliminary results demonstrate the potential of mobility data to classify retail centers considering both supply and demand side of the retail centers. The passenger movement patterns including weekend weekday volume ratio, origin and destination ratio, travel distance and time diversity other than volume show benefits of recognizing demand side that conventional high streets can be differently identified. We expect that the retail classification based on urban movements will broaden understanding of growth and decline in retail centers. We believe more detailed analysis in each cluster will deepen understanding of retail centers in demand side.

LIVED SPACE IN CHANGING PLACES: EXPLORING DIGITAL COGNITIVE MAPPING TO UNDERSTAND PLACE BELONGING AND PLACE-MAKING

Abstract ID: 1315

Individual Paper Submission

Cities are silent repositories of people's memories, emotions, and identity. It is not an exaggeration to claim that in the lived spaces of the city, we find its soul. The writings of Kevin Lynch (1960), Tuan (1975), Henri Lefebvre (1979 [1991]), John Friedmann (1983), and Leonie Sandercock (2003) have shown us that cities are composed of lived spaces and life spaces of symbolic meanings, emotions, and experiences. Fierce contestation in the city often arises when change arising from urban planning and development threatens to undermine the lived space of its inhabitants such as the place belonging and a sense of community identity among the residents (Marris 1982). Lived space is inherently contentious space because of its intimate connection with social inclusion and the right to the city, in addition to its ambiguous nature that resists easy definition and study.

This paper presents an experimental digital cognitive mapping methodology to understand the lived space of urban inhabitants, with particular attention to its use in places of flux. It builds on mental mapping/sketching research by Lynch (1960), Appleyard (1976), Huynh and Doherty (2007), Fenster (2009), Antona (2019), and new ways of emotional mapping by Deitz et al. (2018) and Nold (2018).

Of the interconnected triad of spaces in Lefebvre's theoretical framework of the production of space (perceived-conceived-lived space), lived space is the hardest to study. Surveys, observations, and interviews with users are usually employed to map out perceived space (spatial practices). Likewise, conceived space (mental representations) can be studied via interviews with users and collecting representations of space like maps, documents, and discourses through secondary research. However, a thorough study of lived space eludes conventional surveys or interviews that asked for opinions or feelings toward urban spaces because experiences in urban spaces cannot be evaluated using verbal description alone. The dimension of emplacement which occurs in social-psychological-spatial experiences such as place belonging is not fully accessible via traditional social science research methods and remains a challenging research area in environmental psychology place attachment studies (Lewicka 2011). If we can better understand the formation of lived space, we would be more able to unpack urban inhabitants' interaction with the built and social environments—a knowledge area critical to guide good urban planning.

The paper will present a review of how lived space has been studied in urban and planning research. It will also present findings from an exploratory use of the digital cognitive mapping method to study the formation and anchors of place belonging among youths in their 20s and 30s in Singapore, a city of constant reinvention to stay attractive to global needs. Also known as a "planners' paradise" Ng (1999) where conceived space dominates lived space and orders daily spatial practices, the paper will present a study of how lived space of place belonging is formed within strong centralized planning. Finally, I will reflect and raise opportunities and limitations of the digital cognitive mapping method for further discussion (Mondschein and Moga 2018).

Via the review and discussion of how lived space can be studied, the paper intends to inform inclusive urban planning, particularly with respect to place-making initiatives that are being increasingly incorporated as a goal of sustainable development in cities. Good place-making turns placelessness (Relph 1976) in our cities into spaces of belonging and ownership. For place-making to be truly effective, perceivably the study of the formation of place belonging as a major element of lived space needs to foremost be addressed.

CANADA'S PUSH TO PROMOTE THE SMART CITY: ASSESSING THE IMPACTS OF CANADA'S SMART CITY CHALLENGE ON URBAN GOVERNANCE IN CANADIAN MUNICIPALITIES

Abstract ID: 1323

Individual Paper Submission

BIGGAR, Jeffrey [Dalhousie University] jeffrey.biggar@dal.ca, presenting author
SPICER, Zachary [York University] zspicer@yorku.ca, co-author
ZWICK, Austin [Syracuse University] alswick@syr.edu, co-author

The 'Smart City' has been promoted around the world in places such as Shanghai, Barcelona, London, and Montreal to target private investment toward a range of urban problems - improved energy and water use, efficient transit, and better government - through technological solutions (Kitchin, 2015). Most initiatives, however, are led by the private

sector, with the public sector primarily serving as a facilitator of private investment (Author Redacted, 2021). In 2017, the Government of Canada launched the Smart Cities Challenge (SCC) - a \$300 million pan-Canadian program to spark innovation in technology, governance, and city building across Canadian communities. The SCC was the first of its kind to be open to diverse policy areas and technologies, emphasize government-community collaboration, and include replicability of solutions as a goal (Goodman et al., 2020). There remains, however, an incomplete understanding as to whether the SCC was effective on delivering what it set out to achieve post-hoc. More broadly, there is limited research on the impact of government-led smart city competitions which tend to focus on the innovations themselves not the people and partnerships driving their outcomes (Pereira et al., 2017).

This paper draws on research that investigated the role of the SCC in guiding infrastructure investment associated with the adoption of urban technology in Canadian cities. Unlike other competitions of its kind, the SCC asked cities to choose any technological solution to any urban challenge if they emphasized community engagement. This research examined the impact of the SCC across three planning areas: (1) municipal innovation and governance, (2) collaboration between public/private/community networks, and (3) policy implementation in local government structures. The overarching research question was: to what extent did the SCC accomplish the goals that it established for both the winning and losing proposal bids from participating municipalities? We used a qualitative research approach based on 40 semi-structured interviews with involved stakeholders from the 198 participating cities who comprised a cross-section of winners, finalists, and unsuccessful applicants. The results show how cities use connected technology to inform policy and planning outcomes, and they enrich conceptual and empirical understandings of smart city implementation relevant to other jurisdictions outside of Canada.

DIGITAL PARTICIPATION AND URBAN PLANNING. INTERACTION PATTERNS BETWEEN COMMUNITY GROUPS AND LOCAL GOVERNMENTS

Abstract ID: 1376

Individual Paper Submission

PACCHI, Carolina [Politecnico di Milano] carolinapacchi@yahoo.it, presenting author

While digital communication tools and practices have been characterizing the daily life of a large majority of citizens in the Global North in the last twenty years, scant attention has been devoted in planning literature to the effects of such major changes for planning and for citizenship practices (Wilson, Tewdwr-Jones, 2021).

The main research question of the paper is how and to what extent the use of digital technologies enables citizens and community groups to take part in decision making processes and, more in general, in urban transformation at local level. Several practices based on digital technologies as enablers, such as participatory budgeting, civic crowdfunding (Gullino et al. 2019) and, in Italian cities, Social Streets, already use and experiment such technologies for empowering community groups and engaging in future visioning.

In order to better frame and understand community participation and local activism, the paper will take into account different patterns of interaction between local government and citizen activism at local level: from state regulation and community implementation to different forms of cooperation, to community autonomy, and, finally, community opposition.

The first typology, state regulation and community implementation, sees the state and community organizations in their traditional regulatory and implementation roles, as it happens in plan making, where the state sets basic rules and other actors (private, corporate, or civic) contribute to their implementation.

The second typology identifies cases in which there is structured cooperation, via explicit mechanisms for coordination between community initiatives and local authorities. The coordination in some cases is simultaneous,

when state and civic actors jointly design programs or projects, or it may happen in two steps, when community actors play a creation or design role, and local authorities play an organizational role to support and diffuse existing grassroots initiatives.

The third typology is completely autonomous community initiatives, which do not seek and sometimes explicitly refuse cooperation with the state.

Finally, community organizations and local authorities can be in open opposition. This is the case when local authorities decide to operate in a certain direction and community activists react, taking a clear oppositional stance, which may result in impasse or stalemate, but also explorations of alternative possibilities.

Impinging on these categories to frame local experiences, the paper will critically discuss how the modes of interaction are being transformed by the use of digital technologies, which may be the innovations and opportunities brought about, as well as the risks, in terms of novel forms of exclusion of different local voices, as well as of capture of decision-making processes by more powerful constituencies and groups, exacerbating local inequalities.

The research is based on interviews to community activists in Italian cities, coupled with digital ethnography conducted on Facebook groups dealing with community issues in Milan, Rome and Bologna.

While the research is ongoing, some first findings seem to show that, while digital literacy is generally quite widespread in community organizations, which can make the most out of basic technology and widely-used digital platforms, a critical understanding of the possible threats and pitfalls of those technologies (Isin, Ruppert, 2015) is much less widespread in community organizations and in local governments alike. These emerging findings show the importance of strengthening forms of awareness and digital citizenship, in order to better engage communities in more equal decision making processes in urban transformation.

URBAN GOVERNANCE AND THE PRIVACY CHALLENGE IN SMART CITIES

Abstract ID: 1389

Individual Paper Submission

SUN, Feiyang [University of Washington] fs377@uw.edu, presenting author
WHITTINGTON, Jan [University of Washington] janwhit@uw.edu, co-author

This paper introduces the empirical studies and normative debates surrounding privacy to urban affairs researchers and the broader urban studies audience, placing this important discourse within the context of the communication and surveillance technologies rapidly being deployed in smart cities. The key research question, as yet unanswered, asks how urban affairs scholars and built environment professionals can become aware of and contribute to the preservation of public privacy, in research and in practice. This paper consists of three parts. The first part discusses the concept of anonymity and its critical role for maintaining democracy and a free market, and by doing so, answers the research question of why privacy, for individuals and groups in society, is not only a personal matter but also a public interest and, in particular, a public interest for urban affair scholars to embrace. The second part answers the research question of how spatial anonymity and digital anonymity are interrelated in different urban spaces through the collection of spatial data. The paper introduces the fundamental concept of re-identifiability, which serves as a common measurement for anonymity in existing empirical studies, and then highlights the role of the built environment in elevating the risk of re-identification from supposedly anonymized data. The third part introduces three frameworks - contextual integrity, privacy taxonomy, transaction cost economics - to establish a shared understanding of the approaches being engaged, in research and in the practice of cities, to govern data, and location data in particular. The paper concludes with remarks about the implications of privacy as a research agenda for urban affairs scholarship.

EXPLORING THE IMPACTS OF ROAD NETWORK STRUCTURE ON RETAIL STORE RENTS IN MEGACITIES AND ITS IMPLICATIONS FOR PLANNING INTERVENTION: THE CASE OF HANGZHOU, CHINA

Abstract ID: 1394

Individual Paper Submission

WANG, Can [Yangtze Delta International Institute for AI-Assisted Planning] 525943582@qq.com, presenting author
LIU, Zhuyang [Tongji University] 1911262194@qq.com, primary author

As real estate market is generally considered spatially segmented, extant research has concluded that real estate value is not only affected by the overall supply-demand relation at the city level, but is also determined by geographical factors, including location, public facilities, landscape, etc. However, this paper endeavors to contribute to the current discussion in two aspects: 1) Due to data availability, empirical study on the impacts of the above geographical factors are usually focused on housing market, rather than retail rents; 2) Therefore, even if the road network structure has been proven to have a significant impact on housing prices in certain scales, its interplay with retail rents are yet to be explored. Having sorted out the theoretical foundation and empirical studies on this topic, this research explores the influence of spatial size, building types, consumers' behaviors and location characteristics on the retail store rents using Hedonic Model. Furthermore, this research interprets the characteristics of the road network structure in Hangzhou with spatial syntax calculations and pays special attention to the impacts of road network structure on retail store rents in China's megacities from a multi-scale perspective. Taking Hangzhou, a megacity on the east coast of China as an example, this research obtained open data and collected the retail store rents and their various attributes, and conducted an in-depth empirical investigation on what drives the retail store rents in Hangzhou. Having quantified a series of road network structure indicators through the space design network analysis (sDNA), this research examined the impacts of road network structure on Hangzhou's retail store rents at different scales (such as 0.8km, 1.2km, 2km, 5km, 8km), when some common feature variables are controlled for. It's worth noting that when investigating the impacts of road network structure on retail store rents, the authors also designed a control group where housing prices are also taken as dependent variable in the same area. The preliminary findings reveal that: 1) As location and the distance from CBD and other factors are usually easy to be understood by the public, this research demonstrates that the road network structure as a location feature also significantly affects the retail store rents at some scales, also this impact is not easy to be noticed. 2) The index of accessibility as in the descriptive statistics of road network structure by SDNA is an important factor affecting both housing prices and retail store rents, and it plays an even greater role at the community scale. 3) Compared with residential buildings, retail stores are more closely related to road network system, which is proven to be more influential on retail store rents rather than housing prices in our empirical study. 4) Now that the existing urban road network characteristics and retails distribution in Hangzhou suggests that some parts of the city, for example, the eastern part of Binjiang District in Hangzhou, has the potential to continue to grow to be commercial centers, informed planning interventions will likely improve the local economic development at the community level. This research also offers extended discussion on the policy implications of the findings mentioned above and how they might inform smart planning interventions on community economic development in megacities.

USING GEOLOCATED SOCIAL MEDIA DATA TO UNDERSTAND HUMAN ACTIVITIES, POPULARITY, AND FUNCTIONALITY FOR GREEN SPACES WITH MACHINE LEARNING APPROACHES

Abstract ID: 1450

Individual Paper Submission

CHEN, Si [University of Oklahoma] sichen12@illinois.edu, presenting author

ZHANG, Le [University of Illinois at Urbana-Champaign] lezhang3@illinois.edu, co-author

DEAL, Brian [University of Illinois at Urbana-Champaign] deal@illinois.edu, primary author

Green spaces have significant impacts on urban living environments, providing shared natural areas and entertainment spaces among other benefits. Investigating the human activities within the green spaces, the functionality of green spaces, and the impact factors for visiting popularity is valuable for supporting green space design and guiding land use development around public green spaces. This study utilizes machine learning techniques to mine social media text and image data to extract multi-perspective information on public green space popularity, activities, and functionality. The coupling of the two types of data enables the extraction of a rich and comprehensive analytical frame for understanding how green spaces are used and how they might be improved. The extracted green space popularity under different activity and functionality types is also modeled based on green space design features, locational attributes, and socio-economic features to indicate the design principles for green spaces.

Conventional methods used to extract popularity and functionality information on green spaces have typically relied on questionnaires and in-site observations, both resource and time-consuming processes (Lim et al., 2018). These approaches can also be context-dependent and produce less transferable data across regions. Some academic researchers have realized the gap and attempted to apply data-based analysis (usually using geo-located social media check-in or review data) in information collection for green spaces (Hamstead et al., 2018; Kovacs-Györi et al., 2018). Nevertheless, these studies typically focused on single perspective of green space information. Other perspectives of information, and the geolocated social media images, which have the potential to deepen our insights into green spaces, were not frequently analyzed.

This study aims to propose an information extraction framework to extract richer, more professional, and multi-perspective information for green spaces (popularity, functionality, and activities) through the machine learning-based analysis of social media images, reviews, and ratings. The sentiment analysis on Google review contents and normalized Google ratings are combined to identify the visiting popularity and human activities of green spaces. A vector space for each Google review is firstly created, and then the Random Forest model is used to predict popularity and activities after testing multiple machine learning models.

A deep Convolutional Neural Networks (CNNs) based image processing model is designed to extract green space functionality from social media images. Geo-located green space images collected from social media have the potential to provide comprehensive information but are seldom used because of the difficulty in collecting and parsing data. For example, image datasets can be sparse and of varying quality, and the similarities between images even in different green spaces, are naturally high and difficult to differentiate. To overcome the obstacle, we use a deep learning-based approach to convey generic knowledge learned from other contexts to the deep CNNs pre-training process to lower data requirements and reduce data variation issues, which raised the accuracy in extracting functionality information from 51.11% to 73.34%, which is a relatively good performance using low-quality green space images from social media data.

The City of Chicago is chosen as an application case to test the framework. The result can support better green space planning and design, as well as adjust the current design principles. The regression analytic results for the influences of socioeconomic factors on green space popularity can also imply the planning strategies and policies on spatially distributing green spaces and neighborhood designs. The proposed information extraction framework has the potential to be used beyond green spaces, to extract all types of geolocations using images and texts to provide better analytic information for many fields.

From the beginning of the COVID-19 pandemic, the academic community has reported that urban daily travels and urban economic activities have significantly decreased in cities. Because these abrupt changes have severely impacted on economic vitality in many urban commercial and business districts, the urban resilience concept must include discussions on how planners can develop effective measures or indicators that can be used to visualize geographic vulnerability and temporal changes pertaining to economic vitality in different urban fabrics.

In this study, we present a methodological framework how two important properties of urban resilience, Robustness and Rapidity, can be conceptualized and be measured using Big data. A sustainable and resilient city should be able to enhance the ability to withstand external shock without weakening existing functions (Robustness) and the ability to restore functions quickly or recover economic loss (Rapidity).

We have chosen Seoul metropolitan area in South Korea as a study area. We collected Spatio-temporal Big data of both foot traffic and the commercial retail point-of-sales (POS) data across the entire city from year 2019 to 2021, the pre-and post-pandemic periods. In specific, we focus on empirical analyses that lead to the discussion with three main questions: (1) How can we conceptualize and develop community's resiliency measures for economic recovery in the post-epidemic era? (2) How the Big data of foot traffic and retail points-of-sales and urban analytics methods can be utilized to measure the geographic variability of urban resiliency over the epidemic? (3) Which urban communities and urban development types are less resilient and slower in the economic recovery?

The preliminary analysis results suggest that socio-economically depressed urban communities and old downtowns would struggle more in economic recovery than newly developed, economically viable communities due to the pandemic. In the meantime, we also found that the level of two properties and urban resilience as a whole would spatially and temporally vary by different community's socio-economic profiles and the scale of urban development types in the past.

We also discuss that local urban land-use fabrics are one of the essential explanatory factors in urban resiliency. In specific, commercial areas are the most significantly impacted by the pandemic, whereas the green spaces improved the level of urban resiliency, which provides policy implication that securing green spaces is an effective policy direction to promote urban resilience.

EXAMINING THE RELATIONSHIP BETWEEN CRAFT BREWERIES AND GENTRIFICATION IN JACKSONVILLE, FLORIDA.

Abstract ID: 1496

Individual Paper Submission

HAYS, Jessica [University of Florida] jessica.hays@ufl.edu, presenting author
KAMAL, Azza [University of Florida] azzakamal@ufl.edu, primary author

The craft beer industry has experienced tremendous growth in recent years, as the number of craft breweries in the United States have risen over 900%. In the Jacksonville area alone, there have been over 20 breweries established since 2008. However, their tendency to locate in and “aestheticize” post-industrial economically depressed areas raises concerns over their potential to accelerate gentrification and displacement (Matthews and Picton, 2014). Current research indicates a connection between the presence of craft breweries and the occurrence of gentrification; however, it is unclear whether craft breweries tend to catalyze or follow demographic and housing changes. A study in Portland, Oregon found that craft breweries have the potential to create industrial jobs and revitalize the area where they are located. However, it also noted the tendencies of craft breweries in Portland to follow already-triggered gentrification, and therefore cautions their ability to “solidify on-going patterns of gentrification,” (Walker and Miller, 2018).

This paper examines the relationship between neighborhood change indicating gentrification and openings of craft breweries in Jacksonville, Florida. We used a two-pronged mixed methods approach to inform and contextualize the extent of the changes as they relate to craft breweries. The first part involves a longitudinal analysis of demographic and economic changes that are considered relevant indicators of gentrification. Utilizing ArcGIS Pro 2.8.2 (ESRI, 2021), American Community Survey (ACS 5 -year) estimates for these indicators were mapped and tracked in Jacksonville, Florida, between 2012 and 2019 at the block group level. This process is based on the neighborhood trend analysis outlined by the National Association for Latino Community Asset Builders (NALCAB, 2018) as well as Walker and Miller’s study correlating neighborhood change to craft brewery openings. Indicators comprising this analysis included changes in percent non-Hispanic white alone, percent of people twenty-five years old and above with a bachelor’s degree or higher, median household income, median value of owner-occupied housing units, and median gross rent. Using the city-wide indicators as a baseline, each block group was assigned a numeric score based on the number of indicators that experienced greater directional changes. Total scores were then used to create spatiotemporal year-to-year analyses to measure the extent of gentrification and compare block groups where craft breweries are clustered from with other block groups.

The second part of this research provides more insight into the role of craft breweries and perception of gentrification in Jacksonville through interviews with experts and key-stakeholders of issues relating to gentrification and the craft-brewing industry. Structured, open ended, phone interviews were conducted to identify and summarize key themes surrounding the perceptions towards craft breweries. The results of the interview analyses showed that craft breweries are often seen locating in areas where gentrification is occurring, but do not seem to be the main driving factor in its onset. Many interviewees cited the potential of craft breweries to operate as social, cultural, and economic hubs in revitalization efforts, however, their effectiveness typically relies on the community needs and characteristics. The results of the spatial analysis showed that the block groups containing or directly adjacent to craft breweries block groups experienced higher rates of change indicating gentrification. However, in many areas the most significant changes indicating gentrification occurred prior to the opening of a craft brewery. As a result, this research alerts local planning and revitalization professionals as well as area developers to explore the revitalization opportunities for inner city residents and recommends prioritizing the need for initiating housing affordability measures, including local businesses, to ensure residents’ stability, especially in areas with higher risk of gentrification.

MATERIAL, VIRTUAL AND {RE}CONSTRUCTED WORLDS - 3D DIGITAL MODELING IN HISTORIC PRESERVATION

Abstract ID: 1498

Individual Paper Submission

GAJARE, Rashmi [University of Texas at Austin] rashmigajare@utexas.edu, presenting author

This paper discusses the implications on the future of heritage preservation practice with an analysis of current and proposed uses of 3D Digital Modeling at various scales, from that of an object to {re}constructing worlds. Gaston Bachelard, in his seminal book 'The Poetics of Space', says, "The mind sees and sees again, (mere) objects, while the soul, finds the nest of immensity in one". The nest of immensity – with all its possibilities, reflected in the imminent, digitally re{constructed} worlds where the material virtualized, forms the building blocks of a digitized universe. Carlo Ratti and Matt Claudel speak of our physical world already 'blanketed' by the virtual. This overlap of the material and the virtual is creating entities in hybrid realms. As Moore's Law suggests, a synthesis of convergent technological advances, here in machine learning and artificial intelligence, is slated for exponential growth and will actuate complete transformation through diverse applications in many fields, including that of historic preservation. In this paper I will include works by Factum Foundation, Iconem and, more specifically the Venice Mirror World project at EPFL, that uses various techniques and research applications in visual pattern discovery, morphological and semantic segmentation of point clouds, big data from the past, and Octree for accessing data, while layering spatiotemporal data on a 4D skeleton. This paper is an analysis of the implications of emerging digital world re{construction} projects on the practice and theoretical frameworks of historic preservation.

MAPPING THE PRINTING PRODUCTION NETWORKS THROUGH IMAGE RECOGNITION AND GPS SENSORS

Abstract ID: 1534

Individual Paper Submission

AHN, Chaewon [Yale-NUS College] chaewon.ahn@yale-nus.edu.sg, presenting author

Manufacturing firms within a cluster develop social and industrial networks that make them competitive in the market through reduced transaction costs. This is especially the case with mature small to medium sized urban manufacturing firms that have endured increasing land prices and labor costs while remaining competitive in the market in post-industrial cities. However, gathering information of the production network among such firms can be challenging especially when the information about the business partners is confidential. This study is based in Seoul, South Korea's largest printing district to map the network among printing firms by following 10 makeshift paper delivery vehicles for 2 weeks using DIY sensors. By attaching a GPS and GoPro sensor kit to the makeshift motorcycles, the project gathers production network data between the printing firms following the delivery vehicles. Using map-matching algorithms on the GPS readings, and image processing algorithms on the collected GoPro images, the research team visualizes the trajectory of the delivery vehicles, and the network among printing firms. The analysis contributes to the literature of social networks among urban manufacturing firms, by proposing a small data methodology utilizing DIY sensors to gain access of the sensitive information of the collaborative network. In a context of constant state-led gentrification pressure on urban manufacturing land, the results demonstrate the tight knit community through the social networks the firms have established and emphasizes the role of the makeshift motorcycle drivers as the enablers of the economy of proximity and just-in-time production.

CHANGES IN THE LOCATION AND FUNCTION OF URBAN STREET COMMERCE DUE TO ONLINE SHOPPING

Abstract ID: 1541

Individual Paper Submission

YOON, Yoonchae [Hanyang University] yoonyoonc@gmail.com, presenting author

PARK, Jina [Hanyang University] paran42@hanyang.ac.kr, co-author

Many commercial activities are no longer location-dependent. In recent years, the huge growth of online shopping and the increase in non-face-to-face activities caused by COVID-19 have accelerated this. The proportion of online shopping in Korea's retail sales increased significantly from 21.4% in 2019 to 27.5% in 2021. These social and technological changes can change cities' travel and activities, retail landscape, and urban spatial structure. However, studies are currently limited in providing this knowledge. How is urban commerce changing? And where are these changes taking place? What are the influencing factors of change? Finding an answer to this question can provide valuable knowledge in urban planning and design.

We identify changes in urban retail, identify regional differences in these changes, and ultimately investigate the factors that influence these changes. In particular, noting that social and leisure functions are important characteristics of recent retail changes, we study the location change factors of this type of store. In this study, we consider the temporal availability of urban activities for 24 hours as well as the long-term changes in urban retail (2010-2021). Temporal availability helps us understand the social and leisure characteristics of urban commerce that cannot be replaced online. In addition, considering the temporal availability of urban activities in a situation where online shopping and telecommuting are expanding due to technological advances and non-face-to-face activities are increasing due to COVID-19 can help with more accurate modeling.

We use online shopping data (Statistics Office) and credit card big data to classify over 100 retail businesses (and food and personal services) according to their online alternative, social and leisure characteristics. Credit card big data includes data such as the time and frequency of each commercial activity. In addition, the neighborhood is categorized by using the De Facto Population data. Compared to simply classifying residential, business, and commercial areas based on land use, this classification enables a more sophisticated classification by considering recent non-face-to-face activities and mixed land use characteristics.

Analysis using this data can confirm whether social and leisure factors play an important role in the resilience of urban retail and retail transformation in the recent changes in the urban environment, the so-called 'Retail Apocalypse'. In addition, this study will be able to derive regional differences in these changes and find influence factors other than traditional location factors such as movement economy and centrality paradigm. This study of changes in Seoul's urban commerce provides many insights into the crises and opportunities that may arise globally.

USING GOOGLE ‘PEGMAN’ AUDITS TO COLLECT STREET-LEVEL PEDESTRIAN INFRASTRUCTURE DATA

Abstract ID: 1572

Individual Paper Submission

DETURBIDE, Katherine [Dalhousie University] katherine.deturbide@dal.ca, presenting author

TERASHIMA, Mikiko [Dalhousie University] mikiko.terashima@dal.ca, primary author

CLARK, Kate [Dalhousie University] kate.clark@dal.ca, co-author

Street-level indicators of walkability, such as the presence of curb cuts or shade from tree canopies, are often overlooked in walkability studies in favour of more objective measures of walkability derived from census data or GIS analysis (Stafford & Baldwin, 2018). Although these data are useful, they alone cannot account for the specific walkability (or rollability) needs of all individuals. Detailed built environment data are not often available through government open data collections, and as a result, in-person audit tools are often used by planning researchers to collect them. However, they are labour-intensive and time-consuming, limiting the amount of data that can realistically be collected.

Google Street View remote audits have become well established as effective methods of primary data collection (Vanwolleghem et al., 2014; Mooney et al., 2020). For this project, a remote audit was preferable to an in-person one due to the travel restrictions imposed by the pandemic. This research used the ‘Pegman’ feature to remotely collect street-level pedestrian infrastructure data within neighbourhoods in Halifax Regional Municipality in Nova Scotia (HRM) relevant to accessibility. These data were collected as part of a larger project which included a range of data related to sociodemographic, street-level and community-level indicators of walkability and availability of services in HRM. To our knowledge, this study is the first of its kind to use experience-based methods with Google Street View to collect street-level indicators of walkability (as opposed to more commonly used objective measures, such as NVDI).

Over the course of four months, we identified a total of 3684 curb cuts in our sample; of those, 1369 (37%) of them were considered ‘fan-style’ curb cuts, and only 193 (5%) included tactile attention indicators. Most curb cuts (75%) received a score of 2 or 3 out of 5. In our shade assessment, we sampled a total of 2203 road segments. The majority (62%) of the roads sampled received a shade score of 1 or 2 out of 5. Results have been mapped by each street segment, and as composite scoring for each COMe. Research is currently ongoing to cross-tabulate this data with the other indicator data we collected for this project.

This method proved to be an effective and efficient tool to measure detailed walkability indicators. We believe this methodology is easily replicable and has advantages beyond its suitability for pandemic conditions. The remote audit allowed us to collect a volume of data that would not have been possible had it taken place in-person and has provided a richer picture of walkability in HRM than we could have achieved with census data alone. Although scoring systems are inherently subjective, an unexpected result of this study was that the shade and greenery scoring system used for the ‘Pegman’ audit produced statistically significant results against other methods of auditing. This paper outlines our process, the challenges we encountered, and guidance for researchers who wish to collect data using this methodology.

MEASURING HUMAN SUBJECTIVE MOMENTARY SENTIMENT IN PUBLIC SPACES DURING THE COVID-19 PANDEMIC: USING TWITTER DATA IN MANHATTAN, NEW YORK CITY

Abstract ID: 1584

Individual Paper Submission

In the mist of the COVID-19 pandemic, public spaces have taken on a more significant role in human and urbanized society. While the shutdown and stay-at-home orders have kept people at home, unprecedented stressors have become a hazard to their daily life, directly and indirectly affecting people's physical and psychological wellness. As people have accordingly seek out safe venues for their physical activities and social interactions, the frequency of visitation and use of public spaces have increased during the pandemic period (Honey-Rosés et al., 2020). Exposure to urban public spaces is also of particular importance to urban dwellers to mitigate the negative impacts of COVID-19 crisis, by encouraging social and recreational opportunities as well as reducing stress and depressive symptoms (Lopez et al., 2021).

New York City, one of the hardest-hit areas by COVID-19, have accordingly introduced new and adjusted policies in relation to using public spaces after the onset of the pandemic. In particular, the city's parks and playgrounds that had left empty from the coronavirus-triggered shutdown were allowed to reopen for the public from June 22, 2020 – about 4 months after the first case of COVID-19 reported in New York State. As of June 27, 2020, the city has also required all outdoor privately owned public spaces open to the public, to increase open spaces that could be used for entertainment, dining, and retail amenities as well as health screening in a social distant way. These changes have further affected the habits and behaviors of how people have used public spaces during the pandemic period (Honey-Rosés et al., 2020).

While existing studies have explored the varying effects of public spaces – mainly focusing on urban parks – on public health and well-being, little has been known of subjective human perception and sentiment within both publicly and privately owned public spaces during the pandemic situation. Using a difference-in-differences approach combined with sentiment analysis, this study thus aims to explore how subjective momentary sentiment polarities expressed in tweets within either publicly or privately owned public spaces vary before and after the onset of the COVID-19 pandemic, as compared with those generated outside of the public spaces in Manhattan, New York City. The main datasets in the study are 1) the records and maps of both publicly and privately owned public spaces in Manhattan, New York City, available from the BYTES of the BIG APPLE archive and the MapPLUTO 21v2, and 2) the geolocated Twitter data collected by using the Twitter API v2, both before (from January 2019 to December 2019) and during the pandemic period (from July 2020 to June 2021).

The proposed methodological strategies and data science technologies using social media data have the potential to broaden the understanding of the dynamics of human behaviors, experiences, and lifestyle trends in the places where they live or are active in, but also explore how people characterize their neighborhoods or urban spaces through language (Plunz et al., 2019). These also could address some of the limitations identified with the traditional methods (i.e., observations, surveys, and interviews) – time consuming, labor-intensive, and limited to small sample sizes (Hu et al., 2019). Findings of this study could provide some guidance to policymakers and urban planners for the design and management of urban public spaces, particularly during pandemics, based on the potential ability of public spaces to promote subjective human sentiments and momentary emotions.

HOUSING CHOICE, LIFE EVENTS, AND LAND USE CONSTRAINTS IN A SMALL TOWN: A SPACE-TIME GIS ANALYSIS APPROACH

Abstract ID: 1613

Individual Paper Submission

KASHEM, Shakil [Kansas State University] shakilkashem@ksu.edu, presenting author

Hägerstrand's (1970) time geography framework provides an integrated space-time system to explore individual movement history within various constraints in a space-time context. In this framework, the spatial dimension presents the locational changes of an individual and the temporal dimension tracks the sequence of events over time (Shaw et al., 2008). Prior studies have applied this space-time path concept in gender and transportation studies (Kwan, 2002), but it can also be applied to form an understanding of people's housing choices, subsequent movement history and their correlation with life events over time, as explored in current housing literature (Clark & Lisowski, 2017). In this study we apply space-time GIS approach to explore how life events and land use constraints within a micropolitan area- Manhattan, Kansas- influence the housing choices that people make over time. Housing and the housing market has been central to many planning discussions due to a housing affordability crisis in the US. The micropolitan area of Manhattan, Kansas is home to some 54,100 residents, 60 percent (approx.) of whom rent. Median household income at \$50,900, is below the national level and a significant share of the renters are cost burdened. To understand the issues around housing suitability, availability and affordability and solutions to those issues, Community Solutions for Affordable Housing project held a series of housing forums in the summer of 2018 and 2019. During these facilitated forums, residents were asked to document their individual housing history in the form of maps and note down life events and constraints which led to the various moves. Based in a sample of some 50 maps, we created space-time paths of housing locations of each of the respondents along with the reasons for their move tagged to the movement paths. Housing types and zoning restrictions were also recorded for each of these locations over time. Space-time prisms (Miller, 2017) created through this approach tell a compelling story of how space-time constraints influence people's housing choices in a micropolitan area. By adding more nuance to the understanding of how life events and planning constraints influence housing choices, this paper contributes to the literature on housing choice and has the potential of influencing state and local policy. Through its focus on a micropolitan area, this paper brings to the fore issues faced by residents of small and medium sized cities in the Midwest when accessing housing, a hitherto largely understudied area in planning. Lastly, through the use of space-time GIS analysis, this paper contributes by adding to the repertoire of planning methods and tools used in the study of housing.

USING DEEP NEURAL NETWORKS FOR CRIME PREDICTION MODELS: LIMITATIONS AND POTENTIALS

Abstract ID: 1702

Individual Paper Submission

LEE, Narae [The Pennsylvania State University] narael@psu.edu, presenting author

To provide city planners with insights on how to design safe urban environments, this study used deep neural networks to develop a crime prediction model which was based on several neighborhood characteristics. The research setting of this study was Los Angeles, CA, and the units of analysis were city blocks.

The physical and social characteristics of urban environments shape the behavior of people within these settings; therefore, how neighborhoods are designed can be related to life quality. Public safety is also an important issue in urban planning given that fear of crime can deter the use of places in neighborhoods, thereby undermining the overall life quality of the community members.

Given the ubiquity of so-called “big data” and technological advances in modern computing, attempts have been made to develop crime prediction models using a variety of research methods. Compared with other methods, deep neural networks have been outstanding in their performance. Many crime prediction models have used previous crime as a

predictor of future crime. However, since these models tend not to account for the impact of neighborhood features on the incidence of criminal activities (other than prior rates of neighborhood crime and violence), urban planners cannot gain insight into which neighborhood characteristics should be considered in designing safe city streets.

Therefore, to develop a crime prediction model based on the function of the physical and social characteristics of neighborhoods, this study relied upon the following variables as predictors: walkability, the number of consumer-facing businesses, levels of mood, racial/ethnic heterogeneity, average household income, the percentage of homeowners, sex composition (percent men), age composition (percent aged 16–29), and the ambient population. This study addressed limitations in using deep neural networks in developing neighborhood-level crime prediction models and suggested ways to improve model accuracy and practicality.

MODELING THE RELATIONSHIP BETWEEN URBAN TREE CANOPY, LANDSCAPE HETEROGENEITY, AND LAND SURFACE TEMPERATURE: A MACHINE LEARNING APPROACH

Abstract ID: 1716

Individual Paper Submission

WILSON, Bev [University of Virginia] bw6xs@virginia.edu, presenting author
KASHEM, Shakil [Kansas State University] shakilkashem@ksu.edu, co-author

Cities across the United States and around the globe are embracing urban greening as a strategy for mitigating the effects of rising temperatures on human health and quality-of-life (Bowler et al., 2010). While extreme urban air temperatures have been identified as a leading cause of weather-related deaths (Basu, 2009), studies have also documented associations between lower mortality risk and long-term residential exposure to green space. On the other hand, tree cover and disparities in exposure to heat within U.S. cities (McDonald et al., 2021) demand a more equitable approach to urban greening. Recent studies have demonstrated the importance of considering landscape heterogeneity in estimating the mitigation effects of urban tree canopy (Jung et al., 2021) and studying how the cooling effect of tree canopy varies according to their spatial configuration (Osborne et al., 2019) in addition to the surrounding landscape heterogeneity should help to increase the positive impacts of urban greening. This study applies a machine learning approach (Oukawa et al., 2022) for modeling the relationship between urban tree canopy, landscape heterogeneity, and land surface temperature (LST) using data from nine cities located in nine different climate zones of the United States. We collected summer LST data from the U.S. Geological Survey (USGS) Analysis Ready Data series and processed them to derive mean, minimum, and maximum LST in degrees Fahrenheit for each Census block group within the cities considered. We also calculated the percentage of each block group comprised by the land cover designations in the 2016 or 2019 National Land Cover Database (NLCD) maintained by the USGS, depending on the vintage of the available LST data. High resolution tree canopy data were purchased for all the study cities and the spatial configuration of tree canopy was measured at the block group level using established landscape metrics (Hesselbarth et al., 2019). Landscape metrics of the waterbodies were also calculated to incorporate the cooling effects of waterbodies. The initial modeling approach combined exploratory data analysis with KNN regression and decision tree models to better understand the patterns in the data, then applied a Generalized Boosted Regression Model (GBM) to predict LST from the collected data. Our results show a consistent, but varying contribution of tree canopy coverage and compactness across the study cities. The findings underscore the importance of considering local climate pattern and existing landscape configurations when planning for urban greening.

TRANSACTIONS COSTS OF CYBERSECURITY GOVERNANCE IN SMART CITY INITIATIVES

Abstract ID: 1747

Individual Paper Submission

FAULKNER, Dagin [UC Berkeley] dagin_faulkner@berkeley.edu, presenting author

Smart cities are often discussed as sites of improved financial efficiencies for municipal governments (Kitchin, 2014). Given the vulnerability of widespread digital infrastructure to cyberattacks that can paralyze entire urban regions and subsequently, nations, cybersecurity governance in the context of increased digitalization of urban infrastructure is of top concern to municipal governments, private technology providers, and civil society (Andrade et al., 2020; Kitchin, 2014). This research seeks to answer the question: What are the transaction costs associated with developing and implementing cybersecurity governance frameworks such as third-party data trusts in smart cities? Smart city scholarship includes discussions on third-party data trusts as data governance mechanisms (Andrade et al., 2020) and empirically, there are examples of data trusts in practice in Spain and Estonia. Such trusts are forums wherein the interests of municipal governments, private firms, and civil society are negotiated to create data governance protocols that proponents argue ensure accountability (Meijer and Thaens, 2021), adequate responsiveness to matters of cybersecurity and privacy (Andrade et al., 2020), public access to data of public activities (Andrade et al., 2020), and the protection of private commercial interests (Meijer and Thaens, 2021; Kitchin, 2014). This research looks into the transactions costs accrued at these forums which are understudied in the literature and practice given the novelty of third-party data trusts. Transactions costs are external costs associated with project development and execution and often include the financial costs of projects associated with negotiations, contracts, inspections, dispute settlements, and contract change orders (Whittington, 2012).

Existing scholarship on cybersecurity management in smart cities will benefit from research into these transaction costs because smart cities are purported by their scholarly, commercial, civic, and industrial advocates as less financially burdensome to municipal governments (Kitchin, 2014). The results of this research could then be used as part of efforts to estimate the total costs of smart city initiatives and contribute to more robust evaluations of cybersecurity management processes in urban settings.

With respect to wide-ranging cybersecurity disruptions, the treatment of cybersecurity readiness remains at the sector level (Cyber Oversight, 2021). Cybersecurity failures in the financial sector could lead to national or global catastrophes; failures in transportation, energy, healthcare, and logistics could have cascading effects (Cyber Oversight, 2021) akin to those that smart cities may face (Andrade et al., 2020). Andrade et al. (2020) suggest that the traditional cybersecurity management framework warrants adjustments before application to smart cities as the domain of the latter is geographically larger and involves continuous interactions between the aforementioned sectors. This research builds from what Andrade et al. (2020) suggest, which is including how the structure of the interactions between the actors of the various sectors generate transaction costs when navigating their unique cybersecurity concerns in the context of smart city cybersecurity governance.

This research employs a mixed-methods case study-based approach. Using Whittington's (2012) transaction cost evaluation of the design-build project delivery method as a model for the quantitative portion of this research, semi-structured interviews and document analysis will be conducted to gather data about the transaction costs associated with establishing cybersecurity governance frameworks in cities.

The results of this work will contribute to theory development in urban governance and cybersecurity scholarship particularly given the understudied nature of transaction costs associated with third-party data trusts. This is critical

as recent research regarding third-party trusts as technology governance mechanisms suggests that their presence will persist, especially in Europe and the US (Andrade et al., 2020).

THE DIGITAL GROWTH MACHINE: URBAN CHANGE AND THE IDEOLOGY OF TECHNOLOGY

Abstract ID: 1768

Individual Paper Submission

ROSEN, Jovanna [Rutgers University - Camden] jovanna.rosen@rutgers.edu, presenting author
ALVAREZ LEON, Luis [Dartmouth College] luis.f.alvarez.leon@dartmouth.edu, co-author

We argue that technology sector-led urban growth combines digital accumulation and urban accumulation dynamics to transform urban growth processes and outcomes. This process builds on long-standing growth machine dynamics (Logan & Molotch, 1987) to create a unique and potent urban growth variation: the digital growth machine.

The digital growth machine fosters four related capital accumulation avenues that enable and support its activities: 1) extending long-standing land development and industrial attraction strategies, to promote urban growth and increase exchange values; 2) new possibilities for capturing land-related profit beyond traditional land development and intensification strategies; 3) new opportunities for intermediaries to emerge and profit; and 4) new digital renderings of the city that affect land-related value and perceptions of place. The first process builds on traditional growth machine dynamics in a new industrial context, while the latter three are directly enabled by new digital tools and the digital transformation of urban landscapes, including, for instance, platform urbanism.

By viewing these four avenues together, as interrelated urban growth strategies supported by urban elites, we demonstrate how urban digitization extends—and in so doing, transforms—long-standing growth machine dynamics. Taken together, these processes simultaneously further dynamics of elite control over land that have become deeply entrenched in cities under capitalism, while qualitatively transforming urban life and the role of cities and land in this economic system.

TECH, EQUITY AND THE CITY: PROMISE AND PITFALLS IN REGULATING, DEPLOYING AND MANAGING TECHNOLOGICAL CHANGE TO PROMOTE EQUITABLE AND EFFICIENT OUTCOMES IN URBAN AREAS

Abstract ID: 1789

Individual Paper Submission

CHATMAN, Daniel [University of California Berkeley] dgc@berkeley.edu, presenting author

What technological trends in transportation and land use are the most important and influential in US cities? How are city planners responding to rapid technological changes, and what future challenges will they need to respond to? To what extent do planners' responses to technological trends promise to improve the efficiency of cities, focusing particularly on outcomes for their least advantaged residents? In this study I address this trilogy of research questions by reviewing historical documents, scholarly literature, institutional reports, municipal planning documents, and conference presentations, and by interviewing planners at municipal agencies and nonprofit groups in some of the major metropolitan areas in the US.

Taking an historical approach, the paper discusses bases for many of the disruptive technologies of today, such as the rise of smartphone and GPS technology and high rates of smartphone and data plan ownership across income classes. Relevant technological developments in transportation include app-based ridesharing, bus information systems, point-to-point car sharing, micromobility options such as scooter and bike share systems, and electric and alternative fuel vehicles. The paper also addresses construction and development innovations (e.g., building information management (BIM) systems, construction techniques like modular housing), space-sharing innovations (e.g., Airbnb, WeWork) and innovations in retail, warehousing and freight (e.g., e-commerce trends, rapid warehousing and delivery), though the conference presentation will focus primarily on transportation.

The second part of the paper begins by contextualizing these changes given demographic, economic, workforce, travel and housing trends in the US over the past 20 years, and relating these trends to the technologies discussed in the first part of the paper. It then discusses the planning sector responses to date to these trends, including greater involvement in transit data provision to patrons, regulatory management of intracity freight delivery, public involvement in electrification infrastructure, and municipal charges on private transportation firms, as well as a discussion of existing planning regulations and standards that influence the adoption and use of technology.

The third and final part of the paper evaluates these responses with a focus on equity concerns. Planners, particularly at the municipal level, report efforts to regulate technology in order to positively influence broad social welfare related goals such as road congestion, alternative mode use, accessibility, urban form, and safety. They also report more parochial but highly relevant concerns with the municipal fisc, transit agency ridership and revenue, and parking revenue. In particular, in this section I address which demographic groups are benefiting from the management and regulation of contemporary technologies in transportation and land use, and how; and what could possibly be done to improve technology-related outcomes in the near future, including via the use of technology to facilitate greater levels of participatory planning.

[Note: This paper was accepted for presentation at ACSP in 2021 but I had to withdraw it and did not present.]

Individuals with disabilities participation in community life are important to their health, well-being, self-determination, and quality of life. While many individuals with disabilities reside within the communities, they may often not be a part of their community, not of it. Planners and policymakers influence well-being and participation facilitated by community amenities and related land use. To improve the quality of life for people with and without disabilities, we need to measure how well our social, economic, and environmental ecosystems interact with one another.

One of the more understudied aspects of people with disabilities is the interaction of social satisfaction and the built environment –important elements of quality of life. Social satisfaction describes the extent to which individuals feel satisfied with social bonding, interaction, and participation in their community through daily activities. Interestingly, with the diverse and anecdotal knowledge about the linkages between social satisfaction and the built-environment, researchers do not have a firm grasp on the relative influence that land-use, community design, and amenities have on social satisfaction. To address this knowledge gap, the main research question of the study: is there any relationship between the pattern and accessibility of urban amenities with the level of social satisfaction among individuals with disabilities. To answer this question we generate a spatial model to represent the effect of the pattern and accessibility of amenities that describes social satisfaction among individuals with a disability.

Researchers have examined various factors that impact social satisfaction, but no clear association between these factors and social satisfaction has been found. Furthermore, few studies address the level of social satisfaction and community integration of individuals with disabilities with their surrounding environment. There is evidence that social satisfaction is associated with the (spatial pattern of) built environment, personal characteristics, and social elements. For instance, a supportive environment is an essential contributor that plays a critical role in improving social satisfaction. Among environmental factors, the spatial pattern of urban amenities can influence social satisfaction but has been disregarded in literature and instead aggregated into broader economic assessments. Studies have demonstrated that living close to urban amenities, including shops, cafes and restaurants, schools, public transport, and public spaces, increases satisfaction. Studies that attempt to evaluate social satisfaction have focused primarily on subjective measures, both quantitative and qualitative.

Here we propose a mixed-method approach that combines a subjective evaluation of social satisfaction paired with a spatially explicit objective model. The model evaluates accessibility to urban amenities and environmental factors that influence social satisfaction ratings. To elucidate the relationship between urban amenities and social satisfaction, we defined spatial criteria and metrics based on the literature review within various spatial units (e.g. block groups, blocks and a continuous grid) in the greater Salt Lake MPO. We explored several different metrics for the model: 1) density of urban amenities within a service area buffer, 2) diversity of urban amenities within the area unit, 3) mixedness of urban amenities and residential area, and 4) average proximity of urban amenities to origins. We used the NHTS survey results of daily person miles of travel per person by trip purpose and mode of transportation to determine the driving and transit distance. We conducted a correlation analysis to identify the relationship between the level of social satisfaction (from a survey) and the model results (ArcGIS), as well as between different models themselves. Not all correlations were high, and varied by proximity to different amenities (e.g. places of education, outdoor recreation, restaurants). Results contribute to ongoing evaluation of social satisfaction, particularly for comparing the role the built environment has on social satisfaction for people with and without disabilities.

A GRAVITY MODEL TO ASSESSING THE COST OF SHIFTING TO A SEISMIC RESISTANT CITY

Abstract ID: 1827

CHAN, Shih-Liang [National Taipei University] slchan@mail.ntpu.edu.tw, co-author

In natural hazard management, there have been two well-known mitigation approaches: (1) mitigation theory, by enhancing building resistance through a strict building code, and (2) avoidance theory, by allocating future activities away from hazardous locations (Fulton and Shigley, 2005). While the approach of applying a strict building code (i.e. mitigation theory) has been widely used to deal with seismic hazards, especially from the perspective of seismic engineering, planners prefer the avoidance theory by looking at the allocation of future land uses and public infrastructure investments that would guide new developments away from hazardous locations. In this case, land-use planning could be used as a seismic mitigation tool (Burby et al., 1999) to serve for this purpose. For instance, Wang and Guldmann (2015) developed an optimization modeling framework embedded with an estimated statistical model to prioritize locations for future activities that would minimize aggregate seismic damages for a city.

Along this line, Wang (2020) used the estimated statistical model to simulate seismic damage under four spatial structure scenarios and reported that a polycentric-compact urban form might be the most seismic resistant for the city. The results also revealed that the current city center is essentially seismic vulnerable, and therefore moving the city core away from the seismic hazardous location is, of course, a must for the city. However, it is not clear at what costs it will take to implement all the required mitigation measures (land-use allocation and transportation investments) for the shifting. To fill up this gap, this study aims to (1) find out the most seismic resistant location for Taichung, Taiwan, using an optimization modeling approach; (2) to reshape the city to be seismic resilient by moving the city core to the most seismic resistant location through the means of land-use and transportation planning; and (3) to improve the understanding of how much effort in land-use limits and transportation investments is required to make the shifting take place and how long it will take to complete the process.

Methodologically, a statistical model for seismic damage will be first estimated using simulation data. This seismic damage model will be incorporated into an optimization modeling framework as a constraint. The objective function is to minimize the total seismic damage by reallocating all existing developments away from hazardous locations. Solving this model will reveal the most seismic resistant locations across the city. Urban development involves in local economies, transportation and physical limitation, and therefore a gravity model can be used to understand how much proposed mitigation measures can help reshape the city in a simulation. Three scenarios are considered: (1) business as usual, (2) land-use mitigation plan, and (3) transportation investments together with the planned land-use allocation. TELUM (Transportation, Economic, and Land-Use Model) is selected to simulate for the three scenarios. TELUM, a GIS based system successor of DRAM/EMPAL model, has been widely used for numerous cities in the world, particularly on the relationship between transportation network changes and the resulted land-use allocation for economic activities (Casper et al., 2009).

This study aims to mitigate seismic impacts in an active manner by shifting the city core away hazardous locations with necessary land-use and transportation measures. The approach of using a gravity model in the reverse direction is rare in past literature. The research framework in this study could be extremely important, not only because of its application to seismically hazardous areas, but also to those which may be subjected to flooding, landslides, droughts, or wildfires. The findings would shed light on how planners can help their cities adapt to or cope with these natural hazards through land-use and transportation planning.

OUELLETTE, Nicholas [Stanford University] nto@stanford.edu, co-author

JAIN, Rishee [Stanford University] rishee.jain@stanford.edu, co-author

The United States largely depends on the automobile for personal transportation. For instance, 85% of commuting trips were made by car in 2019 (Burrows et al., 2021). This dominance has significant consequence for society over a range of issues, including the environment, public safety, public health, and equity. It is also the result of several policy and, importantly, infrastructure policy decisions. These policy choices impact the full spectrum of urban typologies of US cities from the most urban to the most exurban. For example, cars are allocated most roadway space even in the most urban areas even though walking or biking are reasonable choices for the short trips that characterize many of the trips in these places (Federal Highway Administration, 2017). Car dependency, however, is most evident in the suburbs where there is no alternative to automobile usage. Federal policy in the postwar era led to the widespread use of car-oriented hierarchical street networks with topological barriers that disadvantage walking, biking, and transit usage (Southworth & Ben-Joseph, 1995). Moreover, the issues associated with the dominance of the automobile are most pressing in the suburbs: most of the US's population lives in suburbs while a spatial inversion of wealth patterns has seen poverty begin to concentrate in them as well (Parker et al., 2018). Any effort to address the negative consequences of automobile dependency in the US needs to consider retrofitting the suburbs and their street networks.

Therefore, we attempt to better understand the feasibility, costs, and tradeoffs of a systematic effort to retrofit a hierarchical, car oriented, street network with passages that make the network suitable to walking, biking, and transit. We consider a class of optimization problems similar to those discussed in (Brelsford et al., 2019) that attempt to maximize access—for walking biking or transit—to points of interest (POIs) within the study area by adding new edges to the street network. The constraints we define for these problems attempt to account for the built environment. In particular, we constrain our solution space by considering topography, property lines, property values, and the locations of existing buildings. We then apply our methodology to multiple suburban areas of varying ages, geographies, densities, and sociodemographic characteristics. We find that such street network retrofits can meaningfully increase access to POIs by walking, biking, and transit in several circumstances, thereby removing one obstacle against reducing suburban car dependency. Given their promise, we believe the methods we outline could present a useful starting point for discussing the potential of street network retrofits in suburban communities across the US.

PLACEMAKING AS AN INTERMEDIARY FOR ENVIRONMENTAL SENSING

Abstract ID: 1854

Individual Paper Submission

Deployment of environmental sensors has proliferated as a part of the Smart Cities paradigm of planning and development. The data collected by environmental sensing can be used to address critical urban issues, including community health and environmental justice. However, even when linked to government policies and social objectives, the integration of sensors, networks, and large-scale analytics tends to reinforce control from the top-down by establishing one-way systems of data collection and keeping the technologies at play largely invisible and unaccountable to citizens and their communities (Houston, Gabrys, and Pritchard 2019). Therefore, community discomfort with sensors and analytics is a significant issue, including high profile cases such as opposition to Sidewalk Labs' Quayside project in Toronto and more widespread skepticism of the intentions and value of urban sensing (Flynn & Valverde, 2019; Mondschein et al., 2019). Overall, sensor-based data collection remains difficult to integrate into community-centered practice, in part because the technologies of sensing and the use of data remain invisible and potentially alienating to communities. While movements towards the democratization of data suggest that bottom-up efforts can address some of the skepticism around urban sensing, sensors and the data collected by them remain fundamentally invisible or illegible within the urban environment they are meant to address. Creative placemaking practices posit that art and cultural practices can activate public spaces, facilitating community engagement and meaning creation through design (Markusen and Gadwa, 2010). If a placemaking is to address matters of distrust in sites of contention, each step of the process must be undertaken with significant engagement, from the beginning of the process through implementation. We hypothesize that the invisibility of environmental sensing may be addressed through engaged creative placemaking practices that make technological systems, and data itself, visible and responsive within public space.

This paper presents a case study of "Networked Public Space" (NPS), an integrated system of open-source environmental sensing technologies, creative placemaking, and community engagement strategies. NPS seeks to make urban environmental data more accessible, meaningful, and actionable for local communities by emphasizing the visible, responsive manifestations of environmental data and data collection technologies in the built environment and online. We present the results of a technological and design development process that have established interconnected sensing, public space design, and engagement practices in Shockoe Bottom, a community seeking pathways to social and environmental justice in Richmond, Virginia. Shockoe Bottom includes the streets and lots under Interstate 95 adjacent to a historic rail station and a new bus rapid transit hub under the highway. While largely unmeasured until this project, the Shockoe faces significant air and noise exposures, varying over space and time, to which multiple populations, including transit users and residents, are exposed. Furthermore, like many sites adjacent to urban highways, this is a location of historic injustice in the name of urban renewal, as well as a site of enslavement only recently being recognized by the city. Working with community stakeholders, NPS has deployed tactical and ongoing installations that not only measure pollution but re-present those data in art/architectural installations in public space and online. We find that integrating environmental data and analysis into placemaking through responsive design can increase the visibility of environmental issues to a population beyond technologists and planners and demystify the use of technology in public spaces. However, integrating open-source technologies into planned public spaces raises significant questions around ownership and permanence of technological placemaking. These questions require further analysis of how networked public spaces should manifest across communities of varied settings, demographics, and demands.

DIFFERENCES IN BROADBAND ADOPTION: INDIVIDUAL AND COMMUNITY IMPACTS ON SMARTPHONE DEPENDENCY AND UNIVERSAL CONNECTIVITY

Abstract ID: 1865

Individual Paper Submission

CRISTE, Michael [UCLA Urban Planning] cristemc@g.ucla.edu, presenting author

Digital inequality is the latest layer in the 20th Century's web of social, cultural, and economic exclusions. The impacts of digital inequalities became more severe during the COVID-19 pandemic. Some workers and students were able to successfully transition to remote settings, while others endured increasingly dangerous conditions in person. This dichotomy emphasizes who is able to take advantage of the opportunities afforded by universal broadband access and those who have remained locked out. The diffusion of internet and communication technologies (ICT) has followed previous patterns of exclusion due to the high costs of implementation, subscriptions for fixed and mobile broadband access, and the necessary devices. In addition to the gap in material access, the compounding forces of exclusion impact the ability to gain the skills necessary and the usage opportunities of ICT to increase educational, employment, and economic outcomes.

Some policymakers and researchers see the adoption of a smartphone and a mobile data plan as gaining access. But, relying solely on a mobile device does not offer the same opportunities as a stable, fixed connection and more robust abilities of a desktop computer. In this paper I add necessary granularity to previous literature, moving past the binary lens of the digital divide to include those who are smartphone dependent. Differentiating between universal connectivity and smartphone dependency, policymakers can better address the different needs of unconnected or under connected urban and rural residents.

To better understand how categorical and opportunity divisions impact the likelihood of a resident's ability to adopt ICT technologies, I examine how ongoing forms of exclusion based on race, gender, and immigration status impact the adoption of broadband in Los Angeles County. Using the 2019 American Community Survey (5 year estimates) public use microdata sample, I develop a logistic regression model that incorporates individual and community-level factors. Preliminary findings indicate that there is a polarity between those who have universal connectivity versus those who are smartphone dependent. Wealthier, more educated, English speaking white residents are nearly unanimously universally connected. Inversely residents of color, with lower incomes, with less than a college education, who may speak a language other than english at home or not speak english at all are increasingly smartphone dependent. Furthermore, a spatial analysis was conducted to demonstrate the impacts of community-level factors and visualize the concentration of exclusionary factors across the county.

The analyses utilized in this study portrays where there is a greater level of disparity in access to ICT. By measuring and visualizing the interactions between digital and ongoing forms of exclusion across space, a more holistic approach to policy making and implementation can be taken to inform future interventions addressing the gaps in resources necessary to use ICT and the opportunities to harness the benefits of adoption.

THE REGULATION OF INFORMAL WORK IN MEXICO CITY AND SAN FRANCISCO: ANALYZING RECENT SHIFTS IN GOVERNANCE STRUCTURES

Abstract ID: 1905

Individual Paper Submission

FARAH, Irene [University of California Berkeley] irenef@berkeley.edu, presenting author

How do shifts in urban governance modify the urban order? In this paper, I will examine how street vendors, street level bureaucrats, and local politicians negotiate over the use of public space by analyzing: 1) the current changes in political institutions in Mexico City, and 2) the impact of new data infrastructures on the regulation of public space in both Mexico City and San Francisco.

Across the globe, informal work is on the rise. From day-laborers, waste-pickers, and street vendors to sex-workers, transportation drivers, and domestic workers, these marginalized groups are increasingly impacting the use and governance of public space in cities. While scholarship of informal politics has long been in place in cities of the global south (Cross, 1998), the increasing number of informal workers in the global north is becoming more prevalent due to increasing entry-barriers to jobs that are secure, well-remunerated, and provide health benefits due to increasing migration, education credentialism, and city densification. For this reason, contrasting Mexico City and San Francisco can elucidate how new forms of organization and resistance strategies of informal workers in the global north can learn from organizing strategies in cities of the global south (Devlin, 2018). In particular, both geographies have worked on city-level open-data portals promoting enumeration efforts that function both as artifacts of recognition and visibility of workers as well as instruments of state surveillance (Scott, 1999) which bring up questions of forbearance of informal workers (Holland, 2017).

Shifts in governance structures are particularly visible for street vendors because they rely on using highly-trafficked and touristic spaces, distributing goods and services in cities (Cross, 1998). While their visibility renders greater political leverage than other informal workers, it also creates greater tensions with powerful vested interests that want to make use of cities' public spaces. In terms of the management of public space, the study of street vendors elucidates the use of discretionary power, revealing the tensions between legal authority and the legitimacy of the state (Davis, 2018).

In this paper, first, I examine how much recent shifts of political institutions have changed street vendors' strategies in negotiating for public space in Mexico City by analyzing how the city's development programs priorities have changed over time. Second, I delineate the political and social implications of carrying out an enumeration of workers through an open-data portal in Mexico City and San Francisco. In the case of Mexico City, I analyze documents created by vendor organizations to analyze how new data infrastructures impact the political struggle of local politicians and street vendors alike. In contrast, San Francisco has an established open-data portal that make visible other types of informal workers (e.g., sex-workers), although under a context of criminalization. This comparative case allows me to understand forbearance structures of informal workers, how organizational structures of the global south could inform regulation processes in the north, and which mechanisms are in place for street vendors to remain in space in certain areas of cities.

SCOOTER-SHARE TRAVEL DEMAND FORECAST: A CONTEXT-AWARE LSTM RECURRENT NEURAL NETWORK APPROACH

Abstract ID: 1917

Individual Paper Submission

BAI, Shunhua [University of Texas at Austin] shunhua@utexas.edu, presenting author

JIAO, Junfeng [University of Texas at Austin] jjiao@austin.utexas.edu, co-author

Shared micromobility, including dockless bike-share and scooter-share, has been popular in many cities in the U.S. Due to its small vehicle size and flexible on-demand riding style, it is considered a viable low-carbon transportation alternative to satisfy people's short-travel demand. Research has shown that shared micromobility trips mostly cluster in downtown areas where there are recreational facilities and shopping stores and on university campuses where students live and study. In addition, researchers have pointed out the possibility of a tight connection between shared micromobility travel demand and economic activities. Following this idea, this study builds a context-aware long-short term memory (CALSTM) recurrent neural network to forecast the daily travel demand for scooter-share in Austin, Texas. The CALSTM model considers the historical visit frequency of points-of-interest (POI) near a scooter-trip destination as well as the weather on a particular day in order to improve the prediction accuracy. By comparing the CALSTM model result with the naïve LSTM model without the consideration of POI visit frequency and the

baseline ARIMA model, this study demonstrates the power of deep learning models for scooter-share travel demand prediction and the importance of including economic activity characters in the model. The result of this study could serve as valuable guidance for transportation planning projects aiming at promoting shared micromobility in cities by predicting high-demand areas based on local economic activity patterns.

ningkexin@stu.pku.edu.cn, co-author

Although there has been a growing interest in causal inference in planning research, only a few studies have incorporated spatiotemporal heterogeneities with causalities, so do the emerging research examining spatial and/or temporal variations in COVID-19's impacts during the early stage of the pandemic. Causally estimating spatiotemporal heterogeneity in non-pharmaceutical interventions' (NPIs) treatment effects is important, because it helps policymakers determine when and where to implement which policies to mediate the mobility and the spread of the pandemic, and identify potential disparities in health risks and unequal burdens for less adaptive spatial contexts. Nevertheless, most existing studies have focused on variations in mobility outcomes or associations and not on causalities, especially in finer-grained spatial and temporal resolutions. Therefore, this study aims to conceptualize a novel framework to comprehend and measure different patterns of spatiotemporal heterogeneity in the causal effects of policy interventions, and apply it to precisely assess how the treatment effects of mobility control policies at the early stage of the COVID-19 outbreak vary across neighborhoods day by day.

This study relies on a dataset of neighborhood-based mobility levels lasting for 145 days from October 2019 to February 2020, which is extracted from a large set of mobile phone signaling data in Shenzhen, China which contains above 500 million individual mobility trajectories of 13 million users. We developed a spatially interrupted time-series (SITS) quasi-experimental design for the policy evaluation of two mobility control interventions, i.e., the first-level response to public health emergencies (FLR) and closed-off management of residential communities (COM), and how the policy effects vary across neighborhoods with different built environment and socioeconomic contexts over time. The SITS design incorporates spatial contextual effects with temporal heterogeneities into causal inference, which is regarded as a methodological innovation compared to traditional spatial modeling that aims to identify correlations and causality inference methods that lack a heterogeneity analysis.

The modeling results reveal significant temporal, spatial, and spatiotemporal heterogeneities in the policies' causal effects. For example, we observed an abrupt decrease of 2.8 km in travel distance as a result the FLR, and a decrease of 0.5 km as a result of the COM, accounting for 44.6% and 7.2% of the baseline level before the pandemic, respectively. Such mobility-reduction effects decayed at a rate of 0.033 km per day after the FLR and 0.076 km per day after the COM. For both policies, the abrupt effects were significantly larger in neighborhoods with a higher residential density and land use mixture, lower average age, and higher income and marriage rate, whereas the gradual effect of the FLR decayed faster in similar compact neighborhoods. These findings demonstrate the importance of incorporating spatiotemporal variations with causality inference for fine-grained policy assessments, which can help policymakers determine when and where to implement which policies to mediate the mobility and the spread of the pandemic. This study also provides recommendation of keep advocating compact and diverse forms of urban development for planning resilient neighborhoods in the postpandemic era, because they are more likely to

achieve favorable health conditions by being adaptive to mobility changes.

ANJOMANI, Ardeshir [University of Texas at Arlington] anjomani@uta.edu, presenting author

To some estimates, 83% of the US population lives in urban areas¹. Cities in the United States constitute these areas, forming our urbanized regions. According to the Bureau of Census, there are 384 metropolitan statistical areas and 543 micropolitan statistical areas in the United States². The cities in these dynamic metro and micro areas deal with ongoing social and economic changes and prepare and implement plans and policies to enhance economic development in the area and accommodate the demographic and employment changes. While most of these efforts are undertaken at city levels, an overlooked point is that a city in the US is a creature of the state, a political jurisdiction to which economic waves and forces are blind. As a result, the effectiveness of these economic development policies and planning efforts is questionable. The persistence of social equity problems in poverty-stricken areas with overwhelming minority populations in so many cities is the evidence. At the same time, strategies of different nature have been implemented sometimes for decades. Considering all the related information beyond a city boundary was not entirely possible until recently. However, the technological and theoretical advancements of the last few decades in big data, GIS, urban analysis, visualization, etc., have made the setting ready for new ways of dealing with old problems.

This paper presents a planning and support system (PSS), ELUENT, that helps with many problems of this nature in urban areas. It utilizes all the relevant information that facilitates the analyses and processes urban-related institutions need to go through for various developmental objectives in the city, a larger subregion, or regional levels. ELUENT considers social, economic, and political considerations when preparing plans or socio-demographic analyses for various policymaking purposes. Its open framework can be tailored to different settings and helps economic development, comprehensive plan-making, and policy decisions of all types at the local, city, county, or regional levels. It introduces innovative approaches to planning an urban area—including a variant of a geographic information system-based land-use and environmental suitability analysis in deriving development potential for small zones or cell grids of the study area. This approach enables public and stakeholder input into the process, facilitating micro-level consideration of different attributes of economic activities and demographic changes in the analysis along with the related land uses and social dimensions. It also includes the effects of future developments on the environment, economic development, stakeholders' input, ease of use for decision-makers, and better integration with other regional planning efforts and MPO's transportation planning process.

These features allow the planning process to be open to human interaction, making it possible to input social and political aspects and decisions into the easy-to-work structure. The input is accomplished by including and participating representatives of the decision-making bodies, stakeholders, and the public in various aspects of the planning process to elicit their information and intimate local knowledge in this critical step and continue during the necessary land-use activity allocation process. This inclusiveness would involve multiple voices during the process from the outset, making it more open and understandable to the public and the decision-makers avoiding later surprises when the results become public. Such information is critical in decision-making, economic development, land-use planning, and resource allocation, which helps achieve results in line with stakeholders' development perceptions, local economic activities, and jurisdictional plans and visions. Furthermore, this input allows the derivation of development potentials in the suitability stage and the more critical land-use activity allocation process, which helps allot commercial and economic activities and households to their most appropriate locations, thus facilitating social equity problems.

CHOOSING SPATIAL WEIGHTS AND SPATIAL SCALES IN LOCAL STATISTICAL ANALYSES

Abstract ID: 1971

Individual Paper Submission

ROGERSON, Peter [Arizona State University] rogerson@buffalo.edu, presenting author

Local spatial statistics are used to measure and test for spatial association in some variable of interest, and to measure and test for clustering around predefined locations. Local Moran's I (1995), the Getis-Ord statistic (1995), and the score test are examples of local (or focused) tests.

Such statistics require that a neighborhood be defined around the location of interest. This is done by specifying weights for surrounding points or regions, where higher values for weights indicate a relatively stronger connection to the focal locations. Specification of the weights is therefore tantamount to specification of the spatial scale at which the local association or clustering is measured and/or tested.

In practice, weights are usually assigned exogenously, with little thought given to their definition. This implies a spatial scale that may or may not be the best one to evaluate the variable under study – perhaps the actual scale of association or clustering is one that is smaller or larger than that implied through the definition of binary adjacency.

Local statistics are most likely to be significant (i.e., have their greatest statistical power) when the weights are chosen to match the spatial extent of the actual association or clustering. In this paper, I focus upon assessing the magnitude of the “cost” of misspecifying the weights. The cost is measured in terms of loss of statistical power – it is more difficult to reject false null hypotheses when the weights are poorly chosen. Furthermore, I show here that it better to overestimate the region of influence around a particular location than it is to underestimate the spatial extent of influence.

Because the actual spatial scale of association or clustering is almost always unknown, an attractive alternative strategy is to try different sets of weights, corresponding to different spatial scales. This is in fact how several local tests work – the statistic is derived at several spatial scales, and the significance of the maximum local statistic is assessed, taking into account the multiple hypothesis testing that occurs across scales. It is common to carry out such assessments using Monte Carlo simulation. But there are statistical tests that allow for examination of some local statistics across multiple spatial scales (Rogerson 200x)

These tests avoid the need for simulation. But here too, choices must still be made regarding the number of spatial scales examined. Looking at many spatial scales will cover the possibility of possible significance at any scale, but the price to be paid is in terms of the reduced statistical power associated with the multiple testing. In this paper, I examine the relative likelihoods of finding spatial clusters, given various choices made for the range of spatial scales examined. This assessment leads to specific recommendations for implementation of these tests and it therefore has direct relevance for the analyses that are carried out in planning applications. If there is uncertainty regarding the scale of the process, there is little cost in examining large spatial scales. Gains in the power to detect significant clustering may be had if the examination of cluster sizes that are clearly too small may be omitted.

CALIBRATING DAILY TRAVEL PATTERNS OF MILLENNIALS: THE DIFFERENCE IN TIME INTERVALS OF COMMUTING AND NON-COMMUTING TRIP

Abstract ID: 1980

Individual Paper Submission

OH, Da Won [Seoul National University] ohdawonv@gmail.com, presenting author

Millennials refer to the generation born in the 1980s to the mid-1990s, and have social characteristics that allow for diversity and a strong will for self-actualization. They are important from an urban planning point of view because they tend to travel less compared to previous generations, own fewer cars, and use alternative modes (Garikapati, Pendyala, Morris, Mokhtarian, & McDonald, 2016). For this reason, they place higher value on urban amenities such as leisure, shopping, and public transport in the metropolitan area (Deka, 2018; Ralph, Voulgaris, Taylor, Blumenberg, & Brown, 2016). Previous research on the travel habits of millennials shed more light on Vehicle Mile Traveled (VMT) commuting and non-commuting trips (Ding, Liu, Zhang, Yang, & Wang, 2017; Jun, Choi, Wen, & Kwon). However, since these generations are experts in using smartphones, they can easily access traffic information and use various transport modes such as personal mobilities. Thus, we need to delve into comprehensive forms of trips, and not just vehicle use.

This study aims to examine the change between each time interval in the average travel time of millennials between commuting travel and non-commuting travel in terms of comprehensive travel modes and attempt to identify the built environment features of their neighborhoods and workplace, such as mixed land use, transit accessibility, and business density. To highlight the difference between each time interval by separating commute and non-commuting travel, quantile regression analysis was applied to each model by dividing the average travel time for a one-way trip into four time intervals: 1) less than 20 minutes, 2) more than 20 minutes and less than 40 minutes, 3) more than 40 minutes and less than 60 minutes, and 4) more than 60 minutes. For this, we use the open-sourced daily travel record data, "Seoul Travel Population," released by the Seoul Metropolitan Government. This data was accumulated in January 2020 with real-time big data (De Facto population counts with mobile phone signal), containing information on all travel arising from daily needs such as commuting, shopping, and leisure both inside and outside of Seoul.

Some distinct differences between commuting travel and non-commuting travel will be detected: The average travel time of commuting is greater than that of non-commuting, but the influence of built environment features of the neighborhood on the average travel time of non-commuting is greater than that of commuting. Additionally, in the case of commuting travel, the effect of transit accessibility and degree of mixed-use of a neighborhood and workplace was the greatest in the average travel time of the 40-60 minutes time interval. However, a neighborhood's residential density and workplace's business density had no effect in any time span. On the other hand, in the case of non-commuting travel, the lower the degree of mixed-use in a neighborhood, especially the lower the commercial proportion, the larger the average travel time, and the higher the transit accessibility associated, the smaller the average travel time.

With a better understanding of millennial mobility needs, metropolitan city space structures and infrastructure networks can respond to these demands. This will help build a more efficient and sustainable city network.

HOW THE SENSE OF PLACE FORMED BY CONSUMER TYPE BASED ON SOCIAL MEDIA

Abstract ID: 1994

Individual Paper Submission

LEE, JI AH [Hanyang University] jiapooh91@gmail.com, presenting author

The sense of place (or placeness) changes with the flow of the times because the various factors that form the place and the experiences of people are interconnected. Therefore, in order to understand the sense of place of modern city that accommodates and mediates various types of information and changes, it is necessary to understand the characteristics of people who are the subjects of change. This study focused on the emergence of social media as a representative influencing factor of changes in consumption behavior. Unlike the era when media did not affect places, in the present era, media information has become very important in enjoying a place.

Therefore, this study aims to reflect the influence of social media, a representative characteristic of changes in consumption behavior in modern society, in understanding the factors and cognitive processes of forming urban consumption spaces. To this end, based on the theoretical model of the relationship between the formation process of placeness and behavioral intention, an analysis was conducted on the characteristics of the consumption behavior of people based on social media.

The research consists of the following steps. In step 1, the consumption group is classified and the characteristics of each group are confirmed through consumer segmentation including social media use characteristics, individuals, and place selection tendencies. Step 2, the recognition of the place components according to the difference between groups and its effect on the formation of a socially empathized image, that is, sense of place. In addition, the behavioral intention according to the formation of sense of place is grasped from a comprehensive perspective. Step 3, analyze the behavior of consumers who are influenced by social media consuming places and identify the mechanisms for the formation process of sense of place they are paying attention to. Through this, we propose the direction of a fundamental strategy that can continuously preserve the spatial value of urban space.

A survey was conducted to collect analysis data. The subjects of the questionnaire were set as people who visited a specific consumption space. After asking them about the characteristics of media use and place selection, the cognitive characteristics and behavioral intentions of place in the situation of place consumption were questioned. A total of three analyses were conducted based on the collected survey data. First, the consumer groups were segmented through cluster analysis. Next, spatial recognition path analysis was conducted for each consumer type, and finally, differences by group were confirmed.

The results of this study can be helpful in understanding urban space and the people living in it as follows. First, in the study of sense of place, the characteristics of the current generation exposed to social media were reflected. Second, in-depth analysis of the characteristics of the current generation from the point of view of place consumption revealed the weaknesses and strengths of each group. This suggests that if the propensity of major consumers in a specific place is identified in advance, it is possible to more effectively prepare strategies for managing and promoting the value of the place that consumers pay attention to. Third, the results of this study point out that it is necessary to find information that is not revealed in public space through social media, and to go beyond simple physical space improvement, and to have a practical plan to preserve and sustain the content value of the place.

DOES DELIVERY METHOD OF VIRTUAL REALITY TECHNOLOGY AFFECT PEOPLE'S VISUAL PERCEPTIONS OF URBAN STREET DESIGN?

Abstract ID: 2014

ZHU, Cenqi [University of Florida] cenqizhu@ufl.edu, presenting author
CHEN, Kanglin [University of Florida] kanglinchen@ufl.edu, co-author
BUFKIN, Jamie [University of Florida] jbufkin@ufl.edu, co-author
NOH, Soowoon [University of Florida] nswscott@gmail.com, co-author
BEJLERI, Ilir [University of Florida] ilir@ufl.edu, co-author

Background

Since Complete Streets movement started in 2005 in United States, urban streets are getting more attention as an essential component of urban environments. However, traditionally the street design is mostly an engineering domain where the perceptions of different road users are not included (Mccann, 2013). The Virtual Reality (VR) technology generates visual environments that have the potential to assess the perception of built environments during the design phase. VR can be delivered in a traditional flat screen as an interactive 360-video or panorama (referred here as 360-web) and in a fully immersive experience delivered by Head-mounted Display (referred her as Headset) (Yeo et al., 2020).

Purpose

The purpose of this research is to evaluate the performance of these two VR delivery methods - 360-web and Headset - in measuring people's visual perception of street design. The variables measured include safety, comfort, place recognition, density, and enclosure. The measurements are conducted using two designed street scenarios which feature urban center and general urban characteristics. Specific research questions include: (1) Are there differences between Headset and 360-web in eliciting participants' perceptions of the 3D street design environments? (2) How do participants' backgrounds affect their preferences between Headset and 360-web?

Methodology

We conducted a two-phase survey using a sample of 42 subjects (participants). First, the subjects are presented with the two design scenarios, first using a Headset, and six days later using the 360-web visualization method. They fill out a questionnaire that allow us to measure the selected variables. The results are analyzed using Wilcoxon signed-rank test and Goodman-Kruskal gamma tests of the subjects' responses about the perception. We also analyzed the relationship between individuals' backgrounds and their perception scores. The background factors include demographics (i.e., gender and age) and experience (i.e., education level, any design background, living density, and prior VR/video game experience).

Results

The results show differences between Headset and 360-web. First, participants largely prefer Headset (63.0%) over the 360-web (37.0%). However, in the assessment of perception itself over half of the participants' scores are similar. Second, when assessing realistic visualization capabilities, Headset show higher scores than the 360-web. Finally, we find that only the perception of "biking comfort" and "driving safety" in the urban general setting, show statistically significant higher score for the Headset than the 360-web.

Personal backgrounds greatly affect the participants' preferences. The preference rate for Headset decreases with age increasing. Participants with design background prefer Headset (65.2%) to 360-web (34.7%), while those without show equal preference. Participants with prior VR/video game experience prefer Headset compared to those without such experiences. The preference rate for Headset decreases when participants' living density increases. The participants' living density show a weak negative correlation with perception of density – people living in denser areas are more likely to give lower score to "density". This result is stronger for urban general setting (lower density design), where more participants give higher perception scores using Headset than 360-web. However, in the urban center scenario (higher density design), fewer participants give higher perception scores.

Contribution

This research contributes to filling the gap in the literature about the lack of evaluation of visualization tools for urban design. Specifically, this research finds that the immersive VR provides a more realistic visualization for assessment of urban street design. This can support the benefit for the extra effort that is typically necessary to use an immersive VR compared to a non-immersive 360-web approach to assess the urban street design scenarios.

LI, Dongying [Texas A&M University] dli@arch.tamu.edu, co-author

GATSON, Sarah [Texas A&M University] gatson@tamu.edu, co-author

BROWN, Robert [Texas A&M University] rbrown@arch.tamu.edu, co-author

Rapid urbanization and high-density development have been major drivers of urban warming. The effects of spatial landscape patterns on the urban thermal environment, specifically for urban heat island (UHI) and land surface temperature (LST), have been well investigated (Mahyar et al., 2019; Lu et al., 2020). The spatial landscape metrics measuring the composition, shape, aggregation, fragmentation, and proximity of greeneries have frequently been linked to urban cooling capacities as they account for the joint effects of land use, land cover, and geographical features (Jane et al., 2019; Zheng et al., 2021). However, few studies have explored the relationship between spatial heterogeneity of landscape patterns to the outdoor human thermal comfort of urban residents. Despite the fact that the UHI and LST are indirect and secondary proxies representing the impact on human heat stress, quantifying the direct cooling effects of spatial landscape patterns on human level thermal comfort has been less considered in previous studies.

Accordingly, this study investigates the relationship between the spatial heterogeneity of landscape patterns and outdoor human thermal comfort. The greenery's cooling effects on the physiological thermal loading of people in various urban settings are explored. Particular attention is given to revealing what spatial patterns of urban greenery – configurations and compositions – have a significant relationship with outdoor thermal comfort. In addition, interaction effects of landscape patterns with proximity to water bodies and urban densities are further analyzed to identify their synergies and mitigations on greenery's cooling effects.

For this longitudinal study, spatial regression models were adopted to quantify the impact of landscape metrics on outdoor human thermal comfort. Tokyo in Japan was selected as a study site since it is a coastal metropolis suffering from high heat-related mortality and morbidity due to the extreme urban heat conditions (Ohashi et al., 2014). The meteorological datasets are obtained from Japan's Ministry of Land, Institute, Transport, and Tourism (MLIT). Landsat 8 and sentinel 2 remote sensing images are collected to measure the land surface temperature and normalized vegetation index (NDVI), respectively. Fragstats is employed to generate landscape metrics using NDVI. COMFA energy budget model is applied to estimate human outdoor thermal comfort using meteorological variables and Sky View Factor (SVF). The SVF is an urban morphological indicator of solar access reaching to the ground and quantified using AI algorithm-driven Google Street View Images Analysis.

The preliminary study results indicated that landscape spatial patterns significantly affect outdoor thermal comfort. We found that the cooling effects of greenery would be increased when they are in a more aggregated, less fragmented, and more complex shape. Furthermore, the cooling efficiency of the landscape pattern can be further boosted when they are nearer to the water body and located in a lower density development area. Our study findings would provide microclimatic urban planning and design implications of how to spatially configure and arrange the urban greenery to improve outdoor thermal comfort at the city scale.

HELPING COMMUNITIES TRACK AND MEASURE RACIALIZED ENDURING DIVERGENCE: KEY INDICATORS FOR ADDRESSING ROOT CAUSES OF NEIGHBORHOOD INEQUALITY

Abstract ID: 2032

Individual Paper Submission

IYER, Seema [University of Baltimore] siyer@ubalt.edu, presenting author

According to the 2020 Census data released in August 2021, only 4 of the 40 cities with population greater than 400,000 in 2010 lost any population at all. Baltimore City was in the minority, experiencing a -5.7% population loss between 2010 and 2020. However, many communities actually gained population in close proximity to communities that lost more than 4 times the citywide average.

The pattern of uneven and disparate growth was nearly the same in the preceding decade 2000 to 2010. Urban sociologist Robert Sampson [12] argues that neighborhoods have enduring properties based on the social, cultural, and physical realities that define places. Although people and individuals help shape neighborhoods, their actions occur within the structural construct of race, history, planning and geography.

This "pulling apart" of communities into those that gain all kinds of resources beyond population and those that do not is described by economist Enrico Moretti [2] as divergence, where inequalities along economic opportunities, socioeconomic class and even cultural amenities separate into different geographic areas. While Moretti developed his theory of divergence based on geographical sorting between cities in the nation, the experience in Baltimore suggests that divergence is occurring among neighborhoods within a city and might be true within other cities as well.

This paper aims to show that intracity growth is subject to "enduring divergence" rooted in structural racism which means that planners need to understand and track the forces that contribute to continued divergence in order to reverse these trends. Moretti points to 3 advantages of attraction for the communities that seem to keep growing despite the diverging experiences of neighboring areas.

1) Size Matters—the supply of services and infrastructure in a community needs to meet the demands of the residents and businesses located there. Once a community starts to lose population, regardless of the absolute size, there is an imbalance between all kinds of relationships such as buyers and sellers, homeowners and houses, or school children and school capacity.

2) Ecosystems Matter—no one in a community (no household, no business, no community organization) does anything alone. They each exist in a symbiotic relationship with the services they may use and/or provide.

3) Spillover Effects Matter—this refers to the unintended consequences that can occur from our interactions. Sometimes interactions can have both negative and positive effects, such as when someone moves in next door at a high market prices that might increase the value of adjacent homes, but then also increase the tax burden. Beyond prices, there are intangible human interactions that help build human and social capital, largely due to the knowledge we gain by interacting with each other.

None of these "advantages" that Moretti identifies are ahistorical or devoid of racial biases therefore we must add [3]

4) Black Neighborhoods Matter—the cumulative lack of attraction advantages that Moretti points to disproportionately impact communities of color. And not just due to historically racist policies that promoted segregation and devaluation in the past, but modern practices impacting Black neighborhoods today.

Based on findings from the Baltimore Community Change Project, using more than 100 community based indicators collected annually between 2010 and 2020, this paper shows empirical evidence of key indicators that can help planners measure the disparity between diverging neighborhoods. While race was certainly one distinct factor, others

included indicators of isolation in terms of market access (no new construction activity), physical mobility (high commute times), digital connectivity (low internet access at home), and civic participation (low voter turnout). These measures can help planners address the missing forces of attraction from within declining neighborhoods.

DIFFERENCES AND SIMILARITIES IN PERCEPTIONS OF AUTONOMOUS VEHICLES BETWEEN PEOPLE WITH DISABILITIES AND PEOPLE WITHOUT DISABILITIES

Abstract ID: 2033

Individual Paper Submission

QU, Tongbin [Michigan State University] teresaqu@msu.edu, presenting author

XU, Chang [Michigan State University] xuchang1@msu.edu, co-author

COTTEN, Shelia [Michigan State University] cotten@msu.edu, co-author

BUSH, Tamara [Michigan State University] reidtama@msu.edu, co-author

The Autonomous Vehicles (AV), often viewed as the next revolution in transportation, will have a great impact on all aspects of our society, especially on mobility. Most research (Claypool, Bin-Nun and Gerlach 2017) show that AV has the potential to increase mobility for those who are unable or unwilling to drive, such as people with disability (PwD) and elderly. The benefits for these groups include independence, reduction in social isolation, and access to essential services. Some of their mobility services are currently provided by public transit, paratransit, or ridesharing companies. But each of these alternatives has significant challenges. Public transit remains hard to utilize due mainly to accessibility-related equipment and attitudinal issues from drivers (Bezyak, Sabella and Gattis 2017). Paratransit services in the United States are being stressed from high demand and low funding (United States Government Accountability Office 2012). Besides of lack of accessible devices, ridesharing services can be expensive for PwD who in general have lower income than People without Disabilities (PwtD) due to decreased accessibility to employment and the corresponding additional challenges (Clewlow and Mishra 2017).

To realize the potential of AV for PwD, it is essential to understand the special needs and understandings from the community. However, there has been little research comparing the differences and similarities between PwD and PwtD in their perceptions of AV. How comfortable and safe that PwD think about AV? How much PwD is willing to pay for the AV technology given their affordability? What are some social factors of AV would make it more likely for PwD to utilize it? These are the questions this study seeks to answer. Additionally, this study asks how these generalities and differences translate into technical requirements and policy recommendations for autonomous vehicles.

Two surveys were used to examine the perceptions of PwD and PwtD about AV and to understand the factors influencing their perceptions. One statewide survey targeted entire Michigan population and the other areawide survey focused on PwD. Multinomial Logistic Regression models were used to analyze the survey results.

The study shows that females were more concerned about the safety of AV whether with disabilities or not. Employment status and ethnicity had no influence on the perception of AV safety for PwD and PwtD. In addition, PwtD who regularly use public transportation were more likely to feel safe and ride AV than those who do not use public transportation. Those with higher levels of education were more likely to feel safe with AV. PwD were not willing to pay more for AV rides than Uber/Lyft rides. Contrary to some of the previous findings, there is strong receptivity to AV among PwD. Despite their social isolation concerns, PwD favored personal AV over shared form AV. This finding indicates that PwD prioritize mobility over social functions in AV technology.

WHERE DID REDLINING MATTER? REGIONAL HETEROGENEITY AND THE UNEVEN DISTRIBUTION OF ADVANTAGE

Abstract ID: 2057

Individual Paper Submission

XU, Wenfei [Cornell University] xu.wenfei@gmail.com, presenting author

This paper studies the regional variation in outcomes of federal home mortgage insurance grading to highlight the contingent discriminatory and economic conditions that mediated housing outcomes. Given these contingencies, this study aims to clarify how the influence of a seemingly standardized federal neighborhood valuation principle nevertheless had heterogeneous outcomes across the United States. What were the city and regional economic and population growth patterns pre-FHA and how may this have shaped loan guarantee patterns? Between 1940 and 1970, was the degree of the FHA's influence, as proxied by the HOLC maps, on A or B ("AB" from here) graded neighborhoods versus C graded neighborhoods in different cities and how did this influence change or persist over time? Is there regional variation in the influence of these grades? What are the longitudinal socioeconomic patterns that may explain the persistence or decline of the AB effect over time? In part 1, I measure the regional variation of central city changes pre-FHA and relate this to the FHA's insurance activities between 1934 and 1940. Part 2 analyzes two outcomes of interest – home value and homeownership – and compares fixed effects of an AB grade to a C grade for cities between 1940 and 1970. It uses a Bayesian hierarchical framework in which AB effects vary across cities, while allowing information about these effects to be shared between cities. Part 3 estimates the persistence of the longitudinal city-level AB fixed effects from Part 2 as explained by regional differences as well as socioeconomic trends. I find that the Pacific and Sunbelt cities that saw the most housing construction also had the highest proportions of FHA loans to overall dwelling units. There is also a distinctive consistency and persistence of benefit on home value and homeownership to AB graded neighborhoods in West coast and Mountain Divisions.

Abstract ACSP Conference 2022 - Asocial Society and Form

Along with the evolution of Canadian society in the last five decades from predominantly rural to being 80% urban, urban form and neighbourhood configurations have also evolved. This legacy of urban form, that Hillier (Hillier, 1996) would argue has been a “rather disorderly outcome of a long history of small-scale, incremental changes, which accumulate over time to produce patterns with neither geometrical nor functional simplicity” provides a backdrop a society that is increasingly disengaged. This lack of engagement – our disconnection from each other, our isolation, the pandemic of loneliness – is escalating. While it would be simple to lay blame on virtual lives replacing social lives, this assumes that the environments we build have no agency or impact on social interaction and people’s connection to society.

Beyond this very new and pressing social issue of the global pandemic, there are longer brewing topics such as an ongoing undermining of democratic systems and processes internationally. The MeToo movement calling out the widespread prevalence of sexual harassment, the Black Lives Matter movement bringing attention to systemic biases towards minorities, and of course, global warming and sustainability putting into question long held expectations about quality of life based on amenities and luxuries.

All these are expressions of social shifts creating rifts that have their expression in built form. Segregated urbanism as an example in South Africa under apartheid urbanism (Turok, 1994) or building walls to protect arbitrary political and religious boundaries such as in Israel (Shoshan, 2010). Also mundane aspects such as suburbia with its individualized and isolating structure (Keil, 2013) was promoted by, and is by itself, promoting an exclusive lifestyle built around the individualization of space. Access to the city is governed by finance and economic power mapping out segregation. Every attempt to revitalize and invest is accompanied by stronger waves of gentrification (Murdie & Teixeira, 2011; Walks et al., 2021).

We cannot separate our asociality from urban form and so this research involves marrying social movements to urban morphology (for example, Modernism, Situationists). We propose four avenues of investigation: 1) Urban Form - There is an abundance of academic research exploring the relationship between urban form/morphology and physical and mental health, environmental outcome and social connectivity, among many others, 2) Policy - These range from social housing policies to land use policies affecting zoning and densification, 3) Action - Citizen-led initiatives provide insight into the psyche of a population, and 4) Examples - A systematic review of large-scale, state-led and privately funded urban renewal projects to uncover their evolution, approach, resident profiles, motivations behind their creation.

We are working with two extensive scoping studies using a methodology based on (Arksey & O’Malley, 2005). Scoping Study 1 focuses on Urban Research and Scoping Study 2 on Municipal Policy.

Comparative analysis of methodologies provides insight on future research strategies, tracking overlapping content, and an understanding of research best-practice.

HOUSING PRICE INDICES FROM BIG DATA: ADDRESSING THE SPATIAL BIAS WITH SAMPLING WEIGHTS

Abstract ID: 2069

Individual Paper Submission

LOPEZ OCHOA, Esteban [University of Texas at San Antonio] esteban.lopezchoa@utsa.edu, presenting author

This paper proposes a method to reduce the inherent sampling bias when estimating housing price indices using big data sources. Producing more accurate and representative metrics is important as new sources of data emerge with higher frequency, detail, and volume, providing more information for policymaking, but usually come with strong sampling biases that are often overlooked. In the case of housing price indices, although the literature around its

estimation is abundant, it has concentrated only in traditional and formal sources of housing data, which is normally not available in some markets (i.e., renting) and locations (developing countries). In this paper I propose a method to create a housing price index (HPI) that is comparable in quality to the industry-standard Case-Shiller HPI but using online listing data. Using online listing data from a developing economy (Chile), this paper shows that large biases present when using raw unweighted data, how these biases can be minimized using sampling weights, and how new and relevant information can be obtained from adjusted HPIs that can lead better policymaking.

THE IMPACT OF AFFORDABLE, HISTORIC, AND SUSTAINABLE DESIGNATIONS ON PUBLIC EVALUATIONS OF PROPOSED HOUSING DEVELOPMENTS

Abstract ID: 1196

Poster

DOUGLAS, Isabella [Stanford University] douglasi@stanford.edu, presenting author
BILLINGTON, Sarah [Stanford University] billingt@stanford.edu, co-author

An important objective in both research and practice relating to urban planning is striving to understand the public's opinions on the design of the built environment, especially around high-profile topics like densification, affordability, preservation, and sustainability. Recent studies have examined how public opinions around densification could be altered with various framing approaches. A positive framing approach, such as emphasizing various public benefits (Doberstein, Hickey, and Li 2016), and a negative framing approach, such as emphasizing developers' potential profits (Monkkonen and Manville 2019), respectively had positive and negative impacts on acceptance of proposed projects. Even a frame shift as subtle as changing one term has been shown to have a significant impact. In a between-subjects survey, 61% of respondents supported or strongly supported the term "lifecycle housing" while only 45% supported or strongly supported the term "affordable housing" both of which were presented with an identical definition (Goetz 2008).

While all these experiments used written framing, given the technical nature of project documentation (e.g., plans, permits, codes) and the scale of the final built form, photos and renderings are also often used to convey information to the public. To efficiently provide context to their study, Whittemore and BenDor (2019) first showed participants an aerial photograph of a development and then presented a series of written supportive frames. While Whittemore and BenDor focused on the impact of the written frames, it is worthwhile to consider the impact of the visual depiction that was included. The use of visual representations in research introduces opportunities for understanding viewer perceptions but also challenges, such as teasing out visual confounds. An emerging methodology that allows research to unobtrusively understand how participants are interacting with visual imagery of the built environment is eye tracking. While scholars have used eye tracking to better understand how people absorb architectural features (Hollander et al. 2020), no research known to the authors has examined how the written designations of buildings and their visual depictions interact to influence public opinion of a proposed building project.

To address this gap, our research seeks to answer: How does the general public interpret and react to photos of buildings? Specifically, how does the context (usage and designation) of a building interact with its visual depiction to impact viewers' initial assessments (such as attractiveness and acceptance)? Two sequential studies will be conducted utilizing a between-subjects design where each participant is shown a series of affordable housing developments and asked to provide their perceptions of attractiveness and acceptance on each. One of five possible building designation labels (affordable, historic, sustainable, affordable and historic, and affordable and sustainable) will be presented as

part of an accompanying framing text introducing the developments. An unlabeled version will be run to act as a baseline. The two independent variables (IV) are the physical building design captured through images and the building designation label captured through the framing text. The second online study will have the same self-report measures as the first and, additionally, incorporate web camera eye tracking to examine how the IVs impact participants' engagement with visual stimuli captured through area-of-interest (AOI) metrics (namely time to first fixation, fixation time, fixation count).

The results of this research will provide insights into how the underlying public connotations (positive or negative) of building designations impact the evaluation and acceptance of a proposed project. Understanding the interactions of these designations with the physical building design and neighborhood context can ultimately inform strategies to more successfully address public opposition that delays or blocks proposed affordable housing projects.

CITIZEN ENGAGEMENT THROUGH E-GOVERNMENT SYSTEM AS CLIMATE ACTION

Abstract ID: 1368

Poster

CHEW, Sean [Columbia University] sc4931@columbia.edu, presenting author
HONG, Boyeong [Columbia University] bh2764@columbia.edu, co-author

As an older coastal city, New York faces imminent threats from climate change including flooding from sea level rise and storms, increasing heat vulnerability, and deteriorating air quality. Simultaneously, many citizens of New York experience threats unequally - often those at highest risk are low income, immigrant populations with fewer resources to advocate for needed policy and infrastructure interventions. NYC311 is the City's platform allowing the government to respond to requests for non-emergency services, which provides New Yorkers an avenue to request action ranging from pest control to maintenance of city infrastructure. As climate change continues to accelerate, it is likely that the scope of complaints 311 oversees will increasingly expand to include those relating to environmental risks. Concurrently, there is an increasing interest in e-governance and civic engagement platforms to promote equitable inclusive policy making. This research will investigate the usage of 311 as a civic engagement platform to advocate for policy and infrastructure changes in light of climate change. Specifically, this study will investigate how equitably New York's 311 services has served its citizens by determining how reporting rates in neighborhoods with higher environmental risks differ from those in lower risk neighborhoods. Using big data and machine learning techniques, this research will investigate 311 complaints, flood maps, air quality information, and building information to inform policy recommendations. The goal is to promote a more equitable implementation of citizen engagement in light of climate change.

ANALYSIS OF SPATIO-TEMPORAL CHANGES IN HEATWAVE IN KOREA DUE TO CLIMATE CHANGE: USING DYNAMICS INDEX AND SPACE-TIME SCAN STATISTICS

Abstract ID: 1910

Poster

HWANG, Hee-soo [Pusan National University] awake5109@pusan.ac.kr, presenting author

KANG, Jung Eun [Pusan National University] jekang@pusan.ac.kr, co-author

LEE, Sang-hyeok [Pusan National University] ubscott@pusan.ac.kr, primary author

Continuous climate changes have increased the intensity and frequency of extreme and adverse weather events, such as temperature rise, heavy rain, and heavy snow; consequently, damage and negative effects also have increased. This study analyzed the present and future impacts of climate change, and examined their temporal and spatial characteristics to cope with the negative impacts.

The study focused on analyzing and presenting changes in the occurrence of heatwaves due to climate change in Korea by using the Dynamics Index and Space-Time Scan Statistics. The Dynamics Index combined with a matrix allows for examination of changes in the impacts of climate change from the current time to the short-, mid-, and long-term future. Therefore, heatwaves associated with climate change were applied in the form of a matrix of the current status (Status) and future changes (Dynamics) so that the magnitude and urgency of the impacts are presented through the status index and the necessity and timing of response can be derived by using the future change (Dynamics Index). Space-Time Scan Statistics is a method for analyzing the complex correlations of time and space dimensions to identify spatial and temporal concentration patterns at the regional level. By exploring the distance and period of impacts from the target region to vicinity areas, it is possible to derive the areas where the spatiotemporal concentration pattern occurs and also examine changes in the short-, mid-, and long-term impacts of heatwaves.

The results of the Dynamics Index and Space-Time Scan Statistics varied depending on the climate change scenario, but similar risk clusters of future occurrence of heatwaves appeared. In both methods, the risk of heatwaves increased over time, and the largest risk cluster occurred in the Capital Seoul and Gyeongsang-do Province, which is in the southeastern part of the Korean Peninsula.

Accordingly, the results obtained through analysis of the Dynamics Index and Space-Time Scan Statistics provide insights into the timing and spatial distribution of risks; therefore, they are considered to be highly useful for decision-making or priority-setting in response to climate change. In addition, the methodological scalability for supporting decision-making on climate change is pronounced.

ASIAN AMERICAN AND PACIFIC ISLANDER ACTIVISM AND PLACE-MAKING

Pre-Organized Session 31 - Summary

Session Includes 1182, 1183, 1184, 1185, 1186

LEE, Aujean C. [University of Oklahoma] aujean@ou.edu, organizer

Planning and policymaking have been used to preserve white wealth and exclusion. Asian Americans and Pacific Islanders (AAPIs) have also been excluded from planning processes and places in part because they are understudied and devalued in planning. Yet, their diversity is key to understanding nuances of intra- and inter-community-led activism and placemaking. This preorganized session includes studies of how AAPIs fight for visibility and community development issues in varying political and geographical contexts. With the immense diversity among AAPIs, they also contend with intracommunity tensions that impact their ability to create panethnic coalitions, from the local to federal level. The papers cover a range of community development and methodological issues, including data disaggregation, historic preservation, suburbanization, faith-based services, and anti-immigrant legislation. The papers also provide recommendations for understanding the impacts of racism and how to engage other racial groups that remain understudied in the planning field for educators and practitioners.

Objectives:

- community development
- race/ethnicity
- planning with diversity

GEORGIA'S IMMIGRANT SUBURBS: INTEGRATION, SEGREGATION AND SPRAWL IN SMALL SOUTHERN TOWNS

Abstract ID: 1182

Abstract within Pre-Organized Session 31

KIM, AJ [San Diego State University] anna.kim@sdsu.edu, presenting author

Suburbs of Atlanta like Doraville, partially inside, and partially outside “the perimeter”, and Norcross, are both inner-ring suburban cities that once boomed with industry, and then subsequently suffered from white flight. The advent of the General Motors Assembly plant in the 1950s led to the development of two waves of housing: 1) planned subdivisions like Northwoods subject to restricted covenants (whites only) and composed of single-family homes, converted from largely agricultural plots of land (1950-1960), and 2) zoning changes, expansion of roads and highways, and apartment buildings all along Buford Highway – colloquially known as an immigrant highway of cheap rents, good food, and everybody from everywhere in close proximity. The mobility of refugees and immigrants movement has replicated the old pattern of white flight, with the majority of immigrants moving further and further northeast, and thereby slowly but surely converting previously majority white cities along Buford Highway into the “new immigrant cities” of Georgia.

Georgia is at a new nexus of immigration and refugee resettlement, particularly in the South, and from this recent growth of foreign-born residents, a number of “Welcoming Cities” have emerged. This paper examines immigrant settlement patterns in the Atlanta metropolitan area, segregation between immigrant and non-immigrant groups, and the emergence of non-traditional “majority-minority” towns. The state of Georgia attempts regularly to pass three types of anti-immigrant acts through its annual legislative sessions (English-only laws, civic engagement bans and/or restrictive voting measures, and driver’s license limits). How do immigrants in Norcross, Georgia, communicate with local officials and city representatives who as yet are not representative of their constituencies? Do some immigrants feel more welcomed than others? How does a distinctly southern immigrant suburb adapt to waves in federal and state policy that can shift local attitudes of welcoming, and vice versa?

DISMANTLING WHITE SUPREMACY IN HISTORIC PRESERVATION: ASIAN AMERICAN AND PACIFIC ISLANDER COMMUNITY-DRIVEN EFFORTS AND CONTEXT STUDIES

Abstract ID: 1183

Abstract within Pre-Organized Session 31

MAGALONG, Michelle [University of Maryland] magalong@umd.edu, presenting author

The field of historic preservation has focused on commemorating and preserving places of architectural mastery associated with master narratives of exceptional people, places, and historical events. Given these standards, less than 8% of listings on the National Register of Historic Places are associated with minoritized groups (including African Americans, Asian Americans, Latinos, Native Americans, Native Hawaiians, Pacific Islanders, women, LGBTQ, the disabled). Historic preservation upholds standards that fail to understand histories of dispossession, displacement, discrimination, and trauma (and the places associated) for minoritized communities. While practitioners, researchers, and policymakers have more recently started to address the historical legacies of systematic discrimination as embedded in historic preservation practice and policy, it is imperative to explore the importance of community-driven engagement in preserving historic sites and cultural resources associated with minoritized groups. This chapter will explore a framework of community-driven historic preservation efforts through context studies, particularly on the creation and implementation of a federal initiative (National Park Service Asian American Pacific Islander Theme Study) and subsequent state and local context statements (City of Los Angeles, State of California, Washington, DC, State of Maryland) that have expanded approaches of community engagement in historic preservation, particularly given the lack of knowledge of Asian Americans in terms of immigration, settlement, and community formation patterns and implicit bias demonstrated by preservation planning staff that calls for the need for community driven efforts in preservation efforts. This presentation will examine the opportunities and benefits of these context studies, as well as limitations and consequences, in terms of processes and outcomes. Do context studies on racialized groups, like Asian Americans and Pacific Islander, help dismantle white supremacy in historic preservation or perpetuate it?

WHO COUNTS? THE POLITICS OF ASIAN PACIFIC AMERICAN DATA DISAGGREGATION IN NEW YORK CITY

Abstract ID: 1184

Abstract within Pre-Organized Session 31

KWON, Haegi [Boston University] haegi@bu.edu, presenting author

Nonprofits are crucial to the well-being of communities across the US. Immigrant-serving nonprofits, in particular, fulfill many necessary functions to support immigrant communities in an increasingly diversifying country. For

example, immigrant-serving nonprofits may offer services tailored to the needs of different immigrant communities (Cordero-Guzmán 2005), play a mediating role to bridge “multiple publics” (Hum 2010), and represent and/or mobilize immigrant groups around planning and/or policy issues (de Graauw 2016) – a necessary role as inclusive and meaningful forms of public participation may not always occur during the planning process, particularly for many non-citizens (Lee 2019).

However, there is little in the planning literature that demonstrates how immigrant-serving organizations construct and/or problematize racial identities in planning and policy contexts, and how these processes relate to planning and policy outcomes. In other words, while it is widely accepted that racial identities are socially constructed (Omi and Winant 2014), it is less clear what this “looks like” in practice in organizations that claim to represent specific ethnic and racial groups.

I fill this gap by investigating how a coalition representing 40+ nonprofit organizations serving and/or representing Asian Pacific Americans (APAs) in New York City attempted to push for the data disaggregation of group members. Ideally, disaggregated data on APAs would draw more attention and resources to the needs of disadvantaged subgroups and equip nonprofit advocates with more data to facilitate their advocacy and service efforts.

The study identifies three key factors (capacity constraints, intragroup tensions, and intergroup tensions) that contributed to the coalition’s challenges during the legislative process. Specifically, I trace how a City Council bill that originally focused on the data disaggregation of APAs was eventually transformed into one focusing on the identification of the top 30 ethnic groups and languages in New York City, effectively undermining the coalition’s attempts to bring attention to underserved APA groups. I demonstrate how these three factors are associated with issues that relate to racial identity construction and representation within the coalition.

This research is a part of a larger qualitative comparative case study of APA advocacy and social services organizations in New York City; this presentation features findings based on 10 semi-structured interviews, participant observation, and document analysis from my fieldwork in 2018. I focus on APAs for several reasons. While APAs are the fastest growing racial group in the US, group members represent over 20 different countries and the majority of individuals are foreign-born. Further, compared to other racial groups in the US, income disparities are greatest among APAs. These dynamics facilitate an exploration of how advocates and activists grapple with issues of identity and constituency within organizational contexts.

Ultimately, this work helps to advance planning scholarship by moving beyond monolithic depictions of immigrant-serving organizations and drawing attention to the kinds of complexities inherent to planning for an equitable and inclusive city.

CHANGING THE SUBURBAN LANDSCAPE: ASIAN AMERICANS, CIVIC ENGAGEMENT, AND COMMUNITY MAKING IN CERRITOS, CA

Abstract ID: 1185

Abstract within Pre-Organized Session 31

PATRAPORN, R. Varisa [California State University Long Beach] varisa.patraporn@csulb.edu, presenting author
KIM, Barbara [California State University, Long Beach] barbara.kim@csulb.edu, co-author

People of color and immigrants have challenged and reshaped traditional models of residential assimilation and segregation in the U.S. in recent decades. Suburbs, long viewed as a homogeneous white, middle-class spaces of exclusion, are increasingly racially, ethnically, and socioeconomically diverse places; the 2010 census showed that increasing numbers of Black, Latino, and Asian Americans lived in suburbs (Frey 2011). Much of the literature on Asian American suburbs has focused on Chinese immigrants in San Gabriel Valley and the interracial tensions and/or

solidarity with other racial groups, particularly Latinos (Li, 1998; Saito, 1998; Cheng, 2013). However, very few, if any, examine the nexus of multiple Asian American groups living in a community with transnationalism and that is multigenerational. But what are the effects of the changing demographics in suburban communities? How might Asian Americans complicate or change notions of suburbanization? How might residents of Asian American suburbs disrupt exclusion, assert belonging, and redefine community-making through their planning and civic engagement?

We use a case study approach to examine civic engagement in Cerritos, CA, a suburb in Los Angeles which is majority Asian American. It is not dominated by one Asian ethnic group and contains a mix of foreign-born and native-born Asian Americans unlike the focus of the prior literature (Li, 1998; Lung-Amam, 2017). It is a typical middle-class suburb with single family homes, an abundance of renovated shopping plazas, well-regarded schools, and plentiful parks. Yet as a racial group with great ethnic and socioeconomic differentiation and disparities in values and interests, and thus, policy and planning preferences can be complicated and conflicting.

Using interviews, participant observation, and content analysis of news media we examine how race, ethnicity, and class have shaped planning issues in the city and the approaches Asian Americans are using to shape suburban communities and a sense of belonging. In doing so, we see the challenges and strengths in organizing across racial and cultural differences, generations, and the political spectrum among Asian Americans. Simultaneously, we examine how Blacks, Latinx, and White residents adapt to and negotiate with the heterogeneous Asian American residents.

Ultimately, this research will provide much for planners to consider regarding how planning processes and participatory planning occurs in such diverse contexts. This study will expand our understanding of majority ethnic places as homogenous even in suburbs where presumably class would prevail in bringing people together and creating a shared identity. As the U.S. population continues to grow in racial, ethnic, and socioeconomic heterogeneity, studies of neighborhoods such as Cerritos urge scholars and planners to reimagine concepts

NURTURING THE VA (SPACE): ACTIVISM AND CIVIC ENGAGEMENT AMONG INDIGENOUS TONGAN PACIFIC ISLANDER LATTER-DAY SAINT COMMUNITIES IN THE UNITED STATES

Abstract ID: 1186

Abstract within Pre-Organized Session 31

SOAKAI, Sarah [Urban Planning PhD Program, UCLA] sarahsoakai@ucla.edu, presenting author

Third sector civil society that include faith-based organizations (FBOs) and institutions fill the gaps not provided by the state or the market. Churches, mosques, synagogues, and other faith-based religious organizations and institutions are uniquely positioned and often the most trusted local neighborhood frontline contact among indigenous, immigrant, low-income communities of color. Indigenous Pacific Islanders in the U.S. diaspora are no exception. Catholic churches, Evangelical churches, Jesuit churches, Latter-day Saint (LDS) Mormon churches, Methodist churches, Protestant churches, and Seventh Day Adventist churches are prominent indigenous faith-based organizations and institutions among Pacific Islander populations. Churches are the central anchor institutions among Pacific Islander communities in the United States. Asian American Pacific Islanders are dedicating their time and resources to local structures and institutions outside of the mainstream, such as churches, where their volunteerism and participation go unmeasured (AAPI Civic Engagement Fund 2020). Of the many, many organizations and institutions that encompass third sector civil society, significant civic engagement with family and neighbor occurs within Pacific Islander churches.

This study focuses on Tongan Latter-day Saint ward congregations in the United States – in particular California, Hawaii and Utah, where a critical contingency currently exists – and how this Pacific Islander population actively

navigates and negotiates an indigenous place within a faith still largely seen as White American. Tongan LDS congregational communities in the United States encompass a critical indigenous margin, willingly participating within a space that has been indigenized in particular ways through language, song, and dance, for instance, to provide tauhi vā (economic, social, and spiritual well-being) to its members. Within these faith congregational spaces, Tongan Pacific Islanders actively participate in sharing economic, mental, and social services and support among its community. While such services and support can be useful in improving lives and the community, resources and capacity are often limited. Questions of if and how the indigenous Tongan LDS faith community can align and connect to state and other sources outside the faith are examined. Interviews, field participatory observations, and archival document analysis were used in the study.

EQUITABLE DEVELOPMENTS: EXPLORING THE POSSIBILITIES AND LIMITATIONS

Pre-Organized Session 37 - Summary

Session Includes 1333, 1334, 1335, 1336

KIM, Minjee [Florida State University] m.kim@fsu.edu, organizer

Growth is a double-edged sword. Urban elites, consisting of policymakers and business interests, have long embraced and promoted the idea that absolute increases in material wealth is a gain for the city regardless of who benefits from such increases. Nevertheless, ample evidence from planning practice and research suggests that this "raw" or "value-free" growth is uneven and reinforces and exacerbates socioeconomic inequality. In response, urban scholars have advocated for the need to distinguish raw growth from growth that is redistributive, reduces inequality, and promotes the well-being of people and the environment. In this session, we use the term "equitable developments" to refer to economic development and real estate development initiatives where the benefit from growth can also be distributed to disadvantaged communities, households, and individuals. We question whether such equitable development is possible and, if so, what it may look like in practice. We also explore the degree to which developments can be made equitable and identify the conditions that can push them towards more or less equity.

Objectives:

- identify the political and regulatory contexts under which growth can be made more equitable
- define what is equitable development and distinguish it from growth that simply means absolute increases in material wealth

DIVERSITY, EQUITY, AND INCLUSION IN MASTER PLANNED COMMUNITIES? AN INVESTIGATION INTO CONTEMPORARY PLANNED COMMUNITY DEVELOPMENT PRACTICES

Abstract ID: 1333

Abstract within Pre-Organized Session 37

KIM, Minjee [Florida State University] m.kim@fsu.edu, presenting author

LEE, Hyojung [Virginia Tech] hyojunglee@vt.edu, co-author

The evolution of the urban planning profession has long been intimately connected with the real estate development industry. Specifically, a particular breed of real estate developers, the "community builders," has been instrumental in shaping zoning and subdivision regulations in the 1920s and 30s (Weiss, 1987) and the communities built by these

developers have set the standards for suburban and exurban development (Jackson, 1987). Nevertheless, the impacts of the community developers' practice on the planning profession is largely understudied, and developers have largely been oversimplified and stereotyped. In the planning field, for instance, developers are often characterized as a homogenous group profiteering from land commodification, standing at odds with planners' pursuit of equitable growth (Kim et al., 2020).

In-depth research into exceptional planned communities suggests that large-scale master planned communities may be different from conventional property developments. The new town research, for example, suggests that the developer's vision and business decisions can affect the racial and socioeconomic diversities of planned communities, as some developers have deliberately strived to create racially and socially integrated communities (Forsyth, 2006). Industry proceedings published by the community developers in recent years further indicate that planned communities of the 2000s are built with heightened sensitivity towards enhancing diversity, equity, and inclusion (Davis et al., 2020). Accordingly, this paper examines contemporary planned community development practices to identify if and how the developers' strategy, vision, and financial interests, among other factors, may explain the racial and socioeconomic diversity, housing affordability, and inclusiveness in their planned communities. We compile a database of the nation's largest master planned communities, including both quantitative and qualitative data. We then use regression models to identify the factors that may lead to more equitable development outcomes. Our ultimate goal is to offer guidance to planners as they work and negotiate with the community developers, so that these large-scale master planned communities can be pushed towards greater equity outcomes.

WHAT CAN COMMUNITY BENEFITS AGREEMENTS LEARN FROM ALLIED POLICIES?

Abstract ID: 1334

Abstract within Pre-Organized Session 37

GANNING, Joanna [Cleveland State University] j.ganning@csuohio.edu, presenting author
ARTHOFFER, Patrick [Cleveland State University] p.arthofer@vikes.csuohio.edu, co-author

Community Benefits Agreements (CBAs) have risen in popularity and usage in the twenty first century. The approach offers an intuitive appeal, involving community members in the process of articulating community needs while facilitating private investment. Much has been written about their legal basis, goals, and challenges, and many CBA cases have been profiled either individually or in groups. A majority of the benefits, challenges, loopholes, and opportunities identified in the CBA literature are well-summarized. Since the advent of CBAs, many similar (and seemingly similar) policy approaches have been developed, including Community Benefits Ordinances, REDD programs, Development Agreements, Impact Benefit Agreements, and others. These allied policies and practices have effectively operated in silos. Via a systematic literature review, this paper catalogs and analyzes those allied policies, and asks what those policies offer in the way of practices and innovations that could be used to productively improve CBA policy in the US.

Our review begins with a level-setting background section outlining the context and boundaries of CBAs in contemporary usage and identifying allied approaches that operate under different names. In this research, "allied" means that policy approaches involve the public in the negotiation process, or are negotiated entirely between the government and private actors where government promotes the same benefits CBAs are designed to achieve. We do not include literature describing the public benefits of economic development generally, economic impact studies, community engagement in economic development, or research on cooperative agreements that exist primarily for financing purposes, such as most public private partnerships. We conduct an Extending Review within the broader category of a Thematic Synthesis literature review around these policies, extracting and synthesizing themes from the

literature.

We identify more than 600 related articles, which we narrow to 140 for data extraction. Based on a systematic data extraction and synthesis, the paper presents lessons pertaining to the central criteria of CBAs: place-based development, community engaged, physical development orientation, community benefit goals.

DESPERATE FOR DEVELOPMENT: THE TENUOUS NATURE OF EQUITY IN RICHMOND, VA

Abstract ID: 1335

Abstract within Pre-Organized Session 37

HOWELL, Kathryn [Virginia Commonwealth University] khowell@vcu.edu, presenting author
GOUGH, Meghan [Virginia Commonwealth University] mzgough@vcu.edu, co-author

On November 9, 2017, the City of Richmond released a request for proposals for the redevelopment of a 12-block area of downtown. With only 90 days over Thanksgiving and the winter holidays, the proposal required community engagement, plan creation, and technical work. Unsurprisingly only one group responded and were subsequently selected by the mayor. Initially referred to as either the North of Broad or Downtown Neighborhood Redevelopment Project, the new developers rebranded the redevelopment as Navy Hill, which was the name of the Black neighborhood destroyed by the previous development of the area. The rebranding of the development, the minimal community benefits and the lack of meaningful community engagement set off a community mobilization effort that forced critical questions about the purpose, need and beneficiaries of development. It failed in a final vote before the Richmond City Council in 2020.

Throughout the history of Richmond's downtown development in the 20th and 21st century, the city, like many across the country, argued for a need for development to expand the tax base, create jobs, build affordable housing and attract new, typically young and affluent workers to the city. This has been particularly relevant in southern cities where resistance to organizing has been high and the drive to appear as a "new" south is critical to urban identities (Stone 1989, Silver 1984). In the 1950s, city residents voted down highway construction twice before the state overrode the vote and created an independent highway authority to take land, which ultimately destroyed nearly all of Richmond's historically Black neighborhoods, including Navy Hill. In the early 2000s, the city created the first of two - ultimately failed - proposals for the redevelopment of Shockoe Bottom, the site of the second largest sale of enslaved people from 1845-1865. Like Navy Hill, Richmonders showed up at hearings, called their council members and ultimately defeated the development. However, rather than try again with a new community-centered approach, city leaders returned with a similar slate of community benefits in a new location, rather than developing community-based partnerships.

Arguing that the only way to make the city viable is through profit-centered planning belies a desperation for development that puts equity as an add-on or negotiated benefit to development, rather than its central goal (Howell 2016). Further, this framing, which suggests a city in economic and livability crisis, creates a necessary rationality of development at any cost (Summers 2019). Though community benefits such as public space, affordable housing or hiring can be a useful tool for ensuring that community is not completely forgotten, they are often poorly enforced, limited in scope and insufficient to address the impact of development (Wolf-Powers 2010; De Barbieri 2016). They further require an organized community entity and power that is listening to the community demands. Moreover, they still place equity as an afterthought to the larger rationality of development and undermine the possibility of a community-driven (Roberts and Kelly 2019) or inclusive (Quick and Feldman 2011) process.

Using interviews of participants in the Navy Hill process, content analysis of documents and direct observation of meetings, we investigate the roots of Richmond's drive for development, the implications for equity and the barriers to resistance or reimagining of space in southern cities. We further explore the patterns of governance in Richmond that enable these patterns of development proposals over time. We argue that the historic and racialized resistance to organizing and community voice by white leaders stymie power development in southern cities. Further, the desperation for development frame creates a false binary where development at any cost is contrasted against doing no development, and subsequently, seeing new benefits for equity.

THE PURPLE LINE CORRIDOR COALITION: BUILDING A SUSTAINABLE AND EQUITABLE LIGHT RAIL CORRIDOR

Abstract ID: 1336

Abstract within Pre-Organized Session 37

KNAAP, Gerrit [University of Maryland] gknaap@umd.edu, presenting author

FINIO, Nicholas [University of Maryland] nfinio@umd.edu, co-author

GEBRU, Dominique [UMD] dgebru@umd.edu, co-author

ROSS, Kim [UMD] kross@umd.edu, co-author

SOMASHEKHER, Sheila [UMD] ssomashe@umd.edu, co-author

BRIGHAM, Steve [Public Engagement Associates] steve@publicengagementassociates.com, co-author

The State of Maryland is building a new light rail system due to open in 2026 called the Purple Line. It will span the inner suburbs of two suburban Maryland counties just outside Washington DC and connect major activity centers and existing Metro subway stops along its 16-mile route. The Purple Line will greatly increase transit accessibility to jobs and other points of interest along its path, potentially increasing land values in neighborhoods where many minority, low-income residents and small businesses are vulnerable to displacement (Lung-Amam and Dawkins, 2020; Peng et al. 2022).

To prevent such displacement, the Purple Line Corridor Coalition (PLCC) was established in 2013. Led by the National Center for Smart Growth at the University of Maryland, the PLCC includes representatives of Montgomery and Prince George County executives and planning departments, Enterprise Community Partners, CASA de Maryland, and many other nonprofit organizations and municipal governments. In 2016, the PLCC crafted the Purple Line Community Development Agreement (CDA) signed by the executives and council members of both Counties, the President of the University of Maryland, and the leaders of many other community organizations. The CDA includes four major goals—preserving small business and fostering economic development, providing housing opportunities for residents of all income levels, promoting workforce development, and maintaining vibrant and culturally rich neighborhoods. Since then, the PLCC has worked collaboratively to advance these goals and secured millions of dollars in funding from public and private sources.

Previous research has shown that without concerted efforts to prevent gentrification and displacement, new investments in light rail transit have to potential to have major adverse social impacts (Zuk et al. 2017). Research has also shown that preventing such adverse impacts requires the persistent and coordinated efforts of multiple public, private, and community-based organizations (Sandoval and Herrera 2015). This is the reason the PLCC was established.

In this paper, we present the history and performance of the PLCC, identify its strengths and weaknesses, and offer lessons for other coalitions in transit corridors and other contexts. It builds on community and cross-section coalition theory (Butterfoss and Keger 2002) often applied in other contexts such as public health, environmental advocacy, and regional planning. Based on analyses of the work conducted by the PLCC, interviews with its leaders and members, and its accomplishments to date, the paper suggests the PLCC exhibits many of the characteristics identified as critical to the success of coalitions in other contexts. The analysis also suggests, however, that the sustenance of the PLCC will depend on its ability to overcome the many challenges that face multi-sector community coalitions. The paper concludes with lessons for the PLCC and other coalitions seeking to prevent gentrification in transit corridors.

PLANNING, POLICING AND ABOLITION 2

Pre-Organized Session 97 - Summary

Session Includes 1560, 1561, 1562, 1563, 1634

SERVON, Lisa [University of Pennsylvania] servon@design.upenn.edu, organizer

This session brings together planning scholarship to address three interrelated themes: 1) the relationships between planning and policing (broadly including courts jails, prisons, immigration detention, reentry, state violence, parole etc); 2) using planning methods and theories to examine the inequitable impacts of policing (including questions around, budgets and financialization, transportation, disaster planning, housing etc); 3) thinking about the possibility for planning to support abolitionist futures (thinking about transformative justice, community safety, care ethics etc).

Objectives:

- relate to ideas and practices of carceral and abolition planning

BOMBA PLANNING: MOVING ACROSS INVITED AND INVENTED SPACES OF ACTION IN PURSUIT OF A JUST RECOVERY

Abstract ID: 1560

Abstract within Pre-Organized Session 97

TORRES-CORDERO, Ariam [University of Illinois, Urbana-Champaign] ariamlt2@illinois.edu, presenting author

Disaster planning literature shows how grassroots groups play an important role in the face of disasters, filling critical gaps left by government recovery processes and helping those most vulnerable (Irazábal & Neville, 2007). Yet, there is little detailed knowledge about the grassroots planning practices used to advance a just recovery. As the grassroots move across what Miraftab (2017) calls invited and invented spaces of action, they mobilize and combine a wide-range of socially transformative practices and meanings. Also, little research explores the evolving landscape of networks and coalitions of groups that give form to the grassroots as they maneuver across invited and invented spaces of action.

To better understand these underexplored dimensions in disaster recovery, this paper suggests that one must look at the dynamic, interactive relationships between grassroots movements and the communities they serve from an insurgent planning perspective. Applying an insurgent planning lens to look at post-disaster environments sheds light on the often occluded planning practices and meanings mobilized by the grassroots. Beyond participating in invited spaces, the paper will show how grassroots groups invent spaces and opportunities for a just recovery. Through protest, proposal, and direct action, they create innovative forms of communication and engagement. They use performance, music, design, social media, encampments to occupy, and other methods to create and defend their spaces of struggle.

This paper uses an insurgent planning framework to explore the grassroots movements in Puerto Rico post-María. Through the lens of insurgent planning, one can analyze three key factors: (1) the capacity of planning extended to community organizers, activists, and everyday citizens, (2) the spaces of direct action, which can be in collaboration with, in opposition to, or “completely beyond the purview of state-sanctioned, formal planning processes” (Beard

2002, p. 15), and (3) the practices and meanings mobilized by grassroots movements to advance their recovery agendas. Adopting a case study research method, the paper presents three key cases that illustrate how the grassroots maneuver across invited and invented spaces of action during disaster recovery to advance their decolonizing vision and anti-colonial praxis. To highlight the distinctive features of the Puerto Rican grassroots, the paper articulates the notion of bomba planning as transformative practices and meanings mobilized through invited and invented spaces of action based on a co-constitutive grassroots-community engagement.

Fieldwork research was done between October 2017 and August 2021, and included semi-structured, in-depth interviews with leaders of five organized groups in Puerto Rico, and open-ended interviews with residents, community leaders, and activists. The paper also draws from observations during community events, workshops, and meetings, both in situ and virtual, and from secondary sources of data, including organizational documents and publications, audio-visual materials, news reports, social media, and others.

PRODUCING ABOLITION: INSIGHTS FROM SEATTLE’S CAPITOL HILL OCCUPIED PROTEST

Abstract ID: 1561

Abstract within Pre-Organized Session 97

BISSIRI, Tony [The University of Texas at Austin] bissiri@utexas.edu, presenting author

Academics in the spatially focused social sciences have relied on Henri Lefebvre's theory of the social production of space to understand how protest in urban public space is a practice which contests hegemonic and oppressive capitalist structures (Halvorsen, 2015). Lefebvre's focus on space makes his theories attractive to planning scholars, who have applied them to both theoretical and applied planning research (Carp, 2008). However, as observed over two decades ago by McCann (1999), a glaring gap in Lefebvre's theories is that they fail to acknowledge issues of race. Given the central roles race and white supremacy play in the struggle for justice in U.S. cities, is Lefebvrian theory at all useful in understanding contemporary social movements' impacts on urban politics and planning?

To investigate this theoretical question, I draw on empirical research conducted with individuals who participated in the Capitol Hill Occupied Protests (CHOP) in Seattle in 2020. Part of the global George Floyd protests, CHOP was established when protesters “occupied” the public space of six city blocks surrounding a Seattle Police Department precinct. During the following one-month period, the SPD drastically reduced their presence in the area, and demonstrators developed robust networks of mutual aid for those present in the space. To gather a recollection of the events of this case, I conducted informal interviews individuals who participated in the CHOP and/or the events directly leading to its establishment.

Within participants' responses, I identified three major themes: freedom of movement, radical re-imaginings, and vulnerability to violence, all three of which are only adequately understood when grounded in theories of race. Thus, by attempting to apply the theory of the social production of space to conversations had with interviewees, I find that by itself the theory fails as an analytical framework to appropriately address the dimension of race. However, I argue that when synthesized with the theories of DuBois' (1998) abolition democracy and Gilmore's (2018) abolition geography, the production of space can be reconceived as an effective framework through which to understand how protest in urban spaces contest the central hegemony of racial capitalism in the U.S.

I conclude with an argument that a theory of the abolitionist production of space is well-positioned as an option for applying ideas of abolition to planning theory and practice. Such a theory can empower justice-seeking planners to understand how spaces of white supremacy and racial capitalism are produced by even the most routine actions of the profession. Further, this theoretical framework can illuminate how seriously listening to the ideas and demands of abolitionist protest movements can serve as a community engagement strategy that is an effective way to pursue more just planning practices.

REFUSING COP CITY AND SINGING OURSELVES BACK TOGETHER: MUSCOGEE FUTURITY IN ATLANTA'S WELAUNEE RIVER FOREST

Abstract ID: 1562

Abstract within Pre-Organized Session 97

HARJO, Laura [University of Oklahoma] harjo@ou.edu, presenting author

The South River Forest (also known as the Welaunee River to Muscogee people) is the site of violent settler practices: expropriation of Muscogee land, a plantation with enslaved people, and my a prison farm. The land has reverted to forest—growing back a decarceral world of human and more-than-human kin. However, a carceral disruption is impending because the former prison farm is the location for a police training facility that will contain a simulated city; Atlanta's city council passed an ordinance to set aside nearly 400 acres of forest land leased at \$10 per year to the Atlanta Police Foundation. In response Muscogee people are (re)membering, and emplacing their presence in their original homelands and singing themselves back together through Muscogee song and stompdance. They are entering relationality with other stakeholders of this site to reckon with pain, hope and conceiving of a spatial imaginary that rematriates the land. The paper will speculate what Black and Indigenous futures could look like on this landscape invoking an Indigenous feminist planning praxis.

CARCERAL LOGICS IN PLANNING: IMPACTING AND POLICING MIGRANT WOMEN'S BODIES

Abstract ID: 1563

Abstract within Pre-Organized Session 97

SWEET, Elizabeth [University of Massachusetts, Boston] betsy.sweet@umb.edu, presenting author

Carceral logics drives much policy-making and practice at multiple levels of governance. Biden's proposal at the state of the union address in March of 2022 highlighted his commitment to more funding for police. Through State legislatures across the US, bills are being passed that criminalize women's health care and critical race theory. Despite the loud calls for defunding the police in response to the murder of George Floyd and many other people of color, the killing continues. In addition to more policing, the courts and prisons wield extreme power over how issues are "solved" (Massaro & Boyce 2021). The results include more mass incarceration in prisons, immigration detention centers, and squalid conditions at the Mexican border, where brown Central American immigrants are stalled (Boyce 2021), and white Ukrainian migrants are welcomed to cross. A combination of these sectors and the idea of

punishment and violence as solutions to problems and maintenance of the status quo constitute carceral logics.

State planners work in the contexts of carceral logics. In some cases, the work of planners enacts carceral logics; in other cases, it enables carceral logics, and in other cases, it is silent on carceral logics. Some policies have mirrored carceral logics for immigrants and those that would support them by renting to them, employing them, or providing any number of supports to migrants. However, in some cases, policymakers and planners have challenged the power of these logics concerning immigrants. The federal DACA program has had positive impacts on young immigrants. Some states have instituted policies that permit immigrants without documents to have drivers' licenses. A handful of cities have declared themselves to be sanctuary cities supporting the human rights of all residents. There have been obstacles for urban planners even if they desire to break with the carceral logics prevalent in physical, social, economic, and environmental planning.

Based on work in three communities of migrant women, Chicago, IL, Norristown, PA, and Salem, MA, I provide evidence of how municipal planning and policy has enacted the punishment and violence of carceral logics on the bodies of migrant women. Using data from these sites, I document the subtle and not-so-subtle practices planners use that impact and police migrant women's bodies. For example, in Salem, MA., the acute disrepair of city streets in the Point, a predominantly Dominican immigrant community, has been emotionally and physically impacted the bodies of the women in this neighborhood. Through body map storytelling in the spring of 2022 in Salem, the participants documented the visceral experiences with the city's infrastructure, housing options, and services. One woman drew her right cheek red and bloody and the ongoing pain in her right hand from a fall over a treacherously uneven sidewalk. The city's infrastructure enforced and maintained an order of disorder, a status quo of inequality, or a system of power imbalances. The practices of planning have abandoned this neighborhood relative to the other much more touristy areas of the city, famous for its history of witches and the home of the Peabody Essex Museum.

My goal with this paper is to document how planners' work is linked to carceral logics, specifically in the case of women migrants, rendering their bodies subservient to municipal policing practices. Then I will suggest how a combination of community accountability and cultural humility could combine to reset relations, space, and time for more equity planning. This type of planning would move away from carceral logics of policing and punishment to spaces of respect, reciprocity, and repair (Dorries & Harjo 2020).

CARCERAL URBANISM: POLICING THROUGH URBAN PLANNING FROM CHOLERA TO GENTRIFICATION

Abstract ID: 1634

Abstract within Pre-Organized Session 97

RUTLAND, Ted [Concordia University] ted.rutland@concordia.ca, presenting author

In recent years, critical scholars have taken a fresh look at urban planning and its relationship to the carceral state (on the one hand) and prison-industrial-complex abolition (on the other hand). Aiming to contribute to this emerging literature, this paper explores the connections between urban planning and policing in three historical moments: (1) the reform or progressive era; (2) the urban renewal era; and (3) the gentrification era. Planning and policing, the paper shows, were intimately linked in these three moments. Planning and policing shared a common perspective on urban crime, its origins, and the means of combating it. Planning also operated as the police in many cases, using spatial interventions to address "criminal" issues. And planning collaborated with the police, often remaking spaces to facilitate police surveillance and other operations. Recognizing these links, the paper concludes, broadens the political terrain for abolitionists and underscores emerging political demands that planners discard their ideological and practical connections to policing and the broader prison industrial complex.

PLANNING, POLICING AND ABOLITION

Pre-Organized Session 98 - Summary

Session Includes 1566, 1864, 1902

SERVON, Lisa [University of Pennsylvania] servon@design.upenn.edu, organizer

This session brings together planning scholarship to address three interrelated themes: 1) the relationships between planning and policing (broadly including courts jails, prisons, immigration detention, reentry, state violence, parole etc); 2) using planning methods and theories to examine the inequitable impacts of policing (including questions around, budgets and financialization, transportation, disaster planning, housing etc); 3) thinking about the possibility for planning to support abolitionist futures (thinking about transformative justice, community safety, care ethics etc).

Objectives:

- Familiarity with carceral planning and abolition planning

MAXIMUM FEASIBLE DISRUPTION: RECONSIDERING NEIGHBORHOOD PLANNING IN THE CONTEXT OF ABOLITIONIST PRINCIPLES

Abstract ID: 1566

Abstract within Pre-Organized Session 98

WAGNER, Jacob [University of Missouri-Kansas City] wagnerjaco@umkc.edu, presenting author

This paper reconsiders neighborhood planning in the context of abolitionist principles with attention to the work of legal scholar Cheryl Harris (1993) on whiteness as property. Applying abolitionist scholarship in planning raises deep and persistent questions about the function of racially segregated neighborhoods in the United States. This paper argues that planning systems have reinforced and reproduced racial inequality through a dynamic of “planning for permanence” and “maximum feasible disruption.” This dynamic remains a key feature of racialized neighborhood planning and real estate development in Kansas City, Missouri.

Goetz, Williams and Damiano (2020) argue that planning and urban studies have often focused on Black segregation, the so-called Black “Underclass” and “ghetto” research – as opposed to white privilege and white practices of racial exclusion. The failure to focus on whiteness in planning has often replicated a language of Black pathology and ignored racial inequality rooted in the production of white racial advantages.

Further, the underlying theories of neighborhood (in)stability in American sociology have normalized Black instability and obscured the role of white violence in the destabilization of stable and diverse neighborhoods. Narratives of Black pathology provide justifications for the over-policing of Black neighborhoods and the exposure of Black citizens to higher levels of state-sponsored violence and incarceration.

One of the guiding concepts in the spatial production of suburbia was the idea of “planning for permanence” promulgated by real estate developer J.C. Nichols in 1948. Permanence, Nichols argued, was a matter of national concern that should be addressed by the private real estate industry. With the increasing association between property values and the racial identities of residents, Nichols’ business model promoted a form of whiteness as property in neighborhood planning and development.

Much of early 20th century planning revolved around the management of neighborhood development in the context of industrialization and urbanization. Beyond the theory of the ideal neighborhood unit – city planning, and private real estate practices managed neighborhood (dis)investment with strikingly different outcomes for white and non-white neighborhoods. The flip side of planning for (white) permanence was the production of spaces of uncertainty – maximum feasible disruption – for Black neighborhoods subject to market and governmental interference rooted in a racialized (de)valuation of diverse urban spaces and Black property ownership.

Numerous planning strategies – racial zoning, redlining, racially-restrictive covenants, and urban renewal to name a few - sought to control the location of Black families in relationship to existing and planned residential neighborhoods. The “Black family” and Black neighborhoods have largely been treated as a “problem” in American sociology with significant influence on the treatment of neighborhoods within planning. As a result, the management of neighborhood (in)stability as a racialized process has been a central organizing principle of modern city planning and real estate in the United States. Betancur and Smith (2016, 31) argue that planning helped to create a “geography of reserve” - defined by racialized residents, de-valORIZED labor, and real estate disinvestment - for redevelopment and gentrification.

Neighborhoods are more than residential real estate submarkets (Bates 2006), they are political units where voters live, policies are applied, and public officials seek election. They are also parts of police patrol districts and the context for policing. Applying abolitionist thinking to neighborhood planning requires planners to raise attention to the disruption of Black neighborhoods and persistent role that racial segregation plays in state sponsored violence.

POLICY ENFORCEMENT: THE RELATIONSHIP BETWEEN URBAN PLANNING AND POLICE

Abstract ID: 1864

Abstract within Pre-Organized Session 98

GREEN, Tiffany [UCLA] green.tiffanyd@gmail.com, presenting author

Local governments rely on police to enforce urban space, specifically within policies that promote urban security and safety, managing the urban form, and maintaining order. Doing so places bureaucratic, political, financial, and social pressures on policing institutions, which creates new forms and strategies of policing (Gordon, 2020). Research about how urban planning policy requires police enforcement is sparse, where existing research concentrates primarily on the violence of banishment, gentrification, and revanchism (Roy et al., 2020; Beck, 2020; Smith, 2005). Sherman (2019) discusses how urban plans create new forms of police through enforcement strategies, highlighting the need for urban planning scholarship to analyze the various police practices that emerge from plan recommendations.

Toward that end, this research explores how city general plans and city employees informing urban space discuss police, police enforcement, and mechanisms for monitoring the outcomes of police enforcement of plan policies. The project involves two tasks: text analysis of California general plans and interviews with California city government employees.

For the first task, I perform a topic modeling analysis of the text surrounding police and police-related mentions in California general plans to reveal how plans address policing. The analysis includes plans from all but the ten California cities who have yet to make their general plans accessible digitally. To deepen this analysis, I manually review and qualitatively categorize the mentions on a sample of the plans to uncover details unavailable through the model.

For the second task, I interview city government employees whose roles may involve enforcement of urban space or development in three cities with differing governance or policing structures: a Strong Mayor form of government with its own police department, a City Manager form of government also with a police department and finally a City Manager governance structure with contracted out policing. Employees involved in urban space, development, and enforcement could fall within Urban Planning, Transportation, City Mayor/Manager, Public Safety and Police Departments. I aim to discover how these urban policies that involve enforcement emerge, methods of monitoring their outcomes, communication between departments, and how decision makers regard their influential role in promoting police agency.

Of the plans that mention policing, the prominent topics refer to police as a service the city provides and has a duty to

resource as it grows. While enforcement is a notable topic, evaluation is seldom mentioned. In my conversations with government employees, policies that require police enforcement arise largely from citizen complaints, where success of the intervention is the absence of complaint. With such limited communication or evaluation of implementation, governmental departments and police agencies are unable to analyze a policy's holistic outcomes. By creating new evaluation structures, planners could more clearly see the outcomes of enforcement-related policy and create avenues for communities to envision the future of police involvement in urban space.

THE FINANCIALIZATION OF THE CRIMINAL JUSTICE SYSTEM: EFFECTS ON WOMEN AND COMMUNITIES

Abstract ID: 1902

Abstract within Pre-Organized Session 98

SERVON, Lisa [University of Pennsylvania] servon@upenn.edu, presenting author

Between 1978 and 2015, the number of women in the U.S. correctional population rose by 834 percent, more than twice the rate of men. Two million women and girls return home every year; one million women currently live under probation, parole, and correctional supervision. During this same period, the criminal justice system became increasingly financialized, evidenced by growth in private prisons and widespread use of legal financial obligations (LFOs) such as fines and fees.

Most research on incarceration and reentry focuses on men or on the justice-involved population as a whole and ignores the unique circumstances of women, and how this increase in the incarceration of women impacts families and communities. This exploratory research begins to fill that gap. Specifically, the paper explores how women's reentry is complicated by their inferior economic status, their caregiving responsibilities, and the justice-related debt they have accumulated. We hypothesize that the financialization of the criminal justice system impacts justice-involved women differently than men.

Analysis of in-depth interviews with twenty justice-involved women, seven criminal law and reentry professionals, and courtroom observations in southeastern Pennsylvania reveals that fines, costs, and fees create intractable reentry barriers for women, contributing to a cycle of prolonged justice-involvement and financial instability.

Our findings demonstrate that the financialization of the criminal justice system contributes to women's greater likelihood of recidivism. Women, whose financial precarity increases with justice involvement, often return to criminal activity after their release out of necessity. Low-income women engage in criminal activity to cover basic expenses. They become incarcerated, a process that adds debt, stigma, and other barriers to their pre-incarceration financial instability. Lack of reentry services and treatment coupled with increased financial precarity contributes to recidivism. Participants expressed a shared sense of increasing financial and legal precarity, whether related to poverty, trauma, or lack of support from male partners. This cycle destabilizes families and communities.

PLANNING, POLICING AND ABOLITION - ROUNDTABLE

Pre-Organized Session 105 - Summary
Session Includes 1646, 1647, 1648, 1862

SERVON, Lisa [University of Pennsylvania] servon@design.upenn.edu, organizer

This session brings together planning scholarship to address three interrelated themes in an interactive roundtable: This session brings together planning scholarship to address three interrelated themes: 1) the relationships between planning and policing (broadly including courts jails, prisons, immigration detention, reentry, state violence, parole etc); 2) using planning methods and theories to examine the inequitable impacts of policing (including questions around, budgets and financialization, transportation, disaster planning, housing etc); 3) thinking about the possibility for planning to support abolitionist futures (thinking about transformative justice, community safety, care ethics etc)

Objectives:

- relate to ideas and practices around carceral and abolitionist planning

BLACK-ASIAN SOLIDARITY? PROMISES AND PITFALLS IN PLANNING FOR FRACTURED COMMUNITIES

Abstract ID: 1646
Abstract within Pre-Organized Session 105

KIM, AJ [San Diego State University] anna.kim@sdsu.edu, presenting author

In this paper I seek to conceptualize the discomfort through which planners avoid more nuanced understandings of "race" in America. Locating Asian Americans within a racial hierarchy that both otherizes and privileges the monolith of the "Asian" body results in both low and high inter-group and social costs, and a precursor to how racial violence is perpetuated through state and local institutions. The most recent context of increasing and escalating "Anti-Asian" violence from 2020 through today, will be juxtaposed with social movements both for and against increased calls for policing across major US cities.

"Viral" media messaging has focused on and created a dominant narrative that BIPOC violence against Asians and Asian Americans is on the rise. Structural and societal mechanisms for sustaining white violence against people of color benefit from this narrative, this re-donned disguise. Here again, Asian Americans occupy a tertiary position that fulfills a racial wedge, a path that is lined with future forms of racial violence, and ongoing formations of spatial and racial buffer zones. In particular Umemoto's framework around the concept of "buffer places" and "racial buffers" will be utilized here to further understandings of how racial violence is perpetuated through the form and function of complex urban racialization processes – as explored through the planner's and planning's role in it the maintenance and creation of racial violence and white supremacy.

I'll discuss how policy and media narratives stir both Anti-Black and Anti-Asian sentiment, simultaneously, and purposefully, creating and maintaining tensions between and outside of various racialized groups, and also how Black death (the pursuit and instigation of it) structures the logics of almost all institutional violence – within and also because of the planning profession. Planners need to be able to see these nuances and dynamics of racialization, racial buffering, and racial violence, in order to confront how we ourselves perpetuate and further violence in our own agencies and institutions, in communities, neighborhoods, and cities.

HOW SETTLER LAW CRIMINALIZES INDIGENOUS PLANNING: EXAMINING CAUSES AND PROPOSING ALTERNATIVES

Abstract ID: 1647

Abstract within Pre-Organized Session 105

DORRIES, Heather [University of Toronto] heather.dorries@utoronto.ca, presenting author

In this paper I examine the ways that planning is connected to regime of violence and carcerality. Drawing on scholarship from the field of Indigenous studies, argue that Indigenous legal orders provide a powerful alternative to the legal orders upon which planning practices in currently rely.

In Canada, Indigenous peoples are often excluded from planning processes because the affairs of Indigenous peoples are considered a federal responsibility, while planning is the domain of provincial governments. As a result, Indigenous peoples and interests are often rendered illegible within planning processes, leaving direct action or “protest” one of the few options available to Indigenous communities and in turn contributing to the criminalization of Indigenous expressions of territorial authority (Borrows 1997). From Oka to Caledonia, many major flashpoints between Indigenous and non-Indigenous peoples in Canada have been precipitated by planning decisions. Yet, these events are often portrayed as problems of law and order, masking the historical and political roots of these conflicts, and ignoring the profound effects local planning can have on Indigenous peoples. In her analysis of media coverage of the events at Caledonia, Métis scholar Jennifer Adese found that the Canadian media “actively crafted the image of indigenous peoples as internal terrorist threats” (Adese 2009). Narratives that position Indigenous peoples as criminals and terrorists invite heavy-handed responses and position police or even military intervention as desirable and rational. Moreover, as Indigenous peoples are construed as criminal the criminality of the settler state is masked while the theft of Indigenous land is justified (Stark 2019). These narratives reinforce the racism of settler colonialism and draws attention away from the historical and political contexts—including policy frameworks and planning processes—which created these situations in the first place.

The question of how planning might begin to take Indigenous political authority and legitimacy as its fundamental premise remains largely unanswered. Some of the difficulty of addressing this question may stem from the tendency to focus on the bureaucratic nature of law, and the regimes of hierarchy which it administers. However, Indigenous perspectives on law and legal orders provide some alternatives. Cree legal scholar Val Napoleon observes, law is about what “large groups of people do to manage themselves” and uses the term “Indigenous legal orders” to describe law as embedded in Indigenous social, political, economic, and spiritual institutions. She explains that Indigenous law is inherently linked to Indigenous self-determination and is part of how Indigenous peoples are “building citizenship, responsibility, and governance, challenging internal and external oppressions, safety and protections, lands and resources, and external political relations with other Indigenous peoples and the state” (Napoleon 2013, 47). Following Napoleon, I consider Indigenous planning as both an expression of Indigenous legal orders as well as the basis for the development of alternative approaches to planning relations between Indigenous peoples and the state.

IDENTIFYING OPPORTUNITIES TO BETTER ENGAGE AND SUPPORT COMMUNITY REENTRY STAKEHOLDERS IN LOCAL PLANNING DECISION-MAKING

Abstract ID: 1648

Abstract within Pre-Organized Session 105

KNAPP, Courtney [Pratt Institute] cknapp@pratt.edu, presenting author

The topics of the carceral state, decarceration, and abolitionist planning have gained momentum within local planning theory and practice over the past decade (Goldsmith 2015, Knapp 2020, Simpson, et al 2020). These preliminary discussions have led to lively debates about whether, and the extent to which, planning as a field of professional praxis is capable of being abolitionist or decarceral in nature or orientation, given the field's historical legacies of coordinated and racialized uneven geographic development (Dozier 2018).

My earlier survey (Knapp 2019) of local planning directors about the extent to which their everyday practice enabled or inhibited community reentry revealed significant gaps in the specific knowledge realms needed to support land use, housing policy, economic development, and community engagement decision-making which supports meaningful and substantive community reentry and integration. At the end of this study, I recommended that local public sector planners engage directly with advocacy and support groups involved with community reentry. These groups are often comprised of (formerly) incarcerated people and their families, social workers, housing, employment, and voting advocates, education and employment service providers, health specialists, clergy, and others reentry supporters. By engaging directly impacted and implicated stakeholder groups in conversations about how local planning practice can better support reentry— and in a broader sense, decarceral planning—our field can develop some practical strategies for engaging meaningfully in this emergent work. Toward this end, this paper asks:

What lessons can planners gain from perspectives within the community reentry arena about how to better respond to the unique and acute housing and economic development needs of formerly incarcerated people?

I present the results of a mixed method case study of the Connecticut Reentry Collaborative, an initiative which brings members of the multifaceted community reentry arena together in ten cities across the state. I summarize the socio-spatial contexts in which these collaborative chapters operate, and the structural inequities they respond to— particularly with respect to housing, education, employment, workforce, and economic development, community engagement in land use decision-making, and civic engagement. I describe the origins and evolution of the Collaborative, paying special attention to the micropolitics of stakeholdership, educational programming, and social networking within these place-based advocacy groups. I also include the preliminary results of an ongoing effort to engage Collaborative members in qualitative interviews and focus groups designed to better understand how, from their varied perspectives, local planning practice might better support the reentry and integration of formerly incarcerated people into society, including but not limited to emerging housing and economic opportunity structures.

LEARNINGS FROM THE CLASSROOM AS LIBERATORY PRACTICE - AN ABOLITIONIST PEDAGOGY WORKSHOP SERIES

Abstract ID: 1862

Abstract within Pre-Organized Session 105

LIU, Jody [University of Southern California] jodyl@usc.edu, presenting author

We regard the classroom as a vital site not only for learning the harms of oppression but also for enacting ways of doing and being together that model the alternative world we hope to inhabit. Namely, we see in the classroom the potential for critical pedagogy and liberation.

Too often, we find prevailing teaching techniques and university structures complicit in reproducing the violence of white supremacy, anti-Blackness, neoliberal capitalism, and settler colonialism. We believe that, within the university, the space of the classroom provides a rare opportunity for all participants to experiment with and realize liberatory futures without the harms of our current institutions; in the classroom, everyone is both an educator and a student. There is much we can do together to explore how knowledge might be circulated to support curiosity, care, and collaboration while rejecting certainties, cruelty, and competition.

Our notion of liberation centers abolitionist futures in particular. We invited educators and community members to facilitate workshops that help us to realize pedagogical techniques towards abolition. The series offered methods that we, as members of the classroom, can adopt and augment to challenge normative classroom logics and to foreground the life-giving and socially-sustaining possibilities of education. Learnings from the workshop were also translated into a zine. For the roundtable, we will reflect on how these practices can be applied to planning education--including learning and organizing with unhoused communities, implementing collective visioning through VR, and integrating compassionate/healing-based communication into decision-making processes.

What we mean by “pedagogy”

We consider pedagogy to be both the knowledge that circulates between people as well as the methods through which that circulation happens. As argued by Paolo Freire in his writing on pedagogy and oppression, the classroom generally provides the normative model of the “teacher” who feeds information to the “student” within the site of the “school.” While Freire coined this the “banking method” of education and argued that it dehumanizes students, we, following scholars such as Bettina Love and David Stovall, understand this educational model as carceral, that it is co-constituted by white supremacy, capitalism, ableism, cisheteropatriarchy, and other systems that reproduce domination, objectification, and control. This carcerality can be seen in the emphasis on grades and credits over comprehension, the use of surveillant/punitive softwares, and the hierarchical organization of the classroom space. Thus, when we argue for an abolitionist pedagogy, we argue for a pedagogy committed to recognizing the full humanity of students, teachers, staff, and all other university community members. In other words, abolitionist pedagogy is that which works to resist oppression in the classroom and, instead, envisions new forms of knowledge to circulate and new modes of circulation that sustain all those who practice them.

What we mean by “abolition”

Abolition asks us to imagine a new and better world (or, in this case, classroom), and then work to create that world. Our definition is rooted in W. E. B. Du Bois’ notion of abolition democracy, where abolishing slavery included both the “negative” emancipation of Black people from bondage and the “positive” building of institutions, practices, and resources necessary for Black freedom”. Angela Davis expanded this concept into one that understands the prison-industrial-complex as “a result of the failure to enact abolition democracy”. For Davis, abolition democracy must be understood as still “to come” and requires the creation of “new institutions and resources” to eliminate prisons. It is “an ongoing, dialectical, and fugitive project of mutual liberation,” theorizing “what might become possible”. As abolitionist educators, we are invested in bringing these projects into the university and understand the classroom as one such site of potential fugitivity and liberation.

Track 2 Roundtables

IMMIGRANT ACTIVISM AND THE URBAN IMAGINATION: CONTEXTS, INFLUENCES, CONSEQUENCES

Abstract ID: 1367

Roundtable

HERNANDEZ, Ashley [University of California Irvine] ashleych@uci.edu, moderator

GONICK, Sophie [New York University] sophie.gonick@nyu.edu, participant

DEVLIN, Ryan [Pratt Institute] rdevli25@pratt.edu, participant

NICHOLLS, Walter [University of California Irvine] wnicholl@uci.edu, participant

The study of social movements and their role in producing the city has been one important area of research within planning scholarship (Castells, 1983). Meanwhile, immigration has transformed many urban areas, and constitutes a core concern within research on cities, from the foundational work of the Chicago School to more recent inquiry on immigrant urbanism within planning and related disciplines (Miraftab, 2016; Sandoval-Strausz, 2019). Recently, urban scholarship has also looked to immigrant social movements as important sites for the articulation of alternative counterpublics and the claiming of rights and recognition (Nicholls & Uitermark, 2016). Little work, however, has examined immigrant social movements as key drivers of urban change and the city. Yet an emergent strand of research demonstrates that as cities across the North Atlantic become more diverse and unequal, immigrant-led grassroots collectives have been at the forefront of struggles over labor and employment, housing, gentrification, and the recent predations and ravages of the COVID-19 pandemic (Gonick, 2021; Theodore, 2014). In this roundtable discussion, we ask: How do these movements come to be? What kinds of challenges and opportunities do they face? How do they influence the production of the city and the urban? And how might they be productive sites of inquiry for planning scholarship?

In this roundtable discussion, we propose examining immigrant urban social movements and their role in challenging, transforming, and resisting dominant models of planning and policy. Moving beyond analyses of diverse social movements, we will instead explore how immigrant urban activism inflects and shapes modes of organizing and political horizons and prefigure struggles yet to come. Here we consider past activist and political struggles in countries of origin, experiences of racialization and othering, and movement and mobility in producing dissent.

The discussion emerges out of consideration for ACSP's 2022 theme; moving beyond an engagement with voices often absent from the planning discipline, we also seek to highlight immigrant influence within emergent struggles over the city and their repertoires of action. The discussion will bring together scholars working on a number of different fields of struggle within a diversity of sites. These include street vendor activism in New York City in the wake of the pandemic, Ecuadorian struggles against indebtedness in urban Spain, and immigrant activism against gentrification in Southern California. In bringing together a range of case studies and perspectives from planning and related disciplines, the panel seeks to open space to consider the role of immigrant publics within planning, politics, the production of more egalitarian urban imaginaries.

Gentrification continues to be one of the most debilitating—and least understood— issues in American cities today. This roundtable includes scholars across the United States and the Global South to discuss current research trends in housing and commercial gentrification and displacement and share their own scholarship. Participants will discuss their areas of expertise, including activism, transit-oriented development, housing, and urban design. This work spans a range of contexts, such as the primarily African-American Historic Third Ward in Houston, Texas, Los Angeles Chinatown, Santiago Chile, and Mexican immigrant and Chicana communities in Southern California Santa Ana and Boyle Heights.

This proposed roundtable discussion will be useful to scholars who desire to learn about varied and common contemporary changes taking place in urban areas, particularly as the most marginalized and materially exploited grapple with the pandemic and inflation and threats of a recession. Our panelists will offer insights to the following questions: What have we learned? How might gentrification and urban inequality be different today versus a decade ago? What research directions should we consider to properly account for rising economic inequality, economic restructuring, and racialization?

WEBER, Rachel [University of Illinois Chicago] rachelw@uic.edu, participant

In twenty-first-century American cities, policy makers increasingly celebrate university-sponsored innovation districts as engines of inclusive growth. But the story is not so simple. Recent experience in University City, Philadelphia viewed in historical context illuminates how the dynamics of innovation district development in the present both depart from and connect to the politics of mid-twentieth-century urban renewal. Even as university and government leaders vow to develop without displacement, what existing residents value is imperiled when innovation-driven redevelopment remains accountable to the property market. In this author roundtable, scholars will discuss recent research on race, uneven development, and the knowledge economy.

EFFECTIVE ENFORCEMENT OF COMMUNITY BENEFITS AGREEMENTS (CBAS)

Abstract ID: 1011

Individual Paper Submission

HUSK, Devin [Dalhousie University] Devin.Husk@dal.ca, presenting author

Materializing in the late 1990s, community benefits agreements (CBAs) have sought to reallocate the historically one-sided profits of development projects while mitigating disproportionate repercussions credited to their construction in marginalized communities (Parks & Warren, 2009; Baxamusa, 2008). CBAs aim to allow community members to push for accountable development and just compensation through formal negotiation, exchanging project endorsement for developer concessions. These concessions may include provisions for affordable housing, guaranteed living wage local employment, access to green space and amenities, environmental remediation, but are only limited to the public's needs and the developer's willingness to provide them (Wolf-Powers, 2010).

The imagery of democratic, grassroots coalitions of community organizations and individuals combating negative development consequences is promising at face value. However, across the growing body of academic literature, there is limited knowledge on CBA enforcement and the degree to which terms are ultimately fulfilled in the community (Gross, 2007). This gap also evokes disagreement as to whether either public or private agreements are better suited for the ultimate realization of benefits. To bridge this knowledge gap, this study uses case study analysis of six agreements to answer the following: What methods of enforcement have and are currently employed? What are the unique benefits and challenges of these methods? And how does the brokering (private or public) of CBAs influence its enforcement and ultimate realization? These questions will be answered through a content analysis of [list materials] for six public and private case studies. The private CBAs cases are Columbia West-Harlem, Peninsula Compost Company, and LA Live Sports and Entertainment District and the public CBAs are Gates-Cherokee, Yale-New Haven Hospital, and Digital Inclusion. To analyze this data for each case, I first identified the contextual community and development background, community organizations involved, negotiation process, community benefit terms, enforcement approach, and degree of ultimate fulfillment. I then compared the findings across the cases for potential insight into enforcement best practices or broader, characteristic observations.

The results from this study indicate that there may not be one clear, decisive best avenue for CBA enforcement. This data suggests that agreements without defined enforcement procedures or monitoring encountered the highest degree of implementation difficulty. However, incorporating enforcement terminology does not guarantee the satisfaction of terms. Moreover, the organizational capacities of both the community coalition and the developer are vital. For coalitions, remaining organized post-signature while continuing to push for agreed-upon benefits is an identified obstacle. Also, coalitions may encounter difficulty pushing back against disparities in financial resources and political pull held by developers. For developers, this research identifies that internal administrative policies may lack the knowledge and experience of delivering community benefits. Lastly, this research suggests that the private-public typology may not be a valuable analytical nuance as CBA success or failure is not loyal to any side of this divide. Further analysis using this typology may be clouded by the ambiguity arising from quasi-public agreements or at what point government involvement warrants a public classification. Findings such as these have been shown to can inform the ways that planners, educators, and practitioners incorporate knowledge of CBAs into curricula (Wolf-Powers, 2013) and can further mobilize CBA policies to position municipalities and community groups for accountable development.

POPUP CIVIC ACTIONS AND THE EVERYDAY POLITICS OF INDIGENOUS RESISTANCE: A CASE STUDY OF THE 2013 DISASTER IN GUERRERO

Abstract ID: 1037

Individual Paper Submission

DAVOUDI, Simin [Newcastle University] simin.davoudi@ncl.ac.uk, presenting author

SCHONEBOOM, Abigail [Newcastle University] abigail.schoneboom@newcastle.ac.uk, co-author

DIAZ ALDRET, Ana [CIDE] ana.diaz@cide.edu, co-author

The 1985 earthquake that shook Mexico City is widely known as triggering a “social quake” (Esteva, 2015: xiv). An eruption of what we call popup civic actions by grassroots communities marked the birth of a ‘new’ civil society in Mexico (Baker, 2002), and the opening of the political space for renewed indigenous struggles for recognition and participation. The self-organized initiatives became the touchstone for subsequent social movements, notably the 1994 neo-Zapatista uprisings. Central to Zapatismo vision was the concept of ‘autonomy’ which emerged alongside “a renewed notion of civil society to designate a new semantic of social transformation” (Esteva, 2015: xi-xii).

In this paper, we unpack this renewed notion to argue that western liberal views of civil society as passive, apolitical networks of voluntary associations that merely play an instrumental role in disaster reliefs have limited utility for understanding the motivations and mobilizations of indigenous popup civic actions in Mexico. Their inadequacy is not simply because of the “cultural differences or differences in historical backgrounds” of indigenous peoples, but also because of their “differentiated positioning [...] vis-à-vis the state, the law and capital” (Dinerstein, 2016:11). Instead, we propose a radical democratic conceptualization of civil society as the capacity of a public to self-organize and play an active political role in the democratization of the public sphere.

We use this theoretical framework to critically examine the popup civic actions that were catalysed by the emotional and relational forces of the 2013 storm in Guerrero - Mexico’s second poorest state in the south with a large rural and indigenous population. The fieldwork for this case study (covering the municipalities of Acapulco and Coyuca) was undertaken during 2020-21. It involved: semi-structured interviews with affected residents and representatives from: formal civil society organizations, grassroots and indigenous communities and public officials; workshop discussions and site visits; and, content analysis of official reports and media coverage.

Based on the findings from the research, we firstly, call into question the conventional view of disasters as exceptional and temporary disruptions to the normal order, arguing that disasters are often the outcomes of this very order whose intersectional injustices cannot be brushed away by techno-managerial approaches to disaster planning and governance. Revealing “the slower-paced disaster of displacement, dispossession and marginalization which characterizes the colonial and post-colonial experiences of indigenous peoples” (Hsu, 2016:72), we show how these processes have been intensified in Mexico by commodification of indigenous lands (ejidos), and contested through indigenous struggles for autonomy and self-determination. Secondly, we argue that contrary to the depoliticized instrumental views of civil society, indigenous popup civic actions are forms of everyday political resistance that fissure colonization and neoliberalization, and open interstices for alternative practices. This understanding challenges the arbitrary separation of civil society from social movements debates in disaster planning and governance.

In line with the post-colonial planning scholarship (Sandercock, 1997), we conclude the paper by: highlighting the importance of attending to locally-rooted and de-colonized understanding of popup civic actions in the debate about civil society’s role in disaster planning and governance; outlining potential limitations of radical democratic theories of civil society; and, proposing lines of inquiry for future research.

EVALUATING THE EMPOWERMENT OF INNER CITY PARTICIPATION IN THE BROWNFIELD REDEVELOPMENT PROCESS USING ARNSTEIN'S LADDER: A QUALITATIVE STUDY OF BIRMINGHAM, ALABAMA.

Abstract ID: 1039

Individual Paper Submission

FRICANO, Russell [Minnesota State University Mankato] russell.fricano@mnsu.edu, presenting author
CUTTS, Sandra [University of Alabama Birmingham] scutts16@uab.edu, primary author
PETERS, Robert [University of Alabama Birmingham] rwpeters@uab.edu, co-author

This case study utilizes Arnstein's Ladder and qualitative analysis to determine perceived levels of empowerment of citizens, public officials, and developers in brownfield redevelopment within predominantly socio-economically disadvantaged neighborhoods in downtown Birmingham, Alabama. It also examines the extent to which stakeholders viewed each project as meeting Birmingham's downtown redevelopment goals. Unlike public officials and developers, citizens perceived their empowerment in the process at levels of tokenism, removed from decision-making. Citizens also viewed Railroad Park, a development with free public access, as more effective in meeting community needs and city redevelopment goals than the Lyric Theatre or Regions Field, which require paid admission. This study concludes that environmental legislation setting the parameters of citizen participation to receiving information and providing input may limit citizens from engaging in higher levels of decision-making. An evaluation of direct and indirect social and economic impacts of redevelopment and more equitable participatory processes is recommended.

COMMUNITY RECOVERY AND SOCIAL COHESION POST-DISASTER

Abstract ID: 1059

Individual Paper Submission

SOBHANINIA, Saeideh [Clemson University] ssobhan@clemson.edu, presenting author

Experiencing a disaster and losing family and friends are tough by themselves. Imagine being forced to live in a temporary shelter for a while, being detached from friends and family, and not knowing when you can return to your place. This uncertainty is what might happen to Puerto Ricans if the fast community rebounding does not reflect in the disaster recovery process. Puerto Ricans have been through hurricanes, earthquakes, and a pandemic. In 2017, Hurricane Maria devastated the island and created acute vulnerabilities that must be addressed by making communities more robust and resilient to future shocks.

This research aims to identify how social cohesion can accelerate the process of disaster recovery and understand the underlying reasons why some communities in Puerto Rico are more resilient and are better able to cope with and recover from a disaster while other communities struggle to normalize their lives. The study's objectives to achieve the goals are identifying the indicators of social cohesion, understanding the relationship between social cohesion and community rebounding rate after Hurricane Maria in Puerto Rico, and proposing a conceptual framework for improving social cohesion in Puerto Rico's recovery process. The results of this research will eventually lead to a faster and stronger return of the forced relocated population to their homes and a better understanding of the best use of funding and the best way to disperse funds pre-and post-disaster.

This research is exploratory and explanatory sequential mixed-method design. The study includes two different steps. The first step will answer the question: "Do places with stronger social cohesion rebound quicker from an environmental disaster than places with weaker social cohesion in Puerto Rico?" A cross-sectional survey design will

be used for this step. Data gathering is via questionnaire, and the method of analysis is multi-variable linear regression. The second step will answer the question: “What factors make places with stronger social cohesion rebound quicker from an environmental disaster than places with weaker social cohesion in Puerto Rico?”. A multiple-case-study design with embedded units of analysis and literal replication will be used to answer this question. Data collection is via in-person interviews, and the method of analysis is qualitative inductive coding.

NONPROFIT PARTNERS IN PUBLIC SPACES: COLLABORATIVE PARK GOVERNANCE IN TORONTO AND LOS ANGELES

Abstract ID: 1066

Individual Paper Submission

NELISCHER, Claire [University of California Los Angeles] cnelischer@ucla.edu, presenting author
LOUKAITOU-SIDERIS, Anastasia [University of California Los Angeles] sideris@ucla.edu, co-author

In recent decades, municipal governments have contended with the convergence of two oppositional forces: intense fiscal constraints and increased demand for parks and public spaces (Barrett et al., 2017). In response, parks and recreation agencies have pursued alternative strategies to expand, enhance, and maintain urban park systems, including partnerships with nonprofit organizations and community groups (Joassart-Marcelli et al., 2011). Such partnerships are increasingly common in Canadian and U.S. cities (Rigolon and Gibson, 2021), as evidenced by the highly visible activities of park conservancies, park friends groups, and volunteer and stewardship networks (De Magalhães & Carmona, 2006; Gazley et al., 2020). Despite scholarship on the extent and outcomes of park partnerships, there has been relatively little research on how public agencies enable and effectuate these shared governance arrangements in parks and to what ends. In response, this study analyzes how local parks agencies manage public-nonprofit partnerships by comparing policy frameworks in two cities: Toronto and Los Angeles. The goal of this research is to enhance our understanding of shared park governance and to consider how the interests of civil society actors are embedded in both the governance and spatial form of the city. Accordingly, this study is guided by two central research questions: 1) What local policy frameworks are in place to guide non-profit participation in urban park development and management?, and 2) What similar or different typologies, trends, and patterns exist in these policy frameworks, across two large, North American cities?

We used a multiple case study approach to compare and analyze park partnership approaches in Toronto and Los Angeles, and undertook a qualitative analysis of the policies, procedures, and practices governing public-nonprofit collaborations in each city. Document analysis of public documents, including policies, plans, guidelines, reports, and decision documents, as well as public communications, including web pages, brochures, and press releases, was supplemented with interviews with key public agency staff.

We construct a typology of park partnerships and partners, which is informed by the considerable diversity in their scale and scope as observed across cases, from one-day event permits to long-term management agreements. Local history and governance structures influence the rise of particular partnership types in each city, including an extensive network of park friends groups in Toronto and many facility use agreements in Los Angeles.

In both cities, policy frameworks sought to balance structure with flexibility to account for the high degree of variability in partners and partnerships. To analyze how cities approach, regulate, and manage public-nonprofit park partnerships, we advance a conceptual framework linking policy approaches to partnerships with enabling administrative structures and tools and further with adaptive processes and practices to effectuate partnerships. Local policy frameworks can thus be understood as adaptive responses to perceived challenges, opportunities, and policy goals associated with park partnerships, particular to each city, including an emphasis on “city building” and collaboration in Toronto and an emphasis on revenue generation in Los Angeles.

These findings highlight the key role of public policies, procedures, and practices in creating enabling conditions for public-nonprofit park collaborations. The results demonstrate how prevailing public ideologies and attitudes towards park provision, public expenditures, and civil society participation inform governance approaches and shape

outcomes in the nature and frequency of park partnerships. These findings open avenues for future research on the links between the policy structures and socio-spatial outcomes of park partnerships, and implications for spatial justice.

REFUGEE RESETTLEMENT IN THE US: ORGANIZATIONAL NETWORKS BEYOND RESETTLEMENT AGENCIES

Abstract ID: 1098

Individual Paper Submission

JUDELSON, Alexandra [University of Michigan] alexjud@umich.edu, presenting author

Resettled refugees regularly conjure considerable debate about their potential to either drain a city's resources or contribute to a city's revitalization (Maxmen, 2018). Yet, how the city that refugees are resettled in affects their ability to thrive and contribute productively to the cultural, economic and social fabric of their host community is rarely considered by urban planning scholars or practitioners. Moreover, the U.S. refugee resettlement program does not consider a city's characteristics when deciding where to place refugees. Once refugees are slated to come to the U.S., national resettlement agencies determine where to place refugees based on family ties or which federally-funded local agencies have immediate capacity to administer resettlement services, with little input from local governments or consideration of other grassroots agencies that often emerge to offer refugee support (U.S. GAO, 2012). Refugee resettlement services center around economic self-sufficiency, viewing refugees as workers (Gonzalez Benson & Taccolini Panaggio, 2019; Okour, 2019). Furthermore, local resettlement agencies are funded to work with their clients for 30 to 90 days, a short amount of time for their clients to adjust to a new culture and gain economic independence.

In other major resettlement countries, integration - where both the immigrant and host community are open to change and diversity - is what resettlement processes center on. The conceptual framework of integration provides a comprehensive understanding of the refugee experience, proposing that successful integration falls into four thematic areas, including “achievement and access across the sectors of employment, housing, education and health; assumptions and practice regarding citizenship and rights; processes of social connection within and between groups within the community; and structural barriers to such connection related to language, culture and the local environment” (Ager & Strang, 2008). Yet in the U.S., our fragmented resettlement system, which differs among states, does not make clear which agencies are responsible for these services.

This research examines the network of formal and informal agencies that assist refugees in resettlement, focusing on two rust belt cities - Buffalo, NY and Grand Rapids, MI - that have served as major resettlement locations in recent years. In addition to a review of municipal policies and plans, data collection methods include semi-structured interviews with local resettlement agencies, government officials, representatives from refugee-run grassroots organizations, and other agencies that support refugee populations. Preliminary findings suggest that more formal institutions such as local governments, healthcare providers, and federally-funded local resettlement agencies work together, but there is a disconnect with grassroots organizations that are centered within the refugee community.

Findings from this research have various implications for refugee resettlement and planning practice. As the US is a global leader in refugee resettlement, having a critical understanding of the impact of placement in the US refugee resettlement program is crucial for ensuring that refugees have the tools to integrate more effectively. Understanding impacts of city placement is imperative, particularly as the number of refugees resettled in the US sharply increases in coming years.

PLANNING THE JUST CITY: OUTCOME-BASED VERSUS PROCESS-BASED PLANNING FOR SOCIAL SERVICES IN THE NORTH AMERICAN CITY

Abstract ID: 1104

Individual Paper Submission

ROBERTSHAW, Sarah [University of Toronto] sarah.robertshaw@mail.utoronto.ca, presenting author

There has been a consistent theoretical debate in planning literature about outcome versus process-based strategies (Healy, 2003; Thomas, 2008; Fainstein, 2010). The main consensus in its current form is an understanding that both sides are necessary and essential for planning policy to both encourage community participation and manage power structures (Christensen, 2015). This is a fair analysis that is held by most professional planners, but I aim to narrow this debate to elements of planning policy. The broad argument of both strategies being equally necessary and effective does not hold when considering social equity-based developments. When we look at these individual projects, those that fall under the category of social planning and services almost always benefit from a focused outcome-based strategy- where the city planners have taken the responsibility to ensure the equitable distribution of benefits and services to citizens.

This paper is established from a scoping review of 50 peer-reviewed articles and books that approach this debate of process and outcome planning, as well as various case studies of social planning projects, specifically harm reduction services (ie free clinics, needle exchanges, drug testing, supervised consumption sites) implemented in the last 20 years in North American cities. The objective was to analyze outcome versus process-based projects on their abilities and ease to implement these often difficult to site services in communities.

Planning policies can easily become ways for neighborhoods to practice order maintenance and social control over space (Thomas, 2008). We have seen arguments like not in my backyard, or NIMBYism become weaponised - affecting public policies and shaping how development happens within a city. When the voting demographic vocally does not want a development like a harm reduction site in their area, even when it is needed, a process-based strategy can allow a door open for this descent to shift the outcomes away from equity or even stop the project before it got off the ground.

This research will be adding to the discourse surrounding planning strategy, and as it is focused on harm reduction services it will also be filling a noticeable gap that planning literature currently has in this area. As North American cities continue to face a growing overdose and poisoned drug supply epidemic, more and more cities are beginning to look to and establish permanent harm reduction sites in the face of extreme NIMBYism. This research will hopefully encourage planners to continue to create the ‘just city’ by consistently placing equitable outcomes at the forefront of projects.

A “GOOD NEIGHBORHOOD” FOR MIDDLE-AGE SINGLES? A CASE FROM TOKYO, JAPAN

Abstract ID: 1118

Individual Paper Submission

MATSUMOTO, Naka [Meiji University] nakam227@gmail.com, presenting author

The number of single-person households in large metropolitan areas has significantly increased over the past decades (Klinenberg 2012). This rapid increase in single households in major urban cities is a worldwide phenomenon, and Tokyo, one of the largest cities in the world, is no exception in this regard (Retherford, Ogawa, and Matsukura, 2001). Unlike the previous generation, most single households in urban cities now consist of never-married individuals without children. As a result, they are often seen as temporary residents with little sense of community in their neighborhoods (Nasar and Julian 1995).

Although local governments and researchers have paid attention to the wellness of singles, they have focused mostly on two groups: elderly single people who may be socially isolated (Findlay 2003) and young singles, many of whom are college students and less attached to the local community (Kenyon 1997). However, despite the significant presence of middle-aged singles in urban cities, there is little discussion about what constitutes a "good neighborhood" for them, especially those on low incomes. Many of them are in low-wage jobs and maintain some social relationships with friends and coworkers. They seem to be surviving, at least for now. Nevertheless, in the near future, when they retire from work and do not have family members to physically, mentally, and financially support them, social isolation in the neighborhood could be a significant issue. In addition, this situation could become a burden for local governments as a large segment of the population may rely on social welfare.

By interviewing 22 middle-aged singles and examining data from a survey (N = 2,598) conducted in central Tokyo in 2019 and 2020, this study attempts to answer the following research questions: What do middle-aged singles, especially low incomes, think about their neighborhood and neighbors? What is a "good neighborhood" for them when they age?

In the interviews, the middle-aged singles expressed the ease of living in a large city, which is convenient and provides entertainment, anonymity, and jobs. Without family obligations, they tend to move residences and jobs more frequently than individuals with families. Many described social relationships with friends through work and specific interests such as sports and music, but very few with neighbors. While some, especially women, acknowledged the importance and comfort of having "good neighbors" in their daily lives as well as in an emergency like a natural disaster, they stated that they were too busy to mingle with neighbors and did not know where to start to form social relationships in the neighborhood. In addition, they often hesitated to actively socialize with family households around them. This hesitation may be due in part to the strong cultural norms in Japan that suggest that middle-aged and never-married singles are "losers" or "immature." With their low-income status, this mindset often makes them refrain from playing active roles in the neighborhood as traditional neighborhood organizations tend to serve mainly family households. As a result, low-income middle-aged singles struggle to find social roles and isolate themselves from the neighborhood community.

In conclusion, this paper advocates the need for inclusive and diverse urban neighborhood environments free from predetermined social roles that depend on marital and socioeconomic status, gender, age, and race. For example, "Chonaikai," a voluntary residence association that is usually spearheaded by retired men, should include not only singles but also immigrants, students, and women with roles that suit their lifestyles. Middle-aged singles playing active roles in their neighborhoods would have been excellent assets for communities and created a critical safety net for the singles.

PLACES TO BE YOUNG: THE DISPOSSESSION OF PUBLIC SPACE IN OLD HAVANA

Abstract ID: 1124

Individual Paper Submission

KOCSIS, Joanna [University of Toronto] joanna.kocsis@utoronto.ca, presenting author

The recreation of Old Havana as a site of heritage tourism involves the emergence of a new spatial imaginary, the enforcement of which is resulting in the loss of places for local residents to be young. After the 1959 Revolution, the Cuban government prioritized social infrastructure for its citizens over tourist amenities for foreigners, bucking the trend of global economic integration and restructuring that was spreading across Latin America and the Caribbean. By the early 1990s, the many factors that complicated the Cuban state's socialist mission forced it to turn to a market-led process of redevelopment to generate income to improve housing and infrastructure in the island's oldest urban settlement. As a result, the Office of the Historian of the City of Havana (OHCH) was granted powers that were unprecedented within Cuba's highly centralized government and centrally planned economy. This put the OHCH in a challenging position in which "[i]n addition to preserving architecture...it is now charged with developing tourism and providing services to the community" (Peters, 2001 p.8 *italics mine*). It is in this dual mandate, to create conditions conducive to tourism and to concern itself with the wellbeing of the local community, that socialist and neoliberal objectives necessarily clash which, I argue, has unique repercussions on the experience of young people living in Old Havana.

The process of neoliberal urbanism (Harvey, 1989) taking place in Old Havana is exceptional in that it is the first example of such a process in the contemporary Cuban context, and it is embedded in an ideological and material context of state-led socialism in ways that similar processes in other parts of North America are not. The conversion of the UNESCO site of world heritage into an entrepreneurial city has forced a community whose political and material expectations were formed by a socialist government to rely on market mechanisms to fund the survival of their neighbourhood, disrupting their identities and spatial imaginaries. The city marketing (McCann, 2009) efforts that fuel the revitalization of Old Havana demand the sanitization of public space, which relies on forms of social control that impact local young people in particular ways. The unique social needs of adolescents, and the material needs of these specific teens whose socio-economic situation limits their access to private space in the home, make public space particularly important to this group. The redaction and policing of public space that are key to the creation of heritage tourism in Old Havana have negative impacts on the identity formation of local youth. This paper uses participatory and arts based research to explore how the spatial practices involved in the enactment of this new imaginary dispossess local youth of places to be young, leading to a missing 'backstage' (Goffman, 1978) for the work of identity formation; how official representations of space physically and symbolically exclude local youth from the reimagined Old Havana, communicating messages about their worth that impact how they see themselves; and how young people's experience of the economically and geographically restructured city impacts the imagined futures of local youth by centring consumption in ways that can make them feel out of place in their own community (Cahill et al., 2019).

GENTRIFICATION AND MINORITY SMALL BUSINESS OWNERSHIP IN THE PURPLE LINE CORRIDOR

Abstract ID: 1136

Individual Paper Submission

FINIO, Nicholas [University of Maryland] nfinio@gmail.com, presenting author
KNAAP, Gerrit [University of Maryland] gknaap@umd.edu, co-author

The State of Maryland is currently building a new light rail system due to open in 2026. It is known as the Purple Line, and it will span the inner suburbs of two suburban counties just outside Washington DC. It will connect multiple major activity centers and existing subway and rail lines along its 16 mile route. The Purple Line will greatly increase transit accessibility to jobs and points of interest along its path, potentially increasing land values in neighborhoods where many minority low-income residents and small business operators may be vulnerable to displacement (Lung-Amam and Dawkins, 2020). In this paper, we seek to understand how gentrification and nearby construction impacts small businesses – particularly minority and woman-owned small businesses - in advance of the opening of the transit line.

The prevalence of gentrification in the Purple Line Corridor and one of its primary consequences, displacement of residents and businesses, is however subject to ongoing debate. One reviewer of gentrification noted the subject is viewed in qualitative and micro-level studies as a social issue that is “deeply problematic and consequential for longtime residents” (Brown-Saracino, 2018, p. 517). In the same review, Brown-Saracino notes that macro-level quantitative analyses offer a viewpoint that gentrification is not as widespread as commonly thought, and further that “displacement is far from endemic” (Brown-Saracino, 2018, p. 520).

The Purple Line as a case-study is relevant to this debate given recent advances made and questions posed in the literature. Large-scale public investment, like the over \$2 billion investment in the Purple Line, has been shown to influence processes of gentrification and potentially catalyze displacement (Zuk et al. 2017). However, macro-scale evidence has shown that new rail transit stations do not directly catalyze higher rates of displacement for low-income residents who live nearby (Nilsson and Delmelle, 2020). Chava and Renne (2021) found that gentrification since the 1980s has been more prevalent in neighborhoods with light rail stations than neighborhoods without, even in advance of the opening of transit.

We advance our case study using both traditional and novel sources of data. We test for the presence of gentrification using census socioeconomic and demographic data at the census tract level from 2000 to 2019. To identify gentrification, we create a subset of eligible areas based on income and recent housing construction. We then track certain supply and demand indicators, alongside race and ethnicity to identify gentrification.

We supplement our identification of gentrification at the local scale with unique sources. The Quarterly Census of Employment and Wages (QCEW), which is an administrative database of firm geolocations and wages, allows for identification of increased economic activity, proxied by firm openings and wages, in census tracts or block groups which may or may not be gentrifying. We merge QCEW data with data from the Paycheck Protection Program, which includes attributes of business owners like minority status and gender. Between these datasets, we analyze the likelihood of survival of minority owned firms between the pre-construction period (before 2017) and through 2021.

We find that gentrification is occurring in the corridor, and many areas in the Corridor are at risk of gentrifying in the future. The business data paints a nuanced story of economic growth that may not be equitably shared, as businesses compete in this dynamic area and struggle against the changes that construction, COVID-19, and shifting demographics bring.

THE EUDAIMONIC TREE PILOT: A STUDY OF PUBLIC ENGAGEMENT IN PARTICIPATORY ART AT THREE SITES

Abstract ID: 1144

Individual Paper Submission

What tools do professionals designing our urban environments have for discovering unknown issues in a more spontaneous and practice-based way? The engagement approaches that many planners and designers use do not typically aim to access deeper questions in society. Surveys, public meetings and focus groups seek tangible results that target specific issues. These forms of engagement offer little room for unknown information to emerge that indicates the community's sense of well-being and do not typically aim to connect community members to each other or their environments.

The Eudaimonic Tree Pilot explored novel forms of engagement through the theoretical framework of eudaimonia (Aristotle & Beresford, 2020; Ryff, 2013). The objective of the study began with a desire to inspire a sense of well-being, eudaimonia, in the community during a time of great loneliness and mental health decline due to the ongoing COVID-19 pandemic (Ammar et al., 2021) which contributed to a national trend that started well before the pandemic occurred (Berry & Okulicz-Kozaryan, 2011). The Eudaimonic Tree Pilot was a response to COVID's exacerbating impacts and was composed of three installations that used trees in the landscape to offer the public a means of expression. Each tree housed a different prompt rooted in eudaimonic sentiments and blank note cards for public response. Their messages hung from tree limbs and became an embodiment of the participatory process.

The planning and design fields do not currently have a framework to assess whether well-being is evoked by designs and projects in the landscape. Through the novel approach of using participatory art as a form of public engagement this study serves as a proof of concept, adapting a prominent eudaimonic well-being scale developed by Dr. Carol Ryff (Ryff, 1989; Ryff, 2013) to assess whether well-being was evoked by the installations. Ryff's Six Dimensions of Eudaimonic Well-Being (Ryff, 1989; Ryff, 2013) provided a framework to code each message. Through this analysis it appears that different prompts and trees evoked distinct responses that aligned with distinct dimensions.

Several profound implications for planning and design fields were uncovered, including that participatory art can catalyze new modes of community dialogue and highly co-created initiatives are likely to generate a eudaimonic effect. This study suggests that the development of a eudaimonic framework intended for geographic application would support the creation of projects that elicit well-being in an effort to serve deeper needs of the community through engagement in participatory art.

IS THERE REGIONAL DISPARITIES IN CULTURAL INFRASTRUCTURE PLANNING?

Abstract ID: 1198

Individual Paper Submission

OH, Jiwoon [Pusan National University] junejwoh@naver.com, presenting author

JUNG, Juchul [Pusan National University] jcjung@pusan.ac.kr, primary author

SUNG, Jin [Pusan National University] genie3511@gmail.com, co-author

[Problems] Cultural infrastructure provides a cultural activity space for citizens, improves the quality of life of citizens through cultural education and exchange, and helps they become more creative person. culture can play a role in creating and maintaining the identity of the local community, its creativity, vitality, and internal cohesion (Revko at al, 2020), and improve overall image of a city through cultural infrastructure development (Bryson, 2007). In addition, it is possible to promote economic development by attracting 'creative class' within the region through investment in cultural infrastructure (Florida, 2002). Therefore, cultural infrastructure should be viewed not as a simple leisure space, but as a public infrastructure that all citizens have the right to enjoy equally, and at the government level, disparities and inequality between regions should be resolved. In this study, the spatial distribution characteristics of cultural infrastructure were checked, and regional disparities and influencing factors were analyzed for each facility.

[Research Methodology] The study area of this paper covers South Korea and GIS analysis was used to OLS and SRM (Spatial Regression Model). The number of cultural infrastructure contains geographic information, spatial autocorrelation is inherent. Therefore, spatial regression model was performed, and spatial error model was adopted as the final model compared with the results of OLS. The independent variables were set to 7 population characteristic variables and 4 cultural policy variables, and the final 10 independent variables were set through the multi-collinearity test. In this study, the relationship between spatial autocorrelation and independent variables for each facility of cultural infrastructure was investigated. Therefore, a total of six analyses were conducted.

[Findings] As a result of the analysis of this study, it was found that the number of cultural infrastructures has spatial autocorrelation, and the largest spatial autocorrelation appears in the 'library'. As a result of the analysis of the final model, it was found that the number of cultural infrastructure had a positive correlation with the total population, population density, the ratio of single-person households, the ratio of foreigners in the region, and the number of cultural organizations. In addition, as a result of analyzing the number of each facility as a dependent variable along with the total number of cultural infrastructure in this study, it was confirmed that the influencing factors and influence vary depending on the detailed setting of the analysis variable. In particular, comparing the analysis results of 'library' and 'museum', 'library' showed a positive correlation between the ratio of youth population and foreigners. On the other hand, in the case of the 'Museum', the ratio of the youth population showed a negative correlation, and a positive correlation was found in the ratio of single-person households and age diversity.

[Policy Implications] Three implications can be derived from the analysis results of this study. First, the number of cultural infrastructure has a correlation with the regional population characteristics. Therefore, through further research in the future, it will be possible to use the expansion of cultural infrastructure as a strategy in policies for increasing a specific population in the region. Second, the number of cultural infrastructure has a correlation with local cultural organizations. This is the result of quantitatively confirming theory that cultural infrastructure creates internal cohesion in the community, and based on this, meaningful research on the impact on the creativity and social integration of cultural infrastructure and community will be possible. Third, the influencing factors and influences vary depending on the detailed classification and analysis unit of cultural infrastructure. Therefore, when establishing a cultural infrastructure policy, it is necessary to analyze and set strategies for each facility according to the direction of the policy.

SATISFIED ENOUGH TO TAKE ACTION? THE EFFECT OF NEIGHBORHOOD PERCEPTIONS ON DISASTER PREPAREDNESS BEHAVIOR

Abstract ID: 1211

Individual Paper Submission

LEE, Ryun Jung [Texas A&M University] ryunjunglee@arch.tamu.edu, presenting author

As the global climate changes and natural disasters are difficult to predict, how to prepare for natural disasters has become more critical than ever. While many deciding factors of disaster preparedness behaviors of individual households have been introduced, the importance of neighborhood environment (socio-physical conditions) in motivating preparedness behaviors has not been stressed. If residents are satisfied with the neighborhood environment, would they be more reluctant to keep emergency supplies because of their satisfaction, or would they try to be more prepared? Conversely, when residents perceive physical disorders or have safety concerns about their neighborhoods, would this trigger an additional motivation to prepare for a disaster or discourage residents from preparing emergency supplies even if a disaster risk exists? Exploring the relationships between neighborhood perceptions, risk perception, and disaster preparedness, this study attempts to identify the dynamics of the neighborhood environment that can encourage residents' disaster preparedness behavior.

Using the 2017 American Housing Survey (AHS) national microdata, this study examines whether or not a positive perception of neighborhood environment could encourage disaster preparedness behaviors using OLS and Ordered

Logit regressions. Disaster preparedness is measured using the AHS survey items directly related to disaster preparedness: availability of emergency food, water, emergency kit, disaster plan with financial and contact info, meeting spot, alternative communication plan, generator, evacuation location, vehicle, and financial resources. Neighborhood perceptions are measured in two different ways: neighborhood rating scores that represent overall neighborhood satisfaction and six specific variables of perceived neighborhood conditions (such as abandoned structures, bars on windows, trash on street, crime, and school quality). The relationship between neighborhood perception and disaster preparedness was also measured when the disaster risk perception is high or low.

The results show that neighborhood perceptions can potentially alter the relationship between risk perception and disaster preparedness. When the neighborhood satisfaction score increased by one point, the preparedness score increased by 0.114 points ($p < 0.001$). Additionally, when abandoned structures are observed in the neighborhood, the preparedness score dropped by 0.394 points ($p < 0.01$) indicating a negative association. Perception of a high-quality school appeared to be a strong indicator for disaster preparedness behavior (coef. = 0.235, $p < 0.01$). When subgroups of risk perception were examined separately, however, there were no significant effects from abandoned structures or high-quality schools on the preparedness behavior of households with high-risk perceptions. This could suggest that neighborhood perceptions matter more with a low perception of disaster risk than when a high risk is perceived. At the same time, high neighborhood satisfaction that captures overall neighborhood perception is still a marginally significant factor influencing preparedness behavior when risk is perceived (OLS: coef. = 0.106, $p < 0.05$ | OL: $p = 0.06$).

This study suggests a potential contribution of neighborhood perceptions on disaster resilience with evidence that positive neighborhood perceptions are related to a high level of disaster preparedness. More importantly, communities with limited knowledge or awareness of existing disaster risk could benefit from an improved neighborhood environment. This study indicates that a positive neighborhood environment can encourage disaster preparedness behaviors, especially when residents do not perceive disaster risk. This implies that residents' perceptions of the neighborhood environment could influence their decision to prepare for potential disaster. Subsequently, potential spillover effects could exist among different types of neighborhood problems. There are several further issues that could be examined: Are there other neighborhood factors that could discourage disaster preparedness behaviors? Does the perception of the neighborhood environment matter in promoting a disaster-resilient society? If so, how much do neighborhood environment and quality matter?

COMPARING THE NEIGHBORHOOD SATISFACTION THROUGH CRIME PREVENTION THROUGH ENVIRONMENTAL DESIGN (CPTED) BETWEEN GROWING AND SHRINKING METROPOLITAN AREAS

Abstract ID: 1251

Individual Paper Submission

SONG, Yonghun [Florida State University] ys18d@my.fsu.edu, presenting author
DUNCAN, Michael [Florida State University] mdduncan@fsu.edu, co-author

Central Theme

Residents have shown decreased satisfaction with their neighborhoods when they observe crime and physical degradation (Grogan-Kaylor et al., 2006; Lee et al., 2017). This is a particularly difficult issue in cities facing population losses with an increase in empty and abandoned buildings and the loss of municipal services (Weaver et al., 2016). Nevertheless, there have been few papers dealing with neighborhood satisfaction in shrinking cities. Therefore, the question addressed with this research is how the relationship between perceptions of crime and the physical environment in neighborhoods and neighborhood satisfaction would differ between a growing and shrinking

metropolitan area.

Methodology

In order to see the relationship between environmental design, crime, and neighborhood satisfaction, a separate path analysis will be conducted for growing and shrinking metropolitan areas. The above described research question will be addressed by comparing the results of these two analyses. The number of abandoned buildings and the frequency of garbage in the streets will be independent variables, and the dependent variable will be neighborhood satisfaction. A level of crime will mediate the independent and dependent variables. Data from the 2019 American Housing Survey (AHS) will be utilized to evaluate the hypothesized relationships. The population change data from the United States Census Bureau will be used to assess whether the metropolitan statistical areas (MSAs) populations have expanded or decreased.

Relevance

Planning in a shrinking city differs from planning in a growing city (Wiechmann & Bontje, 2015). As such, theories and policies for urban planning should be able to deal with urban shrinkage as well as urban growth (Reis et al., 2016). If the negative impact of abandoned buildings on neighborhood satisfaction is more severe in shrinking MSAs, reduced crime through environmental design might be more important in such areas. Policies addressing abandoned structures and litter may be more impactful in shrinking cities and such initiatives may be vital to improving quality of life.

MAKING COMMUNITIES AGE-FRIENDLY: LESSONS FROM IMPLEMENTED PROGRAMS

Abstract ID: 1281

Individual Paper Submission

LYU, Yingying [Harvard University] ylu@gsd.harvard.edu, presenting author
FORSYTH, Ann [Harvard University] aforsyth@gsd.harvard.edu, primary author

The world's population is aging and with that comes a need to make places that can better support older people. Over the past decades, multiple organizations have developed models and published related guides to stimulate creating age-friendly cities and communities, such as Livable Communities by the AARP (formerly the American Association of Retired Persons), the AdvantAge Initiative by the New York Visiting Nurses Association (NYVNA), and Global Age-Friendly Cities by the World Health Organization (WHO) (Gonyea and Hudson 2015; Winick and Jaffe 2015).

In parallel to the age-friendly movement is a small but significant field of academic research on AFCs. Some studies have drawn on theory to review elements of AFCs and propose broad challenges in implementation (e.g., Steels 2015). While the number of published evaluations of AFC effectiveness is modest, several earlier reviews have attempted to summarize existing assessments (e.g., Menec and Brown 2018). However, their reviews did not focus on the outputs and outcomes of the AFCs.

Through a scoping review, this paper synthesizes research evaluating AFC programs to answer the question: Do such programs make a substantial difference? More specifically, have they produced positive outcomes, or outputs that are predicted to lead to positive outcomes for older people? Evaluating AFC outputs/outcomes helps assess if they are effective and worth doing. To facilitate future AFC efforts, it is also helpful to know why some AFCs work better than others in achieving these outputs and outcomes. This matters for planners as these programs provide important models for creating comprehensively age-friendly communities that bring expertise from a variety of partners to the

endeavor (Winick and Jaffe 2015).

In this paper, we focus on those AFCs using versions of the WHO age-friendly model or framework because this model/framework has been applied around the world (World Health Organization n.d.). Focusing on evaluation, we first define the inputs, outputs, and outcomes of an AFC program. We then examine what outputs and outcomes the AFCs have achieved by reviewing journal articles, dissertations, book chapters, and third-party reports on assessing AFC outputs and outcomes. We also pay attention to the uniqueness of AFC implementation in different geographic and economic settings, a key interest for planners.

Compared to the many AFC programs worldwide, we found that relatively few studies have evaluated program outputs and outcomes. Those that are more effective in achieving outputs and outcomes tend to have more resources (political, funding, technical, infrastructural, locational, social), engaged participants (collaborators, leaders, champions, and older people themselves), and use effective strategies to build support (quick wins, awareness raising, and cultural sensitivity). Future research could expand the diversity in evaluation methods and geographical areas. More importantly, work is needed to explore the needs of under-represented older populations such as indigenous and ethnic minority people, and those in deprived areas.

A RESEARCH ON THE CONFIGURATION OF FACILITIES AND BEHAVIORS OF RESIDENTS IN HISTORIC URBAN AREAS FROM THE PERSPECTIVE OF COMMUNITY LIFE CIRCLE: CASE STUDY OF PINGYAO ANCIENT CITY

Abstract ID: 1285

Individual Paper Submission

PAN, YANHAN [College of Architecture and Urban Planning, Tongji University] panda01132@126.com, presenting author

The community life circle is also essentially a portrayal of the interaction between community space and residents' activities. It is an important direction for research to identify the behavioral characteristics of residents' activities according to the classification of residential areas, which are mostly classified by income class and housing type of the current studies.

Historic urban areas have the dual attributes of heritage and habitat, often being both residential, political, commercial and cultural areas, with mixed land uses, high density, complex populations and a variety of activities. While the emphasis is on preserving the physical heritage of historic districts, it is also important to maintain the stability of the community's residential and living functions through a variety of planning, management, financial and technical means, in order to achieve sustainable development for the community and its residents. It is therefore necessary to consider the living standards of the residents and the configuration of public facilities in a people-centred manner.

Historic urban areas differ from ordinary settlements in terms of their social structure and configuration of facilities, and are often characterised by the following features: a high degree of ageing of the population and a high rate of emigration in terms of the composition of the inhabitants; a situation of constant replacement and mixing of old and new residents, local and incoming residents in terms of social network; high density, with few outdoor public spaces and green areas in terms of spatial characteristics; lacking of large scale facilities such as commercial centres and hospitals in terms of facility configuration.

Based on these characteristics, historic urban areas can be studied as a distinct type of settlement, but there are currently few studies that consider historic urban areas from the perspective of community life circle. Are the amenity

needs of residents in historic urban areas more difficult to meet and how their activity behaviours are influenced by the space? Do residents show different characteristics in terms of their daily activity range and activity trajectory? These are the research questions of this paper.

This paper analyses the specific case of the ancient city of Pingyao in China, using the methods of questionnaires and activity trajectory mapping, explores the facility needs and activity behaviour of the residents, and evaluates the current state of the configuration of facilities based on a perspective of community life circle.

The results of the study show that there is less demand for commuting and more demand for basic life activity, with the majority of the population using the facilities being elderly people. The need for basic security facilities such as clinics and pharmacies, markets and hospitals is the most urgent in the ancient city. In terms of plazas and green spaces as well as cultural and sports facilities, emphasis should be placed on the improvement and management of existing facilities. Through this case study, a possible method of analyzing the configuration of facilities and residents' behaviors in historic urban areas based on community life circle is proposed, and relevant suggestions are made. A hierarchical configuration of basic security-type facilities at various spatial levels should be established in the historic urban area. At the same time, the spatial characteristics of the historic urban area should be combined to increase the temporal flexibility and functional complexity of the facility configuration. Based on community living circles, the physical environment of the slow-moving should be optimized, aided by soft means such as the implementation of time-segmented traffic flow restrictions.

ROSS BROWN, Samuel [University of Southern California] srossbro@usc.edu, presenting author
SLOANE, David [University of Southern California] dsloane@usc.edu, primary author

After the devastating flu pandemic of 1919-1919, America quickly moved on. Few novels, movies, or plays did more than make a quick allusion to the death of 25-100 million people worldwide and at least 650,000 Americans. Similarly, America constructed virtually no memorials to those lost. The pandemic simply slide into the fog of history (Segal 2021).

One might have anticipated a similar absence in our current pandemic. While the coronavirus pandemic has caused the death of over 1 million people in the US and over 6 million worldwide and the numbers seem numbing when we consider the loss associated with those deaths for families, friends, and colleagues, America has rarely constructed memorials to the dead of an epidemic.

However, the situation seems quite different with COVID-19 (Fox 2020; Tombley 2020). Artists, activists, and finally governments have begun commemorating the dead soon after the true impact of the pandemic began to be realized. In a database we have constructed, we have identified at least 38 proposed or implemented ephemeral or permanent commemorative actions in the US. These commemorative actions vary from digital to traditional monuments, ephemeral one-day or weekend celebrations to reoccurring actions intended to mark important milestones in the numbers of deaths.

This paper will consider three questions: First, why has COVID elicited such a significant difference from a century ago? Two, how has the current generation of commemorative designs affected the design and location of these memorials? Three, how may the proposed memorials still obscure the full impact of the deaths in ethnic, racial, immigrant, and indigenous communities.

We will draw on a number of literatures to consider these questions, including cultural landscapes and memorial

design (Sloane 2018), memory and its erasure (Sion 2014), and the disparities both in health and historical memory of marginalized groups, especially people of color who have been disproportionately affected by the current pandemic. Careful textual and design analysis will be combined with a consideration of the community development meaning of remembering, memory, and place.

SENSE OF BELONGING IN URBAN SPACE AMONG DIFFERENT GENERATIONS IMMIGRANTS IN TORONTO

Abstract ID: 1398

Individual Paper Submission

HEDAYAT, Homa [York University] homa_hedayat@yahoo.com, presenting author
REISENLEITNER, Markus [York University] mrln@yorku.ca, co-author

The research presents a study of the perception of public places and sense of belonging in residential neighborhoods by younger and older Iranian immigrants living in the Toronto metropolitan area. Few works in the literature have investigated the relationship immigrants develop with the shared spaces of the city and their residential environment, and how that relationship can impact the development of a “sense of belonging” in the city.

This research aims to provide an insight into sense of attachment and belonging as experienced by Iranian immigrant community in Toronto, based on the individual’s gender, age, occupation, duration of stay, type of household, the number of movements, the location of their neighborhood, type of building and tenure. The research uses a two-part methodology, involving qualitative interviews about the experience of immigration, together with quantitative data, collected from an online survey on daily activities responded by a non-probabilistic sample of 150 immigrants.

MEDIA NARRATIVES OF PLANNING: SOCIAL EQUITY AND ENVIRONMENTAL JUSTICE DISCOURSE AT TURKEY CREEK

Abstract ID: 1433

Individual Paper Submission

DAVISON, Mark [University of Florida] davison.mark@ufl.edu, presenting author

Local media powerfully influences public perception. The importance of the media's role in shaping the opinion about planning projects is a critical but often overlooked area of research. News reports work as tools for individuals to

incorporate their own ideas through forced frames of reference positioned by media narrative. Furthermore, the power of the media allows privileged groups to disseminate specific stories and marshal support for planning projects by disseminating specific ideas. The now-famous notion that the news media directs the populace of what to think about is still valid, however, more accurate, is that the news media directs the way the populace thinks about ideas (McCombs & Shaw, 2003).

Planning discourse is based on the underlying predispositions of a group (Healey, 1996). Forester (2009) notes that as culturally framed dispositions lead to conflict, the communicative aspects of planning become more important. Communicative planning's goal as building greater consensus through shared meaning and group intelligence is paramount to increased equity and social justice.

Local news reports form a narrative of planning activities, and the public's perception of planning is molded and magnified by its representation in the press (Clifford, 2006). The rhetorical frames constructed by the media can drive narratives in the act of policy setting (Schön, 1979). However, impartiality does not ground the narrative. The public's attitude towards planning is formed both through historically constituted experience and the imagined heritage of a place (Holman, 2014; Tighe & Opelt, 2016).

The public debate surrounding development in the Turkey Creek neighborhood of Gulfport, Mississippi provides a case for examining the role of local media in framing the planning debate. The Turkey Creek neighborhood was founded by black freedmen in the 1870's and has remained a vital, but economically disadvantaged, African American community since. The neighborhood is threatened by frequent flooding as commercial development encroaches the creek's floodplain. Recently, fierce debate surfaced as the city government proposed the construction of a multilane highway through the neighborhood to alleviate traffic congestion at a nearby interstate interchange and to spur economic development.

This program of research focuses on the media narratives that drive the disconnect between planning practice and the goals of increased social equity and environmental justice. The media's role becomes problematic for free and open debate because local news is often less of a "watchdog" and more a source of boosterism (Shumow & Gutsche, 2015). Local elites and officials utilize the media to reinforce established power structures through specialized language and the reporting of specific events or ideas (Vincent, 2000). Linking equity and environmental justice with narrative inquiry is a novel approach to understanding how diverse groups imagine their shared future. Findings come from 102 newspaper articles and local broadcast reports in the print newspaper Sun Herald and the broadcast television stations WLOX and WXXV between 2015 and 2022.

Through this narrative analysis, this project specifically answers the following questions:

1. How do media reports narrate the past and future at Turkey Creek?
2. How do media reports narrate social equity and environmental justice at Turkey Creek?
3. What is the overall level of discourse surrounding planning, growth, and equity at Turkey Creek?
4. How do these reports combine to communicate a narrative of planning at Turkey Creek?

The narrative analysis of these media reports uncovers the prevailing narratives and frames of reference concerning equity and the future in racially diverse, environmentally vulnerable, and economically stressed neighborhoods. The narratives formed through media reporting of Turkey Creek reveals important insight into how planners can better communicate policy, understand community aspirations, and bridge the gap between community voices and political leadership.

ESCAPING FROM THE IDENTITY ENCLAVE: SOCIAL INCLUSION PROGRAMS AND FLOATING MIGRANTS' SETTLEMENT INTENTION IN CHINA

Abstract ID: 1502

Individual Paper Submission

NIE, Xuanyi [Harvard T. H. Chan School of Public Health] niexuanyi@gmail.com, presenting author
HAN, Mo [Northeastern University] mohan0601@yeah.net, co-author

China has undergone unprecedented waves of internal migration over the last four decades. In general, there are two generations of migrants. The old-generation migrants were born before the 1980s, and they mostly come from rural areas. The new-generation migrants have a higher probability of coming from small towns rather than rural areas. This has fundamentally expanded the pattern of migration in China from a rural-urban dichotomy to a more comprehensive pattern that involves both rural and urban migrants. Meanwhile, the discrimination in life experience imposed by the lack of local urban hukou status reduces rural migrants' settlement intention. This separation of rights puts them into an "identity enclave" which challenges floating migrants' hegemonic constructions of place and identity. Although economic incentives are important for the floating migrants' settlement intention, socio-cultural attachment also plays an equal, if not more important role. The emotional attachment of the floating migrants to their urban milieu could help them develop an identity thereby the intention to stay. This research explores the relationship between social inclusion programs and floating migrants' intention to stay. Based on the theories of social capital through differentiating the effects of bonding social capital and bridging social capital, the research hypothesizes that social inclusion programs, which improve floating migrants' attachment with the local community, are positively associated with their intention to stay. The analysis draws data from the 2017 China Migrants Dynamic Survey (CMDS) and highlights heterogeneous groups by examining the association in the skilled, semi-skilled, and unskilled floating migrants respectively. The findings could be informative for scholars and policymakers to understand how floating migrants in China strive to develop an attachment to their urban environment.

GEOGRAPHICALLY-EMBEDDED, INDIVIDUALLY-MOTIVATED, AND INSTITUTIONALLY-MOBILIZED: SHIFTS IN FOUNDATION GRANTMAKING FOR URBAN DEVELOPMENT

Abstract ID: 1521

Individual Paper Submission

OH, Jeesson [The Ohio State University] oh.483@osu.edu, presenting author

This paper investigates shifts in prominent place-oriented foundations' grantmaking for urban development in cities that have experienced persistent socioeconomic distress. Through longitudinal case studies of three place-oriented foundations, this paper provides insights into their motivations and mobilization in distinctive geographic, institutional, and political contexts: the Kresge (Detroit), Lyndhurst (Chattanooga), and Cleveland Foundations (Cleveland). Prominent philanthropic foundations in the United States have long sought to address urban problems by supporting and, at times, initiating a variety of urban development programs, from neighborhood planning to comprehensive revitalization initiatives (Rohe 2009). These initiatives have primarily focused on poverty alleviation at the community level.

In the recent two decades, however, a number of place-oriented foundations have shifted from providing ameliorative services toward taking on more direct roles in urban development (Thomson 2020). Rather than merely responding to changes in their contexts, these foundations also seek to (re)shape the contexts and forge political will so that they align with the foundations' interests (Lowe and Grengs 2020). Drawing upon the perspectives from organizational

theory, particularly alternative perspectives on the nexus between firm strategies and contexts (Christopherson and Clark 2007; Marshall et al. 2018), this paper analyzes the three prominent foundations' motivations and mobilization strategies in urban development—what has been funded, where, and why. The guiding research questions are: (1) Why have these foundations shifted their problem-solving strategies in urban development in cities in which they operate? (2) Why have their newly defined problem-solving strategies extended to constructing economic, political, and institutional contexts beyond (re)shaping the physical context?

By integrating grant data analysis, content analysis, non-participant observation, and semi-structured interviews, I develop case studies that longitudinally examine the three foundations' grantmaking for urban development in distinctive geographic, institutional, and political contexts. The selection of the Kresge, Lyndhurst, and Cleveland Foundations is based upon three categories: prominence in the space of urban development, comparable socioeconomic distress and divide in the cities they are committed to, and the types of foundations they represent—national/local foundation, local foundation, and community foundation. Using grant data from 2003 through 2017 collected from Foundation Directory Online and IRS Tax Form-990, I identify distinctive problem-solving strategies. Content analysis, non-participant observation, and semi-structured interviews with foundation leaders and planners not only enable refining the categorization, but also shed light into the foundations' motivations and (re)shaping of their economic, political, and institutional contexts.

The findings are threefold. First, important individuals in each foundation initiated the shifts, driven by their interpretation that their organizational interests and the prosperity of the cities of their operation are interconnected and by desire for their own legacy. Secondly, the foundations sought to leverage distinct geographies—waterfront, anchor institutions, downtown—not only for economic growth, but also for the imagination of possible futures, which led to geographic prioritization for their grantmaking and investments. Lastly, the foundations developed extensive organizational networks while creating new institutions with the sole purpose of executing their plans and forged political support at all levels of government in order to create enabling conditions for their new problem-solving strategies; to ensure the continuity of their visions for the cities through mayoral changes; and to project new images of the cities.

By taking the perspectives from organizational theory, with a focus on how organizational strategies extend to the contexts in which they operate, the analysis contributes to more theoretically informed and contextualized understanding of drastic changes in place-oriented foundations' grantmaking for urban development. As planning scholars increasingly question the sustainability of the growth-oriented problem-solving strategies, future research that examines the role of planning and policy in integrating growth with equity in the work of place-oriented foundations is warranted.

SPEAKING OUT ON THE UNSPOKEN GAPS: CRITICAL PERSPECTIVES FROM SOCIALLY ENGAGED ARTISTS IN SEOUL'S JUST CITY AGENDAS

Abstract ID: 1531

Individual Paper Submission

CHOO, Soyoon [University of Southern California] soyoonch@usc.edu, presenting author

Notably since the 2010s and especially since the 2016-17 Candlelight Protests, inclusivity (p'oyong), equity (kongjŏng), and social engagement for change became imprinted in South Korea's policy and public lexicon. Similar narratives and sentiments are also focal in the country's urban development and art sectors. This research focuses on artists primarily in Seoul, South Korea that exhibit socially engaged practices (Helguera, 2011) in what I call "just city agendas": a concerted action that aims to critically reflect the city's trajectories and the role of artists within, and thereby redefine what the procedural and outcome goals of urban planning should be. Seoul serves as an intriguing

research site where just city agendas with artists and cultural means are being sought at various grassroots and institutionalized levels, illustrating a valuable insight into a “creative just city” – where creative practices and value systems intersect with just city values and policies for inclusive growth. To overcome the common, past approaches of lumping artists into an abstract, broad category and bestowing them with certain characteristics and abilities, I focus on the artists’ themselves and their experiences as a key analytical context for policy implication. The research purpose is to both advance the critical perspectives and critiques of the established Creative City and Just City models (McLean, 2014) and further provide a historicized and nuanced understanding of South Korea’s ‘growth pains’ as a developed country striving to transition into a “just society (kongjŏng sahoe)” (Choo & Currid-Halkett, 2020).

Participant-observation and in-depth interviews from 2019 (and into the COVID-19 pandemic) are at the core of this research. The primary interviewees are artists working/that have worked in place-based, socially engaged projects under the following environment(s): (1) as commissioned artists and/or artists-in-residence at “urban regeneration (tosijaesaeng)” projects (implying a transition from top-down, demolition-based redevelopment to participatory, humane approaches) designated by the Seoul Metropolitan Government; (2) community organizations; and (3) grassroots “solidarity activism” or “activism” against urban injustice. Through the narrative arcs of the artists’ upbringing, personal and professional experiences, the process that guides/guided their socially engaged work, and perspectives on urban development and planning issues, I seek the following research questions: 1) how the artists define and view ‘creative just city’ values and themselves in their socially engaged work, and 2) the driving factors to be socially engaged with urban and community issues in their work, and to be involved in just city agenda(s) as a stakeholder.

As a theory and theme-driven research, the employed methods helped in studying existing inquiries behind creative cities and just cities, producing grounded theory where new cases and concepts are found (Brown-Saracino, 2009). This paper deals with the findings emerged from the woes, ambivalent positionality, and learning curves from the artists in carrying out socially engaged projects, working with government (systems) and community/interest groups. Specifically, the ‘unspoken gap’ revealed by female, younger, and/or ‘novice’ artists show how much gender, age/seniority, and lived/work experience account for the precarity and adversity in carrying out projects, the difficulty in creating and sustaining momentum for change, and even influencing one’s perception and expectation about achieving a just and equitable city. Such aspects indicate the country’s exacerbating gender and generational gap issues and the countereffect of stakeholder ‘lumping,’ demonstrating the need to have these voices heard for creative just city agendas to actualize into longer-term, comprehensive change. I anticipate these findings will contribute to the discussions on building more equitable and sustainable bridges within and between the art and urban planning worlds, advancing the humanist approaches in urban planning (Umemoto, 2017) and socially engaged art in creating safe and open environments for long-term inclusive processes and growth.

RESIDENTIAL ENVIRONMENT AND REFUGEES' INTEGRATION INTO THE LOCAL COMMUNITY: THE CASE OF NORTH KOREAN DEFECTORS IN SOUTH KOREA

Abstract ID: 1537

Individual Paper Submission

CHOI, Kounjung [Seoul National University] best8015@snu.ac.kr, presenting author
KIM, Nahyun [Seoul National University] gloria0614@snu.ac.kr, co-author
PARK, In Kwon [Seoul National University] parkik@snu.ac.kr, co-author

According to UNHCR statistics, the number of refugees worldwide has steadily increased in recent years, reaching 82.4 million at the end of 2020. Refugees are forced to migrate to other regions or countries to escape conflicts, political repression, and natural disasters, and they have to settle in a new location. The number of North Korean defectors who entered South Korea reached about 33,000, which is expected to continue to increase. However, problems of settlement and social integration have been raised due to North Korean defectors' maladjustment to

The issue of refugees' social integration is a local level matter because they face challenges in their daily lives on a local level (Daley, 2009). To adapt to the local community, refugees may build new communities or participate in existing communities through the process of acculturation as migrants. For cultural adaptation, migrants choose among several strategies, such as integration, assimilation, separation/segregation, and marginalization (Berry, 1997), and have different attitudes and consciousness toward the local community. Personal factors, such as age, gender, and previous experience, affect this choice (McMillan & Chavis, 1986), as do regional factors in both the original and host areas. In particular, the residential environment, including the physical environment and interactions between neighbors, can affect refugees' adaptation to the community (Bonaiuto et al., 1999). Therefore, it is necessary to study the process of adapting to local communities and forming local communities with natives, focusing on the residential areas that are the basis of settlement. From the perspective of urban planning, it is especially important to understand what residential environment factors affect the formation of local communities for refugees and to consider this for the residential environment plan.

This study aims to examine the process of integration of refugees into the local community using the case of North Korean defectors in South Korea and to analyze how the residential environment affects their cultural adaptation and sense of community. For these purposes, a survey and interviews with North Korean defectors in the Seoul Metropolitan Area will be conducted, and the data will be analyzed both quantitatively and qualitatively. The relationship is evaluated by constructing a model that includes a defector's sense of community as the dependent variable, personal characteristics, interactions with neighbors, and the physical environment as explanatory variables, and his/her adaptation strategy choice as a mediating variable.

The expected results of this study are as follows: First, North Korean defectors' sense of community will be affected by their satisfaction with their physical environment, such as housing, local amenities, and transportation, as well as their level of engagement and co-activities with their neighbors. Second, depending on the adaptation strategy, the local community's features in terms of building a community among North Korean defectors or with South Koreans, as well as the strength of the sense of community, will differ. Due to the peculiarities of North-South Korean relations, the majority of North Korean defectors will be under pressure to assimilate, while some may choose different strategies. These will mediate the relationship between the residential environment and the sense of community. Based on the findings of this study, we will discuss the implications for the residential environment and the activities required for refugees to successfully integrate into the local community.

HOW DOES SCHOOL CHOICE IMPACT COMMUNITY SOCIAL SUSTAINABILITY?

Abstract ID: 1564

Individual Paper Submission

CONROY, Maria [The Ohio State University] conroy.36@osu.edu, presenting author

Communities across the United States have adopted school choice programs which provide educational alternatives beyond the public neighborhood school. These alternatives are varied and ostensibly form a market-based system where schools compete for students, enhancing the quality of their services. While the educational merits of these programs are hotly debated, there have been few investigations into the impacts of such options (as distinct from school closures) on the social sustainability of surrounding neighborhoods. Makris (2018) presents a specific investigation of school choice and gentrification. The planning literature more broadly addresses schools as a destination in an urban design and/or in a transportation mode choice context. Good (2019) and others have considered the impact of school closures on community development and revitalization. Schools as a location for community gardens, and as a contributor to social capital more generally, have also been discussed in the literature. However, there has been little investigation into the question of how school choice systems affect measures of community social sustainability. Additionally, this research assesses the different bonding, bridging, and linking of social capital evidenced in communities with neighborhood schools/choice schools (Osborne et al. 2016). Finally, this study evaluates how schools shifted (or did not shift) their relationship with neighboring communities due to the

pandemic.

Social sustainability as an element of the broader sustainable development concept is considered by many to be the most nebulous of the three sustainability pillars. Even so, Shirazi and Keivani's (2017) meta-analysis of the social sustainability literature highlights a coalescing around seven defining principles among which are "social networking and interaction" and "livelihood and sense of place." These principles form the basis in this work for measuring social connectivity between schools and their surrounding neighborhood. Schools have held key positions in community engagement through athletics and arts performances, supporting a sense of place and providing opportunities for broad community interactions. These enhancements to social sustainability may provide lasting impacts with respect to school fundraising and levy support, as well as increased social capital supporting student achievement (Warren 2017). Additionally, heightened engagement and identity may increase broader sustainability efforts related to, for example, school-based community gardens benefiting the surrounding neighborhood.

This study uses the city of Columbus and its School District (CCS), the largest school district in Ohio, as the focus of inquiry. Columbus and CCS provide a somewhat unique opportunity to explore a variety of school choice alternatives. While traditional neighborhood schools remain in the CCS repertoire, the district also includes lottery admission (up to 100% of school enrollment) in traditional, alternative, and specialty schools. Lottery based schools, therefore, may have few if any students from the immediate surrounding community. Moreover, the state of Ohio has a school choice system where taxpayer-funded assistance means CCS students can attend private schools. There are twenty-one public and nine private high schools within the CCS district boundary.

This paper represents the first phase of a two-phase effort exploring the relationship of high schools within the CCS district boundary with their associated neighborhood. In this phase, community demographic, site visit, and survey data are used to measure the school's identity and connections with the surrounding community. A survey of the CCS high school principals assesses their sense of the role the school plays in the surrounding community. The second phase of the study will assess the community's identity and connections with the schools by focusing on neighborhood business support measures. Results of this work provide insight regarding how school choice influences social sustainability principles related to sense of place and social interactions, and suggest fundamental issues of communication and trust provide policy directions moving forward.

IDENTITIES OF DISPOSSESSION: IMMIGRANT POLITICAL SUBJECTIVITIES AT THE INTERSECTION OF DEPORTATION AND DISPLACEMENT

Abstract ID: 1671

Individual Paper Submission

HERNANDEZ, Ashley [University of California-Irvine] ashleyeh@uci.edu, presenting author

Immigrants with precarious legal status living in global cities are positioned at the intersection of two forces of dispossession: ethnonational deportation and displacement from gentrification. These twin forces structure the everyday lives of immigrants, shaping the ways they engage with the built environment and their activism. Immigrants adopt routines and countless tactics to avoid deportation, contend with rapacious landlords, and organize to protect their communities, while watching their cities underwrite amenities that are designed for gentrifiers. Studies have demonstrated that despite increasing inequality and hostility, immigrant communities have navigated gentrifying urban contexts (Dávila 2004; Pérez, 2004; Pérez et al., 2010) and have served as important contributors to urban social movements (Nicholls & Uitermark, 2016; Nicholls, 2019). Under these circumstances, activists forge

new frameworks and identities to make sense of the urban context and strategies of resistance to dispossession.

This paper uses the case of Boyle Heights – a neighborhood in Los Angeles, California – to assess how activists construct political identities within these spaces of dispossession. The working-class Latinx barrio of Boyle Heights has become a battleground whereby community groups with varying interests engage in multifront battles to stay in the city. Drawing from thirty extensive interviews and participant observations of first, second, and third generation Latinx activists organizing in different community-based groups, this paper demonstrates that activists adopt a political framework that allows them to tie these twin struggles to a rallying cry for the Latinx right to the city.

The paper shows that nearly all activists have constructed a political identity that fuses displacement and deportation into a single overriding threat. Gentrification, housing, detention, and deportations reflect particular instances of the general machine of dispossession. As one activist notes, “If you displace me from my hood, you might as well deport me.” Though the paper documents the formation of an “identity of dispossession” across diverse activists, it also suggests that this identity varies by activist networks. Activists associated with a progressive community development corporation, the East Los Angeles Community Corporation, conceive of dispossession as a threat but also believe that there are viable paths for upward community mobility within the capitalist city. The prospects of achieving the “American Dream” are narrow but possible with sufficient mobilizations and the right policy tools. In contrast, activists associated with the radical network, Defend Boyle Heights, view dispossession as a bulldozer intent on cleansing working class people of color from the city. They see themselves embedded within a life-or-death struggle with no path for inclusion or assimilation. The only path for radical organizers is revolution.

Examining diverse community-based strategies to fight gentrification offer important lessons as to how gentrification and displacement work in relationship to belonging, activism, and political representation in the built environment (Beltrán, 2010). These lessons have larger implications on the integration of marginalized voices in planning processes and civil society at large.

CLIMATE ADAPTATION PLANNING IN EAST BOSTON (MA, USA): MAKING AN ARGUMENT FOR COLLABORATIVE GOVERNANCE

Abstract ID: 1675

Individual Paper Submission

RACITI, Antonio [University of Massachusetts, Boston] antonio.raciti@umb.edu, presenting author
BELLOY, Patricio [University of Massachusetts, Boston] patricio.belloy001@umb.edu, co-author

East Boston (Boston, MA, USA) is a diverse, working-class, immigrant coastal community undergoing rapid gentrification while local environmental problems – such as air and noise pollution determined by the nearby Logan International Airport – continue to harm residents. Additionally, technical and scientific assessments warn that a large part of this community is at risk of being severely affected by climate change impacts such as sea-level rise, storm surges, and heatwaves, among other associated trends and events (City of Boston, 2016).

In East Boston, city-led planning efforts and climate resilience strategies have prioritized the preservation of socioeconomic systems perpetuating business as usual paths of urban development, aggravating overcrowded housing conditions and the displacement of long-time residents. Today, proposed interventions – including hard, soft, and hybrid strategies that integrate green and blue infrastructures – offer planners, developers, and local residents many opportunities to consider. However, these interventions also raise questions about whether plans for coastal protection interventions are sufficient to structure a comprehensive strategy that, while protecting vulnerable communities, will also improve their quality of life in the long term.

We conducted a year-long research process aimed at (1) exploring residents’ priorities, needs, and concerns, (2) generating a better understanding of how these fit (or not) in the current planning for resilience public agenda, and

(3) providing a roadmap to local residents and planners to frame planning for resilience through a justice lens. Our work in the field has led us to provide recommendations for East Boston's communities to achieve increased and meaningful participation, strategies to address the intersecting injustices, and a proposal for a more incremental evaluation of planning objectives. While these recommendations have the final goal to offer immediate responses to surfaced challenges, this research also sheds some light on the urgent need to overcome the rhetoric of public participation and rethink planning for resilience by shaping planning actions using principles of advocacy and pluralism (Davidoff, 1965).

By drawing from literature on climate justice (Henrique & Tschakert, 2020), this paper critically reflects on the East Boston case and shows how climate adaptation stakeholders' power asymmetries are fueled by planning approaches rooted in modernist paradigms. The paper argues that planning for adaptation has to go beyond the production of resilient plans and generate new social spaces to nurture innovative forms of collaborative planning and governance (Healey, 1997; Innes et al., 2010) that can challenge the status quo if just processes and outcomes are desired.

GENTRIFICATION-INDUCED DISPLACEMENT IN COLUMBUS, OHIO

Abstract ID: 1704

Individual Paper Submission

KHALEEL, Sahar [Ohio State University] khaleel.3@osu.edu, presenting author

HANLON, Bernadette [The Ohio State University] hanlon.42@osu.edu, primary author

This study explores the impact of gentrification in the city on the displacement of low-income populations, focusing on Columbus, Ohio as a case study. Research suggests that gentrification-induced displacement results in higher levels of suburban poverty (Ehrenhalt, 2012, Hochstenbach & Musterd., 2021), stronger poverty concentration in affordable parts of the city (Wyly and Hammell, 1999), and a decline in social mixing and increased spatial polarization (Newman and Wyly, 2006; Walks & Maaranen, 2008). A study across eight cities in Ohio found that for every one neighborhood that turned around (i.e. high poverty in 1980 and became low poverty by 2018), fifteen neighborhoods in the city went in the opposite direction to become newly poor (Segedy, 2020). In this study, we ask the following broad research questions: Are low-income populations in gentrifying neighborhoods in Columbus more likely to move out as a result of the gentrification process? and what kinds of neighborhoods do displaced low-income populations move to? To answer these questions, we utilize data from DataAxel, formerly InfoGroup's U.S. Consumer Database for years from 2007 to 2017. Using linear regression fixed effects modeling, we identify the relationship between gentrification, urban poverty, and suburban poverty in Franklin County, the county where the city of Columbus is located. We find that gentrification results in the movement of low-income populations to both city and suburban neighborhoods, increasing poverty in these neighborhoods. The effect is stronger for urban neighborhood poverty increases. Further, our results indicate that low-income families with children moving from gentrifying neighborhoods are more likely to move to suburban neighborhoods.

UNDERSTANDING THE SCHOOL-TO-PRISON PIPELINE: EVIDENCE FROM THE ADD HEALTH NATIONAL LONGITUDINAL STUDY

Abstract ID: 1746

Individual Paper Submission

YUN, Jinhee [Cleveland State University] jhyun321@gmail.com, presenting author
MALLET, Christopher [Cleveland State University] c.a.mallett@csuohio.edu, co-author
QUINN, Linda [Cleveland State University] L.QUINN@csuohio.edu, co-author
TEDOR, Miyuki [Cleveland State University] M.FUKUSHIMA@csuohio.edu, co-author

Over the past twenty years, the phrase “school-to-prison pipeline” has become ubiquitously connected to those students at risk of becoming involved with the justice systems because of school difficulties, discipline, or removal. The “pipeline,” though, is often only part of the explanation as the at-risk young people tend to experience challenges across other areas, including the family, peers, and neighborhoods. Because of the confounding of risk factors, there remain some critical empirical questions regarding this pipeline. First, how does the pipeline function for many students? Second, how are these pathways developed or followed for many young people? It is crucial to understand how this pipeline works for young people most at risk to provide earlier and appropriate interventions to divert from juvenile and criminal justice system involvement. Because of multivariate empirical challenges, the starting point may be the identification of multiple school pathways toward the justice systems (and, for some, incarceration) for different groups of students.

Difficulties at home, in neighborhoods, and at school place many young people at an elevated risk for following a pathway to the justice systems. Indeed, hundreds of thousands of middle and high school students nationwide are at significant risk for delinquency adjudication, juvenile court supervision, and incarceration. Their problems often begin, or more commonly, are exacerbated by school discipline and exclusion protocols. Moreover, these experiences disproportionately impact certain young people including those of color and those who identify as LGBTQ.

Using longitudinal Add Health data collected among a nationally representative sample of youth in the U.S. (n=6,259), the present study examines pathways to adult incarceration through school discipline protocols and dropout across race, biological sex, and sexual orientation. Two major risk factors were examined: family-level risk factors include traumas resulting from maltreatment, family suicide, homelessness, witnessing violence, and parental incarceration; and neighborhood-level risk factors include measures of social disorganization such as racial/ethnic heterogeneity, a low level of homeownership, a high unemployment level, a low household education level, and a high poverty level.

First, the study examined the pathways from family-based trauma and neighborhood social disorganization through school discipline outcomes to adult incarceration; and second, looked at disparities in outcomes or differentiating pathways based on race/ethnicity, biological sex, or sexual orientation. There were two major findings. First, while the experience of childhood trauma both directly and indirectly increased the risk of adulthood incarceration, growing up in a socially disorganized neighborhood only indirectly increased the risk of adulthood incarceration through its increased risk of school suspension. Second, as expected, there was significant race/ethnicity inequality in socioeconomic status, as measured by the experience of receiving public assistance/welfare before age 18.

Understanding how the school-to-prison pipeline involves young people and leads to nefarious outcomes is difficult because of the multitude of risk factors and impacts over time. This study expanded upon other recent research by including known important explanatory variables as well as looking at the (indirect) impact of neighborhood social disorganization and family trauma. Future research should continue to investigate the impact of early family experiences, traumas, and related problems that place young people at greater risk for school exclusion and subsequently justice systems involvement. Because investigations continue to find significant race/ethnicity and gender disparities across trauma experiences, these are important to further understand; as well as the increasing recognition of the over-involvement of young people who identify as LGBTQ+ in the pipeline.

MAKING SPACE FOR AN ALTERNATIVE TO AUSTERITY IN SHRINKING CITIES: A STORY OF ADVOCACY FOR LAND BANKING POLICY IN INDIANA FROM 2020 - 2022

Abstract ID: 1760

Individual Paper Submission

WEST, John [Ball State University] jhwest@bsu.edu, presenting author

This paper provides a narrative summary of efforts to establish new legislative and contractual arrangements in support of a land bank in Muncie, Indiana, from 2020 through 2022. Focusing on a campaign to persuade city, county and state officials to amend existing law, the author examines building public capacity in the context of 'organized deprivation' (Hackworth 2019, p.12 - 27). Organized deprivation describes self-reinforcing austerity policies enacted by state and local units of government in shrinking Midwestern cities. This theory posits that racialized perceptions of cities, conservative ideology and physical decline become the justification for austerity and limits to local control. Hackworth's intervention is part of a growing political economy critique of governance and planning in shrinking mid-western cities that examines how places with population decline become sites of innovative governance strategies to support private accumulation (Akers 2013, Berglund 2020). These authors help make sense of why planning and policy initiatives to address the issue of property abandonment have been unevenly implemented in the wake of the 2008 financial crisis (Heins and Abdelazim 2014, Mallach 2006). From three years of advocacy for changes to laws enabling land banking practice, the author finds organized deprivation to be a useful heuristic for understanding the political economy of his site of practice. However, the author also describes strategies and tactics for seeking to preserve and expand the space for an alternative to austerity. While the political economy critique of the dynamics of urban decline accurately describes conditions, far too little is known or written about the practice of collaborative urban planning in declining cities, with some notable exceptions (Dewar and Linn 2015). Through first-hand accounts, interviews and descriptive data, this paper shows both the realities and possibilities of planning efforts in shrinking cities.

TRAN, Cuong [University of Hawaii at Manoa] cuongt@hawaii.edu, co-author

The threat of natural disasters will become more frequent and destructive as climate change intensifies in the upcoming decades (Pachauri et al., 2014). Disasters result in loss of life, economic instability, environmental damages, and the disruption of daily activities. As climate change induces more disasters, Hawai'i's remote geographical location makes the transport of emergency supplies from the continental United States difficult, unpredictable, and time-consuming, which calls for a better understanding and strengthening of community self-sufficiency and resilience.

While there is rich literature defining and exploring community resilience (e.g., Freitag et al., 2014; Cutter et al., 2016; Yu and Berke, 2021), there is a lack of understanding of how community assets contribute to different aspects of community resilience. This study seeks to address this gap by utilizing a community asset-based approach (Green and Haines, 2015) to identify and rank different types of community assets in promoting community resilience. Based on community surveys distributed in both urban and rural communities on O'ahu, Hawai'i, this study seeks to

understand how different types of community assets (i.e., physical, human, and social assets) contribute to four key community resilience elements (i.e., community networks and relationships, teamwork and leadership, information and communication, and training and education) in both urban and rural communities. Two-way analysis of variance (ANOVA) tests and post hoc Tukey HSD tests were performed to analyze the quantitative data from roughly 300 survey responses and compare the relative importance between different types of assets and the differences between urban and rural communities.

The findings show significant differences in the perceived importance of community assets between urban and rural communities. In general, residents in rural communities rank the importance of physical, human, and social assets for all four community resilience elements significantly higher than residents in urban areas. It is also interesting to find that compared to urban residents, rural residents consider physical assets (e.g., education facilities, medical facilities and clinics, and government and non-government buildings) much more important than human and social assets. The findings demonstrate that rural communities may have a lack of critical physical assets compared to urban communities in adapting to projected climate-related hazards and need more critical physical assets such as medical facilities. On the other hand, the urban residents seem to have fewer community connections and communications compared to rural residents and need to strengthen human assets (e.g., residents with extensive knowledge of the community, knowledgeable in farming and gardening, and knowledgeable in Native Hawaiian practices) and social assets (e.g., close connections with a community-based organization, frequently gather and share information to other households, or provide physical and emotional support to other households in times of need).

Investigating the relationship between community assets and community resilience could provide insight for state and local municipalities in developing future resilience projects that mobilize these community assets. Community-based and community-led projects like Community Resilience Hubs, which have grown in popularity, should be customized to function accordingly to fill the gaps in communities' existing assets.

COMMUNITY REINVESTMENT PLANNING: LEARNING FROM NEIGHBORHOOD STAKEHOLDER EXPERIENCES

Abstract ID: 1803

Individual Paper Submission

BORN, Andrew [University of Illinois Chicago] aborn2@uic.edu, presenting author

This paper examines neighborhood stakeholder experiences of participating in community reinvestment planning in one Chicago neighborhood. I refer to community reinvestment planning as the activities, interactions, and processes that are carried out with the intention of channeling the investments of financial institutions into underdeveloped urban neighborhoods. Community reinvestment planning practices emerged from the community reinvestment movement in U.S. cities during the 1970s (Squires, 1992). Further, they involve a diverse array of approaches, including agitational forms of community organizing, where community groups pressure financial institutions into negotiating an investment plan, and more collaborative approaches, where financial institutions voluntarily partner with community groups to plan targeted investments (Schwartz, 1998). While there are numerous cases that document the former approach (see Immergluck, 2015; Squires, 1992; 2011), we still know very little about the latter. This study is specifically interested in examining community reinvestment planning that is initiated and steered by financial institutions. It specifically examines the experiences of neighborhood stakeholders that participate in planning activities to ask two inter-related research questions: 1) what practices do different neighborhood stakeholders engage in to influence participatory community reinvestment planning processes? And 2) how do experiences with participatory community reinvestment planning processes influence the attitudes and perspectives of neighborhood stakeholders towards the financial institutions that initiate them?

In order to answer these questions, I interrogate the experiences of neighborhood stakeholders that have participated in community reinvestment planning for a predominantly African-American Chicago neighborhood that has struggled to fight financial disinvestment since the 1960s. They not only include long-term business owners, residents, and leaders of neighborhood-based non-profit organizations, but also the staff of financial intermediaries and foundations, consultants, and other individuals who have a vested interest in neighborhood reinvestment. Rather than investigating their experience with one case of reinvestment planning, my study examines their historic and contemporary experience as participants in these initiatives. I draw heavily from interviews of neighborhood stakeholders in order to understand their experiences and perspectives. I also supplement my interview data with participant observation and historical documents.

My preliminary analysis suggests the following findings. First, neighborhood stakeholders that participate in bank-led community reinvestment planning employ a variety of tactics to influence the ultimate plan for reinvestment. These range from attempts to structure the overall planning process through proposal writing, presentations, meeting facilitation, as well as tactics that can either facilitate or impeded the planning process. Intersectional identities, which importantly include affiliations with community-based organizations, positions within those organizations, and relational connections to the neighborhood, play an important role in the tactics that neighborhood stakeholders employ. Second, neighborhood stakeholder participation in community reinvestment planning transforms views of financial institutions from potential and needed financial investors to philanthropic sponsors of community-based non-profits. That is, planning processes often result in partnerships between banks and community-based organizations, as well as charitable donations to the non-profits that neighborhood stakeholders are affiliated with. These findings suggest that community reinvestment planning has helped large banks extend their power and influence into the very geographies that they continue to exploit. Neighborhood stakeholders who are interested in equity, must employ existing, and develop new, subversive practices to disrupt this power relation.

SEEKING SOCIALLY JUST CITIES IN SOUTHERN CALIFORNIA: COMMUNITY-BASED STRUGGLES IN THE CITY PLANNING PROCESS

Abstract ID: 1806

Individual Paper Submission

BARAN, Ian [University of California Irvine] ibaran@uci.edu, presenting author

The utilization of the planning process in order to support marginalized communities has been a contested issue in both planning activism and planning theory (Arnstein, 1969; Mirafitab, 2009). There is a continuum which forms, in which on one end, planning reinscribes the dominant (racial) capitalist mode of production (Harvey, 2008), and on the other end, is a faith in the planning process as a site of equitable decision-making through community participation (Davidoff, 1969). Within this continuum are “pragmatic,” pluralist, and communicative theories in which the planner is the representative of a community and/or the medium through which honest communication takes place, and a narrow focus on participation in the planning process (Forester, 1982). The planning process becomes a battle of arguments between interested stakeholders or a space of small reforms, rather than one which understands, and takes seriously, state power and structural constraints. Additionally, progressive planning theories tend focus on the final outcome of the process, which, I will argue, limits our analyses, and can easily be trapped in binary thinking, such as Not In My Backyard vs Yes In My Backyard thinking, or reformism. While not undermining the potential importance of planning outcomes, a focus on outcomes limits our understanding of the importance of actions throughout the entire planning process to achieve other ends (Gilmore, 2008). Further, many progressive planning theories tend to overemphasize or take for granted (potential) progressive tendencies within planning.

Planning theories and on-the-ground actors are limited in their conceptualization of who the community is, how community-based organizations should engage the planning process, and how planners can support community-based organizations, without reinscribing racial capitalist legitimacy. We are left lacking an understanding of why and how communities utilize the planning process towards socially just ends, as well as in what specific ways do they

negotiate against state power and reformism.

In order to examine both the structural constraints and importance of the planning process for community-based organizations, I analyze two cases of community-based organizing in Southern California. The first case examines a community-based coalition that mobilized against a jail construction plan in Los Angeles. This fight built on 15 years of struggle against jail expansion in Los Angeles, in which the planning process was utilized at all stages. I focus specifically on organizing around the Environmental Impact Report because it best exemplifies a key planning tool that was utilized in this struggle. The second case study examines a community-based organization which has been challenging a General Plan update in Santa Ana. This organization acts both independently and in coalition, and seeks to challenge the city's General Plan update process due to the lack of community input and Environmental Justice language. Instead of focusing on one aspect, I will show how these organizations utilize the entire planning process towards organizing ends, while I highlight how they delayed the vote in order to influence the plan. These two cases highlight overlapping yet different practices, which illuminate the planning process for community-based organizations and coalitions seeking social justice.

This paper makes contributions to the planning literatures by showing how residents and community-based organization engage the planning process and highlights the specifics of how they struggle within the realm of planning. Additionally, I argue, that progressive planning theories need to better understand community-led development strategies, in order to support marginalized communities, while not legitimating the planning process as a site of equitable outcomes. In understanding the limitations and possibilities of the planning process through these two cases, I aim to further our ability to support communities in their analysis and struggle for the right to the city.

SOCIAL CAPITAL AS A FACTOR SHAPING THE URBAN RENEWAL PROCESS: THE CASE OF KIRSEHIR BAGBASI NEIGHBORHOOD

Abstract ID: 1814

Individual Paper Submission

EZME GÜRLEK, Albeniz Tuğçe [Kirsehir Ahi Evran University] albenizezme@yahoo.com, presenting author

Urban renewal has become an essential tool of neo-liberal urban policies implemented after 2000 in developing countries. When the urban renewal processes experiences of the developing world are examined, it is seen that very similar renewal practices are repeated in many geographies from Latin America to Turkey. However, each landscape hosts different processes according to society's socio-political characteristics and cultural structure. Despite similar practices by central and local policymakers, each city confronts us with varying renewal processes. What is the dynamic in the social structure that creates these different renewal processes, despite the central government's effort to homogenize urban areas and the local governments' goal of modernizing run-down neighbourhoods, which is repeated almost everywhere in Turkey? This study, built on this question, argues that the existing social capital in transformation areas is one of the most critical elements that shape the urban renewal process. And the study demonstrates this argument with the fieldwork carried out in the Kirsehir Bagbasi Urban Renewal Project implemented between 2011 and 2021.

Kirsehir is a small city known as a representative of the Abdals in Turkey. The term 'Abdal' refers to a unique ethnicity and the local folk musicians in Kirsehir, and the Bagbasi neighbourhood has been a home for them for years. Because the Abdals live there, Bagbasi has always been famous in Kirsehir and Turkey's broader Central Anatolian region. Despite the cultural value of this unique community, the Abdals have been a disadvantaged group socio-economically. As a result, they have been especially vulnerable to an urban renewal process implemented by the municipality. In 2011, the municipality initiated the renewal project. The community is neither consulted and informed, nor able to provide their input to the renewal plan due to the socioeconomic and educational levels. Today, thanks to the national

development goals, the Abdals, like other disadvantaged groups, confront serious risks, chief among them displacement. Due to a decision made without their contribution, the Abdals suffer the worst possible outcome of the process. While some Abdal families were displaced, some of them were settled in the new apartments built by the Housing Development Administration of Turkey (TOKI), and some others had to vacate the neighbourhood since they were tenants. Most of the Abdal families still live in their own homes in the area not included in the urban renewal area. But the neighbourhood's new environment and its changing socioeconomic profile do not support this unique culture, just as the apartment life proved to be unsuited for the lifestyle of Abdals who moved into TOKI blocks. The renewal causes many Abdal families to desert the neighbourhood by moving to houses in other districts where they can live with their cultural rituals.

The case study is structured on fieldwork conducted in two qualitative methods: participant observation and open-ended interviews. I have taken the opportunity to observe the renewal process first-hand for years, and I did open-ended interviews with twenty residents of Abdals, three municipal officials, and three local actors since 2018. This data collection process permits understanding the process from those who implemented it, who observed it, and those affected.

The findings show that the shaping of social capital, is one of the most critical determinants of an urban renewal process: the city scale where the project is implemented, the place of the renewal area in the social memory of that city, the trust and solidarity relations established by the residents of the renewal area within their community; their social networks based with the residents of the city, the local actors, the municipality and the state are also determinative.

PRESERVATION ECOLOGY FOR INDIGENOUS LEARNING

Abstract ID: 1828

Individual Paper Submission

STEVENSON, Dylan [Cornell University] dms547@cornell.edu, presenting author

Land is intrinsically embedded with the cultural heritage of Indigenous peoples despite the substantial alteration, transformation, and destruction of the landscape(s). Many scholars have noted that planning, especially as a government activity, is nestled within an epistemology that allows for the reproduction of norms and values that support the settler-colonial project at the expense of Indigenous lifeways (Natcher et al., 2013; Porter, 2010, 2016). There has been growing interest in the planner's role for more inclusive practice which, at times, involves including indigenous groups to a pre-established planning process and/or project. While this certainly includes indigenous perspectives into planning, it ultimately falls short of advancing indigenous sovereignty by not defining said planning activities on Indigenous terms and continues the cycle of upholding settler-colonial ideals.

In her work, Leanne Simpson is rightfully critical of the settler-colonial project (through which mainstream planning serves) and the role of the academy in dispossessing indigenous people of their land and knowledge systems under the banner of inclusivity. Further, she calls for indigenous people to look to the land as pedagogy where indigenous people can become enmeshed in their traditional knowledge systems, learn within their community, and learn how to be on the land (Simpson, 2014). Doing so challenges the reiteration of settler colonialism and allows for indigenous resurgence. This begs the question: If there is a role for planning to support Indigenous resurgence, what does it look and how does function?

This paper looks to historic preservation as a potential avenue for which planners can support indigenous resurgence. I approach historic preservation as a means to care for the legacy of cultural heritage to include both physical materials and intangible cultural practices such spirituality, patterns of thinking, and values (Tomlan, 2015). Using case studies at the intersection of historic preservation and environmental stewardship in the United States, this paper develops a framework that planners, preservationists, and Indigenous nations can refer to in meaningful

collaborations to help guide restorative practices that help enable the opportunity for Indigenous education through land pedagogy. In other words, this framework sets out to center the primacy of land in Indigenous resurgence by looking at ecological systems through a preservationist lens and contribute towards developing strategies where concepts like preservation, rehabilitation, restoration, and reconstruction, fundamentally serve Indigenous sovereignty. The paper contributes to ongoing conversations surrounding the interpretation of sacred landscapes, the limitations of the Secretary of the Interior standards, and the protection of indigenous landscapes from predatory development practices.

Uneven development between neighborhoods and retrenchment of the public sphere under neoliberal capitalism has led to increasingly poor outcomes for low-income and communities of color. Scholars claim that local government retrenchment has produced a larger role for the private sphere in service provision and community development, but the philanthropic sector has likewise filled many of these gaps in funding and governance. Since at least the 1990s, one response to the ills of neoliberal development and governance has been Comprehensive Community Initiatives (CCIs). CCIs are place-based, systemic interventions in low-income neighborhoods often led by philanthropic foundations collaborating with a variety of public and private stakeholders. While CCIs have been praised by foundation leadership as an avenue for creation of neighborhood stability in low-income neighborhoods, the academic literature is far less optimistic about the prospects of these initiatives in stabilizing neighborhoods (Martinez-Cosio & Rabinowitz Bussell, 2013; Pill, 2019). Most examinations of CCIs have utilized theory of change evaluations to determine foundation best practices; however, this type of evaluation provides no sense of how CCIs contribute to neighborhood change or stability. Thus, this paper asks the question: does the presence of a CCI in a neighborhood affect positive outcomes in terms of neighborhood stability?

To contribute to the scant literature on the efficacy of CCIs in stabilizing neighborhoods, this paper uses measures of residential and economic stability taken from the literatures on neighborhood stability and displacement to examine the outcomes of a CCI strategy, Purpose Built Communities. Purpose Built Communities was founded in 2009 by Tom Cousins, Warren Buffett, and Julian Robertson to replicate Cousin's community development work in the Atlanta neighborhoods of East Lake and Kirkwood. The strategy transforms neighborhoods by providing mixed-income housing, as well as education and community wellness programs, and has since been enacted in twenty-four cities throughout the Midwestern, Southern, and Northeastern United States by twenty-seven foundations. We use American Community Survey (ACS), Department of Housing and Urban Development (HUD), and county level tax appraiser data and quasi-experimental methods to examine this CCI strategy. While other studies have used quasi-experimental methods to examine single site CCIs (Rosenblatt & DeLuca, 2017; Theodos, 2022), this study provides the first multi-site quantitative examination of CCI efficacy in producing stable neighborhoods. Unlike previous quantitative studies of CCIs, this paper establishes counterfactuals at the county level instead of the city level as neighborhood change should be understood in comparison to regional changes. Likewise, we use measures of low-income neighborhood stability such as lack of in-mover exclusion, growth of affordable housing stock, and stability of low-income households (e.g. lack of evictions, foreclosures, and condo conversions) instead of milestones of middle-class attainment such as rising incomes and homeownership.

This study will contribute to the budding literature on CCI effectiveness in neighborhood stabilization. Understanding the outcomes of these programs that alter the built environment is important as massive amounts of money are being put toward these initiatives in United States cities. A recent study of only thirty cities found that foundations contributed at least half a billion dollars to community development (Thomson, 2021). Previous examinations of CCIs in San Diego and Atlanta found little positive change in neighborhood outcomes (Rosenblatt & DeLuca, 2017; Theodos, 2022). This raises concerns about the accountability of CCIs to communities (Martinez-Cosio & Rabinowitz Bussell, 2013), as well as local planners and municipal officials that assume foundations are producing neighborhood stability. Thus, this study could help communities, planners, and other public officials understand the work of CCIs and possibly help CCI practitioners reconsider their strategies. The study likewise contributes to the literature on neighborhood stability by highlighting the importance of the philanthropic sector in community development.

AGING IN A CHANGING PLACE: THE ADAPTATION OF SOCIAL SERVICES FOR OLDER ADULTS OF COLOR AMID GENTRIFICATION

Abstract ID: 1884

Individual Paper Submission

DELGADO, Laura [Trinity College] laura.delgado@trincoll.edu, presenting author

The majority of older adults prefer to age in place, but that can become more difficult when the places around them change. Older adults can experience displacement pressure through rising housing costs that occur with gentrification, and those who manage to remain can experience cultural and political displacement. This is especially true for older adults of color. Through changes in institutional and public spaces, older adults can come to feel that the neighborhoods they have called home for decades are no longer welcoming of them. This is particularly concerning when one considers that older adults tend to be more geographically restricted to their immediate neighborhoods than younger populations.

This research asks how one type of local institution, the social service agency, serves the needs of older adults of color while also navigating the evolving needs and demands of a changing local community. Using a social service agency in a gentrifying neighborhood of Boston, Massachusetts, as a case study, I address the following questions: what challenges do social service agencies face in targeting services to older adults when the neighborhood in which they are located gentrifies? What types of social, political, and economic pressures, if any, do social service agencies experience in gentrifying neighborhoods, and how do they react or adapt to these pressures? What are the implications of these reactions or adaptations for older adults of color aging in place? The findings reveal that social service agencies located in gentrifying neighborhoods must navigate a variety of pressures that come from new residents, longtime residents, the real estate market, local government, and funders. These lead to changes in mission, services, and target population, as well as physical displacement. This research builds on scholarship about gentrification and its impact on older adults, populations of color, and community-based organizations.

PERCEPTIONS OF CLIMATE ADAPTATION AND RESILIENCE IN THE COMMUNITY DEVELOPMENT FIELD

Abstract ID: 1886

Individual Paper Submission

MATTIUZZI, Elizabeth [Federal Reserve Bank of San Francisco] elizabeth.mattiuZZi@sf.frb.org, presenting author

Major wildfires, heat waves, and drought conditions in the western United States have made headlines over the past few years. Climate change exacerbates the frequency and severity of these shocks and stresses, which disproportionately impact low- and moderate-income (LMI) communities and communities of color. The community development (CD) field helps address poverty through various approaches to promoting racial and economic equity (Rios et al. 2021). Yet climate adaptation and resilience are relatively new topics for many CD organizations and practitioners. CD organizations work across many sectors that influence the built environment, social services, and wealth building for LMI communities and communities of color. Whether focusing directly on climate issues or on other CD topics, their work affects prospects for "transformative" climate adaptation and resilience, i.e., measures that improve people's lives (Berke and Stevens 2016, Shi and Moser 2021). However, the majority of CD organizations' missions are not explicitly related to climate adaptation and resilience. While adaptation and resilience have risen on the agenda of planners and other local practitioners, social equity is not always well integrated into this work (Meerow, Pajouhesh and Miller 2019). How do community development practitioners perceive the risks associated with climate change for the communities they serve and what capacity (Glickman and Servon 2003) do they have to respond to impacts on their work and their communities? What do CD professionals think the obstacles and opportunities are for adaptation and resilience work in the different geographies they serve? A survey of CD professionals conducted June–August 2021 in the western US provides a starting point for understanding these questions. Focus groups with professionals in three CD subsectors—affordable housing, community development finance, and workforce development—provide additional insights into the obstacles, opportunities, and partnerships currently present in CD climate adaptation and resilience work. Roughly a dozen in-depth interviews with survey respondents provide additional insights into how CD practitioners in different geographies and subsectors perceive climate adaptation and resilience issues in relation to their organizational capacity and communities they serve.

IT'S ACCRUAL WORLD: HOW PERCEIVED CHICAGO CDFI CREDIT RISK DRIVES UP THE COST OF COMMUNITY DEVELOPMENT CAPITAL

Abstract ID: 1906

Individual Paper Submission

PROCHASKA, Natalie [University of Illinois at Urbana-Champaign] prochask@illinois.edu, presenting author

A massive gap exists between what community development financial institutions (CDFIs) do and what the larger community development industry imagines they do. What unites CDFIs is the centrality of improving economic conditions for low-income communities through the increased flow of capital (Caplan, 2014). Contrary to conventional understanding, CDFIs do not universally provide below market rate financing to community borrowers. This research lays out a framework for understanding why this is the case.

CDFIs have evolved since the mid-1990s into vital intermediaries between finance capital and community development actors. But they are an understudied link between capital markets and communities, despite having an outsized impact on the available development financing in low- and moderate-income (LMI) communities (Benjamin, Rubin, & Zielenbach, 2004; Rubin, Caskey, Dickstein, & Zielenbach, 2008; Swack, Hangen, & Northrup, 2014). Although CDFIs play an outsized role in community and economic development financing, there are no studies documenting the details of their lending processes and how internal credit decisions are made. No one has documented how community development loan funds (one type of CDFI), provide multifamily real estate financing. Across existing literature, less is known about how CDLFs work from the inside.

This research is a qualitative explanatory parallel case study of a single type of CDFI – loan funds – used as a lens through which to assess financial investment risk calculations in Chicago. I identify how credit pricing choices are made within and between financial organizations by focusing on who makes risk pricing choices and what those choice-makers consider. Contemporary multifamily housing development finance results in uneven investments in local housing markets (Layser, 2019). Rather than looking at housing unit production and rehab “on the ground,” I focus on understanding how “upstream” activity within CDLFs, risk rating agencies, and other sources of capital shapes credit availability for investments in Chicago’s small and medium sized (SMMF) housing stock (Garboden, 2021). I ask the question: Why do CDLFs provide above market cost capital to community borrowers? To answer this question, I draw heavily on participant observation from working as an underwriter for the Federal Home Loan Bank of Chicago for five months in 2020. I combine that participant observation with qualitative interview data from 72 interviews (32 formal under IRB, 40 off-record conversations) between 2019-2021, including risk analysts across the FHLBC, rating analysts from S&P, AERIS and Moody’s, and financial managers from each of my three Chicago case CDLFs.

I find that one of the primary problems driving higher borrower cost is the mismatch between loan fund investors’ assessments of risk (what I call ‘perceived’ risk) and actual loss risk in lending (what I call ‘real’ risk) stemming from a lack of CDLF data transparency. I find that investors’ perceived risk of CDLF lending is the result of three primary things endemic to unregulated financial firms: (1) existing publicly available data are insufficient for rigorous outside assessment; (2) informational opacity drives higher investor risk ratings; (3) relying on proxy tools like ratings for risk analysis is fraught with conflicting goals and methods that do not always serve CDLFs well and can raise their organizational cost of capital. Higher institutional costs of capital for CDLFs mean higher costs for their community borrowers.

My research fills gaps in extant CDFI literature by delving into the weeds of CDLFs to illustrate the real limitations placed on what they can do resulting from structural constraints imposed by financial ratings. In doing so, my research challenges conventional ideas about how finance in LMI communities works and encourages a deeper understanding of what is needed to support and expand this industry without losing its original community mission.

PUBLIC CONTACT AND NEIGHBORHOOD SOCIAL COHESION IN BEIJING, CHINA: AN EMPIRICAL STUDY COMBINING MOBILE PHONE DATA WITH QUESTIONNAIRE SURVEY DATA

Abstract ID: 1912

Individual Paper Submission

WANG, Xiaomeng [Tsinghua University] wangxm18@mails.tsinghua.edu.cn, presenting author

A long-standing view in planning practices has been that urban public spaces play an instrumental role in promoting social cohesion by facilitating social interactions across social groups. Public contact, in which people engage in neighborhood-scale public spaces during day-to-day routines, is the origin of familiarity and thereby more cohesive urban society (Curley, 2010; Jacobs, 1961). However, most existing studies have relied on questionnaire surveys to understand neighborhood social interaction and its effects on cohesion (Williams & Hipp, 2019). Yet this method only captures interactions with familiar neighbors rather than the full spectrum of public contact often with strangers, making empirical tests of the theory difficult. Recent studies (Browning et al., 2017) have sought to capture public contact through social network analysis of routine activity spaces derived from activity surveys.

This study extends this emerging literature to examine the effects of neighborhood-level public contact potential on neighborhood social cohesion in a rapidly urbanizing context of Beijing, China. With the economic reform and social transformation, Chinese cities have experienced declined neighborhood social cohesion since the 1980s (Forrest & Yip, 2007). Using anonymized mobile phone geolocated data over the month of June 2017 by China Unicom, we constructed an actor-location network of routine activity locations of permanent residents for each neighborhood in urban Beijing, which allowed us to generate neighborhood-level indicators of public contact potential. We link this data to a questionnaire survey of 1,260 residents in 36 neighborhoods conducted in April–May, 2017. We adopt multi-level regression models to test whether residents are more likely to possess a higher level of neighborhood social cohesion if living in a neighborhood with higher extensity of public contact potential (i.e. a higher share of residents in the neighborhood potentially making public contact), and with higher intensity of public contact potential (i.e. a greater share of residents potentially making contact in multiple public spaces).

This research contributes to both the scholarly understanding of the social cohesion implications of public spaces, as well as the emerging literature on neighborhood social cohesion in Chinese cities. By focusing on everyday-life contact in public space, this research offers practical implications for planning urban public spaces toward a cohesive urban society.

WHO IS “THE COMMUNITY” IN COMMUNITY BENEFITS AGREEMENTS? – POWER, EMPOWERMENT, AND DISEMPOWERMENT IN A SUCCESSFUL CAMPAIGN

Abstract ID: 1942

Individual Paper Submission

GOLDMAN, Laurie [Tufts University] laurie.goldman@tufts.edu, presenting author

Community benefits agreements (CBAs) are gaining in popularity as a tool for ensuring that transit-oriented and other large-scale development projects yield lasting benefits for residents and small business owners who are vulnerable to displacement. These binding contracts between private sector developers and community groups can result in affordable housing, job opportunities, small business supports, green and open space, sustainable building, and other benefits (e.g., Baxamusa 2008; Saito and Truong 2015). Moreover, they have mobilized broad coalitions around a common anti-displacement agenda (Belongie and Silverman 2009; Jansenn-Jansen and van der Veen 2017; King and Rich 2021).

Debates about whether CBAs are worth the typically arduous effort of negotiation and enforcement have focused on both the scope of the outcomes and the process of building community power. This paper contributes to these debates by examining what “the community” means in a CBA campaign. Which community members benefit most from the outcomes? Who is engaged in which aspects of the process? What are the implications of this realization of community for longer-term movement building?

The six-years of community organizing and negotiations that led to the ratification of a \$20 million agreement in the

context of a 15 acre transit-oriented development in Somerville, Massachusetts, a working-class city of immigrants, offer an opportune case study for exploring these questions. The CBA has been deemed successful. Wins include \$20 million of affordable housing, job training resources, small business supports, green and open spaces, and public art investments as well as commitments to local hiring, labor-friendly construction contracts, and sustainable building designs. Perhaps more significantly, involvement of multiple types of community groups over the course of the CBA campaign affords analysis of dynamics of legitimacy and power and tensions between inclusion and marginalization among stakeholders with diverse backgrounds, experience, and expertise. Moreover, recent immigrants and other low-income residents played significant and recognized roles in the campaign.

The study is grounded in participant observation throughout the campaign and the following two years of implementation. Document analysis, media coverage, public hearing testimonies, and interviews with key actors from the grassroots coalition that launched the CBA campaign, the elected neighborhood council that negotiated the contract, other influential resident and labor groups, and city-appointed advisory committees supplement the observations.

Analysis calls attention to four areas of contestation about the meaning of community in the CBA campaign.

Agenda-setting: That the coalition overcame the City's initial resistance to direct community-led negotiations with the master developer evidences that organized immigrants and their equity driven allies cannot only command a seat at the table; they can also influence the menu of development opportunities.

Representation: The negotiation of contact with the elected neighborhood council as opposed to the grassroots coalition illuminates how legitimate representation of the community is challenged and established.

Compromise: Tensions between the various the coalitions and groups involved in the CBA campaign surface how power imbalances within communities shape issue prioritization.

Voice: Although recent immigrants and other low-income residents of color were among the recognized leaders in many of the community forums, their voices were not always heard with the force of those with more technical expertise and more extensive and consistent time to devote to meetings.

Together, these insights contribute to the emerging discourse on CBAs and they provide useful guidance for community activists and local planners considering whether to pursue CBAs and what organizational capacity is necessary to sustain community engagement, access legal and other expert advice, and provide facilitation and coordination supports for over-extended volunteers.

TOWARDS A FULLER UNDERSTANDING OF GENTRIFICATION: GEOGRAPHY OF GENTRIFICATION IN CHICAGO

Abstract ID: 2068

Individual Paper Submission

LEE, Bumsoo [University of Illinois at Urbana-Champaign] bumsoo@illinois.edu, presenting author

LEE, Yongsung [The University of Hong Kong] yongsung@hku.hk, co-author

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, co-author

There are growing concerns about gentrification worldwide. In particular, the recent rise of gentrification has often been attributed to the influx of young generations, Millennials and Gen Z-ers, into central urban neighborhoods in

recent decades. Transit oriented development around major public transit systems has also been blamed for triggering gentrification. However, despite the increasing alerts on gentrification, results of recent quantitative studies on gentrification and displacement are mixed at best. Due to the lack of data to trace displacement of low income and minority households in gentrifying neighborhoods, these studies typically attempted, but failed in many cases, to identify significantly higher moving rates in gentrifying neighborhoods than in other comparable neighborhoods (Freeman, 2005; McKinnish et al., 2010; Ding et al., 2016). However, these mobility-focused studies have critical limitations in fully addressing overall impacts of gentrification on low income families in gentrifying neighborhoods. Does gentrification involve extensive displacement? What are the characteristics of places where people being displaced move to? After displacement, do people suffer from lower access to employment opportunities, lower income, and/or lower access to public transit services? What are the typical timing and pace of relocation of both gentrifiers and people who are being displaced?

To address these research questions, we investigate the geography and temporal dimensions of gentrification in the Chicago metropolitan area, using a unique proprietary dataset—InfoUSA U.S. Consumer Database. This dataset, developed for commercial use, records longitudinal geographical location and demographic information of 155 million households nationwide, and we analyze 42 million data points for the Chicago area from 2006 to 2015. As panel data, not repeated cross-sectional samples, InfoUSA has many advantages over other types of data for studying the spatial and temporal patterns of relocations among both gentrifiers and people who are being displaced.

In this study, we perform a series of data analyses. First, we identify two sets of census tracts, either gentrified for 2000-2015, or comparable to the former in the starting year, but not gentrified by the end of the study period. These sets work as treatment and control neighborhoods. In doing so, we employ the 2010 decennial U.S. Census and the American Community Survey 5-year estimates for 2009-2017. Second, we examine socioeconomic and demographic characteristics of existing residents and more importantly, movers into/out of these two sets of census tracts to determine any systematic differences among two resident (or mover) groups. Third, we compare selected attributes of destination census tracts for out-movers from gentrified and gentrifiable-but-not-gentrified census tracts, such as median household income, unemployment rate, and access to public transit. We also perform a multinomial logit analysis to study the determinants of relocation decisions and relocation destinations. Lastly, but most importantly, we investigate existing residents' timing of moving out from two sets of census tracts over time, which will enable us to identify any differences in displacement patterns.

Track 3 Pre-Organized Session Summaries and Abstracts for the Sessions

ALTERNATIVES IN COMMUNITY ECONOMIC DEVELOPMENT: NEW APPROACHES TO STUBBORN PROBLEMS

Pre-Organized Session 1 - Summary

Session Includes 1073, 1074, 1075

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, organizer

Urban economies face multiple challenges to which the conventional machinery of economic development – industrial recruitment, real estate development, competition for skilled professionals – cannot convincingly respond. As elected officials, community organizations and citizens respond to challenges such as automation, mass gentrification and the systemic inequalities of racial capitalism, they seek new approaches to economic development. Accordingly, this panel presents completed original research on a range of alternative approaches to economic development, and particularly to community economic development. To date, such alternative approaches have been studied at the level of individual cases. The papers in this panel take a more systematic approach, grounding alternative approaches in classic frameworks focused on growth, equity and economic diversification. They answer the following questions: What long-standing problems do alternative approaches hope to solve? How do they connect economic development to other planning specializations? What shapes and limits the diffusion of these new approaches to economic development?

Objectives:

- Learn about new approaches to core problems in economic development
- Understand the spread and increasing popularity of alternative approaches

THE BASIC INCOME: ALTERNATIVE ECONOMIC POLICY FOR SITES OF ECONOMIC AND INSTITUTIONAL BREAKDOWN

Abstract ID: 1073

Abstract within Pre-Organized Session 1

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, presenting author

Basic income trial programs continue to expand across U.S. cities (Mayors for a Guaranteed Income 2022). They are growing even more rapidly in Europe, where regional government bodies in the British Isles are in the process of authorizing multi-year, mass basic income pilots that provide years of support to youth, artists and other sub-populations (Morris 2022). The emergent leap from randomized control trials to state policy increases the basic income's relevance to economic development and community development by providing information on a wide range of potential impacts, and by making possible a shift from randomized control trials to fully fledged public policy (Young 2018). This shift raises simple but important questions about when and where the basic income will expand.

I answer those questions with evidence on the diffusion of basic income activism and basic income policy across European states and sub-national regions. Drawing on primary documents from basic income policy proposals and advocacy organizations, and more than 80 original interviews with activists, third-sector organizations, elected officials and unions, I show that basic income policies gain support when they successfully demonstrate means of financing regular cash payments and show limited risk of recipients exiting the labor market. My field data demonstrate that three distinct pathways to basic income policy address both these challenges: 1) Tying the basic income to national autonomy movements with devolved fiscal control, 2) Rolling out basic income pilots for sub-populations (such as youth and artists) associated with high unemployment rates and/or high propensity to work, and 3) rolling out programs in high-unemployment regions where the failure of alternatives reduces hesitancy to rewrite fiscal and welfare policy. I detail the point by mapping the high incidence of basic income advocacy organizations and trial programs in high-poverty regions, national sub-regions with fiscal independence, and places where new political coalitions use their power to focus on sub-populations.

By contrast, basic income policy pilots remain politically marginal in countries retaining high trust in the welfare state (France, Germany, Scandinavia) and where regional autonomy movements are subdued or shut out from fiscal self-rule. In addition to identifying potential pathways to the basic income's growth in the U.S., understanding the policy's

appeal in these terms points to the importance of non-material effects of economic development policies and programs. This indicates the need to value mental health, reduced stress, civic participation and other life-quality measures currently displaced from the agenda by the proxy study of GDP growth, unemployment rates and technology.

COMMUNITY LAND TRUSTS: TECHNOCRATIC HOUSING AFFORDABILITY TOOL, OR TRANSFORMATIVE COMMUNITY ECONOMIC DEVELOPMENT MODEL?

Abstract ID: 1074

Abstract within Pre-Organized Session 1

SHATAN, Nicholas [University of California, Berkeley] n.shatan@berkeley.edu, presenting author
SPICER, Jason [University of Toronto] jason.spicer@utoronto.ca, co-author

In the field of US community economic development, there has been a revival of interest in alternative ownership models (Spicer, 2020; Spicer and Casper-Futterman, 2020). These models are being applied not only to business enterprises, which are often the traditional focus of economic development, but to land and housing, as well, through models like the Community Land Trust (CLT).

Echoing practitioners' concerns, recent academic CLT research has focused on whether they have remained true to their roots in Civil Rights and housing justice movements, drawing a distinction between "transformative"/radical and "technocratic"/reformist CLTs (DeFilippis, Stromberg, and Williams 2018; DeFilippis, et al, 2019). The former purportedly address broader political-economic goals (e.g. de commodification of land/housing), while the latter focus on affordable housing provision. Despite transformative CLTs' purported focus on broader goals, there has been limited empirical measurement of how their distinct institutional logic might differentially manifest with respect to specific planning and implementation practices, or how such practices might reach beyond the domain of housing/land to accomplish greater community economic development goals. To that end, our study asks two questions: does the transformative/technocratic distinction translate into observable differences in terms of planning practices deployed by CLTs? And given transformative CLTs' broader focus, what does their model have to offer from a community economic development perspective?

To answer these questions, we conducted a qualitative matched-pair study of 12 North American CLTs in six regions, using data generated from interviews with CLTs which were externally identified as "technocratic" and "transformative" in each region, and supplemented by document analysis of these CLTs' missions, activities, affiliations, and funding. We find transformative CLTs more consistently deploy six specific practices than do technocratic peers, including several which might help advance community economic development goals. These practices include: participatory planning; developing relationships with citywide/regional coalitions; connecting with other solidarity economy organizations; community finance and acquisition mechanisms; policy and advocacy campaigns; and community base-building and tenant organizing. But we also find the transformative/technocratic divide is not clear-cut: technocratic CLTs also often engage, in a time-varying manner, with a select number of these practices, and often state plans to implement more. We also find that CLTs in both "camps" often collaborate with one another, indicating that the divide may not run as deep as existing academic research might suggest. Affirming the findings of existing research in economic sociology on alternative enterprises (Schneiberg, King, and Smith 2008), we suggest that the observed differences between "technocratic" and "transformative" CLTs represent the simultaneous existence of two competing institutional or field logics at work among CLTs, traceable to the organizations' varying relationship to social movements.

Beyond advancing academic planning's understanding of variations in CLTs' practices and their relationship to broader community economic development goals, our study has implications for practitioners. Planners, policymakers, and community organizers should consider how the varying implementation approaches of different types of CLTs align with their stated goals. Community economic developers, like others who seek to deploy CLTs to achieve broader political and socio-economic goals, might wish to explicitly incorporate the six transformative

planning practices we identified into their CLTs' organizational and program design, either at inception or a later date. For those with more limited goals centered on affordable housing, not all of these practices may be seen as necessary or worthwhile. In particular, community economic development-related CLT practices (such as connecting with other solidarity economy organizations, community finance initiatives, and community base-building and tenant organizing) may be less germane to those practitioners who are primarily focused on affordable housing provision.

COMMUNITY WEALTH-BUILDING: RADICALLY REIMAGINING COMMUNITY ECONOMIC DEVELOPMENT MEANS AND ENDS

Abstract ID: 1075

Abstract within Pre-Organized Session 1

SUTTON, Stacey [University of Illinois Chicago] suttons@uic.edu, presenting author

The cooperative movement is ascendent, though most people may be unaware of it. The 2008 foreclosure and financial crisis unmasked the chimera of economic security and upward mobility for the average worker in the United States. It also fomented the Occupy Movement and popular resistance to extreme inequalities, capitalist exploitation, and the insidious conviction that "there is no alternative." Post-Great Recession economic expansion (2009 – 2019) is lauded for historic economic growth. As such many middle-class White households were able to recoup wealth eroded by the financial crisis. Rather than experiencing alleged benefits of historic economic growth and full employment, the average Black household and low wage worker experiences a multiplicity of crises long in the making, including racial and economic inequalities, wage stagnation, incessant erosion of labor power, insurmountable debt, prolonged if not permanent detachment from the formal labor market, housing insecurity, derisory healthcare, and environmental degradation. None of which can be eradicated by the system of corporate capitalism that created them.

It is within this context that community wealth-building (CWB) and heterodox models of cooperative economics are emerging in Black and indigenous communities (Bledsoe, McCreary & Wright 2019; Gordon-Nembhard 2014; Hudson 2019; Sutton 2015; Sutton and Gordon-Nembhard 2022). This paper draws on WEB Du Bois' theory of cooperative economics to expound CWB which the Democracy Collaborative characterizes as place- and people-based initiatives that intentionally and explicitly promote local, democratic, and shared ownership and control of community assets. Although elements of CWB have existed in the U.S. for decades, little is known about how policies, legal frameworks, tools, financing mechanisms, educational resources, and community support, constitute enabling environments for community wealth-building enterprises. The purpose of this paper is threefold: First, to document CWB ecosystems, particularly initiatives emerging in majority Black neighborhoods in Chicago and New York City; second, to analyze the infrastructures, ideologies, resources, and practices of CWB models; third, to compare CWB to conventional community economic development initiatives.

COVID, ARPA AND THE POTENTIAL FOR PROGRESSIVE CITIES

Pre-Organized Session 3 - Summary

Session Includes 1022, 1023, 1024, 1025, 1042

WARNER, Mildred [Cornell University] mew15@cornell.edu, organizer

The COVID-19 pandemic created a shift in US urban policy. Public health, racial inequality and economic dislocation all generated pressures for new national policies, such as Coronavirus Relief (CARES), America Rescue Plan (ARPA) and the Infrastructure bill (IIJA). Expanded public health concerns, economic supports and aid to state and local government have created an opportunity for more progressive action at the city level. But which cities will choose to be more progressive and how do we understand these shifts? This panel will draw from urban justice coalitions and policy entrepreneurship theories to explore how cities have chosen to invest their ARPA funds. The role of progressive politics, citizen protest, planning, local capacity and policy competition will be explored across policy arenas relating to infrastructure, public health, violence prevention and economic development.

Objectives:

- This session will explore new economic development approaches promoting equity
- Attention will be given to the role of community engagement and planning as relates to ARPA funds
- Differentiating communities which address equity in their ARPA plans

URBAN JUSTICE COALITIONS, POLICY ENTREPRENEURSHIP AND PROGRESSIVE POLITICS IN FEDERAL POLICY IMPLEMENTATION

Abstract ID: 1022

Abstract within Pre-Organized Session 3

SCHROCK, Greg [Portland State University] gschrock@pdx.edu, presenting author

DOUSSARD, Marc [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, co-author

The Biden Administration's embrace of counter-austerity policies in economic recovery from Covid-19, such as the American Rescue Plan Act (ARPA), raises hopes of a new era of Federally led progressive policy. A key question is how much of this potential remains despite proposed investments in social infrastructure stalling. While Federal political realities currently foreclose additional action, provisions for local discretion in policy implementation in existing legislation like ARPA open the door for urban justice coalitions.

At the Federal level, ARPA proceeded as a classic case of policy entrepreneurship (Kingdon 1984). In Multiple Streams Analysis (MSA) of policy studies, agenda windows open when new possibilities emerge in the so-called "politics stream" for linking known problems to relevant policy proposals. At the Federal level this often occurs through exogenous events such as disasters. ARPA's support for local discretion opens the possibility for urban-level policy entrepreneurship. Although scholars have long studied the dynamics of local implementation of Federal policy (Van Horn 1979), the role of local politics and organizing in shaping those dynamics has been underappreciated. In contrast to the Federal level, urban policy entrepreneurship toward progressive policy is driven by the interplay between local organizers within Economic and Racial Justice (ERJ) coalitions, who build coalitions and pressure for policy change in the urban context, and "inside game" actors who work City Hall to craft policy proposals (Doussard and Schrock 2022). Although such inside-outside dynamics are not unique to the local scale, the urban scale offers activists and organizers a fertile landscape to build power toward policy change.

Our paper provides a conceptual framework for analyzing local policy change outcomes from ARPA or other federal legislative frameworks that involve localized policy implementation, centering on two types of activities at the local scale. One, organizing efforts on the part of ERJ coalitions to shape problem definitions; and two, the networking efforts on the part of urban policy entrepreneurs to develop policy proposals, often in coordination with national-scale policy advocacy organizations or peers in other cities.

We test the framework through the exploratory case of guaranteed basic income (GBI) pilot programs, which represent a limited variation on "universal basic income" (UBI) initiatives that propose unconditional cash payments to ensure a minimum subsistence income for households (Mayors for a Guaranteed Income 2022). Several U.S. cities launched GBI pilots using ARPA funding; although many of them (e.g., Seattle, Madison WI) are classic "progressive

cities,” others like Denver and Chicago are not. Our framework suggests that local adoption of progressive policies would not simply align to a priori local political orientation, but would instead be more variegated and contingent. Through semi-structured interviews with activists, urban policy entrepreneurs and local agency officials in three ARPA-funded GBI pilot cities (Seattle, Chicago, Denver), we address two questions. One, how important was federal (ARPA) funding in catalyzing these pilots? Two, what role did ERJ coalitions and urban policy entrepreneurship play in elevating AGI in those cities? We find that ARPA funding was catalytic because of its flexibility, multi-year duration and potential to leverage philanthropic support. And second, justice coalitions were most impactful in “mixed-progressive” cities where competing interests were advocating more conventional approaches to utilizing ARPA funding. Our findings affirm the importance of local politics in mediating the impact of Federal policy on progressive change. For planners, the findings underscore the local economic development potential of household income support and the importance of engaging justice coalitions in policy formulation and implementation.

CHALLENGING AUSTERITY UNDER THE COVID-19 STATE

Abstract ID: 1023

Abstract within Pre-Organized Session 3

WARNER, Mildred [Cornell University] mew15@cornell.edu, presenting author

KELLY, Paige [Cornell University] pmk92@cornell.edu, co-author

ZHANG, Xue [Cornell University] xz435@cornell.edu, co-author

The COVID-19 pandemic created an opening for more progressive US urban policy. While neoliberalism has dominated policy approaches for the past 40 years, recent federal policy changes offer the promise to reshape both citizen expectations of the state and the nature of federal-state-local relations. The COVID-19 pandemic represents a short term shift in US social policy. Under the CARES Act and the American Rescue Plan, the federal government prioritized households by raising the floor for child support and unemployment benefits, and restoring fiscal federalism by providing increased funds to state and local governments. Scholars have called attention to the devastating impacts of austerity since the Great Recession (Lobao et al., 2021), but understanding the role of the state in the COVID and post COVID-19 era requires a revised theoretical frame. The COVID crisis has required a state response which holds the potential to open up Keynesian style approaches (Warner and Zhang, 2021). This paper explores new frameworks for understanding progressive action.

We do this through analysis of state action at three scales: federal, state and local. At the federal level we contrast the COVID response during Trump’s final year 2020 (CARES Act) with programs passed in Biden’s first year in office 2021 (American Rescue Plan, ARPA). While the CARES act increased unemployment benefits and provided direct payments to families, it reserved much of its funding for private business. The ARPA, represents both an extension and a shift as it instituted a new child care tax credit which holds the potential to expand social citizenship. Decentralization and austerity have been used to reduce citizen expectations of the state, but the need for a strong state response to COVID, has opened new possibilities for state action – at the federal, state and local level.

ARPA provides significant funding to state and local governments (\$350 billion). This gives state and local government more flexibility to respond to a range of issues from revenue shortfalls, to support for social equity, to investment in infrastructure. Research during the Great Recession has shown wider spatial diversity in state and local government action than austerity theory would expect (Warner et al. 2021), but it has also pointed to the challenges of a broken fiscal federalism where the nation shifts expenditure burdens to lower levels of government (Warner and Xu, 2022). The ARPA changes that – at least for now.

We held three focus groups with local government officials and then designed and implemented a survey of local governments across the US to assess how they are planning to spend these new funds. Our nationwide survey finds local governments with more citizen participation and Black Lives Matter protests prioritize social equity investments, while those with more Trump voters prioritize physical infrastructure. Equity investments are also prioritized among local governments that have ARPA specific plans and engage in regional collaboration.

COVID-19 led to new policy approaches that expand government investment. These have the potential to help reshape citizen expectations and repair federal-state-local relations. The process is contested, and spatially diverse, but we find some cities have shifted from market oriented welfare conventions (Chiapello and Knoll 2020) to something more social. By looking across three levels of the state (Federal, State and Local), we assess policy design and offer new insights for conceptualizing progressive governmental action in the post-COVID era.

HOW ARE CITIES USING ARPA FISCAL RECOVERY FUNDS TO REDUCE VIOLENCE?

Abstract ID: 1024

Abstract within Pre-Organized Session 3

KASS, Amanda [University of Illinois at Chicago] akass6@uic.edu, presenting author
ROCCO, Philip [Marquette University] philip.rocco@marquette.edu, co-author

The American Rescue Plan Act included the creation of a program, the Coronavirus State and Local Fiscal Recovery Funds (CSLFRF), that allocates an unprecedented \$350 billion in flexible aid to U.S. states, local governments, tribal governments, and territories. The CSLFRF's creation marks a notable change in public policy as it is a departure from the neoliberal approaches of the past forty years (Lopez-Santana and Rocco 2021). Not only is the CSLFRF larger than prior rounds of emergency aid, but it was also designed to address a far broader series of crises and provide public officials greater autonomy. In this paper we explore the extent to which the CSLFRF program is facilitating a move away from traditional forms of policing that focus on criminalization and incarceration to community violence interventions that aim at tackling root causes like poverty and racism.

The CSLFRF aid can be used for a broad range of purposes tied to the direct and indirect health and economic effects of COVID-19. The Biden administration intentionally created administrative guidelines and rules that encourage governments to deploy funds in targeted ways that benefit communities most affected by the pandemic and address racial equity (Department of the Treasury 2021). In addition to COVID's disproportionate effects, the issue of racial equity came to the political forefront because of nationwide protests demanding racial justice, particularly around policing, that were sparked by recent police killings of Black Americans (White House 2021). In the summer of 2021, the Biden administration tied the CSLFRF program to violence prevention by labeling gun violence a public health issue that had worsened during the pandemic. In addition, President Biden explicitly encouraged and empowered cities to use CSLFRF aid to address that issue and invest in community violence interventions. Our paper offers a systematic look at cities' frameworks for using CSLFRF dollars to advance the goals of racial equity, gun-violence prevention, and criminal justice reform.

While local governments have wide latitude in how they deploy CSLFRF aid, the wide-ranging effects of the COVID crisis and lingering impacts of the Great Recession austerity environment means there are competing needs and interests (Warner et al. 2021). Our project is a mixed-methods study examining how cities plan to use their fiscal recovery funds as it relates to violence prevention and mitigation. In particular we examine whether cities plan to use funds on violence prevention initiatives in novel ways that mark a departure from past spending and traditional policing. Local governments serving a population of at least 250,000 were required to submit plans to the Treasury Department, and we analyze these plans to identify how many of these 338 governments included issues of crime and violence in their reports. In addition, we track detailed spending plans for 26 case study cities. Our study sites include 13 cities that are part of the Community Violence Intervention Collaborative (CVIC), which aims at scaling "evidence-based community-led strategies to reduce gun violence and enhance public safety" (White House 2021). The remaining 13 cities are ones that are similar in population size and rates of violent crime to the 13 CVIC cities. We track how our case-study cities plan to use their fiscal recovery funds and compare it to pre-COVID spending by analyzing budgets, annual comprehensive financial reports, and additional financial reports. Last, we examine the 26 cities' spending plans to identify policy priorities and the process involved in allocating CSLFRF aid. Combined, this

work allows us to identify barriers to and facilitators of cities' use of federal dollars to advance the goals of racial equity, gun-violence prevention, and criminal justice reform.

DETERMINANTS OF EQUITABLE DEVELOPMENT: PURSUITS OF A PROGRESSIVE AGENDA

Abstract ID: 1025

Abstract within Pre-Organized Session 3

STOKAN, Eric [University of Baltimore, Maryland County] estokan@umbc.edu, presenting author

DESLATTE, Aaron [Indiana University] adeslatt@iu.edu, co-author

OVERTON, Michael [University of Idaho] Moverton@uidaho.edu, co-author

Local governments are grappling with wide ranging issues including balancing economic growth, stabilizing fiscal revenues, redressing inequalities, repairing crumbling infrastructure, and promoting environmental sustainability. These tasks have become only more complicated in the wake of the COVID-19 pandemic. [1] As a result of this hardship, the federal government has passed an unprecedented set of bills worth trillions of dollars (the Coronavirus, Aid, Relief, and Economic Security Act (CARES), American Rescue Plan Act of 2021 (ARPA), and the Infrastructure, Investment and Jobs Act (IIJA) to, in part, support state and local governments.

Inherent in these efforts is the desire to ensure local governments have necessary resources to stave off budget cuts, staff layoffs, and even receivership, while simultaneously prioritizing economic recovery and growth alongside racial and economic equality. Local factors impact their ability to strike a balance between economic growth, social equity, and sustainability. [2][3][4][5] Further, economic crises, like the Great Recession, alter local policy prioritization [6][7], available resource streams, and fiscal responses.[8] Thus, federal intervention provides necessary resources. Yet, the way in which these external resources translate into economic growth and equity, and how city-level factors determine equitable access to these funds at a neighborhood scale, has received scant attention. While the full implications of CARES, ARPA, and IIJA may take years to fully realize, we can better understand the implications of federal funds on local priorities at the neighborhood-level.

We build a novel database tracking CDBG, HOMES, and NMTC expenditures from 1999 to 2014 aggregated to the neighborhood level. Joined with several waves of local economic development surveys we analyze how municipal-level characteristics for more than 2,000 cities impacts the spatial distribution and policy selection toward growth and equity-oriented goals for more than 67,000 neighborhoods within those cities.

We ask two fundamental questions. First, what municipal-level factors (e.g. participants in the policy process, competitive pressures, form of government, etc.) explain varying neighborhood-level distributional decisions for these programs? Empirically, we examine the moderating influence of neighborhood-level social need on the municipal-level determinants of distributional allocations of these federal resources. Second, we ask how these distributional and policy choices impact economic and equity-oriented outcomes? Such analyses are important when considering the impact that COVID-19 relief may have on the future trajectory of economic growth and equitable development going forward.

ARPA AND BROADBAND ACCESS: LOCAL ACTION AND REGULATORY CHALLENGES

Abstract ID: 1042

Abstract within Pre-Organized Session 3

BRAVO, Natassia [Cornell University] nb576@cornell.edu, presenting author

The global pandemic brought meaningful changes to the landscape of broadband policy in the US. Increasing access had been a priority for the federal government before the beginning of the global pandemic, but with the American Rescue Plan Act 2021, the federal government acknowledged and pledged their support for local governments in their efforts to address the digital divide. The Capital Projects Fund (\$10 billion) will support not only broadband infrastructure projects, but also device acquisition and the habilitation of facilities for education and health. Pandemic relief aid from the State and Local Fiscal Recovery Funds (\$350 billion), which is already available, can be channeled to states and local governments, directly or through state programs, and used for broadband. This is a defining moment in the landscape of broadband policy, as local governments become empowered to take a more active role in making broadband access universal – and states play a key role in how local governments will access federal and state funds.

Scholarship has expanded beyond the traditional conception of the digital divide, which largely focuses on the lack of service availability, affordability, and adoption. It can also signify lack of connectivity and access to devices; lack of digital literacy, and inequalities in the realization of benefits from Internet usage due to identity and socioeconomic factors (van Dijk and Hackner, 2003; Ali, 2021). Additionally, the broadband gap continues to expand as older technologies and speed requirements become obsolete. By granting local governments more flexibility in how they can spend broadband funds, the federal government can contribute to ongoing local efforts to address the various levels of the digital divide. What are the progressive steps cities are taking towards equity in broadband access? How will the current regulatory landscape enable or challenge how local governments channel federal support?

Some states have limited the municipal role in expanding broadband access (Bravo et al 2020), but states have also helped address equity in enacting policy for awarding federal and state funds. States have an opportunity to cooperate with the progressive efforts of local and regional coalitions – cities and counties partnering with private ISPs, cooperatives and industry experts to realize the benefits of broadband in education, telehealth, public safety and economic growth. We will learn about the variety of ways in which these partnerships seek to make broadband access more inclusive - from open access, middle-mile projects that can connect anchor institutions and facilitate last-mile deployment and the entry of new providers, to the buildout of hotspots and creation of training and digital navigator programs to serve students and senior citizens. At the same time, states can also ensure all communities, regardless of their size, wealth or degree of rurality, have an opportunity to access grant funds and improve their connectivity (Read, 2021).

Using data from the Pew Charitable Trusts, NLC and NACo on state broadband grants, policy and ARPA-funded projects, in combination with American Community Survey data, this paper will analyze the common factors between locations who were awarded federal and state funding. How is regulation determining how broadband grant funds are spent? Can current policy be improved to increase access to grant funds for less wealthy communities? How can state requirements increase equitable access to broadband and stimulate competition? How are cities using ARPA funds to continue their efforts towards universal broadband access and skill-building? This analysis will highlight how cities and counties are working towards both universality and equity in broadband access, and how they navigate the challenges and opportunities of ARPA and state policy.

INFRASTRUCTURE FOR BUSINESS DEVELOPMENT AND WEALTH GENERATION IN COMMUNITIES OF COLOR

Pre-Organized Session 15 - Summary
Session Includes 1082, 1083, 1084

WOLF-POWERS, Anna Laura [Hunter College, CUNY] aw2416@hunter.edu, organizer

Enterprises owned and operated by entrepreneurs of color can be sources of intergenerational wealth, jobs, training, youth mentorship, and even philanthropy. But economic development planners' efforts to cultivate and support BIPOC-led businesses – especially at the municipal level -- have been limited and are only recently receiving scholarly attention in the planning field. This session highlights place-based research into the conditions, environments, and policies that inhibit and encourage the success of entrepreneurs of color, exploring the types of civic and social infrastructure that help these businesses thrive and pointing to historical and ongoing barriers presented by racism-freighted planning paradigms and policy frameworks. Several of the authors on this panel are conducting community-engaged research funded by the Ewing Marion Kauffman Foundation or the Sloan Foundation and will use the session to present preliminary results.

Objectives:

- surface new knowledge about entrepreneurship in communities of color
- promote understanding of civic and social infrastructure that help BIPOC-owned businesses thrive

STRENGTHENING TIES BETWEEN HEALTHCARE ANCHORS AND RACIALLY DIVERSE SUPPLIER NETWORKS: PRELIMINARY RESULTS OF A PARTICIPATORY ACTION RESEARCH STUDY

Abstract ID: 1082

Abstract within Pre-Organized Session 15

SHIPP, Sigmund [Hunter College, City University of New York] sshipp@hunter.cuny.edu, presenting author

This paper reports findings from a study involving Hunter College researchers and the Brooklyn Health Enterprise Hub. The Hub is dedicated to building a health-focused enterprise system that sets the stage for local residents to participate more fully in the economy and healthcare industry. The research aims to further understanding of ecosystems for black businesses in East and Central Brooklyn, NY. The multi-step, multi-faceted study approach relies on participatory action research (PAR) that builds knowledge about the environment for existing small businesses in Bed-Stuy, Brownsville and East New York, with specific focus on food/farming; housing construction; energy production; and health and wellness. Rooted in a contextual discussion of the theories underlying supplier diversity programs and policies created over the past five decades to incorporate black-owned businesses into local economies, the paper analyzes preliminary findings from the PAR study conducted in the summer of 2022 in the target neighborhoods. The authors explore the implications of the study findings for on-the-ground efforts to enhance local black businesses in East and Central Brooklyn and consider how they may become worker cooperatives.

The research is made possible through a three-year community engagement grant from the Ewing M. Kauffman Foundation. The funding supports the completion of the research about the HUB's goal to not only create a cadre of minority businesses that become stable and profitable but also to ensure that the HUB's anchor institutions are able to be sensitive and responsive to the challenges that minority businesses in their community confront.

LEARNING FROM ASSET WALKS: INSIGHTS INTO EVERYDAY ENTREPRENEURSHIP

Abstract ID: 1083

Abstract within Pre-Organized Session 15

FRISCH, Michael [University of Missouri Kansas City] frischm@umkc.edu, presenting author

DINA, Newman [University of Missouri Kansas City] Newmand@umkc.edu, co-author

ERIN, Royals [University of Missouri Kansas City] royalse@umkc.edu, co-author

WAGNER, Jacob [University of Missouri Kansas City] wagnerjaco@umkc.edu, co-author

This paper presents evidence from our community-engaged research on the obstacles and opportunities for local business development in Kansas City's diverse urban neighborhoods. Despite progress toward a less segregated metropolitan area, the legacy of racial segregation continues to impact Kansas City's neighborhoods and businesses. Minority businesses in urban neighborhoods are often under-capitalized and they benefit from efforts to expand markets beyond the minority community originally served (Bates 2006). Evidence suggests that there is a reserve of entrepreneurial capacity in these neighborhoods as well as variety of needs currently going unmet. Our approach to this issue applies an asset-based community development lens (Kretzmann and McKnight 1996) leading to what we are calling everyday entrepreneurship (Welter, et. al. 2017). Everyday entrepreneurship includes traditional firms with full legal status, but also includes other activities that are entrepreneurial in scope but have less formal status as a business.

Data and preliminary findings are drawn from a series of Asset Walks – a methodology developed by the UMKC Center for Neighborhoods and our neighborhood partners. An Asset Walk is a mobile conversation where researchers, residents, leaders, and advocates visit different locations in a specific geography on foot together in a group to learn about the strengths and community capitals. Taking a walk together, observing the characteristics of a particular place, and listening to the voices of locals leads to co-production of local knowledge about particular places (Pierce and Lawhon 2016). Asset Walks are only one part of a trust-building process between researchers, planners, and communities. Researchers may seek to return to the neighborhood multiple times to get a better sense of how entrepreneurship happens at different times of day and different ways across the seasons or days of the week. A key aspect of an asset walk is that researchers meet people where they are – rather than asking people to recall neighborhood details from memory at a public forum.

We find that being present together in a place as a conversation or interview is happening adds the environment as an interactive element in the conversation. Asset-based thinking requires moving beyond stereotypes of people and places. These stereotypes can be broken down by the experiential process of engaging in an indeterminate conversation. Trust gets built through listening to stories that might reveal a specific opportunity contingent to the particulars of place. Planning policies to support everyday entrepreneurship developed through this process then reveal themselves to be multifaceted and not lot limited to a particular community economic development approach (Spicer and Casper-Futterman 2020).

UNDERSTANDING PATHWAYS TO SUCCESS: AN EXAMINATION OF WHICH LOCAL INSTITUTIONS RACIALLY DIVERSE ENTREPRENEURS TURN TO FOR ASSISTANCE AND WHY

Abstract ID: 1084

Abstract within Pre-Organized Session 15

HARPER-ANDERSON, Elsie [Virginia Commonwealth University] elharperande@vcu.edu, presenting author

Recently there has been a great deal of attention from policymakers and scholars focused on creating diversity and equity within entrepreneurial ecosystems. Historically, minority firms have higher closure rates, lower sales, fewer employees, and lower profits than white-owned firms (Fairlie and Robb 2008). While there has been a great deal of research focused on the entrepreneur and their individual characteristics to explain racial differences, more recent studies focus more on the ecosystem and the interaction between the entrepreneur and the broader network of institutional stakeholders including entrepreneurial support organizations (ESOs).

ESOs play a critical role in helping entrepreneurs access resources and information to start and grow their businesses (Motoyama, 2015). ESO configurations range from service providers and traditional incubators to more recent manifestations, including accelerators, maker spaces and rental spaces for gig economy contractors. ESOs often act as a critical link between the individual entrepreneur and a wide variety of information and resources available in the broader ecosystem. However, evidence is starting to emerge documenting how entrepreneurs from historically marginalized groups face barriers to accessing services offered by ESOs. Evidence points to geographic barriers, weak social networks, unattainable requirements among other factors. The COVID-19 pandemic inflicted even more stress on an already challenging situation. Businesses run by African-Americans and Latinos were hit especially hard with Black-owned businesses decreasing by 41% in the initial months of the pandemic.

This study focuses on entrepreneurs in the Richmond, Virginia ecosystem. Richmond holds a unique place in the economic and social history of the US. As the former capital of the confederacy, the city has a long history of economic marginalization of blacks. At the same time, as the former “Wall street of the south”, the city also has a legacy of a black entrepreneurial spirit.

This study adds to the literature on racial inequality in entrepreneurship, by exploring the various paths entrepreneurs take in establishing and growing their businesses paying particular attention to the barriers they face, where they turn for assistance, how they make decisions and where they actually receive resources and information. Ultimately, we hope to compare the experiences of entrepreneurs of different racial groups have with ESOs within the Richmond ecosystem.

This mixed methods community engaged research follows forty entrepreneurs from different races and ethnicities (Black, White and Hispanic) through the Richmond, Virginia ecosystem for an entire year using weekly diaries. The data collection instrument was co-designed by the research team and a group of local entrepreneurs. Our aim is to understand the differences in the paths they take, and the factors that contribute to success and failure for each group. Diary entries are coded for key themes and patterns using Dedoose qualitative software. We also use social network analysis to trace the paths of where entrepreneurs turn for assistance. Finally, based on issues raised by entrepreneurs, we interview administrators of ESOs to understand their views and explore questions and issues raised by entrepreneurs about their organizations.

RESEARCH ON THE POLICY PERFORMANCE OF NATIONAL HIGH-TECH INDUSTRIAL DEVELOPMENT ZONE FOR URBAN INNOVATION AND DEVELOPMENT: ANALYSIS BASED ON DIFFERENCE-IN-DIFFERENCE TEST

Abstract ID: 1016

Individual Paper Submission

WANG, Qixuan [College of Architecture and Urban Planning, Tongji University] wxq3@qq.com, presenting author
REN, Jie [College of Architecture and Urban Planning, Tongji University] renjie_cathy@163.com, co-author

Since its implementation in the 1980s, the high-tech industrial development zone (HIDZ) aims to promote the progress of national science and technology industry and drive the innovative development of cities in China. The role of HIDZ and their related policies in promoting urban development has been confirmed by many studies, but their policy performance differences in urban innovation and economic growth still need to be further analyzed. Based on the panel data of cities from 2000 to 2019, this paper uses the PSM-DID model to study the policy performance and difference of the establishment of HIDZ on urban economic growth and innovation output. Firstly, 226 cities suitable for econometric analysis are selected according to the PSM method, and then the statistical regression analysis of DID method is carried out. The empirical results show that: In general, national HIDZ can drive urban economic development and improve regional innovation ability, and their effectiveness in increasing urban innovation output is better than promoting economic growth. Further research shows that in promoting innovation, the establishment of HIDZ has a better effect on the cities in eastern region, cities with higher administrative levels and cities with economic development zones; In terms of promoting economic growth, it will help the cities in western region, small cities and cities without economic development zones. Finally, based on the empirical assumptions, combined with the actual situation of China's HIDZ, this paper obtains some policy enlightenment for the development of HIDZ and cities. The research shows that the evaluation of China's HIDZ should focus on their impact on urban and regional development; at the same time, we should reflect on the necessity of establishing all kinds of development zones such as HIDZ with clear spatial boundaries in various regions after entering the era of stock development. The value of this study is to systematically verify the pure policy performance of China's HIDZ construction for urban innovation and development.

ASSESSING THE ECONOMIC RECOVERY OF LOCAL BUSINESS INTERRUPTION AFTER DISASTERS, SALT LAKE CITY, UTAH

Abstract ID: 1018

Individual Paper Submission

KIM, Sua [University of Utah] sua.kim@utah.edu, presenting author
CHANDRASEKHAR, Divya [University of Utah] d.chandrasekhar@utah.edu, co-author

Small businesses are fundamental units in local economic development since they promote job creation, tax revenue for the local economy, and maintain social networks for community well-being. However, they are particularly vulnerable to disasters and supply chain disruptions. Current literature on supply management falls short of examining the behaviors of small businesses in response to supply chain disruptions (Kull et al., 2018). Post-disaster supply chain disruptions are more likely to impact small businesses because they are typically fewer resources

adversely, have higher rates of minority ownerships than other size businesses (Marshall & Shrank, 2014), and are limited in their ability to develop alternative supply streams (Mesquita & Lazzarini, 2008), and have higher transaction costs due to lower bargaining power and reputation (Arend & Wisner, 2005). This study fills these gaps and examines the recovery experiences of small businesses after the 2020 Magna UT Earthquake and COVID- 19 pandemic in Salt Lake City, UT has a hypothesis: Small businesses are more likely to have supply chain issues and less likely to recover from the disasters.

A local business survey was conducted from November 2021 to March 2022. Data builds on PI's previous research that has identified ten industrial sectors most likely to be impacted by supply disruptions in case of an M7.0 earthquake in the Wasatch Front region. Business databases were drawn using stratified sampling method from the Mergent Intellect business information database. A total of 150 businesses out of 3,830 (3.9% response rate) completed the survey by email and dropped off the paper copy. The number of employees under 10 accounts for 66.15% and seven businesses show over 100 employees in their business (5.3%). The mean of operation year is 27 years ranging from 1 year to 150 years. Descriptive statistics and linear regression will be conducted to identify the impact of disasters by the size of the business (small or large). The results will expect small businesses are more likely to be vulnerable to dealing with the supply chain issues, which leads to deter their business operation and retention. The results of this study will allow planners and policymakers to make strategic and equitable economic and community infrastructure investments to help small businesses survive and thrive in the face of disasters.

DUESLING, Pam [University of Guelph] pam.duesling@brant.ca, presenting author
 SOUSA, Emily C. [University of Guelph] sousa.emilyc@gmail.com, co-author
 CALDWELL, Wayne [University of Guelph] wcaldwel@uoguelph.ca, primary author

Despite vast geography, only five percent of Canada's land base is prime agricultural land – a finite, non-renewable resource foundational for the nation's food, fibre, and fur production, the local food economy, agri-food exports, and the growing bio-based economy (MMAH, 2020). Despite this incredible value, prime agricultural land in Canada is decreasing in all ten provinces, especially in Ontario, home to over half of Canada's class 1 farmland (Caldwell et al., 2022). While 98% of farms in Canada are family-owned, the number of small and medium-sized farms is dwindling while the number of large farms has increased (Statistics Canada, 2016). These statistics illustrate the difficulty for smaller family farms to prosper in today's agri-food system.

Farmers are responding by pushing the entrepreneurial envelope to go beyond the traditional growing of crops and raising livestock, especially in Ontario (Fox & Wang, 2016). To keep their agricultural operations viable, many farmers establish uses on their lands that planning professionals have never seen before in rural areas, such as wineries, circus schools, wake parks, theatres, and more. In Ontario, the Provincial Policy Statement (2020) and the Guidelines on Permitted Uses in Ontario's Prime Agricultural Areas (2016) introduce on-farm diversified uses (OFDUS) in agricultural areas, allowing farmers to balance development opportunities with farmland protection. These policy provisions and guidance documents provide an avenue for the land use planning profession to recognize that it is not enough to preserve farmland, but that society must also preserve the family farmer.

With municipalities now tasked with translating the Guidelines into local policies and community contexts, the planning profession and municipal sector are left with more questions than answers: How should zoning bylaws allow or prohibit these types of entrepreneurial activities on farms? How should planners assess the appropriateness of OFDUS and deal with issues of scale, compatibility, and cumulative effects? What are the implications on farming, and at what point does diversification negatively impact farm operations and erode the viability of agricultural production? How does this happen without promoting another form of urban sprawl or detracting from the vitality of rural downtowns?

Using a mixed-method research design, this research explores three questions: (i) What is the current effectiveness of policy that allows for OFDUs within Ontario at an individual farm, municipal, and provincial scale? (ii) What is the specific effect of OFDUs policy on individual farmers diversifying their land uses and operations? And (iii) what best practices for policy and strategies for OFDUs exist amongst municipalities and farmers to balance farmland preservation with land-based development?

Data collection is achieved through a quantitative e-survey administered to farmers and municipalities across rural Ontario and through 71 interviews conducted with ministry staff, municipal planning staff, and farmers diversifying operations across rural Ontario. Focus groups were conducted with these stakeholders to review and assure accurate interpretation of research results, share best practices, co-identify recommendations, and discuss the next steps for Ontario's land-use planning system. Findings suggest that supplementary guidance materials, training opportunities, and sharing of best practices would be valuable for municipalities, the province, and farmers alike. These actions ensure on-farm diversification maintains compatibility with farm operations and balances long-term agricultural viability, farmland protection, and rural economic opportunity.

This study is supported by the Ontario Agri-Food Innovation Alliance, a partnership between the Ontario Ministry of Agriculture, Food and Rural Affairs and the University of Guelph.

HOW DO LOCAL POLICIES SHAPE THE STATUS OF GREEN JOB DEVELOPMENT?

Abstract ID: 1054

Individual Paper Submission

LIU, Haijing [University of Texas at Austin] hjliu@utexas.edu, presenting author

My dissertation aims to explore and understand the geographical distribution and growth trends of green jobs over the past 20 years in the US. Particularly in this paper, I will investigate what are the local employment effects of state and local environmental policies on green employment growth? More specifically, are there differential employment effects of state and local environmental policies by workers' skill level? In addition, I would also like to compare the equity status of green jobs between different localities. Is there evidence of wage discrimination in green jobs and how do state and local environmental policies play into the discrimination effect? The purpose of this analysis is to generate information for policymakers regarding actions that might support the equitable growth of green activities and jobs.

An important inspiration for this dissertation topic is the work of Scott Campbell. While his sustainable development paradigm has gained ground in planning documents and is becoming more institutionalized (Campbell, 2016), the conflicts between environment, equity, and economic development remain prominent in real planning practice. The existing literature is lacking in three aspects. First, many of these studies, especially those focusing on local or city levels, lack a consistent definition and reproducible measures of green activity and jobs. Second, most of the studies treated the various policy instruments as the same and fail to recognize the heterogeneous effect of different policy instruments, especially on the local level. Third, the discussion of the equity aspect of green jobs is limited and in need of further exploration. We need to better understand how policy impacts might disproportionately affect some populations more than others. In the context of "Green New Deal" proposals, this question is particularly important given the fact that many federal-level policies in the past did not adopt community-based approaches and thus have disproportionately affected more marginalized populations (Goh, 2020).

To address these research questions, I will first deploy a descriptive analysis to explore the geographical distribution and growth pattern, as well as the characteristics of green jobs at the local level. The measure of green jobs follows Vona et al. (2019)'s occupational approach. The quality of jobs can be measured by combining the BLS's employment data with IPUMS USA data to obtain information on wages and other job aspects. Second, I will employ a set of fixed-effect models to estimate how different types of policy impact the number of total jobs and green jobs, as well as the wage premium. The key policy variables will come from the Database of State Incentives for Renewables & Efficiency (DSIRE). Finally, I will explore whether discriminations exist among green jobs by using the wage discrimination model to investigate how being in a marginalized group affects an individual's wage level.

THE DRIVERS OF URBAN DECLINE BY SHRINKING TRAJECTORIES: A PANEL ANALYSIS OF 285 CHINESE CITIES DURING 2004-2019

Abstract ID: 1071

Individual Paper Submission

MA, Fengdi [Seoul National University] fengdima@snu.ac.kr, presenting author
YOON, Heeyeun [Seoul National University] hyoon@snu.ac.kr, primary author

The phenomenon of shrinking cities has been in process since the 1950s and has attracted the attention of scholars and practitioners since the 1990s. Previous classifications examining and comparing the trajectories of urban shrinkage mainly focus on population loss, while few studies investigated shrinking trajectories by population loss and economic decline. The periods of previous studies are often split into time intervals for before-and-after comparisons, yet few studies have analyzed continuous time-series data for shrinking trajectories identification. Because the drivers differ by individual city, it is also challenging to identify the drivers of urban shrinkage for understanding the mechanism behind the formation and evolution of shrinking cities. Here, we assumed that there are common factors of such declination among cities that share similar growth/decline trajectories. We first used time-series machine learning to classify the 285 Chinese cities into four groups that share similar trajectories of population and economic changes from 2004 to 2019. Then we estimated the effects of potential drivers on urban growth and decline using panel data regression. The first group is characterized by continued economic and demographic growth; the second one has experienced economic decline but continued population growth; the third group is still growing economically but has experienced population decline; the fourth group of cities has experienced a decline in both populations and economy. Panel data regression revealed that: the shares of secondary industry and tertiary industry have different significant impacts on the population growth in the first and second groups; people employed in manufacturing and averaged wage have different significant impacts on the economic growth in the first and third group; and unexpectedly, average wage growth is associated with population decline in all cities except for the fourth group. This paper advances a more nuanced understanding of shrinkage and provides new and specific evidence to support the planning and design of sustainable cities.

HOW CAN INNOVATION NETWORK STRUCTURE INFLUENCE POST-DISASTER ECONOMIC RESILIENCE?

Abstract ID: 1110

Individual Paper Submission

WEN, Yijia [Florida State University] yw2obn@my.fsu.edu, presenting author

FANG, Kerry [Florida State University] lfang3@fsu.edu, primary author

Innovation promotes economic resilience by creating new business, promoting employment, and improving productivity. Innovation is a social and communicative process, so it is likely to occur in collaboration. The network reflecting how inventors collaborate indicates shared resources, knowledge, and capital between agents. Different network structures exhibit various levels of coordination capabilities and openness. For example, a decentralized network increases access to diverse information and promotes learning, but lacks the effectiveness in coordinating resources and diffusing information, while a centralized network presents the opposite characteristics.

Characteristics of different network structures imply various economic resilience. The economic resilience literature generally identifies two categories for the resilience conception. The first is adaptation. It concerns the capability of an economic system to resist external shock, and bounce back to the pre-shock development path (Boschma, 2015). The second is adaptability. It refers to long-term capabilities of developing new growth paths (Boschma, 2015). The two kinds of resilience present a trade-off relationship (Pike et al., 2010). When a region is efficient in returning to pre-existing path, it may be reluctant to develop a novel growth path, and vice versa (Martin, 2012; Xiao & Drucker, 2013).

Prior studies have examined the impact of innovation on regional resilience (Muštra et al., 2020), but how different network structures influence different dimensions of economic resilience (i.e., adaptation, adaptability), respectively, is understudied. This paper fills in the gap and studies the following research questions: (1) What characteristics of innovation network structures contribute to a region's capability of resisting external shock and recovering to pre-shock conditions (i.e., adaptation)? (2) What characteristics of innovation network structures contribute to the capability of developing new growth paths (i.e., adaptability)? (3) How to balance the trade-off relations and achieve an overall strong resilience?

We use 9.5 million patent inventors' data from U.S. Patent and Trademark Office (USPTO) to construct the inventors' co-patenting networks in all the metropolitan and micropolitan areas in the U.S. from 1990 to 2020. We adopt social network analysis (SNA) to quantify the innovation network structures. Our indicators of network structures include average betweenness centrality, average closeness centrality, average degree centrality, and component ratio.

We identify four kinds of natural disasters (i.e., flooding, hurricane, earthquake and tsunami) as exogenous shocks to examine post-disaster economic resilience. We focus on hazards that cause more than 10 million direct property damages. We collect 1605 disaster records covering 296 metropolitan and micropolitan areas between 1990 and 2020 from the Spatial Hazard Events and Losses Database for the U.S. (SHELDUSTM).

We collect employment data at the four-digit industry code level between 1990 and 2020 from the U.S. Bureau of Labor Statistics. We identify local pillar industries using location quotients before the natural-disaster shock. We use the average change rate of pillar-industries' location quotients before and after the disasters to measure regional economic resilience. So far, we have cleaned all the data and calculated the dependent and independent variables over time. Next step, we will use regression to examine the influence of network structure on different kinds of economic resilience.

The study contributes to economic resilience literature by deepening the understanding of utilizing specific network structural advantages to empower different aspects of resilience. Practically, this study could guide planners to target stimulus packages to optimize innovation network structures and improve overall economic resilience.

DEFINING THE “BLUE ECONOMY”: A REVIEW OF EMPIRICAL APPROACHES TO QUANTIFYING “BLUE ECONOMY” CLUSTERS

Abstract ID: 1114

Individual Paper Submission

SMITH, Christopher [University of Southern Mississippi] cd.smith@usm.edu, presenting author

As the concept of the "Blue Economy" gains popularity, planners and economic developers seeking to assess and forecast the performance of local blue economies face inconsistencies in how the blue economy is defined. In this study, I explore how the blue economy is defined and measured, focusing on identifying common points of conflict in how the blue economy concept is mapped on to standard industrial classification systems. Through a review of literature, I compare and contrast industrial definitions of the blue economy sector. I use the identified blue economy sector definitions to estimate industrial economic indicators for coastal MSAs and to identify blue economy clusters in the United States. I also conduct a case study review of “green economy” literature to identify strategies for reconciling definitional conflicts. Additionally, I explore other indicators and metrics of blue economy industrial performance rooted datasets outside the standard industrial classification systems. My research reveals that many conflicts between definitions of the blue economy sector are rooted in the inadequate coverage of standard industrial classifications of hybridization of traditional maritime industries with advanced technology manufacturing and services fields. My work has implications for the study and practice of blue economic development. My work provides scholars and practitioners with new contextual understanding of prevailing measurements of the blue economy and new strategies for measuring blue economy industrial activity.

NETWORK POWER OR POWER PENETRATED NETWORK? AN ANALYSIS OF THE COMMUNICATION NETWORK IN AN ECONOMIC DEVELOPMENT PROJECT

Abstract ID: 1121

Individual Paper Submission

FANG, Kerry [Florida State University] lfang3@fsu.edu, presenting author
 STALEY, Samuel [Florida State University] sstaley@fsu.edu, co-author
 ERLEBACHER, Gordon [Florida State University] gerlebacher@fsu.edu, co-author

 WEN, Yijia [Florida State University] yw20bn@my.fsu.edu, co-author

Planning theorists have, for long, recognized that communication networks affect planning outcomes (Innes, 1995). However, the theoretical and empirical description of such networks remains largely static, portraying a network structure either as positive (collaborative) or negative (power-penetrated). Collaborative networks engage a wide range of diverse and interdependent community members in authentic dialogue, which allow free exchange of knowledge and opinion, and enable planning to adapt to emerging situations. However, communication networks can also be highly hierarchical, with privileged participants perpetuating their power through the network. They may block knowledge flow, distort information, and manipulate communication to obtain their desired outcomes.

Extant empirical studies have analyzed excerpts of planning communications or mapped communication networks in a snapshot (Lyles, 2015; Wu et al., 2020), but few have documented and analyzed the dynamics of the communication flow for a planning project from beginning to finish (Eräranta and Mladenović, 2021). As a result, our understanding of the communication pattern and power dynamics throughout the planning process is limited. This paper fills this gap.

Using social network analysis and text mining methods, we analyzed the entire collection of email exchanges involving key decision-makers of a local economic development project in the city of Tallahassee over five years—from the start till completion. We visualized and quantified the structure of the communication network during different phases of this project, and identified key individuals with significant power to block or distort information. We also zoomed into key decision-makers to quantify the communication sentiment among them and study how those sentiments shape their decisions. We also specifically examined the shifting roles of planners in the communication network throughout this project.

The preliminary results show that political power has penetrated into the communication network with some key actors holding the power to manipulate information. However, people holding power have shifted across various stages of this development project, and towards the completion of the project, the network has become more decentralized. This power-penetrated network in the study case has resulted in several key politicians engaged in corruptive activities during this project.

This study shows that network analysis can help identify power imbalances in the communication network during an economic development project. With that information, planners can take the initiative to decentralize the network to promote a truly collaborative communication process. This case study also shows the importance for economic development educators to introduce negotiation into their classes (Wolf-Powers, 2013); a power-penetrated negotiation can result in a corruptive project, regardless of how well the technical analyses have been done. Therefore, educating planning students to understand and catch red flags in the negotiation process is no less important than teaching traditional analytical techniques.

OH, Seunghoon [University of Cincinnati] ohs2@mail.uc.edu, presenting author
VOM HOFE, Rainer [University of Cincinnati] rainer.vomhofe@uc.edu, co-author

The impact of transit improvement on agglomeration economies has been studied in regional science and urban planning. However, few studies focused on the relationship between the transit-induced agglomeration and a disadvantaged labor force. This study highlights an equity issue related to economic development associated with transit. To fill this gap, we investigate heterogeneous impacts of the transit-induced agglomeration on job opportunity for employees in different skill levels and service sectors. In Philadelphia, PA, recent urban revitalization projects have recruited multinational firms, which consequently concentrated high-skilled jobs to the transit-rich urban central areas. The Location Quotient (LQ) is an indicator for job opportunity by skill level and industry, and the effective density represents transit-induced agglomeration. We use spatial econometric models to estimate direct and spillover impacts of effective density on LQ for low- and high-skilled jobs and different industries. Results show that transit-induced agglomeration has a negative direct effect on low-skilled jobs, and a positive direct effect on high-skilled jobs. These results imply that the development strategy heavily favored high-tech and knowledge-based firms,

which concentrated high-skilled workers while low-skilled workers became underrepresented in the urban core areas. This could undermine the transit-dependent low-skilled workers' accessibility to job opportunity. The spillover effect on low-skilled LQ is positive, which implies that resources and investments were concentrated in enclaved revitalized zones leaving the neighboring areas in decline. The revitalizations projects may have caused uneven and inconsistent local economic conditions across the metropolitan area.

Globalization and technological change have had profound impacts on urban systems worldwide, generating winners and losers and contributing to rising intra- and interurban inequality. This is particularly visible in the United States, where scholarly studies and media reports suggest that along with these processes firms and governments have “left behind” smaller, isolated city-regions, while concentrating high-income jobs and resources in the most dynamic urban areas. Empirical evidence reveals strong concentration process of economic activity in these city-regions, whereas systematic investigations of shifts in the linkages between the large dynamic regions and smaller less-advantaged regions have been relatively limited. Using the unique LexisNexis Corporate Affiliations database, we construct a network of subsidiary linkages that covers the entire U.S. urban system and analyze changes in this network through investment and disinvestment decisions between 1993 and 2017. Using social network techniques, we i) characterize how the geography of firms' linkages within the U.S. urban system and around the globe has changed over time and ii) identify how these changes are related to employment, income and demographic patterns. We identify a complex typology of the changing role of city-regions within the urban system, beyond simply winners and losers.

WHERE DO WE GO FROM HERE? ENTREPRENEURS' POST-INCUBATION LOCATION DECISIONS

Abstract ID: 1392

Individual Paper Submission

CLAYTON, Paige [Georgia Institute of Technology] paigeclayton@gatech.edu, presenting author

Entrepreneurs are decidedly rooted in place when it comes to making decisions about where to start or relocate their firms. They are apt to choose the region that is 'home' (Dahl & Sorenson 2012; Figueiredo et al. 2002). This phenomenon flies in the face of economic theory that predicts entrepreneurs should city-hop, seeking the city that

will maximize profit. Economic developers should care about where firms locate because location decisions affect firms' innovation capacity (Ferreira et al. 2017) and other metrics of success (Vedula & Kim 2019). These in turn impact the economic trajectories of regions.

Attachment to place is not the entire story of firm location, as is evidenced by the many successful immigrant entrepreneurs (Huang & Liu 2019). Entrepreneurs need a variety of specialized resources and access to capital (Stephens et al. 2019) that, as much as they wish, may not be available in their desired locale. Scholars have found support for location explanations such as the role of sector (Ferreira et al. 2016), regulations (Rohlin et al. 2014), universities (Audretsch & Lehmann 2017; Donegan & Lowe 2020), commute (Backman & Karlsson 2017), urban 'third places' (Fang et al. 2022), crime (Matti & Ross 2016), visual appeal (Smit 2011), and serendipity (Berg 2014). The most well supported reason for why firms, new and incumbent, locate where they do is the benefits of agglomeration economies (Marshall 1920; Jacobs 1969). Such economies operate below the city level, even at the neighborhood and individual building level (Adler et al. 2019; Rosenthal & Strange 2020). Agglomeration economies bolster the arguments for entrepreneurial support organizations (ESOs) like incubators and accelerators that bring start-ups together to learn from mentors and experts.

Co-location in ESOs is important for developing social networks (Brennitz et al. 2018) and accessing resources (Amezcuca et al. 2013; Clayton et al. 2018; Hallen et al. 2020) and has urban economic development impacts (Madaleno et al. 2022). One unexplored element is the influence of local ESOs on entrepreneurs' location decisions. How the proliferation in the number of ESOs in the past decade has influenced the geography of local entrepreneurship is an open question, as well as how these organizations impact their participants' subsequent location decisions. This paper takes up the latter question.

Specifically, the paper traces start-ups' post-incubator locations to understand how local ESOs shape the geography of local entrepreneurial ecosystems. The paper hypothesizes that location decisions may be grouped into three motivations: 1) economic, 2) home/place-bias, and 3) external forces (e.g., VC requires a move to their location). To study movement patterns the paper provides an in-depth, quantitative analysis of start-ups in Atlanta Georgia, a growing technology hub. The paper compares location decisions over the past 10 years for firms that used two different types of incubators (one university based and one private located in different neighborhoods). The paper's quantitative, empirical analysis uses a new dataset on Georgia entrepreneurship (PLACE: Georgia) that combines data from National Establishment Time Series, business registrations, web scraped ESO participation archives, Crunchbase, Patents View, company websites, and others, supplemented with informational interview data.

Preliminary analysis of firm moves indicates most movement occurs within metropolitan Atlanta, to the northeast economic region of the state, and out of state. The contributions of this paper are, first, to advance theory on the geography of entrepreneurial ecosystems and firms, and second, to add to the literature on entrepreneur location decisions a consideration of the role of ESOs. The paper concludes with practical implications for local economic development practitioners seeking to support entrepreneurship and technology-based economic development activity that is spatially inclusive.

JOB TRAINING AND CLIMATE JUSTICE: PAVING THE WAY FOR VULNERABLE RESIDENTS

Abstract ID: 1393

Individual Paper Submission

HADDAD, Monica [Iowa State University] haddad@iastate.edu, presenting author
WERNER, Edmundo [London South Bank University] dewernae@lsbu.ac.uk, co-author
SICK, Alexandra [Iowa State University] asick@iastate.edu, co-author
STEPHENS, Joshua [Iowa State University] joshuas3@iastate.edu, co-author

On his first day in office, President Biden rejoined the Paris Agreement, which highlights the importance of a national approach to climate change mitigation, one that seeks to further climate justice, as it “tak[es] into consideration vulnerable groups, communities and ecosystems,” and “integrat[es] adaptation into relevant socio-economic and environmental policies and actions, where appropriate” (United Nations, 2016). Additionally, President Biden signed a series of environmental executive orders on January 27, 2021, which will be “empowering American workers and businesses to lead a clean energy revolution that achieves a carbon pollution-free power sector by 2035”. The creation of clean energy jobs (henceforth green jobs) is central to these executive orders, which will be implemented on different scales and locations across the country. Considering that climate mitigation efforts can unfold on a variety of scales, this study focuses on the local level.

One of the pillars of climate change mitigation should be climate justice, as this framework can foster “a ‘just transition’ to a post-carbon economy and [provide] assistance to disadvantaged communities” (Schlosberg & Collins, 2014, p. 366). If efforts to mitigate climate change are implemented in ways that do not further justice, then the post-carbon economy will replicate the current unequitable global socio-economic structure. Seeing as the built environment contributes to 59% of greenhouse gas emissions, it is imperative to promote changes in cities to move towards carbon pollution-free cities (Fitzgerald, 2020; Mi et al, 2019). In the context of climate justice, such changes can consist in making green jobs available to those who need them the most.

This study investigates how training programs can include disadvantaged residents in the green workforce through training for local “green” jobs. The following research questions are posed: How do local organizations attempt to respond to climate mitigation in ways that promote justice by implementing workforce development and training programs to include disadvantaged residents in the green economy? How do local organizations interact with city governments in the process of implementing green workforce development and training programs?

To answer these questions, we compared 14 different green job training programs across the U.S., conducting in-depth interviews with program staff and analyzing contents of the program materials available online. Examples of such programs are: a program that connects people who have workforce barriers to sustainability-related careers, and another large city’s workforce development program that collaborates with the city’s public housing residents and the sustainability office to work towards carbon emission goals. Using NVivo software, our analysis examined codes such as stipend, partnerships, wraparound services. With the aim of providing good practice on green jobs training initiatives, our findings could assist urban planners and public officials interested in learning how to combat climate change in ways that include disadvantaged residents in the local green economies.

KELMENSEN, Sophie [University of North Carolina at Chapel Hill] sophiekelmenson@gmail.com, presenting author
KUMAR, Tanu [Urban Manufacturing Alliance] tanu@urbanmfg.org, co-author
LOWE, Nichola [University of North Carolina at Chapel Hill] nlowe@unc.edu, co-author

“The Great Resignation,” and employers’ struggles to hire and retain workers spotlighted poor working conditions in the United States. And while the pandemic may be sunsetting, climate change is only just beginning to rise, bringing even more economic restructuring. It is time for new economic thinking.

One paradigm to abandon in the transition to innovative, equitable, and sustainable futures is the “skills-mismatch” explanation for income inequality. This flawed theory suggests that impoverished workers struggle because they lack in-demand skills or the right education credentials, rather than because employer practices suppress wages or keep

quality jobs inaccessible, particularly for workers of color. Coded language for certain skills and discourses of individual responsibility enable employers to justify occupational segregation and wage suppression and to jettison their responsibility to invest in worker skills and career mobility (Wurhust et. al., 2017; Cottom, 2017; Iskander, 2021).

As these critiques imply, skill is not simply the outcome of individual effort or applied learning. It is a contested concept that can demean and debase some workers, while holding up others' contributions. An alternative to skills-mismatch theory does not reject skill. It recognizes mediating institutions that engage employers around the evolving politics of skills by shaping its interpretation and building mutual responsibility for its development.

We present research in support of a new institutional construction of skill, meaning that institutions may influence and support skill reinterpretation for the benefit and inclusion of frontline workers. While others (Wurhust et. al., 2017) analyze social constructions of skill, an institutional reframing analyzes the “ecosystems and exoskeletons” surrounding firms that influence and condition workforce development (Lowe, 2022). We examine the constellation of partners supporting workforce development who foster inclusive innovation by using the ambiguity of skill to jointly (re)construct systems that uphold skill as an avenue for workforce gains and improved business and organizational strategy, particularly in light of technological change.

We feature four case studies of different aspects of a new institutional construction of skill in advanced manufacturing settings. Qualitative interviews across ecosystems of organizations, including firms, workforce intermediaries, education partners, business associations, and community organizations, show how partners influence inclusive innovation. In Buffalo, intra-regional institutional threads buttress implementation of robots that absorb “dull, dirty, and dangerous” roles, leaving higher-paying, rewarding responsibilities to people in communities experiencing the impacts of historic disinvestment. In Orlando, pathways out of low-quality hospitality and service roles and into and into family-supporting career pathways in advanced manufacturing reflect cross-sectoral institutional mechanisms. In Baton Rouge, pathways into existing career opportunities in the energy sector with an eye towards renewable energy futures exhibit cross-temporal threads. Finally, a national virtual reality training company demonstrates an enterprise-oriented approach to build clear career pathways for previously difficult-to-fill roles.

For practitioners, these cases identify important institutional mechanisms for generating and sharing resources that elevate worker priorities, but benefit firms as well, with potential for regionally-reinforcing positive returns. For theory building, these cases initiate a working understanding of the construction of institutions that influence inclusive and innovative behavior within and across firms.

AIRPORT-LINKED ECONOMIC DEVELOPMENT IN A VUCA WORLD: EVIDENCE ON DYNAMIC CHANGES IN THE BIRTH OF ENTERPRISES FROM SINGAPORE

Abstract ID: 1527

Individual Paper Submission

MURAKAMI, Jin [Singapore University of Technology and Design] jin_murakami@sutd.edu.sg, presenting author
LIN, Shuyan [Singapore University of Technology and Design] shuyan_lin@sutd.edu.sg, co-author

Before the COVID-19 pandemic, cities worldwide tended to concentrate multibillion-dollar investments in hub airports as transportation nodes to manage global traffic growth and as employment subcenters to drive local economic growth. According to a series of urban location theories, the development and management of airport transportation systems were supposed to reduce system operating costs, expand intercity access to numerous resources and markets, attract speed-sensitive firms/tourists, and produce business opportunities and innovations in and around airport districts, called “Airport City,” as well as airport-connected economic zones/business centers and corridors, called “Aerotropolis.” The vision of airport-linked economic development, or the Airport City/Aerotropolis development model, has gained political priority from city leaders and policy makers in Asia and the Middle East for

global competitiveness and entrepreneurship. On the other hand, several scholars and planners have questioned the long-term sustainability of such aviation-centric economic development models in a volatility, uncertainty, complexity, and ambiguity (VUCA) world (e.g., Charles et al., 2007).

Indeed, a variety of contemporary business studies have addressed growing concerns about the significance of globally disruptive forces (e.g., financial crisis, pandemic, natural disaster, terrorism, war) in influencing the development, management, and/or performance of urban systems across sectors, including air transportation, trade and supply chain, and tourism in the presence of VUCA conditions (Gudmundsson et al., 2021; Mack et al., 2015; Uğur and Akbiyik, 2020). While public policy responses to global risk exposures appeared to vary per region, country, or city under different geopolitical circumstances and cultural norms, the nonlinearity and unforeseeability of future demand for intercity mobility/connectivity (flows and interactions) commonly necessitate proactive city leaders and strategic policy makers to take not only more “integrated” systems solutions across sectors at multiple geographic scales but also more “adaptive” planning approaches to airport-linked economic development under changeable conditions (Kwakkel et al., 2010). Nonetheless, there is still a paucity of long-term information and in-depth knowledge of the interplays between globally disruptive forces and urban business transformations for systemic and flexible investment decisions in cities with hub airports based on possible development scenarios.

To fill the information and knowledge gaps, this research attempts to provide scientific evidence on dynamic changes in the birth (and/or death) of enterprises using a case study method. More specifically, the empirical work spatiotemporally visualizes and statistically estimates binomial probability (1/0) from the ACRA business registration dataset for key industrial sectors across the island-wide commercial territories and airport-linked planning units of Singapore with the development and management of world-class transportation and land use systems, in response to a series of global risk events (or selected disruptive forces) over the last three decades (since the 1990s), covering the global financial crisis and pandemics. The uneven distribution patterns of changes in the birth and/or death of multi-scale business entities (e.g., high-tech manufacturing and advanced business services in airport-linked industrial parks and local retailers and restaurants in airport-linked major hotel districts and tourism destinations) are very likely to indicate both the effectiveness of massive airport system investment for the global competitiveness of cities and the criticalness of adaptive transportation-land use rezoning coordination (as well as flexible governmental assistance and inclusive financial support) during emergencies for the long-term sustainability of airport-linked economic development or the Airport City/Aerotropolis development model in a VUCA world.

URBAN RESTRUCTURING OF TOKYO AND MONETARY EASING AS DEVELOPMENTAL STATE INTERVENTIONS

Abstract ID: 1611

Individual Paper Submission

KAMIZAKI, Kuni [University of Toronto] kuni.kamizaki@utoronto.ca, presenting author

Tokyo faces a looming condition of “post-growth” (Hirayama & Izuhara, 2018) marked by decades-long deflation, population aging, growing care gaps, and nation-wide population decline projected from the current 126 million to 88 million by 2065. Despite the inevitable shrinkage, however, Japan’s developmental state continues to (re)develop central Tokyo where over 300 urban revitalization projects are underway. While the developmental state has historically marshalled land development and Tokyo’s world city making as a vital engine of national economic growth (Machimura, 1992), urban restructuring of central Tokyo has gained a heightened significance for the developmental state in the time of post-growth.

What planning and policy tools has the developmental state mobilized to intensify massive spatial restructuring of central Tokyo as a way to overcome limits to growth? What economic growth imaginaries are produced and

materialized by the urban restructuring processes? This paper examines these questions with due consideration to the role of Bank of Japan's unconventional monetary easing (e.g. quantitative and qualitative easing) in economic development strategies. Growing impacts of monetary easing warrant a critical scrutiny for understanding the role of public finance in relation to financialization and urban redevelopment (August et al, 2021). To answer these questions, this paper draws on qualitative data from policy reports and semi-structured interviews with Tokyo's development experts and policy planners. This paper also analyzes statistical data from the Bank of Japan and the Japan's Association for Real Estate Securitization.

The paper argues that unconventional monetary easing, coupled with a special economic zone program and fiscal investments in infrastructure renewals for Tokyo Olympics & Paralympics 2020, has created a condition for speculative urbanization in central Tokyo. The monetary base expanded considerably from JPY109 trillion in 2010 to JPY540 trillion (about \$5 trillion) in 2020, while the ratio of real estate investment relative to the GDP reached the highest in the last 40 years. Numerous world city projects are remaking Tokyo in the name of efficient circulation to attract global capital and tourists. Planners envision that increasing the speed of people's flow across places, despite depopulation, would break the condition of economic stasis. Under the context of abundant money supply, regional banks in Tokyo's peripheries are increasing their translocal investments in Japan's Real Estate Investment Trusts (REITs) whose assets tend to concentrate in central Tokyo. This paper demonstrates uneven effects of monetary easing that has deepened socio-spatial inequalities between central Tokyo and its peripheries. This is a challenge that planners have to confront in responding to dramatic population changes, as Japan's post-growth condition is not an exception but prefigures systemic crises and peak populations among other economies where massive monetary easing has become integral to government's economic strategies.

MOTOYAMA, Yasuyuki [The Ohio State University] motoyama.1@osu.edu, co-author
PARK, Seungbin [The Ohio State University] park.2897@osu.edu, co-author

The COVID-19 pandemic has had many significant impacts on the global, national, and local economies. Current estimates suggest that upwards of 100,000 retail businesses and outlets have closed as a result of the pandemic. In this presentation, we present findings from our study of the impact of COVID-19 related college and university campus shutdowns on area retail. Given that student-oriented retail has grown as a strategy for campus-adjacent commercial development, we are hypothesizing that the sudden shutdown of many college and university campuses in March 2020, and subsequent delayed or hybrid campus reopening in the subsequent academic terms, presented student- and campus-dependent retail with a higher-probability of closure than their non-campus adjacent counterparts. Using data on campus closures and reopenings from Ann Arbor, Michigan and New Haven, Connecticut, and pre- and post-pandemic retail data derived from Yelp! we will present both exploratory and results from logistic regression analysis to identify the relationship between campus-adjacent retail and closures. Using a spatial buffer to distinguish between campus adjacent businesses and all other businesses, our preliminary exploratory analysis shows higher closure rates closer to campuses. This research supports the premise that college and university campus-facing retail is highly sensitive to campus planning, operations, and growth. The abrupt closures and shifts in modes of instruction may hold lasting consequences on university-driven commercial development, campus adjacent revitalization efforts and the attractiveness of campus-adjacent neighborhoods for off-campus housing and student living.

IMPACTS OF PROXIMITY TO FIXED-GUIDEWAY TRANSIT SYSTEMS ON THE LONGEVITY OF BUSINESSES IN THE CENSUS MOUNTAIN DIVISION

Abstract ID: 1636

Individual Paper Submission

KIM, Keuntae [University of Utah] kimprins@hotmail.com, presenting author

In the U.S., approximately twenty percent of new businesses have experienced business failure within one year since 2005. Given that the physical location of a business establishment represents the extent of its accessibility and performance to deliver products or services to customers, it is important to identify factors affecting whether, and if so, how much business establishments can fail in the market over time.

Emerging in ecology, the term resilience has been widely accepted by urban planners in a variety of contexts, primarily in climate change and natural disaster planning research. From an urban economic perspective, the concept of economic resilience can be measured by changes in the duration of businesses in response to their individual characteristics and their surroundings. Nevertheless, due to limited availability of time-series business microdata, there have been only a few studies that examines factors affecting the probability of business survival. Particularly, almost no studies on the impacts of fixed guideway transit development on change in the probability of business survival exist due to a lack of conceptualization and an operational research framework for measuring business survival as a measure of economic resilience (Martin & Sunley, 2015).

To achieve this research goal, this study explores the effects of proximity to fixed-guideway transit systems on the duration of business establishments in three urban areas within the Census Mountain Division as case studies. How do fixed-guideway transit routes affect the longevity of new and existing businesses as a proxy measure for the extent of economic resilience?

Using survival data analysis techniques, this study estimates the likelihoods of each business establishments being survived longer depending on proximity to its nearest fixed-guideway transit stations--that is, a light rail transit station. This study assumes that the estimated hazard ratios of business failure as an event can be determined as a function of the distance from their nearest fixed-guideway transit station, showing that business establishments located close to fixed-guideway transit stations are more likely to survive longer and expansion of high-quality fixed-guideway transit systems can play a significant role in strengthening the overall economic resilience. Using 0.5 million ReferenceUSA business microdata for three urban areas--Salt Lake-West Valley, Utah, Denver-Aurora, Colorado, and Phoenix-Mesa, Arizona, this study develops a set of survival data models to test impacts of transportation infrastructure on increasing the duration of business establishments over different time periods and to different business cohorts.

The multilevel cohort-based survival data regression model results show that business establishments located near the fixed-guideway transit station are more likely to have the lower hazard ratio of business failure, meaning that the probability of a business establishment being failed in the market can be determined as a function of distance from the fixed-guideway transit station. Frailty scores of business closure estimated from the Cox Proportional Hazard Ratio regression models suggests that Census block groups close to the LRT stations tend to have lower hazard ratios of business failure across all business cohorts. Prediction of frailty scores using the survival data regression models can help planners and decision-makers develop more targeted policy development for sustainable economic development and establish an in-depth understanding of the feasibility of transit-oriented development in terms of business survival.

MAKING A MOVE: PANDEMIC PLACE-MAKING, TALENT ATTRACTION AND ECONOMIC DEVELOPMENT

Abstract ID: 1679

Individual Paper Submission

VINODRAI, Tara [University of Toronto] tara.vinodrai@utoronto.ca, presenting author
MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, co-author

Prior to the global pandemic, there was consensus that city-regions play a key role in anchoring and coordinating the global economy. Cities – especially larger ones, but also their mid-sized counterparts – were viewed as important sites for the generation of new ideas, products, and firms. Moreover, firms in newer tech-based industries have tended to favour urban locations to access talent, knowledge infrastructure, and other critical amenities and resources. The advent of the pandemic has led to debate over the future of cities as the primary engines of economic growth, innovation and development (Bailey et al. 2020; Nathan 2020; Florida et al. 2021). Driving this point home, several prominent tech companies, including Shopify and Facebook, announced very early in the pandemic that they would be shift a high proportion of their workforce to remote work. And indeed, several analysts suggested that a high proportion of work could be conducted off-site (Dingel and Neiman 2020).

While the debate about the locational choices and organizational practices of firms remains an open question, individual jurisdictions were not passive agents standing on the sidelines as firms made decisions regarding their workforce. Indeed, economic development offices across the United States and elsewhere began to develop strategies for attracting a presumed group of suddenly mobile workers. One widely reported upon platform, MakeMyMove.com, became a clearinghouse for communities that had established such programs. The landing page for the MakeMyMove website announces, “Get paid to do what you love, in a place that you love. Communities across the U.S. are paying remote workers to relocate.” The onset of the pandemic accelerated an already existing trend whereby second-tier cities and smaller communities introduced incentive packages to attract highly skilled workers to their communities. Some places, such as Tulsa, Oklahoma, were early adopters of this strategy: Tulsa Remote was designed with a \$10,000 cash incentive to assist remote workers in moving to and buying a home in their community. The Tulsa campaign is widely acknowledged as one of the first campaigns to specifically attract remote workers. However, since March 2020, the number of jurisdictions using this particular strategy has multiplied, as many office-based workers found themselves working from home with no clear idea of if – and when – they may return to their office. Due to the relative novelty of such programs, very little is known about the contours of these programs and how cities positioned themselves to attract footloose talent.

In this paper, we examine the incentive relocation programs for 63 jurisdictions listed on MakeMyMove.com. The website features structured details about the communities, their incentive packages, and eligibility criteria. We systematically classified and coded the information presented, including key amenities and lifestyle features. We then analyzed the content of the website to glean how communities positioned themselves, through the use of financial and other incentives, cultural amenities and other place-based assets. Overall, our analysis provides a window into the contemporary landscape of incentives aimed at a highly skilled, remote workforce rather than firms. It is instructive regarding the types of incentives used and how jurisdictions use tropes related to the ‘creative class’ imaginary. We also frame our findings in terms of the much longer debate in economic development planning regarding talent attraction, noting that this current round of economic development practices build on traditions developed over two decades.

Arts and cultural planning, a sub-field of city and regional planning, has become an increasingly adopted component of economic and community development strategies. Arts and cultural programming and investments contribute to placemaking, neighborhood redevelopment, downtown revitalization, healthy communities, and historic preservation, although critics point out that many of the positive economic impacts of such efforts support economic growth for the elite rather than an expanded set of constituencies and communities. In many cities in the US, these efforts are guided by municipal-level arts and cultural planning documents, which are often generated outside of traditional planning offices and departments. Previous research has explored how these municipal arts and cultural plans address issues of diversity, equity, and inclusion, draw upon universities and colleges as arts anchor institutions, and plan for placemaking and placekeeping. Yet we still know little about the motivations, processes, actors, and impacts behind the creation of these plans. In this study, we investigate why and how communities create arts and cultural plans; how different stakeholders view the importance of these plans; how they are connected to general planning practice; their long-term contributions and concerns; and barriers to implementation.

In this paper, we report the results of a national electronic survey conducted in spring 2022 of US city planners and arts and cultural planners in 64 cities with arts and cultural plans for a total population of 128 practitioners. Our survey asks about the roles of different actors in arts and cultural planning processes; how different local government actors use the plan; how well the plan aligns with actual arts and cultural activities; and to what extent and in what ways the plan has been implemented (and barriers to implementation). We hypothesize that arts and cultural plans are on the periphery of more traditional planning practices and that priorities differ between general planning departments and those departments or bodies that conduct arts and cultural planning. We expect these thematic or topical plans to be less well-utilized by general planners given that they tend to have more of a marketing philosophy and are less connected to the master, general, or comprehensive plans that guide overall city growth and development. However, we think that there is great potential for arts and cultural planning and general planning to align to address economic, equity, and cultural goals and for arts and cultural plans to be a more robust tool for cities and communities, just as parks and recreation plans or transportation plans may align with or act as components of a comprehensive plan. We expect the results of this applied research to contribute to practical knowledge to improve collaborations between sectors as well as contribute to a better theoretical understanding of the role of arts and cultural planning in the planning field at large. We also hope this research will contribute to scholarly debates about the nature of plan implementation.

DOES TECHNOLOGICAL GROWTH-INDUCED MIGRATION LEAD TO INCOME CONVERGENCE? THE CASE OF INDIA'S EARLY 2000S TELECOM BOOM

Abstract ID: 1771

Individual Paper Submission

DUTTA, Arnab [University of Southern California] arnabdut@usc.edu, presenting author
RANDOLPH, Gregory [University of Southern California] grandolp@usc.edu, co-author

Does the growth of virtual communication technologies enhance or diminish the pull of cities for migrants? Do changes in migration patterns following technological shocks influence income convergence across regions? Social scientists, in particular urban economists and economic geographers, have been asking these questions since the 1990s (Gaspar and Glaeser, 1998, Moretti, 2012, Storper and Venables, 2004). We address these issues in this paper by studying the impact of mobile phone infrastructure expansion or telecom expansion on internal migration in India following the 2001 auction that allocated licenses to mobile phone service providers, or telecom operators, bidding for the 1800 MHz band of spectrum, and explore the implications of technology-induced mobility for income convergence across urban areas of India. We demonstrate that India's telecom expansion during the early 2000s increased net rural to urban migration by 13 million, out of which 4 million moved for employment. Next, we find that the wealthiest 20% of Indian cities received the most migrants, and hence, felt the greatest impact of the resulting labor supply shock. This should have led to income convergence, *ceteris paribus*. However, we find that telecom growth-induced mobility increased the inter-urban nominal consumption and wage dispersion by 0.02 standard deviation points. We argue that skill-based sorting of migrants could partly explain the migration-induced income divergence. We find that rural residents with STEM education were 0.7 percentage points more likely to move to urban areas than those without STEM education, because of the telecom shock, even though both groups earned a similar migration premium of almost 50%. We speculate that this skill-based sorting occurred due to highly skilled individuals having more access to mobile phones, a telecom-growth induced change in the industry mix, and the relocation of firms employing low-skilled labor from urban to rural areas. More broadly, our findings indicate that technological change can influence the structure of urban economies, the pace of urbanization, and the types of migrants drawn to cities, which has implications for urban housing policies and economic development.

ARE POLICIES LOOKING FOR PERSISTENTLY HIGH-GROWING FIRMS FUTILE? : THE VARIANCE IN THE GROWTH PATTERNS AMONG SMALL- AND MEDIUM-SIZED HIGH-GROWING FIRMS IN SOUTH KOREA

Abstract ID: 1860

Individual Paper Submission

JUNG, Namji [Seoul National University] pinkcloudsoo@snu.ac.kr, presenting author

There is an ongoing fascination with high-growing firms in the public domain. Thus, many policy initiatives or policy-related studies have strived to identify firms that sustain high-growth for a stretched period of time. Existing empirical studies, however, have consistently found that high-growth firms (henceforth HGFs) are short-lived one-hit wonders (Holzl, 2013; Coad et al, 2014). This is more likely so for small- and medium-sized enterprises (SMEs) because of their limited internal resources to repeat the high-growth within a short period of time. However, this aspect has been less discussed so far.

To fill the chasm, this research explores different growth patterns of high-growing SMEs. More specifically, it looks at the annual growth rates of HGFs after drawing HGFs by using the OECD definition. While there is no concrete agreement made on how to define high growth firms, the OECD definition is the one that has been commonly used both in policy and research circles: 'all enterprises with average annualised growth greater than 20% per annum, over a three-year period, and with ten or more employees at the beginning of the observation period (Eurostat-OECD, 2008, p 61)'. It measures firm growth by taking the mean growth rate, or size difference between the starting year and the ending year.[1] Therefore, it omits the naturally occurring ups and downs of firm growth within the three-year

observation period.

Building on the OECD definition, this research will perform another level of analysis to complement what we currently overlook: the annual growth rate of HGFs within the three-year period. In doing so, this research will use the small and medium-sized firm data for eight major cities in South Korea between 2017 and 2020.

The results show that even during a three-year observation period, HGFs exhibited different growth patterns which are associated with firm characteristics. Most micro-HGFs achieve only one-time sharp growth (more than 72.8% at once, One-time HGFs). HGFs that are bigger and more mature show two times of high-growth during the observation period (Two-times HGFs). More than 80% of HGFs are One-time HGFs while Two-times HGFs are only 12%. Lastly, firms that sustain their high-growth for three consecutive years (Three-times HGFs) accounted only for approximately one percent.

It is revealing that, unlike the policy preference, most SMEs cannot sustain their high-growth in a consecutive manner even for three years. A large proportion of SMEs can achieve high-growth only once but their growth rate is high enough to be equalized with the rate of 20 % annual growth for three years. These results resonate with the existing empirical studies arguing that HGFs are short-lived one-hit wonders. On the other hand, it debunks the relevance of the policy direction that trying to target persistent high-growing firms. This policy preference might be misled by the tiny minority cases of exemplary HGFs such as Apple, Google, and Amazon. If most HGFs can sustain their high-growth only for such a short period, then the HGF related policies aiming to find sustainable growing firms, particularly in the context of SMEs, should be reoriented. This research concludes by discussing some alternative policy directions.

[1] The Eurostat-OECD manual (2008) states that ‘It is sufficient to consider only the population of active enterprises reaching the employee threshold (Nt) in year xx-3 and to measure the number of employees in year xx’ (p61).

SPURLOCK, Danielle [University of North Carolina at Chapel Hill] dspurloc@email.unc.edu, presenting author
BAILEY, Adams [University of North Carolina at Chapel Hill] adamsbn8@live.unc.edu, co-author
WILSON, Matthew [University of North Carolina- Chapel Hill] mwilson2@live.unc.edu, co-author

In metropolitan economies across the U.S., racial and economic residential segregation, fragmented networks of social capital and cohesion, elevated housing costs, and stagnant wages contribute to a substantial and widening racial wealth gap that burdens Black and Latinx individuals, families, and communities (Bhutta et al., 2020). Local stakeholders often portray aggregate economic growth as a panacea that will alleviate economic inequalities, address social problems, and provide widespread opportunity — justifying business attraction strategies instead of investments in communities (Kantor et al., 1997). Displacement fueled by tech-sector fueled growth will disproportionately affect marginalized communities (Parilla & Liu, 2018; Zandiatashbar & Kayanan 2019), and the absence of discussion centering Black and Latinx workers in local economy implies acceptance of this consequence.

In 2017, Amazon released a request for proposal (RFP) for its new second headquarters. They received responses from entities such as municipal and state governments, chambers of commerce, and business alliances who each justified why their jurisdiction was an ideal location for Amazon’s HQ2, its estimated \$5 billion investment, and the approximately 50,000 jobs with an average salary of \$100,000. The RFP outlines Amazon’s preferences and criteria, such as a population of over one million people; a downtown project site; a suitable labor force; fiber internet infrastructure; a stable business climate; and transportation connectivity. Additionally, the RFP lists “Cultural Community Fit” as one of eight key decision drivers. Within this category, Amazon states it values the “presence and support of a diverse population”. The RFP, however, does not elaborate on its definition of “a diverse population” or give indications of how cities might respond to the prompt. Without guidance on how to respond to this element,

competition for Amazon's HQ2 presents an opportunity to observe how local stakeholders define and portray diversity in their firm recruitment.

This project uses diversity ideology as a framework to examine how proposals for Amazon's second headquarters (HQ2) reflect applicants' beliefs and value systems around racial and ethnic diversity, equity, and inclusion. In our sample of 70 proposals, respondents layered four primary tactics: disregard, limited engagement, acknowledgement without culpability, and value claiming. Prominent approaches included avoidance of any discussion of diversity, objectification of racial and ethnic minority populations as an economic or cultural input, and the assertion a racially and ethnically diverse workforce is an attainable goal while utilizing stereotypes. Each of these approaches reflects different ways racial and ethnic minority populations remain marginalized, even when firms actively solicit information on their presence and support.

Equitable economic development encompasses the capabilities of individuals to find meaningful careers, achieve mobility, avoid displacement, and enjoy high-quality of life. Atlanta, Georgia's proposal dismissed concerns of racial injustice by referencing its historic label as a "city too busy to hate". Many proposals echoed this ethos: productive, progressive, international metropolises where diversity is present but unobtrusive, and where prejudice and injustices are artifacts of the past. Our analysis suggests persistent support for the creation and reinforcement of a hierarchy using a growth model, which does not value the individual employee, let alone historically marginalized populations.

Our coding framework can be applied broadly to economic development initiatives, plans, and policies. Local policy makers involved in local economic development can reflect on current practices and refocus goals to include equity and justice principles, centering the experiences of marginalized groups as a central tenet of success, instead of narrowly focusing on growth as an isolated goal (Fainstein 2010).

CAN YOUR ZIP CODE HELP YOU FIND A JOB? AN EXPLORATION OF NEIGHBORHOOD FACTORS AND (RE)EMPLOYMENT

Abstract ID: 1887

Individual Paper Submission

RENSKI, Henry [University of Massachusetts Amherst] hrenski@larp.umass.edu, presenting author
FORBES, Allison [Center for Regional Economic Competitiveness] aforbes@crec.net, co-author

This study uses a unique micro-dataset of unemployment insurance (UI) program participants to study how personal and neighborhood factors influence one's chances of returning to employment. We draw upon the economic mobility, occupational change, and workforce development literatures to develop a conceptual framework for understanding how personal, spatial, social, and institutional factors shape one's employment prospects. Building upon this framework, we estimate a multi-level model where personal attributes combine with neighborhood contextual factors to determine the likelihood of (re)employment using data from the Colorado unemployment program tracking system for the pre-COVID years of 2017 through 2019.

Although purely correlative, our analysis reveals several interesting insights. First, and not surprisingly, personal attributes are the dominant predictors of (re)employment. Educational attainment has the largest positive impact, with age, race (black), ethnicity (Hispanic), and gender (female) also having positive and significant effects. In contrast, displaced homemakers, low-income individuals, and persons with disabilities are at a profound disadvantage in finding employment. Participants in UI-related training programs also have a higher chance of (re)employment, as are those living in areas with higher transit use. However, we cannot say for certain whether it is

superior transit access that helps them secure employment, or some related factor. Place-bound social influences also shape one's ability to capitalize upon meaningful job opportunities. Neighborhood wealth is positive and significant to (re)employment, although the education level of one's neighborhood is not. Likewise, while overall area poverty rates are insignificant, high poverty among one's own racial group lowers chances of finding employment – providing possible evidence of the importance of social networks within one's likely peer group over general area characteristics.

WHEN MATURE CLUSTERS INNOVATE: TRACING HIGH POINT'S TRANSITION FROM SEASONAL FURNISHING RETAIL TO AN EMERGENT DESIGN-HUB

Abstract ID: 1901

Individual Paper Submission

TASSI, Francesco [University of North Carolina at Chapel Hill] ftassi@unc.edu, presenting author

TEWARI, Meenu [University of North Carolina at Chapel Hill] mtewari@email.unc.edu, co-author

How and under conditions do mature clusters transform and remake themselves? What are the mechanisms through which innovation occurs, especially in places where the inertia of old identities and prominent historical legacies can create resistance to change and promote status quo?

The creation of extra-local, bridging ties, some argue, can help mature clusters overcome the 'paradox of embeddedness' (Uzzi 1997, Granovetter 1983; Grabher 2005; Stolarick and Florida, 2006). Others argue that changes within local institutional environments can shape a cluster's capacity for adaptation and dynamism (Hassink 2010). Yet others point to the importance of entrepreneurial intermediaries that can support innovation and new knowledge creation (Rantisi 2014, Bathelt and Cohendet 2014). Although all agree on the significance of linkages to cross-cutting knowledge networks for innovation in mature industry clusters, the mechanisms and conditions under which they are created remain insufficiently explored.

In this paper we use qualitative methods and network analysis to unpack the institutional processes and interlocking networks through which High Point's traditional furniture cluster is transforming from a seasonal showroom-space anchored by its famed furniture Market to a year-round 'design-hub' that is recombining existing and new resources in innovative ways.

North Carolina's furniture cluster, despite maintaining national economic relevance, has shed nearly half its employment base in recent decades, largely due to offshoring (Florida 2012). Despite this decline, data show that pre-production services—furniture design, engineering and all manner of other design services—have gained in employment with the greatest wage increases across all segments (Brun et al. 2013; Debbage, Walcott 2010).

This rise of design that is evident in the date, is manifest in the rise of new institutions in High Point, most notably, Congdon Yards, a mixed-use campus housing offices and studios, an event center, a 20,000 square foot design center that opened in 2019, and The Generator, a 6,000 square foot pay-per-use prototyping facility housing millions of dollars of state-of-the-art furniture and other design equipment. Tenants range from design firms, the city's chamber of commerce, to home-furnishings materials consultancies and a textiles firm, leading to new synergies between textiles and furniture via design. Despite only opening to the public in 2021, several local home-furnishings related SMEs, as well as design firms, have already used The Generator for batch production. Through a collaboration between The Generator and a local community college, the Chamber is seeking to launch a new CNC certification program. Congdon Yards and The Generator are managed by the city's chamber of commerce and both facilities already under expansion.

Through 17 semi-structured interviews with public and nonprofit organizations, industry associations, and manufacturers in High Point, and a network analysis of boards of 26 local associations spanning fourteen civic

organizations, two economic development organizations, and ten industry-related associations in High Point, representing a cumulative 650 seats on local boards, we show how and why the Chamber of Commerce, a relatively weak body for decades, succeeded in fostering major innovations in the cluster. We argue that underneath the story of the rise of design in High Point is the story of land development. With the market under constant threat from other furniture markets, the Chamber and a group of local CEOs combined forces to change City Council politics and through them, zoning. This created new downtown redevelopment organizations which in turn facilitated access to the design community—as drivers of mixed-use spaces. Through them, furniture and textiles are becoming spatially and structurally reintegrated in new ways.

UNIVERSITIES AND HUMAN CAPITAL DEVELOPMENT IN THE UNITED STATES: REGIONAL PATTERNS AND IMPACTS

Abstract ID: 1930

Individual Paper Submission

BAGCHI-SEN, Sharmistha [Arizona State University] Sharmistha.Bagchi-Sen@asu.edu, presenting author
O'NEILL, Moira [Kent State University] moneil18@kent.edu, co-author

Public colleges and universities play an important role in the formation of human capital through the attraction, training, and often local-regional retention of students. Much of the existing research on the subject examines one stage in this process, one type of institution, and/or one type of regional environment. While such studies can generate important insights, taking too narrow a perspective on one or more of these elements can lead to distortions about the impact of institutions of higher learning on the regions they serve. This paper adds to the literature by (i) widening the temporal frame of analysis to include the student's journey from hometown to campus and then to additional locations 10 years after graduation, and (ii) by deepening the cross-sectional view of a region's layered institutions to include the many different types of public higher education and the variety of human capital they support. Data from 64 institutions spread across 10 labor market regions under the State University of New York show how institution type corresponds to 1) the geography of populations served, 2) the nature of skills and training supplied, and 3) local/regional retention a decade later. The empirical study also identifies the extent to which factors such as regional variation, degree level, and students' program of study associate with human capital development (e.g., wages, retention) and therefore contributes to a more nuanced understanding of the broader relationship between institutions of higher learning and local/regional human capital formation. In particular, this study illustrates the need to consider higher education's role in multiple stages of regional human capital development, since student inflows at one stage correspond to differential patterns of human capital outflows at another. In the literature, student mobility patterns are usually analyzed through the lens of research institutions and are typically concerned with either student attraction or graduate retention. Consistent with this literature, we find institutional prestige and desirable locations do draw students from farther away. Specialized programs and curricula, often corresponding to the nature of the institution itself (e.g., liberal arts colleges) are also important (potential) human capital attractors. Yet colleges and universities that attract students from outside their region also exhibit lower overall retention rates. This is a finding that previous studies, focused on a single stage in the human capital development process, have not explicitly captured. This raises important questions regarding the relative importance of local versus non-local students on the region—while migrant students provide much-needed revenue and short-term local impacts, retention stretches that impact over a long term with regional spillovers that are difficult to measure. Furthermore, because graduate retention rates are lower than the proportion of students that originate from New York across most institution types, the public state system is generally facilitating outflows of human capital or a broader impact that is difficult to measure. The system trains and then releases human capital into the national and global economy with very limited tracking of this labor. While these net outflows (local-to-global pipelines) do represent regional and state losses in human capital, they also likely represent important social and economic linkages to other parts of the country and the world. The extent to which these linkages feed each region's development is an important area for future research on universities and scalable networks. As a result, this multi-

stage, multi-institution study opens the door to several new research directions and emphasizes the need for collecting comparable human capital data across systems and regions that consider the relative impact of smaller and student-oriented public institutions on localized human capital development over time vis-à-vis large public research institutions.

INTEGRATION OR PRECARIZATION? REFUGEE LABOR IN A SEGMENTED LABOR MARKET IN GERMANY

Abstract ID: 1976

Individual Paper Submission

YENIGUN, Ozge [University of Illinois at Urbana-Champaign] yenigun2@illinois.edu, presenting author

A big challenge for EU countries receiving a large number of asylum seekers and refugees after 2015 has been their inclusion in the labor market. Germany, which has received almost a half of the asylum seekers arriving in Europe, has taken the lead in these inclusion efforts, where governments at federal, state and municipal levels have invested significant resources to introduce a wide range of integration courses, language courses, vocational training and qualifications programs targeted at refugee employment. Following the National Integration Bill in 2016, the federal government has adopted a strategy of active and early labor market integration of refugees into the labor market. The current approach, however, is steered by the assumption that refugees have to be pressured to find employment and get integrated into the labor market as quickly as possible. This approach puts little emphasis on job quality and the matching of skills and qualifications with the job, while typically channeling refugees into sectors characterized by low-pay, instability, and poor working conditions. If they are lucky enough to find jobs in low-wage sectors, many 'integrated' refugees will remain in precarious segments of the labor market with limited chances of upward labor market mobility. The government's approach, on the other hand, also includes recent attempts to attract highly skilled immigrants and refugees, following the Skilled Worker Immigration Act introduced in 2020, which provide assistance and incentives for employers who are interested in hiring highly skilled foreigners.

This paper argues that 1) Refugee labor market inclusion is characterized by segmentation and precarity, which leave low-skilled refugees and refugees with insecure legal status vulnerable for exploitation. 2) The government approaches labor market integration in a way that maximizes the profit German economy can draw from refugee labor. 75 in-depth interviews conducted between September 2020 and December 2021 with civil society organizations, representatives of state agencies, professional associations, and other actors in three cities, Berlin, Hamburg, and Munich, indicate precarity, contingent work, and exploitation. This paper first discusses this inclusion approach and the local factors that shape refugees' employment experiences in three German cities from a comparative perspective. Second, it discusses the strategies developed by non-profit organizations and refugees in each city to cope with uncertainty and hurdles faced by refugees who are segmented into the jobs at the bottom of the labor market.

ORGANIZING THE IMPERIAL PRECARIAT: PACIFIC ISLANDERS AND ETHNIC BOUNDARY-MAKING UNDER 21ST-CENTURY EMPIRE

Abstract ID: 2013

Individual Paper Submission

LEE, Kevin [Massachusetts Institute of Technology] kevinjl@mit.edu, presenting author

Amidst the continued expansion and degradation of low-wage industries in the United States, our growing multiscalar labor and community organizing infrastructure offers a central pathway through which low-wage workers and communities of color address injustice not only at the workplace, but across a wide range of policy and issue domains—from housing to healthcare and the environment (Doussard 2020). While much is known about how labor and community organizations serve low-wage Asian, Black and Latinx workers, not much is known at all about how they serve low-wage Pacific Islander workers or low-income Pacific Islander communities more generally.

Addressing this knowledge gap is politically salient today for at least three pertinent reasons. First, Pacific Islanders constitute a relatively small share (1 percent) of the total US population, but are currently one of the fastest-growing ethnoracial groups in the nation. Second, as Indigenous peoples displaced from our Pacific Island homelands because of historical colonialism and ongoing legacies of 21st-century empire, our stories are also deeply aligned with our field's revitalized (albeit still inadequate) commitments to racial justice and decolonization. And third, to address the heightened vulnerabilities of Pacific Islander communities to the devastating impacts of COVID-19, Pacific Islander-serving labor and community organizations have seen an influx of national and state resources (e.g. funding, technical assistance), prompting increased formalization and coordination across space and scale.

Against this political and institutional backdrop, this research pursues two central questions: (1) What are the key challenges facing the nascent labor and community organizational infrastructure for Pacific Islanders in the continental United States? and (2) How do labor and community organizations mediate the relationship between low-wage Pacific Islander workers and the 21st-century US empire? Drawing on a national survey of Pacific Islander-serving labor and community organizations in the continental US, I provide basic descriptive statistics to highlight key organizational and network features of these organizations. In addition to the standard capacity issues that accompany nonstate planning efforts with small, geographically disperse communities, I show that these organizations also face the unique challenges of Pacific Islander ethnic boundary-making (Wimmer 2013)—wherein strong historical legacies of single-ethnic Pacific Islander organizing impedes the formation of broader panethnic, trans-Indigenous or multiracial coalitions.

Then, focusing on the “best-case” local context of Los Angeles, with its storied legacy of multiracial labor and community organizing and its vibrant Pacific Islander community, I offer an in-depth institutional study of how these complex dynamics of ethnic boundary-making are articulated in place. Drawing on interviews with local labor standards enforcement agency officials, industry experts, Pacific Islander-serving labor and community organizational staff and low-wage Pacific Islander workers in the retail and home health care industries, I show how ethnic boundary-making processes unfold at the local level—largely to the detriment of Pacific Islander workers at the bottom of the labor market. At the same time, the relatively recent emergence and formalization of explicitly pro-Indigenous and panethnic Pacific Islander/Oceanic organizations seemingly hold promise as progressive sites of ethnic boundary-making amenable to broader and stronger labor and community organizing coalitions.

Ultimately, this project offers two main contributions to planning scholarship. First, given the growing centrality of race to labor and community organizing practice (Lesniewski and Doussard 2017), this research emphasizes the utility of understanding the geographically uneven processes of ethnic boundary-making as part of building broader and stronger labor and community organizing coalitions. Second, it extends the subfield of Indigenous Planning beyond its traditional domains of land and natural resource management (Lane and Hibbard 2005; Hibbard, Lane, and Rasmussen 2008) to the (low-wage) labor market, which functions as a complex site of Indigenous dispossession and Indigenous resurgence.

SPLINTERING SILICON VALLEY? THE IMPACT OF THE COVID-19 PANDEMIC ON THE EMPLOYMENT LOCATION PREFERENCE OF HIGH TECH WORKERS

Abstract ID: 2024

Individual Paper Submission

LESTER, T. William [San Jose State University] thomas.lester@sjsu.edu, presenting author

TAN, Simon [San Jose State University] simon.tan@sjsu.edu, co-author

For decades, cities and regions across the globe have tried to emulate the economic success of California's Silicon Valley. Evoking the semiconducting element's name as part of their economic development strategies to attract increasingly mobile capital investment, local policymakers have dubbed their towns Silicon Gulch, Silicon Prairie, or Silicon Beach in attempt to capture high technology investment and build an economically competitive cluster. Although early attempts to copy Silicon Valley focused on attracting high-tech manufacturing in sectors such as semi-conductors or computer assembly, recent strategies focus instead on inculcating an entrepreneurial environment and attracting a workforce with high-tech skills (Etzkowitz, 2019). While such efforts have had some limited success, Silicon Valley still remained the dominant location for innovation as measured by venture capital invests, patent filings, and the number of start-ups (Fuerlinger & Garzik, 2022). Prior to the pandemic, Silicon Valley and the wider Bay Area were also one of the top locations for high-tech workers to locate, which in turn helped spark a housing affordability crisis and widespread gentrification.

However, the COVID-19 pandemic and state mandated stay at home orders forced a radical shift in the geography of work, with millions of workers across a wide swath of industries shifting from working at traditional offices to their living rooms. While, millions of workers who previously worked at factories, farms, hospitals, restaurants and other "essential" roles were unable to work from home, the geography of jobs that could be performed from home varied greatly by region. According to Dingel and Neiman (2020), the Bay Area region had the highest share of remote-eligible jobs (51 percent) at the start of the pandemic. As the pandemic continued over more than two years, there were increasing media reports of workers moving away from expensive coastal cities and permanently relocating to lower-cost regions; a shift that even caused a temporary, but pronounced drop in rents in the Bay Area.

As COVID-19 case counts have fallen in early 2022 and some workers are returning to their offices, there are suggestions that the pandemic served as a profound shock to the preferences of workers both in terms of their willingness to commute to an office (Bote, 2022) as well as their desire to live and play in dense urban centers. As the Sharon Zukin (2020) notes, these shifts could "weaken the value of the city's fixed capital of buildings and land, its social capital of institutional networks and communities, and its human capital of workers with tech skills."

The degree to which these impacts will occur and the degree to which tech-work in general will relocate away from core regions like Silicon Valley is an empirical question. To assess the degree to which such a shift is underway, we designed a survey of high-tech workers in the Bay Area, distributed it through various online forums for tech-workers, and used paid ads on social media to attract respondents. With a sample of over 900 respondents, we found that 20 percent moved during the pandemic because of remote work options and an additional 23% expressed an interest in moving. An examination of the destination zip codes of workers who relocated during the pandemic showed a shift towards less dense neighborhoods. However, most moves were not to distant regions or second tier tech hubs, but were to more peripheral, lower cost parts of California where larger homes could be afforded. The high rate of interest in relocating and the preference for increased working from home could have profound economic development impacts for core parts of Silicon Valley and the Bay Area generally.

THE FALSE PROMISES OF OPPORTUNITY ZONES: HOW A “FLEXIBLE” TAX INCENTIVE PROVED RIGID AND UNDERMINED CITY DESIRED ECONOMIC DEVELOPMENT

Abstract ID: 2031

Individual Paper Submission

WILSON, Matthew [University of Illinois at Chicago] mwilso25@uic.edu, presenting author

The federal Opportunity Zone (OZ) program was created as part of the Tax Cuts and Jobs Act (TCJA) in 2017 and aims to bring private investments into economically distressed neighborhoods. The OZ program operates through providing preferential tax treatment to individuals or businesses who invest their capital gains into OZs. OZs were designated in all 50 US states, Washington DC, and Puerto Rico between April and June of 2018, making over 8,700 census tracts eligible for the program's incentives. The choices for which census tracts to designate as OZ were left to states' governors who often called upon the expertise and local knowledge of local county and city governments to collaboratively choose OZs. States could nominate a quarter of their eligible tracts with eligibility being broadly defined, making about 57% of the US's census tracts eligible to be designated as OZs.

There is belief amongst OZ supporters that attributes of the OZ program and key differences from previous place-based federal programs will make OZs successful. In a 2018 congressional hearing titled “The Promise of Opportunity Zones,” expert witnesses centered their arguments for why OZs would be successful around two main points, reliance on local expertise to designate zones and determine needed development, and the program's flexibility to support an array of development types that would respond to unique community needs (U.S. Congress. Joint Economic Committee 2018). Despite the advertised strengths of the program, the OZ program has targeted tracts against city government recommendations (Wessel 2021) and has facilitated investments into projects that did not respond to locally identified needs (Kim 2021). While researchers have pointed out the ways the federally-determined structure of incentives is likely to attract investment in less risky real-estate projects in comparatively well-off spaces (Gelfond and Looney 2018; Jordan 2020), little is known about how city governments developed targeting schemes and collaborated with States to target OZs or how they perceive the program's ability to deliver on its promises to respond to unique community needs.

Through interviews with local government officials in Houston, Miami, Milwaukee, and St. Louis, this paper chronicles city government experiences with OZ targeting and implementation. Early findings suggest city governments were limited in their ability to target tracts to be designated as OZs, with State Governors often designating OZs in areas city governments did not identify as priorities and were perceived as not needing incentives to attract investment. Additionally, while city governments came up with sophisticated data-driven approaches and community engagement strategies to help target zones, local economic development practitioners expressed regrets about some areas they targeted. These regrets stem from how quickly States and the Federal Government required tract nominations from city governments and fundamental misunderstandings about how the program worked early on.

This research will inform how federal place-based economic development incentives can be better targeted towards localities with lessons learned from on-the-ground implementation experiences. Additionally, since divergences in visions to implement the OZ program exist between state and city governments, this paper can suggest practices for better collaboration between higher- and lower-levels of government for implementing economic development policy.

BREWERY DISPERSION: RECONSIDERING THE ROLE OF PLANNERS IN ENCOURAGING ECONOMIC DEVELOPMENT THROUGH BEER TOURISM

Abstract ID: 2052

Individual Paper Submission

NEWTON, Josh [University of Texas at Arlington] joshua.newton@uta.edu, presenting author

Since at least the late 1980s, craft beer has exponentially grown as an industry in the United States in terms of production, overall sales, and number of breweries. In particular, the physical establishments and culture of craft breweries have caught the attention of urban planning and geography scholars for multiple related reasons. Craft breweries contribute to economic development through “beer tourism”; are touted as prime catalysts of adaptive reuse, as well as neighborhood preservation and revitalization (Reid, 2018); and have a positive effect on residential property value (Nilsson & Reid, 2019) and reductions in crime (Nilsson et al., 2020). Craft breweries are also understood to be significant agents of place-making and social interaction in neighborhoods (Nelson, 2020). These positive externalities have drawn increasing attention to the geographic location of craft breweries. Most of the literature to this point has examined the tendency of breweries to concentrate and the benefits accrued to them through agglomeration (Nilsson et al., 2018). Planning and policy solutions to increase brewery entrepreneurship and tourism have been based on these presumptions. However, agglomeration of breweries has not been proven to occur in all contexts and time frames. As such, this paper asks the question, is agglomeration a universal strategy of all craft breweries in the United States across contexts and time periods?

To answer this question, I begin by revisiting classic economic location theory from Harold Hotelling and August Lösch. An examination of the work of these two theorists reveals that agglomeration does not naturally occur in new brewery markets, but rather craft breweries will choose to disperse to maximize their market area. To test these theories, I use GIS pattern analysis to investigate three uncanny cases: Montgomery County (a mostly rural brewery market), San Diego between the years of 1989 and 1996 (a historical case of a major brewery market), and Fort Worth (an emerging urban brewery market). Using data from Brewers Association, local data sources, and PubQuest—an app that locates breweries throughout the United States—breweries are located for each of the three cases. Afterward, multi-distance spatial cluster analysis and average nearest neighbor analysis are utilized to determine clustering or dispersion with statistical significance in each of the three cities. The typical Ripley’s K function is supplemented with average nearest neighbor analysis because the cases contain less than thirty points of data. Using average nearest neighbor analysis Montgomery County and the historical case of San Diego exhibited dispersion, and Fort Worth displayed slight dispersion.

These findings suggest the need to reconsider the types and timing of planning and policy interventions. The paper particularly focuses on three possibilities in this regard. First, instead of focusing on zoning reform, which is only helpful later in the formation of a brewery market, planners could collaborate with city councils to enact reform that would make brewery entrepreneurship easier. Second, planners can combine the goals of economic and community development to encourage equitable revitalization of neighborhoods. Last, planners can creatively encourage brewery patronage through elements of public engagement. Ultimately, this paper indicates the need for more research into brewery location including GIS analysis of more cases, qualitative research, and in-depth case studies.

GEOGRAPHICAL CHANGE OF THE BIRTH AND DEATH OF SERVICE ESTABLISHMENTS IN THE CATERING INDUSTRY AFTER COVID-19 IN SEOUL, KOREA

Abstract ID: 1321

Poster

SONG, Changhyun [Yonsei University] changhyunsong@yonsei.ac.kr, presenting author

LIM, Up [Yonsei University] uplim@yonsei.ac.kr, co-author

Background and Purpose

The COVID-19 pandemic has posed unprecedented challenges in cities and regions around the world. Adopting social distancing policies as a response to the pandemic reduced human mobility, which had a heterogeneous socioeconomic impact on regions (Trasberg & Cheshire, 2021; Zhai, Liu, & Peng, 2021). Previous literature dealing with the economic impact of social distancing emphasized that the decrease in the floating population caused by social distancing has led to various shocks in sales in the face-to-face service sector and increases in business closure (Gunay & Kurtulmus, 2021). Despite the growing importance of exploring entrepreneurship dynamics at a micro-regional level due to the deterioration of the service sector, most previous research has focused on geographical human mobility changes (Eom et al., 2021; Nikiforiadis et al., 2022). Only a few studies have attempted to explore the relationship between mobility changes and urban entrepreneurship.

In this background, our study explores how geographical changes in the floating population due to social distancing in Seoul in December 2020 appear differently according to urban spatial characteristics and empirically analyzes how these changes affect the birth and death rate of catering establishments. Our study addresses two research questions: (1) How do changes in the floating population appear depending on the spatial characteristics after social distancing? (2) How do these changes affect the births and deaths of catering establishments?

Data and Methods

To examining the changes in human mobility after social distancing, we used De Facto Population data from Seoul Metropolitan Government. De Facto Population data is mobile big data based on long-term evolution signal and it widely used to investigate the human mobility pattern in research. And to investigate the relationship between change of human mobility patterns and entrepreneurship dynamics in catering industry, The Trade Area Analysis Service from Seoul Public Data were used. Our methodology consisted of the following. First, 425 administrative districts (dong) of Seoul were classified into four types by performing time-series clustering based on the trend change of floating population from January 1, 2020, to June 6, 2021. Second, exploratory spatial data analysis was performed to see how social distancing influenced the floating population across the classified cluster. Third, by using a spatial fixed effects model, we empirically analyzed how these changes affect the birth and death rates of catering establishments.

Findings and implications

After social distancing in Seoul, the change in the floating population of Seoul compared with the same period of the previous year ranged from -34.2% to +2.7%, indicating the variation depends on the type of dong-level cluster characteristics. In the case of areas belonging to clusters with a high proportion of commercial areas, the number of floating populations in the evening and birth rate of catering establishments decreased dramatically; in commercial areas near residential districts, the rate slightly increased. Empirical results also show the decrease of the floating population had a significant relationship with the change in the birth and death rates of catering establishments. From these findings, our study suggests implications for planners by providing a better understanding of the relationship between human mobility changes caused by social distancing and entrepreneurship in the catering industry.

OVERCOMING ANALYSIS PARALYSIS IN COLLABORATIVE GOVERNANCE AND THE ROLE OF STRATEGIC DOING

Pre-Organized Session 68 - Summary
Session Includes 1382, 1383, 1384

Collaborative Governance in the Era of Climate Change The lack of federal and state policy leadership related to climate change is leading many cities to explore collaborative approaches to reducing greenhouse gas emissions or adapting to the new realities of a changing climate. These collaborative approaches are fostering new regional initiatives, which largely rely on the shared benefits of working across jurisdictions to voluntarily implement strategies. In this pre-organized session, researchers examine the findings from individual efforts and cross-case comparisons.

Objectives:

- Understand strategies for implementation through collaborative regional strategies
- Understand range of structures for supporting climate change collaboratives

THE POWER OF COLLABORATING WITHOUT AUTHORITY: MAKING PROGRESS THROUGH REGIONAL CLIMATE COLLABORATIVES IN FLORIDA

Abstract ID: 1382
Abstract within Pre-Organized Session 68

BUTLER, William [Florida State University] wbutler@fsu.edu, presenting author
HOLMES, Tisha [Florida State University] ttholmes@fsu.edu, co-author

For over a century, regional planning has responded to the need for collective action on complex social and ecological issues that cross jurisdictional and sectoral boundaries. Various paradigms to achieve regional governance have been attempted, with new regionalism dominating since the 1990s. New regionalism is characterized by voluntary networks of multiple, cross-sector stakeholders (public, private, non-profit, non-governmental, and others) working together towards a common goal and focuses on governance arrangements (voluntary, informal, and horizontally linked institutions) rather than government structures (formal, vertical layers of political authority). Although widely practiced, new regionalism has seen mixed success. Challenges with new regionalism are many: the tension between local autonomy and regional needs, lack of effective regional institutions and funding, inadequate regional identity and social or civic capital, and lack of regional consensus. Successful new regionalism efforts depend upon a foundation of regional civic infrastructure supported by vertical and multilevel political power.

Florida was a leader of regional efforts to attend to environmental and growth management in the 20th century establishing Water Management Districts in 1972 through the Water Resources Act, and Regional Planning Councils (RPCs) in 1980 although interlocal agreements had created regional councils as early as the 1960s. RPCs have been under attack since the governorship of Rick Scott placed state planning institutions in the crosshairs of state policy. In the context of federalism, regional planning entities like Florida's RPCs have virtually no authority to make policy level decisions to address the problems they are purported to deal with (growth management, affordable housing, transportation, emergency management, public health, economic development, and more). They have limited responsibility to address these issues only insofar as they are able to obtain grants and support from their council members who include elected officials from their affiliated local governments as well as gubernatorial appointees.

As climate change impacts become increasingly salient, regional climate collaboratives have emerged as a way to address cross jurisdictional planning and capacity building to facilitate more effective climate mitigation and adaptation. Regionalism has been touted as a way forward where local capacity is limited, issues extend beyond local scales, and higher-level governments eschew direct climate action (Shi et al. 2015, Shi 2017). In recent years, new regional bodies to address climate change have been established in SE Florida (Vella et al., 2016), the Tampa Bay region, East Central Florida, and Northeast Florida. Other areas of the state in the Panhandle and Southwest are

considering similar models. Moreover, regional climate collaboratives were specifically targeted for funding to address sea level rise adaptation efforts in 2021 legislation that committed nearly \$1 billion to such projects. Regionalism, it seems, has found a new purpose and newfound legitimacy in the state.

While regional efforts lack regulatory teeth, funding resources, and jurisdictional control of land management decisions, they draw on other sources of influence and power. The purpose of this paper is to explore the impacts that these entities are having in Florida in the face of climate change and sea level rise. Specifically, the project aims to understand how regional activities influence policy both upstream (at the state level) and downstream (at the local level). This research is based on a range of data sources including a 2019 statewide survey of coastal planners and managers, a review of comprehensive plans from coastal jurisdictions, and preliminary case studies of four regional climate collaboratives. Through these data sources we shed light on how regional climate collaboratives have influenced state policies and facilitated uptake of local planning policies and practices that could make progress on planning for sea level rise.

Abstract within Pre-Organized Session 68

GENSKOW, Kenneth [University of Wisconsin-Madison] kgenskow@wisc.edu, presenting author
HUSEN, Sara [University of Wisconsin-Madison] husen@wisc.edu, co-author

Across the United States (and globally) communities and regions are wrestling with issues around climate change adaptation and mitigation strategies. For too many communities and local governments, including those seeking to coordinate their actions across jurisdictions, those issues can involve continuing challenges from the general public or elected office. Whereas planners and climate activists across scales are advancing comprehensive goals and priorities to reduce greenhouse gas emissions and better prepare communities to be more resilient ahead of intensified natural disasters, efforts to coordinate meaningful implementation actions among local jurisdictions remain challenging. County-level Natural Hazard Mitigation Plans (NHMP) offer a process and structure to improve communication and coordination across local jurisdictions and potentially lead to more robust collaborative governance arrangements.

Building upon programs in multiple coastal states, the Disaster Mitigation Act of 2000 created a national program in the United States that incentivized counties to create NHMPs. While somewhat prescriptive, county NHMPs, funded through federal planning grants, identify local risks and priorities around flooding and other potential hazards, and once approved by the US Federal Emergency Management Agency (FEMA), become vehicles for funding mitigation actions, including for hazard risks that are amplified due to climate change. Experiences with NHMPs vary substantially within and across states.

Dane County, Wisconsin, pursued a collaborative, multi-jurisdictional approach to their natural hazard planning process based on a five-year cycle of engagement with residents, built environment professionals, and governmental departments/agencies. This multi-jurisdictional NHMP approach emphasizes coordinating with local jurisdictions for risk assessment, incorporating local priorities via "annex" within the county plan, and committing to continued active engagement beyond the planning process. Engagement requirements, data documentation, community-based assessments, and mitigation strategy development are all included in each local jurisdiction's annex. This process provides the county and local jurisdictions with unique benefits for identifying priority actions and creating opportunities to collaborate around funding and implementation actions.

This paper uses the Dane County experience as a case study to explore challenges of collaboration across jurisdictions

to identify, prioritize, and implement climate adaptation and disaster mitigation actions. Drawing from interviews, surveys, and other data sources, authors will describe one county's efforts at multi-jurisdictional planning and the associated challenges and opportunities when reaching for climate collaboration through county hazard mitigation plans.

OVERCOMING ANALYSIS PARALYSIS IN COLLABORATIVE GOVERNANCE AND THE ROLE OF STRATEGIC DOING

Abstract ID: 1384

Abstract within Pre-Organized Session 68

MARGERUM, Richard [University of Oregon] rdm@uoregon.edu, presenting author

Collaboration has been increasingly used to address complex regional problems that cross political boundaries and jurisdictions. The roles, approaches and implementation issues associated with collaboration strategies and networks have been widely discussed in the research literature (Forester, 2013; Healey, 1997; Innes & Booher, 2010; Koppenjan, 2008; Margerum, 2011). There has been less analysis of the approaches and deliberations associated with convening collaborative efforts (Vella et al., 2016). Some researchers have identified common processes and issues, but there has also been criticism of the lack of concrete progress and implementation of regional efforts (Margerum, 2011; Shi, 2020; Shi et al., 2015). This article examines a cross section of 11 case studies using document analysis, report reviews, and interviews with twenty one key staff. The forty five to sixty minute interviews explored the steps in the convening process, and the key factors or barriers related to tangible progress. One of the key factors that emerged was the need to develop “small wins,” “momentum,” or “tangible reportable progress.” Using a framework called Strategic Doing (Morrison et al., 2019), I conduct a post-hoc qualitative analysis of these strategies and compare them to the strategic doing framework. The goal is to test the steps and approaches of strategic doing to determine if it can be a framework to assist climate collaboratives in moving their deliberations and efforts toward tangible outcomes.

A GRAND CHALLENGE IN URBAN GREENING: BALANCING NATURE CONTACT BENEFITS, EQUITY, AND ECO-GENTRIFICATION

Abstract ID: 1100

Roundtable

EISENMAN, Theodore [University of Massachusetts Amherst] teisenman@umass.edu, organizer, moderator
ANGUELOVSKI, Isabelle [Universitat Autònoma de Barcelona (UAB)] Isabelle.Anguelovski@uab.cat, participant
CARMICHAEL, Christine [Fair Forests] fairforests@gmail.com, participant
SCOTT, Jacqueline [University of Toronto] jacqueline.scott@mail.utoronto.ca, participant
TENNETI, Ambika [University of Toronto] ambika.tenneti@mail.utoronto.ca, participant

Municipal leaders worldwide are showing substantial interest in urban greening, defined as a social practice of organized or semi-organized efforts to introduce, conserve, or maintain outdoor vegetation in urban areas. This encompasses incentives, policies, and programs to vegetate urban landscapes through implementation of green roofs and walls, rainwater harvesting gardens, and transformation of post-industrial spaces into new types of green spaces and parks. It also includes large-scale urban tree planting initiatives (TPIs). Over the past decade, there has been a seven-fold increase in scholarly use of terms denoting TPIs; this reflects a bloom of interest in urban greening research and practice, and a potentially important chapter in the historic arc of city greening (Eisenman et al. 2021).

There are a wide range of social and environmental benefits of urban greening including but not limited to cooling air temperature, managing stormwater, providing wildlife habitat, and enhancing human health; this includes a robust body of scholarship that consistently finds improved mental health and stress-related outcomes from viewing and spending time in or near vegetated spaces (Hartig et al. 2014). Yet, urban greening interventions can also generate disbenefits such as falling limbs, pollen-associated allergenicity, and increased real estate values that may spur gentrification and displacement of vulnerable residents. This latter issue has prompted calls for greening “just enough” (Wolch, Byrne, and Newell 2014), and it has given rise to a growing body of scholarship on green gentrification and procedural justice (Anguelovski and Connolly 2022; Carmichael and McDonough 2018).

All of this sets up a grand challenge: how do municipal leaders promote and implement greening initiatives in a way that maximizes benefits while minimizing disbenefits? This is an issue of pressing concern, as the vast majority of people worldwide are projected to live in urban areas by the end of this century, and the need for nearby nature becomes increasingly urgent. Moreover, populations that are at risk of displacement from green gentrification are also the people who might especially benefit from urban greening, given research showing links between historical racism, housing segregation, and canopy cover (Locke et al. 2021). Balancing the tradeoffs of urban greening is further complicated by poor communication between different disciplines such as environmental psychology, landscape architecture, political science, and urban forestry. This, however, represents an opportunity for urban planners, whose interdisciplinary orientation and role as conveners and facilitators is unique. This roundtable discussion seeks to advance a conversation on this important topic by convening leading scholars on the mental health benefits of nature contact, eco-gentrification and equity, and urban greening, with an eye towards generating constructive directions for transdisciplinary research and practice.

Climate justice has taken on a global value form, a way to measure and communicate how the burdens of climate change are disproportionately distributed across the planet. International-scale solutions to the climate crisis and climate injustice are thus oriented around the pursuit of commensurability across emissions sources, sinks, costs, and benefits (De Lucia, 2009). Yet, far from being universal, climate injustices—often revealed during sudden or slow onset weather events—harm health and disrupt livelihoods (UNHCR, 2020) in ways that are highly contingent and intimately connected to place-based environmental transformations. In this roundtable, we explore experiences with place-making, place-keeping, displacement, and emplacement in the context of the climate crisis (Butts & Adams, 2020; Porter et al., 2020; Raven, 2020). Key questions driving our discussion include: how do local institutions enable and subvert climate justice? How does climate resilient place-making leverage climate-induced migrant flows? How do planners incorporate the climate crisis and climate justice concerns into their routines, and how are practices adapting? We highlight strategies that a variety of frontline communities and climate planners are using to redefine place and identity in relation to climate refuge, haven, resettlement, and emplacement, and examine how place-based discourses of climate comport with experiences of residents and new migrants. Drawing from field work in India, Sub-Saharan Africa, North America, and other regions, we engage in a comparative discussion around place-based climate injustice experiences with agrarian distress, food insecurity, flooding, and heat waves.

WINTER STORM URI AND THE TEXAS ENERGY CRISIS: IMPLICATIONS FOR CLIMATE AND ENERGY JUSTICE IN SAN ANTONIO, TX

Abstract ID: 1026

Individual Paper Submission

TERRACCIANO, Emmalyn [Korea Advanced Institute of Science and Technology] eterracc@gmail.com, presenting author

HAN, Albert Tonghoon [Korea Advanced Institute of Science and Technology] albert.han@kaist.ac.kr, co-author

Winter Storm Uri hit Texas in February 2021, leaving millions of people without power. This winter storm and resulting energy crisis provide an example of failed climate planning and insufficient preparedness for cold weather events (Doss-Gollin et al. 2021). However, it also presents an opportunity to understand response and resiliency during climate change-related events in Texas, a state where climate change remains a controversial topic.

Previous research has uncovered the environmental justice concern of disparate impacts of ecosystem services in San Antonio, TX (Yi et al. 2019) as well as the relationship between social vulnerability, heat, and emergency medical service incidents (Zottarelli et al. 2020). However, research on climate and energy justice is falling behind in San Antonio as the threat of climate change-related events intensifies. Thus, there is a need for evidence-based research on the energy crisis and planning implications for infrastructure needs to protect vulnerable Texas communities. To understand community resiliency, it is important to assess communities' perceived impacts during the crisis. One way to assess this is to study how elected officials, utility entities, and energy providers communicated with communities before, during, and after the crisis through social media. Recent literature showed increasing use of social media platforms for communications during disasters (Lovari and Bowen 2020; Palen and Hughes 2018). When such discussions lead toward agreement amongst populations, they contribute to community resiliency (Singleton, Kumar, and Li, 2018). However, in an analysis of social media data from the Tianjin Port Explosion, Deng et al. (2020) found that there was a mismatch between the information the public wanted and what officials were communicating to them.

We collected Twitter data from San Antonio's elected officials, utility providers, and the public during a four-week timeframe covering the pre-, during, and post-disaster period. We used the natural language processing techniques of topic modeling, sentiment analysis, and semantic analysis to understand what each user group was discussing and prioritizing using keywords related to the crisis context. We also conducted a keyword analysis on City Council meeting minutes to determine how crisis communications on Twitter were translated into action. Through these analyses, we tested the following hypotheses: 1) Communities within San Antonio experienced disproportional impacts from Winter Storm Uri; and 2) Elected officials' disaster response through social media platforms was not enough to address the needs of vulnerable communities.

From our preliminary analysis, we found variations in sentiment and centrality (i.e., priority) of the keywords between Twitter user groups. When the storm hit (Week 2), the keywords "freeze" and "pipes" had negative sentiments from each user category. However, keywords that relate to resiliency, such as "crisis" and "emergency", showed more variation among groups over time, perhaps reflecting disparities in disaster preparedness between communities and levels of leadership. Notably, "climate change" was largely absent from the conversation over the entire data collection period. In fact, climate change was absent as a node for all elected officials and energy providers, while the public tweeting from San Antonio showed higher centrality, indicating the public's stronger perception of the linkage between the crisis and climate change. Once we complete our analysis using socioeconomic data and council minutes, we expect to find whether the needs and wants of the disadvantaged communities impacted by the storm were heard by their elected representatives and led to appropriate actions (e.g., distribution of emergency resources). These results will be an important contribution toward climate and energy justice in San Antonio as the city must grapple with its resiliency, both physical and perceived, when planning for imminent climate change-related events.

PREACT: PLANNING FOR RESILIENCE AND EQUITY THROUGH ACCESSIBLE COMMUNITY TECHNOLOGY

Abstract ID: 1029

Individual Paper Submission

ROSAN, Christina [Temple University] cdrosan@temple.edu, presenting author
HECKERT, Megan [West Chester University] mheckert@wcupa.edu, co-author

The types of planning changes we make today for a sustainable future often don't align with very real community concerns — especially in low income communities. Scientific research is pointing to the severity of urban heat island effects, the climate pressures on aging housing and civic infrastructure, the need for a transition to distributed and renewable energy resources, the challenge of weatherization of buildings, and the need to invest now in resilience planning such as green space and flood protection and mitigation (Gill et al. 2018; Weber et al. 2015). However, residents may view the focus on long-range planning and climate as ignoring their immediate needs, and thus feel further excluded from planning decision-making and priority setting. Or they may perceive investments in sustainability as contributing to green gentrification (Anguelovski et al 2019, Pearsall 2010; Shokry et al 2020).

Expanding on the authors' GI Equity Index framework, PREACT (Planning for Resilience and Equity through Accessible Community Technology, NSF-SCC Planning Grant 2125375), is a multipurpose and multi-scalar climate preparedness and neighborhood planning software application informed by community need and community assets.

The PREACT Planning team is working to design a process and planning tool that will:

- take into account the needs and experiences of community members, designing a model of technology co-production that addresses community needs and allows for the integration of social and scientific data for more informed decision-making.
- enable users to specify a geographical area of interest, choose from and weigh the importance of a range of factors relevant to a climate planning concern, and generate a map indicating the areas of greatest vulnerability.
- also help identify ways to systematically address vulnerabilities through support for existing community assets, opportunities to reinvest in social, ecological, and physical infrastructure in communities, better local enforcement of existing public health regulations, and changes in land-use decisions and planning.
- ensure that the data and assumptions that underpin PREACT are more representative of community needs and informed by lived experience through the inclusion of citizen groups and citizen science.
- open up opportunities for a more deliberative dialogue among citizens, scholars, government, and business about needs and preferences for policy interventions.
- create a technological tool that empowers citizens and makes the government more responsive to community needs.

The paper will highlight existing progress on the NSF-SCC Planning Grant and our efforts to develop a theoretical and actionable framework for a more nuanced and citizen driven approach to responsive climate planning, preparedness, and justice.

RESOURCE PROTECTION IN OREGON

Abstract ID: 1034

Individual Paper Submission

SULLIVAN, Edward [Portland State University] esulliva@gmail.com, presenting author
HUEGEL, Caleb [None] cjhuegel@gmail.com, co-author

Oregon is the ninth largest American state, with an area of approximately 250,000 square kilometers and a geography that includes a 583-kilometer coast, two significant mountain ranges, a desert, and many other natural and man-made resources. It has a population of approximately 4.2 million, three quarters of which live in the Willamette Valley, which has an area of approximately 14,000 square kilometers. As with almost any place in America, there are political and legal conflicts over the use of natural and man-made resources on private and public lands. There is a vigorous property rights movement throughout the United States, which comes into conflict with the rights of indigenous peoples, minimum instream flow requirements, and other public rights. It is useful to have a legal regime that minimizes those types of conflicts and provides a level of consensus over the use of those resources.

Over the past half-century, such a regime has been crafted in Oregon. That regime brings together various interests to support the planning and regulation of fifteen categories of natural and man-made resources. In addition to the broad constituency for wilderness areas and fish and wildlife habitat, those interests include users of recreation trails and scenic waterways, supporters of historic and cultural preservation, purveyors of energy and mineral resources, and the more conservation-oriented Portland metropolitan area. The result is a system that holds its own against private property rights absolutists.

This paper addresses protections for natural and man-made resources in the context of Oregon's statewide land use planning program. It discusses the history, evolution, and mechanics of such protections, which generally take the form of comprehensive plan policies and land use regulations. It also analyzes and evaluates the current system and its prospects for improvement.

DOES CLIMATE INVESTMENT INTENSITY GREEN GENTRIFICATION?

Abstract ID: 1045

Individual Paper Submission

YUE, Haoyu [University of Washington] yohaoyu@uw.edu, presenting author
WHITTINGTON, Jan [University of Washington] janwhit@uw.edu, co-author
ACOLIN, Arthur [University of Washington] acolin@uw.edu, co-author

Climate change has negatively impacted human health, livelihoods, and key infrastructure in urban areas, especially within communities with economically and socially marginalized residents. To reduce exposure and vulnerability to climate change, public climate investment, mainly in urban green infrastructures, plays a key role in accelerating urban climate adaptation and improving urban resilience (IPCC, 2021). In California, California Climate Investments (CCI) supports a series of projects statewide to reduce greenhouse gas emissions and deliver other economic, environmental, and public health by distributing the proceeds from the carbon credit auction of California Cap-and-Trade, one of the largest carbon markets in the United States. These investments, however, have been shown to have a limited positive impact on vulnerable communities and are always accompanied by displacement and gentrification caused by rising property value and rents, which will damage long-term social equity and environmental justice.

This study examines the impact of climate investment on gentrification in the San Francisco-Oakland-Berkeley Metropolitan Statistical Area (SFOB MSA) between 2015 and 2020. The CCI invested in 262 climate-related projects within SFOB MSA from 2015 to 2020 with the whole investment amount of approximately 1.2 billion US dollars. We use California Climate Investment Implemented Project Dataset (CCIIP) from California Air Board with detailed investment information and American Community Survey (ACS) 5-year Estimate Data. We construct the climate

investment index to show the spatial distribution of investments with the consideration of spillover effects of investment spatially. We also identify the gentrified area where middle- and upper-class gentlemen moved in and replaced residents of low-income communities, and identify gentrification types by implementing spatial analysis and the K-Means clustering algorithm. In the end, we conduct a time-series statistical analysis on climate investment intensity and the identified gentrification types, as well as the demographic characteristics of different communities in SFOB MSA.

Our preliminary results show that (1) Green gentrification occurred, especially within disadvantaged communities, between 2015 and 2020 associated with the implementation of climate investments; (2) The degree and characteristics of gentrification are influenced by the intensity and type of investments; (3) Public transportation investment, as the largest part of CCI, has shown the most significant impact on the gentrified process. These results can provide empirical knowledge of the relationship between climate investment and green gentrification, which government and planners could use to better conduct climate infrastructure plans to minimize the negative impact on disadvantaged communities and realize the environmental justice we pursued.

Practices and policies around informal settlement upgrading or re – urbanization developed well before climate change risks were a global concern, and actually much of what good informal settlement up grading provides reduces climate related risks. However anticipatory some of the measures undertaken, there has been little recorded experiences and lessons of informal settlement re – urbanization processes that include a climate resilience lens, much less a transformative one, were aspects of equity, justice and power distribution in decision making gain prevalence (Satterthwaite et al 2020). Notions of decarbonization rarely guide informal settlement re urbanization policies and practices. In addition, a growing body of literature points to the need for caution in framing resilience and climate adaptation related interventions as benefiting everyone, therefore the need to incorporate equality and justice dimensions (Meerow and Newell 2016, Leal Filho, W. et al 2021).

The paper aims to contribute to understand pathways for transformative resilience (Pelling 2011) by responding to the following: 1. Which are the barriers for strong community - local government partnerships to assess and incorporate future risk levels and reduce carbon footprints in informal settlement re urbanization processes?, 2. Which are the appropriate social settings that allow the exploration of innovative tools and frameworks to advance in transformative climate resilience in complex urban settings?, and 3. To what extent new frameworks and alternative practices such as the use of green infrastructure approaches can serve as a means to solve structural-deficits and incorporated as part of routine design, and not as complement that can only be thought of once urgent issues are resolved by conventional means?. Though responses to these questions are context specific some generalizations for the Latin American context can be made.

This research builds from a lived experience: the ongoing re-urbanization process in Villa 20, an informal settlement in the City of Buenos Aires (Argentina) that has a strong participatory platform made up of multiple spaces and devices for consensual decision-making that guide the re-urbanization process (Almansi et al 2020). In Villa 20, several interrelated projects have started to focus on sustainability. In particular, the Transformative Urban Coalitions (TUC) of the International Climate Initiative (IKI) is connecting decarbonization with urban inequalities and urban justice. As researcher and country coordinator of the TUC project in Argentina responses to the above questions derive from 1. Literature review, 2. Actor mapping, 3. Results of surveys and interviews to local actors and base line, 4. Participation in spaces of consensual decision making and co – design, 5. Participation in bi-lateral meetings with local actors (government and none-governmental). Results from this research will provide a valuable contribution to planning, implementation and policy making around re – urbanization processes and the possibilities of decarbonization in cities of the global south.

HOW THE LOSS AND RESTORATION OF URBAN STREAMS RE-SHAPES CITIES: A COMPARATIVE MORPHOLOGICAL ANALYSIS OF SEOUL’S CHEONGGYEcheon RESTORATION AND ZÜRICH’S STREAM DAYLIGHTING

Abstract ID: 1061

Individual Paper Submission

KHIRFAN, Luna [University of Waterloo] lkhirfan@uwaterloo.ca, presenting author

MOHTAT, Niloofer [University of Waterloo] nmohtat@uwaterloo.ca, co-author

The unprecedented 20th century urbanization led to the culverting, hence, the disappearance of streams from urban landscapes, severing their urban socio-spatial connections (Broadhead, Horn, & Lerner, 2015). Arising environmental and climate change concerns prompted the reversal of culverting practices through “daylighting” buried urban streams (Wild, Dempsey, & Broadhead, 2019)—impacting, in new ways, these streams’ connections to their surrounding urban morphology. This study investigates the hitherto unexplored urban morphological impacts of urban streams’ loss and eventual restoration through daylighting (Khirfan, Mohtat, & Peck, 2020) through a cross-national comparative study of two fundamentally different approaches to stream restoration in Seoul (S. Korea) and Zürich (Switzerland). While Seoul restored one 7km stretch of the Cheonggyecheon stream in 2004, Zürich has daylighted over 25km of streams spread throughout its urban fabric since 1988 (L. Khirfan, M. L. Peck, & N. Mohtat, 2020). This study is, therefore, multi-layered, comparing: how over time, each city’s streams were lost and restored; how these streams’ loss and restoration impacted urban morphology; and how the two different approaches to stream restoration bear on the socio-spatial connections among other parameters.

Our methodology includes historic archival research, spatial analysis, and a systematic content analysis literature review (L. Khirfan, M. Peck, & N. Mohtat, 2020). Through historic archival research, we acquired historical maps and aerial photos, for each of Seoul and Zürich, before and after the loss of their urban streams. We also acquired contemporary GIS spatial data for Seoul (2015) and Zürich (2020). We georeferenced and digitized the historic maps and aerial photos using ArcGIS: a 500-meter buffer around Seoul’s Cheonggyecheon and Zürich’s twelve districts. The ensuing spatial data led to a multi-layered comparative analysis. Firstly, for each city, we compared how the urban morphological arrangements, namely the town plan’s street networks, building footprints, and urban blocks changed over time vis-à-vis its urban streams. Secondly, combining the spatial data and the systematic content analysis literature review facilitated comparing Seoul’s stream restoration and Zürich’s stream daylighting approaches. Spatially, the comparison contrasted the two approaches’ impacts on the longitudinal connections (the socio-spatial routes along the streams), the lateral connections (like bridges and dams); and the vertical connections (riverbanks) (Kondolf & Pinto, 2017). The literature review facilitated comparing the two approaches along

nine parameters, namely: area, cost, ecology, hydrology, politics and policy, economy, public participation, socio-cultural dimensions, and infrastructure.

The findings reveal how twentieth century urban development that led to the loss of Seoul's and Zürich's streams also severed their longitudinal, lateral, and vertical connections with urban morphology. Both cities opted to 'restore' their urban streams albeit for different reasons. Seoul's mega-project that daylighted 7km of the Cheonggyecheon centred on place making and city branding while Zürich's incremental policy that daylighted over 25 kilometers of small stream segments throughout the city was economically driven by the need to separate clean run-off from the sewage system. These different scales and rationales also differently impacted the ensuing morphological connections. Where Seoul's Cheonggyecheon restoration entailed major morphological changes, Zürich's daylighting bore minimal morphological impacts. Yet, both are effective nature-based solutions that contribute to climate adaptation and mitigation, albeit differently.

RESPONDING TO THE PLASTIC CRISIS: LOCAL GOVERNMENT PLASTIC BANS AND CONSUMER BEHAVIOR TOWARDS SINGLE-USE PLASTIC BAGS IN TARLAC, PHILIPPINES

Abstract ID: 1062

Individual Paper Submission

CROWLEY, Julia [University of Missouri-Kansas City] jccrowley@wcu.edu, presenting author
ERGUIZA PACADA, Pearl [University of the Philippines Diliman] pearlerguiza.pacada@gmail.com, co-author

The global plastic system has been recognized for its contribution to severe environmental problems (Nielsen et al., 2020). Growing concerns in regards to the environmental impacts of single-use plastics have led to plastic bans and taxes. However, past studies have suggested that a myriad of factors influence an individual's single-use plastic consumption habits. For example, Jakovcevic et al. (2014) conducted field studies to test the effects of a charge for single-use plastic bags that was implemented in Buenos Aires City, Argentina. Results demonstrated an increase in reusable bag use since the plastic charge, and the majority of consumers reported that they brought their own bags to protect the environment (Jakovcevic et al., 2014). Similarly, Ari and Yilmaz (2017) found single-use plastic bag reduction rates to be high among individuals who are aware of the impacts of plastic bags on the environment, and who feel a sense of social pressure. In a comparative study of three Northern Philippine municipalities that do not have plastic bans, Crowley (2020) concluded that single-use plastic bag consumption levels were significantly higher in a municipality that provides plastic shredding and recycling compared to two other municipalities that do not provide such a service. Jia et al. (2019) suggest that behavior theory is a suitable method for assisting policy makers with motivating plastic mitigation actions. This theory tells us that an individual makes a demand decision by examining behavioral costs and benefits that come from values in consumption activities (Jia et al., 2019).

Variations in single-use plastic consumption habits are apparent in the Central Philippine Province of Tarlac where a provincial plastic ban was recently adopted by the Governor, but it has not been enforced uniformly throughout Tarlac's seventeen municipalities. The purpose of this research is to incorporate behavior theory to examine the relationship between local plastic bans and individual consumer behaviors pertaining to the consumption of single-use plastics. To address this research question, residents of municipalities in Tarlac with varying levels of plastic ban enforcement were surveyed. Questions pertained to demographic information, frequency of reusable shopping bag use, willingness to pay for a reusable shopping bag, weekly consumption levels of single-use plastic bags, availability of plastic bags at local stores, and perceptions of the environmental impacts of plastics. A multinomial logistic regression model was run to examine factors that influence the overall frequency of using reusable shopping bags

with the following three levels: most of the time, sometimes, and never. A weighted least square regression model was run to examine factors that influence weekly single-use plastic bag consumption levels. Results suggest that a variety of demographic factors, perceptions of the environmental impacts of plastics, and the municipality's plastic ban enforcement level were significant predictors of the frequency of using reusable shopping bags, and the weekly single-use plastic bag consumption levels. Such findings are crucial for understanding effective planning practices for enforcing plastic bans, and motivating individual consumers to make conscious decisions to reduce their single-use plastic consumption levels.

ATTAINING CLIMATE JUSTICE THROUGH THE ADAPTATION OF URBAN FORM TO CLIMATE CHANGE: FLOOD RISKS IN TORONTO

Abstract ID: 1063

Individual Paper Submission

MOHTAT, Niloofar [University of Waterloo] nmohtat@uwaterloo.ca, presenting author
KHIRFAN, Luna [University of Waterloo] lkhirfan@uwaterloo.ca, primary author

Entrenched cost-benefit rationales underlying most urban form adaptations to climate change unequally exacerbate vulnerabilities and hazard exposures, hence, engender risk inequalities and trigger climate injustice (cite Long & Rice). The three pillars of justice redress climate injustice, namely: distributive justice (the just spatial distribution of adaptation responses); procedural justice (the fairness of decision-making processes); and recognitional justice (the legitimization of marginalized groups) (Klinsky & Mavrogianni, 2020; Schlosberg, 2001). We assessed the extent of the theoretical and empirical integration of these pillars in the planning scholarship through a systematic review of urban climate justice vis-à-vis adaptation interventions that revealed a lack of such integration (Mohtat & Khirfan 2021).

To overcome these omissions, we develop a theoretical framework that connects the climate justice pillars with urban form adaptive interventions for managing climate change-induced floods. Specifically, we: 1) capitalize on the distributive justice's interconnections with differential vulnerabilities, flood exposures, and the adaptive capacity of urban form to identify areas that unequally experience flood risks; 2) expand upon the connections among recognitional justice, epistemic justice (Fricker, 2007), and local experiential knowledge (LEK) to determine the root causes of the risk inequalities; 3) draw on the collaborative planning theory (Godschalk and Mills 1966), to advance the procedural justice in urban form adaptation. We operationalize our theoretical framework using a multi-criteria model whose variables and indicators assess the spatial distribution of social vulnerabilities, exposure, and urban form's adaptive capacity. Our model underscores participatory mapping that includes vulnerable groups' LEK. Specifically, this model facilitates an assessment of "who" is unequally at-risk to flooding events; "where" are they located; "why" they are unequally vulnerable; and "how" can urban form adaptive interventions advance climate justice.

We test our model in Toronto, Ontario where we operationalize our spatial multi-criteria model firstly, through weighted overlay analysis using ArcGIS and an online survey of 120 Toronto-based flooding experts the results of which identified four priority neighborhoods at a disproportionate risk of floods. Surely, these are inner-city high density tower communities with old infrastructure and low-income, racialized, and migrant populations – typical of postwar tower block communities across North America and Europe.

Secondly, we focused on green and blue infrastructure (GBI) planning in one of these neighborhoods, Thorncliffe Park, where we conducted an online survey of its residents and in-depth interviews with its community leaders and flooding experts to investigate how residents' LEK has been recognized in adaptation decisions. Lastly, we performed an online participatory-mapping activity during which neighborhood residents identified locations requiring GBI and overlaid their maps with land use run-off coefficients to inform future planning of site allocations for GBI. Our

findings from Thorncliffe Park reveal that notwithstanding its vulnerability to flooding, its residents' primary concerns are housing and subsistence needs – needs at the core of structural vulnerabilities, hence, our recommendation for planning interventions to combine adaptation interventions and socio-cultural needs central to vulnerability.

LIEBERKNECHT, Katherine [University of Texas at Austin] klieberknecht@utexas.edu, co-author

Municipal leaders worldwide are showing substantial interest in urban greening. This encompasses incentives, policies, and programs to vegetate urban landscapes, and it often includes urban tree planting initiatives (TPIs). Over the past decade there has been a seven-fold increase in scholarly use of terms denoting TPIs, and roughly two-thirds of associated studies address TPIs in the United States (U.S.). This reflects a bloom of scholarly interest in TPIs that is also reflected in practice. Indeed, contemporary TPIs and associated programs may reflect a significant chapter in the historical arc of urban greening that has direct implications for landscape planning and design norms. Yet, there has been limited research on contemporary TPIs as historically situated cultural phenomena (Pincetl et al., 2013), and there has been no nationwide assessment of TPIs across municipal scales.

Addressing these gaps, this presentation will report on findings from a survey of 41 TPIs in the United States (Eisenman et al., 2021), reporting on typical traits of U.S. TPIs across six themes: background, dates and goals, public awareness, funding and governance, planting, and stewardship. Respondents identified over 115 traits that distinguish TPIs from typical urban tree planting activity, suggesting that TPIs are a discrete form of urban forestry. Over two-thirds of TPIs are funded separate from traditional urban forestry; this supports concerns noted in previous urban planning scholarship that lack of institutionalization raises questions about the long-term viability of large scale tree planting programs as a form of living green infrastructure (Young, 2011).

TPIs mobilize political and financial resources for program launch, tree purchasing, and planting, but there may be a need for greater investment in stewardship activities and the social infrastructure that undergirds green infrastructure, especially in post-industrial towns that face distinct challenges associated with population decline (Breger et al., 2019). Large shade trees for ecosystem services and native trees are the principal factors informing TPI species lists. Beautification and regulating ecosystem functions are, in turn, the principal potential benefits animating tree planting goals, yet few TPIs have conducted research to assess the fulfillment of associated outcomes. This echoes concerns that the magnitude of ecosystem function benefits of urban trees may be overstated (Pataki et al., 2021).

This study provides a foundation for future scholarship on TPIs, and a basis to investigate the normative implications of TPIs for landscape planning and design in urban settings. Importantly, city planners do not have a significant presence this line of scholarship, and this presentation aims to encourage increased engagement of urban planning researchers on TPIs.

FACTORS INFLUENCING CITIES TO IMPLEMENT CLIMATE ADAPTATION PLANNING

Abstract ID: 1143

Individual Paper Submission

MATOS, Melina [Texas A&M University] melina_matos@tamu.edu, presenting author

This paper will examine the factors influencing cities to implement climate adaptation planning. Despite the imminent threat of climate change, few U.S. cities are adapting to it. A 2011 survey of 248 U.S. cities engaged in sustainable development found that 55% were discussing climate adaptation activities. Yet, in 2021, only 73 of those had a plan addressing adaptation. What factors enabled these cities to implement adaptation planning? How can the success be replicated in other places? Therefore, it is essential to identify the conditions that allowed those cities to advance in the policy process.

The research uses the 2011 survey of cities developed by Dr. JoAnn Carmin at MIT (Massachusetts Institute of Technology) in partnership with ICLEI (Local Governments for Sustainability), augmented with new complementary secondary data from sources such as Yale Climate Opinion, FEMA, Georgetown Climate Center, and the Census. Carmin's research group identified the general stage of adaptation efforts in cities worldwide and factors that hindered them from engaging in climate adaptation. However, it focused on the first step of the policy process, agenda-setting, when an issue becomes a priority for action. Unfortunately, no study has assessed how cities move from discussing climate adaptation to addressing it in a plan. Evaluating the 2011 sample, I found out that, despite a ten-year timeframe, only 29% of cities previously engaged in sustainable development have a plan addressing climate adaptation. Therefore, the current state of knowledge of what influences a city, from discussing adaptation to formulating a plan, is uneven and incomplete.

Climate adaptation is a prime example of urban innovation, defined as new ideas designed and implemented. Cities identified climate change as a problem and are trying to address the issue spontaneously. There is no requirement from the state or Federal government to coerce cities to adapt; they did it independently. According to the diffusion of innovation theory, by studying why early adopters engage in innovation, our insight into the likelihood of adoption among followers is enhanced. Early adopters are involved in climate adaptation (Abunnasr, Hamin, & Brabec, 2015). Therefore, the central goal of this study is to explore the factors influencing climate adaptation through the lenses of innovation theory. For this study, innovators and early adopters are the cities that embraced climate adaptation by declaring engaged in adaptation in the 2011 survey and had a plan by 2021.

Innovation is influenced by motivation, perception of need, resources, and engagement in learning networks. I use logistic analysis to assess how these factors influenced a city to engage in adaptation and implementation. Preliminary results suggest communities with a strong perception of need from public officials and citizens are more likely to become innovators and early adopters of climate adaptation. They also have strong motivation variables; they have specific learning partners and higher financial resources.

As organizations successfully innovate, others are more inclined to adopt it since the risks are lower. But when a plan is the "innovative product," just following a similar document structure will not ensure success. Instead, it is necessary to consider the process and underlying factors that led the early adopter to their innovation. Thus, there is a critical need to determine why some cities take action to adapt to a changing climate. Nurturing climate adaptation in the broader community will be challenging without this knowledge.

A HEDONIC APPROACH TO COASTAL RESILIENCE IN POST-HURRICANE MARIA'S PUERTO RICO

Abstract ID: 1187

Individual Paper Submission

SANTIAGO, Luis [University of Central Florida] luis.santiago2@ucf.edu, presenting author
 BARRETO, Maritza [University of Puerto Rico] maritza.barreto@upr.edu, primary author
 CASTRO, Aurelio [University of Puerto Rico] aurelio.castro@upr.edu, co-author
 PEREZ, Kevian [University of Puerto Rico] kevin.perez@upr.edu, co-author
 GARCIA, Jaime [university of central Florida] jaimeeuclides@knights.ucf.edu, co-author

Five years have passed since Hurricane Maria devastated Puerto Rico. Throughout its coastal regions, loss in natural infrastructure elements such as beach width reduction, coastal dune flattening (Barreto-Orta et al. 2019; Mayer et al. 2018), coastal wetland loss, live coral cover reduction and fragmentation, and damaged seagrass beds (Hernandez-Delgado et al. 2018; NOAA 2018) were identified after the 2017 hurricane season. Current field work conducted by our research team has shown that widespread physical and natural infrastructure damage is still observed in vulnerable coastal communities.

The Commonwealth of Puerto Rico and local municipal governments are seeking economic development opportunities after experiencing three events with devastating consequences in a five-year period (2017-2022): Hurricane Maria in September, 2017, a magnitude 6.4 earthquake on January 7, 2020, and the COVID-19 pandemic. Economic development in coastal regions of Puerto Rico has partly focused on commercial and housing construction projects. In 2021, 3,277 construction permits were approved by the Puerto Rico Permits Management Office along coastal municipalities (Centro de Periodismo Investigativo, 2022). Rebuilding efforts which include new housing, business and hotel development along coastal regions may lead to increased vulnerability due to the increasing likelihood of sea level rise, coastal erosion and storm surge.

If resilient outcomes are sought as part of a post-Maria coastal development effort, current coastal physical and social vulnerability should be considered to guide any development and reconstruction efforts. To achieve this end, an accessible and replicable coastal vulnerability indicator framework has already been designed to assist commonwealth and federal policy makers in the allocation of funding for coastal recovery (Santiago et al., 2020). The index can also serve as input to the construction permitting process.

Our main research question is: Do homeowners implicitly consider the value of coastal environmental protection attributes when purchasing a property? We seek to enhance the current coastal vulnerability profile by incorporating results from a first stage Hedonic valuation model to assess the value attributed by coastal homeowners to environmental attributes that may provide protection to their properties, including beach width, erosion and accretion levels, flood zone location, coastal type and elevation. Hedonic valuation estimates would allow stakeholders to assess vulnerability from a different angle, through estimates of monetary losses resulting from increased erosion rates, decreases in beach width, and changes in coastal type, flood zone location and elevation. Our hope is that model estimates would assist commonwealth and municipal planning and permitting authorities in the evaluation of coastline development projects, explicitly considering beach width, erosion patterns, and other potential coastal protection resources in the decision-making process.

WHOSE CARBON FOOTPRINT? RACE, CLASS AND HISTORICAL CARBON MAPPING

Abstract ID: 1197

Individual Paper Submission

KIM, Woolack [University of Cincinnati] sgkimwl@gmail.com, presenting author
GIOIELLI, Robert [University of Cincinnati] rob.gioielli@uc.edu, primary author

Over the past two decades, local, state and regional governments have paid increasing attention to household carbon footprints to try and develop policies to limit greenhouse gas emissions. More recently, planning agencies have also been working on climate change mitigation strategies that will address rising sea levels, increasing ferocity of storms and floods, and urban heat waves that will be a part of our ever-warming future. Much of this work has also begun to plan for the reality that climate impacts will not be felt equally, that many of the most historically marginalized communities will be hotter and wetter in the future. This paper, which is part of the “Environmental History of White Flight” project on the history of race, sprawl and sustainability in the American city, looks to combine these two methods of analysis by asking which metropolitan communities have contributed to climate change historically and contemporarily. More broadly, it looks to consider how social processes, such as racism and income inequality, have actually been drivers of climate change.

This project began with an effort to overlay data related to contemporary household carbon use in major American cities with demographic data related to race and income. The goal was to visualize possible correlations between current carbon footprints and race. The initial results can be viewed here: https://ucdscenter.github.io/climate_race_maps/. We did find some relevant connections between household emissions and race, especially as it related to transportation. In cities with stronger public transit systems, communities of color had lower carbon footprints. But one of the larger questions of this project was how the ongoing racialization of metropolitan spaces and infrastructure, particularly all forms of housing and mobility, drove a continued dependence on fossil fuels. Thus we decided that a historical perspective was necessary, and so we began the process of looking for ways to find historic data on household carbon use.

This phase of the project, first, aims to examine historic household carbon emissions of the United States to identify the changing geography of carbon footprints between 1980 and 2017. The estimation uses average household consumption data from the Consumer Expenditure Survey and average household vehicle miles traveled data from the National Household Travel Survey to estimate average household carbon emission in census tract level. The methodology is borrowed from existing research by Jones (2020) and Jones & Kammen (2014) which employed econometrics and input-output model to estimate household carbon emission. This allows us to understand how the geography of carbon emission has changed historically. Then, we address the relationship between carbon emission and demographic information, particularly race and income, to identify which community contributes to the greenhouse gas emissions more, ultimately, to understand whether race and income matter to carbon emission.

The goals of this project are twofold. The first is data exploration, to see which particular places and types of urban development have been the key drivers of carbon use in American cities, and the role of race in those shifts. The second is data visualization, to communicate to officials, planners, advocacy groups and the general public in major American cities how race and resource intensive suburban sprawl are driving America’s metropolitan carbon footprint. We are currently completing our data analysis with the goal of publishing the second phase of historical visualizations by August 2022. This paper will outline project goals and methodology, as well as explore our initial analysis and visualizations.

PLANNING-CENTERED MODEL OF COMMUNITY RELOCATION: LESSONS LEARNED OVER 6 YEARS FROM TYPHOON HAIYAN

Abstract ID: 1199

Individual Paper Submission

IUCHI, Kanako [Tohoku University] iuchi@tohoku.ac.jp, presenting author

Relocation is associated with adverse outcomes (Ferris, 2011). Past research suggests that relocation disrupts social ties and financial networks, which poor populations – often the target of government-led relocation – heavily rely on (e.g., Vanclay, 2017). Relocation also has a negative psychological impact, as unexpected life events can create emotional stress (Esnard & Sapat, 2014). In post-disaster relocation, new sites are usually prepared in government-owned remote locations in order to develop quickly under time pressure (Balachandran, Olshansky, & Johnson, 2021). However, research findings on negative consequences tend to focus on the early phase of post-relocation and are limited to a longitudinal understanding of the adaptation processes of relocating communities.

This paper longitudinally explores a large-scale relocation of typhoon-affected coastal communities, and presents a new planning-centered model of community relocation, adding a layer to classic resettlement models (Scudder, 1985). It focuses on coastal residents targeted for relocation in the Tacloban City of Leyte Province, the Philippines, affected by 2013 Typhoon Haiyan. The study used an ethnographic approach, including observation, interviews, and unofficial conversations, which lasted from March 2014 to March 2020. Highlights of the research include the changing perception of communities on relocation. To collect data, we conducted semi-structured, open-ended interviews targeting more than 400 residents from both the new relocation sites and original coastal neighborhoods.

There are two major findings. First, there was a noticeable change in the community's perception of relocation. Early on, residents were excited about relocating to the safer yet remote area for security reasons. However, their feelings toward relocation started to change after some time, as their concern shifted from hazard reduction to everyday survival and reestablishing life. In the last phase, residents' feelings toward relocation became optimistic again, as they put effort into improving their living environment to adapt to the new location. Second, despite residents' housing location in the relocation process, whether close to or far from their original neighborhoods, their central concern was securing everyday life and thus continuously improvised ways to survive better. This was especially evident when residents began keeping two houses – one in the original neighborhood and one in the new site. Even when the new housing was ready to live in, residents either kept or built new barracks back in their old neighborhoods. It was critical for them to make a living and connect to the social and economic networks in their original neighborhoods. Such strategies developed in the relocation process support the idea that low-income residents are, in fact, much more innovative and resourceful than what has been presented in earlier research findings.

The proposed planning-centered model of community relocation is based on the finding that residents' perception of relocation changes over time, from reducing hazards to reestablishing life and adapting to a new environment. Despite the changing mindsets and displaced locations of the relocating residents in the relocation process, "sustaining daily life" had always been the central issue for them. Thus, securing life stability should be a central concern when planning relocation while also considering the impact of time on their psychosocial feelings. Therefore, securing access to economic and social opportunities, whether creating new or keeping the old, is vital in every phase of community relocation. Because community relocation is an evolving process and residents are much more resourceful than previously understood, relocating residents would benefit from the opportunity to co-design both the planning and implementation of relocation.

DERIVING SPATIAL CHARACTERISTICS OF URBAN HEAT ISLAND EFFECT BASED ON THE LOCAL CLIMATE ZONE: A CASE STUDY OF SHANGHAI, CHINA

Abstract ID: 1204

Individual Paper Submission

YOU, Meizi [New York University Shanghai] my2683@nyu.edu, presenting author

GUAN, Chenghe [New York University Shanghai] chenghe.guan@nyu.edu, primary author

Local Climate Zones (LCZs) is an urban morphological unit that decipher the principles of urban thermal environment in terms of spatial scale and design elements. LCZs can decipher the principles of urban thermal environment and improve the analysis of blurred urban-rural boundaries in the definition of urban heat island (UHI) effect. Previous studies try to find correlation between LCZ and UHI, however, few have successfully quantified the contribution of each LCZ type to land surface temperature (LST). Also, there is a lack of investigation in proposing spatially targeted strategies for urban development. In this study, we analyze Shanghai's spatial variation using the Local Indicators of Spatial Association (LISAs) and Hot Spots methods. We specify the outliers and clusters of hot/cold islands and further analyze the causality from the perspective of spatial structure, composition, and environment. The LCZ of the central area was mapped using the World Urban Database and Access Portal Tool (WUDAPT) and the characteristic scale of LCZ to UHI was detected by Geodetector. The influence and interactions of LCZs on LSTs were quantified from the perspective of structure type, spatial openness, and development intensity. We found that (1) High-High clusters show a spatial pattern of spreading from the central face to the surrounding belt, which is consistent with the direction and level of urbanization; Low-Low clusters are basically distributed along the coastline; LH-Outliers are divided into four categories: transportation hubs, industrial/industrial parks, CBD and dense residential areas; (2) The optimal study scale is 300 m, with LCZ-1(compact high-rise), LCZ-4(open high-rise), and LCZ-5(open mid-rise) types dominating the central area; (3) The built-up type has a lower explanatory degree than the nature type. The influence of LCZ-G(water) was the largest (influence=0.2260); and (4) LCZs exhibit bi-linear or non-linear enhanced relationships in the interactions. Findings provide urban planners and policy makers with theoretical guidance for climate-sensitive planning.

CREATIVE RESPONSES TO THE HIDDEN AND AGING DAM INFRASTRUCTURE

Abstract ID: 1214

Individual Paper Submission

FRIEDMAN, Mirit [University of Michigan] mirit@umich.edu, presenting author

LARSEN, Larissa [University of Michigan] larissal@umich.edu, co-author

Dams provide important community benefits, such as flood control, water supply, recreation, and hydropower among others; however, dams are also aging, obsolete in many cases, and failing, threatening human safety, structures, and environmental resources. Since 1980, roughly 1,000 of the 90,000 dams in the United States have failed. The cascading failures of Michigan's Edenville and Sanford Dams in 2020 demonstrated their potential impacts. Though no lives were lost, these failures impacted 2,500 structures, causing nearly \$250 million dollars in damages. Land use changes, unanticipated water volume variation, neglected maintenance, and expensive repairs all increase the risks of dangerous dam failures. Despite the high financial and environmental costs associated with dam failures, there are few strategies and limited funding for proactively managing dams and variable regulations across the US. Although states regulate dams, private owners and public authorities are responsible for managing the dams and their surroundings. In the age of climate change, aging dams are easily overlooked by all of these actors despite their looming danger.

As concerns rise around aging dams and the uncertainty and risk that climate change poses to infrastructure planning, we ask in this project: 1) What creative approaches to dam management are states and local governments pursuing?; and 2) What makes these approaches effective in addressing dam management challenges? Through a national U.S. scan, we selected five existing approaches to dam management as possible strategies for wider implementation: emergency action planning regulations in California; land use planning in Virginia; local taxation authorities in Texas; dam update funding programs in Massachusetts; and expedited dam removals in Pennsylvania. We developed case studies of each approach based on interviews with 21 local and state regulators, dam owners, planners, and non-governmental organization (NGO) partners in dam management; site visits to 10 dams in Massachusetts and Pennsylvania, and document analysis to review key policies, reports, and legislative documents.

The effectiveness of these five approaches depended on interventions from state and local governments and the support of NGOs. State regulations and enforcement in California led to improved adoption of Emergency Action Plans, preparing communities for potential dam breach events. Through data collection and a new state code which prevents development in dam break inundation zones, the Commonwealth of Virginia is deterring development in these zones, and thus reducing flood risk. The Baker-Polito administration for the Commonwealth of Massachusetts is incentivizing dam upgrades and renewals through a new funding program. Pennsylvania actively promotes dam removals through communication programs with dam owners and streamlined permitting processes. Finally, despite an environment of deregulation of dams in Texas, local governments such as Water Control Improvement Districts are developing property taxes to support the maintenance and improvement of their flood control dams. These progressive management efforts often resulted from a combination of experiences with dam breach events, climate change planning efforts, and the support of stakeholders, such as NGO partners, state government officials, or regional planning agencies. Strong NGO participation, in particular, helped initiate and maintain dam modification and removal efforts.

These findings will inform recommendations for improved dam management practices across the U.S. The need for promising practices is especially relevant with the passage of the national Infrastructure Bill - which earmarked \$2.3 billion for dam removals, retrofitting, and rehabilitation. With recent dam failure events looming and climate change effects worsening, strategic use of such funding for infrastructure planning is urgent.

RESIDENTIAL MOBILITY AND EXPOSURE TO CLIMATE HAZARDS IN NORTH CAROLINA

Abstract ID: 1217

Individual Paper Submission

HINO, Miyuki [University of North Carolina at Chapel Hill] mhino@email.unc.edu, presenting author
JUNG, Jihoon [University of North Carolina at Chapel Hill] climate@email.unc.edu, primary author

Climate change is anticipated to affect migration patterns through both climate extremes and slow-onset changes such as sea level rise (McLeman & Smit, 2006). Evidence from a range of contexts has shown that extreme weather events (e.g., extreme heat, wildfire, flooding) affect the frequencies and patterns of international and domestic migration (Berleemann & Steinhardt, 2017). However, residential mobility can also exacerbate exposure to climate extremes. In the US, migration has led to increases in the population exposed to coastal hazards and in wildfire-prone areas (Climate Central & Zillow, 2018; Radeloff et al., 2018). The extent to which residential mobility increases or decreases exposure to climate hazards is likely to vary substantially across groups. For example, socioeconomically and demographically vulnerable subpopulations may be more likely to be displaced by climate extremes due to older, low-quality housing, but may also face resource constraints that prevent them from moving to safer places. Wealthier households have the resources to out-migrate, but those resources can also serve to protect themselves in place.

How is exposure to climate hazards influenced by residential mobility, and how does this relationship differ across groups? While most studies have focused on the effects of climate extremes on migration, here we examine the reverse: how an individual's migration history affects their exposures by either moving away from or towards hazardous areas. We leverage a unique dataset of individual address histories covering over 15M individuals – most living adults ever residing in North Carolina. We use those address histories to track exposures to three different hazards: extreme temperatures, wildfire-induced air pollution (PM_{2.5}), and riverine and coastal floods. We quantify if and how much residential mobility alters lifetime exposure to those hazards for the study population. Since local knowledge may influence decisions about where to move, we examine differences between short- and long-distance moves, as well as differences between people who move often vs. infrequently. Additionally, we compare the impacts of residential mobility on exposure across gradients of social vulnerability at the neighborhood scale, such as socioeconomic status, disability, minority status, and housing type. The results demonstrate where and for whom residential mobility serves as a pathway to safer ground, as opposed to leading to more people in harm's way. Our findings not only reflect the aggregate relationship between migration and exposure to climate hazards, but also how different sub-populations are and are not able to move to protect themselves.

Understanding the diverse relationships between residential mobility and climate hazards can enable more resilient housing and land use planning by indicating where safe housing is necessary and where demand for risky housing may pose challenges in the future. As climate change worsens, considering in- and out-migration in relation to climate risk is increasingly critical for community resilience.

TRACKING AND MINING THE LITERATURE ON CLIMATE CHANGE RESILIENCE IN PLANNING

Abstract ID: 1245

Individual Paper Submission

LI, Zekun [The Ohio State University] li.12350@osu.edu, presenting author
CHEN, Zhenhua [The Ohio State University] chen.7172@osu.edu, co-author

As climate change-induced natural disasters increasingly strike cities, how to improve resilience to climate change has become critically important but challenging for urban planning practitioners (Meerow et al., 2016; Sharifi et al., 2017). Although there is increasing literature assessing various mitigation and resilience strategies through different geographic and hazard contexts, it remains unclear what the climate change resilience literature's overall trend, characteristics, and evolutionary patterns are. In addition, it is also not clear what the major research gaps are and what the future research directions are.

This study aims to provide a comprehensive examination of the evolution of the climate change resilience literature, with a focus on planning-related journals. Specifically, the following research questions are addressed: what is the

global trend of scientific publication on climate change resilience in planning? What themes are uncovered from its evolution in various phases? And what are the future directions of research in this field? We investigated these research questions using both bibliometric analysis and text mining methods. The bibliometric analysis is used to explore the meta information of published papers in a broader field, such as topics, authors, affiliations, etc. Text mining method (Fang and Ewing, 2020) is adopted to further extract more information from the full content of the literature and identify specific topic models in the planning field.

Results show that the topic of resilience research to natural disasters has evolved from floods and hurricanes to power and technology. When discussing urban resilience in the planning field, there is an extensive collaboration among scholars from different disciplinary backgrounds, such as geography, environmental science, sociology, public administration, and psychology. In addition, we found that most research focused on vulnerability rather than on resilience itself, and their research focuses have also changed from spatial planning to green infrastructure and environmental justice. Co-occurrence words and topic model reflect the research network on various clusters of themes, such as farm-agriculture-drought, vulnerability-household-income, government (multilevel)-project-funding. The study provides new insights to help us systematically understand the climate change resilience literature. Through this research endeavor, the identified research gaps, needs, and directions will also facilitate future planning practice to enhance resilience to climate change disruptions.

HOW WORLDVIEWS INFORM STAKEHOLDER PREFERENCES FOR COASTAL HOUSING ADAPTATION STRATEGIES

Abstract ID: 1246

Individual Paper Submission

GERONIMO, Laura [Rutgers, The State University of New Jersey] laura.geronimo@rutgers.edu, presenting author

Coastal communities face unprecedented challenges due to growing flood hazards like sea level rise and storm surge. How should these communities adapt in the face of uncertain flood risk, and how should public dollars be prioritized to aid these communities? Given limited resources and the great number of people and assets at risk in the coastal zone, investing in adaptation strategies will involve equity and efficiency tradeoffs (Chandra-Putra & Andrews, 2019). Some populations may win while others lose. Some strategies may be politically popular in the short run but inefficient over time, and prone to giving a false sense of security. Designing coastal adaptation policies that are socially desirable and politically feasible requires careful risk analysis, evaluation of alternatives, and public engagement. This paper focuses on the engagement piece to better understand the perspectives of decision-makers and residents regarding coastal adaptation strategies in the case study township of Toms River, New Jersey.

The paper builds on prior empirical work that examines the spatial distribution of FEMA funded home buyouts and elevations, two popular coastal adaptation strategies at the household level. To be implemented through FEMA's Hazard Mitigation Grant Program (HMGP), projects must meet a series of criteria, including cost-effectiveness. Prior work on buyouts across the U.S. suggests that the evaluation criteria and processes for approving buyouts may benefit Whiter and wealthier communities while displacing minority and low-income communities (Siders, 2019). In coastal shoreline counties, we find that elevations tend to be in zip codes with higher proportions of White population compared to buyouts. These findings raise concerns about the equity and efficiency tradeoffs of federally funded buyouts and elevations in the coastal zone.

The research for this paper helps build a theory basis to better explain why elevations concentrate in some locations versus others. Building upon prior work on the sociology of climate change, our central research question is: What worldviews inform different stakeholder preferences toward federally funded coastal risk reduction strategies?

We focus on the case study of Toms River, New Jersey, a place which we have identified as having one of the highest proportions of FEMA funded home elevations compared to other coastal municipalities. We conducted 10 interviews with decision-makers at the federal, state, and local levels who are involved in preparing and approving HMGP projects. We also interviewed 10 residents in Ortley Beach, a barrier island community in Toms River that has seen

repetitive loss but prefers to continuously rebuild and elevate as an adaptation strategy. Following Bessette et al., 2017, we use Value-Informed Mental Modeling (ViMM) to unpack how values inform stakeholder preferences. Adopting Kahan's cultural cognition approach to the cultural theory of risk, we use a short form survey to measure worldviews following the interviews (Kahan, 2012). Findings suggest that people with hierarchical-individualistic worldviews tend to prefer that government direct resources toward strategies that enhance their property values.

This research helps fill important gaps in coastal climate adaptation policy and planning. According to Buchanan et al., 2019, "there are limited empirical studies on the influence of households' values and biases on coastal adaptation." By exploring this relationship further, we hope to contribute to a theory basis that can help make sense of larger trends and "promote collective management of public perceptions of risk and the effect of policies for mitigating them" (Kahan, 2012).

THE IMPACT OF POST-HURRICANE RECOVERY STRATEGY ON HOUSE RECOVERY: A CASE STUDY OF HURRICANE MICHAEL IN FLORIDA USING STREET VIEW IMAGES

Abstract ID: 1257

Individual Paper Submission

ZHAI, Wei [University of Texas at San Antonio] wei.zhai@ufl.edu, presenting author

Postdisaster recovery inevitably involves the tension between speed and quality, which are the two sides of postdisaster recovery. On one hand, speed is the key to ensure local businesses alive and provide short-term and long-term housing for residents and victims. For instance, if it takes two decades for a community to build back, residents and victims may have migrated to other cities. On the other hand, even though expediting recovery is important, it is necessary to spend more time carefully arranging the postdisaster reconstruction. If the community recovers fast, it may imply that there are not adequate discussions with stakeholders. Specially, if the local government aims to reduce risk and rebuild homes shortly after the disaster, the urgent pressure can result in ineffective planning, the unexpected increasing long-term vulnerability of damaged areas.

Despite the importance of the trade-off between speed and quality, it has not been quantitatively examined in previous studies. More specifically, even though the speed and deliberation issue has been discussed theoretically and qualitatively examined on the city or regional level, the problem has not been examined on the parcel level. Specifically, researchers have developed the concept of "time compression" to theorize how the time-compressed environment distorts the recovery quality from the perspective of capital services. However, the theory has not been empirically demonstrated yet. In addition, researchers have qualitatively examined the tension of "speed vs. quality" based on interviews for postdisaster recovery in Japan and Turkey and analyzed the phenomena on a macro level. However, the results indeed are not explicitly enough for guiding the neighborhood recovery, which needs more specific guidance of parcel-level projects.

Therefore, the purpose of this research is to fill these gaps by examining two topics: the impacts of resilience strategies on the housing recovery speed and impacts of resilience strategies on the home sale behavior. Specifically, it would employ Mexico Beach, FL as a study area to examine the effects of local planning on recovery progress. Hurricane Michael, as a Category 5 hurricane, made landfall in northwest Florida on October 10, 2018. Mexico Beach was totally wiped out due to the strong wind and storm surge. For recovery, the city council and planning agency developed two resilience strategies to make the community more resilient: elevation ordinance and wind-load ordinance. Using Mexico Beach as a case study, it firstly employed street view images to quantify the parcel level damage and recovery. Next, it aims to understand the effectiveness of resilience strategy in terms of reducing damage in a natural disaster event.

The result indicates that the resilience strategy would partially slow the recovery progress. In this case, elevating houses may slow the reconstruction speed whereas wind load strategy does not make a difference. This pattern also applies to home sale behavior. That is, if the property is required to be elevated in the reconstruction phase, the odds of the property being sold would increase. These findings are consistent with the “speed vs. quality” issue it stated in the very beginning. By filling the gaps stated earlier, the contribution of this research relies on two aspects: (1) It introduced an approach to examine the “speed vs. quality” problem on the parcel level; (2) It demonstrated that the “speed vs. quality” could happen when the resilience strategy is applied for post-disaster reconstruction.

MANDATED GREEN INFRASTRUCTURE PLANNING: WHAT MAKES DIFFERENCES?

Abstract ID: 1269

Individual Paper Submission

KIM, Chaeri [University of Pennsylvania] chaeri@upenn.edu, presenting author

A growing number of cities are adopting green infrastructure to address urban issues. In the United States, this trend has been obvious, especially in wastewater and stormwater management (Matsler et al. 2021; Fletcher et al. 2015). In 2007 when the Environmental Protection Agency (EPA) issued a series of policy memos encouraging the use of green infrastructure and acknowledging the economic burdens of local governments and the cost-effectiveness of green infrastructure (EPA 2007). Since then, the federal agency has included green infrastructure terms in some consent decrees to enforce green infrastructure planning and implementation. The term green infrastructure first appeared in a federal consent decree in 2010. Some early adopters started to complete their green infrastructure planning and implementation requirements. This study investigates how green infrastructure provisions in a consent decree have affected local green infrastructure planning through two case studies: Cleveland, Ohio, and St. Louis, Missouri.

Building upon Yin (2018)’s case selection logic, this study selected two cases that “predict contrasting results but for anticipatable reasons (Yin 2018, 55).” Both local governments entered into the federal consent decrees with green infrastructure requirements in the early 2010s and accomplished major compliance projects. Despite similarities in environmental and socioeconomic contexts in postindustrial cities (Schilling and Logan 2008), the EPA’s green infrastructure enforcement approach to each case was drastically different. To understand how such differences in requirements made differences in planning and practice, this study analyzes public documents, including consent decrees, plans, and progress reports, and interviews with green infrastructure program managers at the federal, state, and local governments.

The findings of this study illuminate three aspects of green infrastructure planning and implementation for wastewater and stormwater management, particularly in the federal enforcement context. First, each case shows how the consent decree parties, EPA, state, and local governments negotiated the terms for green infrastructure adoption. Second, the cases describe how the local governments developed and implemented plans for green infrastructure. Finally, in addition to the lessons from early implementation, the cases demonstrate the next steps of local green infrastructure planning, beyond the consent decree mandates.

SAME GOAL FOR CARBON NEUTRALITY, DIFFERENT GROWTH PATHS?

Abstract ID: 1309

Individual Paper Submission

PARK, Ji-Yong [Pusan National University] jyxnq@daum.net, presenting author

KANG, Seung-Won [Pusan National University] allan92@naver.com, co-author

LEE, Dalbyul [Dong-Eui University] moon@deu.ac.kr, co-author

JUNG, Juchul [Pusan National University] juchuljung@gmail.com, co-author

[Central Theme and Research Objective]

In the process of achieving carbon-neutral goal, enormous costs can be incurred by the supply shock on energy sector. Costs may vary depending on geographical characteristics and socioeconomic conditions of each region. If the central government present a goal for 2050 carbon net zero, could all regions reach the goal without hindering sustainable growth? Or aren't there different optimal sustainable growth paths for each region to be carbon neutral? The purpose of this study is to derive optimal growth paths for regional energy transition that does not hinder regional sustainable growth in the era of carbon neutrality.

[Approach and Methodology]

We selected South Korea's metropolitan local governments, which are vulnerable to energy supply shocks due to their high dependence on energy, as the target area for analysis. First, 15 metropolitan regions were categorized into several types. Through a review of related literature such as national greenhouse gas inventory data and IPCC guidelines, we examined carbon emission characteristics of each regional type, and analyzed regional response to the shock of the 1997 foreign exchange crisis through the vector autoregressive (VAR) model on the basis of carbon emission trend changes. We applied the impulse-response functions derived above to the Hartwick (1977) rule-based optimal model and analyze regional optimal growth paths for energy transition.

[Findings]

As a result of regional types classification analysis, 15 regions could be classified into four regional types (Energy Production Type; Urban Consumption Type; Industrial Type; Absorption Type) according to carbon emission characteristics. Using GRDP (Growth Regional Domestic Product), population, the number of employee in each region as response variables, we analyzed impulse-response on energy sector. We selected GRDP and the number of employee to analyze regional economic growth, and population to analyze regional growth. As a result, the trend fluctuations of regional economic variables were different for each regional type. In the case of Energy Production Type (EPT), supply shock on the energy sector had a significant negative effect on all response variables. On the other hand, there was no significant variation in Urban Consumption Type (UCT) by supply shock for any variable, and the Industrial Type (IT) and Absolute Type (AT) only responded by the number of employees. The patterns of response are different for each regional type in time. Finally, we derived the optimal sustainable growth path for each regional type considering the energy supply shock in the process of transition to a carbon-neutral society in 2050. In the process of reaching carbon neutrality with sustainable growth in 2050, EPT and IT should establish a more gradual growth path before 2030, and CPT has been shown to be the best path to establish a more active carbon neutral growth path than other regions. AT needs to establish a growth path that maintains the status quo in a way that does not damage carbon absorption such as forests as much as possible. In conclusion, optimal sustainable growth path was different for each regional type.

[Discussions]

Due to the limitations of statistical data, this study is localized based on carbon emissions per metropolitan area. There has not enough sample size to analyze impulse-response function. There is also a limitation in that we could not analyze the effect of the supply shock on the AD-AS curve because regional inflation data are not available. In this study, we tried a bold attempt to see the impact of energy supply shock through trends in carbon emissions, but economically and theoretically, sufficient discussion has not been made yet. Therefore, it is necessary to discuss these methodological and planning issues.

POLITICAL ECONOMY OF AIR POLLUTION IN KENYA

Abstract ID: 1351

Individual Paper Submission

DESOUZA, Priyanka [University of Colorado Denver] priyanka.desouza@ucdenver.edu, presenting author

Air pollution is a major environmental health risk factor in Nairobi, Kenya. Most research conducted on air pollution in Nairobi has focused on measuring pollution concentrations. Although this research is very important, it is also crucial to understand barriers in the regulatory process that prevents this data from translating into effective action. This article attempts to fill in this gap. It starts by detailing the history of urban planning in Nairobi and its legacy in shaping contemporary urbanization and spatial patterns of air pollution. It then relies on interviews, participant observations, and a close reading of key laws and policies to evaluate current political, institutional, and data-infrastructure gaps in the Kenyan air pollution governance framework that serve as barriers for equitable air pollution mitigation. Finally, it draws on interviews and media analyses to examine the promises and perils of citizen science to improve air quality levels in Kenya. It ends by making policy recommendations to make Nairobi more liveable and breathable in the long term.

ADAPTATION IN THE 'VULNERABLE' GLOBAL SOUTH: CASE STUDY OF ADAPTATION PROGRAMING IN PAKISTAN

Abstract ID: 1353

Individual Paper Submission

MALIK, Marwah Maqbool [University of Illinois Urbana Champaign] mmmalik2@illinois.edu, presenting author

As the world hurtles towards 2 degrees Celsius warming, large parts of the world are already facing the brunt of climatic changes in the form of erratic weather patterns, sea level rise, floods, droughts which intersect with interlocking patterns of oppressions, exclusions, and marginalization (Adger et al., 2003; Wisner et. al., 2004). Adapting to these climatic changes is crucial for people at the brink of or in the line of these hazards that impact livelihoods, dwellings, and people's way of being. As climatic hazards come knocking, communities on the ground engage in adaptive practices. However, these practices are largely absent from or do not fit the categories of adaptive actions as conceived in adaptation programs developed by policymakers and planners (Adger, 2006). Enmeshed with global discourse on adaptation, these programs not only regurgitate concepts and methods developed in and by the Global North but also work on an imaginative Global South of 'vulnerable' people (Mikulewicz, 2020). While countries most impacted by climatic changes have emphasized the role of context-specific solutions and importance of local knowledge(s) (UNFCC, 2003; Berkes, 2005), the extent to which this has been incorporated in global programing and translates to action on ground is debatable (Ford et al., 2015).

Drawing on theories from the South that call for epistemologies of the South (Roy, 2009; Santos, 2014; Bahn, 2019), and intersectional feminist theories that emphasize the importance of dialogue in the production of knowledge (Jacobs, 2019) and partial perspectives (Haraway, 1998), I explicate how certain methods in community-based adaptation programs attempt to be radical but fall short of being transformative. I draw on a content analysis of policy and program documents of Oxfam's community-based adaptation programs in Pakistan, supplemented by interviews with project staff ranging from project managers involved in conceptualizing programs to project officers involved in on-ground implementation. I argue that narrow understandings of adaptation potentially recreate universalizing conceptions of Global South's vulnerability and resilience rendering these programs detached from historical contexts, intersectional concerns, and local knowledge(s). Knowledge is created not by way of a dialogue rather through conversations, the contours of which are set by program developers.

The findings of my research have implications for sub-national (provincial) adaptation planning in Pakistan as subnational disaster management agencies not only use findings from Oxfam's adaptation programs in determining funding priorities but also use the same methodologies for subnational surveys mapping vulnerability and resilience in the province. For planning in general, the findings heed to the call from critical planning scholars to decenter EuroAmerican knowledge and imaginations and engage in theorizing from the South. For adaptation solutions to be effective and transformative, they need to be rooted in their historical, socio-economic and political contexts. With impacts of climate change fast exacerbating, adaptation actions short of transformation will do little to bring people out of interlocking webs of vulnerabilities.

EVALUATING THE EFFECT OF HEAT VULNERABILITY ON EMERGENCY MEDICAL SERVICE (EMS) INCIDENTS IN AUSTIN, TEXAS

Abstract ID: 1359

Individual Paper Submission

SEONG, Kijin [The University of Texas at Austin] kijin.seong@austin.utexas.edu, presenting author
 MANDALAPU, Akhil [The University of Texas at Austin] akhilm@utexas.edu, co-author
 JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, co-author

Climate change has exacerbated Texas's characteristically hot climate, with hotter days and less reprieve from high temperatures. Urban heat exposure and sensitivity have been a growing concern in urban regions since the effect of urban heat is often considerably greater than that of surrounding rural environments, posing a threat to public health, water supply, and infrastructure (Bixler, 2021). Heat-related illnesses necessitate a rapid response from Emergency Medical Services (EMS), as such illnesses might result in death or severe impairment if emergency care is not provided promptly (Lee, 2022). Despite growing concerns about urban heat waves and relevant health issues in urban areas, limited research has been conducted on the effect of heat vulnerability during summer days on heat-related local emergency medical services incidents (Zottarelli, 2021).

This study investigates the spatial distribution of heat vulnerability in the Austin-Travis County area of Texas, specifically in terms of urban heat exposure, sensitivity, and adaptive capacity. Then, using normalized quantitative indicators and geospatial bivariate maps, we identify neighborhoods with a high degree of heat vulnerability and limited EMS accessibility – in terms of heat-related EMS incidents and response time – to establish risk reduction priority areas. Finally, we investigate the effect of heat vulnerability on heat-related EMS incidents to identify spatial disparities in vulnerable neighborhoods. A total of 28,431 heat-related EMS events were aggregated at the census block group level (N=578), confined to a constrained calendar year from May to September for 2020 and 2021. We used principal component analysis (PCA) to transform the data for greater interpretability and lower complexity, and bivariate mapping to investigate the relationship between heat vulnerability and EMS accessibility. Finally, negative binomial regression was utilized to determine which heat vulnerability indicators are linked with heat-related EMS

events at the block group level. Heat-related EMS calls have increased in block groups with a larger percentage of impervious surfaces, Hispanic populations, those receiving social benefits, households living alone, and the elderly. Furthermore, increased urban capacity, including higher road density, percentage of water area, and green space, is more likely to reduce heat-related EMS incidents.

This study adds insight into the relationship between extreme heat events as chronic disasters and heat-related health issues. This study presents data-driven evidence for planning practitioners to prioritize vulnerable areas and communities to focus local efforts on resolving heat-related health concerns in the neighborhood context. As a result, the study recommends a better-designed heat mitigation and community resilience plan to promote public health.

SULLIVAN, Patrick [University of Kansas] p994so47@ku.edu, co-author

Communities worldwide have experienced repeated disaster events in quick succession as anthropogenic climate change exacerbates existing risks from natural hazards like hurricanes, floods, and fires (Collins et al. 2019). In the United States, coastal areas, such as the Southeastern states exemplify the new normal of a perpetual process of preparing for a major disaster, recovering from one, and preparing for another close on the heels of the first (National Climate Assessment 2018). For instance, Hurricanes Florence and Michael were separated by only a few weeks in 2018. From 2016 to 2020, Southeastern regions experienced a handful of major declared disasters. The repetitive disasters challenge by states', counties', and municipalities' capacities to cope in addition to adapting. This adds to the need for expanding the knowledge on the conventional framework of a Disaster Mitigation-Preparedness-Response-Recovery cycle.

For planning scholars and practitioners, the dynamics between recovery and mitigation planning practices raise myriad questions about planning processes and plans that need to be updated before the proverbial ink is dried. Additionally, some jurisdictions may never have a chance to complete recovery planning because all their time and effort is spent doing the work of recovery. These dynamics raise questions regarding why some jurisdictions get recovery planning done while others do not, particularly about the networks of people at the local level responsible for planning (Berke et al., 2015; Eräranta & Mladenović, 2021). With that, we ask the following questions: 1) to what extent are hazard mitigation and recovery planning efforts (e.g., plans and planning processes) integrated? 2) to what extent are planning capacities (e.g., technical, and financial support from collaborative entities and federal aids) integrated? And 3) what local factors make a successfully integrated planning network in addition to the factors that fails in doing so?

We tackle these questions using a comparative case study research design, arising from a broader ongoing National Science Funded study (#1760183). We first applied systematic plan quality content analysis methods (Lyles and Stevens 2014) to assess variation of integration of plans and planning processes in 10 counties in Florida, Georgia, and North Carolina. We then used publicly available data on the Federal Emergency Management Agency's Mitigation Assistance, Public Assistance, and Individual Assistance Programs to identify to assess variations in federal funding for risk-reduction and recovery projects. Finally, we conducted digital surveys and semi-structured interviews with key stakeholders in mitigation and recovery planning in each jurisdiction to complement and extend

the plan and funding data. Specific themes we explored across each data set include 1) integration across the plan documents; 2) the collaborative networks of stakeholders with special attention to the provision of technical and financial support in each planning process; and 3) connections to long-term land use planning and other planning processes (e.g., transportation, climate change, housing, etc.).

Our preliminary findings suggest that the mitigation and recovery planning exhibit marked differences in their plan networks and stakeholders' networks involving individuals and agencies being part of the planning team. Mitigation tends to be standardized across counties within each state, while varying across states, consistent with state agency interpretation of the Federal Disaster Mitigation Act of 2000. Recovery efforts are more difficult to characterize. In Florida and Georgia, we found wide variation in plans, stakeholder networks, and funding; in North Carolina, the plans were all nearly identical, but the stakeholder networks and funding vary widely. Our findings speak to the influence of mandates and their interpretation, local stakeholder networks, and access to external funding.

CLIMATE RISK VULNERABILITY TO EXTREME HEAT AND PARTICULATE MATTER: A SPATIOTEMPORAL ANALYSIS USING REALTIME CONCENTRATION OF FLOATING POPULATION IN SEOUL, SOUTH KOREA

Abstract ID: 1369

Individual Paper Submission

SEONG, Kijin [The University of Texas at Austin] kijin.seong@austin.utexas.edu, presenting author

CHOI, Seung Jun [The University of Texas at Austin] jun.choi@utexas.edu, co-author

JIAO, Junfeng [The University of Texas at Austin] jjiao@austin.utexas.edu, co-author

Climate change has augmented the frequency and intensity of extreme heat and air pollution concentration. The recurring summer heatwaves and particulate matter (PM₁₀ and PM_{2.5}) in winter and spring in Seoul, S.Korea, have been considered the "New Normal" that calls for perpetual attention (Kim, 2018). Hence, the climate threat to Seoul's living environment and public health concerns, including the safety of populations vulnerable to climate risks, are snowballing. From an environmental equity perspective, heat-related mortalities and illnesses are unevenly distributed, severely exposing vulnerable populations to extreme heat (Inostroza, Palme, & de la Barrera, 2016; Kim, Deo, Lee, & Yeom, 2017; Wilson & Chakraborty, 2019). Similarly, existing literature demonstrated that exposure and damage to the particulate matter have more detrimental effects on the elderly and children (Ho, Wong, Yang, Chan, & Bilal, 2018). Studies have investigated the static occurrence of heatwaves or particulate matter based on spatial information using urban climate IoT sensing devices in Seoul. However, limited research has examined the spatiotemporal climate risk exposure patterns of vulnerable groups by applying real-time floating population data captured by mobile phone signals.

This study traced the high-resolution climate risk factors, focusing on extreme heat and particulate matters, using IoT environmental sensors deployed throughout Seoul. We combined spatiotemporal climate hazard vulnerability assessment in hour periods with floating population data classified in different age groups. Then, we conducted a T-test to identify the statistical differences in socioeconomic characteristics and infrastructure status between neighborhoods with the lowest and highest climate risks. This study also discussed policy implications for better dealing with the recurring climate hazards.

We collected urban climate sensing data from deployed IoT sensor named Smart Seoul Data of Things (i.e., S-DOT) and floating population data, with a confined timeframe of 43 days with climate risk advisory for extreme heat, PM₁₀, and PM_{2.5}, from April 1, 2020, to March 31, 2021. Through descriptive spatiotemporal analysis and hot-spot analysis, our study found the concentration patterns of extreme heat and particulate matter on abnormally risky days. The results revealed different exposure of climate risk factors to floating populations in age groups across space and time.

Our T-test result showed that neighborhoods with high climate risks appear to be associated with socio-economically vulnerable areas.

For researchers, a framework for urban climate sensing application is suggested for future climate vulnerability assessment research. For planners and policymakers, this study provides empirical research evidence to support smart city approaches pertinent to climate resilience using IoT.

The combination of climate change and the urban heat island (UHI) effect is increasing the number of perilously hot days and the need for communities everywhere to equitably plan for heat resilience (Wilson, 2020). While planners increasingly recognize this imperative, they face many obstacles including a lack of research-based heat guidance for planning processes, underdeveloped regulatory structures, as well as siloed research, decision-making, and community plans (Meerow & Keith, 2021). Planning for heat resilience requires an integrated planning approach that coordinates strategies across community plans and uses the best available heat risk information to prioritize heat mitigation strategies for the most vulnerable communities (Keith, Meerow, Hondula, Turner, & Arnott, 2021).

With support from NOAA and in partnership with the American Planning Association, we developed a methodology for assessing heat resilience planning. We adapted the Plan Integration for Resilience Scorecard approach, originally developed for flood risk (Berke et al., 2015), to the unique challenges of extreme heat. The resulting Plan Integration for Resilience Scorecard for Heat (PIRSH) methodology was piloted in five geographically diverse U.S. communities (Boston, MA, Baltimore, MD, Fort Lauderdale, FL, Seattle, WA, and Houston, TX). We developed a typology of heat mitigation strategies through an expert elicitation and literature review process. For each city, two researchers independently analyzed all policies in the comprehensive plan, hazard mitigation plan, climate action plan, and climate change adaptation, resilience, or sustainability plan, if relevant. Policies were only included if they had the potential to impact on urban heat, were place-specific, and contained a recognizable policy tool. Policies were then scored based on whether they would likely mitigate heat ('+1'), worsen heat ('-1'), or the impact was unclear from the description in the plan ('Unknown'). Scored policies were mapped to relevant census tracts across the cities to evaluate their spatial distribution and net effect on heat resilience. The resulting PIRSH scorecard was then compared with heat exposure and vulnerability data to assess policy alignment with heat risks and to identify opportunities for improved planning. The results showed that across all five cities, plans contained many policies that would likely impact urban heat, but this was rarely acknowledged. Policies that provided enough detail to be scored were much more likely to enhance heat resilience than worsen it. Some categories of policy tools and heat mitigation strategies were more common than others.

THE IMPACTS OF THE SPATIAL PATTERN OF GREEN INFRASTRUCTURE ON LAND SURFACE TEMPERATURE

Abstract ID: 1422

Individual Paper Submission

CHEN, Peng [The Ohio State University] chen.10996@osu.edu, presenting author

Extreme heat has been one of the greatest challenges brought by climate change. It leads to more deaths than any other climate-related disaster combined in the United States, and is believed to adversely affect urban sustainability by deteriorating air pollution, increasing energy and water consumption, impairing urban residents' health, and disturbing ecological cycles (Zawadzka et al., 2021). Urban areas are suffering more from it due to the Urban Heat Island (UHI) effect caused by the increase in impermeable land uses and anthropogenic heat emissions. (Yang et al., 2021; Feyisa et al., 2014). In response to this challenge, green infrastructure (GI) planning has been introduced as a cost-effective, environmentally friendly, and politically acceptable strategy. GI can mitigate the UHI effects and create comfortable urban thermal environments due to its capacity of reducing air and surface temperatures through shading and evapotranspiration (Yang et al., 2021).

However, GI is unevenly distributed across communities with varying socioeconomic statuses, exacerbating geographical inequalities in urban thermal environments (Venter et al., 2020; Feyisa et al., 2014). Moreover, despite a growing body of literature on the impacts of area, species composition, and shape of GI on its mitigation services for the UHI effect, few researchers have paid attention to the effects of morphological attributes of GI distribution. Therefore, in order to empirically examine the disparities in the distribution of urban thermal environments and spatial pattern of GI among communities, and to address the research gap, this study investigates two questions: 1) Do thermal environments and spatial patterns of GI vary across census tracts with different socioeconomic statuses? 2) Does the spatial pattern of GI distribution significantly impact its capacity to mitigate UHI effects?

This pilot study takes 47 census tracts adjacent to the campus of The Ohio State University in Columbus, Ohio, as study cases. These are part of the broader urban heat problem highlighted by Climate Central, a science and news organization dedicated to studying climate change and its impacts. They also vary in demographic characteristics such as household income and racial diversity. This study uses Land Surface Temperature (LST) to reflect urban heat environments, and measure the spatial pattern of GI distribution in each tract by calculating parameters including Patch density (PD), Edge density (ED), Mixed Variance (MV), Aggregation Index (AI), and Eccentricity Index (EI) in ArcGIS (Zawadzka et al., 2021; Zhu et al., 2021). We categorize tracts into three groups based on their average LST, and conduct an Analysis of variance (ANOVA) to examine whether race composition, household income, educational attainment, employment rate, as well spatial patterns of GI distribution vary significantly among these groups. Furthermore, based on the parameters of spatial pattern, this study conducts the Spatial Durbin Model (SDM) to analyze whether the spatial pattern of GI distribution has significant impacts on LST and to measure the intensity of its influence. Since it is acknowledged that the area and biomass of GI can significantly impact LST, this study also calculates the Normalized Difference Vegetation Index (NDVI) and Normalized Difference Water Index (NDWI) based on land cover data using ArcGIS and incorporates them into the SDM analysis.

This study helps fill the research gaps in GI planning by empirically examining the inequality distribution of urban heat environments across communities with diverse socioeconomic statuses and by taking the issue of spatial pattern into GI planning. The results also suggest a more effective and distributionally equitable GI planning strategy.

RESILIENCE POLICY PORTFOLIO: A REVIEW OF HAZARD RESILIENCE POLICIES IN THE UNITED STATES

Abstract ID: 1437

Individual Paper Submission

FRENCH, Steven [Georgia Institute of Technology] steve.french@design.gatech.edu, presenting author

AYERS, Joshua [Georgia Institute of Technology] gtg014b@gatech.edu, co-author

NEWMAN, Ian [Georgia Institute of Technology] ian.newman@rsandh.com, co-author

This paper presents a review and analysis of the policy choices available to local communities to improve resilience to the spectrum of natural hazard events. It draws on the extensive natural hazard literature developed over the past five decades to provide a useful summary of what is known about policies intended to improve community resilience. Much of the previous research on natural hazards has focused on a single hazard. This paper takes a multi-hazard approach and attempts to tailor policy responses to specific combinations of hazard and community types. When considering various disaster risk reduction and resilience policy choices and investments, local jurisdictions can sometimes lack the background and the risk analysis tools necessary to properly evaluate the combined efficacy of potential policy portfolios. This paper reviews the extensive natural hazard literature to develop a comprehensive list of hazard mitigation and resilience policies and interventions that are currently being implemented across the United States. We then identify the most widely used policies and provide a more in-depth discussion of how those policies operate to improve resilience. We review the available research on the effectiveness of those policies. Hazards vary in terms of their spatial extent and their damage mechanisms. Communities vary widely in terms of their social and economic characteristics as well as their planning and administrative capacity. Based on the extensive natural hazard literature community factors such as rate of growth and economic vitality have been shown to affect the success of policy interventions. Similarly, the spatial extent of the hazard and the amount of lead time available before a hazard event shape the appropriateness of individual policy interventions. Based on the results of previous studies we suggest what of policies are most likely to be effective for particular types of communities that are facing particular types of hazards (e.g., fast growing communities facing a flood hazard vs. slow growing community facing a tornado risk). Where available from the literature we present examples of return-on-investment (ROI) or benefit-cost ratios (BCRs) for various policy measures in particular types of communities. This research is intended to support and extend the development of the Interdependent Networked Community Resilience Modeling Environment (IN-CORE) being developed by the NIST-funded Center for Risk-Based Community Resilience Planning. These policies are included as a part of this risk modeling and decision support software framework designed to help local jurisdictions develop effective hazard resilience policy portfolios.

RISK-SHIFT IN URBAN CLIMATE PLANNING

Abstract ID: 1460

Individual Paper Submission

CONNOLLY, James [University of British Columbia] jconnoll@mail.ubc.ca, presenting author

Urban land use intervention has become a central mechanism for climate action, but the extent to which such interventions determine who should experience greater or lesser degrees of risk and where that risk should be concentrated is not always acknowledged. Rather, debates about urban land-use-based climate interventions sometimes stay at the surface level, for example when they become embedded in the politics of “neighborhood character” effects from increased density.

This paper seeks to decidedly embed land-use-based climate action within a deeper “riskscape” framework. It asks: How do land-use-based greenhouse gas reduction strategies reorder the local geography of risk for urban residents?

The paper employs a mixed methods approach to examine what happens from the resident view when targeted development zones are used as a primary tool within urban and regional planning for climate mitigation and are coupled with high profile climate adaptation measures. It draws from roughly fifty interviews with developers, policymakers, planners, and neighborhood activists completed in 2019 in two cities – Austin, Texas and San Francisco, California. These interviews provide insight into how people perceived new land-use-based climate interventions focused on increased density and green climate resilient infrastructure within targeted development zones. I supplement the qualitative findings with a spatial autoregressive analysis that measures the extent to which the priority development areas in Austin and San Francisco predict more intense processes of gentrification for neighborhoods within them, and thus increase at least the perceived risk of displacement that comes along with gentrification.

The interviews and spatial analysis show how and why the relative weighting by residents of local social and ecological risks shifts over time as these interventions roll out. This shift occurs differently depending upon social status and geography. I argue that this means that urban climate interventions are not fundamentally about reducing risk, but rather about reordering the spatial dimension of risk – or creating a new riskscape pattern – within cities. This reordering occurs specifically through the perceived interactions across social and ecological risks that become clear within my interviews and the gentrification-oriented changes that are clear within my spatial analysis.

Overall, this paper reframes urban climate mitigation as primarily an exercise in reordering the spatial dimension of risk. Somewhat provocatively, it challenges the notion that systemic reduction of risk is the actual purpose of land-use-based climate planning. Rather, it is argued, the underlying goal is to direct the process of urban risk shift. This framing of urban climate planning has important implications for how land use planning seeking to address the challenges of climate change moves forward. It is, I argue, imperative that risk shift implications are openly acknowledged in order to avoid a stalemate situation wherein social and ecological goals are seen as in-conflict.

EXAMINING THE IMPACT OF INEQUITIES IN STORMWATER INFRASTRUCTURE DEVELOPMENT ON LOCALIZED FLOOD DAMAGES AT THE NEIGHBORHOOD SCALE IN THE CITY OF HOUSTON, TEXAS

Abstract ID: 1470

Individual Paper Submission

LEE, Jessica [Texas A&M University] jjlee8605@tamu.edu, presenting author

VAN ZANDT, Shannon [Texas A&M University] svanzandt@arch.tamu.edu, co-author

Urban flooding has become a growing threat due to rapid urbanization, as well as heavy and frequent rainfall events intensified by climate change. Stormwater infrastructure plays a crucial role in mitigating urban flooding, especially localized flooding by controlling surface runoff. Local government's decisions on stormwater infrastructure planning, as well as land use planning and development, may generate inequities in development patterns that lead to disparities in flood damage levels. However, research on vulnerability to flood hazards has disregarded the effects of stormwater infrastructure development on the extent of localized flood damage. It mainly focused on land-use changes (e.g., impervious surfaces and wetland alteration) and infrastructure development for mitigating riverine or coastal flooding (e.g., dams and sea walls) (Brody, et al., 2008; Highfield, et al., 2014; Zahran, et al., 2008). To address the gaps, this research explores how the inequities in stormwater infrastructure development are associated with the disparities in localized flood damage levels in Houston, Texas.

We conduct a cross-sectional multilevel regression to examine the impacts of stormwater infrastructure development by type, socio-demographic and economic characteristics of households, and the inequities in the stormwater infrastructure development on localized flood damages. While both socio-economic characteristics and stormwater infrastructure development influence flood damages, the environmental justice and social vulnerability literature also suggest that socio-economic characteristics of residents in neighborhoods interact with stormwater infrastructure development in the neighborhoods to further exacerbate flood damages in disadvantaged neighborhoods (Hendricks and Van Zandt, 2021; Porse, 2018).

The levels of analysis include the street segment level (the smallest unit, in which infrastructure elements tend to have similar characteristics) and the Census block group level (the smallest neighborhood unit, in which racial and ethnic characteristics of residents are provided). The analysis here is based on the spatially merged secondary datasets at the street segment and block group levels in the Geographic Information System (GIS). The secondary datasets include public stormwater infrastructure, street segments, and appraisal values in Houston, Multi-Resolution Land Characteristics Consortium's national land cover, socio-demographic and economic characteristics of block groups from Census ACS 5-year tables, and flooded buildings from Hurricane Harvey and floodplain maps of Harris County. To examine the extent of localized flood damage, we exclude flooded houses within floodplains, which may be flooded due to riverine flooding.

Our hypotheses are based on the findings from social vulnerability and environmental justice literature: 1) Street segments having a higher density of stormwater infrastructure and predominantly served by storm sewers rather than roadside ditches, tend to have fewer flooded houses outside of floodplains: 2) Street segments located in block groups dominated by privileged groups of people (white, higher-income people), are more likely to withstand the flood damages because the streets are served by higher density of stormwater infrastructure, compared to street segments in block groups dominated by marginalized groups of people (people of color and lower-income): 3) Street segments located in block groups dominated by privileged groups of people are more likely to withstand the flood damages because the streets are served predominantly by sewers rather than ditches: 4) Street segments having higher appraisal values of parcels, are more likely to withstand the flood damage because the street segments have higher density of stormwater infrastructure and they are served dominantly by sewers, compared to street segments of lower appraisal values of parcels. The findings of this study have implications for equitable stormwater management while developing flood mitigation strategies in capital improvement and land use plans.

SOCIAL EQUITY AND CLIMATE JUSTICE: THE ROLE OF JOB CREATION IN SAN FRANCISCO

Abstract ID: 1476

Individual Paper Submission

CHEN, Chin-Wei [University of Washington Seattle] cchen83@uw.edu, presenting author

WHITTINGTON, Jan [University of Washington Seattle] janwhit@uw.edu, co-author

Though cities are increasingly rising to the challenge of the climate crisis by creating action plans and greenhouse gas inventories, the means to improve social equity or at the very least avoid worsening inequities in the transition to clean energy and more resilient infrastructure are not as well-defined. For clean energy, US policymakers appeal to a wide audience by considering the role of job creation. The burgeoning literature on climate justice in planning, especially with regard to climate adaptation, appears focused on exposure, sensitivity, and the capacity to adapt to changes brought about by climate impacts and their proposed remedies. And yet, in order to realize the twin goals of global carbon neutrality (i.e., CO₂e) and adaptation to climate change, all manner of infrastructure investments require modification in their design, materials, and technologies, and with those choices come questions of climate justice.

The purpose of this research is to examine methods for integrating social equity, in the form of workforce participation for underrepresented minorities, within a climate-smart approach to capital investment planning cities. This paper is a case study research, exploring the public utility planning process using data collected from San Francisco's stormwater projects. The method presented simulates job creation to forecast the difference in social equity considerations between conventional and climate-friendly scenarios. We hypothesize that projects designed for improved alignment with climate targets improve social equity from job creation when compared to conventional project designs. Also, this research highlights gaps and dimensions that local governments could take to fulfill climate justice through job creation in the infrastructure planning process. We close by proposing a research agenda to further understand the relationship between climate justice and social equity through the lens of job creation in the capital planning process, using multiple regression analysis statistical techniques.

NEIGHBORHOOD CHANGE AND CLIMATE GENTRIFICATION: MYTH OR FACT?

Abstract ID: 1493

Individual Paper Submission

LI, Yanmei [Florida Atlantic University] yli22@fau.edu, presenting author

ZHANG, Sumei [University of Louisville] sumei.zhang@louisville.edu, co-author

HOERMANN, Serena [Florida Atlantic University] shoermann@fau.edu, co-author

Traditional theories of neighborhood change focus on ecological factors, political economy, subcultural factors, and other factors (Galster, Cutsinger, & Lim, 2007; Harvey, 1973; Li & Morrow-Jones, 2010; Rothenberg et al., 1991). The natural succession of neighborhoods goes through a few stages, but is not always linear, and different neighborhoods change differently over time. Ecological factors, such as residential preferences and mobility, and the natural process of aging in housing and infrastructure, determines the fundamental change of neighborhoods. The push and pull factors explain the directions of mobility. Public agencies often use pull factors to attract intended residents. The push factors often stem from neighborhood decline and/or neighborhood revitalization, while such revitalization may be pull factors for other types of residents. When residents are pushed away involuntarily due to increased property value and rents, and/or cultural changes due to revitalization, displacement from gentrification may occur.

In recent years, climate change associated with increased intensity of human activity and increased carbon footprint has yielded an alarming trend of melting glaciers and rising sea levels. Although the projected magnitude of sea-level rise (SLR) is different based on different models, the overall unpredictability of weather patterns, increased tropical cyclone activities, and worsening king-tide inundation in low-lying urban areas along the coast have prompted many developers and home-buyers to consider elevation and flood exposure when making home development or purchase decisions. Speculations about developers eyeing higher-elevation areas for redevelopment have prompted researchers to investigate whether climate related gentrification is happening in higher-elevation low-income neighborhoods. In a study in Miami-Dade County, Keenan, Hill, & Gumber (2018) found that housing units in higher elevation areas tend to have higher appreciation rates than units in lower-elevation areas. While higher-income/higher-elevation areas may be resistant to displacement, lower-income areas may be more susceptible. Some of the higher elevation areas are the neighborhoods with predominantly Haitian (Little Haiti) and low-income minorities (Liberty City). In addition to the threat from climate gentrification, many also worry about the spillover effect of redevelopment and property value increases from adjacent neighborhoods, for example, Wynwood Business Improvement District in the City of Miami. Existing study about the impact of climate gentrification, particularly flooding, is scanty and mostly focuses on parcel-level research on price appreciation. This current study takes a different angle to explore whether neighborhood change relates to elevation and flood exposure.

We use the American Community Survey (ACS) five-year data for all the block groups in the tri-county South Florida area, Palm Beach County, Broward County, and Miami-Dade County. The selected neighborhood-level and city-level socioeconomic and regulatory variables are combined with the average elevation at the block group level using the Digital Elevation Model (DEM) from the USGS (U.S. Geological Survey) and the flood exposure calculated from the floodplain data from FEMA to measure changes in selected neighborhood characteristics. For example, neighborhood and city-level variables in 2006-2010 (the 2010 5-year estimate), along with neighborhood elevation and flood exposure, are used to measure changes in certain neighborhood characteristics, such as median household income, housing value, and percentage racial and ethnic minorities from the period of 2011-2015 (the 2015 5-year estimate) to 2016-2020 (the 2020 5-year estimate). A series of Hierarchical Linear Regression Models are used to measure how elevation is associated with the changes in household income, housing value, and percentage minorities, the common indicators of gentrification.

If our analysis indicates that higher elevation and less flood exposure are significantly related to neighborhood change variables, potential neighborhoods with the most impact will be identified and policy recommendations will be made to ensure such change would not cause displacement of residents, particularly vulnerable populations such as lower-income minorities and immigrants.

PLAN INTEGRATION FOR ECOLOGICAL RESILIENCE: EXAMINE FACTORS ASSOCIATED WITH WETLAND ALTERATION

Abstract ID: 1503

Individual Paper Submission

YU, Siyu [Texas A&M University] syu@arch.tamu.edu, presenting author

Abstract: Coastal wetlands are effective methods for protection from flood damage. Inversely, wetland loss can amplify damage from floods over a larger area. Resilience to flood disturbances also heavily depends on a healthy ecosystem and its related services. Changes in ecological conditions associated with land use development can directly impact ecosystem services, including their ability to withstand natural hazards and sustain human activities on a larger scale. City plans and growth policies help determine how effective urban growth can be in mitigating flooding, preventing wetland loss, and enhancing ecological resilience. The resilience of the built and natural environments is strongly influenced by the growth management guidance provided by a community's 'network of plans (e.g. comprehensive, hazard mitigation, open space, etc.)'. This study is the first to explore the influence of plan integration on wetland alteration in hazard-prone areas by comparing findings from Fort Lauderdale, FL, and League City, TX. The research questions are:

(1) Does level of plan integration have a stronger relationship with the built out community or the rapidly developing community, comparing a fixed and an expanding city?

(2) Are higher levels of plan integration related to a network of plans that target "hotspots" of wetland loss, thereby helping deter the decreases in wetland amounts?

To conduct this research, we combine spatial analytics, a Plan Integration for Resilience Scorecard evaluation, and correlational statistics. We find that the rate of change in wetland land cover within the 100-year floodplain was faster in Fort Lauderdale than in League City from 2006 to 2010. The networks of plans, particularly in League City, target areas of higher wetland loss to reduce this trend. Wetland alteration is shown to be strongly associated with medium-, and low-intensity development patterns, though variations exist between the two cities. Further, districts with high per capita income and high physical vulnerability are more likely to experience wetland loss.

A growing number of wetland-related policies, are put into place because naturally occurring wetlands provide various essential ecosystem services to communities, and their loss will amplify property damage from floods over a larger area, especially for coastal communities. Undervaluing these important natural ecosystems may have the effect of compromising safety in coastal communities. As such, effective planning that helps protect naturally occurring wetlands can significantly aid in building resilient communities and reducing losses from hazard events. Improvements in policies for integrating wetland protection with flood mitigation, adopting wetland protection ordinances, and exceeding minimum NFIP requirements are therefore recommended. The process of incorporating wetland protection into a local network of plans can significantly aid in building resilient communities and stemming losses from hazard events.

THEORETICAL FRAMEWORKS ON THE USES OF AUGMENTED AND VIRTUAL REALITY IN ENVIRONMENTAL PLANNING FROM 2010 TO PRESENT

Abstract ID: 1506

Individual Paper Submission

With technological advances, such as augmented reality (AR) and virtual reality (VR), planners have unique ways of presenting environmental plans to the public. Originally, plans utilized text and visuals, such as maps, photographs, and sketches. Visuals are crucial in communicating with the public and ultimately enable public participation. The popularity of AR and VR in modern use by the public makes them potentially powerful tools for planners to utilize when presenting plans. Visuals through AR and VR allow ideas and concepts to be tangible. The realistic visuals in AR and VR show that planners should adapt to new forms of visualizations to utilize them and present them to the public, allowing many actors, the public and private sector, to understand future plans and decision-making regarding their cities. AR and VR can be especially helpful in environmental planning. While climate change and environmental problems have become the main concern, many cities have been including climate change plans.

Previous studies have surveyed the opinions of landscape architects and the populaces to find differences in preference in Green Stormwater Infrastructure through images (Suppakittpaisarn et al. 2019). Meanwhile, Portman et al. (2015) reviewed VR in architecture, landscape architecture, and environmental planning and found that environmental planning used VR applications to show the effects of climate change to various stakeholders. The studies are in allied fields but do not fully review both applications of AR and VR, specifically in environmental planning. This research aims to 1) review the modern use of AR and VR in environmental planning, 2) determine to what extent AR and VR have influenced environmental planning, and 3) find effective approaches and new directions for AR and VR in environmental planning.

In order to meet the objectives, this paper uses query protocol, topic modeling, and a literature review. First, I use a query protocol to identify literature on AR and VR in environmental planning in the Web of Science database from 2010 to 2021. A query protocol uses terms to identify the relevant text. For this study, I use words that would detect literature on AR and VR in environmental planning. Although AR was developed in the 1960s, AR applications have become more widely used in the 2010s. Second, I use topic modeling, a type of unsupervised machine learning and natural language processing (NLP). Topic modeling undergoes a statistical process that takes text data to create related major topics. By taking the input of AR and VR in the field of environmental planning text data, I will obtain key topics. Last, the literature review allows for an in-depth understanding of the advantages and limitations of new visualization tools and how they aid the comprehension of urgent problems in environmental planning, such as climate change. The review also offers suggestions for new directions for visualization methods in environmental planning.

My results will extend the research for planners to acknowledge the importance of AR and VR in environmental planning. New opportunities seem promising, but planners must also be aware of the drawbacks and potential problems of using AR and VR to inform and broaden participation. A comprehensive review of the literature provides a strong foundation for implementing new methods and visualization techniques in real environmental planning situations and predicting upcoming challenges. Using AR and VR provides the ability for planners to revolutionize ways for the public to absorb the plan materials. Offering visualization tools will enable planners to develop equitable cities with technology-driven public participation.

AN INVESTIGATION OF THE RESILIENCE OF ACCESSIBILITY TO EMERGENCY AND LIFESAVING FACILITIES UNDER THE THREATS OF NATURAL HAZARDS

Abstract ID: 1533

Individual Paper Submission

CHEN, Na [Sun Yat-sen University] chenn85@mail.sysu.edu.cn, presenting author

WANG, Chih-Hao [California State University, Fresno] cwang@csufresno.edu, primary author

OLWERT, Craig [California State University, Northridge] craig.olwert@csun.edu, co-author

In planning, land-use allocation determines where the urban resources/opportunities to be located, and transportation network provides various combinations of routes leading to them. Therefore, accessibility can be regarded as a physical result of the interaction between land-use allocation and transportation network. One motivation of widely studying accessibility is that both the transportation network and land-use system of a city influence individuals' daily activities and thus quality of life. Despite all these, it is rare to assess its vulnerability considering the increasingly and frequently emergent natural hazards, such as climate-change-induced hazards (e.g., wildfire and sea-level rising), and some other hazards like earthquakes and landslides. When facing these natural hazards, emergency and lifesaving (E&L) facilities play an important role in the response phase of the natural hazard management circle. Since this is a question of how easy a resident can access to an E&L facility subject to travel constraints (e.g., fleeing for refuge and relocating victims), it becomes possible to use the idea of accessibility to solve this problem. Most existing transportation resilience studies either examine whether the transportation system would remain functioning during a disaster or assess how difficult the function could be recovered back afterward. They basically neglect the fact that accessibility (facility access or service delivery) is also a result of facility allocation.

Based on the understanding of natural disaster risk as a function of hazard, vulnerability, and exposure (Randolph, 2004), avoidance theory and mitigation theory are typically applied to develop traditional natural hazard mitigation measures (Godschalk, 2003). The former would propose to allocate activities away from natural hazard areas to reduce exposure, while the latter would suggest structure engineering measures to reduce the vulnerability on site (Randolph, 2012). The logic of these two theories responds to the role of urban planning in natural hazard management mentioned above. However, urban planning is also playing the role in natural hazard management in terms of the preparedness for emergency response as "soft mitigation" (Lichterman, 2000) such as efficient allocation of emergency response facilities. This role seems to be neglected in planning literature.

Therefore, this study aims to develop a research framework to examine the resilience of the accessibility to E&L facilities under natural hazards. The San Fernando Valley in CA is selected as the study region by considering two natural hazards, earthquakes and wildfires. Using the cumulative-opportunity approach (Chen and Wang, 2020), we firstly calculate accessibility to parks, schools, hospitals, roads, and fire stations respectively during normal situation. Then considering the spatial distribution of two natural hazards and population density, accessibility to these facilities is repeatedly recalculated by removing a part of the transportation network within the potential hazard zone at a time until achieving a large number for statistical analysis. The accessibility results before and after the consideration of the two natural hazards are statistically compared to point out that where accessibility would drop most significantly. For those hotspots, at last, we create a normalized difference accessibility index (NDAI) to suggest that the improvement of accessibility resilience should focus on facility allocation or transportation network itself. Such a research framework can be utilized by urban planners to find out the most vulnerable locations and needed hazard mitigation resources in terms of facility allocation and transportation investments.

INFORMAL COPING AND ADAPTIVE PRACTICES: EXPLORING COMMUNITY-LED EFFORTS TO ADDRESS GAPS IN RELOCATION AND RESETTLEMENT PROGRAMS

Abstract ID: 1535

Individual Paper Submission

CONTRERAS, Santana [University of Southern California] santinac@usc.edu, presenting author

As part of efforts toward addressing the growing number of environmental and climatic risks impacting communities, relocation and managed retreat initiatives are frequently presented as potential strategies for use in mitigating the threats associated with living in hazardous areas (Hino, Field, & Mach, 2017). While there can be many positive benefits to these strategies, there is a growing amount of research critiquing the goals, motivations, and implementation of relocation activities (Balachandran, Olshansky, Johnson, 2021). This is particularly true as it relates to addressing how relocation activities address the interests of those falling outside of formalized planning structures, such as informal communities.

In cases such as this, when relocation efforts do not fully address the diversity of issues and vulnerabilities impacting a community, it can lead to the initiation of coping and adaptive practices. Specifically, this often centers on individuals and groups implementing their own measures and modifications to reduce their exposure and vulnerability to environmental risks (López-Marrero, 2010; Wamsler & Brink, 2014). While efforts of this sort are not the dominant focus of relocation discussions, when looking at these coping and adaptive practices closely, we see that these community-led activities often work to develop community resilience to hazards in a way that formalized relocation practices frequently miss or are unable to address.

Community-led resilience building efforts surrounding the relocation of informal communities in Puerto Rico presents a useful case for exploring these questions in more depth. Informal communities in Puerto Rico face widespread issues, such as inadequate infrastructure, unsafe living conditions, and frequent exposure to environmental hazards. Relocation and resettlement activities are often presented as useful approaches for addressing the hazard and development related issues facing informal communities. However, these formal hazard planning initiatives frequently fail to fully address the needs of informal communities, causing them to initiate resilience building efforts of their own. The examination of these actions provides an opportunity for exploring alternative vantage points of the resilience building process.

In this study, we draw on data collected from interviews with local planners and focus groups with community members to present lessons learned from community-led coping and adaptive activities in Puerto Rico. Specifically, this study centers on addressing (1) how informal communities work to build resilience surrounding relocation through coping and adaptive practices; (2) how community-led coping and adaptive practices highlight the gaps in formal relocation efforts; and (3) how community-led efforts place undue burdens and responsibilities on community members to fill the gaps left behind formal relocation efforts. Through this work, we highlight the ways in which community-led efforts can be used as a teaching tool for understanding the implementation, assumptions, and gaps surrounding the application of relocation and broader resilience building activities in planning research and practice.

MITIGATING FLOOD THROUGH LAND USE PLANNING IN KATHMANDU VALLEY, NEPAL: ENVIRONMENTAL, SOCIAL, AND INSTITUTIONAL CHALLENGES

Abstract ID: 1538

Individual Paper Submission

GHIMIRE, Jiwnath [Iowa State University] jghimire@iastate.edu, presenting author
NEPAL, Ratna Mani [Tribhuvan University] nepalratnamani@gmail.com, co-author
GURAGAIN, Shyam [K and K College] shyam.guragain@gmail.com, co-author

Flooding is the most frequent disaster in the world. With climate change and rapid land-use conversions, flood events are becoming more severe and intense in urban areas. Cities in developing countries are increasingly becoming hotspots of flooding. Socioeconomic characteristics, land-use practices, and environmental changes determine the disaster impacts (Blaikie et al., 1994; Burby et al., 2000; Cutter, Boruff, & Shirley, 2003), including flood damages and vulnerabilities in cities. Specific population segments are disproportionately vulnerable to disaster events (Morrow, 1999; Fothergill & Peek, 2004). With a case study of Kathmandu Valley, Nepal, this research explores how land-use planning, disaster information, and risk perception influence flood management practices in rapidly developing cities.

With extreme rainfall events during the monsoon season (June to August), Nepal experiences reoccurring floods that cause extensive damage in hill and plain regions of the country, mainly in urban areas. Kathmandu is the capital city of Nepal, with a population density of more than 50 thousand people per square mile. It is the economic and administrative hub of the country. Uncontrolled urban growths, no zoning enforcement, encroachment of river banks and wetlands, increasing impervious surfaces, and climate change exacerbated flood impacts in Kathmandu. Based on geospatial analyses, household surveys, and expert interviews, this study identifies a gap between policies and practices of urban flood management and risk-sensitive land use planning in Kathmandu Valley. Land-use changes and flood patterns were analyzed by interpreting satellite images and historical land-use maps. Two hundred household surveys were administered in flood-prone settlements along the Bagmati River corridor to understand changes in flooding. Thirty semi-structured interviews were conducted among municipal planners, consultants, and flood managers to analyze land use planning and flood mitigation practices. The significant contribution of this study is the policy recommendations for urban flood mitigation through land-use planning and disaster risk communication in Nepal and other developing countries where financial, technological, and human resources are limited for environmental planning and disaster risk management.

SOCIOECONOMIC GROUPS AND THEIR GREEN SPACES AVAILABILITY IN URBAN AREAS OF CHINA: A DISTRIBUTIONAL JUSTICE PERSPECTIVE

Abstract ID: 1540

Individual Paper Submission

WU, Longfeng [Peking University] longfengwu@outlook.com, presenting author

Relying on a nationwide social survey, this study examines green space availability among different socioeconomic groups in urban areas of China. The national survey collected data at the individual level, which depicts residents' socioeconomic statuses in a direct and comprehensive manner. Geocoded addresses of respondents were extracted to calculate three different indicators of green space availability: the coverage ratio of the overall areas of vegetation, the coverage ratio of park areas, and the closest distance to a park. The results revealed that the provision of green space did not discriminate against people's socioeconomic levels in China. Instead, the majority of disadvantaged groups were, at times, provided with more green spaces than comparison groups. Low-income residents have more vegetation coverage nearby than people with high incomes. Residents in affordable communities and urban villages have a higher vegetation coverage ratio than other groups, but urban villages are further from parks. This study expands the current inquiry on the distributive equity of green space by adding a nationwide exploration in a developing country. The results evaluated green space availability in urban areas across the country, which also can inform decision-makers and planners about which disadvantaged groups should be the focus of efforts to mitigate inequality in green space distribution.

THE EFFECT OF URBAN MORPHOLOGY INEQUITY ON EMISSIONS IN UTAH, US: FOCUSING ON NO₂

Abstract ID: 1549

Individual Paper Submission

KIM, Junsik [University of Utah] junsik.kim@utah.edu, presenting author
EWING, Reid [University of Utah] ewing@arch.utah.edu, co-author

The importance of mitigation of emissions is not only for the environmental problem. Because emissions have directly adverse effects on physical and mental health, such as asthma and cardiovascular disease, it is directly related to the increased economic burden on public health, and the city's sustainability (Bourdrel et al., 2017; Khreis et al., 2017). Especially, Utah ranked the worst air quality state in the US, and Salt Lake City ranked fourth worst air quality on earth in 2021, according to IQAir. If the current emissions pattern continues, it will lead to serious public health, financial, and structural burdens.

Transit agencies effort hard to decrease emissions through the various programs, however, for emissions reduction, previous strategies focused a lot on reducing traffic and increasing public transit ridership without considering the urban morphology and urban components. Especially, due to the recent rapid increase in housing prices in the centers of Utah, disadvantaged populations are being forced the displacement from the city center, which has compact urban morphology and higher accessibility to public transit, to suburban areas.

In previous research, many studies continuously focused on the emissions impact of traffic volume and congestion (Barth and Boriboonsomsin, 2009; Zhang and Batterman, 2013). However, aspects of urban morphology had been relatively overlooked. Urban morphology has a direct impact on the accessibility of public transit, vehicle miles traveled (VMT), congestion, and dispersion of emissions (Ewing, 2008). Accordingly, recently, some studies about the emissions impact of traffic and public transit focused on the disperse and geographical vulnerability considering 3D urban morphology and other components (Pomponi et al., 2021; Voordeckers et al., 2021).

This study focused on the effect of urban morphology inequity on emissions. Specifically, to understand the effect of inequity of urban morphology on emissions, this study was divided into three aspects, 1) generation (Vehicle Miles Traveled, and congestion), 2) reduction (public transit accessibility, trees, land cover, and land use), and 3) dispersion (building geometry, slope, height). Urban morphology's impact on individual factors was measured. Through this, urban morphology's impact on net emissions was identified.

To identify 2D/3D urban morphology, sky view factor (SVF), building height, building arrangement (building density, largest patch index, mean patch size, mean nearest neighbor, edge density) were measured. Also, average annual daily traffic (AADT) for calculation of vehicle miles traveled (VMT) and HERE data to measure congestion were used. The tree canopy was identified using Lidar data. In determining the emissions, the NO₂ from Sentinel-5P TROPOMI and the station data (NO₂, PM 2.5, PM₁₀) were used through verification of correlation. For statistical analysis, the quantitative impact of urban morphology on emissions by socio-demographic characteristics was identified using Geographically Weighted Regression (GWR).

As a result, sprawling development patterns (high SVF, low building height, high mean patch size, low patch density, high mean nearest neighbor) appeared in areas with a higher proportion of the disadvantaged population. Also, it was found that a low tree cover ratio. In addition, it was found to be exposed to higher VMT by highway and other major arterials, and low accessibility of public transit (LRT, BRT, streetcar) appeared. Through this, we found that the low-density development area that has a higher population of the disadvantaged population is exposed to higher emissions (NO₂, PM 2.5, PM 10) relative to the population. Based on this result, it was identified that displacement of disadvantaged people from urban centers to suburban which have low density was accelerated, and due to the

inequity of building morphology, unequal exposure of the emissions was also accelerated. The findings of this research allow giving insights to mitigate emissions through urban planning to stakeholders and transportation planners.

DOES RESIDENT SATISFACTION ENCOURAGE PARTICIPATION IN URBAN TREE PLANTING INITIATIVES? AN EXPLORATORY CASE FROM GREENFIELD, MASSACHUSETTS

Abstract ID: 1582

Individual Paper Submission

COLEMAN, Alicia [University of Connecticut] alicia.f.coleman@gmail.com, presenting author
EISENMAN, Theodore [University of Massachusetts Amherst] teisenman@umass.edu, co-author
LOCKE, Dexter [USDA Forest Service, Northern Research Station] dexter.locke@gmail.com, co-author
HARPER, Richard [University of Massachusetts Amherst] rharper@eco.umass.edu, co-author

Street-facing trees are a unique form of living infrastructure that provide various environmental and quality of life benefits. Tree planting initiatives, specifically, often target private yards and city streets, relying on residents to provide critical tree care and maintenance. Theories of resident satisfaction may, in turn, elucidate community interest and capacity for long-term tree stewardship. Resident satisfaction provides a generalized view into the well-being of residents (Kweon et al. 2010) and can demonstrate the degree of “fit” between one’s ideal vision of a neighborhood and the actual, existing circumstances (Loo 1986) and have often been used as a form of public input for political decision-making (Aragonés et al. 2017). Relating practice and scholarship, we studied links between street trees and resident satisfaction, correlated objective attributes of, and subjective attitudes toward, street trees, and assessed the role of resident satisfaction to participating in urban tree planting.

This presentation will first describe the institutional dynamics of urban tree planting initiatives in mid-sized U.S. cities and highlight the implications of relying on private residents for the provisioning of 'public good' environmental benefits - on both public and private properties. Then, results from a spatially-explicit resident satisfaction study (n=369) will be presented as a case study analyzed alongside objective tree measures, like tree health. Results showed that residents are less satisfied with existing street trees and mature trees than other neighborhood features; and interestingly, varying rates of satisfaction related to interest in local urban tree planting.

Together, this research suggests that resident’s attitudes and preferences toward urban trees are important considerations during urban greening. There may also be a range of tradeoffs and synergies in relying on private residents for urban natural resource management. Our research is timely given the rapid adoption of tree planting as a tool to equitably distribute environmental and quality of life benefits in cities (Young 2011, Nguyen 2017).

COMMUNITY ADVOCACY AND ENVIRONMENTAL STEWARDSHIP: THE CASE OF COASTAL FLOODING

Abstract ID: 1583

Individual Paper Submission

SAKALKER, Amruta [University of Texas, Arlington] amruta.sakalker@mavs.uta.edu, presenting author
 BEZBORUAH, Karabi [University of Texas, Arlington] bezborua@uta.edu, primary author
 HUMMELL, Michelle [University of Texas, Arlington] michelle.hummel@uta.edu, co-author
 JENEWEIN, Oswald [University of Texas, Arlington] oswald.jenewein@uta.edu, co-author
 MASTEN, Kathryn [IOBCWA] kathrynmasten@yahoo.com, co-author
 YONGHE, Liu [University of Texas, Arlington] yonghe@cse.uta.edu, co-author

While the Texas coast continues to grow as a major gateway to international and domestic maritime commerce, Texas coastal communities have historically faced multiple hazards from flooding, air, and water pollution, rising sea levels and tropical storms (Kinzer et al., 2021). Although many hazards are associated with natural processes, growing industrial activities and a lack of comprehensive data and policy measures to mitigate hazardous events have intensified their threats (Cigler, 2017; Consoer & Milman, 2017; Kick et al., 2011; N. Lam et al., 2016; Sadiq, 2017; Tyler et al., 2019). Researchers argue that coastal floods stem from a mix of physical, social, built, and political environments (Brody et al., 2011). While policies to address devastation are made in response to such events, developments along coastal areas continue unabated for their economic returns and benefits (Wong-Parodi et al., 2017). Developments in coastal areas along with the rising sea levels and increased precipitation have increased the risks as well as occurrences of flooding. Others have argued that the flood policies at the federal level are costly and ineffective and do not discourage construction in high-risk flood zones (Cigler, 2017; Strother, 2016). In fact, these policies are fragmented, reactive, and changed after catastrophic events (Birkland, 2001).

Some adaptation strategies include structural and non-structural measures of preservation and relocation (Hirschfeld et al., 2020). These, however, depend on the local contexts and community capacity (Corburn, 2003; Silbernagel et al., 2015). To assess the structure of existing communication, information-gathering, information-sharing, and policymaking networks in the coastal region of Texas, we take the city of Ingleside on the Bay (IOB) to conduct an in-depth case study of the community adaptive capacity in addressing the environmental and industrial threats to coastal flooding. To assess this, our interdisciplinary team (Social Science, Engineering, planning and Architecture), asks the overarching question, How is the community addressing environmental challenges from coastal flooding? In doing so, we ask:

1. What is the community capacity for responding to flooding issues?
2. What adaptive strategies are in place to address flooding?
3. What strategies work to increase the capacity of networks and build relationships among community nonprofit organizations?
4. What are the policy implications of the initiatives?

We apply the grounded theory (GT) framework to assess the local context of coastal flooding and develop an understanding of community based adaptive measures. As GT is an inductive research method it helps to uncover theoretical explanations and interpretations from social science data using a bottom-up, inclusive approach (Dunn & Swierczek, 1977). IOB is a coastal town near Corpus Christi, Texas. We hypothesize that understanding existing networks for gathering, sharing, and leveraging information among residents and decision-makers is a critical first step toward identifying data needs and effectively integrating sensing technologies into future planning and policymaking efforts. We generate data from focus group discussions of community stakeholders, analyze the local, regional, and state level flood policies, and study the initiatives of the local government and community-based environmental organizations. The findings from this research are intended to help strengthen adaptation and advocacy efforts of rural communities and inform the socio-technical method to develop a secure, energy-efficient,

real-time, and reliable sensing network and data dashboard for environmental monitoring.

PROPOSING THE MEGA-ECO: A STUDY OF LARGE-SCALE NATURE-BASED MEGAPROJECTS

Abstract ID: 1591

Individual Paper Submission

LEVINTHAL, Robert [University of Pennsylvania] robmlev@upenn.edu, presenting author
WELLER, Richard [University of Pennsylvania] rjweller@design.upenn.edu, co-author

Anthropogenic activities have created two interrelated global crises of climate change and mass extinction (Daniels, 2014). Nature-based Solutions (NbS) was coined in 2008 by the World Bank as a strategy to tackle these concerns by sequestering massive amounts of carbon while also providing human and biodiversity co-benefits (Faivre, N. et al., 2017). As a result, NbS have become exceedingly popular, with many academics and practitioners calling for their rapid upscaling as if they were a novel concept (IUCN, 2020). However, examples of large-scale environmental restoration projects already exist, and no one has holistically evaluated and inventoried them. In collaboration with the University of Pennsylvania Chair of Landscape Architecture, Richard Weller, we have identified over 170 of these works and are examining them under the proposed new term "mega-eco projects" to remedy this gap. This paper will address the questions: (1) What constitutes a mega-eco project? (2) Where are these projects located? (3) Who has implemented them? (4) What potential do mega-eco projects have to combat climate change and the extinction crisis?

Weller and I define mega-eco projects as complex, landscape-scale environmental restoration and construction endeavors that aim to help biodiversity and communities adapt to climate change. From this definition, we have further organized mega-eco projects into a typology composed of four types: conservation projects, anti-desertification projects, watershed projects, and metropolitan projects. These works are rivaled only at a scale and often a price tag by megaprojects, from which the mega-eco draws its name. Studies on megaprojects began in the 1960s by examining billion-dollar hard infrastructure composed primarily of human-made concrete and steel. Recently, economic geographer Bent Flyvbjerg determined that nearly everyone is over time, over budget, and underperforms, which is known as the "iron law of megaprojects" (Flyvbjerg, 2014). In the current United Nation's Decade of Ecosystem Restoration, it is imperative that the nature-based mega-eco projects are recognized and studied to avoid a similar trend.

This paper, composed of four parts, will establish mega-eco projects into the common vernacular of NbS and planning fields by developing the idea and directing future studies toward best management practices and risk avoidance. The first section illustrates the need for mega-eco projects to combat our current crises and provides a synthesis of relevant literature. Following this, the second part establishes the definition and description of mega-eco projects. Part three introduces the typology with a brief history of each type and provides mapped boundaries of these works. Additionally, this part gives examples that show different aspects of mega-eco project performance, implementation, and operation. Finally, the paper addresses the potential of mega-eco projects to combat these crises and areas for future research. From the modern \$14 billion-dollar Great Green Wall of the Sahara and the Sahel to Olmsted's 1870s Emerald Necklace, mega-eco projects create hope in the Anthropocene epoch. This study and paper of past, present, and emerging mega-eco projects will begin the process of their analysis.

CLOSING THE CLIMATE GAP: COMMUNITY-LED CREATION OF A TOOL AND PROCESS TO INCORPORATE FRONTLINE RESIDENTS' KNOWLEDGE INTO CLIMATE ADAPTATION PLANNING

Abstract ID: 1607

Individual Paper Submission

LIEBERKNECHT, Katherine [University of Texas at Austin] klieberknecht@utexas.edu, presenting author

This article seeks to address the following research questions: what knowledge do residents have about climate-related flooding, heat, and air quality events, and how does this knowledge relate to gaps in municipal climate adaptation planning identified by residents?

Local communities experience firsthand the impacts of climate events, such as flooding, extreme heat, and wildfire. Marginalized populations see these impacts magnified by underlying conditions such as poverty and poor health. At the same time, residents on the frontline of climate events frequently have critical knowledge about the characteristics of these challenges, the harms they cause, and potential solutions. Inclusion of local knowledge into climate adaptation planning may increase procedural justice for frontline populations as well as generate a suite of positive outcomes stemming from participation itself. For instance, research has found that residents' participation in climate adaptation planning increases their understanding and awareness of environmental risks as well as their capacity to work toward equitable climate adaptation. Additional research has found that residents' lived experiences and participation can improve overall climate adaptation plan quality.

However, frontline communities often have scarce opportunity to participate in climate adaptation planning. In response, researchers, communities, local agencies, and nonprofit organizations have identified the urgent need to better link everyday knowledge about people's experiences of and responses to climate events to climate adaptation planning. This article seeks to address this gap in part by presenting findings from interviews with residents conducted at the beginning of a four-year community-based participatory research project focused on co-designing a climate adaptation planning tool and process centered on local knowledge. Interviews were conducted with 35 residents of the Dove Springs (Austin, Texas) neighborhood, a diverse, socially vibrant, and predominantly Hispanic/Latinx neighborhood experiencing repeated and severe flooding, increasing urban heat, and growing air quality impacts from wildfires. After a severe flood that resulted in loss of life and extensive property loss, residents and a community-serving organization, Go Austin!, Vamos Austin! (GAVA) identified the need for a website and phone app where residents can both share knowledge about their community, climate events, and other chronic stressors as well as find information needed to prepare for and respond to climate events. UT Austin researchers partnered with residents, GAVA, and the City of Austin to secure a National Science Foundation grant to co-develop website/app supported by the establishment of a network of residents training in disaster preparedness and community organizing techniques.

Interview recordings were transcribed and coded into key themes through several rounds of qualitative analysis by multiple researchers. Key themes present information about residents' knowledge of climate events and gaps in existing climate adaptation planning. Participants identified household, block, and neighborhood-scaled impacts, with a particular focus on how climate events exacerbate existing health, food insecurity, and household financial challenges. Residents highlighted in particular the need to develop climate adaptation tools and processes which include non-English-speaking and immigrant communities that frequently lack trust in municipality-led climate adaptation planning. We then outline next steps for community-driven ideas about how to link local knowledge to municipal, NGO, and household-scaled climate adaptation decision making. Our findings are relevant for planning scholars and practitioners considering how to integrate local knowledge into climate adaptation planning, as well as for residents seeking tools and processes that can be used to increase preparedness and response—at the household as well as municipal scale. In addition, the online data interface, community engagement processes, and policy-making process developed by this project can be adapted by other communities in the US experiencing climate events and chronic stressors.

Like most protected land strategies, conservation easements (CEs) are static instruments. They are used primarily on private lands, with numerous federally enabled purposes that effectuate a broader public interest. However beneficial, cumulative private CE decisions have the potential to affect public land use options and systematic conservation planning. With climate change associated biome shifts and the imperative to prevent land conversion, private land conservation is an increasingly integral element of the conservation toolkit. CEs can protect endangered species, threatened ecosystems, and human food systems, contributing to a larger landscape conservation network of undeveloped and working lands (Clancy et al., 2020; Kareiva et al., 2021; Loeb & D'Amato, 2020).

CEs offer permanence through perpetuity, which is precisely what makes them appealing for present day land conservation. But that perpetual rigidity is the Achilles heel of climate change adaptation, ultimately threatening CEs' enumerated purposes and therefore, legal viability. This can occur either directly, through physical destruction from climate change that changes the character of the conserved land (heat, sea level rise, hurricanes, etc.) or more indirectly by forcing growth adjacent to the CEs (surrounding and isolating properties), reducing their ability to effectuate their purpose(s). To date, most of the social science literature exploring climate change impacts on CEs has been focused on adapting the documents themselves, and potential solutions through options to purchase CEs (Cheever & Owley, 2016). One line of examination involved CE document examination of 269 CEs and interviews with seventy conservation officials in six states across the country to determine, in part, how CEs could be adapted to climate change (Rissman et al., 2015; Owley et al., 2018). Owley et al. identified "four types of climate-responsive land conservation" including "shift[ing] land acquisition priorities to account for potential climate change impacts; consider[ing] conservation tools other than perpetual CEs; ensur[ing] that the terms of CEs permit the holder to adapt to climate change successfully; and provid[ing] for more active stewardship of conservation assets" (pp. 733 – 734).

As part of a larger study with multiple objectives, our line of inquiry augments aspects of the Owley et al. (2018) typology, but more fundamentally examines how CEs in growing exurban areas are positioned to address climate change through the perspective of the land trusts and landowners stewarding them. To answer this question, we employed a multi-modal approach, including coding over 2,000 CE instruments, conducting interviews with land trusts in spring and summer 2019, and administering a subsequent survey of the landowners with CEs in summer 2021 in twelve exurban study counties in six eco-regionally representative states (CA, CO, MN, SC, PA, and VA). These counties represent areas with significant growth pressure and need for conservation, making them prime for the issues faced with climate-change induced land conversion. We used a semi-structured interview method with the staff of the LTs that we identified through CE instrument coding for CEs placed between 1997 and 2008/2009. For the survey, we generated a post-test survey instrument for dissemination via mailed invitation to respond on-line, followed by a mailed hard copy (Dillman et al., 2014) to all of the known property owners with CEs placed between 1997 and 2008/2009 in each county. These methods allowed us to offer a unique perspective in this burgeoning line of inquiry; namely, the land trust and landowners' intents with their CEs in the face of climate change. We were able to both test and augment the Owley et al. (2018) findings regarding active stewardship, adding a new perspective on how exurban CEs can respond to current and future climate change concerns, which will impact land conversion and

future public land use options.

LEARNING FROM WORKERS: THE SOCIAL EQUITY AND URBAN PLANNING IMPLICATIONS OF GREEN JOBS PROGRAMS

Abstract ID: 1618

Individual Paper Submission

SOLIS, Miriam [University of Texas at Austin] solis@austin.utexas.edu, presenting author

BISSIRI, Tony [University of Texas at Austin] bissiri@austin.utexas.edu, co-author

Local jurisdictions are increasingly promoting green workforce initiatives as part of their social policy and climate mitigation efforts. But urban greening initiatives are now central to neoliberal growth. Government and private officials often tout green jobs growth plans without offering a new environmental or labor ethic (Kouri and Clarke 2014). These ecological modernization approaches extend exploitative divisions of labor that are racialized and gendered (Barca 2019). Alternatively, environmental justice approaches to labor initiatives involve disrupting existing reproduction processes, and they link the grassroots with institutional actions. Living wages, unionization, safe workplace conditions, and employer-ownership are key mechanisms by which these justice-oriented approaches have been pursued.

Urban planning scholars have made the case for the planning field's critical role in creating these improved material conditions. Shrock (2014) points out that the workforce development field bridges planners' focus on "place" and "people" prosperity by rethinking how communities might benefit from urban development. The workforce development field's focus on skills, networks, and careers creates the people prosperity central to equity planning. To build on this potential, cities need multi-stakeholder governance processes that hold sociocultural diversity and attend to structural disadvantages that exist amongst historical actors (Song 2016). In addition, green workforce development programs can carry out collective priorities through the adoption of community education principles. These are instances where program design goes beyond identifying and responding to individual needs by also working to solve problems at a social level (Griswold 2013).

Understanding that workers themselves hold critical insights on community-wide problems, this study examined the individual and community-level equity implications of green workforce development programs. Our research-practice partnership included university researchers, a nonprofit workforce development organization, and two city agencies. Project partners collaborated to determine how local Civilization Conservation Corps members, a city-sponsored green career exposure program, was preparing program participants for green career pathways. We employed photovoice, a participatory action research methodology that involves participants taking photographs in response to a series of prompts that were iteratively developed amongst project partners. Over the course of the workshops, participants collected and discussed 52 images, and the group's insights were synthesized and linked to recommendations for program improvement.

Our findings illustrate how green workforce development programs hold important consequences for social and spatial equity in cities, and they suggest some potential paths forward. Under certain conditions, these programs can enroll people who hold a deep commitment to serving urban communities and mitigating environmental degradation; we found that most participants wanted post-program careers where they would continue to do both. However, participants expressed dissatisfaction with how little they knew about the history of their worksites. They also questioned whether their park-cleaning efforts reinforced inequity by enabling gentrification or maintaining the upkeep of already affluent communities.

We conceptualize program participants' critical reflections as fissures of neoliberal urban green development. On the one hand, they hold the commitment to service that harkens back to New Deal Civilization Conservation Corps programs. On the other hand, their critiques challenge the role of green jobs programs in unequal urban development. We argue that community education approaches to green workforce development are a key mechanism by which to link jobs programs to equity planning efforts.

PLANNING FOR THE ENERGY TRANSITION IN RURAL CANADA

Abstract ID: 1624

Individual Paper Submission

KVERN, Michael [University of Guelph] kvern.michael@gmail.com, presenting author
DEACON, Leith [University of Guelph] leith.deacon@uoguelph.ca, co-author

The biggest challenge facing municipalities today is how to embrace the ongoing energy transition from fossil fuels to renewables. The goal of this research is to contribute knowledge on how rural municipalities in southern Ontario and Manitoba are integrating energy planning into their official plans. Energy production systems are transitioning away from fossil fuels and centralized distribution to small-scale decentralized systems using renewable sources. Energy generation will become a more visible and predominant land use. Rural spaces are already highly contested in southern Ontario and southern Manitoba where rapidly growing population are creating significant development pressure. This creates a challenge for planners who must adapt land-use planning frameworks to include renewable energy into settlement patterns and the built form. This research uses a series of case studies (N = 6) to assess the integration of energy planning and land-use planning in rural contexts. Data collection includes a survey of professional planners (N=60), and key-informant interviews with planners, developers, and utility staff from each municipality to identify what enables and prevents integration of energy and land-use planning (N=18). Preliminary findings suggest support from provincial / state governments and local political leadership are essential to successful integration. Limited capacity, lack of jurisdiction, lack of political will, and poor cooperation with utility companies are key barriers planners and local governments face in integrating energy and planning. Rural communities are at the forefront of the renewable energy transition, but existing land-use planning frameworks are maladapted to enable it. Many communities have attempted to integrate energy within their land-use plans, only to see limited results. This research contributes to understanding why this implementation gap exists, and what planners can do to address it.

ENVIRONMENTAL JUSTICE IN ENERGY TRANSITION: QUANTIFYING RACIAL DISPARITIES IN AIR QUALITY USING A CASE STUDY OF CLEAN TRUCK PROGRAM IN NEW YORK AND NEW JERSEY

Abstract ID: 1639

Individual Paper Submission

PARK, Yeonkyeong [Cornell University] yp394@cornell.edu, presenting author

Many studies find that environmental injustice exists that pollution disproportionately impacts poor communities, and generates severe health disparities in the lower income households (Richmond-Bryant et al. 2020). Although policy efforts for cleaner air have been reported to successfully reduce some air pollution, there have been far less empirical studies quantifying the effectiveness of those measures from an environmental justice (EJ) perspective.

This study provides empirical evidence regarding environmental justice improvements from the Clean Truck Program at the Port of New York and New Jersey. The Clean Truck Program (CTP) is a nation-wide voluntary subsidy program that seeks to replace the old heavy-duty diesel trucks with newer trucks to improve fuel economy. My research question is: how much does the CTP improve the air quality for the EJ communities? My hypothesis is that the marginal decrease in pollution would be higher for the EJ communities (lower-income Black and Hispanic populations) than the other groups after implementing the CTP. I measure how much the annual average nitrogen dioxide (NO₂) concentration level is reduced for the local EJ communities before and after implementation in 2010.

To conduct the analysis, two kinds of data are used: air pollution and demography data. As air pollution data, I use the predicted NO₂ values estimated using the Land Use Regression model from (Wang 2020) to better represent the local air quality than the values from monitoring stations. In terms of the demographic data, I use the American Community Survey 5-YR estimate in 2006-2010 and 2011-2015 to obtain the race and socio-economic variables. Those include median income, median housing value, poverty level, and education attainment. Other explanatory variables include: (i) a dummy variable denoting when the Clean Truck Program was in effect, which is sourced from the PANYNJ; and (ii) the “distance from the port terminals” variable, which I calculated using ArcGIS Pro version 2.9.2. In terms of the research methodology, Difference-in-Differences model is used to quantify the marginal reduction in pollutants by population.

This study contributes to analyzing the local environmental impact of sustainable port activities. My research is important due to its higher relevancy for other U.S. ports. similar level of infrastructure facility and located in the similar surrounding local neighborhood to the majority of the U.S. ports, making my findings useful in the wider region.

FREEMARK, Yonah [Urban Institute] yfreemark@gmail.com, co-author

MOODY, Joanna [World Bank] jmoody1@worldbank.org, co-author

Climate change mitigation and adaptation is a defining challenge for cities over the next several decades. Though there are many actions that municipal leaders can take right now to assume leadership in mitigation strategies and to prepare their cities for a changing climate, their assessments of specific policies are clouded by uncertainty regarding both climate science and policy interventions. Climate change is clearly already impacting cities but the range of forecasts from the IPCC is wide and downscaling climate science is a difficult and costly exercise. Climate uncertainty is thus inevitable – it should be a priority for researchers to better understand how this uncertainty is impacting decisions to pass climate policy. Our research seeks to understand whether uncertainty encourages additional, precautionary action or if uncertainty degrades the likelihood of climate action.

In order to answer our questions, we sent a survey to every elected city councilor (or equivalent) and mayor in cities with over 100,000 people. We received 245 completed responses that we analyzed using structural equation modeling (SEM). This survey also included a gain/loss/no framing section in order to determine if framing effects interact with uncertainty to influence municipal action. The SEM approach allows us to derive latent variables of ‘climate uncertainty’ and ‘climate policy propensity’. We are additionally able to test multiple pathways for uncertainty to impact climate action. Our results indicated that uncertainty does indeed diminish the probability for municipal elected officials to take climate action but we found no framing effect. In addition to answering the central research questions, we also provide a rare snapshot on municipal elected officials’ perspective on climate change. While we found widespread support for action, political party and gender were significant variables that determine the level of support.

LEGACIES OF REDLINING LEAD TO UNEQUAL COOLING EFFECTS OF URBAN TREE CANOPY

Abstract ID: 1654

Individual Paper Submission

JUNG, Meen Chel [University of Washington Seattle] jmc129@uw.edu, presenting author
ALBERTI, Marina [University of Washington Seattle] malberti@uw.edu, co-author

Many previous studies have explored the spatiotemporal characteristics of urban thermal environments or compared the cooling effects of various mitigation strategies. These results provide grounds for urban planners and policymakers to effectively counteract climate change challenges. A parallel research area has recently started to document the legacy effect of land use policies on urban forests uncovering social inequities. One of the social drivers that have been influencing US-based intra-urban temperature heterogeneity is the historic redlining policy. The policy was officially abolished about 50 years ago, but its lingering impacts on environmental racism, including the inner-city differences in temperature and canopy cover levels, have been detected through a few empirical studies. Nonetheless, redlining policy-induced temperature inequality is still underexplored due to several methodological limitations inherent in previous research.

In this study, we first explore the descriptive patterns of land surface temperature and canopy area by the Home Owners’ Loan Corporation (HOLC) redlining grades and then statistically uncover the varying canopy cooling effects by the grades based on the neighborhoods in Portland, Oregon, and Philadelphia, Pennsylvania. The primary assumption of the research is that past redlining policy has been influencing the current urban environments. We test three hypotheses to unravel the heterogeneous relationships between canopy cover and land surface temperature according to the redlining grades: (1) A higher HOLC redlining grade records a lower land surface temperature level, and this relationship persists over time, (2) A higher HOLC redlining grade has a larger canopy area, and this relationship persists over time, and (3) A neighborhood with a higher redlining grade benefits more from canopy

cooling benefits.

We develop a research protocol to integrate multiple spatial datasets—Landsat Analysis Ready Data Level-2 surface temperature product, canopy cover datasets, building footprints, and estimated block group population layer—into a master dataset. We use Landsat-based grid cells (30 m × 30 m) from land surface temperature products as analytical units to test three research hypotheses. The master dataset has a hierarchical structure—level 1 (grid-level) variables are land surface temperature, canopy area, and building area, and level 2 (neighborhood-level) variables are redlining grade and population density. First, we conduct boxplots, Kruskal–Wallis H tests, and post-hoc multiple comparison tests to examine the distributions of land surface temperature and canopy area by the HOLC redlining grades in 2007 and 2017. The HOLC redlining grades are adjusted into three grades based on the descriptive patterns captured by the boxplots. Then, we introduce mixed-effects models to statistically investigate the different magnitude of canopy cooling effects by the adjusted redlining grades.

We show that the higher HOLC grade has lower land surface temperature and a larger canopy area in both Portland and Philadelphia. Using mixed-effects models, we find the statistically significant and different magnitude of canopy cooling effects across the redlining grades, but the two cities show the opposite direction of effects in the low grade. Specifically, the increase in canopy area in the lower grade shows a greater cooling effect than in the high grade in Portland, whereas the high grade benefits more from increasing the canopy area than the low grade in Philadelphia. Overall, this research can provide empirical evidence for promoting a more equitable urban environment. Given the limited budgets and spaces, the efficiency of installing additional trees may be considered as a major factor, but this research suggests that equity should also be considered in responding to the elevated intra-urban thermal environments.

PARK, Minkyu [University of Maryland] mkpark@umd.edu, presenting author
HENDRICKS, Marccus [University of Maryland] mdh1@umd.edu, co-author
WHITEHEART, Rachel [University of Maryland] rmw95@umd.edu, co-author

Historically, hazard literature has used 'social vulnerability' to describe how social stratification, based on race, income, education, gender, and other factors, differentially affects the risks and impacts that a community experiences in a disaster. The theories and empirical findings of disaster literature indicate that racially or socially marginalized communities have access to less safe built environments. Recent studies exploring green stormwater infrastructure (GSI) distribution from the perspective of environmental justice show that a high distribution of GSI significantly correlates with better-resourced communities. However, those studies do not show whether marginalized communities less benefited from protective measures are socially vulnerable and whether the vulnerable communities are relatively excluded from the flood mitigation benefits of stormwater infrastructure, linking the distribution of infrastructure only to specific socio-economic factors. Based on the Pressure and Release (PAR) model of hazards and social vulnerability, this study analyzes whether a communities' social vulnerability is associated with the unequal distribution of gray and green stormwater infrastructure by using the social vulnerability index. The analysis reveals that both gray and green infrastructure capacity has statistically significant correlations with population density, imperviousness rate, and social vulnerability. They show that the infrastructure separation from planning could raise an equity issue in terms of flooding and give support to the role of infrastructure as a mechanism that deepens social vulnerability. These findings require a broader role of planning that includes urban infrastructure elements and more collaborative works with engineers.

TACKLING BIOLOGICAL INVASION: UNPACKING THE NASCENT DOMAIN OF INVASIVE SPECIES MANAGEMENT PLANNING

Abstract ID: 1684

Individual Paper Submission

SCHENK, Todd [Virginia Polytechnic Institute and State University] tschenk@vt.edu, presenting author

Invasive species of all taxa—from zebra mussels in the Great Lakes to West Nile virus around the world, and Water hyacinth in the Nile to European rabbits in Australia—pose significant threats to ecosystems and the services they provide us, displacing native species, reducing biodiversity, harming agricultural production and forestry, changing our landscapes, and costing trillions of dollars annually in damages and management costs (Humair et al., 2014). Both the drivers and consequences of biological invasions are often found within our planned and built environments, underscoring that they are ultimately and very deeply socio-ecological in nature (Barney et al., 2019). Whether intentionally or not, invasive species are virtually always introduced by humans through horticulture, pet release, ‘hitchhiking’ associated with shipping and travel, and other activities we engage in. The implications are acutely felt through altered landscapes, impacts on human health, and challenges to our food systems. And last but not least, efforts to address invasive species are intertwined with the various interests, priorities, and perspectives of different stakeholders. For example, exotic pet dealers may have different perspectives than ecologists concerned about particular ecosystems in which those exotic pets might find viable homes if released.

Given how intertwined invasive species are with our built environments and their significant impacts, it is surprising how little attention this issue receives in the planning literature and practice. A search of the American Planning Association’s Planning.org website yields two memos, one Planning magazine article, and a handful of workshop listings related to ‘biological invasions’ and ‘invasive species’. A similar search of the Journal of the American Planning Association archives yields six articles that include the term ‘invasive species’ but none is explicitly about this issue. A search of the Journal of Planning Education and Research yields five only marginally related articles. 59 articles in the Journal of Environmental Planning & Management include the term “invasive species”; many of these address policy options and/or land management, but none explicitly focus on planning processes and the tools planning institutions might bring to bear on this issue.

A handful of jurisdictions have developed invasive species management studies and plans—including Bowie, Maryland (2013), Mississauga, Ontario (2021), and the Confederated Tribes of Coos, Lower Umpqua, and Siuslaw Indians (2020)—but such plans and planning processes are not widespread.

However, the impacts of invasive species are expected to grow significantly, including as a result of climate change, further necessitating action. It is anticipated that invasive species plans will thus become more common in the coming years.

This paper examines the nascent domain of invasive species management planning at the municipal level and provides some insights into emerging best practices. Insights are drawn not only from the few existing plans, but also from somewhat similar planning processes that are more institutionalized, such as those for climate action.

The underlying research agenda involves document analysis of existing invasive species management plans, a survey of best practices in other similar domains, and interviews with practitioners involved in the work of putting such plans together and implementing them. Insights are also drawn from a case study of nascent efforts to advance invasive species management in the Town of Blacksburg, Virginia, which the author is directly involved with.

Green infrastructure [GI] tries to simulate natural hydrologic systems to address urban stormwater problems related to excessive flooding and pollution of water bodies. Although GI for stormwater management is on the rise; there is little research that has examined the role of stakeholder perception and decision making in the GI planning process (Montalto et al., 2013).

Innes and Booher [2010] suggests 'collaborative rationality' or incorporating stakeholders in the decision-making process as a key element of planning for urban areas identified as complex socio-ecological systems [SES] (Holling & Gunderson, 2002). Though literature identifies stormwater managers as a key stakeholder for GI implementation (Shandas et al., 2010), there remains a lack of research that incorporates the perception of stormwater managers in formal models of GI implementation (Carlet, 2015). Most GI implementation plans are based on hydrology & hydraulic models that identify optimal placement of GI on the urban landscape, but fail to account for variability in perceptions and decision-making by the people who determine when and where GI is used.

In this paper, we employ an agent-based model [ABM] (Railsback & Grimm, 2011) to explore our hypothesis that GI planning outcomes and adoption rate change when stakeholder perceptions and decision-making are accounted. The model captures the impact of stormwater managers' existing experience and knowledge in implementing green infrastructure. The specific research question is how does incorporation of perceptions regarding GI in an otherwise deterministic model change the overall GI implementation rate and associated environmental outcomes?

We created an ABM in Netlogo (Wilensky, 1999) to simulate GI implementation under two different scenarios. Agents in the model are stormwater managers who choose GI type and location in both scenarios. The first scenario assumes perfect, objective knowledge on the part of the stormwater managers, leading to an optimal solution for the choice and distribution of GI. This model uses deterministic variables to assess GI suitability and overall cost and benefit accrued after implementation [in terms of flood reduction, pollutant removals, etc]. In the second scenario, implementation decisions are weighted using insights from surveys of stormwater managers concerning their awareness and perceived effectiveness of GI types. The resulting pattern of GI implementation is expected to better represent outcomes that are shaped by real-world stormwater manager perceptions about GI. We then extend the second model to simulate how learning (knowledge transfer) might occur over time through managers' direct experience of GI efficacy, contact with other agents, and implementation of policy incentives. Different assumptions about the pace of learning and shifts in perceptions are used to assess how quickly results from the two models will converge. The process of 'learning' and updating perception demonstrates importance that observation, experience, and interaction hold for evolution of GI adoption and how the gap between optimal and practical GI implementation may be bridged.

Agent perceptions of GI are based on a survey of stormwater managers from 48 cities in Utah. The model environment replicates the landscape of these cities with regard to impervious area, built up area, land use, soil, groundwater depth and population density, collected from secondary sources.

The final simulation model illustrates how the various perception stemming from stormwater manager's knowledge of issues translates in different cities and portray in the ultimate choice of stormwater management technique. Our findings demonstrate the importance of knowledge transfer as both a top-down and bottom-up process, in designing GI for stormwater management. In particular, the results will illustrate the role of innovation spread, through dialogue and interaction between agents. The primary relevance of this study is in bridging the gap between a purely objective choice model for GI and more qualitative information on stakeholders' preconceptions and preferences.

COMMUNICATING THE U.S. EPA'S TOXICS RELEASE INVENTORY DATA IN NEWS MEDIA

Abstract ID: 1701

Individual Paper Submission

SEO, Hye-jeong [VIRGINIA Tech] seohj@vt.edu, presenting author

SCHENK, Todd [Virginia Polytechnic Institute and State University] tschenk@vt.edu, co-author

This study aims to examine how Toxics Release Inventory (TRI) data is communicated in print and online news texts using content analysis. The TRI program tracks the management of designated toxic chemicals that pose a threat to human health and the environment, and provides the public with information about potential pollution exposures. The program was established as one of the major components of the Emergency Planning and Community Right-To-Know Act (EPCRA) in 1986, briefly after the Bhopal gas leak in 1984. This high-profile accident attracted public attention to potential chemical risks and shedded light on the lack of understanding about the uses, releases, and transfers of toxic chemicals, which led to the legislation of EPCRA.

The TRI program reduced the release of toxic chemicals listed in the inventory by 45% between its inception in 1988 and 1995. The government's provision of information about toxic chemical releases spurs action from communities, civil society, and other social actors, or self-regulation on the part of polluting companies themselves by functioning "as a form of intervention by government in the negotiation process" between social actors (Stephan, 2002, p. 191). Generation and transmission of environmental information like TRI not only elicit action from social actors, but also bring institutional changes such as self-organization of local communities, more inclusive interactions, or newly defined space and territories for environmental governance (Gilek & Kern, 2016; Mol, 2008; Soma et al., 2016). Understanding the way information is processed, reorganized, and transmitted can significantly contribute to the production and management of environmental data for assisting public use.

The news media has a strong advantage when it comes to increasing public knowledge about toxic chemical information due to its accessibility to the broader public. It acts as a conduit for public access to TRI data helping other social actors spread information with its capabilities to reach large audiences without requiring intense previous knowledge or active information-seeking actions on the part of the wider public. As a result, news media becomes a fascinating research territory that displays who are various social players surrounding TRI data, including the media itself, and how they communicate TRI data aimed to reach the public. One thing noteworthy is that the news media does not simply carry what social actors want to communicate, but either selects certain information attractive to the audience or reprocesses information to be newsworthy. Thus, the final form of TRI information delivered to the public through news media is knowledge about health and environmental risk reconstructed by social actors and journalists (Staab, 1990).

In this study, content analysis is conducted to systematically examine patterns in news texts and explore meanings attached to those patterns. Two research questions are addressed: 1) by whom and how is TRI data is communicated in news media with what claims and additional information attached 2) which news values are associated with the communication of TRI data in news media. News articles published from 2017 to 2021 that contain keywords regarding the TRI program and data are coded according to six criteria in addition to basic information about articles: claims-makers, sources of cited TRI data, triggering events relevant to news coverage of TRI, the purpose of mentioning TRI, geographic information, and polluting facilities information. Additional line-by-line coding is performed for sentences and paragraphs containing news value components: personalization, controversy, negativity, eliteness, influence and relevance, unexpectedness, and geographical proximity. Exploratory content analysis and news value analysis are conducted to discover the repeatedly appearing themes and patterns in news values that coincide with the use of TRI data in the news.

EVALUATING URBAN CLIMATE PLANS ON HEAT MITIGATION AND PREPAREDNESS

Abstract ID: 1721

Individual Paper Submission

ROSE, Rebecca [University of Wisconsin-Madison] rmrose2@wisc.edu, presenting author
GOCMEN, Asligul [University of Wisconsin-Madison] gocmen@wisc.edu, primary author

As climate change continues to intensify temperature extremes across the world, understanding the impacts of extreme heat events and planning strategies for heat adaptation and mitigation are critical to human wellbeing. Urban populations are especially vulnerable to heat waves due to the urban heat island (UHI) effect and social and economic inequities. Under this effect, a lack of greenery and a greater area of heat-absorbing, impermeable surfaces cause cities to have higher temperatures than surrounding rural areas, which can have severe health consequences. Given the sheer number of people exposed to extreme heat in cities, our central research question is: how well are cities preparing for heat? What patterns emerge in municipal plans that center around heat and climate change? How do these plans follow or deviate from best practices in urban planning when focusing on heat preparedness?

To do this, we evaluate and compare thirteen climate-related plans of six American cities that have only recently begun dealing with extreme heat due to climate change coupled with the UHI effect: Baltimore, Boston, Chicago, Louisville, Minneapolis, and New York City. We use criteria that we have identified to gauge how effective these plans should be in mitigating the local UHI effect and improving health outcomes. The criteria is derived from planning literature on what makes a good plan, such as a high-quality fact base and steps to monitor and evaluate progress, and the level of detail in policy goals and implementation, such as funding, timeline, and delegation, coupled with the presence and strength of heat-mitigating or response policies such as vegetative cover or cooling centers. A plan that scores highly in these criteria can be expected to both prioritize heat mitigation and improved health outcomes and be more likely successful in achieving these goals, which we also examine as part of a larger study.

We find that even among ambitious cities known for being proactive in planning for climate change, there is a great variety in quality in their plans and policies. New York City emerges as the leader with excellent, high-scoring plans. Vegetative cover, traffic reduction, and improving building efficiency are the most frequently included and high-scoring policies found across plans, while other measures such as utilizing the third dimension of cities (using building exterior walls as reflective or vegetated surfaces) are largely omitted. Monitoring and evaluation are rarely a rigorous part of plans. Mentions of equity and prioritizing the most vulnerable residents appear in almost all plans, but substantial demonstrations of a commitment to truly realize these goals are more rare. Heat management measures (those designed to deal with the health impacts of extreme heat in heat emergencies but do not physically

cool a city) barely appear but are improving with time. Given the differences in plan quality, there is substantial room for improvement and learning from other communities to improve the urban environment and health outcomes.

‘EQUITY IN ACTION’ OR EQUITY INACTION? NEW ORLEANS AND THE RISING TIDE OF URBAN FLOOD RISK

Abstract ID: 1742

Individual Paper Submission

ABBOTT, Martin [Cornell University] mja273@cornell.edu, presenting author

In the USA, flooding is a major socio-ecological planning issue because it causes more damage than any other natural hazard. Exacerbated by the climate crisis, experts identify urban flooding as the number one future flood risk to the nation (ASFPM Foundation, 2020). In New Orleans, chronic urban flooding caused by heavy rainfall leads to significant, repetitive damage and loss. However, the lie of the land in this below-sea-level city means some people and places flood more frequently than others. Established in 1968, the trillion-dollar National Flood Insurance Program (NFIP) is a federal land use policy that guides how and where development takes place in the USA. The program ranks among governments’ most powerful policy tools to minimize the impact of flooding and mitigate and adapt cities to the climate crisis.

In the aftermath of flooding disasters, however, environmental justice scholars highlight the inequitable impact of FEMA’s standardized recovery programs. For example, post Hurricane Katrina, Robert Bullard and Beverly Wright (2012: 59) observed that FEMA’s programs favored White communities and discriminated against African Americans. Quantifying the uneven distribution of relief, Junia Howell and James Elliott (2019: 457) find that as hazard damages increase, so too does wealth inequality between Black and White residents. This makes the redrawing of flood risk in the NFIP contentious and a matter of consequence for equity, the environment, and the economy.

In this paper, I take up Miyuki Hino and Earthea Nance’s (2021: 29) call to scrutinize the disproportionate impacts of flooding and planning mechanisms that perpetuate inequity. I argue the NFIP not only disregards urban flood risk but also the concept of justice. Drawing on ethnographic field research in New Orleans and interviews with planners, hazard mitigation experts, and community leaders, I show how low-income residents and people of color, who represent the majority of New Orleans’ population, live in high flood risk areas and are disproportionately affected by urban flooding. To address this glaring urban injustice, I think with Fayola Jacobs’ (2019) Black feminist and radical planning approaches to examine FEMA’s new insurance rating methodology, “Risk Rating 2.0: Equity in Action.” Because the NFIP insures over 5 million homes in the USA, this seismic shift in how the price of flood insurance is calculated will affect the sustainability of the built environment nationally. However, Risk Rating 2.0 targets economic fairness only. The climate crisis and environmental equity, among other intersections of race, class, and gender, are not factored into the new pricing methodology’s algorithm. I also argue that Risk Rating 2.0 perpetuates environmental inequity and racial injustice. Consequently, as Risk Rating 2.0 phases in, I demonstrate how under this new approach flood insurance may become more expensive and unattainable for the vulnerable communities that need it the most. To address this injustice, I suggest how the NFIP can be reformed to prioritize more just futures for every-one/thing as the climate crisis intensifies.

GENES AND GEOGRAPHY: DISPARITIES IN CANCER INCIDENCE AND OUTCOMES IN THE BLACK CANADIAN COMMUNITY OF SHELBURNE NOVA SCOTIA – A PRELIMINARY HISTORICAL GEOGRAPHY

Abstract ID: 1761

Individual Paper Submission

HOSTOVSKY, Charles [Simon Fraser University] charles_hostovsky@sfu.ca, presenting author
GINDI, Ella [Dalhousie University] el447650@dal.ca, co-author

Little is known about Canadian cancer disparities despite numerous international studies reporting disparities in cancer incidence and outcomes for people of African ancestry. These disparities reflect the interplay of social determinants of health, the environment and genetics. As the lack of Canadian cancer disparity data may be shortening the lifespan of marginalized communities, we are studying a historic Black Nova Scotian community (Shelburne) who have an inordinately high incidence and family history of various cancers. This research requires a high-risk framework incorporating natural and social sciences to determine if environmental, biological, genetic, socio-economic and lifestyle factors are associated with the high cancer incidence and mortality.

This study, funded by the SSHRC's New Frontiers in Research fund, follows up on the pioneering work on Canadian environmental racism by Ingrid Waldron (this study's Co-PI) through her book (2018) and subsequent documentary film (2019). The book and film featured the African Nova Scotian residents of Shelburne.

The study includes:

1. Identifying geographical hotspots of cancer incidence and deaths - investigating the link between genetics, environment, lifestyle and chronic diseases. The demographic and socioeconomic profile of Shelburne residents will be determined using questionnaires and cancer registries.
2. Creating a biorepository and determine environmental exposures in Shelburne residents using biological samples to assess heavy metal and carcinogen levels.
3. Identifying genetic changes that may explain an ancestral cancer susceptibility using whole genome sequencing of saliva samples.

While research ethics is presently under review for much of the study, the presenters are presently conducting the historical geography of the site. In January 2022 we conducted an on-site reconnaissance of the dump with Town of Shelburne staff in order to create a photographic record of anomalies such as leachate runoff, off gassing, and lack of cover final over deployed waste in cells. Further research underway includes:

- Retrieving historical information, photos and other paraphernalia from community members;
- Obtaining historical air-photos of the dump site and surrounding town;
- Field visits in the surrounding Shelburne community examining homes closest to the dump in terms of exposure potential, mapping house locations (GIS);
- Reviewing local archives;
- An historical review of local and Halifax print and online newspapers concerning the dump; and
- Internet and social media search of dump information, ethnographic thematic analysis of social media postings.

Our preliminary findings indicate that the dump operated from 1947 until 1996, when waste was diverted to an approved modern, engineered landfill in another community. The dump acted as a white metals transfer station and construction debris until it officially closed in 2016. The dump has no engineered features in terms of leachate collection and methane management and is located in a swamp, which has a high water table that can lead to the spreading of leachate offsite. No attempt has been made to monitor or remediate environmental contamination at the site. The historical review indicates the dump received waste from the national defence department (Navy), Roswell hospital, fisheries and timber industries, as well as municipal and household waste. The site contains a creek and is in

a bog, hence the potential exists for the presence of carcinogenic materials through exposure pathways to surface water and groundwater as well as landfill gas.

Considering the analysis indicates there are industrial and hazardous materials in the site over and above local household “garbage”, the lack of modern landfill engineering contamination mitigation methods, and inappropriate location of the dump by modern environmental planning standards in a bog with surface water features extending off site, it appears that the Shelburne dump is potential sources of contaminant exposure to the local community.

RELATING LOCAL CLIMATIC ZONES AND UHI MAPPING TO PREDICT CHANGES IN LOCAL THERMAL ENVIRONMENT

Abstract ID: 1763

Individual Paper Submission

BUDDE, Sandeep [University of Alberta] sbudde@ualberta.ca, presenting author
AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, primary author
WELEGEDARA, Nilusha [University of Alberta] yalingas@ualberta.ca, co-author

Local climatic zone (LCZ) is a standardized framework which is used to study urban microclimate. In the LCZ mapping, an urban area is classified into different zones based on urban morphology and the built-up area , sky-view factor, pervious and impervious surfaces and vegetation cover (Wang et al., 2018; Chen et al., 2020)

The World Urban Database and Access Portal Tools (WUDAPT) method is commonly used to categorize different LCZs within a city. The LCZ maps can be used to determine the relationship between the landscapes of different urban forms and their thermal effects. Despite the increase in the number of UHI studies, few studies have focused on winter cities that are located above 50th parallel. This study intends to understand the effect of LCZ on the UHI effect in winter cities. Edmonton, a winter city with a population of million people located at the 53rd parallel, was selected as a case study.

The LCZ mapping process for the city of Edmonton included three steps: 1) the city area s divided into LCZ classes based on different built-up and landcover categories such as the density of trees, vegetation type, landuse, surface materials (Yang et al., 2020; Lehnert et al., 2021) 2) The LCZs were created based on the trained data sets from the online tool developed by Ching et al. (2018) and the LCZ classification developed by Wang et al. (2018b). 3) Using the WUDAPT model and Google Earth imagery, the LCZs were created for the city. This 3 step exercise resulted in 29 zones across the city, which were analysed systematically at the neighbourhood scale.

Preliminary results show a significant effect of LCZ on UHI. For instance, the LCZ 3 (Compact Low Rise residential), LCZ 10 (Heavy Industrial), LCZ 5 (open mid rise) and LCZ 7 (Light Weight Low Rise) showed the highest average temperature then LCZ 8 (Large Low Rise Residential) and LCZ 9 (Open Low Rise Residential). LCZs with mostly vegetation and greengreen cover showed lower temperatures than those characterized with paved surface, and water bodies. The method employed here helps in eliciting stronger relationship between built typology and average UHI within a city. This way, the method can then help municipal planners to identify areas in the city, which are most in need of UHI mitigation measures.

THEY AREN'T FROM AROUND HERE AND OTHER FALSE NARRATIVES FROM THE MEANING MAKING PROCESS POST EXTREME FLOODING: A HARRIS COUNTY, TEXAS CASE STUDY

Abstract ID: 1765

Individual Paper Submission

POWERS, Liza [Texas Southern University] lizatpowers04@gmail.com, presenting author

Flood related fatalities are the second most common death from natural disasters, and those that drive during extreme flooding account for more than half of flood related fatalities (Ashley & Ashley, 2006). As more extreme weather is predicted due to climate change, the number of deaths has steadily increased from flood events since the 1990s (Maples & Tiefenbacher, 2009). Texas leads the United States in flood related deaths, where almost 75% are related to driving in the extreme flooding event (Sharif et al, 2012).

This case study targeted catastrophic storms from 2000 to 2019 Harris County, Texas. Houston, county seat to Harris County, is the largest city in Texas and fourth largest city in the United States. Harris County is both prone to both sudden and slow onset flooding. Through a convenience sample, almost one hundred people were interviewed that had driven during a catastrophic flooding event during the last twenty years. Hours of live news reporting were also viewed and coded through NVivo to explore on air interviews of driving during the flood events. This research asks the question: what collective thoughts can be observed by people who experienced driving during extreme flooding events in Harris County, Texas?

Major themes were discovered about the meaning making process that occurs following the trauma experienced from extreme flood events that resulted in mass casualties. Themes from the interviews emerged that contradicted actual findings from those that died during these events. People generalized that those that died were not long-term residents of Harris County, Texas. Interviewers reported a belief that they would not experience the same fate as others from personally driving during the rain event. Research also revealed that residents seemed too comfortable with risky driving scenarios and most believed there was a right way versus a wrong way to drive during extreme flood events. Findings from this research are useful in public education forums to educate drivers and potentially save lives.

UNDERSTANDING THE PUBLIC'S QUESTIONS AND CONCERNS RELATED TO POTABLE WATER REUSE: AN ANALYSIS OF SURVEY WRITE-IN RESPONSES FROM RESIDENTS OF ALBUQUERQUE, NEW MEXICO

Abstract ID: 1769

Individual Paper Submission

SCRUGGS, Caroline [University of New Mexico] cscruggs@unm.edu, presenting author
HEYNE, Catherine [University of New Mexico] heyne@unm.edu, co-author

Urban centers around the world, including those in the American Southwest, are grappling with the challenges associated with population increases, drought, and projected water shortages. In New Mexico, water management and climate change experts warn of a new reality characterized by higher temperatures and less precipitation. This future requires new thinking regarding water management, use, and governance. Potable water reuse (i.e., purification of domestic wastewater for reuse as drinking water) is emerging as an option for supplementing existing water supplies without requiring substantial changes to lifestyles or infrastructure. Although researchers and practitioners have demonstrated that existing technologies can be used to safely implement potable reuse, public opposition is currently seen as the main barrier to new projects. Thus, much research has been conducted on public perceptions of potable water reuse to better understand how to communicate and engage with the public on the topic.

Most of the data about public perceptions were collected using surveys with multiple choice questions, which constrained survey respondents to describing their concerns by choosing from a few response options. This approach does not achieve the objective of gathering meaningful data about the public's actual questions and concerns to allow design of effective programming for public education, outreach, and communication. Thus, a knowledge gap exists regarding the public's true questions and concerns about potable water reuse.

This research fills the knowledge gap by providing the first detailed analysis of public questions and concerns about water resources and potable water reuse based on hundreds of write-in responses to a large (n=4,000) survey conducted in Albuquerque, New Mexico. Examining survey respondents' questions and concerns – written in their own words – in addition to the data from multiple choice questions has the potential to improve design of educational and engagement materials to make them more meaningful. The survey write-in response data were analyzed using an iterative process of coding and theme development, similar to that used for analysis of interview data. Findings demonstrate that including ample opportunities for survey respondents to voice their questions and concerns in their own words, especially concerning a complex topic such as potable water reuse, adds richness and nuance that cannot be obtained when relying on multiple-choice questions alone; this additional dimension to the data is crucial for creating public outreach and educational programming that more reasonably meets members of the community where they are. The results are unique in the literature and are important to communities in the Southwestern US and elsewhere that aim to design meaningful and effective public education, outreach, and communication programming on the topic of potable water reuse.

SOCIAL CAPITAL INFLUENCE IN PUERTO RICO AFTER 2017 HURRICANE MARIA

Abstract ID: 1780

Individual Paper Submission

ZENO, Ed [Florida State University] ez17b@my.fsu.edu, presenting author

Climate change impacts are revealing the need for professionals with a holistic understanding of disaster resilience. Planners are occupied by analyzing community systems and providing assistance to find solutions to their development limitations. However, a key intangible and often ignored component in community systems is related to the health of the relationships among citizens. The literature on disaster resilience has shown that social capital has an influence over post-disaster recovery (Aldrich, 2011; 2012; Ganapati, 2012; Joshi & Aoki, 2013; Nakagawa & Shaw, 2004; Masud-All-Kamal & Hassan, 2018). However, many studies focus on post-disaster experiences but pay less attention to the history of community participation. In response, this study seeks to understand to what extent

and how does social capital and the history of community participation interact and influence community responses after a major disaster event.

The current study defines social capital as the social networks, the relationships among community members and civic institutions inside and outside geographical boundaries. Social capital can be perceived as the agglomeration of those social networks that collectively form community social capital. The study understands that prior community participation may have an impact on the structural formation of the community's social capital that gets visibility in post disaster recovery through different manifestations, e.g., accessing information and economic capital. In this study the manifestations of social capital are classified into the well-known categories of bonding, bridging and linking social capital.

The study consists of a qualitative case study in the Municipality of Adjuntas, Puerto Rico, which was one of the most devastated areas on the island from hurricanes Irma and Category 5-hurricane Maria in 2017 and one of the first communities in Puerto Rico developing multiple solar energy community initiatives. Semi-structured interviews were performed targeting different community sectors within the case study area. A snowball sampling technique was employed, and field observations were conducted to identify informants and to explore the different community perspectives.

Data collection was facilitated by an interview guide with open-ended questions that addressed aspects of community participation and social capital in recovery. The data was analyzed independently using NVivo and triangulated with secondary sources. Pattern matching was performed to identify patterns that described elements of bonding, bridging and linking social capital and their connections to community recovery initiatives in the study area.

Preliminary findings resonate with the literature in terms of the contribution of social networks to post-disaster recovery processes (e.g., Aldrich 2012). This study suggests that geographically isolated rural communities in Puerto Rico post-Hurricane Maria relied more on social capital to access resources for recovery than urban communities in Puerto Rico. A key finding is the predominant role of NGOs in accessing resources for their communities through their existing social capital and by capitalizing on the expanded social capital post-disaster. Consequently, not only prior community participation structured by NGOs facilitates community response post-disaster, but also the community benefits generously from NGOs' linking social capital to be effective in long-term recovery.

These findings confirm the need to link the health of citizens relationships to disaster resilience strategies. Planners have an opportunity to present to community actors the value of integrating collaborative approaches pre-disaster to build relationships and social networks among citizens and NGOs. The second implication for planning scholars is the need to study the relationship between NGOs' social capital and economic capital for recovery. Another implication pertaining to NGO practitioners is about the need to accept the inevitable demand of assisting their communities within disaster contexts and given by this reality they could integrate to their strategic plans, programs to build community social capital, but also expanding on NGOs' linking social capital.

THE ROLE OF MULTIMEDIA TOOLS IN ENVIRONMENTAL POLICY FRAMING

Abstract ID: 1782

Individual Paper Submission

LOPEZ, Jaime [University of Southern California] jaimeilo@usc.edu, presenting author

Environmental justice is the notion that all people have the same degree of protection from environmental harm and access to participation in environmental decision-making and amenities (US EPA, 2017). However, governments tend to rely on scientific terminology when addressing environmental injustices, often ignoring the embodied experience of

local residents. Even the most well-intentioned institutionalized forms of public participation often fail to achieve authentic engagement. One commonly proposed solution involves the use of community-based video and social media as tools that help bridge existing knowledge gaps between community members and the technocratic power structures. But research on video and social media impacts related to environmental justice is sparse, leaving policymakers without a clear sense for how communities should be engaged to co-produce environmental knowledge and solutions.

Environmental justice scholars and activists have criticized planning and policy approaches that fail to genuinely legitimize marginalized voices within decision-making processes. Community-based video and testimony can either counter or inform government narratives that frame environments and injustices. Though not a panacea, video productions created by community based organizations (CBOs) may function as extended forms of public participation, ultimately “lifting up the experiential knowledge of community members alongside other professional ways of capturing data” (Corburn, 2017). Since marginalized communities often lack access to experts of their own, I focus on CBOs working to amplify their voices.

Southeast Los Angeles (SELA) is the area of study, with case studies in the cities of Bell Gardens, Commerce, South Gate and Paramount. Despite being in a state held as a leader on environmental issues, Los Angeles features some of the country’s worst air pollution (psr-la.org). From a policy perspective, scholars have raised the need to direct more attention to industrial zones and pollution clusters, rather than just the siting process and individual facilities (Pulido, 2000). SELA has some of county’s most densely populated and under-resourced communities, and is also one of its largest industrial zones. For decades, SELA has been to a “dumping ground” and “sacrifice zone” for heavy industry (Carter, 2016).

Academic research has struggled to measure the “impact” of video and social media. This project asks:

1. Do community advocates and leaders use video and social media strategically to get their perspectives heard, if so, how, and does it have an impact?
2. How do official depictions of local environmental issues in SELA reflect the relationship, if any, between technocratic knowledge and community narratives?

A close reading of CBO-produced content and government documents is conducted to better understand how environmental issues and affected communities are understood. To triangulate the narratives collected by such different data, I use focus groups with local residents and in-depth interviews with CBO staff and leadership, local policymakers, and community residents. I interrogate how participants frame their environmental concerns, their community, the planning process itself, and their relationship to community-based video and social media content.

This research is an uncharted view of CBOs working in SELA to address local environmental justice issues, offering insights on how CBOs can improve their visual communication strategies. Ultimately I study the possible effects of CBO video and social media on local knowledge creation and decision making by: (1) creating an inventory of videos and social media posts by CBOs, including a typology of CBOs by use of video and social media; (2) analyzing public media accounts and interviewing local policymakers to assess the effects of these videos and social media posts as part of a qualitative analysis exploring how policymakers incorporate or not video and social media activism in their decision making.

GREEN URBANISM AND SUSTAINABILITY PLANNING: LEARNING FROM MUNICIPAL PRACTICES

Abstract ID: 1784

Individual Paper Submission

GOCMEN, Asligul [University of Wisconsin-Madison] gocmen@wisc.edu, presenting author

Since the 1990s, communities across the United States have been developing sustainability plans and identifying other ways to develop green communities. Green urbanism aims to create communities that are environmentally sustainable, with strategies that target reduced carbon emissions and ecological footprints as well as the integration of nature within urban areas (Beatley, 2000; Lehmann, 2011).

The devastating impacts of the changing climate have exacerbated the need to plan our communities using green urbanism principles. While there have been significant study of who plans for sustainability and the quality of these plans in general (Conroy and Berke, 2000; Svava et al., 2013), we do not know the extent to which a holistic set of green urbanism principles are integrated in these plans. This paper will help address this gap in the literature.

This paper investigates thirty municipal plans for the extent of integration of eleven green urbanism principles identified by Lehmann (2011). The municipal plans included in this assessment were selected based on the findings from a recent nationwide survey of local governments, which found that 586 local governments, representing approximately one-third of the surveyed governments, have completed a sustainability plan (ICMA, 2016). The sample selected for this paper is a random sample of municipalities with over 10,000 population that had indicated that they completed a sustainability plan in ICMA's survey.

Preliminary findings suggest that communities have prioritized certain green urbanism principles over others and the strength and the extent of integration of green urbanism principles differ significantly among communities. I expect to find these differences to be based organizational capacity and environmental stressors that these communities have (e.g., being prone to sea level rise).

TEXTUAL CONTENT ANALYSIS OF CLIMATE ACTION PLANS FOR US CITIES

Abstract ID: 1785

Individual Paper Submission

BYAHUT, Sweta [Auburn University] szb0054@auburn.edu, presenting author

MITRA, Chandana [Auburn University] czm0033@auburn.edu, primary author

ATASOY, Murat [Auburn University] mza0055@auburn.edu, co-author

DEBBAGE, Neil [University of Texas at San Antonio] neil.debbage@utsa.edu, co-author

Climate change leads to havoc and extreme weather events such as storms, floods, heat waves, drought, and wildfire by influencing the variances in the intensity, duration, frequency and spatial extent of these events worldwide (IPCC 2012). As major consequences of climate change, extreme events and disasters are contingent on vulnerability components such as geographic, physical and social conditions. In attempts to adapt a transforming environment and protect society from disastrous results of climate change effects, planning is one of the fundamental strategies for sustainable development, policy making and implications. US cities are addressing climate challenges at the local and regional scales by implementing Climate Action Plans (CAPs), a planning framework that gained a momentum in the mid-1990s (Wheeler 2008). Several states are also implementing CAPs with mitigation and adaptation strategies to inform decision makers (Tang et al. 2013).

Several researchers have assessed Climate Action Plans across the US in recent years to determine their effectiveness and focus by applying a variety of tools. Millard Ball (2012) examined 478 Californian cities in 2008 to determine their environmental performance on a range of measures. Bassett and Shandas (2010) conducted interviews and examined 20 municipal CAPs of varied sizes and location and found that while some plans are used as motivational

tools, others are comprehensive plans with specific targets and objectives, and informed strategies. Boswell et al. (2010) applied content analysis to examine 30 CAPs in the US cities on 70 parameters of embodied emissions and operational energy use. They found that while GHG estimations were generally correct, their mitigation goals fell short of international targets, and plans did not connect mitigation actions to reduction targets. Deetjen et al. (2018) examined CAPs of 29 US cities and identified building quality, parking restrictions, and dense development as key strategies. They found that parking policy and compact development strategies are generally left from climate plans even though they are required to support transit, denser building form, improve walkability, and key strategies for reducing emissions. Stone et al. (2012) evaluated continuous climatic data for 50 most populous cities in the US and find that municipal and state CAPs do not provide adequate protection against heat.

In this research we aim to assess the current state of climate planning and carry out textual content analysis of Climate Action Plans (CAPs) for 216 cities in the United States. Based on the population size, these cities are organized into small, medium, and large cities/metro regions. CAPs have also been stratified by time and climate regions. The plans are evaluated for their emphasis on short term and long-term goals, disaster preparedness and resiliency goals, and well as broader adaptation measures. Some of the research questions investigated are: What emphasis of climate plans is on greenhouse gas mitigation, urban heat, and flooding threats? How do plans differ spatially (regions of US), temporally (older versus newer plans), and across city size? How do climate plans address health, economic, and environmental benefits?

These research questions are explored using word histogram/word cloud. Preliminary assessments show that there is a greater emphasis on reducing emissions, which is unsurprising as greenhouse gases (accounting and reduction) are considered the cornerstone of climate planning. Many small medium cities do not engage sufficiently in climate planning, and there are missed opportunities for cities to be resilient towards heat and flood risks. This analysis explores the breadth and spread of climate action planning in the US cities and provides key takeaways for planners and policymakers.

FLOODING AND THE PLIGHT OF FARMING IN THE MISSISSIPPI DELTA: STORIES OF BLACK FARMERS

Abstract ID: 1795

Individual Paper Submission

HERBERT, Berniece [Jackson State University] berneece.herbert@jsums.edu, presenting author

THOMAS, Talya [Jackson State University] talya.d.thomas@jsums.edu, co-author

Changnon (1998) describes the titanic struggle between the people of the Mississippi River basin and flooding for the past 150 years. In recent years, however, floods have become more frequent and unpredictable due to climate change, resulting in billions of dollars in losses for farmers, causing long-term damage to farmland, reducing farming longevity and profitability.

The plight is a double edged sword for small, rural Black farmers according to McGinnis (2019). Floods often delay planting efforts and farmers are forced to wait until the soil is dry enough to plant. However, deferred planting can often result in the crops producing less yield. In the spring of 2019 much of the Mississippi Delta was flooded. A perfect storm of conditions led to severe flooding across the region. At its peak, water spread across 550,000 acres, inundating homes, businesses, and farmland across five counties. This particularly impacted Black farm families who have, historically, had to contend with many adversities including limited access to credit, exorbitant interest rates, restricted economic, and social mobility due to scarcity of opportunities for advancement, and unequal distributions of government subsidies. Year 2020 brought even more flooding, and coupled with the pressures of the pandemic, has

intensified the needs of these disadvantaged farmers.

The purpose of this research is to investigate and highlight the plight of flooding in the Black farming community in the Mississippi Delta utilizing content analysis of online newspaper articles and narrative storytelling. The research also seeks to understand the perceptions of the potential risk that the climate crisis has on the Mississippi Delta and its inhabitants. This significance of this research is highlighted in a New York Times article by Tabuchi and Popovich (2021) who contend that two of the Biden administration's biggest priorities - addressing racial inequality and fighting climate change - are converging in the lives of black farmers. Given the magnitude of human health and economic risks that severe flood events pose to this region, it is essential to understand farmers' perspectives to identify key gaps and priorities regarding flood risk reduction and climate adaptation in the Mississippi delta.

NAVIGATING THE DEFINITION OF URBAN FLOODING: A CONCEPTUAL AND SYSTEMATIC REVIEW OF THE LITERATURE

Abstract ID: 1810

Individual Paper Submission

ALVES, Priscila [University of Maryland] pbralves@umd.edu, presenting author

Flood risk cases continue to occur worldwide, particularly in urban areas. However, while flooding impacts appear to be known, the definition of what constitutes urban flooding and how it separates from more traditional flooding, is still nebulous in the literature. The fact is there are many different definitions of urban flooding, especially between natural (e.g. ecologists), physical (e.g. engineers), and social scientists (e.g. urban planners). In order to draw a definition of urban flooding that incorporates current views on flood risk and the role of the built environment, the main objective of this paper is to conduct a systematic literature review on the relevant studies on flooding, however not restricted to a specific field of science. The literature review was developed in two main phases covering the (i) articles' screening, (ii) articles' selection. Phase 1 refers to screening articles in Web of Science database with twelve search pairings, structured to contain one element of "flooding" with a "flooding term". Flooding terms included "interior", "inland", "pluvial", and "urban flooding", which yielded 574 articles. In phase 2, with the aim of providing an overview of how urban flooding was defined in the literature, these articles were analyzed by answering (i) if flooding was discussed in the context of human settlements, (ii) if there is a definition of urban flooding, (iii) if rainfall events are examined in the article, (iv) if stormwater infrastructure is considered, and (v) if the article provides an original definition of flood risk. After screening articles, 40 articles were selected for this literature review. Findings shows that definitions for urban flooding rarely are explicit. In fact, almost 60% of the papers base their discussion on the causes of urban flooding without providing an explicit definition (n = 23). Instead of defining Urban Flooding itself, authors present urban flooding as a series of possible flood risks that have their own – though possibly overlapping – engineering solutions. Other definitions look at the causes or amplifying factors of urban flood events; in some cases, vaguely defined as "urbanization". In addition, results indicated that only a few authors define what is "urban" compared to what is not "urban". More complex definitions explicitly describe impervious surfaces and stormwater infrastructure as the human elements of flooding. This article concludes by providing an inclusive and comprehensive definition of urban flooding as a function or dysfunction of three general components: the source of the water, the amount of impervious surface in the area in question by way of urban transformations, and what human or natural (possibly human augmented) drainage systems exist to distribute the water in the built environment.

PATHWAYS TO ADAPTATION: THE RATIONALITY OF “THINK GLOBAL, ACT LOCAL”: A CASE STUDY OF SZÉKELY-HUNGARIAN CULTURAL LANDSCAPES

Abstract ID: 1822

Individual Paper Submission

PAP, Gitta Margit [Texas A&M University] gittapap@tamu.edu, presenting author
 ROGERS, George [Texas A&M University] rogers@arch.tamu.edu, co-author
 JOURDAN, Dawn [University of Maryland] djourdan@umd.edu, co-author
 MOWRER, Jake [Texas A&M University] jake.mowrer@ag.tamu.edu, co-author

This qualitative case study used an interpretive-social constructivist approach to study Székely-Hungarian villages and their cultural landscapes in Romania. The convergent interview method (Dick 2017) was used to understand landowner’s decision-making processes and their “think global, act local” responses as they influence community, village, and landscape. Local level adaptation processes to global challenges such as climate change and natural resource depletion is unfolding in “real time and space” within this ethnoregional context. A local level articulated rationality was captured through the adaptation strategies of six emerging key types of personalities of the “intellectual peasants,” “heirloomers,” “locally rooted farmers,” “necessity farmers,” “hoarders,” and “floaters.” Each of these personalities is attributed with key human developmental characteristics that are perceived to influence the Székely ethnic village and cultural landscapes with ramifications for local and global sustainability goals. A local adaptation mechanism to rural, social, environmental, institutional, and demographic changes is discussed. Further, we elaborate our findings through the lens of personal (individual) resilience. Personal resilience, after Liebenberg and her colleagues (2017), Masten (2016), and Taormina (2015) defined as the pathway of positive adaptation where individuals have the capacity to:

- (1) to function and cope with chronic stressful situations,
- (2) transform sources from the environment (social, economic, personal etc.) into resources, and
- (3) make sense of events during change times.

The findings of this study complement the predominantly spatial and ecological body of work that has been carried out at larger scales to date. Furthermore, the study highlights the importance of focusing on local-scale dynamics and individual resilience for future cultural landscape adaptation and community resilience studies.

THE ROLE OF WASTE SEGREGATION IN SUSTAINABLE URBAN AGRICULTURE AND CLIMATE RESILIENCE IN CITIES OF THE GLOBAL SOUTH

Abstract ID: 1824

Individual Paper Submission

OSHINUSI, Omobolanle [University of Toronto] o.oshinusi@mail.utoronto.ca, presenting author

Solid waste management (SWM) is a universal matter that affects every individual, no matter their social or economic demographic status. Cities of the Global South like Lagos, Nigeria are disproportionately affected, where weak infrastructure, high population densities, and lack of safe solid waste collection, removal and disposal systems correlate with harmful environmental pollution and inadequate public health measures. Urban planners need to implement well-constructed and efficient SWM systems, which aid in reducing the environmental, economic, social and health burdens associated with the overproduction of waste and its impact on a city's resiliency to climate change. An estimated 2.6 billion tonnes of carbon dioxide will be emitted by 2050 from dumped waste sources and open burning sites globally. In particular, food and organic waste causes 8 - 10% of methane emissions responsible for current global warming levels. Urban agriculture has been considered an effective solution to bolster food security in these communities by harnessing organic waste for compost production, allowing for improved access to more nutritious foods for the urban poor, who are some of the most vulnerable populations to climate change impacts.

By asking the research question: What is the political and socioeconomic feasibility of implementing a household organic waste segregation initiative in support of sustainable urban farming in Lagos, Nigeria? this study will focus on the political and social implications of planning an urban farming initiative as a green infrastructure strategy that harnesses food and organic waste from households as a way to reduce overall solid waste production and improve food security in municipal districts of Lagos. By interviewing local policymakers, urban farmers and primary homeowners, we will study their willingness with integrating waste segregation programs at the household consumer level. Looking at the interplays between waste overproduction and its impact on food security and climate change, a further assessment will be conducted to study how this system can contribute to improving overall climate resiliency in cities like Lagos. Anticipated outcomes will include the varying viewpoints of these targeted populations in determining whether they deem waste segregation practices to be beneficial in improving their overall access to locally produced foods, whilst diverting the amount of waste sent to local dump sites.

THE ASSIMILATION OF SEA-LEVEL SCIENCE BY DECISION MAKERS: PLANNING AND DESIGN IMPLICATIONS

Abstract ID: 1831

Individual Paper Submission

HIRSCHFELD, Daniella [Utah State University] daniella.hirschfeld@usu.edu, presenting author

BEHAR, David [San Francisco Public Utilities Commission] dbehar@sfgwater.org, co-author

Theoretical Context and Questions

Successful coastal adaptation requires robust science-policy integration and a well-designed climate services system, both built on ensuring the usability of scientific information (Findlater et al., 2021; Lemos et al., 2012). Building and designing these systems, requires an understanding of the decisions to be made and how they relate to sea-level rise

science including its large uncertainties. With a few exceptions (McEvoy et al., 2021; Tol et al., 2008), however, there has been little comparative studies of adaptation practice in coastal areas and especially the sea-level scenarios used by decision makers to inform the science-policy interface. Filling this critical gap will inform the future development sea-level rise science, associated translation efforts including treatment of uncertainty, and uptake in the decision environment.

In this context our research explores two broad questions. First, what is the current state of practice when it comes to acquiring sea-level rise projections for use in planning? Second, we explore the question, what capacities would enable planners to better integrate sea-level rise projections into decision-making frameworks and adaptation action?

Approach & Methods

We use a mixed methods approach to gain insights for planners and climate service providers globally. First, a 22-member international author team produced a questionnaire designed for coastal managers to help us understand publicly available information about places and their selection of sea level rise projections for use in planning. The questionnaire was conducted online by through Qualtrics and was available in 8 languages. Second, two parallel practitioner-led workshops – one each in the eastern and western hemispheres – engaged practitioners from 29 countries and every inhabited continent to understand the state of sea level rise adaptation with a focus on science translation and adoption, planning and implementation of adaptation, and communicating with key stakeholders.

Preliminary Findings and Contributions

Here we synthesize responses of 254 coastal decision-makers from 49 countries to a global questionnaire about the use of sea-level projections for adaptation. Practice varies greatly globally with 98% of respondents working to use sea-level rise in their decision making. However, of those who did formally adopt sea-level rise projections, 53% are planning for only a single estimate in 2100 despite the scientific consensus that a broad range of sea level rise is possible by end of century. In contrast, places with long histories of adaptation and consistent national support show signs of sounder assimilation of sea-level rise into local decisions. These more advanced locations and practices provide critical insights into the design of improved guidance materials and climate services.

MISSED OPPORTUNITIES FOR RESILIENT (DE)GROWTH: EVIDENCE FROM POST-DISASTER MIGRATION

Abstract ID: 1833

Individual Paper Submission

SCHWALLER, Nora [University of North Carolina, Chapel Hill] nschwall@live.unc.edu, presenting author

Anthropogenic climate change introduces a number of stressors that undermine the viability of communities across the United States representing millions of individuals. Considering that our global community is failing to reduce greenhouse gas emissions, and the time to make the adjustments necessary to avert catastrophic impacts of climate change is running out, we must consider strategies for living with and adapting to a more hostile world. This includes retreat from high-risk areas to increase broader resilience.

Unfortunately, current government funded initiatives for managed retreat are insufficient and are primarily reactive rather than anticipatory. This heightens the importance of finding interventions to increase resilience that work within established patterns of habitation and movement. To that end, this paper analyzes the impact of disaster exposure and vulnerability on migration systems to demonstrate that we are replicating rather than reducing vulnerability.

For this analysis, I leverage a novel, individual-level database acquired from the credit agency TransUnion, which has

comprehensive coverage of eastern North Carolina. I track the address changes of over 500,000 individuals who moved in the aftermath of Hurricanes Matthew (2016) and Florence (2018). The results show that roughly 10% of individuals living within floodplains in this area moved within two-years of the aftermath of both storms, and that more than 80% of those individuals moved out of the floodplain over the same period. However, I also show that the majority of these movers were replaced by new in-migration to the floodplains, creating a condition where individuals may increase their resilience, but the overall community-level vulnerability remains constant.

These findings are discussed as a missed opportunity in the context of existing legislation and related hazard mitigation plans, which rarely include provisions to support de-growth. Implications for reducing replacement migration, and the effect that could have on the housing market are considered and presented. Finally, I suggest policy interventions that could support long-term de-growth by capitalizing on pre-existing migration systems.

NATURE-BASED SOLUTIONS AS AN EFFECTIVE COLLABORATIVE PLANNING MECHANISM FOR COASTAL RESILIENCE IN THE UNITED STATES

Abstract ID: 1836

Individual Paper Submission

LAHAV, Sean [Florida State University] slahav21@gmail.com, presenting author

When examining coastal adaptation planning efforts that have taken place across the U.S. in recent years, a solution that has been vetted and implemented by policymakers, coastal engineers, and resilience planners is the ecological framework of "Nature-Based Solutions", also referred to as "NBS" and/or "Green Infrastructure." In addressing local community challenges related to coastal flooding, storm surge, and the long-range threat of sea level rise, NBS presents an innovative approach to flood hazard mitigation that relies on natural features (i.e., living shorelines and oyster reefs) for protection instead of more traditional approaches to flood mitigation (i.e., sea walls and levees). While NBS as a policy mechanism is heavily influenced by technical and rational approaches to planning, its utility in Federal program design and implementation is often operationalized through collaborative governance/planning methods and guidance. In evaluating the evolution of NBS at the Federal level in the U.S., the goal of this paper is to demonstrate how a collaborative approach to planning has been successfully integrated across a wide array of national programs over the past several decades. To accomplish this goal, Federal NBS programs are compared against collaborative planning theory (CPT) which represents a successful model of collaborative governance. CPT maintains that a successful approach to collaborative governance relies on: multiple ways of knowing and learning; an orientation toward inclusion of a diversity of voices and perspectives; and fostering shared understanding. Through an evaluation of Federal programs administered by FEMA, NOAA, and USACE, this paper argues that these programs demonstrate how a collaborative approach to planning/governance has been successfully integrated into mainstream policy arenas. When comparing these programs against collaborative planning theory as a model for collaborative governance, what becomes evident is that each of these programs hold collaborative planning values at a high level of importance. This paper maintains that guidance published for each of these programs emphasizes: local wisdom and knowledge; a concern for multiple ways of knowing; an orientation toward inclusion of a diversity of voices and perspectives; and sharing of stories to bolster, maximize, and learn from successes. In terms of future directions to expand on this research, next steps will include to determine whether the intended orientation to collaboration in these programs actually materializes in specific case studies of funded projects. The question that remains relates to whether Federal NBS guidance actually results in more inclusive, equitable, and collaborative outcomes across different scales, geographies, and coastal environments.

RACE AND COASTAL PLANNING FOR CLIMATE CHANGE AT THE END OF THE WORLD

Abstract ID: 1848

Individual Paper Submission

IVESTER, Sukari [Tulane University] sukari@tulane.edu, presenting author

Plaquemines Parish has often been referred to as 'the end of the world'. It is Louisiana’s southernmost parish (county), where the Mississippi River meets the Gulf of Mexico. The parish produces millions of pounds of shrimp, oysters, crabs, and fish each year and is a hub for the offshore oil and gas industry. The Parish is also on the front lines of climate change and land loss, with current estimates stating that the Parish may lose 55% of its land area over the next 50 years. This paper focuses on the intersection of race, marginality and coastal planning in Plaquemines Parish, LA, and the politics of resistance and citizenship.

A place with a rich historical tapestry, the Parish has suffered from the impacts of decades of environmental racism and makes for a powerful case study of coastal planning. Many of the communities that live on the exposed bayous and marshes at the frontlines of the land loss crisis in Plaquemines are descendants of enslaved laborers from Africa along with free people of color, indigenous groups dispossessed from their land, and other migrant groups (e.g., Vietnamese and Croatian) that have come together in the bayous over the past three centuries of colonial settlement.

The coupling of science and technology is directly tied to the exploitation of both land and labor on this “working coast” along the lower Mississippi River and has co-constituted deep social inequalities in the Parish – from the extraction of natural resources and the simultaneous carving of industrial canals into the waterscape over decades in the 20th century. This erosion of the waterscape for energy extraction is widely implicated in the destructive force of Hurricane Katrina in 2005. In the aftermath of Katrina, the U.S. Army Corps of Engineers began immediately repairing and upgrading the Hurricane Storm Damage Risk Reduction System (HSDRRS). While the new system was upgraded to protect the larger New Orleans Metropolitan area, much of Plaquemines Parish is outside “the wall”.

It is in the context of this social geohistory, using a qualitative case study (which includes in-depth interviews and participant observation), that this paper considers the planned Mid-Barataria Sediment Diversion (slated to begin in fall 2022) in Plaquemines parish to explore the relationship between coastal planning and marginality- past and present. At \$8 billion, one of the most expensive, ambitious, and controversial proposals in Louisiana’s 50-year, \$50 billion attempt to save the southern third of the state from disappearing into the Gulf of Mexico. However, the project is controversial among fishers who rely on shrimp, oysters, and finfish that are now harvested in the existing mix of fresh to salt water. They contend that freshening the basin with river water will destroy their livelihoods and dilute region’s rich culture and are mobilizing for resistance.

This research builds on work in environmental planning and geography that examines the coastal environment as a means through which regional, racial formations are forged, particularly for African American communities in the U.S. coastal south. This work engages with emerging literature about how coastal science often reproduces racial inequalities in climate changed environments. This work is also situated within scholarship interested in political geographies of race and critical analyses of racism and science. In the end, it is the same vulnerable and marginalized communities that have so long suffered as a result of racial and environmental injustice that stand to lose the most if the social costs of coastal planning in Louisiana are not sufficiently considered- as has historically been the case. In planning for land and population loss in Plaquemines, it is critical not to repeat the past mistakes.

CUMULATIVE IMPACT OF REPEATED WILDFIRE DISPLACEMENT EVENTS ON MIGRATION IN THE WESTERN UNITED STATES

Abstract ID: 1857

Individual Paper Submission

CARPEN, Bo [UMass Amherst] bcarpen@umass.edu, presenting author

Climate migration has been identified as an urgent issue that will likely add greater complexity to existing climate change planning efforts (Black, 2011; Ahsan, 2011). While findings indicate that climate change is impacting migration on both global and local scales, existing climate migration literature has primarily focused on international migration and the Global South, offering limited applicability to internal conditions in developed countries due to the issue's high context dependency (Hoffman, 2020). Local and municipal planners have a responsibility to pursue evidence-based climate adaptation strategies (Mitchell, 2020). Yet, planners lack reliable data to forecast potential changes to regional migration based on repeated exposure to climate stressors. Overwhelmingly, research has been qualitative in nature, leaving a need for quantitative, spatial studies to detect larger patterns in comparison to survey and interview-based findings (Piguet, 2018). Within developed countries, research that integrates environmental factors into typical migration estimation methods used by community development and economic planners is needed to determine the extent that rapid environment change may alter existing migration trends. This paper contributes to the literature on internal climate migration in developed countries by comparing the cumulative impact of repeated sudden onset climate stressors (i.e., natural disasters) on migration patterns within western US counties during the years 2017 - 2019. Wildfire displacement data from the Internal Displacement Monitoring Centre (IDMC) is compared to annual county-to-county migration estimates provided by the US Internal Revenue Service Statistics of Income Program (SOI) to identify the effects of repeated wildfire displacement events on in-migration, out-migration, and destination choice. The results of this work demonstrate how repeated climate-aggravated natural disasters may alter typical regional migration destination patterns. The study also presents initial findings on socioeconomic characteristics of climate migrants, which could support future research questions on the equity dimensions of interregional climate migration within the US.

NEGOTIATING THE ENVIRONMENTAL STATE IN AND FOR URBAN CLIMATE EXPERIMENTS

Abstract ID: 1873

Individual Paper Submission

LI, Yunjing [The University of Hong Kong] yjli2510@hku.hk, presenting author

In the post-Kyoto years, increasing expectations and hope have been placed on cities as promising solutions to the global crisis of climate change. Nevertheless, a significant gap has been constantly observed between the high promise and disappointing reality, raising the question of how this gap comes about and why urban-scale climate experiments succeed in some places and fail in others. While many hindering factors are found to have much to do with a city's 'embeddedness' in broader political and institutional contexts, the role played by the nation state's environmental functioning, or the "environmental state" (Duit et al., 2016), has remained ambiguous. Its strategic role has been highlighted recently as different national governments leverage the climate agenda to steer both domestic and foreign policymaking in the post-pandemic era. It would not be possible to capture the full range of dynamics of urban climate experimentation and make sense of the prevalent promise-reality gap without a careful and critical evaluation of the nation-state-related factors.

This study is concerned with the dynamics of urban climate experiments within an emerging decarbonization-focused environmental state. It raises two research questions. First, how is the national agenda for carbon reduction articulated on the ground? Second, how does the articulation process affect the consequences of urban climate experiments? To answer these questions, a two-level analysis was conducted using China as a case, including (1) an analysis of 341 legal cases nation-wide to identify the pattern of articulations and contestations of the decarbonization agenda at local levels and (2) a detailed comparative case study of low-carbon city initiatives in two neighboring cities of Shenzhen and Huizhou in the Pearl River Delta region to illuminate how this pattern unfolded in and shaped specific climate experiments.

An interesting legitimacy space has been found with the emergence of a decarbonization-centered environmental state. This space is manipulated locally, driven by four rationales, namely carbon re-regulation, carbon formalization, carbon rationalization, and carbon exceptionalism. Despite similar combinations of these rationales, the two studied cases exhibited divergent outcomes partly due to their respective responses and strategies of negotiating different expectations, articulations, and exploitations of the 'low-carbon' framework. Specifically, effective orchestration of different rationales, which was achieved by a multiplicity of intermediary organizations (e.g., research institutions, industrial associations, NGOs) with established relationships with the local government, facilitated the implementation of Shenzhen's experiment.

This research sheds new light on the persistent gap between the high promise and disappointing reality of urban climate governance by introducing the environmental state as an analytical concept. The distinctive mechanism through which the national priority for carbon reduction shapes urban climate initiatives from below and inside with local actors' contestations highlights the dialectic rather than dichotomist relationship between the endogenous and exogenous factors for urban climate action. As climate experiments become platforms where scalar relations embedded in socio-ecological systems are mediated, negotiated, reconfigured, and transformed via the rhetoric as well as the materiality of carbon (Swyngedouw & Heynen, 2003), the role of planners as intermediaries between different scales and actors becomes crucial for delivering effective urban climate planning. Furthermore, this research engages with the ongoing debate over the nature of low-carbon urbanism (While et al., 2010; Long & Rice, 2019). The identified legitimacy space points to a strange combination of 'carbon' as quantifiable and territorially accountable material, on the one hand, and conceptual and discursive symbol, on the other. This point is of particular significance considering China's authoritarian style of climate governance (Lo, 2015), which theoretically minimizes the space for contestation at local levels. Through an 'extreme case,' the study demonstrates the contested nature of low-carbon urbanism, calling for more attention to the deliberative processes involved.

SPATIOTEMPORAL CHANGES OF URBAN HEAT ISLAND INTENSITY IN WINTER CITIES: A CASE OF EDMONTON, CANADA

Abstract ID: 1877

WELEGEDARA, Nilusha [University of Alberta] yalingas@ualberta.ca, presenting author
AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, co-author
LOTFI, Ghazal [University of Alberta] lotfi@ualberta.ca, co-author

Urban heat exposures have considerably increased around the world over the past few decades (Tuholske et al., 2021). A number of factors at the neighbourhood scale such as land cover, spatial composition, and socio-economic status could influence urban heat exposure variations across a city leading to inequality of heat exposure. This study explores the spatiotemporal (seasonal and decadal) variations in urban heat islands (UHIs) and factors affecting UHI at the neighborhood scale in the City of Edmonton in Canada, North America's northernmost city of close to a million people, situated at about the 54th parallel. Among large Canadian census metropolitan areas, the built-up area in Edmonton increased multiple folds during the 1971-2011 period (Agrawal, 2016). Our assumption was that this increased built-up contributed to the UHI effect of the city as the built surfaces tend to absorb and store a large quantity of solar radiation (Fischer et. al., 2012).

We used Landsat satellite images from 1999 to 2021 acquired during the winter, spring, summer, and fall seasons to generate UHI maps and land use maps. Census and transportation data were used to determine the relationship between UHI and physical, and socio-economic factors across the NBHDs whereas Particulate Matter (PM_{2.5}) data were used to find out the relationship between UHI and air quality.

Our results show a significant UHI increase within residential neighbourhoods, particularly in newly master-planned neighbourhoods in the last decade or so. We also noticed that surface temperature in some industrial and residential neighborhoods increased by 2-6°C in winter, 2-6°C in spring, 6-12°C in summer, and 1-3°C in fall seasons compared to the surrounding rural areas. The temperature increases in these neighborhoods were strongly linked with the reduced vegetation cover and increased built-up areas. Apart from that, population density, houses and road network, and the average daily traffic volume of neighborhoods showed a significant positive relationship, whereas area covered by water bodies and neighbourhood area exhibited a significant negative relationship with the UHI of neighbourhoods. Neighbourhoods with higher median income and education showed a negative relationship with neighborhood UHI values. Neighbourhoods with a higher dependency ratio and lone-parent households showed a positive relationship with the UHI. Even though there is no significant relationship with UHI when PM_{2.5} is less than 10 µg m⁻³, a strong positive relationship was observed when PM_{2.5} is increased greater than 35.5 µg m⁻³, which is an unhealthy level for sensitive groups (EPA, 2022). These results demonstrate that high-latitude winter cities exhibit significantly amplified UHIs, especially in the summer, spring, and winter months. The outcome of this study will help municipal planners and policy-makers to develop heat mitigation and adaptation strategies for existing neighborhoods in parallel winter city designs. It will also inform the planning and design of new and existing neighbourhoods, so they elicit minimum UHI effects.

GOVERNANCE FOR SYSTEM RESILIENCE: CONTRIBUTIONS OF INFRASTRUCTURE SYSTEM METHODS TO COLLABORATIVE RESOURCE MANAGEMENT THEORY AND PRACTICE

Abstract ID: 1894

Individual Paper Submission

PINEL, Sandra [US Cybersecurity & Infrastructure Security Agency] sleepinel@gmail.com, presenting author
WOOLUMS, Chandra [ABSG Consulting, Inc.] chandra.woolums@associates.cisa.dhs.gov, co-author
WORMSER, Julie [Mystic River Watershed Association] julie.wormser@mysticriver.org, co-author

Multi-disciplinary social and ecological systems and environmental planning literature investigates the potential of collaborative resource management for building adaptive capacity while largely neglecting the role of infrastructure systems in supporting community resilience. The fields of engineering and business studies separately address the vulnerabilities and business continuity of energy, communications, and other infrastructure sectors and systems

without sufficient attention to communities and governance. In a changing threat landscape, we need integrated concepts and methods that support the development of inclusive institutions that convene owners, operators, communities, and decision-makers. How can infrastructure dependency assessment methods be used to build more resilient governance?

With its responsibility for leading the national critical infrastructure security and resilience partnership, the US Cybersecurity and Infrastructure Security Agency (CISA in the US Department of Homeland Security) developed, released, and piloted the Infrastructure Resilience Planning Framework infrastructure system dependency assessment methods that can be used to engage the public and private sectors in characterizing the system and reducing cascading consequences of disruptions. The paper examines three case-study applications of the infrastructure resilience methodology: 1) a Kentucky multi-hazard and regional mitigation plan application; 2) an economic and national defense port assessment; and 3) a watershed collaborative scenario exercise and projects to reduce the vulnerability of major Boston infrastructure facilities and communities of workers to future storm surge and sea level rise. Initial case-study findings support the importance of regional planning and suggest that infrastructure dependency assessment methods can support collaborative resource management and regional planning and governance practices among public, private, and non-governmental actors. The last case provides an example of integrating social vulnerability assessment with infrastructure planning and prioritization. The paper will conclude by outlining some of the challenges for the use of these methods by tribal governments, future case studies, and the questions for evaluation in 2023 by academic partners through an agreement with the Department of Homeland Security Centers of Excellence.

If the profession and academy are to contribute to resilience and adaptive capacity, planning scholars and practitioners need to know more about infrastructure operations and how to use dependency analysis to manage cascading consequences of disruptions across communities and scales.

PUBLIC PERCEPTIONS OF ENERGY PLANNING: EXAMINING KNOWLEDGE AND EXPERIENCE WITH PUBLIC, PRIVATE, AND COOPERATIVELY OWNED ELECTRIC UTILITY SERVICE PROVIDERS IN THE US

Abstract ID: 1899

Individual Paper Submission

CAGGIANO, Holly [Princeton University] holly.caggiano@princeton.edu, presenting author
CONSTANTINO, Sara [Northeastern University] sara.constantino@gmail.com, co-author
NEMETH, Jessica [Northeastern University] nemeth.j@northeastern.edu, co-author

As the visible faces of energy production for most US consumers, utility service providers will play a variety of important roles in a nation-wide net-zero energy transition (Frei et al., 2018). Little research currently explores public perceptions of energy utility providers, including knowledge of energy sources, trust in rates and service, and perceptions of political power. Across the country, groups have issued calls for public takeover of currently private utilities, most notably in New York (Public Power NY) and California. These groups cite concerns about private companies prioritizing profit over system maintenance, climate threats, and consumer safety. Many of these calls for municipalization or community ownership center environmental justice concerns (Bozuwa et al., 2021). Further, case study research suggests that utility ownership plays a key role in transitions to 100% renewable electricity, with many municipality-owned utilities making the transition (Adesanya et al., 2020).

To investigate consumer perceptions of electric utilities, we draw from a cross-sectional non-probability sample of US residents (n=4000) collected using the Qualtrics survey platform. We developed survey questions to measure a wide range of knowledge and perceptions about electric utilities, including knowledge about current service providers,

satisfaction with and trust in providers, perceptions of priorities, political power, and equity. Initial results show that almost a quarter of respondents do not know the ownership structure of the provider that services their home (privately owned by a company, publicly owned by a government entity, or cooperatively owned by consumers). Most respondents (63%) report that they are generally satisfied with their utility or feel neutral (23%), and 51% of respondents trust their utility to act in their best interests. Further, 30% of respondents feel their utility holds too much political power. Additional analysis will examine sociodemographic and psychological predictors of preferences for ownership structures and differences in perceptions across ownership structures.

The ownership structures of utilities have wide ranging implications for planning practice to push forward an equitable renewable energy transition. Understanding public perceptions and experiences with electric utility providers can help inform efforts to reorient planning and policy structures to enable rapid decarbonization. Understanding consumer perceptions of local utilities can also inform efforts to communicate with households about energy efficiency and conservation programs, particularly as widespread adoption of home decarbonization technology is necessary for a net-zero transition. Utilities are often the main communicators of these programs directly to consumers, suggesting strategies to reduce consumption, establishing social norms through feedback programs, and offering free or discounted technology upgrades (like smart thermostats). As research shows that trust in the source of information influences the effectiveness of messaging, specifically around technology adoption, understanding consumer perceptions of their utilities can support efforts toward building community support for a renewable energy transition (Yoeli et al., 2017). Developing a comprehensive understanding of public perceptions of energy planning institutions is necessary to envision and build new models of public engagement and ownership structures that prioritize equitable energy access.

ESTIMATING THE EFFECTS OF CLIMATE CHANGE ON THE SEASONAL TOURISM INDUSTRY - THE CASE IN SOUTH KOREA

Abstract ID: 1934

Individual Paper Submission

BAEK, SeungJoo [Seoul National University] s_joo94@snu.ac.kr, presenting author

YOON, Heeyun [Seoul national university] hyoon@snu.ac.kr, co-author

Since 1975, global temperature has increased by 0.15 to 0.20°C on average per decade (Nasa earth observatory, n.d.). Climate change has become a serious issue, exerting multi-faceted and mostly negative influences on daily life, such as food insecurity, increasing the frequency of natural disasters, and disruptions in outdoor exercise. In particular, climate change significantly influences the tourism industry, because weather condition is one of the important factors that people consider in taking outdoor activities. Global warming substantially damages the winter tourism industries, such as skiing or snowboarding, because the days of snow and ice has been shortened, and extra cooling facilities were required to keep the good condition for the sports activities. This results in higher maintenance costs and shorter operating period, hence the reduced profit (Hewer & Gough, 2018; Damm et al., 2017).

The average annual temperature in Korea was 12.2°C during the 1980s and increased to 13.0°C in the 2010s, or by 0.20 – 0.40°C per decade. As a result, summer in the last twenty years (2001 – 2020) has got twenty days longer—from 113 days to 123 days, compared with twenty years ago (1981 – 2000). Meanwhile, winter has gotten six days shorter, from 96 to 90 days in the same period (Korea Meteorological Administration, 2020). Longer summers and shorter winters increase the vulnerability of tourism industries that consist primarily of outdoor activities (Kim et al., 2017). Despite the magnitude of the issue, we still lack quantitative research that examines the effects of climate

change on the tourism industries. Many researchers utilizing natural environmental conditions (sea level, elevation, and slope) as well as weather conditions (temperature, precipitation, and wind speed) to clarify the significant negative impacts imposed by climate change on beach tourism. However, although various factors affect the tourism industry, many studies considered only a limited range of aspects. When evaluating the effects of climate change on the tourism industry, it is necessary to consider the use of the natural environment and weather conditions, as well as location and social characteristics such as nearby commercial facilities, accessibility, and surrounding tourist attractions.

In this backdrop, this study aims to assess the effect of climate change on tourism. We hypothesize that as the global temperature rises, the number of visitors in summer season decreases. The spatial scope of the study is 277 beaches in South Korea, and the temporal scope is summer (July to August), 2007 to 2022. We use the generalized additive model (GAM) to decipher nonlinear relationships between the level of temperature and the number of tourists in summer season, controlling for various compounding effects of macroeconomic and weather conditions. Information on the number of tourists is provided by the Tourism Knowledge & Information System.

As an early empirical study of the effect of climate change on seasonal tourism, the findings of this research will guide local governments in establishing local policies for helping tourism industry.

UNIVERSITIES AS SUSTAINABILITY CHAMPIONS: THE PERFORMANCE OF TOP CANADIAN INSTITUTIONS

Abstract ID: 1951

Individual Paper Submission

MACEDO, Joseli [University of Calgary] joseli.macedo@ucalgary.ca, presenting author

Universities have led the world with new ideas and innovation for centuries; they are places that not only educate students, but also show them values and ways of life. University campuses are microcosms of a more complex city, illustrating the complexities and environmental issues faced by cities, and must therefore be sustainable themselves and act as a living laboratory to experiment and create new solutions. This premise suggests that, if our universities change their operations and management practices to incorporate sustainability principles, our students would be internalizing behaviours that would be valuable in integrating sustainability practices in their professional and personal lives.

Canada's "U15" universities comprise the top research-oriented institutions in the country. Combined, the U15 undertake 80% of all competitive university research in Canada. These universities stand to be leaders not only in research and education, but also in innovation in sustainability, and they have direct and indirect impact on the surrounding environment through development, resource consumption, hazardous waste, and energy usage. A survey of their policies, operations, and practices regarding sustainability reveals their levels of commitment and their leadership as stewards of our environment.

This research analyses Canadian U15 universities' policies and practices and uses sustainability indicators to determine their levels of commitment to implementing sustainable environments. The survey, based on both a quantitative analysis of environmental sustainability outputs and a sustainability assessment model, compares the sustainability levels of the U15 universities with the purpose of ranking them according to their environmental sustainability practices and the institutionalized policies that support these practices. A scoring system uses a point-based scale across several categories. The criteria used for those include green building policies, carbon management plans and reduction targets, greenhouse gas emissions, water usage, waste diversion, and electricity usage. These

criteria were developed to be straightforward, objective, and easily replicable. The methods used include gathering data from each university for each category and calculating per-capita values based on the number of campus users at each university. The results indicate that the type of evaluation method used can make a significant difference in which of the U15 universities are deemed to be most sustainable.

The results also provide a snapshot of how Canada's leading research universities compare to one another on campus environmental sustainability. While most of the universities included in this study track their sustainability performance to some extent, the existing metrics are not very useful for comparing against one another since there is a lack of consistency among them. Consistency between universities is lacking regarding the time that baselines were established, and the specific metrics used to track changes. The method and scoring system used in this project can be easily and broadly applied to other universities; however, the results may not be consistent, unless there is uniformity of data collected and used. Ultimately, a longitudinal study using metrics based on the criteria established in this study would be most useful in determining what criteria should be used to measure environmental sustainability on university campuses.

This work is relevant to university leaders, campus planners, faculty and students who spend their lives on university campuses, and anyone interested in using university campuses as living labs for practices that could be adopted citywide. University campuses can be part of the solution to climate change and increase the sustainability needs of most of our built environments, making a contribution beyond the education they provide to students. Providing incentives to universities to incorporate certain sustainable practices into their policies and operations is but one way to implement change and start a trend towards greener, healthier, and more energy efficient cities.

COORDINATING COADAPTATION – PLANNING FOR ECOSYSTEM MIGRATIONS WITHIN MANAGED RETREAT IN NEW YORK STATE

Abstract ID: 1961

Individual Paper Submission

ENRIQUEZ, Jared [State University of New York at Albany] jenriquez@albany.edu, presenting author
BOBKO, Tyler [SUNY Albany] tbobko@albany.edu, co-author
VARGHESE, Lijo [SUNY Albany] lmazhuvanchery@albany.edu, co-author

Environmental hazards and the effects of climate change are causing various coastal and shoreline ecosystems to begin to migrate inland. Since most communities are still at the nascent stages of planning for managed retreat - the strategic relocation of structures or abandonment of land to manage natural hazard risk, local governments and stakeholders alike are not yet actively prepared for managing these ecological migrations. The relocation and resettlement of established human communities is an incredibly complicated and contentious process, so planners have largely failed to pair human resettlement with the active relocation of plant and animal populations. Complex regulations and concerns over native species generally make the translocation of many species impractical, so scientists have generally favored the preservation and restoration of landscapes to protect or repopulate aquatic, animal, and plant species.

Nevertheless, assisted colonization—the translocation and establishment of populations of organisms outside their historical range—could prove necessary to facilitate some species' survival. (IUCN, 2013). Managed retreat plans could conscientiously facilitate the migration of species from their shrinking climate refugia to new locations that have the conditions needed for their persistence. (Brodie et al., 2021).

This paper addresses the research question, how are planners in New York State coordinating species migration with hazard mitigation and flood resiliency planning? We assess how local governments and non-profits engage with

property owners to protect and conserve wetland migration corridors and higher ground establishment areas.

The first case study concentrates on New York City and Long Island to demonstrate how sand dune restoration, amended zoning laws, property buyouts and acquisitions, and laws against hard armoring are effectively coordinating ecosystem protection and restoration with residents' flood resiliency. The second case study of the Adirondacks and North Country regions of NY investigates how wildlife corridors, zoning laws to prevent forest fragmentation, and the acquisition and conversion of agricultural lands can rewild landscapes to maximize the inland migration of indicator and keystone species.

The case studies involved over 20 semi-structured interviews with county and local planners, wildlife management professionals, and conservation non-profit leaders. Our findings reveal that local actors aiming to pair species migration planning with communities' hazard mitigation and climate adaptation plans have demonstrated several successes but face several significant challenges. First, most state and federal policies favor in situ place-based mitigation strategies that can deter the landscape design options needed to maximize inland migration. Second, there are many disparities in the state regarding local capacity to demonstrate to residents how inland migration will impact existing and future land uses and development. New York State could encourage the incorporation of scenario planning (Chakraborty et. al. 2011) in hazard mitigation updates to equip capacity-constrained local governments to better demonstrate how inland migration will impact residents.

This study aims to support county and town planners with information that can help them proactively alleviate residential concerns and conflicts regarding species migration, including undesirable impacts like maladaptation or the migration of predators and invasive species.

WILL THE URBAN LAND DEVELOPMENT INTENSITY AFFECT CARBON DIOXIDE EMISSIONS? A CASE STUDY OF FIVE MEGA CITIES IN CHINA.

Abstract ID: 1998

Individual Paper Submission

HU, Jinjing [Chongqing University] joymeteor@live.com, presenting author

On March 5, 2021, the 2021 annual government work report of the State Council pointed out that China should do solid work in carbon peak and carbon neutralization to deal with global warming. With the industrial development and a series of industrial revolutions, cities also produce a large amount of carbon dioxide in the process of development, resulting in the urban heat island effect. Research shows that the scale of urban land use is positively correlated with carbon dioxide emissions to a certain extent, but many studies show that a more compact urban spatial structure can slow down carbon dioxide emissions. Therefore, the impact of urban land use intensity on carbon dioxide has not been specifically disclosed. Also, studies show the proportion of carbon dioxide emitted by mega cities is the highest in the region. Therefore, the relevant research on mega cities will contribute to the overall optimization of carbon emissions in the region. Analyzing the relationship between land urbanization and carbon dioxide emission in mega cities from the perspective of land development intensity can better plan urban land and spatial development and effectively alleviate urban heat island. However, the current research mainly focuses on the macro level, and pays less attention to the land development intensity at the micro level. The research at the medium and micro level will help to point to the formulation of more specific measures. This study will take five representative mega cities in China: Beijing, Shanghai, Chongqing, Wuhan and Guangzhou as the research objects. Using the nuclear density analysis model, this paper analyzes the spatial distribution of land development intensity in mega cities, makes a spatial regression analysis on the distribution of carbon dioxide emissions based on the spatial regression method, explores whether carbon dioxide has spatial heterogeneity in space, and tries to analyze its impact on the spatial distribution of carbon dioxide based on several important indicators of urban land opening intensity. The results show that: (1) the land development intensity of the five cities has the characteristics of aggregation in space, and the average land development intensity of coastal cities is significantly different from that of inland cities. (2)

Carbon dioxide emissions have obvious spatial difference distribution characteristics, and there are significant differences in carbon dioxide emissions in different regions. (3) There is a positive effect between carbon dioxide emission and land development intensity to a certain extent, but it is also found that a compact and reasonable urban land development and utilization model can reduce carbon dioxide emission to a certain extent. This conclusion is helpful to explore the relationship between land development intensity and carbon dioxide emission in mega cities, and provides suggestions for the spatial layout of urban compact development.

A GLOBAL READING OF URBAN RESILIENCY: THE CHANGING ROLES OF THE ECO FRINGES IN MUMBAI, AMSTERDAM, NEW YORK AND TOKYO

Abstract ID: 2010

Individual Paper Submission

YILDIZ, Sevin [University of Illinois Chicago] seviny@uic.edu, presenting author

Transition ecologies, namely ecotones, are where life started. Deltas, estuaries, bayous, and wetlands are places where different ecosystems merge and evolutionary processes take place. This paper explores four coastal cities to look at the relationship between environmental values and urban expansionist paradigms through reclamation projects. It argues that these thresholds, occurring contemporaneously in expanding metropolitan regions, correspond to changing conceptualizations of urban-nature relationships, in other words, urban core's changing relationships to fringe ecosystems. The metropolitan regions used as case studies for this piece are Mumbai, Amsterdam, New York, and Tokyo. Each has used reclamation as a grand expansion strategy during political, or economic transitions. During each grand alteration attempt in these regions, the developers, reclamation enthusiasts or urban planners revisited the city's immediate ecological fringe for expansion and following these revisitation, a new geographical order formed in their subsequent regions. The urban fringe has become the socio-spatial zone where new and experimental ideas about urban development encounter complex natural systems. The exploration of land use negotiations and reclamation's role in shaping the urban-nature relationships are critical gaps in the planning field. Today, any future-looking climate resiliency plan should build on the reading of this transitional palimpsest and understand how these environmental values were traded and how global expansion narratives transformed the urban-nature gradient.

CLIMATE JUSTICESCAPE IN WATER-ENERGY-FOOD NEXUS: A CASE FOR PHOENIX, ARIZONA

Abstract ID: 2018

Individual Paper Submission

CHENG, Chingwen [Arizona State University] Chingwen.Cheng@asu.edu, presenting author
RODRIGUEZ ESCOBAR, Luz [Arizona State University] lrodri88@asu.edu, co-author

Water-Energy-Food (WEF) nexus systems framework has been applied in urban studies, engineering, and environmental science and policies to understand the complexity and dynamics of the three core systems in sustainable development (Albrecht et al. 2018). To understand the social equity and environmental justice of the nexus system under climate change impacts spatially, a Climate Justicescape framework was developed in particularly for assessing climate change-associated risks to vulnerable populations (Cheng 2019). We first conducted a systemic literature review using keywords of water, energy, food, justice, and equity in SCOPUS database and reviewed a hundred peer-reviewed articles to understand how justice and equity concepts are addressed in current WEF literature. Among 106 articles, environmental justice and urban resilience, food security, and governance were identified among the top research topics. In order to plan for uncertainty and enhance community resilience under climatic change, a holistic understanding of the intersections of climate justice and water-energy-food nexus systems is critical. Climate change is associated with increased hot extremes, uncertainty in heavy precipitations, and increased droughts, which has direct implications in energy, water and food security and community impacts in the western United States (IPCC 2021). To what degree do the socially vulnerable groups are exposed to climate change associated hazards and insecurity in the Water-Food-Energy nexus systems of climate justice implications? We use Phoenix, Arizona, as a case study. The zoning segregation practices in Phoenix in the past have contributed to incompatible land uses and environmental justice issues in central city south neighborhood where minority populations reside (Bolin et al. 2005). Phoenix is the fifth largest city and the fastest growing city in the US since 2010 census shown. We identified flood hazards, surface temperature, and proximity to fresh produce as indicators associated with water, energy, and food security associated with climate change impacts and overlay with race, income, and poverty rate in ArcGIS. The findings suggest the largest minority population in the City of Phoenix, the Hispanics (43% in US Census 2020), are among the most vulnerable under WEF Climate Justicescape, which is consistent with systemic injustice patterns in Phoenix area. The study suggests that the progressing climate change impacts will continue and aggravate the systemic vulnerability in cities. It is urged to ensure persistent equity planning is in place to prioritized investment on city's water, energy, and food systems infrastructure development and climate change mitigation and adaptation solutions in climate injustice neighborhoods in order to make justice goals be accountable and achieve sustainable, resilient, and just futures in every city.

PLANNING FOR WASTELANDS: A SOCIO-ECOLOGICAL DESIGN APPROACH IN PARIS' PETITE CEINTURE

Abstract ID: 2019

Individual Paper Submission

FOSTER, Jennifer [York University] jfoster@yorku.ca, presenting author

Post-industrial urban spaces present incredible urban ecological and social opportunities. As industrial operations close or wind down, these spaces are often disregarded or abandoned, with little oversight or management. As they evolve rapidly through successional states, untended post-industrial spaces produce novel ecological systems with rich habitat and dynamic social opportunities. Although they may be considered wastelands, these are unique spaces and outstanding urban assets.

In Paris, France, the Petite Ceinture is a 32-kilometer decommissioned rail line that connects the industrial heritage of the city's former automobile manufacturers, abattoirs, quarries, warehouses and other industrial fabric. The rail line ran for 140 years, but was decommissioned in the wake of economic globalization. The final train ran in 1993, after which the Petite Ceinture was simply sealed off from the public and left to be. It soon became a wildlife corridor connecting two major woodlands on the eastern and western edges of the city, and then evolved into breeding habitat in itself. As patches of herbs and grasses gave way to closed canopy forest, the Petite Ceinture developed structural diversity and astounding biodiversity. With no management regime and human visitation officially prohibited, it soon became a beloved "secret garden" lacing the city's outer arrondissements. Naturalists and adventurers found entry points through the fencing, artists occupied the abandoned stations, and people set up urban homesteads on the

edges of the tracks.

In response to competing visions of how this astounding urban asset should be planned and managed, the City of Paris launched public consultations in 2013 that were organized around a set of provocation questions that could lead to more open-ended and visionary discussions. Consultations included educational events, guided tours, online portal discussions, community-specific workshops, public meetings, and public gatherings with elected officials. The consultative process generated vivid public exchange. Thousands participated, building the foundation of a plan to support the Petite Ceinture as a social and “respiration” space in the city, with emphasis on the potential to learn how to “live together” through the Petite Ceinture. There were points of deep disagreement, such as the level of security necessary for enjoyment of the space and the intensity of access compatible with biodiversity conservation. The City proceeded with a light touch, opting not to develop any portions intensively. Rather, the City decided to simply start opening portions of the Petite Ceinture and welcome people onto the tracks.

The City created access points and basic safety measures, and opted to continue the “hands off” approach that had already generated such a verdant urban landscape. Particular portions have been more carefully landscaped, with a view to habitat enhancement, according to local preferences. But for the most part, the Petite Ceinture remains off limits to human visitors, and the design approach embraces the ideals of terrain vague, with indeterminacy and unregulation as guiding principles.

This presentation presents the Petite Ceinture as a case study in planning for urban wastelands as socio-ecologically important spaces in their own right. The presentation suggests that these spaces hold unique values, and that there is much to be gained by building awareness for novel ecosystems and aesthetic appreciation beyond conventional Western expectations. The presentation is based on archival and field research, as well as site analysis, intensive interviews and analysis of policy and planning documents. This presentation situates the Petite Ceinture as an innovative approach to urban sustainability, particularly in terms of post-industrial sites and urban wastelands.

ARE CITIES PREPARING FOR THE CLEAN ENERGY TRANSITION? A CONTENT ANALYSIS OF 30 U.S. LOCALITIES.

Abstract ID: 2021

Individual Paper Submission

PITT, Damian [Virginia Commonwealth University] dpitt@vcu.edu, presenting author

The clean energy transition is upon us. What are cities doing about it? This paper will address the role of local governments in the clean energy transition, and will evaluate the extent to which U.S. cities are currently embracing and preparing for that role via their master or comprehensive plans, sustainability or climate action plans, and municipal zoning codes.

We begin by discussing the specific ways in which local governments can support and facilitate the transition to an economy and society driven by clean energy systems with net-zero carbon emissions. Our focus is not on the broad range of carbon-reduction strategies found in most municipal climate action plans, which includes the reorientation of traditional land use and transportation planning functions with the goal of greenhouse gas (GHG) emission reduction. We focus solely on the evolving role of cities in supporting clean energy systems, primarily distributed renewable electricity systems and the “grid-edge” technologies (e.g., energy storage) needed to help those technologies displace conventional fossil-fuel generation in our electricity portfolio. Our focus on energy systems builds off of early research by Andrews (2008) who identified emerging planning challenges related to clean energy siting, district energy systems, etc., as well as more recent work on how urban planning can help to support solar energy and other distributed energy resources (DER’s) including micro-grids, smart energy management systems, energy storage, and electric vehicle infrastructure (e.g., Adil and Ko, 2016).

Our methodology is inspired by prior studies that analyzed municipal planning documents to evaluate the extent to which cities are preparing for sustainable development (Berke and Conroy, 2000), adopting innovative climate action

practices (Bassett and Shandas, 2010), or incorporating equity and justice into climate action plans (Schrock, et al., 2015). Similar to those studies, we conduct a methodical content analysis of planning documents from 30 U.S. cities, representing a range of high, middle, and low rankings on the American Council for an Energy-Efficient Economy's Clean City Energy Scorecard.

We examine each selected city's comprehensive or master plan, as well as their most recent sustainability or climate action plan, to determine if the plans address DER's in their discussion of existing conditions, needs, and opportunities, recommend DER's for incorporation into municipal operations, or recommend any policies or programs to support DER technologies in the community. Unlike many of the previous studies, we also examine each city's municipal code to determine whether DER's are identified and defined, permitted (where applicable) as an allowed use in any zoning districts, or in any way promoted or incentivized for use in the community.

These findings will provide an understanding of whether U.S. cities are preparing for their role in the clean energy transition, whether certain DER technologies are more recognized than others in local planning documents, and whether cities known as leaders on renewable energy and efficiency (i.e., per the ACEEE rankings) are also more prepared for other emerging aspects of the clean energy transition. It will also set the stage for further research analyzing the characteristics of the cities that are farthest along in the clean energy transition, as well as for detailed qualitative research on planners' and city officials' perspectives on the role of cities in this transition.

SPATIAL DISTRIBUTION OF USES OF GREEN SPACES BY SCHOOLS AND THE SOCIAL BENEFITS: THE CASE OF STAVANGER, NORWAY

Abstract ID: 2029

Individual Paper Submission

KORKOU, Maria [University of Stavanger] maria.korkou@uis.no, presenting author

MONTALVAN CASTILLA, Johana Evelin [University of Stavanger] johana.e.montalvancastilla@uis.no, co-author

Green spaces are an inextricable part of a city as it offers plenty of valuable things and traits to the urban environment and people-residents. Past studies have documented that green spaces bring various types of benefits to people and a major part of the literature focuses on how adults use green areas and parks, however, the schools' use of green areas has attracted less interest. Green spaces are a key component of the urban environment as it provides multiple advantages to people of all age groups (from infants to elderly) and presents various functions, such as recreation, education, play. Regarding the benefits, one of them is the socio-cultural aspects that are derived from the green spaces. The term includes educational values, aesthetic values, social relations, sense of place, cultural values and psychological well-being, and also the interaction with nature. The effect of green areas on the sustainability and quality of life is documented (Cilliers & Cornelius, 2018). Children's way of interacting with green spaces can differ from that of adults. In that regard, the social aspects parks provide for children have been explored, particularly regarding play, social integration or socialization, and inclusion (Seaman et al., 2010). For older children and teenagers, parks are known to provide important settings for socializing with their peers and getting involved in sports and physical activity (Loukaitou-Sideris & Sideris, 2009). Urban-dwelling children in proximity to nature have been found to have better social skills and social, emotional, and behavioural scores (Richardson et al., 2017). It has also been hypothesized that, by encouraging the development of social contacts, green spaces might improve psychological health (Maas et al., 2009). The present study focuses on the spatial allocation of green spaces' uses by schools and the social benefits that children gain from the interaction with urban nature. The analysis is based on a dataset consisting of 51 green spaces units (ranging from small neighbourhood green spaces to large urban forests)

and on a survey and interviews. The survey and interviews were conducted by schoolteachers of the four different grades (kindergartens, primary, secondary and high schools) in the city of Stavanger in Norway. The survey indicated that the green spaces are located in a close distance to the different school grades. Hence, an outcome of the analysis of the results concluded that schools use the nearby green spaces at a close distance of 1000 meters. This average distance is bigger comparing to the standards proximity of green spaces to houses, which ranges from 250 to 400 meters. Based on the schools' responses, the majority of the identified green spaces are situated inside their respective area and radius influence. However, it is observed that 42% of the schools use also green spaces that are outside of their local area and far away from their units. Those identified green spaces consists major big and known green areas in Stavanger city as they are landmarks of the whole town.

Climate change impacts are intensifying existing social inequalities locally and globally. Exposure to those impacts, as well as the ability to prepare for and recover from them, are shaped by complex power structures. Growing scholarship documents how systems like racial capitalism, patriarchy, heteronormativity, and ableism impact how people experience climate change, perceive future threats, and envision actions to reduce harms (Goldsmith, Raditz, & Méndez, 2021). Simultaneously, an expanding body of literature uses an intersectional lens to explicate a more nuanced understanding of how co-constituted power structures manufacture differential climate vulnerability (Combahee River Collective, 1983; Jacobs, 2019). This is complemented by research describing innovative acts of refusal and survival against environmental violence that are rooted in an intersectional understanding of oppression and liberation (Amorim-Maia et al., 2022; Dorries & Harjo, 2020). Despite the increasing focus on intersectional approaches to climate planning, there are limited quantitative studies examining how the co-constituted processes of being racialized and gendered influence climate change perceptions in the United States. In contribution to these conversations, we examine how race and gender together shape experiences of climate impacts, perceptions of future risk, and desire for adaptation actions in Austin, Texas.

Our research, based on a city-wide survey of Austin households, suggests that race and gender are related to which climate threat people have experienced, their estimates of past and future changes to various climate risks, their trust in major actors for climate adaptation projects, and overall concern regarding climate change. For example, we found that Black men and women were more likely to report experiences with extreme heat and poor air quality, while white men indicated greater exposure to drought risks. Importantly, we note that Black women were less likely than white men to report experiencing climate impacts but held significantly higher concerns for climate change more broadly. Generally, white men had lower concerns for climate change compared to all other groups, even while holding income, education, and political party constant. Additionally, the survey indicates that all groups preferred local community organizations or local governments to develop adaptation projects instead of NGOs, the federal government, or the State of Texas. However, the perception of the roles of local government and community organizations in adaptation projects varied considerably, with Latino men, Latina women, and Black women being less supportive of local government actions.

Together, this paper offers an analysis to examine climate change perceptions in Austin and provides insights into how research centering intersectional experiences can be used to shape local plans, policies, and programs to address climate injustices. Our study contributes to larger conversations on understanding and addressing interlocking systems of oppression in climate planning research and practice.

RETHINKING THE SPATIAL FRAMEWORK AGAINST GROWING HEAT VULNERABILITY IN DEVELOPED COUNTRIES' CITIES: THE CASE OF SEOUL, SOUTH KOREA

Abstract ID: 2041

Individual Paper Submission

KANG, Inkoo [Harvard Graduate School of Design] archibrick@gmail.com, presenting author

Cities worldwide have faced inevitable impacts of climate change on their citizens' lives in recent years, and cities of developed countries are no exception. Among different kinds of climate change impact, this research specifically aims to suggest the countermeasures against the growing heat vulnerability in developed countries' cities that can be contributed from urban planning and design perspective. Seoul, the capital city of South Korea, was selected as the appropriate study area since the Republic of Korea was the country with the OECD member country with the highest population density in 2020, which would mean the biggest impact to the most population, and Seoul was the 7th climate-vulnerable country according to the Nestpick's 2050 Climate Change City Index, since its' climate shift will move from the hot summer continental climates to dry winter humid subtropical climate and its temperature shift by 2.12 in the annual average temperature fluctuation. The two most significant changes of Seoul are the urban heat island effect and the heatwave. The average daily temperature in summer has enormously risen so far, and so is the number of days with the heatwave. Seoul has its natural condition conditions of mountains that cover 60.75 mi² out of 233.68 mi² with rare developed land the plain left and a network of riverside parks along the Han River. It also has the urban condition of public transportation composed of the public shared system of bicycle, bus, and subway, which has 10 lines, 331 stations, hourly passenger traffic of 18,000, and also is transferable to bus freely. Also, its megastructure shows increasing multi-purpose complex buildings that are often connected to metro stations and underground spaces. The current discourse in terms of these climate change impacts are the street amenities including the shading canopies at crosswalk and cooling fog systems and the wind path plan in the planning progress currently. Their limitations are, however, that there is still lack of the comprehensive approach to the spatial framework on the whole city scale. Thus, this research looks into how the city will look differently with two future suggestions. First, transit-oriented densification will show the adaption for the urban island heat that there will be no need to go out for pedestrians in the case of extreme heat outside with the spatial solution of direct connection of multi-purpose megastructures and buildings to metro stations with underground development and inter-structural connection and also the qualitative solution of incentives for the new public or private development near the metro stations. The hierarchy of connection and incentives can depend on the level of centers in the city. Second, the mitigation for the heatwave that moderates heatwaves in urban areas by natural air conditioning through the wind path, can have the spatial solution of empty or green corridor linkage between mountains and rivers or the qualitative solution of the regulations on the high rises completely blocking the riverside.

EQUITABLE COMMUNITY RESILIENCE: THE CASE OF WINTER STORM URI IN TEXAS

Abstract ID: 2070

Individual Paper Submission

SOLITARE, Laura [Texas Southern University] Laura.Solitare@tsu.edu, presenting author

NEJIT, Ali [Texas Tech University] ali.nejat@ttu.edu, co-author

PETTITT, Edward [Texas Southern University] edpettitt@gmail.com, co-author

MOHSENIAN-RAD, Hamed [University of California, Riverside] hamed@ece.ucr.edu, co-author

Between February 13-17, 2021, Winter Storm Uri impacted 25 states and more than 150 million Americans leading to extended power and water outages nationwide, with Texas being the hardest hit. The impact of Uri on the state of Texas was far beyond expectation due to the lack of precautionary measures to withstand prolonged freezing temperatures]. While the electric grid in Texas is capable of withstanding extreme humidity and warm weather conditions, it was not designed to endure extended freezing temperatures, leaving administrators with no other options than to implement rolling blackouts. These blackouts were supposed to last less than an hour but ranged anywhere from couple of hours to couple of days across the state. The storm led to several deaths due to carbon monoxide poisoning, a significant halt in the administration of COVID-19 vaccines, and an economic loss that is estimated to be around \$90 billion. Meanwhile, various outlets brought to light the issue of environmental justice, and the human-centric and equity aspects of the impact. While four million people lost electricity and water in Texas the impact was disproportionate in low-income communities of color. Low-income non-white families were reported to bear the brunt of compounding crises in the aftermath of Uri.

Community resilience in the face of natural hazards relies on a community's potential to bounce back. A failure to integrate equity into resilience considerations results in unequal recovery and disproportionate impacts on vulnerable populations, which has long been a concern in the United States. This research investigated aspects of equity related to community resilience in the aftermath of Winter Storm Uri in Texas which led to extended power outages for more than 4 million households. County-level outage/recovery data was analyzed to explore potential significant links between various county attributes and their share of the outages during the recovery/restoration phase. Next, satellite imagery was used to examine data at a much higher geographical resolution focusing on census tracts in the city of Houston. The goal was to use computer vision to extract the extent of outages within census tracts and investigate their linkages to census tracts attributes. Results from various statistical procedures revealed statistically significant negative associations between counties' percentage of non-Hispanic whites and median household income with the ratio of outages. Additionally, at census tract level, variables including percentages of linguistically isolated population and public transport users exhibited positive associations with the group of census tracts that were affected by the outage as detected by computer vision analysis. Informed by these results, engineering solutions such as the applicability of grid modernization technologies, together with distributed and renewable energy resources, when controlled for the region's topographical characteristics, are proposed to enhance equitable power grid resiliency in the face of natural hazards. Additional discussion is on planning policy for critical infrastructure investment.

URBAN FORM AND RESIDENTIAL WATER CONSUMPTION: ANALYSIS OF CALIFORNIA CITIES

Abstract ID: 1556

Poster

FANG, Kevin [Sonoma State University] kmfang@gmail.com, presenting author

In the relatively dry Western United States, as much or more water is consumed outdoors (e.g. irrigation for lawns and gardens) than is consumed indoors. How much outdoor space there is to irrigate is directly influenced by city land use policies. In this paper, we explored the degree to which land use and built environment characteristics affect per capita residential water use across 194 California cities.

To investigate this relationship, we performed linear regression analyses comparing residential per capita water use in January and July 2021 with various land use and non-land use characteristics hypothesized to have an impact with water use. Data on water use came from the Pacific Institute's California Urban Water Use Map, which is a compilation of state reported data. Independent variable data came from multiple sources including the American Community Survey, ESRI, weather stations, and original calculations based off property data.

Our analysis revealed the importance of several land use characteristics. In the summer, share of detached houses in a city, share of large lots, and the presence of swimming pools were all significantly associated with increased water use. Presence of detached houses was the second most impactful variable in the model ($\beta = 0.38$), second only to temperature ($\beta = 0.41$), and more important than household size ($\beta = -0.32$). Share of large lots ($\beta = 0.19$) was a stronger predictor than precipitation ($\beta = -0.13$).

In the cooler and wetter winter, there was less variation between cities in water use. As a result, all explanatory variables had less influence on water use than in the summer. However, detached houses still significantly impacted water use, and was the single strongest predictor in the model ($\beta = 0.39$).

These results have clear implications for planning practice as planning policies directly influence the share of detached houses in a city and lot size. To save water, cities could legalize more attached housing, eliminate minimum lot size requirements (and perhaps institute maximum lot size requirements), and reduce setback requirements that also enforce large yards. Additionally, California could locate more of its housing growth in Mediterranean climate areas, which had significantly lower water use, versus semi-arid and desert areas.

VULNERABILITY OF MIAMI-DADE COUNTY, FLORIDA TO IMPACTS OF CLIMATE CHANGE (SEA-LEVEL RISE AND REPETITIVE FLOODING)

Abstract ID: 1665

Poster

BORATE, Aishwarya [University of California Irvine] aborate@uci.edu, presenting author

BUKVIC, Anamaria [Virginia Tech] ana.bukvic@vt.edu, co-author

MCCARTY, Frances [Virginia Tech] fmccarty@vt.edu, co-author

Over the last 40 years, the United States has sustained 273 weather and climate disasters with overall costs exceeding \$1.7 trillion. In addition to these more extreme events, flood damages from repetitive non-extreme flooding and sea-level rise are also expected to increase both in frequency and severity with climate change. Therefore, identifying and measuring the vulnerability of communities to climate change is crucial for long-term risk management and planning.

Vulnerability indices are used increasingly by researchers and practitioners because of their ability to reflect multidimensional data with reduced complexity (Rufat et al., 2019). However, a lot remains unknown about the accuracy and validity of these indices (Gall, 2013). For example, most current vulnerability indices have limited power to explain flooding exposure, damage, and post-disaster assistance when validated using outcome variables (Rufat et al., 2019; Tate, 2012). Additionally, much of the social vulnerability index literature focuses on extreme weather events like severe storms and hurricanes.

While taking a different approach, this study proposes to test the validity of individual components of vulnerability and an aggregate index at a spatial scale more relevant to local planning and decision making (blocks groups). This study focuses on Miami-Dade County, Florida, as a high-value region particularly vulnerable to climate change and coastal flooding. The research uses information on areas prone to repetitive flooding and losses to validate the individual vulnerability components and the aggregate index.

The analysis proceeds in three steps. 1) identification and mapping of individual vulnerability components at the block group level, 2) cluster analysis, and 3) validation of the individual vulnerability components and the aggregate vulnerability index. First, the main contributing factors of vulnerability were identified through a literature review (Cutter, 2003) and consolidated using Principal Component Analysis (PCA). The primary data source is the 2016 ACS and the 2010 decennial census. After examining variable distributions and assessing multicollinearity, data on 33 variables reflecting demographic, housing, and neighborhood characteristics were used for these analyses. The seven components extracted from PCA explained 70.6 % of the variance. Next, the component scores (regression) were generated and mapped for each block group. Second, we implement K-means clustering to identify clusters of vulnerable populations based on the vulnerability components identified from the PCA. We find that block groups scoring high on population density and smaller housing size, older housing with less vehicular access, and low on personal resources are situated in areas prone to sea-level rise in Miami springs, downtown Miami, and other block groups along the Miami River.

The next step in the analysis will be to validate the individual vulnerability components and the aggregate vulnerability index. We will use the information on exposure (sea-level rise and repetitive flooding spots), and post-flooding assistance (repetitive flood loss data) to understand the distribution of vulnerability in Miami-Dade county. Vulnerability components and indices validated using SLR and repetitive flooding data will be crucial for decision-making in communities like Miami-Dade facing the threats of climate change.

CLIMATE SCIENCE AND GOVERNMENT CAPACITY: HOW SEA LEVEL RISE SCIENCE VARIES BY MUNICIPALITY SIZE, WEALTH, AND POLITICS

Abstract ID: 1826

KARAMESINES, Saul [Utah State University] saul.karamesines@usu.edu, presenting author
HIRSCHFELD, Daniella [Utah State University] daniella.hirschfeld@usu.edu, co-author

National and state agencies are increasingly pushing responsibility for adapting to climate change down the ladder to local governments (Baker et al., 2012). However, local planning agencies' capacity and willingness to adapt to climate change can vary significantly (Fu, 2020; Measham et al., 2011). These variances in adaptive capacity especially matter in sea level rise planning, where expensive adaptation measures intersect with uncertainty over future sea level rise conditions.

This study evaluates questionnaire responses from 40 United States municipalities. It explores the degree to which population size, per capita income, and political leanings affect the quality of sea level rise science used in local planning processes. By understanding how uptake of sea level rise science varies between differing municipalities,

climate planners and strategists may better engage with a diverse array of communities facing uncertain climate futures.

This study was conducted as part of a global study on the quality of sea level rise science used by national, state, and local planning agencies. In our work we gathered empirical data to understand how municipalities in the United States are using sea-level rise science. We used an online questionnaire to gather data from 40 municipalities. We then designed a new numerical scoring system based on the presence of six key measures of sea level rise science, which we applied to the municipalities' responses. This produced a measure of the rigor of municipalities' sea level rise science which we evaluated for relationships to the municipalities' population sizes, per capita income, and political leanings.

Preliminary results suggest two insights into the variations in quality of sea level rise science between municipalities.

First, the quality of sea level rise science appears to shift slightly with political leanings. We found a small but significant positive correlation between the percent of Democratic voters at the county level and the quality of sea level rise science for municipalities in those counties. Likewise, there is a small but significant negative correlation for percent of Republican voters. While political climate is not the primary driver, it does seem to influence the quality of sea level rise science that municipalities use. This suggests that Democratic-leaning municipalities will generally show greater adaptive capacity in a wider range of potential climate futures than Republican-leaning municipalities.

Second, contrary to initial expectations, population size does not appear to correlate with quality of sea level rise science used in municipal planning. One possible explanation is that smaller municipalities appear to rely heavily on the existing science done by larger communities in their regions, as well as state and national datasets that provide place-specific analysis at the local scale. This makes networking between municipalities an important factor for planning. This also indicates that large-scale planning entities play an important role in local-scale climate adaptation even when they are not directly involved.

HOW RESILIENCE PLANNING THREATENS POOR AND VULNERABLE COMMUNITIES: A CASE STUDY OF NEW BERN, NORTH CAROLINA U.S.

Abstract ID: 1898

Poster

GARCIA, Helena [University of North Carolina at Chapel Hill] hmgarcia@unc.edu, presenting author
BERKE, Philip [University of North Carolina at Chapel Hill] pberke@email.unc.edu, co-author

Cities are increasingly adopting resilience plans (Meerow et al. 2019). Resilience plans focused on flood hazard mitigation utilize solutions that span structural and natural infrastructure investments, changes in land use regulations, and relocation efforts. These solutions, however, can produce unjust outcomes for historically marginalized and underrepresented communities (Anguelovski et al. 2016). As flood hazards become more frequent and intense with climate changes, both the risks and the impacts of inappropriate resilience planning increase (Berke et al. 2019). As a result, poor and vulnerable communities, already burdened by inequitable exposure to flood hazards from past planning injustices, will see disproportionate negative impacts from resilience policies, unless planning efforts across sectors integrate their other goals, like economic development and equity inspired investments, to also address flood risk reduction.

Low income, minority, and immigrant communities have been historically underrepresented and marginalized in planning processes. Although these procedural inequities persist, recent planning efforts seek to remediate distributional inequities that were caused by historically unjust practices. These efforts often call for structural and economic investments in vulnerable communities that can unintentionally contribute to the resilience and equity planning paradox. For example, costly investments in vulnerable communities may simultaneously increase the community's risk of losses in future flood events and perpetuate existing trends of disproportionate flood hazard loss

and recovery burdens (Burby 2006).

In this project I use a case study approach to examine how a lack of integration of resilience and equity policies across planning efforts represent a new form of injustice for flood prone poor and vulnerable communities. I use New Bern, North Carolina as my case study city as it is a southern city in the United States that experiences riverine and coastal flooding hazards, has a long tradition of planning, and a history of racial discrimination. Additionally, current planning efforts in New Bern have produced a network of plans that include a hazard mitigation plan, multiple neighborhood revitalization plans, a comprehensive land use plan, and a recent resilience plan, making a study such as this one timely.

To examine how New Bern's historical planning practices have contributed to present day inequalities in flood exposure, I use an archival analysis of local historical maps to identify how planning practices have produced the current spatial pattern of social demographics and flood exposure in New Bern. Part of this analysis includes an evaluation of historical documents from the area which help interpret how past planning policies and priorities helped shape the current landscape. I use these historical analyses as context for evaluating the resilience and equity outcomes of current planning efforts in New Bern. To investigate if the policies within the current network of plans exacerbate flood injustices in New Bern, I use the Plan Integration for Resilience Scorecard (PIRS) methodology to spatially analyze where, and for whom, plan policies are integrating to promote resilience to flood hazards in the city (Berke et al. 2015).

The combination of these methods reveals that policies promoting flood resilience in New Bern are concentrated within the 100-year flood hazard area and in neighborhoods with higher median household incomes and proportions of white residents. Areas just outside of the 100-year flood hazard area, particularly those flooded during Hurricane Florence in 2018, show less robust integration of policies for flood resilience and in some areas have policies that will contribute to increased risk of losses in future flood events. The results of this New Bern case study present an example of the resilience and equity planning paradox and underscore the need for increased integration across planning sectors to avoid creating new forms of injustices through resilience planning efforts.

The proportion of the world's urban population has reached 55%, and it is expected to increase to 68% within 30 years (United Nations, 2018). Rapid urbanization is a key contributor to greenhouse gases (GHG) emissions and air pollution. Massive emissions of GHGs are leading to global warming and change in climate (IPCC, 2014). Large-scale urbanization is also increasing the temperature inside urban areas leading to the urban heat island (UHI) (Zhou et al., 2014). In addition, Crutzen (2004) pointed out that the UHI effect exacerbated the emission of air pollutants. People who are exposed to high concentrations of air pollutants for a long time will suffer from various diseases (Chen et al.,

2011). Therefore, the characteristics and processes of UHI and air pollution are worthy of an in-depth study. Since UHI and air pollution can affect human health and wellbeing, energy wastage, regional planning and climate, studying the temporal and spatial evolution of UHI and air pollution is of great significance to regional, national, and even global climate change. However, no one has studied the coupling relationship between UHI and air quality in Canada. Thus, this study aims to analyze the temporal and spatial patterns of UHI and air quality in five major Canadian cities in 2020 and their interrelationships to fill this gap.

This study selected five major Canadian cities, including Toronto, Montreal, Vancouver, Edmonton and Calgary, as case studies. Based on MODIS land use/cover data, we extracted the built-up area of each city, and created the buffer zone with a radius of 5km which is determined as the suburb, as well as the land use maps of each city. Then we utilized MODIS surface temperature data to calculate the day and night urban heat island intensity of each city in the four seasons in 2020 to obtain the temporal and spatial variation patterns of the UHI in each city. Besides, we used the daily average PM_{2.5} data of National Air Pollution Surveillance (NAPS) program to obtain the time trends of air quality, and use the air quality and air pollutants data of the ground monitoring station on the PurpleAir website to obtain the spatial distribution of air pollutants in these five cities through spatial interpolation. At the same time, the UHI and air quality of different land cover types were analyzed. Finally, we will compare the spatial distribution of urban heat islands with the spatial distribution of air pollutants in each city to find out whether there is any relationship between UHI and Air Quality in these cities, as well as determine whether these five major Canadian cities follow the same spatial-temporal relationship.

This study can provide ideas for the improvement of the urban ecological environment and the sustainable development of the city, and provide certain reference significance for urban planners and urban ecological environmental researchers.

PARK SECTOR REDLINING: EXAMINING THE IMPACTS OF PARK SECTOR FINANCING ON GREENSPACE EQUITY IN HOUSTON, TEXAS.

Abstract ID: 2022

Poster

PETTITT, Edward [Texas Southern University] edpettitt@gmail.com, presenting author
CHUN, Bumseok [Texas Southern University] bum.chun@tsu.edu, co-author

In Houston, Texas, new parks and greenspace development are funded through fees in lieu of land dedication (impact assessment or "linkage" fees) equivalent to \$700 per dwelling unit, limited by nexus to 21 park sectors. ArcMap was used to overlay Mean Normalized Differential Vegetation Index (NDVI) data derived from Landsat ETM+ satellite imagery, Houston's parks inventory, 1930s Home Owners Loan Corporation (HOLC) mortgage redlining boundaries, Houston's park sector boundaries, and collected linkage fees in Houston's Parks Dedication Fund. Our GIS analysis found a high degree of correlation between park sector boundaries, which determine the collection of fees-in-lieu of park dedication from developers, and the 1930s race-based security ratings of the Home Owners' Loan Corporation. Sectors 15 (Third Ward), 11 (East End), and 17 (Near Northside/Fifth Ward), which were heavily redlined by HOLC as "hazardous" and "declining" neighborhoods and remain predominantly Hispanic and African-American, each have around \$100,000-\$200,000 available for new park acquisition, while the predominantly white areas on the west side of Houston rated as "desirable" and "best" by HOLC each have \$1 million or more in their park dedication funds, even though they already contain the bulk of Houston's greenspace. Sector 14, which encompasses River Oaks, Montrose, Midtown, Upper Kirby, and Rice Military, has over \$6 million available for new park acquisition, even though it already contains Memorial Park Conservancy and Buffalo Bayou Park, Houston's largest expanse of park space. Additional analysis is currently underway to understand interaction between urban heat island effect, tree canopy, and Houston's park sector financing of greenspace expansion. Data show a 17.1°F difference in

temperature across Houston/Harris County at the same time of day. Furthermore, Houston has a discrepancy of about 14% between tree canopy cover in the wealthiest and the most impoverished neighborhoods; and a 16% difference between communities with the highest share of white residents compared to those with the highest share of residents who are people of color. We will conduct simulation and scenario analysis of decreasing land surface temperature across Houston through tree canopy expansion. Ultimately, we hope this research will help planners and policymakers to understand the funding redistribution required in each park sector to offset urban heat island effect in an equitable manner; understand how park sector funding affects the balance of burdens and benefits in environmental justice communities; expand tree planting interventions throughout Houston; and reform Houston's park sector financing scheme. This research will also have application to other cities who fund parks and greenspace expansion through defined park sectors and/or linkage fee assessments.

Track 5 – Gender & Diversity in Planning

Track 5 Pre-Organized Session Summaries and Abstracts for the Sessions

CREATING PLACE: QUEER, TRANS, AND GENDER EXPANSIVE UNDERSTANDINGS OF URBAN SPACE

Pre-Organized Session 76 - Summary

Session Includes 1545, 1546, 1548

AZHAR, Awais [University of Texas Austin] awais.azhar@utexas.edu, organizer

Even though Lesbian, Gay, Bisexual, Transgender, Queer, and Intersex (LGBTQI+) individuals and communities can be found throughout the United States and the world, their everyday experiences are largely absent from planning practice and planning theory. To create a more inclusive planning field, it is vital for academics and practitioners to develop a deeper understanding of queer, trans, and gender expansive spaces and places. Drawing from a diverse range of fields including queer theory, critical geography, social psychology, mobility justice, feminist studies, and transfeminism, the papers included in this session advance planning's engagement with both gender and queerness. This work provides a foundation for understanding what a queer, trans, and gender expansive urban environment is and how we might bring such a vision into the work of planners. In an effort to be perfectly queer, this session brings LGBTQIA+ communities and theories related to queerness into the center and reimagines mobilities, aging, safe spaces, inclusive cities, and the possibilities of planning itself.

Objectives:

- Develop a deeper understanding of queer, trans, and gender expansive theories and practices within urban planning
- Expand knowledge on spaces and places serving the LGBTQI+ communities

TRANS FEMINIST PERSPECTIVES ON CITIES

Abstract ID: 1545

Abstract within Pre-Organized Session 76

DOAN, Petra [Florida State University] pdoan@fsu.edu, presenting author

In the past several years people who identify as transgender are increasingly in the crosshairs of critics from the right as well as some radical presumably left-leaning feminists. At the same time there is a proliferation of gender non-conforming (GNC) identities that fall roughly under the trans umbrella (Doan 2019, Doan and Johnston 2022). Multiple state legislatures within the United States have already or are considering passing legislation to limit the ability of trans youth to participate in sports, receive gender-affirming health care (cf. the attempt in Texas to prosecute parents for child abuse who support their trans children's need to transition), and even to be discussed openly in schools. Prior attempts to regulate trans use of bathrooms has failed legislatively and in the courts (Cofield and Doan 2021), and these most recent efforts similarly politicize and weaponize non-conforming identities.

Similarly, there is an of these anti-trans policies on the far left from radical feminists reviving trans exclusionary rhetoric from the 1990s. This resistance may reflect their deep-seated unease that visibility of trans issues may have sidelined still unresolved women's issues (equal pay, abortion rights, etc) and threatened vitally important women's spaces by the "invasion" of trans and GNC (Stryker and Bettcher, 2016). Furthermore, because many trans and GNC people have been subjected to discrimination over correct pronouns and criticisms about gender identity, some individuals within this population have developed a fierce and self-protective radar that causes them to try to silence incorrect pronouns, unflattering terminology, and critiques of their very identity. This has in turn lead to claims of censorship by trans exclusionary radical feminists (TERFs) who feel deeply threatened by the very existence of people who destabilize the gender binary.

Because of these attacks from the left and the right, it is not clear whether the attempt to plan for safe spaces for trans and gender non-conforming people can survive, much less thrive. In general, cities have been safer and more inclusive spaces for a variety of sexual and gender non-conforming people. However, the current push by state legislatures to pass sweeping bills that pre-empt local ordinances, threatens these protections. Will there be a pushback similar to the widespread condemnation that forced the rescinding of North Carolina's 2016 bathroom bill (NC-2) or is there a real pendulum swing against queer people that threatens to undermine decades of social

acceptance. This paper reviews the ways that these politics complicate the possibilities for creating safe spaces in cities for the trans community.

This paper will provide a review of these debates and examine transfeminist perspectives on the urban. The paper will reflect on what this means for planning and urban policy. To that end the paper will consider the following questions:

What is the nature of the relationship between feminist and transgender work in urban studies?

How does transfeminist urban research confront persistent material and power imbalances in the circuits of academic knowledge production, including academic feminism and feminist urban studies?

QUEERS IN THE CITY: DELHI SINCE THE REPEAL OF SECTION 377

Abstract ID: 1546

Abstract within Pre-Organized Session 76

CHALANA, Manish [University of Washington Seattle] chalana@uw.edu, presenting author

After India's independence from Britain in 1947, the country maintained much of the colonial legal code. This included Section 377, which criminalized "unnatural sex" as a punishable offense with up to 10 years of imprisonment; the law was codified in 1861 and modeled after Britain's 16th century Buggery Act, in turn based on interpretation of the Judeo-Christian Old Testament. Sexual minorities in post-colonial India have been marginalized, with limited access to jobs, services and opportunities, and subject to public humiliation. Scholars argue that much of this discrimination is rooted in the colonial practice of criminalizing non-conforming sexualities and gender identities, as pre-colonial India had carved spaces for varied sexualities and gender expressions. This colonial marginalization was most severe for the Hijras—a blanket term covering eunuchs, intersex, asexual, transsexual and sometime even gay persons—categorizing them as "criminal tribes" and a threat to colonial morality and political authority. This is especially ironic since Hijras have traditionally held a special place in Hinduism for their loyalty towards Hindu gods and with traditionally recognized powers of blessings and curses.

After seven decades, and multiple legal twists and turns, the Supreme Court of India finally ruled in 2018 that the application of Section 377 to consensual homosexual sex between adults was unconstitutional. More recently, Hijras have gained some protections through the Transgender Persons (Protection of Rights) Act, 2019 so that they have guaranteed access to education and livelihoods. All these developments have led to greater visibility of queer folk in India, especially in large cities.

This visibility has in fact been growing for well over a decade now. Many cities have since 2009 been hosting Pride festivities. Queer folk have been using various online location-based apps to not just find romantic and sexual partners, but also to organize social events and activism. Bollywood has been increasingly churning out queer-themed cinema, bringing wide-spread visibility. Delhi and other major metros now have a small number of queer-friendly eateries and bars (in addition to long-standing gay cruising spots), and some host weekly queer events and gatherings on certain week nights. Most of these spaces, however, are in practice limited to primarily the upper classes and caste, and specifically to educated, cis-gendered, gay men, whose various forms of privilege allow them to afford the venues, take on the social and financial risks of being "out", and shield them from discrimination.

This work relies on archival and field ethnography to understand how queerness has been shaped in the urban Indian context since colonial times up to the present-day, with a particular focus on Delhi, as the capital city. In somewhere as dense and teeming as Delhi, every use of public space is a highly visible and often fraught process. This is especially true in this time of highly divergent politics, with a right-wing Hindu nationalist government in power at the national level but a center-left reformist party in Delhi proper. Urban battle lines are being etched, as claim to public spaces and their "appropriate" use are being contested. Ultimately as some spaces open up for a certain class of queers,

others that have served a much larger community of more economically and socially marginal queers are taken away. This work documents these changes and their impacts on the many people and communities within the broad umbrella of "queer". While the particulars here are of great importance, the main story mimics so many other aspects of urban Indian society: to become a truly inclusive city, Delhi will need to find a way to accommodate the needs and aspirations of all city inhabitants and not just the elite that it continues to prioritize.

LOCATING LESBIAN LIVES: AGING-IN-(QUEER)-PLACE

Abstract ID: 1548

Abstract within Pre-Organized Session 76

TURESKY, Marisa [University of Southern California] turesky@usc.edu, presenting author

Although there has been a recent increase in attention to urban planning for aging populations in the United States (Warner, Homsey, & Morken, 2017; Kan, Forsyth, & Molinsky, 2020), the scholarship scarcely notes differences in aging based on gender and sexual orientation. This paper adds a queer feminist lens to frameworks of aging-in-place by centering older lesbians' attachments to the home as they navigate loneliness, one of the strongest predictors for poor health and quality of life among older LGBTQ+ adults (Fredriksen-Goldsen et al., 2019).

With thirty oral histories of lesbians aged 65 to 85 in Los Angeles County, I examine the different ways in which older lesbians use homes to develop identity and community in the face of ageism, homophobia, and patriarchy. In particular, I ask: does aging shape lesbians' homemaking practices? Does lesbian identity affect aging-in-place? Is a house a sanctuary, an escape, or a trap for lesbians as they age? This paper contributes to urban planning research that advances the liberation of a heterogeneous LGBTQ+ community. These spatial oral histories demonstrate ways for neighborhoods and cities to enhance services and the built environment in ways that would improve the safety and health of the LGBTQ+ community.

PLANNING THE 'INCLUSIVE CITY' IN THE FACE OF SOCIO-LEGAL EXCLUSIONS

Pre-Organized Session 80 - Summary

Session Includes 1593, 1594, 1595, 1596, 1597

SOTOMAYOR, Luisa [York University] sotomay@yorku.ca, organizer

While planners increasingly recognize the need to engage with many ‘stakeholders’ and include the voices of historically marginalized publics, people facing socio-legal exclusions –such as non-citizens, migrant workers, and others with precarious status, as well as Indigenous people– continue to be excluded from planning processes and adequate policy formulation. These populations participate in place-making, shape the urban fabric, and build regional economies. Yet, they do so in the shadows (Sandoval, 2013). They are also increasingly confronted with state tactics of illegalization, expulsion and border enforcement that produce geographies of death in what De Genova and Roy (2020) describe as racialized regimes of citizenship. This session will examine the way various planning actors negotiate the ambiguous relationships and processes of marginalization of populations facing socio-legal exclusions. It will present research that theoretically and empirically opens the process of engagement incapacitating various voices, histories, and positionalities, and those exposing the socio-legal firewalls causing exclusion and insecurity.

Objectives:

- To reflect in the way socio-legal exclusions marginalized undocumented, Indigenous and unhoused people form the planning process

NON-STATUS CITIZENSHIP AND THE PROMISES OF THE INCLUSIVE CITY

Abstract ID: 1593

Abstract within Pre-Organized Session 80

GILBERT, Liette [York University] gilbertl@yorku.ca, presenting author

Proud of its diversity and progressive politics, the City of Toronto adopted a ‘sanctuary policy’ in 2013. However, municipal governments and urban planners have yet to fully address the ‘local turn’ of migration politics at a time when they are increasingly confronted with anti-austerity, anti-racism, and anti-colonial movements. Urban planners have been complicit in neglecting particular populations through the production of uneven urban environments.

This paper presents an examination of how non-status citizenship is negotiated in municipal governance and planning politics in Toronto – in the current moment of COVID-19 pandemic and anti-racism mobilizations. Despite their precarious presence in the city, non-status citizens are subjected to everyday socio-legal violence invested in historical and current state/planning practices of dispossession and racial capitalism. Our inquiry aims to recenter the limits and possibilities of creating an urban fabric where different sectors and service providers within and beyond the state may resist “irregularity” to “circumvent non-juridical status” and where illegalized migrants are increasingly included and afforded housing, labor, and mobility justice (beyond limited sanctuary policy). Using content analysis of official documents and undocumented testimonies, our research seeks to put forward a collective project of planning for migrant solidarity that activate new openings to disrupt exclusionary discontinuities in access to substantive citizenship, services and infrastructure.

BARRIERS VS BRIDGES: ACCESS TO POST-SECONDARY EDUCATION FOR NON-STATUS MIGRANTS

Abstract ID: 1594

Abstract within Pre-Organized Session 80

HUDSON, Graham [Toronto Metropolitan University] graham.hudson@ryerson.ca, presenting author

This paper examines the right to post-secondary education for non-status migrants in Ontario, and the legal, policy, and administrative means of bypassing barriers to access. The paper outlines the legal and moral basis for access to

higher education. Using the examples of York University and X University, it then examines how universities can provide access. Attention is paid to: a) legal questions concerning privacy of student records, b) issues of campus security, and c) relationships to larger "sanctuary" initiatives at local levels. Attention is also paid to the place of sanctuary campuses in the broader context of federalism, with specific reference to existing international student framework agreements between federal and provincial governments

BARRED FROM PUBLIC SPACE: ENCAMPMENT EVICTIONS AND URBAN CITIZENSHIP IN TORONTO

Abstract ID: 1595

Abstract within Pre-Organized Session 80

RADY, Farida [York University] frady@yorku.ca, presenting author

In the summer of 2021, Toronto police executed paramilitary-style raids, brutalizing the most vulnerated residents in the city - encampment residents - and their supporters in three downtown public parks. During these evictions, state violence manifested in police brutality, using force against encampment residents and their supporters and intimidation tactics including kettling. In October 2021, the state issued Suspension Notices to perceived encampment leaders that barr them from public space and public services. In light of these new eviction tactics, the questions of urban citizenship, the meanings of the "public" in public space, and the processes by which individuals are made illegal are acutely pertinent.

This paper examines contemporary processes of illegalization against unhoused dwellers through eviction notices aimed at formally barring unhoused residents from public spaces. Building on recent socio-legal research on urban exclusion, homelessness, citizenship, and dispossession, it examines how encampment residents in cities of the Global North are subject to arbitrary, changing, and exceptional legal processes of exclusion. Such processes raise questions about urban rights and differentiated citizenships. Reading the North from the South (Parnell & Robinson, 2012), the paper utilizes an informality approach to illuminate state violence against dispossessed publics and state-society tensions around homelessness and encampments in public parks of so-called global cities.

This paper is informed by a discourse analysis of media articles and municipal press briefings where narratives relating to binary thinking, ambiguity of responsibility, aesthetics, and "good" governance are identified. This is complemented with qualitative data from walking interviews with housing justice activists and community lawyers, conducted in the spring of 2022.

Findings from the discourse analysis expose the ambiguity of law. State violence - in the forms of police brutality, encampment evictions, the barring of people from public space, and the invisibilization of unhoused people are evidence of this ambiguity. These ambiguities can also be seen in the un-enforceability of the suspension notice, the mobilization of a provincial act to intimidate encampment residents, and the criminalization of activities that occur outside what the state permits as legitimate. The paper concludes that encampment evictions are a form of legally imposed spatial exclusion, or what Graziani et al (2021) refer to as *banishment*. Encampment residents and other unhoused people are also subject to *migrantization* - where the state enforces the colonial logics of borders, illegalization, and disposability to other historically marginalized groups to subordinate and dispossess them (De Genova and Roy, 2020).

Findings additionally indicate that aesthetics and in/visibility influence the illegalization of encampment residents and other unhoused people. The aesthetics of encampments, their location in the downtown core, the waste they produce, and the “risks” they allegedly pose to housed people contribute to the framing of encampments and their residents as outside of the public order. Their classification as *other* contrasts with propertied residents of the city, who are seen as the public whose access to and behaviour in public space is permissible and legitimate. Overall, this paper offers new insights on processes of illegalization of unhoused dwellers from public space in cities of the Global North.

TREATY RELATIONS IN TORONTO: EXCAVATING INDIGENOUS URBAN HISTORY THROUGH A COLLABORATIVE APPROACH

Abstract ID: 1596

Abstract within Pre-Organized Session 80

MARTHA, Stiegman [York Univeristy] stiegman@yorku.ca, presenting author

Despite recent calls to decolonize planning and develop meaningful partnerships with Indigenous nations and communities, and the recent changes to the planning policy statement in Ontario, little progress has been made in the field. Many planners don’t know where to start. There is confusion over jurisdictional responsibilities with respect to the Crown’s Duty to Consult. At the very least, planners need to consult with Indigenous peoples; many call for planners to go much farther, by decolonizing their practice and developing meaningful relationships with Indigenous partners grounded in respect and understanding of Indigenous ways of knowing and being, and in-line with the Indigenous governance traditions and structures these relationships must seek to honor. As Bob Goulais of Niibisin Consulting puts it, must learn to “plan at the speed of trust” (Goulais 2021).

Located on the territories of the Huron-Wendat, Haudenosaunee Confederacy, the Anishinaabek Nation and the Mississaugas of the Credit First Nation, the Indigenous history and present of Toronto is rich and complex. Today Toronto is home to a diverse Indigenous population that numbers between 70,000 and 100,000 (Carter 2021). There is an intricate and fraught history of treaty agreements (between Indigenous nations, and between Indigenous nations and the Crown) that allowed for settlement, and eventually the city to be here. From the Toronto’s name, which derives from the Mohawk Tkaronto, to the Black Oak Savannas of High Park, the last remnants of a more than 4000-year-old ecosystem tended by Indigenous stewards; the Indigenous foundations of this place are everywhere – but only to the trained eye. Most planners, like the majority of Torontonians, are ignorant of this history and of the many ways Toronto’s vibrant Indigenous communities are asserting their relationships with the Lands and waters of this place and are shaping the City in the present. While learning about this history is far from enough to establish right relations, it is an important first step in working towards (re)conciliation in the present.

Talking Treaties is a project of Jumblies Theatre + Arts, a Toronto-based community arts organization that collaborates with professional artists, scholars, and diverse communities to make art with, for, and about those communities. Led by Mohawk artist Ange Loft, Associate Artistic Director of Jumblies, Talking Treaties has twinned scholarly and community-based historical research with many forms of Indigenous-led arts-based engagement to explore the history and present of Treaty relations in the city. Stiegman has been collaborating with Talking Treaties since 2016. Our latest project is *A Treaty Guide for Torontonians*, a 200-page artful examination of the complex intercultural roots of treaty relationships in the place we now call Toronto. From the Two Row Wampum and Dish with One Spoon, to the Toronto Purchase, we trace the history of treaty making between Indigenous nations, and between Indigenous nations and the Crown. *A Treaty Guide* inspires an active approach to treaty awareness through embodied learning tools. Land-based activities, theatrical exercises, drawing and writing prompts help readers find their own relationship to this history, and to take up their treaty responsibilities in the present.

In this session I will provide a brief overview of the network of treaty relationships relevant to the Toronto area explored in A Treaty Guide; describe the transdisciplinary collaborative research methodology used to produce the manuscript; and lead the audience in a sample of the arts-based activities presented in the guide in order to consider the ways that community arts-based research can deepen an understanding of Indigenous-settler relations, our treaty responsibilities to each other and to the Land; and to consider the ways such approaches might help planners to decolonize their practice.

REPRESENTATIONAL DISTORTIONS: PLANNING IM/POSSIBILITIES FOR LGBTQ+ STUDENTS IN SUBURBAN MUMBAI

Abstract ID: 1597

Abstract within Pre-Organized Session 80

ARUN-PINA, Chan [York University] chan.arunnarendra@gmail.com, presenting author

“[A]way from home” and their respective parental family units, “free-floating” university students by their very transient nature are governed by local communities firmly grounded in cis-heteronormative family values. Landowners, in particular, as key community stakeholders in the provision of local student housing assume authority over students’ bodily and spatial relations and occupations. Within the in/formal landlord-tenant agreements, the former often concerns themselves with students’ promiscuity, whereas students themselves often perceive their student life as that of an ascetic because of rigorous academic demands and meager financial means. This is the formulation of tenacious “representational distortions” that a student-image confronts, resulting in especially acute experiences of socio-legal exclusion and spatial unbelonging particular to LGBTQ+ student-tenants in contemporary urban city-regions in India. Thus, this paper deliberates the disjuncts and the congruences between various urban stakeholders involved in shaping the multi-scalar landscape of off-campus student rental accommodation provision surrounding the Deonar campus of the Tata Institute of Social Sciences (TISS) in suburban Mumbai, the wealthiest and the most expensive megacity to live in India. This paper begins with a critical queer review of the urban scholarship on “studentification” which in its current form, is wanting a sexualities framework, is trans-negative, and altogether overlooks LGBTQ+ students’ perspectives and voices. It then looks at the role of various urban stakeholders in distorting the student-image and thereby contributing to, what I argue are, two mutually feeding phenomena—‘studentphobia’ and ‘familification’. In queering the urban scholarship on studentification, this paper counter-positions the term ‘familification’ as multiple ways in which various urban actors that feel threatened by difference in ways of living based on one’s identities (at the intersection of gender, sexual, ethnic, religion, region, and caste), work together to ‘restore’ residential landscapes to a homogenized “spatial purity and temporal order...and its carefully organized family activities” (Bain et al., 2018, p. 11). Here, ‘studentphobia’, specifically in the urban case of India, is witnessed as inseparable from and as a subset of queer/transphobia. The paper then lands the discussion in three empirical “spatial stories” (Certeau, 1984) of unbelonging accentuating 13 LGBTQ+ students’ perspectives, voices and lived experiences from the Deonar Campus of Tata Institute of Social Sciences (TISS) University, Mumbai. These three spatial stories, respectively, follow the three stages of: (i) securing home, or more colloquially known among students as “house-hunting”; (ii) making home; and (iii) leaving home. Distilled from these three stages are six facets of a student-image as they emerge from LGBTQ+ students’ encounters with various formal-legal and informal-social actors at multiple spatial scales—the anti-national terrorist, the future citizen-leader, the activist, the student-client, the promiscuous non-adult, and the ascetic. This paper works to “understand the force of representations” at the intersection of “symbolic and material violences of representations [in] their often hidden but always powerful capacity to harm and damage” (Anderson, 2019, pp. 1120–21) historically marginalized and precarious urban populations. What socio-spatial implications do these representational typologies have on LGBTQ+ students’ access to and lived experiences of housing, particularly, when one or more of these facets work to discredit and invisibilize them, while others alienate and hypervisibilize? Various queer urban scholars in duly noting “barriers that prevent the integration of queer concerns” in planning (Broto, 2021), have challenged the disciplinary “silence on queer issues” (Broto, 2021; Doan, 2011; Vallerand, 2020) and worked towards inclusive planning approaches. Subsequently, the paper concludes by considering how urban planning in a sub/urban context where unaffordable housing market is

routinely compounded with trans/homonegative environment, might enable a sense of belonging for LGBTQ+ university students in India.

Track 5 Roundtables

PLACE MATTERS: COMPARING PLACE-BASED APPROACHES TO UNDERSTANDING IMMIGRANT INTEGRATION EXPERIENCES IN CANADIAN AND U.S. SECOND/THIRD-TIER CITIES

Abstract ID: 1221

Roundtable

ZHUANG, Zhixi [Toronto Metropolitan University] zczhuang@ryerson.ca, organizer, moderator
AGRAWAL, Sandeep [University of Alberta] sagrawal@ualberta.ca, participant
DEAN, Jennifer [University of Waterloo] jennifer.dean@uwaterloo.ca, participant
HARWOOD, Stacy [University of Utah] harwood@arch.utah.edu, participant
LIU, Cathy [Georgia State University] cylui@gsu.edu, participant
FENNIRI, Stephanie Rivera [University of Pennsylvania] sfenniri@design.upenn.edu, participant

Research on immigrant settlement primarily focuses on traditional gateways in Canada and the United States. There is a dearth of comparative study on smaller cities, or second/third-tier, non-traditional gateway cities, which prevents a pluralistic understanding of the integration challenges different from traditional gateways, the new racial, ethnic, and cultural dynamics emerging in smaller urban, suburban, and rural communities, and the welcoming approaches adopted under different national, regional, and local contexts.

As two major global migration destinations, Canada and the United States share geographical proximity and rich immigration histories. Under these geopolitical contexts, the literature has revealed common tendencies towards the localization of immigration policies and place-based approaches in both countries, such as the federally funded Local Immigration Partnerships in Canada and the grassroots Welcoming Cities and Counties initiatives in the US (Harwood, 2022; Huang & Liu, 2018; Zhuang, 2022).

Despite these shared experiences, the two nations greatly differ from each other in terms of the role of the state in the admission and selection of immigrants, jurisdictional power at the state, provincial, and municipal levels, and how local policies and politics have shaped the destination places. Considering the similar but distinct policy and political contexts between the two countries, it has become imperative to develop a thorough understanding of how local immigration policies and place-based approaches have shaped immigrants' settlement and integration experiences.

Scholars on this roundtable have conducted recent research on the role of planning and local governments in the Welcoming Cities movement (Harwood, 2022; Huang & Liu, 2018), refugee resettlement process (Agrawal & Sangapala, 2020), health promotion of rural migrants (Patel et al., 2019), and in facilitating place-making and spatial integration beyond settlement services (Zhuang, 2022). Drawing upon these studies, the roundtable session will present a comparative perspective that is important but often neglected in the literature and will enhance our understanding of the varied places and local initiatives that help shape immigrants' lived experiences in smaller communities, and vice versa. Specifically, it will address the following questions:

1. How do second/third-tier cities develop place-based approaches that address local contexts and needs?
2. What is the role of municipalities and planners in these place-based approaches?
3. Based on immigrants' lived experiences, what are the contributing factors to welcoming and inclusive integration in second/third-tier cities?

The roundtable discussions will help develop a renewed understanding of how immigrants shape their communities in smaller cities and their relationships with place, and how these differ based on ethnic community, city size (and rural/urban/suburban contexts), municipal planning mechanisms, availability of services, provision of infrastructure, and local history and context.

Though awareness and acceptance of LGBTQIA+ people have grown since the turn of the century, people of sexual and gender minorities have been surviving and thriving in cities long before the latest spate of backlash and inclusion debates. Anti-LGBTQIA+ legislation restricts, and even criminalizes, LGBTQIA+ people's participation in their local services and built environments (ACLU, 2022). In other contexts, the increased visibility and public participation of LGBTQIA+ people realized through complex interaction between activism and local urban politics reveals critical tension between inclusion and normative responsibilities (Podmore, 2015). With genealogies in urban and criminal justice discourse, as well as women of color writing (Moraga & Anzaldúa, 1981), scholars of queer justice (Bacchetta, El-Tayeb, and Haritaworn, 2015; Haritaworn, Moussa, Ware, & Rodriguez, 2018) seek to develop paradigms for dismantling institutional, interpersonal, and market-driven violence.

In this roundtable, we will examine LGBTQIA+ people's claims for justice in cities over time as they inform urban planning's concepts and conversations of inclusive cities. Topics will include racial and colonial capitalisms, telling histories; and modeling, mapping, and sharing spaces. This roundtable highlights case studies from cities in Canada, the United States, and Turkey to explore a queer planning justice through intersectional claims for justice in an inclusive city. We will discuss how the built environment is a site of power and resistance, mobilizing theory in service of healing, community-building, and healing.

Queer experiences of the city elucidate gaps in the field's knowledge of what cities have been, are, and could be. By centering those who have crossed and expanded social boundaries of acceptable genders, this panel asks: who deserves to take up space in what ways? Who deserves to be remembered? How might we better understand how to radically transform fields within urban planning and our roles in moving cities toward inclusive urbanism?

Most universities are now openly embracing Diversity, Equity, and Inclusion (DEI) policies. While this applies not only to college campuses but also to professional and academic organizations, this panel will more purposefully focus on universities. In most campuses around the US an office, many times at the vice-presidential level, has been created to directly address ways to diversify faculty and students. Many of these positions are being held by minority faculties who are working in white majority campuses.

This roundtable discussion proposal is led by faculty who have actively participated on "Diversity Councils" or on Diversity Committees" or on any other equivalent office dealing with DEI. The objective of this session is to critically discuss such DEI efforts, their effect on the faculty involved, how are they being implemented, and their impact on their stated objectives. In other words, are they actually creating a more diverse, equitable, and inclusive campus? Specifically, we propose our conversation to address these questions:

- 1) How are DEI policies actually being implemented specifically on planning and design programs? Are they "working"? Are they ingrained in the actual curriculum, research, and engagement/service? Are they institutionalized? For example, have they had any impact on the way recruiting is happening? Or the value assigned to publications vs activism among faculty? Are courses in the planning and design curriculum that directly address systemic racism?
- 2) Who are the faculty engaged on DEI initiatives, policies and actual implementation? Have their service being valued and their voice heard? As most of them are minorities, are they "tokenized"? Is their involvement on DEI making them even more isolated?
- 3) Are DEI offices and policies part of a more integrated university vision of inclusion and equity? Or are they isolated with disconnected initiatives at the university level? Are the upper administration policies actually addressing systemic racism, colonialism, oppression?

Based on the actual experience of those faculty leading this roundtable, this proposal aims at sharing our experiences and learning from each other. We realized that our experiences are systematically similar, our obstacles are sometimes identical, and our progress many times is minimal. We invite all faculty to listen and share their experiences from within and from outside DEI efforts. Are DEI policies relevant? Are DEI strategies impacting faculty? Are they actually promoting diverse, inclusive campuses?

EQU(AL)ITY AND WELFARE: A POLICY PARADOX VIEW OF PUBLIC HOUSING

Abstract ID: 1064

Individual Paper Submission

ROVERSI, Elena [Auburn University] e.roversi@auburn.edu, presenting author

Starting by exploring how the content and forms of equity and welfare are multiple and shifting over time and space, the research question addressed in this paper is what are the implications of policymakers' choices when giving voice to one claim and one perspective of an issue through public housing policies. Making public housing policies implies deciding over a series of challenging and sometimes contradictory values, going from fundamental rights to the real estate market. Together with other segregationist provisions, public housing policies supported the creation of slums to isolate the African American population of many cities and prevented them from being eligible for public subsidies. It also fostered the creation of a distorted image of housing beneficiaries, often portrayed as lazy, opportunistic, and unskilled, exemplified in the image of the racialized and sexualized "welfare queen".

The method I use in this analysis centers on the concepts of equity and welfare as policy goals analyzed through Deborah Stone's Policy Paradox framework. I examine how four policies (the 1937 and 1949 Housing Acts, the 1968 Fair Housing Act, and Section 8 of the Amendment to the Housing Act of 1974) define who should receive the benefits (equity) and what those benefits represent for them and their community (welfare). I did a literature review of the creation of the Acts and the implications of their provisions adopting Stone's perspective, housing, and planning literature. I used documentation from the development of the Housing Acts and analyzed secondary demographic data on the populations that were subject to, or excluded from, the benefits.

This research finds that a unique and agreed definition of equality is often too ambitious and policymakers are challenged when trying to translate this into practice. Since the initial stages of public housing, this policy sector aimed at providing accommodations for those who could afford decent ones but was never aimed at supporting the poorest segments of the population, such as individuals without revenue. Having income as a requirement for accessing housing subsidies appears to be a paradox, especially for a policy that supplies essential goods to the lowest-income households. It also means rewarding the merit of the beneficiaries, but how can policymakers define, measure, and quantify the abstract concept of merit and translate it into an objective and universal policy? Also, individual effort plays a minor role in how income is distributed, on the possibility of having job opportunities or a regular salary. The definition of welfare is also problematic, particularly since policymakers are generally more interested in satisfying instrumental needs rather than intrinsic ones, leading to less attention to what Amartya Sen defines as the most important strategy for policymakers: assessing people's capabilities to pursue whatever they choose. Relative welfare between the white middle-class household and the black one is brought as an example of the challenges in operationalizing welfare for everyone.

The major implication of this research is that fluctuating social norms and political priorities are in a continuous struggle for their affirmation and concepts like equity and welfare have multiple and valid meanings. Planners cannot avoid operating in a context of perpetual redefinition of perspectives and political claims, but they need to pay more attention to their normative and contextual roots and integrate them into their responses to communities' and minorities' necessities. The "rationality project" is an inappropriate model to understand the dynamics of the polis and address its challenges: there is no absolute right way to frame equity and welfare, but there is a multitude of valid ways for planners to address the needs and quest for equity and wellbeing.

STUDY THE UNDERSTUDIED POPULATION'S TRAVEL BEHAVIORS WITH A NON-TRADITIONAL APPROACH

Abstract ID: 1125

Individual Paper Submission

TIAN, Guang [University of New Orleans] gtian@uno.edu, presenting author

If living in most of cities and places in the United States, it is not easy to get around if you do not have a car. That is because the current transportation systems were planned and built primarily for automobiles decades ago, which has resulted in auto dependency. Not only has auto dependency resulted in many of today's most vexing problems— such as urban sprawl, highway congestion, physical inactivity and obesity, air pollution and climate change, etc., but it also leads to an unequal society. For instance, people who cannot afford or choose not to own cars find public transportation unreliable and inconvenient. People who have to, or prefer to, walk or bike find streets unsafe and unfriendly for pedestrians and cyclists. Evidence shows that certain groups of population tend to walk, bike, or take public transit more than others. These people's travel behaviors and travel needs are understudied in the current literature (TRD, 2022).

When quantifying the relationship between built environment and travel behavior, certain statistical models are always employed. For instance, linear regression models are employed when the objectives are continuous variables, such as vehicle miles traveled (VMT), ridership, etc. In fact, the wide usage of statistical models by individual empirical studies has made the meta-analysis studies possible (Aston et al., 2021; Ewing & Cervero, 2017). All statistical models have an assumption – there is a linear (or can be transferred to linear) relationship between the dependent variable (travel behavior) and independent variables (built environmental variables). However, that assumption is not always met or that is not always the case, as planners know in practice. Planners know that population density has to reach a certain point to make walking to destinations possible. Planners also know that a transit network has to reach certain coverage to attract people taking transit. It is also a known issue in research as threshold effects for years (Galster, 2018). Due to the limitation of data and methodology, this issue has not been addressed until recently. In the last a few years, with the availability of machine-learning techniques, scholars have started to explore this issue by unitizing random forest, gradient boosting decision tree (GBDT), and other machine-learning based models. It is still in an early stage and there are many unanswered questions (Zhao et al., 2020).

To summarize, the issues on travel behavior research in the current literature are: 1) understudying certain population groups' travel behaviors and travel needs; and 2) assuming the relationships between built environment variables and travel behaviors are linear.

This study aims to address these issues by focusing on minority population in U.S. and employing machine-learning techniques based on a 36-region database (over 1,000,000 trips generated by 100,000 households across 36 metropolitan areas in U.S.). This dataset also provides precise household locations and trip ends. Household locations are critical for studying walking and biking behaviors since their travel distances are relatively short, and allow the creation of network buffers around each household location to capture spatial heterogeneity of neighborhoods. As active and more affordable transportation modes, walking and biking are also more likely used certain racial groups and low-income population.

This research will have scientific significance and contributions to the current literature in two ways: 1) explore nonlinear relationship between travel behavior and built environment; 2) investigate the travel behaviors and transportation needs of understudied population – minorities. It will provide better understandings of this understudied population group's transportation needs and advance current knowledge on the effects of built environments on travel behavior. It will help promote an equitable, healthy, and environmentally friendly built environment and society.

THE PROMISE AND PERIL OF RACIAL EQUITY PLANNING

Abstract ID: 1180

Individual Paper Submission

FREEMAN, Lance [University of Pennsylvania] lancefre@design.upenn.edu, presenting author
PAUL, Brian [New York City Council, Land Use Division] bpaul@council.nyc.gov, co-author

Racial equity planning is an explicit attempt to address racial inequities that have arisen due to discriminatory practices and segregation in the built environment. As such it represents a stark departure from the neoliberal, trickle down approach of recent decades which is assumed that race blind planning practices would serve to benefit all in an equitable way. The aim of this article is to introduce the idea of racial equity planning to a broader audience and to contribute to ongoing discussions of how to address persistent racial inequities in the built environment.

We define racial equity analysis or planning as the use of planning studies that explicitly consider whether there are disparate impacts by race or ethnicity resulting from planning actions. The logic behind racial equity analyses is analogous to that which underlies regulations requiring Environmental Impact Statements (EIS). Just as large-scale projects are required to produce EISs to aid in understanding how the environment will be impacted by development, racial equity analyses will help us understand how large-scale planning projects impact racial equity.

The article begins by briefly describing the exclusionary history of land use planning in the US, the legacy of these practices, and the ongoing need to explicitly address racial inequality. The second part of the article describes the case of the Gowanus Neighborhood Plan, a mixed income development in Brooklyn, New York, and the racial equity report that was crafted as a way of examining how the project impacted racial equity. In the last section of the article, the promise, peril and limitations of racial equity planning are discussed.

INCLUSIVE FUTURES? A SYSTEMATIC REVIEW OF SOCIAL EQUITY IN SCENARIO PLANNING

Abstract ID: 1188

Individual Paper Submission

AYAMBIRE, Raphael [University of Waterloo] raayambi@uwaterloo.ca, presenting author
MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, co-author

Scenario planning is gaining popularity and its value has become particularly evident during these times of uncertainty arising from the intersection of the pandemic, climate change, and growing social and environmental injustices (Stojanovic et al., 2014; Zapata, 2021). However, there has been little consideration of how scenario planning as a method incorporates social equity considerations. While there is growing scholarship and practical applications of more inclusive and participatory planning processes that use scenarios in their approach (Berbés-Blázquez et al., 2021), it is less clear whether and how scenario planning as a method used in various disciplines and

across fields of study is driven by and/or integrates equity considerations at all.

Therefore, as a first step in this research, we conduct a systematic literature review to address the question; in what ways does scenario planning address social equity? We specifically investigate (1) whether existing scenario approaches address equity proactively, (2) the dimensions of equity that are addressed, and (3) the approaches used to operationalize equity. The literature search yielded 1,416 results based on searches in SCOPUS and the Web of Science core collection. The 1,416 articles were imported into the EPPI-Reviewer systematic review software and screened for inclusion using predetermined criteria (e.g., English-language, peer-reviewed papers applying scenario planning to urban futures). Post-screening, 200 peer-reviewed articles were included in the analysis. The articles were published between 1996 and 2021 across various fields, including transportation engineering, energy engineering, and urban planning. We frame social equity broadly, allowing us to look for equity in scenario planning in the ways that it corrects or exacerbates past injustices, addresses different types and depths of participatory processes, and serves the creation of more equitable futures for historically marginalized populations.

Overall, the review reveals that social equity in scenario planning is generally ignored completely or underemphasized in favour of quantitative and analytical rigour of scenario processes and cost reduction. For example, only 10 percent of the papers explicitly address equity as a goal and/or potential future outcome of scenario planning processes. Another 20 percent embed social equity under the themes of power, values, and stakeholder interest dynamics in scenario processes and as an outcome of participation. However, most of the studies that speak to equity do so in a shallow manner, equating social equity merely to the presence of some degree of participation. Few consider how the unique circumstances of historically marginalized groups predispose them to manipulation in scenario planning processes and disproportionate impacts of scenario outcomes.

We still find potential in scenario planning as a tool for implementing aspirations of “co-production” (Barry & Agyeman, 2020) and in considering multiple plausible futures with different equity outcomes. But we emphasize that the deliberate integration of social equity as a core component of the scenario planning process is needed across fields of study. As more planners and policymakers in general turn to scenario planning for insight during uncertain times, it is not only essential to gain a better understanding of if and how equity is being addressed in these approaches but also to develop guides for meaningful equity consideration in the scenario building process. This applies to planning scholarship and practice but importantly also to other fields of study that planning practice commonly draws on for scenario building such as transportation engineering, construction management, and economics. The findings point to the need for planning academics to look outside their immediate research areas and publication circles to speak more directly to how scenario planning can become more participatory across disciplines and fields of study.

INCIVILITIES AND WOMEN’S FEAR OF SAFETY IN LOW-INCOME PARKS OF MEGACITY KARACHI, PAKISTAN

Abstract ID: 1260

Individual Paper Submission

SADAF, Afsheen [University of Florida] afsheen82@ufl.edu, presenting author

Parks/Playgrounds are integral part of community open spaces and provides physical, mental, and social benefits to its visitors. Parks/Playgrounds are also perceived as amenities aim to provide equal access to all its residents with no associated cost burden to its users. In practice, this assumption found to be failing in communities and cities which are segregated through race, SES, and any other means. Research on Parks/Playgrounds is usually based on either spatial (park acreage and park accessibility etc.) and/or non-spatial dimension (park quality, park diversity, PA, and optimal park use etc.). “Park Quality” is considered as a very important non-spatial dimension of parks which recently has been gaining more attention from researchers than any of spatial dimensions.

PA and optimal park use are also important factors of park visitation which associate both with spatial and non-spatial dimensions of parks. Some earlier studies generalize both women participation in PA outdoor and park visitation are considerably suppressed by various reasons such as perception and fear of safety, sexual harassment/assaults, distance to parks/playgrounds and presence of opposite gender. One study refers violence, concerning behavior, lack of maintenance, lack of lighting, and traffic/busy roads as biggest indicators of women perception of safety and safety for park visitation. Whereas, other study found “Incivilities”, including use of alcohol and drugs, gangs/political groups activities, graffiti/tagging and sex related incidences, as major deterrent in park use by general population specially women. “Incivility” has a Latin origin “in Civilis” meaning “not of a citizen”. It describes any social behavior which is disruptive and/or threatening. It includes unacceptable social practices such as littering, dumping of waste near, on or around park, graffiti, vandalism, drunkenness, use of drugs, political groups activities etc. These physical surroundings and/or social behaviors send some signal to park users which clearly deters park use by park visitors especially females.

In case of megacity of global south, Karachi, Pakistan, the overall quality of neighborhood parks is entirely depending on the SES they associate with. A previous survey of 50 parks (from all SES) indicates that parks in low-income neighborhood of Karachi are low quality and low maintenance parks including some of the parks where female visitation was null. A recent survey of 15 neighborhood parks in Karachi city reveals that parks showing signs of “Incivilities” are devoid of female presence. The purpose of this paper is to explore the nature of “Incivility” and its level of impact on female perception of safety and park visitation. We want to examine whether this effect is temporary or permanent by surveying those parks periodically in a month. We also want to analyze whether the female perception of safety is limited to adults or is it also prevailing in female children. This study also focuses on the societal norms and cultural views regarding the role of genders in public open spaces such as parks. This paper root its analysis on both quantitative and qualitative data. This empirical study aims to investigate the non-spatial dimension of parks where incivilities in low-income parks are significantly associated with park use and park visitation by women and girls. Their perception of safety and concerns for safety contribute to suppressed park use which ultimately affect their health, independence of using recreational spaces and confidence in urban spaces mainly parks/playgrounds.

NATURE IS (UN)FREE: HOW RACE SHAPES ACCESS TO URBAN NATURE FOR RACIALISED YOUTH

Abstract ID: 1325

Individual Paper Submission

SCOTT, Jacqueline [University of Toronto] jacqueline.scott@mail.utoronto.ca, presenting author
TENNETI, Ambika [University of Toronto] ambika.tenneti@mail.utoronto.ca, co-author

The voices of Black and racialised immigrant youth are often absent from the environmentalism discourse in Canada. This needs assessment was undertaken to explore the experiences of these youth in nearby nature and urban forestry (Scott & Tenneti, 2021). Through focus group interviews, the research explored how access to nature is shaped by race, urbanization, and other socio-economic factors for these youth. As the Black and racialised immigrant youth are sharing space on Indigenous land, the assessment also explored how urban nature can be used as bridge between Indigenous people and racialised immigrant youth in the city.

Two significant events occurred which impacted the needs assessment. First, though the research was blindsided by the Covid-19 pandemic, the pandemic itself changed racialised youth’s perception of, and access to urban nature. Second, the research occurred in the context of the police killing of George Floyd and Breonna Taylor, and the racial profiling of Christian Cooper a Black birdwatcher in Central Park, New York. Thus, discussions on racialised youth

experiences in nature, were heightened by the police murders and the subsequent world-wide protests in support of Black Lives Matter, and the racial harassment of Black people in nature spaces.

The study is significant as it disturbs the waters of environmental discussions in Canada – by including the experiences of youth of colour. These youth, like Black people and people of colour, are largely invisible in environmentalism conversations (Finney, 2014). Studies on immigrant youth tend to focus on education, employment and health/mental health challenges they encounter during the settlement process (Shields et al 2018; Long et al 2014). Intersectional analysis on youth, race, and nature engagement other than in a few outdoor recreation studies are limited (Kloek et al, 2015). This study is a bridge between the environmental sector and the lived experiences of racialised youth in nature. Furthermore, the study questions the standard perception that nature is free and accessible to everyone. It underlined that nature is not a neutral space and access to it is entangled with geographies of race and space (McKittrick, 2006).

CENTERING EQUITY AND JUSTICE IN PARTICIPATORY CLIMATE ACTION PLANNING: DO LOCAL GOVERNMENTS HAVE WHAT IT TAKES?

Abstract ID: 1327

Individual Paper Submission

SWANSON, Kayleigh [University of Waterloo] keswanso@uwaterloo.ca, presenting author

Advancing equity and justice in climate action planning presents a considerable challenge for urban governance actors. This paper provides necessary and practical guidance for developing participatory approaches that can help planners avoid perpetuating the dominant knowledge systems and corresponding planning interventions that have brought us to the current state of climate change and social inequity. The paper advances debate about the nature of equitable and just climate action, and encourages us to consider whether local government planning systems are equally capable of advancing progressive climate action and equity and justice goals.

As climate change increasingly causes disruptions to our natural and societal systems, cities are rapidly developing climate action plans as a comprehensive policy mechanism for reducing carbon emissions and adapting to the risks and opportunities posed by climate change. Debates about equity and justice are central to this trend, but clarity is needed about how these concepts are defined and deployed, and whether efforts to integrate equity and justice concerns into local climate action planning lead to better outcomes for marginalized residents.

The current state of municipal climate action planning indicates a discernible trend toward trying to address equity and justice concerns in local government planning systems, but substantive engagement with equity and justice in climate action planning is mainly rhetorical. Cities acknowledge the unequal climate risks faced by vulnerable residents and stress the importance of equity and justice in addressing disparate climate vulnerability, but proposed climate actions rarely direct resources to the people or places identified as vulnerable (Zoll, 2022). There also appears to be a trade-off between achieving long-term viability of municipal climate action agendas, and participatory approaches that grant voice and decision-making power to vulnerable residents (Chu et al., 2016).

At the same time, deliberation on climate change continues to privilege scientific and rational types of knowledge over ways of knowing that tend to be possessed by less powerful communities (Byskov et al., 2021). Scholars emphasize the need to prioritize disadvantaged residents in our responses to climate change, but participatory planning scholarship is much less explicit about the need to prioritize marginalized residents during decision-making processes. Consequently, the voices of people experiencing overlapping, concurrent forms of oppression are largely excluded from climate action planning processes. This oversight results in mismatches between local needs and the policies recommended in climate action plans.

With the shortcomings of current approaches in mind, this paper addresses two key questions: Can we reasonably expect municipal government planning systems to achieve equity and justice goals, and if so, how might we advance these goals in climate action planning? I argue that addressing equity and justice principles in climate action planning requires participatory processes that make specific efforts to center vulnerable residents. To make this argument, I draw on urban justice and participatory planning scholarship to establish a connection between recognition justice and participatory processes that support communication across differences in social position and systems of meaning. I demonstrate that achieving equity and justice in municipal climate action planning beyond the level of rhetoric requires an expansion of the scope of knowledge—and correspondingly, the scope of actors—we consider during participatory processes (Olazabal et al., 2021). This transition—which would begin to address the dissonance between who cities say are vulnerable, and who benefits from climate action planning—requires reflexive practice. Planners must consider how climate change issues are framed and by whom, who participates and how, according to whose terms of reference, and under what structural patterns of advantage and disadvantage (Blue et al., 2019). Reflection of this nature contributes to embedding equity and justice in the collective conscious of planning.

The significance of micropolitics or the microlevel practices that influence community based practices in planning has been recognized for decades (Briggs, 1998). Yet practical tools for understanding and potentially intervening in these politics are still needed (Meléndez & Martinez-Cosio, 2019). Micropolitics in planning has been used to refer to the role of culture and art, communication practices, and collective emotions like trust (Tait, 2011). These politics are present in co-design processes and affect their outcomes (Calderon, 2020).

In summer 2021 we conducted a design charrette (DC) for the purposes of co-designing an intervention into the accessibility of Work Integrated Learning for Students with Disabilities. We knew in advance that addressing power imbalances and accessibility would be important to this process so we made adjustments to the charrette format based in co-design literature and critical disability studies (Stephens et al, under review). Despite our efforts it was clear that power dynamics still influenced the charrette process in important ways. We proposed to answer 2 overarching questions 1) Where do we see power relations operating within the co-design process, and what do they look like? 2) How do these power relations affect the co design process and the interventions it generated?

To address these questions our multidisciplinary team conducted a qualitative analysis of the data from the DC from August to Dec 2021, with a focus on understanding power dynamics in the charrette. The analysis used the products of the DC, full transcripts of the DC, and observational data gathered by our "Vibes watch"/observational team. We coded the data using a mixed coding approach to account for the known structural hierarchies in the group (student/instructor, disability identifying/non disabled, and professional role) and potential sites of power that were

unexpected. We were broadly led by an intersectional assemblage approach to consider both the flow and fixity of power (Puar, 2012).

Several findings emerged: We noted that ablism (discrimination against people with disabilities) was an identifiable force that led to power imbalances in the co design process. It was significant in that it did seem to impact who's ideas were most centered and received most attention. Ablism was most often structural and took the form of time limits on activities or unspoken cultural preferences for forms of communication, which limited the participation of participants with disabilities among other things. Ablism rarely took the form of explicit discriminatory comments, and in this way this force remained below the surface and was harder to identify/address by participants and facilitators. Ablism was often intertwined with other power dynamics making an intersectional approach necessary.

We also noticed struggles over power happening in the way problems were framed and scoped. Our analysis showed that at times students and professionals framed the problem of access to education quite differently from one another (e.g. the problems within the accommodations process vs the problem with the idea of an accommodations process). The struggle to define a problem within a conversation is a key political moment. The micropolitics present in this struggle included the use of common/dominant discourses, existing structural processes, or unspoken cultural ideas, which could be used to shift the conversation back to a more normative interpretation (e.g. deploying discriminatory ideas that students with disability were a "poor fit" for placements). More effort seemed needed in the deliberative process to reframe a problem in a new way (that might challenge widely accepted ideas) as opposed to maintaining a status quo. This reaffirms the critical role of facilitative leadership, both in pre-consultation to surface different understandings of scope, and in supporting difficult frame shifts if they arise in a collaborative process.

AN EVALUATION OF SOCIAL EQUITY AND RACIAL DISPARITIES IN VISION ZERO ACTION PLANS FOR TRANSPORTATION SAFETY IN US CITIES AND REGIONS

Abstract ID: 1451

Individual Paper Submission

YIN, Jordan [Alabama A&M University] jordan.yin@aamu.edu, presenting author

This paper examines the treatment of social equity and racial disparities in Vision Zero Action Plans for transportation safety in US cities and regions. More than 60 cities and regions throughout US have created action plans since 2014 with the goal of eliminating transportation related fatalities and serious injuries (Walljasper 2019). Issues of social equity and racial disparities are particularly important within this genre of strategic plans due to the well-documented disproportionate incidence of traffic fatalities and injuries faced by people of color (National Safety Council, 2021; Governors Highway Safety Association, 2021).

Content analysis of a robust sample of these plans is used to determine how social equity and racial disparities are addressed in different functional areas of the plan (such as analysis, goals, and implementation), as well as specific measures of plan elements targeting communities of color and addressing racial disparities (Loh and Kim; 2021; Vision Zero Network, 2017). Examination of Vision Zero Action Plans for US cities and regions serves as the basis for both identifying current best practices within the field, as well as defining corrective plan-making approaches and policy improvements based on observed strengths and weaknesses of existing plans.

CYCLING FACILITIES, GENDERED EXPERIENCES AND BICYCLING FREQUENCY AMONG WOMEN

Abstract ID: 1500

Individual Paper Submission

GIACOMANTONIO, Sarah [Toronto Metropolitan University] sarah.giacomantonio@ryerson.ca, presenting author
MITRA, Raktim [Toronto Metropolitan University] raktim.mitra@ryerson.ca, primary author
HESS, Paul [University of Toronto] hess@geog.utoronto.ca, co-author

Central theme: Cycling facilities are a widely used transportation policy tool aimed at promoting healthy and sustainable transportation choices. Although cycling facilities have been shown to enable increased cycling in some contexts (Mitra et al., 2021), the impacts of cycling facilities on mitigating gendered barriers to bicycling is unclear. Women constitute only a small proportion of current bicyclists in North America, with little known about how gender construction and the interplay between various aspects of identity may create barriers to cycling (Garrard et al., 2012; Ravensbergen et al., 2019). Within this context, two research questions are addressed in this paper: 1) How do self-identified women's gendered life experiences influence their commute-related bicycling frequency when compared to men? And 2) What is the role of new cycling facilities in modifying these above-mentioned relationships?

Methods: An online household survey (n= 1,492) was conducted in the Greater Toronto Area (GTA), Canada, in summer and fall of 2019, specifically focusing on 10 urban and suburban neighbourhoods. Five of these neighbourhoods had one recently installed cycling facility, while five others did not have any cycling facility. Correlates of women's bicycling frequency were explored using weighted ordinal logistic regression models. In these statistical models, we examined the interaction between gender (women versus other) and four life experiences (living situation, age, employment and trip chaining).

Results: Results indicated a higher likelihood of commute-related bicycling among women who are between the ages 30-44 years, who work part-time, and who have children, in neighbourhoods with a new cycling facility. Younger women are likely to bicycle more frequently (for commuting) in the absence of cycling facilities. We observed no statistical difference in self-reported bicycling frequency between women who work full time and women who work part time, when cycling facilities were not present. Regardless of the presence of cycling facilities, car ownership negatively influences the likelihood of anyone cycling. Those with a higher education (Bachelor degree or higher) were more likely to cycle to commute in the absence of cycling facilities, but the presence of cycling facilities, a respondent's education level was not associated with their commute-related cycling frequency.

Conclusions: Using a feminist geography lens, we argue that the presence of cycling facilities potentially allow some women to minimize the patriarchal barriers they experience when bicycling, including psychological and social expectations around feminine performance, and embodiment and material understanding of their "cycling body" (Hanson, 2010; Ravensbergen et al., 2020). Findings support the policy efforts focused on providing safe bicycle infrastructure for all population groups.

FINDING COMMON GROUND: INCLUSIVE ENGAGEMENT OF NEWCOMER COMMUNITIES IN LAND USE AND PLANNING DECISION-MAKING PROCESSES IN THE GREATER TORONTO AREA

Abstract ID: 1507

Individual Paper Submission

GHAEM-MAGHAMI, Shervin [University of Toronto Mississauga] shervin.ghaemmaghami@utoronto.ca, presenting author

Following decades of immigration-centered growth, Toronto is among the fastest growing cities in North America and lays claim to being the most diverse city in the world. In recent years, municipal planners in the Greater Toronto Area (GTA) have endeavored to refine their approach to engaging local communities—especially its newcomer populations—in public consultations that inform the planning decision-making process. However, since the beginning of the COVID-19 pandemic, local governments in the region have had to take greater strides towards infusing their engagement practices with added creativity, particularly in confronting obstacles for the effective inclusion of immigrant communities. Drawing upon interviews eliciting the knowledge and experience of planning practitioners, representatives of locally-based civil society organizations, and migrant community members, this research uses case studies concentrating on land use and planning public participation exercises in selected municipalities in the GTA to determine how municipal decision-making processes are evolving to best accommodate newcomers' strengths and adapt to their particular needs.

While some progress has been made with respect to drawing planners' attention to the realities of managing and embracing diversity, commonly-held notions persist among many practitioners that the public interest should be promoted without consideration for the demands of specific groups (Burayidi, 2015). As it relates to planning *for* and *with* diverse populations, Fincher & Iveson (2008) describe the need for generating 'encounter', the production of spaces and environments that can foster meaningful interactions and cultivate mutual understanding and reciprocity among different segments of society. Key elements in this regard are recognition of the value in developing creative participation techniques that engage *multiple* publics and the careful management of expectations on the potential scope, outcomes, and impact of such processes across and within contributing communities (Nguyen et al., 2015).

As immigrants form an increasingly sizable proportion of the GTA's population, learning how to engage them as co-producers of municipal and community plans not only serves to make the practice of public participation in planning a more inclusive and representative enterprise, but also has broader implications for policies relating to multiculturalism, integration, and citizenship. Planning practitioners in the GTA have taken innovative steps to design more accessible methods of engagement during the COVID-19 pandemic, especially in terms of taking on more of an 'activist' role (Sager, 2012) to advocate for the needs of newcomer communities and convene them in a variety of settings to better capture their voices. In particular, there has been a pronounced flourishing of a sense of 'community'—employed as an action to be performed, rather than as a noun or a phenomenon simply to be studied—in order to allow for the identification of a common purpose and the emergence of more cooperative forms of interaction (Blokland, 2017). Nevertheless, as they struggle to navigate the barriers to entry inherent to the top-down planning logic informing most local governments' development practices, planners continue to confront significant barriers to promoting more inclusive engagement activities. It is essential for local governments to extend additional resources to support planning practitioners as they seek to implement culturally-sensitive public participation practices and revitalize their governance structures to more effectively integrate the contributions of and, in turn, best serve the interests of their diverse communities.

WHAT ARE WE PRESERVING? GENTRIFICATION, HISTORIC PRESERVATION, AND PROFESSIONALIZED NONPROFITS AND STONEWALL NATIONAL MONUMENT

GALLEGOS, Joe [University of California Irvine] jgalleg@uci.edu, presenting author

Situated in New York City's Greenwich Village is Stonewall National Monument. Designated by President Obama in 2016, the park commemorates the events of the 1969 Stonewall riots, where queer people fought back after years of harassment and violence by the NYPD. The monument's designation was spearheaded by several nonprofit organizations, including the NYC LGBTQ Historic Sites Project and the National Parks Conservation Association, in the waning years of the Obama administration. The monument consists of the Stonewall Inn bar, neighboring Christopher Park, and uniquely, several of the streets on the surrounding blocks to commemorate the riots that occurred on those streets.

The monument is now a major tourist attraction in Greenwich Village. When visiting the site, one can see people taking selfie pictures with the Gay Liberation statue, which depicts two gay men and two lesbians conversing in the park, or one can go into the bar for an expensive drink (even by New York City standards) with barely an acknowledgment of the events that happened at that site in 1969, save for a small interpretive sign near the Gay Liberation statue. How is there a site to a critical moment in radical history that is seemingly also so sanitized? In this paper, I argue that this may be due to the relationship between professionalized nonprofit organizations, especially ones engaged in historic preservation, and processes of gentrification.

The literature on social movements and historic preservation answer some of this. Social movements have been shown to adopt increasingly bourgeois and middle-class values as they professionalize and grow.[1] Additionally, large philanthropic organizations can engage in movement capture through funding mechanisms.[2] Notably, the NYC LGBTQ Historic Sites Project is part of the larger philanthropic organization Fund for the City of New York. This major organization provides millions of dollars in funding to various nonprofit organizations in and around New York City. The literature on historic preservation illustrates the potential for historic preservationists to engage in gentrification.[3]

The question then is how this might be happening in the context of Stonewall National Monument. Stonewall is in one of the most heavily gentrified neighborhoods in New York City. The monument is flanked by high-end boutique shops and expensive condominiums, both classic hallmarks of gentrification.[4] I will attempt to address this through interviews and archival documents for some of the organizations in question, including the Fund for the City of New York and the NYC LGBTQ Historic Sites Project. Additionally, I am conducting interviews with people at the National Park Service, which oversees the monument.

This has significant implications for planning practice and education because it is essential for planners to consider which nonprofits and organizations to partner with when planning monument projects such as Stonewall. If an organization promotes gentrification in the promotion of a project, planners may need to consider different partners or limit the influence of those partners.

GENTRIFICATION BY ATTRITION, THE CASE OF PILSEN IN CHICAGO

Abstract ID: 1627
Individual Paper Submission

VANIK, Leonor [Independent Researcher] leonor.vanik@me.com, presenting author
BETANCUR, John [University of Illinois at Chicago] betancur@uic.edu, co-author

Gentrification has showed to be highly sensitive to local political economies and specific neighborhood dynamics. Despite the mounting resistance to urban renewal, the neighborhoods of the Near North, Lincoln Park, and Hyde Park in Chicago gentrified rather expediently through the removal of their low-income populations. Similarly, the

central area of the city absorbed neighborhoods to its west and south in a short period of time establishing a continuum of gentrification in the central area of the city. In contrast, despite its central location, Pilsen resisted first 'urban renewal' gentrification in the 1970s and 1980s and public-private gentrification drives thereafter remaining a predominately low-income Latino neighborhood after five decades. This paper examines the ways in which local resistance has kept gentrification in check, especially in the last two decades. This, however, does not mean that the threat of gentrification is over; rather, gentrification has been eroding the neighborhood compact and resistance via attrition measure by the progressive loss of families, the end of Pilsen as an immigrant receiving port of entry, studentification, lack of affordability, culture, and symbolic gentrification.

This research is part of a longitudinal study of Pilsen's immigrant Latino community's trajectory over the past 30 years through a historical genealogical approach using a mixed methods approach of grounded critical visualization by the authors who have followed carefully the politics of gentrification in the neighborhood. We conduct spatial analysis using longitudinal Census data to document the significant and subtle shifts. Using published and unpublished materials from archives, secondary data, published research, interviews, and participant observations to show the ways in which gentrification has proceeded under the radar screen.

As a major form in the recolonization of the city by capital, gentrification has produced significant scholarship ranging from the macro- to the micro-level. Yet, the continued additions to the literature have demonstrated the complexity of the issue and the multiple forms it takes and processes it follows in different contexts and political economies. This paper intends to contribute to the literature through a case that introduces a form of gentrification missing from the literature, gentrification by attrition, while at the same time adding to the literature on neighborhood resistance that, in this case, defeated the repeated intents of growth coalitions for nearly five decades. Lastly, it asks whether resistance can address this form of gentrification - assuming more subtle forms and advancing often under the radar screen.

SUPPORTING AGING POPULATIONS IN A DECLINING REGION: IDENTIFYING OPPORTUNITIES FOR COLLABORATION(S)

Abstract ID: 1683

Individual Paper Submission

MILGROM, Richard [University of Manitoba] richard.milgrom@umanitoba.ca, presenting author

Over the Winter 2021 term, a University of Manitoba planning studio examined a rural region in western Manitoba (see Milgrom & Camps 2021). It is declining in population but includes ten settlement areas ranging in population from 80 to 1,300. The population is also aging at a rate well above that of the provincial average, as is its aging index (the ration of seniors to children). The work of the studio sought to understand the challenges faced by older adults in this environment, and to identify opportunities to support older adults in this situation, where declining populations are followed by dwindling resources and amenities.

The work covered five municipalities that are arrayed in close proximity to the Yellowhead Highway, the main east-west road connection between Winnipeg and Edmonton. They are immediately south of Riding Mountain National Park, and other tourist attractions. And they are adjacent to several First Nations, that range in population from 100 to 1400.

The work has been carried out as part of Social Sciences and Humanities Research Council (SSHRC) funded project: Age-Friendly Community Initiatives: Impact and Sustainability (PI, Verena Menec, Community Health Sciences, University of Manitoba). It has been examining the resilience of the Age Friendly Manitoba Initiative (AFMI) that was launched in 2008, following the principles of the Age-friendly Cities: a guide (WHO 2007) and the Age-friendly Rural and Remote Communities: a guide (PHAC 2009). The communities that were the focus of the studio investigation were represented by local age-friendly committees and/or local political figures interested to continuing to develop

age-friendly projects, or eager to reinvigorate work that had lost its focus.

Students in the studio conducted GIS analysis and met with members of age-friendly committees, local politicians, and agencies in all of the municipalities. They conducted visual surveys of the settlement areas (all virtual during the pandemic). While there were successes (e.g., the development of walking trails, local handi-transit services), the challenges were significant. Most communities lacked a full range of housing choices for seniors, medical and emergency services had been reduced, and lack of coordination between communities led to inefficient and sometime redundant services. Some feared the loss of ability to renew their communities as they aged – schools were expected to close in some places, and retail outlets were closing.

However, the studio also identified some possibilities for collaboration within the region that might shore up supports for older adults. These avenues were explored by a focus group that included stakeholders from the municipalities, and members of the Manitoba Age-Friendly Resource Team, that advocated for seniors' quality of life for seniors and carries some weight with policy makers. Possibilities started with departments and agencies (e.g., planning, housing, infrastructure, health) within the Provincial prevue but the conservative leanings of current government may limit short-term potential for better services (similar to situations identified in the US by Warner & Zhang 2021). But less conventional approaches were also discussed. These included: collaboration between municipalities to improve the efficiency of hand-transit services between communities, and to provide more frequent access to larger centres; taking advantage of the relatively healthy tourist economy of the region to provide age-friendly amenities and services (one small town boasts a good size supermarket because of the large number of near-by cottages; cooperation between the municipalities to attract economic development along the Yellowhead corridor; and potential partnerships with neighbouring First Nations, whose demographic profiles are currently the growing far faster in the youngest cohorts.

EXPERIENCE, EXPERTISE, AND THE RATIONAL IDEAL: FUNDS OF KNOWLEDGE AND INFLUENCE IN OREGON'S DECISION-MAKING BODIES

Abstract ID: 1689

Individual Paper Submission

MELENDEZ, Jose W. [University of Oregon] jmelende@uoregon.edu, presenting author

RENIRIE, Alex [Healthy Democracy] alex@healthydemocracy.org, co-author

As reflected in both planning and public administration theory, there is growing interest in placing communities at the center of government decision-making processes. Planners and administration scholars and practitioners largely agree that public engagement is necessary for establishing legitimate governance. In turn, residents expect to have a role in shaping public policy that impacts their lives. Expectations for government planning processes have moved beyond gathering input and service delivery toward meeting needs and creating more fulfilling experiences for individuals (Lee, 2019; Zingale, Cook, & Mazanec, 2018). More recently, as U.S. states and localities have become increasingly diverse, there are mounting calls for decision making to reflect a wide range of demographic identities, with particular emphasis on the inclusion of communities that have historically been underrepresented and marginalized in planning and policymaking. Yet, designing inclusive spaces requires administrators, planners, and public involvement professionals to decipher how power operates within decision making and pay close attention to design elements that may help balance structural power differentials (Quick & Feldman, 2011; Anonymized for Review, 2021).

This article focuses on one foundational way that power manifests in participatory governance spaces—through access to knowledge, expertise, and ways of knowing. Drawing on interviews with 46 first- and second-generation immigrants serving in public decision-making bodies across various jurisdictions in the state of Oregon, our study sought to uncover how participants employed various “funds of knowledge” based in lived experience, identities, and cultural and institutional affiliations (Esteban-Guitart et al., 2020). The funds-of-knowledge approach was initially

developed by researchers in education and anthropology as a framework for incorporating knowledge systems familiar to culturally diverse students into the highly rational U.S. education model. Central to this approach is identifying knowledge and skills that individuals (i.e., students) have in their homes and their communities that can be activated in a setting (i.e., a classroom). This study drew on this framework to examine the sources of knowledge immigrants employed within participatory bodies. Further, it examined whether immigrants felt they had more influence over government decisions if they relied more heavily on knowledge based in lived experience or technical training. The study findings contribute important insights about the kinds of knowledge that immigrants rely on to participate and influence decision makers. In line with Young (2000) and others, we argue that to create inclusive and empowering forums for participation, planners, bureaucrats and decision makers should actively level the playing field, balancing highly rational forms of knowledge derived from technical training and forms of knowledge that are contextualized, experiential, cultural, and non-rational. We conclude this article with recommendations for facilitating decision-making processes that aim to be inclusive of different forms of knowledge expression. Although we used the term decision-making body across the research informing this article, we note that, while these bodies do make decisions and policy recommendations, most of the bodies studied are advisory groups that have no formal, binding decision-making authority over policy.

THE COLONIA TARAHUMARA IN CIUDAD JUAREZ

Abstract ID: 1732

Individual Paper Submission

VAZQUEZ CASTILLO, Maria Teresa [Universidad Autonoma de Ciudad Juarez] ma.tere.vazquez@gmail.com, presenting author

The Tarahumaras or Raramuris are one of the main indigenous groups in the state of Chihuahua, in northern Mexico. Although they have been living for several decades in the border city of Ciudad Juárez, their colonia only began to take shape in approximately 1996. Climate change and violence have been gradually displacing this indigenous groups to urban areas. Droughts and the land grabbing by drug traffickers have limited the chances of Tarahumaras for survival and have been reducing their chances for living in peace in their places of origin. How is this community integrated in Ciudad Juárez, an industrial city with more than 380 maquiladoras? Where do they live and how are they organized? What is the relationship and representation that this community has in the city? Is city planning takes them into account? These are some of the research questions that motivated this study. Ciudad Juárez receives many immigrants due to the job opportunities in the maquila and the Raramuris have joined this labor force. Racism and classism are elements faced by this indigenous community that wears their indigenous clothes and makes their handicrafts to sell. How does the industrial city behave towards this colonia? Recently, the municipal government opened the space for Tarahumara representative in the City Council and with it the possibility of having a voice in this space previously closed to them. With field visits, interviews with people from the Raramuri community and their representative in the city, I document this colonia that is located on the outskirts of the city. This research documents their way of organizing and their way of planning the Tarahumara colony in a border city that continues to be violent and unjust. Although this community has been widely documented in its places of origin, in the southern highlands of Chihuahua, the documentation of this indigenous group must be done to trace their presence in the city and to propose alternatives to ensure their rights in the city.

GENDERED CYCLING UNDER THE COVID-19 PANDEMIC IN QUITO, ECUADOR

Abstract ID: 1733

Individual Paper Submission

GAMBLE, Julie [Trinity College] julie.gamble@trincoll.edu, presenting author

The global COVID-19 pandemic immobilized cities around the world. Yet in cities like Quito, it became clear that ordinary people went out on a daily basis because they had no other choice. In response in April 2020, the municipal government of the metropolitan district of Quito (DMQ) added bike lanes to existing infrastructure to provide people with healthy mobility options to move around during the global emergency. The Covid-19 pandemic demanded overnight solutions to urban mobility due to limited or canceled transportation offerings. As cycling lanes were constructed, the city grew more insecure for everyone and in particular for women. How did cycling infrastructure create opportunities for women's inclusion in urban public space? Did women's cycling mobilities change during pandemic conditions? This paper responds to these questions by presenting research findings recovered through digital and in-person ethnography. By following ten women who cycle, it draws on participatory WhatsApp photo-diaries, a WhatsApp focus group, semi-structured interviews, and GoPro ride-alongs to show how urban planners extended secure spaces for cycling. Despite physical bodily protection that the feminine cyclists felt against the virus, the paper shows how municipal planners did not directly address other forms of safety required for women to feel safe. As a result, this paper focuses on how feminine mestiza cyclists navigated an insecure urban landscape by bicycle. It presents data that underscore how design solutions that only focus on the built environment do little to address the wider causes of women's fear.

ADDRESSING GAPS IN 'AVERAGE' MEASURES WHEN ASSESSING WALKABILITY FOR ALL

Abstract ID: 1758

Individual Paper Submission

CLARK, Kate [Dalhousie University] kate.clark@dal.ca, presenting author
 TERASHIMA, Mikiko [Dalhousie University] mikiko.terashima@dal.ca, co-author
 DETURBIDE, Katherine [Dalhousie University] katherine.deturbide@dal.ca, co-author

The '15-Minute Neighbourhood' concept – where residents live within a 15-minute walk (or roll) to daily goods, services, and amenities – is a popular basis for the design and analysis of pedestrian-friendly communities. However, the 15-minute 'walkable' journey has often been applied using an assumed 'average' pedestrian model – often adult, male, and able-bodied (Hamraie, 2017) – limiting clear consideration for community members of varying age, gender, or abilities in the assessment of neighbourhood walkability.

Using 'average' walk speed (1.2m/s), most able-bodied adults can travel approximately 1,080 metres – or just over 1 kilometre – in 15 minutes. Residents who are older or live with disabilities experience greater challenges moving around and participating in their communities whose built environment has not been designed with them in mind (Forsyth, 2015). When considering average walking speed of pedestrians with mobility impairment, such as persons who use a cane or crutch (0.8m/s), the 15-minute walkable distance is reduced to 720 metres, while the 15-minute walkable distance of small children and oldest older adults may be as short as 360m (0.4m/s). Pedestrians using

wheeled mobility devices, such as manual and power-assist wheelchairs or scooters, will also have variable speeds of travel.

This research collected indicators of walkability and access to services for 117 communities in Halifax Regional Municipality (HRM), Nova Scotia. Locations of essential services and destinations (e.g., supermarkets, pharmacies, transit stops, outdoor recreation space) were mapped and analysed within three radii of walking distances from most residences in a community. The three distances used for this analysis were 1200m (derived from 1.2m/s, considered to be the average walk speed), 800m (considered more inclusive of persons with mobility impairments), and 400m (the most conservative threshold). Initial results show that while access to all services is available within a 1200m journey in 25% of the communities assessed (29/117), only 12% of communities offer the same within a 800m journey (14/117), and 1% within a 400m journey (1/117). Similar comparisons are made between communities that are home to higher proportions of vulnerable pedestrians. For instance, in communities with the oldest populations (20% or greater proportion of residents aged 65 years or older), 9.1% (2/22) offer all services within a 800m journey. The same was found true of only 2.1% (1/48) of communities with the highest proportions of children (40% or greater).

This research exposes the extent to which vulnerable pedestrians are less likely to comfortably and independently access services and destinations in their communities. By using diverse measures for walkability, including varying 'walkable' distances as well as other environmental factors, neighbourhood-level assessments can offer a more complete and inclusive picture of whose needs are being adequately served. This research proposes a new status quo for walkability assessments to go beyond 'average' measures, by demonstrating the value of considering indicators of walkability with vulnerable pedestrians, particularly children, older adults, and persons who experience disability, in mind.

CONTEXTUALIZING IDENTITY AND HISTORICAL NARRATIVES IN LANGLEY PARK FOR ECONOMIC DEVELOPMENT STRATEGIES

Abstract ID: 1774

Individual Paper Submission

ALVAREZ, Nohely [University of Maryland] nohelyt1@umd.edu, presenting author

In the last two decades, the growth of multi-ethnic immigrant concentrations in the suburbs has outpaced that of the inner-city. Once the aspirational destination for homeownership, upward economic mobility, and White families, inner-ring suburbs have gone through extensive demographic and structural changes. Langley Park is an inner-ring suburb of Washington, D.C. composed predominantly of working-class Latinx residents. Like several post-World War II communities, Langley Park has become racially and ethnically diverse. Yet, it has also faced disinvestment since the 1980s. Due to their proximity to the urban core, inner-ring suburbs like Langley Park have become recent casualties of significant economic redevelopment efforts, such as transit-oriented development. This paper examines the historical and economic development strategies since the 1970s that have been considered by the county and planning agency, and other institutions, as Langley Park became a predominantly Latinx immigrant community.

I argue that post-World War II inner-ring suburbs that were revitalized by minority and immigrant-serving businesses in the 1980s are not benefiting from contemporary economic redevelopment strategies. Instead, their minoritarian identities are being molded and used to encourage redevelopment, all the while marginalizing and displacing small businesses that do not fit the dominant and most profitable narrative. The 2000s saw the naming of the commercial corridor on University of Boulevard as the 'International Corridor', the creation of the Takoma-Langley Crossroads Community Development Agency, and changes in jurisdictional boundaries. These initiatives have been primarily conducted by top-down actors, with an emphasis on marketing and branding potential. Nevertheless, while these institutional narratives capture the capitalization of its demographic body, sector plans often describe the Langley Park community as 'lacking a formal identity.' In 2016, the corridor's area was renamed

the Northern Gateway by Councilmember Deni Taveras to bring together unincorporated legacy communities of her district in Prince George's County. This effort's goal has been to 'rebrand and rejuvenate' and to 'reduce blight in the community' (PG Sentinel, 2016). The most recent effort has been a campaign around 'the Salvadoran Corridor', initiated by the CEO of Salvadoran Corridor Los Angeles, the Salvadoran American Chamber of Commercial, Comunidades Transnacionales Salvadoreñas Americanas, and the local councilmember.

This paper is based on findings from semi-structured interviews and historical analysis and archival research from newspapers and planning proposals, and from dissertation fieldwork. The semi-structured interviews with local small businesses will answer how economic development strategies such as marketing or branding initiatives have may (or may not) helped them and will address the challenges they face during neighborhood changes. Semi-structured interviews will also be conducted with top-down stakeholders, such as the local councilmember, non-profits, and city agencies. These interviews will be compared to understand how narratives of local businesses' lived experiences differ from top-down understandings of the commercial landscape. Through this lens, my paper aims to answer, "Are economic and redevelopment strategies that focus on ethnic identity for marketing and branding purposes valuable in helping immigrant-serving businesses stay in place?"

STUDENTS TAKING OWNERSHIP OF SAFETY ON AN URBAN CAMPUS

Abstract ID: 1815

Individual Paper Submission

LOOYE, Johanna [University of Cincinnati] johanna.looye@uc.edu, presenting author
RAMIREZ LOAIZA, Sebastián [University of Cincinnati] ramirezj3@mail.uc.edu, co-author
SMITH, Carolyn [University of Cincinnati] carolyn.smith@uc.edu, co-author

Central Theme. Gender-based violence against women and other marginalized populations is a significant problem in cities and university campuses across the globe. Cincinnati and the University of Cincinnati campus are no exception. According to the 2017 Women Helping Women annual report, sexual assault responses rose 40 percent and therapy services more than doubled. They served nearly 11,300 clients including nearly 6,000 survivors. On UC's Uptown Campus, according to the Department of Public Safety, 15 cases of rape were reported on campus (including residence facilities) in 2020, with 15 in 2019 and 9 in 2018. Aggravated assault included 15, 16, and 24 for the same years (though not necessarily against women).

This Participatory Action Research (PAR) project describes researchers partnering with UC-related women's groups to employ a cellphone mapping app (e.g., Safetipin) that tracks respondents' perception of the safety of specific spaces on and around campus. This employment of cell phones provides an opportunity to update findings from earlier studies on campus violence. In addition, the project employs Geographic Information System mapping of where crime has occurred, based on official reporting. Focused largely on the built environment, the self-reporting and official records will be compared to produce a data base of campus locations associated with violence.

The focus on the built environment reflects how elements are often designed and installed without adequate consideration of how they may increase potential for violence against women and other vulnerable populations. In terms of the characteristics of the spaces, the Safetipin app asks for an assessment of variables raised in the literature: lighting, openness, visibility, people, security, walk path, public transport, gender usage, feeling.

Approach and Methodology. The Participatory Action Research methodology emphasizes the research team working alongside student groups in identifying problems, selecting software, collecting, analyzing, and interpreting data, and developing and implementing action plans to address the issues. Several campus organizations will be partners in the process, which is anticipated to last one year.

The first, assessment, phase of the research is the subject of this paper and examines the research team mapping crime data based on City of Cincinnati and the UC Department of Public Safety's records, beginning with on-campus

incidents, and extending to near-campus incidents. A complementary element involves collaborating with groups on campus that are particularly vulnerable to violence. Initially we will engage campus women's groups, like sororities. These groups will use cellphone apps like Safetipin to assess perception of safety on different paths through campus, at different times of day.

Main results. The main result will be the comparison of the two datasets via GIS. The expectation is that there will be considerable overlap between places where fear of crime is high and where crimes have occurred. If this is the case, then we hope to be able to assess the effectiveness of Safetipin-type apps to identify problem spots. Mismatches will either point to places where crime may be likely but has not (yet) occurred or where the app needs refinement. Qualitative analysis of photographic evidence will look for elements of the built environment that reveal patterns.

Relevance. This phase of the research will examine the intersection of self-reported sense of safety on/near campus and official data on crimes from university and municipal reports. Ultimately, the PAR project proposes to collaboratively identify places that make persons feel vulnerable, recognizing that violence against vulnerable population is facilitated by the physical environment in which they live. The project will eventually incorporate co-creation/modification of software and analytical approaches to examine patterns of crime and perceived risk and to develop strategies to advocate for mitigating problems and new construction on/near campus.

INSURGENT BUREAUCRATS: HOW MUNICIPAL BUREAUCRATS MOBILIZE FOR RACIAL EQUITY AND JUSTICE IN LONG BEACH CALIFORNIA

Abstract ID: 1825

Individual Paper Submission

NICHOLLS, Walter [University of California Irvine] wnicholl@uci.edu, presenting author
COUTIN, Susan [University of California, Irvine] scoutin@uci.edu, co-author

Central Themes:

This paper examines how municipal bureaucrats can play a strategic role in pushing a racial equity and social justice agenda in their cities. It does this through the case of Long Beach, California. The literature on advocacy and insurgent planning largely focuses on the role of community organizations in mobilizing for more inclusive policies (Miraftab 2009; Friedmann 2011). This literature conceives of government bureaucrats as either working on behalf of the neoliberal capitalist state (Brenner and Theodore 2002; Stein 2019) or as playing the role of neutral arbiter in deliberations between contending stakeholders (Forrester 2009). Rather than serve as a tool of the neoliberal state or neutral arbiter in planning deliberations, this paper shows that bureaucrats can also become insurgents who collaborate with allies (community organizations and elected officials) in a struggle to advance equity and social justice agendas.

Methodology

The paper draws on five sources of information. First, we performed interviews with 16 bureaucrats and nonprofit organizations. Second, we employed demographic and political data to assess the changing context. Third, we constructed a dataset based on newspapers articles for the period of 2010-2020. The searches yielded a total of 153 relevant articles. This data was used to analyze issues and debates, key actors involved in debates, and protests. Fourth, we performed observations and analyses of relevant pre-recorded city council meetings and public deliberation for the 2010-2020 period. Fifth, we performed qualitative and quantitative analyses of important

documents (e.g., Strategic Plans, Housing Element) of two different departments (Parks and Recreation, Urban Planning) over a twenty-year period. This allowed us to assess the impact of insurgent bureaucrats on language and strategic priorities.

Findings

Our paper shows that Long Beach has moved in a decidedly inclusive direction over the past ten years. The city sponsored a racial reconciliation committee run by insurgent bureaucrats, city council adopted many of the committee's recommendations, and strategic documents (Housing Element, Strategic Plan) embrace the language and goals of racial equity and social justice. We explain for these changes by identifying the growing prominence of insurgent bureaucrats from 2016 onwards. These bureaucrats collaborated with like-minded bureaucrats and community allies, adopted similar discourses and viewpoints, and mounted Rather than serve as a tool of the neoliberal state or neutral arbiter in planning deliberations, campaigns to achieve their common goals. They worked closely with one another to incrementally improve their positioning within the bureaucratic field. Over time, this small group of bureaucrats acquired more resources, climbed the bureaucratic hierarchy, and established a network of supporters across the bureaucratic field. Alongside progressive organizations and politicians, this network of bureaucratic insurgents played a decisive role in pushing the enactment of more equitable and inclusionary policies.

Relevance

The planning literature largely ignores the role of bureaucrats as activists or insurgents in broader struggles for social justice and racial equity. This paper suggests that, under certain conditions, government bureaucrats can work in broader coalitions to achieve such goals. Though we understand the important structural constraints on bureaucrats, we nevertheless argue that the planning literature needs to develop better theory to understand the varying levels of political agency within government bureaucracies.

Community planning is an essential pathway to addressing social, cultural, and economic discrimination (Christensen, 2010). The characteristics of the physical environment affect opportunities for community integration independent of socioeconomic and demographic variables. In particular, the human-made environment that provides the setting for human activity influences an individual's community integration (Christensen & Byrne, 2014). A supportive environment facilitates participation in everyday activities and relationships, provides opportunities for self-determination, and allows individuals to build social capital (Law, 2002).

This presentation is part of a larger research project developing a comprehensive socio-ecologic framework describing the physical environmental factors associated with community participation for individuals with disabilities. The lack of inclusion of people with disabilities in planning and design fields has contributed to physical environments that exclude this population from accessing and participating (Imrie & Kumar, 1998). This framework will examine the effect of mainstream community planning practices and policies on individuals with disabilities' community participation.

This research addresses inclusion in planning policy and practices by asking, what barriers prevent people with disabilities from participating in their communities? And what practices exist in evaluating obstacles and facilitators to inclusion in the built environment?

To assess accessibility and community participation issues for individuals with disabilities, the research team reviewed literature focused on evaluating the built environment and social participation of people with disabilities. Building from the literature review, researchers adopted the framework Human Development Model- Disability Creation Process (Fougeyrollas et al., 2019). The tools used to validate the HDM-DCP, the LIFE-H, and the Measure of Quality Environment questionnaires, account for physical limitations, built environment, and social obstacles to inclusion. These assessment tools are complemented by the built environment and social sustainability assessments methodologies (Mahmood et al., 2019; Rashidfarokhi et al., 2018), together with elements from the Community Health Inclusion Index (NCHPAD, 2015)

The researchers maintained the categories of both the LIFE-H and MQE questionnaires that are under the influence of planning policy, including physical accessibility, public infrastructure, and commercial services. In addition, a review of publications-covering a variety of disabilities collected obstacles and facilitators noted throughout the studies. Using the category classification and the scoring scale of the LIFE-H/MQE questionnaires, researchers created a rubric for planners to evaluate planning documents' considerations of these obstacles and facilitators, for example, commercial and community services, an-MQE categorization, can support or hinder the life habit of participating in community life (LIFE-H). Influencing factors include location size, accessible parking, and usability of entrance (Lit Review). The following steps in this project include reviewing planning documents using the rubric to score the level of facilitators and obstacles addressed.

Findings in reviewing disability-inclusive planning policies include a lack of explicit disability focus in plans, a limited scope of disability, focusing on aging and mobility, and the role of attitudinal barriers in preventing inclusion despite the accessibility of the environment. These findings help identify gaps in included populations, amplify the concerns of stigma, ableism, and discrimination as barriers to accessing the physical environment, and help further the planning best practices to prioritize a variety of disabilities in the planning process.

STRENGTHENING NETWORKS OF SURVIVAL FOR UNDOCUMENTED IMMIGRANTS: FROM RELIEF DISTRIBUTION TO RADICAL FORMS OF CARE

Abstract ID: 1892

Individual Paper Submission

SARMIENTO, Carolina [University of Wisconsin-Madison] carolina.sarmiento@wisc.edu, presenting author

While immigrant communities in the United were disproportionately harmed by the COVID-19 pandemic, undocumented immigrants were categorically excluded from the federal stimulus checks in 2020 and face numerous barriers to accessing other forms of assistance. Building on years of organizing against gentrification, deportations, and other discriminatory planning practices at various scales (Hum 2010; Carpio, Irazábal, & Pulido, 2011, Sandoval 2021), migrant and migrant serving organizations responded to the crisis by providing mutual aid and relief aid. However, even national organizations reached capacity minutes after opening applications due to having less aid available than what was needed. The state of California and other organizations made additional funding available through public-private partnership, grantmakers, and nonprofit organizations.

This research is a participatory action research project done in collaboration with one local grassroots organization on the front line of supporting undocumented immigrants through cash assistance in the City of Santa Ana, one of the hardest hit cities in Orange County, California. Despite the years of experience, organizations like this cultural center

had never experienced this type of health crisis nor had participated in cash assistance programs at this level but build on local organizing and transnational networks (Sarmiento & Beard 2014). Lxs Esenciales was a project meant to reach those individuals excluded not only from the federal relief program but also from the majority of relief efforts due to undocumented status, precarious housing, flexible employment, and low rates of formal education. The case study analyzes participant observation of the relief distribution processes, organizing meetings, and in depth interviews with a group of 14 immigrant women from the community. The research also includes a participatory analysis of 682 survey responses of benefit recipients from across Orange County that were administered by community organizers. These analyses were completed in collaboration between organizers and University of Wisconsin-Madison graduate researchers and intend to both provide an overview of benefit recipients (who they are, their struggles during the pandemic, and how they compare to surrounding communities in the context of COVID-19) — and also highlight the experiences of the interviewers whose organizing has been essential to the success of Lxs Esenciales. In addition to activating spatial, cultural, and social networks, organizers established agreements in distributing assistance and provided community support as a way to process trauma, rehumanize, and rebuild trust in each other in order to reach those most in need (even amongst the undocumented community). We found that the organizers of Lxs Esenciales, most of whom were undocumented women, expressed radical care in various forms at the individual and community level, with implications for how to address structural barriers and the compounded risks experienced by the community. These actions helped reinforce trust in each other, specifically in community organizations, but not necessarily trust in structural systems. Instead, the assurance and safe keeping fostered between community members and the organizers demonstrated how mutual aid and community networks may be reliable resources but heavily dependent on established relationships and spatial, social, and cultural networks.

DO SIZE AND LOCATION MATTER? THE IMPACT OF LOCAL IMMIGRATION PARTNERSHIPS ON IMMIGRANT INTEGRATION IN SMALL AND MEDIUM-SIZED CANADIAN CITIES

Abstract ID: 1909

Individual Paper Submission

ZHUANG, Zhixi [Toronto Metropolitan University] zczhuang@ryerson.ca, presenting author

In Canada, 75% of immigrants concentrate in three gateway cities (i.e., Toronto, Vancouver, Montreal), which have primarily drawn researchers' attention. There is a dearth of research on immigrant retention and integration in Canadian smaller cities despite a growing number of immigrants settling there in recent years (Williams et al., 2015).

In order to attract immigrants to small and medium-sized communities to address local economic and demographic challenges (Graham & Pottie-Sherman 2020), the federal government has formed the Local Immigration Partnerships (LIPs) since 2008 to leverage community resources and engage local governments and agencies to strategically plan for the settlement and integration of newcomers at the ground level. LIPs have been found to be successful by virtue of place-based initiatives, localized program delivery, and their ability to build strong multi-sectoral partnerships (Cullen & Walton-Roberts, 2019; Veronis, 2019). Therefore, LIPs have been described as an essential framework in fostering improved outcomes for newcomers. However, much of the research attention regarding LIPs had focused on specific case studies at specific locations whereas a systematic examination of LIPs practices, priorities, and challenges have not yet been academically studied. This hinders our understanding of the varied places and local initiatives that help shape immigrants' lived experiences. It calls for a systematic approach to compare and contrast local policies and settlement and integration approaches which will help local governments and communities to tackle settlement and integration challenges in smaller communities.

This study aims to investigate two research questions: 1) How have small (<50,000), medium (50,000-500,000), and large (>500,000) municipalities across Canada developed local intentions and integration strategies? 2) Considering various local contexts (e.g. historical, geographical, and physical attributes), what are the contributing factors to welcoming and inclusive integration in small and medium-sized cities?

Using a mixed-methods approach, this study systematically surveyed 62 respondents from 42 LIPs across Canada

about their current priorities, practices, and challenges of immigrant settlement work from a local capacity; followed by 19 semi-structured interviews with LIP coordinators who had filled out the survey. The results indicated that LIPs regardless of size and location were primarily established to coordinate service delivery at a localized capacity and coordinate inclusion to address increasing diversity in their communities, and that physical location impacts LIP-partner coordination. For most small and medium-sized cities, the current prioritization of LIPs are related to immediate settlement needs such as employment, housing, and language training, whereas the civic, social, and multi- and inter- cultural (including Indigenous-Newcomer relations) related integration work tends to be recognized as important but are secondary or not considered in implementation. Notable practical challenges that smaller LIPs may face were found to be: a disconnection between the role of LIPs to facilitate local coordination and their capacity and mandate from the federal government, challenges to municipal buy-in especially in politically conservative environments, contingency on municipal and provincial support to implement place-based initiatives, and engagement implications from the COVID-19 pandemic.

This paper argues that municipalities have an imperative role to play in championing and supporting the work of LIPs and developing a structured framework for social, cultural, and civic engagement and inclusion is required. The findings highlight the importance of smaller LIPs in shaping welcoming and inclusive communities and what this means for the future of immigrant settlement and integration in the Canadian context. It contributes empirical knowledge of the role and imperative of smaller LIPs to address challenges related to newcomer integration in place which may have implications towards diversity, equity, and inclusion related to anti-racism and reconciliation.

TOWARDS ANTI-RACIST PLANNING IN MINNESOTA? EXPLORING THE EXPERIENCES OF PROGRESSIVE WHITE AND BIPOC PLANNERS

Abstract ID: 1920

Individual Paper Submission

BURGA, Fernando [University of Minnesota] hfburga@umn.edu, presenting author

As the discipline of urban planning in the United States confronts an institutional reckoning due to its embedded legacies of white supremacy, professional planning culture in Minnesota (MN) emerges as a relevant field to investigate how progressive planners incorporate antiracist approaches into their practice. By carrying out a qualitative study based on archival research, policy analysis and open ended interviews, we argue that the incorporation of anti-racist approaches in urban planning practices involves a tension defined by the embrace of new discourses, techniques and frameworks addressing Racial justice, but also re-affirmation of a progressive status quo. To consider this position we interviewed 20 self-identified white and BIPOC planners from across MN. Our findings establish a conceptual framework based on three domains: Technocratic Resistance and DEI Fatigue, Tepid Ally ship, and Emergent Double Agency. Within this framework White progressive planners struggle with the notion of allyship and negotiate questions of Race to maintain the status quo, while BIPOC planners steer away from DEI work to practice a double agency based on anti-racist strategies and tactics. We conclude by considering how the imperative for anti-racist work may involve moving beyond the delivery of DEI frameworks prioritizing the education of white practitioners towards the recognition of BIPOC identities as the basis for emergent anti-racist strategies and tactics in urban planning work.

BLACKENING THE CITY: COUNTER-CARTOGRAPHIES AS A TOOL FOR COMMUNITY PLANNING

Abstract ID: 1922

Individual Paper Submission

HAMILTON, Bria [York University] bria.shamilton@gmail.com, presenting author

Blackening The City: Counter-Cartographies as a Tool for Community Planning engages with the concept of counter cartographies as a tool for creating spatial equity, underpinned by Black Feminist Theory. Historically and currently, the spatial distribution of cities is heavily skewed to favour those in positions of power. Practices have focused on the needs of socioeconomic elites and prioritized the city as a vehicle for economic success, rather than the success of its citizens. Access to social services, transportation, safe and affordable housing, healthcare, and other necessities need to be prioritized in marginalized communities for them to thrive. Black Feminist Theory offers a theoretical lens through which planning processes can be viewed, as it centres the intersection of racialized and gendered oppression towards creating equitable spaces. Black Feminist Theory elevates marginalized voices, as they are the most knowledgeable of the issues they face.

This study focuses on Jane and Finch, a community in Toronto that is predominantly made up of visible minorities, with Black people making up just over twenty six percent of the population. The community is heavily stigmatized, due to white supremacist stereotypes associated with racialized, migrant, and low-income communities. This study documents ways in which Black women move through and connect with their community using counter cartographic methodologies. Community members are engaged in a participatory counter mapping workshop using GIS software, and walking interviews. The information gathered in both methodologies is evidentiary of the multiple ideas, experiences, and truths that exist in space and across time. A spatial analysis is then performed on the data collected, that culminates in an online mapping tool that writes the community from the view of its residents, and serve as a planning consulting and advocacy tool. The spatial analysis highlights the ways Black women move through and engage with space, and how this movement is shaped by current urban planning practices and policies.

Counter cartographies offer a vehicle through which Black Feminist Theory can be applied. Through using counter cartographic tools and methods, this study rewrites space through a gendered and racialized lens, and subverts the power imbalance that exists in traditional mapping. The final mapping tool includes the knowledges of Black women in Jane and Finch, and visualizes narratives of marginalized communities, voices, and geographies. This study investigates the use of counter cartographies as a vital planning tool towards creating more equitable communities where the needs of marginalized people are met, and their dreams and desires are written into their landscapes. Since urban planners regularly consult maps, I conclude that counter cartographies aid in centring the knowledges of Black women in a tool that underpins much of planning work, and thus ground planning in anti-colonial and anti-oppressive knowledges and practices.

Recognizing that urban configuration is not neutral and how one navigates the city is shaped by diverse experiences, recent contributions made by feminist scholars and feminist movements in the past decades have called for a gender perspective in urban planning and design. According to Valdivia (2018), social characteristics determine the privileges and oppressions that we experience in our daily lives in the urban space. Some of these include gender, class, race, sexual identity, age or functional diversity, among others. The city, designed with an androcentric character, has failed to consider the plurality of needs and experiences of women and cuerpas disidentes in its configuration. Framed upon Ana Falú (2009) and other contributions (Vega, 2011; Ramos, 2021; Valdivia, 2018), we define cuerpas disidentes as bodies that challenge the politics and social norms of binary definitions of gender. Drawing on feminist critiques of Lefebvre's "right to the city" theorization, Pérez Sanz (2013) emphasizes the importance of reflecting on the countless violations gendered bodies are subjected to when exercising their rights to public spaces. These violations, such as sexual violence, street harassment, transphobia, and other forms of gendered violence, entail serious implications on patterns of movements, daily reproductive tasks, and matters of safety when women and cuerpas disidentes navigate the city. Several studies in the disciplines of geography, planning, and architecture have paid close attention to women and cuerpas disidentes' perceptions of (in)security in urban spaces. While there is scholarly literature found on the subject, there is a limited body of literature regarding the experiences of Caribbean women and cuerpas disidentes on these matters. This study seeks to contribute a particular focus on the experiences of Puerto Rican women and cuerpas disidentes' perceptions of (in)security when moving through public spaces in the urban center of Río Piedras.

Like many town centers in Puerto Rico, Río Piedras started as a colonial plaza surrounded by a grid system buzzing with housing and commerce. Due to its direct connection to the capital through the Carretera Central, it became the ideal transit and exchange hub between San Juan and the rest of the island. However, during the second half of the twentieth century, the combination of sub-urbanization efforts and large-scale shopping malls pushed citizens and local businesses out of the area. In addition, other migrating spatial and geographical limitations on a national level, such as an increase in migration to the United States (Ramos, 2021), have resulted in the loss of residential population in Río Piedras, leaving behind a shadow of what the urban center once was. Despite having the largest University of Puerto Rico (UPR) campus on the archipiélago a few blocks away and a culturally diverse population, community efforts have not been supported enough by the State to prevent its fragmentation. For these reasons, the deteriorating infrastructure, enclosed alleys, poor illumination, and the social-spatial implications of public disinvestment have contributed to the area's high incidence of street violence.

Driven by the increasing levels of gender violence in Puerto Rico and our own experiences navigating the urban center as gendered bodies studying at UPR, this action-research experience focused on urban design elements and their relation to perceptions of (in)security by women and cuerpas disidentes that either study-live-work-play Río Piedras. Using participatory mapping methodologies, walks, and community dialogues, we identified what elements in the urban space made participants perceive certain areas as more or less (in)secure.

WHY INDIA'S TRANSPORT SYSTEM FAIL ITS WOMEN? GENDER SEGREGATION, SURVEILLANCE, AND TECHNOLOGY FETISHIZATION

Abstract ID: 1944

Individual Paper Submission

SINGH, Seema [Cornell University] ss3625@cornell.edu, presenting author

In India, women's concerns in urban transportation primarily surfaced through the lens of safety in 2012 (ITDP, 2017; Mahadevi et. al, 2016), post the high-profile gang-rape case of a 23-year-old student on a moving bus in Delhi – the nation's capital. The Government of India, since then, has undertaken multiple initiatives to address women's mobility needs in cities in India. Some of the common interventions include increased real-time tracking of public vehicles, the introduction of CCTV cameras in public spaces, and the introduction of women-only helplines and women-only transportation services, among others. This paper presents a critical review and analysis of the state response to providing a safe and inclusive mobility environment, particularly for women in cities in India. In doing so, it highlights the limitations and gaps of this 'security-led' approach and how it fails women by not adequately accounting for their needs.

The article draws on the fieldwork undertaken in the northern state of Haryana in India between 2017-19. A diverse range of research methods, including on-site observations, document analysis, and in-depth interviews conducted with planning actors, women groups, and other stakeholders, are used to assess and challenge the current transport policies and planning approach, with a focus on identifying gaps and limitations of this 'security-led' approach.

The preliminary study findings indicate that the Indian state's response to women's mobility concerns can be grouped into three broad categories: gender segregation in public transport vehicles (Agrawal & Sharma, 2015), increased surveillance of public spaces (Banerjee & Loukaitou-Sideris, 2013), and heavy reliance on technology for quicker response to incidents of violence. The paper argues that this approach of the Indian government is not only reactive and scattered in nature, but also offers only a temporary solution to a much more complicated problem. Though in some ways, the security-led approach has led to an increase in the perceived sense of security among women on specific routes or transport modes, it however does not get to the root of the problem of gender-blindness in transport of gender-blindness in transport policies and planning practices. It instead creates new geographies of tension and gender-based conflict and reaffirms the patriarchal belief that 'women need protection.' The paper concludes with a discussion about the limitations of this 'security-led' policy response of the Indian government and suggests measures for a more comprehensive approach towards building more gender-sensitive mobility systems in cities in India.

The study findings would be of particular interest to transport planners and policymakers interested in gender-sensitive planning and policymaking in general and in special context to India.

WE THEE DISPLACED: INVESTIGATING HOW BLACK WOMEN NAVIGATE THEIR TRANSITION OUT OF GENTRIFYING NEIGHBORHOODS

Abstract ID: 1948

Individual Paper Submission

ANDREWS, Bi'Anncha [University of Maryland, College Park] andrews1@terpmail.umd.edu, presenting author

Central theme

As gentrification rapidly reshapes historically disinvested neighborhoods, low-income African American communities have been a primary focal point for researchers. While scholars have critically analyzed this process primarily in terms of race and class-based inequality; few studies articulate how race, class, and gender dynamics intersect (Butler and Hamnett, 1994; Bondi, 1999) and contribute to why specifically low-income Black Women are often more vulnerable to displacement. Moreover, there is little research within the gentrification and displacement literature that follows

black women to their new locations post-displacement to understand what the transition process is like for them specifically. Meanwhile, Black Women are forced to grapple with rising housing costs, the social and physical transformation of their communities, and ultimately displacement to make way for more affluent households. Consequentially, the exclusion of their thoughts, concerns, and basic needs from the decision-making process is often followed by the greenlighting of demolition and/or new development projects that fuels their displacement. As a result, this qualitative study will pursue the following questions: (1) where do black women go post-displacement; (2) how do they navigate their transition out of gentrifying neighborhoods? and (3) how can their perspectives help inform effective anti-displacement policies and strategies designed to protect Black Women when their communities gentrify.

Approach/Methodology

Theoretically grounded in Black Feminist Thought, this study will collect primary and secondary data using semi-structured interviews and archival analysis, to investigating how low-income Black Women experience gentrification, survive displacement, and navigating their transition out of gentrifying neighborhoods. Following IRB approval, I will recruit participants through snowball and convenience sampling from multiple neighborhoods that have gentrified across the U.S. In addition, I will conduct an archival analysis of newspaper articles and reports that document black women's displacement and their participation in anti-displacement efforts after learning that their communities were being gentrified. Compensation to participants will be in kind services and assistance with connecting to needed resources and opportunities in their new locations. For my participant sample, I will purposefully seek a diverse array of identities and expressions to speak to the layered complexities that make up black women's lives (Collins, 2015; Crenshaw, 1990). I will transcribe and code each of the participant interviews, employ software to assist with analyzing the data for themes, and conclude with a full summary of the experiences shared.

Relevance

Gentrification is much more than the redevelopment of a neighborhood or an increase in the flow of capital into a non-affluent community. It is a multifaceted process of strategic community redevelopment that is socially, politically, economically, and culturally driven. When accompanied by displacement, it becomes a vicious process that changes the characteristics of a community by uprooting longtime residents, erasing local histories, and disrupting social networks and community institutions (Fullilove, 2004). For black women specifically, more research is necessary to understand the pressures that force their displacement; and how to create effective anti-displacement policies and strategies that protect them when their communities gentrify.

FRAMES OF BLACKNESS IN THE RACIALIZED PALIMPSEST CITY: AN INCORPORATED COMPARISON OF CHICAGO, ILLINOIS AND JOHANNESBURG, SOUTH AFRICA

Abstract ID: 1967

Individual Paper Submission

WOODARD, Davon [University of Washington Tacoma] davon@uw.edu, presenting author

This research, an incorporated comparison, explores the digital dialectic between local municipalities and Black-identified residents centering on the digital discursive practices and frames of Blackness enacted within municipal Twitter accounts of the cities of Johannesburg, South Africa and Chicago, Illinois.

The United States and South Africa, specifically, Chicago and Johannesburg, are exemplars of “archsegregation” (Nightingale, 2012). While Blackness was differently operationalized in the respective geographies, both histories derive from a singular racialized evolutionary arc based on the conceptualization, and centering of race, and humanity, within European whiteness and categorization of Blackness as “other,” and “nonhuman,” as theorized within Wynter’s archipelago of Human Otherness (Wynter, 2003).

Embedded in the fabric of urban form and function through the profession and practice of planning, the operationalization of these delineations transforms the modern city into a racialized palimpsest city, defined as an urban form in which historical racialized forms and functions remain not just politically, socially, and institutionally legible, but their presence and ineffective erasure alters and undermines new discursive content and contexts – continuing to inform the differentiated geospatial, health, social, and economic outcomes of Black communities.

As the most resident proximal unit of government with comprehensive economic, spatial, physical control over its residents, the city has become both the site, and source, of discourse and contestation of urban place and space. Following municipal adoption of social media tools, the sites of urban discourse now encompass both physical and digital space and place. While initially called “great equalizers,” social media practices are enacted from, and within, broader social, political, and economic matrixes derived from historic and contemporary choices centered on racialized otherness, geographically embedded over time. The continuation of racialized othering within urban (digital) discourse, harms through a “ubiquitous and deep-seated form of injustice, called ‘misrecognition’...whether out of malice or out of ignorance...[Misrecognition] subverts the possibility of equal democratic participation” (Harris-Perry, 2011).

In complementing ways, discourse analysis and framing analysis are both “preoccupied with how ideas, culture, and ideology are used, interpreted, and spliced together with certain situations or phenomena in order to construct particular ideative patterns through which the world is understood by audiences” (Lindekilde, 2014). This research strives to deepen the understanding of the frames of race (Blackness) embedded in municipal discourse to understand their ideologies, contextualizations, and motivations and most critically, how Black audiences engage, disengage or contest these representations.

Situated within a transnational Black feminist social matrix. This research applied integrated qualitative mixed-methods, including digital ethnography, grounded theory, frame analysis and Fairclough’s social change discourse analysis (Fairclough, 1992) to four-months of Twitter data collected from the respective cities between December 2019 and March 2020. Through this research, six latent frames used to enact Blackness, of which four were present in both geographies, emerged from within the data. Additionally, this research contributes and an analysis of the contradictions present within democratizing municipal discursive practices enacted within existing hegemonic structures of control.

EXPERIENCES OF WOMEN AND MINORITIES IN THE WORKPLACE: BIAS, UNFAIR TREATMENT, AND THE STATE OF DEI IN THE PLANNING INDUSTRY

Abstract ID: 1969

Individual Paper Submission

SHIRGAOKAR, Manish [University of Colorado Denver] manish.shirgaokar@ucdenver.edu, presenting author

Equity has been central to the planning profession for some time. The Code of Conduct for the AICP includes a section on working to provide economic, social, and racial equity in communities where planners practice. Recently, AICP has started requiring annual credit maintenance for equity training. However, there has been limited attention by scholars focused inward on diversity, equity, and inclusion within the planning profession itself (García et al. 2020; García et al. 2021; Jackson et al. 2020; Lee et al. 2020; Transportation Research Board, 2021). Focusing on positions around DEI within the profession and tools for changing DEI outcomes, I ask: how do women and racial/ethnic minorities vary in their assessment of DEI relative to men and the white majority?

This paper is based on a survey that was designed through deliberations within the DEI committee and feedback from the Board at APA Colorado. Topic areas covered in the survey included workplace environment, perspectives on DEI in the planning field, and questions about how to make improvements in those areas. A series of Likert-scale questions were used to collect information on attitudes around how DEI is experienced by planners. Specifically, anxieties about career development, inclusiveness of opinions, work-life balance, and flexibility, examined through a DEI lens, were part of the attitudinal statements. The survey was disseminated online during April-May 2021, with

1,695 completed of which 397 (23%) were retained for the analysis after detailed checks.

Using this data, I examined consensus about two ideas in the planning profession. First, that positions around DEI were well thought through, and second that tools existed for employers to improve on DEI outcomes in the workplace. Using a series of bivariate and multivariate analyses, I examined how planners across cohorts by gender and racial/ethnic identities varied in their assessment of the state of DEI in the profession. Specifically, I developed latent constructs to capture notions of DEI relying on collected attitudinal data, and used discrete choice models to examine consensus about DEI. I relied on a thematic analysis of open-ended responses to foreground lived experiences that emerged in the statistical analysis.

Most (89%) respondents felt like they belonged in their workplace. However, when the responses were broken down by gender and race/ethnicity, women and people of color reported not belonging in the workplace at higher rates than their counterparts. A majority (86%) reported that they had experienced some sort of bias. This worrying finding indicates that very few planners taking this survey have been able to escape bias in the workplace. Particularly, individuals who identify as female and people of color reported experiencing bias at even higher rates than their counterparts. Overall, almost half of respondents said they had been treated unfairly. When asked to discuss details of their unfair treatment, many reported some sort of in-group and out-group in their workplace. Respondents mentioned a “boys club” or not respecting opinions of younger, less experienced planners. Unfair compensation and promotions were also commonly mentioned. When asked about DEI principles in the planning workplace, only about half of the respondents agreed that DEI is well thought through in the profession, or that DEI tools exist in their workplace; this is a cause for concern. Evidence provided through open-ended commentary suggested that leadership is particularly important in the work environment, as is building a community of allies to counteract the systemic bias inherent in the planning industry.

BRUNCHING WHILE BLACK: AN ETHNOGRAPHIC STUDY OF BLACK JOY AND PLACEMAKING IN AMERICAN CITIES

Abstract ID: 2015

Individual Paper Submission

REDDEN, Ty [Gettysburg College] tredden@gettysburg.edu, presenting author

Often located in the historic (and gentrifying) downtown districts of predominantly Black American cities, Trap Brunch is a cultural repository for Black millennials, acting as a centralized and weekly hub of fashion, dance, and communal fellowship. The research project examines the ways in which an ascendant Black Millennial middle class is co-opting historically white elite cultural practices, specifically weekend brunches. The hybridizing of elite conspicuous consumption with Black cultural production is analyzed through the study of trap brunches in three major U.S. cities, each associated with a distinct Black urban experience: Atlanta, Georgia; Detroit, Michigan; and Washington, D.C. Brunch, historically a family affair for middle-class and affluent white Americans, has evolved to a decadent weekend tradition for urban millennials and Trap Brunch, has emerged in recent years as a themed variant proliferated by their Black counterparts.

Using a mixed method approach that employs both ethnographic interviews and participant observation in all three study sites, I detail how Trap Brunch provides a vibrant, analytical lens through which to witness Black Millennials

fusing place-making and Black American cultural production in subversive ways and in historic spaces. Trap music, a hip hop subgenre emerging in the American South in the mid-2000s, is known for gritty street narratives that detail the illicit drug trade and the increasing economic disparities that fall squarely along racial cleavages in the United States. The merger of trap music and brunch cuisine is not coincidental or random but rather is the intersection of economic ascendancy and staunch reminders of the structural barriers and violence that many Black millennials are transcending in order to enjoy bottomless mimosas and eggs benedict. Trap Brunch (and its R&B-themed variants) acts as a site of Black joy, optimism, and kinship immersed in the soundtrack of Black resilience and nourished by ancestral Southern fare.

WOMEN LIVING IN SHARED HOUSING: EXPERIENCE OF COMING OF AGE AND MOVING OUT IN SOUTH KOREA

Abstract ID: 2035

Individual Paper Submission

LEE, NaYeon [Rutgers, The State University of New Jersey] nylee3336@gmail.com, presenting author

The experience of home varies depending on gender, class, and age. Especially between adolescence and adulthood, the experience Korean men and women have in their family's home is distinct due to patriarchal norms derived from Confucianism rooted in modern Korean society. In a patriarchal family, gender division of consumption and production is salient between daughters and sons, where daughters focus on household labor and sons on economic production (Hagan et al., 1987). The gendered experience differentiates how individuals perceive and create the meaning of their home. For the adults who have failed to leave their parents' house, following their transition to adulthood, home is a place where parental domination operates. However, the strict rules tend to be more weighted on women. The women were perceived to have a lack of privacy through being violated by the restrictions on their body and sexuality (White, 2002).

Currently, in South Korea, 86% of the residents living in shared housing are women in their twenties. This article seeks to identify the reasons for the lopsided phenomenon through women's experience of coming of age and moving out of their family home. The circumstances of young women in their 20s, whose age is in the distinctive stage between adolescence and adulthood, is defined as Emerging Adulthood, a stage in the life cycle first coined by Arnett (2000). The study examined the conflicts and compromises between the familism and individualization of young adults trying to achieve autonomy from their parents. The in-depth interviews were conducted with people in the stage of Emerging Adulthood, who were living or have experienced living in house-sharing.

The result showed that Korean women choose shared housing as the first autonomous space for several reasons. When making decision to move out, women face a limited choice of the dwelling due to their gender. They are concerned about the safety of urban spaces and fear of crime (Young, 1990). Second, they are constrained by stigmatizing views on women who live alone, created by the males and older generations (Song, 2010). Third, because they receive financial help from their parents, they are required to obtain parental permission for their choice. As a result, women end up in shared housing exclusively for women. Parents allow shared housing because the sexuality of their daughter can be controlled and watched at a minimum level. Hence, though physically away from families, women cannot fully achieve autonomous space because of the ways in which shared housing operates by having public and private spaces inside the house.

In conclusion, shared housing has a similar nature to young people in their emerging adulthood stage. A temporary dwelling that serves as a steppingstone from lower to upper housing, providing an incomplete space rather than the fully autonomous space. The implication of this study is to take gender perspective into account of how individuals consume and make choices regarding dwellings. It is not merely by personal reasons but by genderized social views and spatial exclusion inherent in urban spaces. Also, this study points out the limitations and possibilities of shared housing which in previous studies were not interpreted in terms of social and cultural terms.

POLICING IN AMERICAN INDIAN RESERVATIONS: A CASE STUDY OF TRIBAL SOVEREIGNTY AND INTER-GOVERNMENTAL COORDINATION

Abstract ID: 2055

Individual Paper Submission

QUICK, Kathryn [University of Minnesota] kquick@umn.edu, presenting author

Within the United States, 573 federally recognized tribes exist as sovereign governments, and as such are responsible for the direct provision of services to residents of their reservations as well as their tribally enrolled citizens, wherever they may live. To date, research on tribal governance within the field of planning (Barry and Porter, 2012; Zafateros, 2015; Webster, 2016) and public administration and management has been limited (Ronquillo, 2011; Evans, 2011). In particular, the ways in which state and local governments should and do interact and work with tribes is rarely researched, nor are the basic principles of tribal sovereignty and native rights typically taught to planners in the United States. Yet, this is an important knowledge basis for intergovernmental relations that are rightfully respectful of tribal sovereignty and are well informed about American Indians’ rights and contexts across an array of planning and other public policy areas (Quick, 2021).

Policing and public safety are particularly important aspects of this relationship. As with other non-White populations in the U.S., law enforcement is one of the key points of contact with government for many Native people. Manifestations of coordination among Native- and non-Native police departments, emergency responders, and court systems is central to coercive and welfare tensions, legitimacy, authority, and equity in the context of the U.S. settler-colonial state (Dunbar-Ortiz 2021) and the historically patronizing “ward/guardian” dynamic of the U.S. government’s relationships with native people (Anderson et al., 2015). In a confusing over-write of sovereignty in some U.S. states, Public Law 280 allows state and county police to make arrests for felonies and misdemeanors in reservations (French, 2015); conversely, tribal law enforcement may or may not have authority on and off the reservation (Fletcher et al., 2010).

In this paper, I analyze ethnographic and survey data on police interactions around roadway safety in American reservations as a case study in tribal sovereignty and inter-governmental coordination. Data are drawn from four case studies conducted in partnership with the tribal governments of Red Lake, Fond du Lac, Leech Lake, and Mille Lacs in Minnesota, which involved extensive ethnographic fieldwork (90 days), interviews (n=102), focus groups (n=8), and brief surveys with residents (n=220) (Quick and Narváez, 2017). We interviewed both tribal government leaders and their counterparts in county, city, and state government agencies with overlapping – and indeed often ambiguous and competing – jurisdiction and responsibility for policing and public safety.

Analysis of the data uncovers strong interdependence between tribes and local governments in three areas of roadway safety, including law enforcement. Despite interdependence, actual practice is mixed. Often, local governments challenge tribal sovereignty out of hostility and/or ignorance. In other areas, tribes and local governments coordinate well in selected areas (e.g., mutual aid between county and tribal law enforcement), or actively cultivate synergy to enhance safety (e.g., pooling resources for road improvements, collaborating on safe routes to school infrastructure).

I conclude the paper with a brief discussion of the implications of the study for urban and regional planning and governance research, education, and practice on equity, tensions of state authority, and Native sovereignty.

HOW FAMILY NETWORKS AFFECT THE QUALITY OF LIFE AND HAPPINESS OF MARRIED WOMEN IN KOREA

Abstract ID: 1883

Poster

KIM, Jaewon [Yonsei University] jaewonkim@yonsei.ac.kr, presenting author
 LIM, Up [Yonsei University] uplim@yonsei.ac.kr, co-author

Research Question

For married women, who are in an important position in the family network and have to maintain a balance between both work and family, the advantage of a family network may be that it promotes intimate dialogue and enables physical and economic mutual assistance beyond simply connecting family members. The purpose of this study is to empirically analyze which factors among the social capital possessed by the family network affect the quality of life and happiness of married women.

Data and Methods

This study obtained data on 6,577 married women from the seventh wave of the Korean Longitudinal Survey of Women and Families (KLoWF) (2018). KLoWF data includes information about whether the respondent's family members live together, and whether or not they give or receive financial help. It also contains specific information on the type and frequency of conversations being held within the family network. In this study, the number and types of connections with family members were used as key explanatory variables for measuring the advantages of family networks, which were analyzed in terms of the degree of economic help and the types of conversations between family members.

The health-related quality of life perception of an individual (QoL), which is a dependent variable, is related to five areas: exercise ability, self-management, daily activities, pain/discomfort, and anxiety/depression. As a collection of individual perceptions of each level, a binomial variable was constructed, in which 0 indicates there was a problem in each category and 1 indicates there was not. Another dependent variable, happiness (Happiness), was composed of a continuous variable with a 1 assigned to the answer being “very unhappy” and a 10 for being “very happy” in response to the question of how happy one is.

This study employed logistic regression to identify the effect of family networks on quality of life (see Model 1). As seen in Model 2, this study also empirically analyzed how family networks affect married women's happiness by using the ordinary least squares model. Both the number and types of connections married women have with their family members—assessed according to the degree of economic help they receive and the types of conversations among family members—were used to measure the advantages of strong family networks.

Findings

An increase in additional family member types with whom married women frequently converse positively impacts married women's quality of life and well-being. In contrast, an increase in additional family member types based on economic help negatively impacts married women's quality of life and well-being. In fact, this study affirms the effects of family networks in the Korean context, suggesting that an increase in networks based on abundant opportunities

for conversations may positively impact individual happiness rather than simply increasing the varied types of connection.

Implications

In terms of government policy and urban planning, it is important to not simply increase the size of the network and implement a policy to connect its members but also to establish a network that allows members to regard each other as close in order to increase the social capital of family relations. For example, community facilities, open spaces, and public spaces can be created so that individuals can communicate and feel intimacy. This study suggests that not only the economic aspect but also the emotional and cognitive aspects should be considered in the policymaking for urban welfare promotion.

RESIDENTIAL MOBILITY AND NEIGHBORHOOD TRAJECTORIES

Pre-Organized Session 14 - Summary

Session Includes 1149, 1150, 1151, 1152, 1153

PARKER, Madeleine [University of California Berkeley] madeleine.parker@berkeley.edu, organizer

Neighborhood characteristics have significant implications for household outcomes. The types of neighborhoods residents move to, in comparison to their origin neighborhoods, are very important. The papers in this session examine residential mobility outcomes in relation to factors including rezoning, gentrification, and housing policy. How do these factors influence residential moves and the types of neighborhoods households move to? Residential mobility has historically been hard to study due to a lack of longitudinal household data: by using unique proprietary data on individual households and moves, these papers shed new light on residential mobility in relation to different causes.

Objectives:

- To understand how different factors, including rezoning, gentrification, and housing policy, influence residential mobility and the types of neighborhoods households move to
- To understand how residential mobility and neighborhood trajectories are moderated by household demographics as well as planning factors

RESIDENTIAL MOBILITY OUTCOMES AFTER LEAVING HOUSING ASSISTANCE: THE ROLE OF LOCAL HOUSING MARKET CONDITIONS

Abstract ID: 1149

Abstract within Pre-Organized Session 14

RAMILLER, Alex [University of California Berkeley] alexramiller@berkeley.edu, presenting author

REID, Carolina [University of California Berkeley] c_reid@berkeley.edu, co-author

Relatively few studies have assessed the experiences of households that leave HUD-assisted housing, particularly with respect to the role of local housing market conditions in determining household outcomes. Most research focuses on outcomes for households currently living in public housing and/or for those who receive a voucher, but understanding what happens after a household leaves subsidized housing can provide insights into whether HUD programs provide a ladder for upward mobility, or whether the loss of subsidy leads to negative outcomes such as subsequent housing instability and/or worsening neighborhood conditions. In this paper, we examine the housing trajectories of households who leave HUD-assisted housing, focusing on housing tenure, housing stability, and neighborhood attainment. Specifically, we consider how leaving HUD-assisted housing influences subsequent housing and neighborhood outcomes, as well as how these outcomes differ within different local housing market contexts. Does an exit from HUD-subsidized housing lead to moves to higher or lower poverty neighborhoods? Are these exits associated with moves within particular housing submarkets? What household and housing market factors influence those outcomes? To answer these questions, we match HUD administrative data with annual residential address data from Data Axle between 2006 and 2020 to track residential moves. We find some neighborhood improvements for those who leave housing assistance overall, but also observe significant variation due to local housing market costs and dynamics related to racial segregation.

REZONING AND RESIDENTIAL MOBILITY IN SEATTLE, WA

Abstract ID: 1150

Abstract within Pre-Organized Session 14

PARKER, Madeleine [University of California, Berkeley] madeleine.parker@berkeley.edu, presenting author

In response to rising housing costs and supply constraints, many cities are considering upzoning—rezoning to allow for increased density. However, there are concerns about potential impacts on current residents: How will upzonings and possible housing price changes affect residents in upzoned areas? Who will be moving into upzoned neighborhoods, and will there be displacement of current residents? This paper examines the processes of residential mobility and neighborhood change in relation to upzonings and inclusionary housing policies in Seattle, WA.

There is ongoing debate on the impacts of upzonings on housing outcomes, including supply, cost, and neighborhood change. While anti-density restrictions have been associated with higher levels of segregation (Rothwell, 2011), recent research in New York City has found that upzonings are associated with neighborhoods becoming whiter (Davis, 2021). Neighborhood change, along with income, has been associated with residential mobility (Greenlee 2019). However, residential mobility in relation to upzoning has been understudied, in part due to the recency of many upzonings and to the difficulty in tracing household locations over time. There is recognition of the association of neighborhood characteristics with economic, social, and health outcomes (Galster & Sharkey, 2017), and academics have described a lack of research linking neighborhood change to residential mobility (Ellen & O'Regan, 2010). This paper uses the case of Seattle to examine the effects of upzoning on both residential mobility and neighborhood change.

In the 1990s, the City of Seattle began to target new growth and transportation improvements to designated “Urban Village” neighborhoods across the city. Upzoning and inclusionary housing policies were implemented in six of these Urban Villages in 2017, expanding to 27 neighborhoods in 2019. Inclusionary housing policies, requiring new development to include a portion of affordable units or contribute to a fund for affordable housing, aim to increase affordability and reduce potential displacement. Seattle provides a useful site for this research, as it allows examination of the impacts of upzoning accompanied by inclusionary housing programs across different types of neighborhoods.

I use a combination of spatial and econometric analysis to examine the impacts of these upzoning and inclusionary housing policies on residential mobility and neighborhood change. To understand neighborhood change, I use data on neighborhood characteristics and housing cost over time (2010–2021) to understand how these upzoned neighborhoods are changing, in comparison to other neighborhoods, prior to and after the upzonings. To understand residential mobility, I use a proprietary household-level dataset to trace moves over time, looking at residents moving into and out of upzoned neighborhoods both before and after zoning changes (2014–2021). Analyzing the characteristics of neighborhoods households are moving to, in terms of housing cost and transportation access, among other factors, helps me understand how they compare to the original upzoned neighborhoods. Similarly, examining household and neighborhood characteristics of households moving into the upzoned neighborhoods allows me to get a sense of the types of moves these households are making.

This research holds significant implications for understanding the impacts of upzoning policies on residential mobility and neighborhood change in US cities.

DOES GENTRIFICATION PROMOTE INCOME AND RACIAL DIVERSITY? EVIDENCE FROM NEW YORK CITY AND SAN FRANCISCO BAY AREA (2013-2019)

Abstract ID: 1151

Abstract within Pre-Organized Session 14

SONG, Taesoo [University of California Berkeley] taesoo.song@berkeley.edu, presenting author
CHAPPLE, Karen [University of Toronto] karen.chapple@utoronto.ca, co-author

An ongoing debate concerning gentrification is whether it increases diversity in affected areas (Ellen, 2017). Gentrification is often understood as a process of neighborhood ascent that involves an influx of wealthier households into previously disinvested inner-city areas, which could ultimately prompt income and racial integration. However, gentrification could also result in the displacement of low-income and minority households, leading to stagnant or even decreased diversity. Planners and researchers will need to better understand these relationships to facilitate equitable urban development while developing and implementing policies that protect vulnerable populations.

Unfortunately, scholarship on this topic is scarce and fails to explicitly connect the relationship between neighborhood diversity and displacement of vulnerable populations. Using census tract-level decennial census data from 1970 to 2000, Freeman (2009) reported that gentrifying areas in US Metropolitan areas did not experience a decrease in class or racial diversity. However, the study is based on descriptive aggregate data with long intervals, which prohibits observation and statistical testing of short-term neighborhood dynamics as well as population movements. Moreover, the study generalizes outcomes across metropolitan areas with very different characteristics. While more empirical studies examined the impacts of gentrification on displacement, they did not find critical evidence of gentrification-induced displacement, potentially due to the lack of adequate longitudinal data (Easton et al., 2020). Moreover, these studies focused on household mobility outcomes and did not discuss how they relate to neighborhood-level sociodemographic characteristics.

This study aims to investigate the relationships between gentrification and income and racial diversity by comparing outcomes for two distinct metropolitan areas, New York City (NYC) and San Francisco Bay Area (SFB), from 2013 to 2019. Using Chapple et al.'s (2021) gentrification measurement and entropy diversity indices employed by Freeman (2009), we proceed with our analysis in two stages. In the first stage, we analyze American Community Survey (ACS) block group-level data to investigate if gentrifying areas experience a higher growth or decline in income and racial diversity compared to other areas. We analyze the data using multilevel growth models to consider potential spatial and temporal autocorrelation between the observations. In the second stage, we analyze the Infogroup US Consumer Dataset, an annually collected household-level longitudinal dataset, to study if the probabilities of moving in and moving out vary for different income and racial groups and for neighborhood types. We employ multilevel models to control for household and neighborhood-level covariates.

Preliminary results indicate that gentrifying areas start with low levels of income diversity but experience a much more substantial growth than non-gentrifying and non-vulnerable neighborhoods in both NYC and SFB. Although racial diversity increased in gentrifying areas, this growth was not significantly higher than in other neighborhood types. Preliminary results also suggest that low-income households in gentrifying neighborhoods were significantly more likely to move out compared to other neighborhood types in both regions. We connect these findings to discuss if the changes in diversity in gentrifying neighborhoods stem from incumbent residents' changes in income or population movement. We also discuss if the changes in neighborhood diversity are attributable to the residential mobility of certain income and race groups. We then build on our conclusion to provide implications for policy and research.

THE IMPACT OF REZONING ON LOCAL HOUSING SUPPLY AND DEMAND: EVIDENCE FROM NEW YORK CITY

Abstract ID: 1152

Abstract within Pre-Organized Session 14

LIAO, Hsi-Ling [New York University] hsiling.liao@nyu.edu, presenting author

Housing affordability has continued to be a challenge that many large, economically successful cities face in the United States. Literature points to the role that limited housing supply and stringent land-use regulations play in exacerbating the housing affordability crisis in these cities (Gyourko and Molloy, 2015). Some local governments try to tackle this issue by relaxing land-use regulations and increasing the residential capacity of land that can be developed. This type of “upzoning” policy aims to increase housing supply and lower local rents. However, upzoning can also create amenity effects that attract high-income households and lead to gentrification. This raises concerns that incumbent residents living in these neighborhoods will face higher rents and increased risk of displacement (Hwang and Ding, 2020). The incumbent residents, especially low-income renters, may be displaced to higher-poverty or lower-opportunity neighborhoods, worsening urban inequality.

Housing affordability has continued to be a challenge that many large, economically successful cities face in the United States. Literature points to the role that limited housing supply and stringent land-use regulations play in exacerbating the housing affordability crisis in these cities (Gyourko and Molloy, 2015). Some local governments try to tackle this issue by relaxing land-use regulations and increasing the residential capacity of land that can be developed. This type of “upzoning” policy aims to increase housing supply and lower local rents. However, upzoning can also create amenity effects that attract high-income households and lead to gentrification. This raises concerns that incumbent residents living in these neighborhoods will face higher rents and increased risk of displacement (Hwang and Ding, 2020). The incumbent residents, especially low-income renters, may be displaced to higher-poverty or lower-opportunity neighborhoods, worsening urban inequality.

Existing literature on zoning policy has primarily focused on the relationships between land-use regulations, housing construction, and housing prices by exploiting the variation across metropolitan areas or over municipal boundaries. Few studies have examined how large-scale changes in land-use regulations over time, such as rezoning, affect local housing prices and rents given the rarity of such events and challenges in acquiring data (Freemark, 2020). There are also very few studies that examine the effect of rezoning on neighborhood change and mobility patterns of incumbent residents. This paper will address this gap in the literature.

In this paper, I study the effect of 2004–2013 New York City upzoning on local housing supply, prices, rents, and residential mobility using a difference-in-difference method. By exploiting the granularity of the data at the building level and the plausibly exogenous boundary of upzoned areas, I compare the upzoned areas and the areas slightly farther away from the boundary before and after upzoning. This paper also uses unique data with individual-level address history to examine the mobility patterns of in-migrants and incumbent residents in the upzoned areas. Specifically, I ask the following questions: Does upzoning change the socioeconomic and demographic characteristics of in-migrants? Are incumbent residents more likely to move and be displaced to less desirable neighborhoods after upzoning? If so, which groups of incumbent residents are more likely to be displaced? Preliminary results on housing supply and prices show that developers took up the opportunity to build and that housing supply increased after upzoning. However, there is also suggestive evidence of increased housing prices, especially among condo properties.

RESIDENTIAL MOBILITY IN AND OUT OF BLACK NEIGHBORHOODS SINCE 1970

Abstract ID: 1153

Abstract within Pre-Organized Session 14

LENS, Michael [University of California Los Angeles] mlens@ucla.edu, presenting author

This paper examines residential mobility in and out of Black neighborhoods in U.S. cities. Starting in 1970, a key inflection point in the history of Black neighborhoods (and urban America more generally), this paper identifies a sample of Black neighborhoods and traces movements in and out of these neighborhoods, and the impacts on individuals and neighborhoods alike.

The conventional understanding of the Black neighborhood from 1970 through the early 21st century – often a site of population and socioeconomic decline – is limited in at least two ways. First, we do not know what role household mobility played in these trajectories of neighborhood change. Second, household mobility decisions remain opaque in the literature, and the role of neighborhood racial composition is unclear in those decisions, particularly with respect to Black households and neighborhoods.

Using data from the U.S. Census, I first identify a sample of neighborhoods where Blacks constitute the largest racial or ethnic group in the decennial census years and the 2015-19 wave of the American Community Survey. The number of Black census tracts more than doubles during this time period, in spite of substantial declines in Western metros, buttressed by large gains in the South. Two broad patterns emerge. First, there has been a slow but steady convergence of outcomes between Black and non-Black neighborhoods. Second, there is a great diversity in Black neighborhood conditions - at the broadest level, conditions in Black neighborhoods in the Midwest are far worse than those in the South and especially the West, where Black neighborhoods are virtually disappearing. Two Southern metros - Washington, DC and Atlanta - stand out as having a large and growing number of solidly middle class Black neighborhoods. Median incomes in Black neighborhoods in Washington, DC are substantially higher than even non-Black neighborhoods in many metros.

Using the Panel Study of Income Dynamics (PSID) and InfoUSA, a consumer database, I examine the consequences of residential mobility in and out of these neighborhoods. The PSID offers rich information on a smaller sample (5,000) of households going back to 1968, with several observations on a consistent panel over time. Infutur provides data on virtually every household with a residential address in the U.S. from 2007 to 2019. These data include location information on origin and destinations, for multiple moves per individual. These allow me to see whether in-movers to and leavers from Black neighborhoods are making “positive” moves to neighborhoods with greater opportunity, or if they are making “negative” moves to neighborhoods with greater disadvantage. I can further identify what types of Black neighborhoods are the ones in which positive and negative moves are made to and from, and identify whether particular neighborhood types appear to be stepping stones to neighborhoods with higher opportunity.

Planning decisions shape neighborhood conditions, and the potential for households to access neighborhoods with stronger neighborhood opportunity. In many metropolitan areas, Black neighborhoods are facing gentrification pressures and rising rents. Understanding who is moving in and out of these neighborhoods, and how these movements relate to both neighborhood and household outcomes is key to developing planning practices that support these neighborhoods and allow incumbent residents to remain.

HOUSING CRISIS, HOUSING JUSTICE, AND DECOMMODIFICATION: SESSION 1 OF 2

Pre-Organized Session 25 - Summary

Session Includes 1287, 1288, 1289, 1290

COOPER, Sarah [University of Manitoba] sarah.cooper@umanitoba.ca, organizer

The crisis of affordability in housing is not new, but has been exacerbated by the COVID-19 pandemic. While historically interventions to address housing need have involved some form of removal of property from the market, today the market is increasingly seen as the solution to housing need. Many of the housing crises of the past few decades have been shaped by their relationship to the market: social housing is increasingly drawn into market practices, while rental housing is being snapped up by investors through Real Estate Investment Trusts and homeownership is becoming less accessible, especially for younger households. These processes do not occur without resistance, however: tenants, housing providers and, at times, governments have developed policies, strategies and actions to confront commodification and find new practices to enable access to housing. This session will explore both factors that are intensifying crisis, and strategies pursued by organizers, governments and others to address it.

Objectives:

- Ability to identify and assess factors that are intensifying housing crisis, and strategies pursued by organizers, governments and others to address it.

THE EMPTY CITY? EXPLORING URBAN VACANCY IN AND BEYOND THE PANDEMIC

Abstract ID: 1287

Abstract within Pre-Organized Session 25

FRIENDLY, Abigail [Utrecht University] a.r.friendly@uu.nl, presenting author

In the face of an abrupt reversal in cities during the COVID-19 pandemic due to lockdowns, the issue of urban vacancy gained new meaning around the world. Even before the pandemic, recognition of the size and scope of urban vacancy in connection to housing precarity, affordability and the housing crisis emerged, likely due to speculation and expectations of future price increases. Yet this situation worsened as the pandemic raged, producing a common image of cities at a standstill, a key trope of the pandemic. As urban centres emptied out, the pandemic further exposed cities' fragilities under neoliberal regimes of governance. Globally, variation of the problem of urban vacancy abound, including brownfields, vacant lots, and land held by speculators, combined with multiple reasons why land remains idle or unused. Broadly, the issue of urban vacancy underscores the issue of inequitable access to urban land and housing, and the role played by the deregulation of real estate markets. While vacancy emphasizes norms of exclusion, vulnerability and housing precarity within contemporary cities, it may also open possibilities for transformation through new policies, legislation and mechanisms for change. In some cities, political support for vulnerable populations occurred, though often as temporary fixes rather than lasting solutions to systemic issues. Likewise, struggles by urban movements, such as squats, underline the vacancy issue, sometimes capable of promoting political changes in support of transformation alongside a confrontation of commodification.

Focusing on a case study of São Paulo, in this paper, I use a political economy perspective to untangle the complex property regimes implicit in producing urban vacancy, the struggles, contestations, and forms of participation emerging alongside vacant land, and the opportunities for urban transformations amidst urban vacancy in and beyond the pandemic. In doing this, I underline both the inequalities and fragilities produced by property regimes in such contexts, yet also the possibilities for urban transformation which may emerge.

CONTESTING THE SUB-STATE ROLE IN HOUSING FINANCIALIZATION: TENANTS, BUY-TO-RENT INVESTORS, AND CORPORATE LANDLORD DISCURSIVE STRATEGIES IN RESPONSE TO ONTARIO'S PROTECTING TENANTS AND COMMUNITY HOUSING ACT, 2020

Abstract ID: 1288

Abstract within Pre-Organized Session 25

DIRKS, Yutaka [York University] dirksy@yorku.ca, presenting author

The state plays a crucial role in the financialization of housing. Through a strategy of 'regulated deregulation,' the state reforms existing regulations to allow for greater freedom for certain financial actors just as it creates new regulatory regimes which create and structure new markets and opportunities for finance-driven accumulation within the built environment (Aalbers Haila 2018). This paper examines the financialization of rental housing in Canada and the role of the sub-state/province in these processes of accumulation. August (2020) and others have examined the role of real estate investment trusts (REITs) in housing financialization and link the variable penetration of REITs in provincial markets to the impact of different provincial (sub-state) regulatory regimes. Shilton (2021) shows how tenants respond to the impact of financialization of their homes through organizing, mobilization, and direct action taken against their landlords. Waldron (2019) identifies how real estate and financial actors are accommodated in the policy-making process because of aligned interests with the state and well-resourced lobby efforts. Following Fields (2017) formulation of the 'unwilling subjects of financialization,' I analyze the demands of the State to manage conflict between landlord and tenant interests as articulated by tenants and landlords, including both large, financialized corporations and small buy-to-rent landlords, through a case study of the Protecting Tenants and Community Housing Act, 2020, a suite of regulatory changes introduced by the conservative Ontario government in 2020. I apply a discourse analysis methodology in my examination of Ontario Legislature committee hearings into the Protecting Tenants and Community Housing Act, 2020 and the respective positions and discursive strategies employed by each constituency during the hearings. I find that tenants, as 'unwilling subjects of financialization,' have developed a consciousness of their condition and its causes and advance arguments for policy intervention to mitigate financialization-driven accumulation by dispossession. I also find that smaller buy-to-rent landlords and corporate landlords employ distinct narratives and conceive of their interests and reform proposals in dissimilar ways, despite both constituencies benefiting from legislative reform aimed at facilitating financialization. The findings suggest an aligned-accommodation by the sub-national state of large, corporate and REIT landlords.

BUT WE PLANNED THE NEIGHBOURHOOD 'SINGLE-FAMILY DWELLING': STUDENTIFICATION, SHORT-TERM RENTALS AND INFORMALITY IN TORONTO'S INNER SUBURBS

Abstract ID: 1289

Abstract within Pre-Organized Session 25

SOTOMAYOR, Luisa [York University] sotomay@yorku.ca, presenting author

EVANS, Allison [UC-Berkeley] allison.r.evans@gmail.com, co-author

HAMEED, Yasir [York University] yasirh@yorku.ca, co-author

This paper examines the role of planning—as urban development and governance practice—in the material, social, and symbolic construction of “studentified” neighbourhoods as spaces of socio-spatial relegation. While much of the literature on studentification takes this neighbourhood change process as a proxy for gentrification, students can often face conditions of marginalization when constrained by little choice and exploitative rental arrangements. Taking a case study from a racialized neighbourhood in proximity to a university in Toronto's inner suburbs, we examine: first, the role of the university as a development actor involved in neighbourhood “improvement” through the sell-off of land for a single-family New Urbanist development; second, the rapid conversion of single-family housing into unlicensed rooming houses for students; and third, the further transformation of the neighbourhood

through the loss of student dwelling rooms to short-term rentals.

We argue that, in the absence of affordable student housing and adequate planning responses to studentification, an ambivalent municipal regulatory regime for the licencing of rooming houses creates a lucrative opportunity for small and medium-sized landlords -- including holding companies -- to extract rent from illegal conversions and amplify the possibilities for rent extraction. This state-market nexus enables a highly competitive, unregulated and financialized private rental segment that is exploitative of students.

While this case could be interpreted as a failure of planning or an absence of state action, we argue instead that these gray regulatory areas constitute by themselves key strategies of power. Crucially, the ability to trace boundaries, cut land deals, and define the cases where rules are enforced, are essential to councillors and other power brokers whose ad hoc interventions make them indispensable to urban development processes. Similarly, the authority to define the student housing “crisis” under particular terms, and to propose “common sense” policy interventions, typically involving the compartmentalization of students into private sector solutions, is how neighbourhood groups, higher education institutions, landlords, and developers retain their grip over a generationed, temporary, and geographically contained market segment where those affected have little choice and are seldom recognized as stakeholders.

FINANCIALIZATION AND HOUSING INEQUALITY: MEASURING IMPACTS ON AFFORDABILITY IN TORONTO

Abstract ID: 1290

Abstract within Pre-Organized Session 25

AUGUST, Martine [University of Waterloo] martine.august@uwaterloo.ca, presenting author
ST-HILAIRE, Cloe [University of Waterloo] csthilaire@uwaterloo.ca, co-author

Researchers and housing organizers have recently shed light on financialization as a process reshaping the rental housing landscape. Politico-economic shifts combined with technological change (Sassen 2012) have created a fertile terrain for the rise of “financialized landlords” (August 2020) and the investment of global capital into residential real estate (Aalbers, 2016). Critics of this trend have identified downsides that affect housing justice and inequality in the city, arguing that financialization leads to the treatment of housing as a commodity and financial asset, rather than a human right (Rolnik 2013). Scholars have linked financialization with growing indebtedness, displacement, eviction, housing insecurity, unaffordability, and urban spatial inequality. This process has disproportionate racial impacts as well, enabling finance capital to mobilize property as a mechanism of racial dispossession (Fields & Raymond 2021). While many of these trends have been well-documented, there are few spatio-temporal studies that clearly demonstrate the link between financialized property ownership and housing affordability. This paper examines whether the acquisition of rental housing by a financial firm (such as a Real Estate Investment Trust [REIT], private equity fund, or institutional investor) is followed by an increase in rent charges, and therefore declining housing affordability.

To explore this question, we mixed qualitative and quantitative methods. Drawing on data from publicly filed financial records and observation at industry conferences, we examine the stated business strategies of financial firms related to systematic strategies to drive higher rents. To measure the effects of financial ownership on rent levels we use a two-pronged approach, focusing on the city of Toronto, Canada's premiere site of financialized rental housing. First, we conduct a longitudinal analysis of multi-family transactions (1980-2021) to trace the growing presence of financialized landlords. To examine the impacts on rent levels we use a novel combination of datasets – multi-family sales data, rent data from the Canadian census, and annual rent data from Canada's housing agency (the CMHC) – creating a portrait of acquisition patterns and their impacts on the rates of rent changes. We find that by the 2000s financial firms were the largest acquirers of apartment buildings, with increased activity in 2010 and near-total dominance by 2020. Early analysis shows that buildings bought by financial firms (from non-financial firms) are associated with the highest rent increases, with the second-highest increases following sales from one financial firm to another. Our study points to the growing power of these firms, as buildings that are sold into financial ownership are rarely ‘de-financialized’. We will also explore the links between neighbourhood socio-economic data, financial ownership, and rents to identify geographic strategies of rent increases deployed by financial firms, and the impacts of these on patterns of urban spatial inequality.

This paper provides novel and important findings on the links between financialization – a contemporary trend that is reshaping cities and housing – and affordability. This is of relevance to planning scholarship and practice in areas of housing, affordability, and urban inequality. Our paper will touch on policy-related solutions and the potential to ‘plan’ for the de-financialization of housing.

GENDER, HOUSING, AND HOME

Pre-Organized Session 47 - Summary
Session Includes 1466, 1467, 1468

HARTEN, Julia [University of British Columbia] julia.harten@ubc.ca, organizer

With the post-industrial turn concentrating economic activity in the urban, most cities are experiencing affordability crises. Space in the city is increasingly contested; Housing has come to the fore as a defining planning issue of our time. This session proposes feminist theorizing of housing and home as sites of competing power relations as an avenue for productive inquiry – both to better understand gendered housing experiences and trajectories of women and gender-diverse people and to leverage a feminist understanding of housing and home as embedded, relational, and negotiated to stimulate new housing conversations. Urging us to conceive of housing as a social process, this session asks: What new impulses can feminist housing scholarship offer inclusive housing planners? Citing evidence from cities across the Global North and South, participants in this session grapple with two key, interrelated themes: (i) the role of gender in the housing search and in accessing housing, and (ii) the social construction of home amidst changing constituting variables, such as labor and unaffordability.

Objectives:

- Gender and Housing

HIGH WAGES, NO HOUSING: GENDER, DISCRIMINATION, AND WOMEN'S ACCESS TO RENTAL HOUSING IN URBAN INDIA

Abstract ID: 1466

Abstract within Pre-Organized Session 47

MOHANDAS, Meghna [University of British Columbia] meghnamo@student.ubc.ca, presenting author
HARTEN, Julia [University of British Columbia] julia.harten@ubc.ca, primary author

In India, women find housing as wives, married mothers, sisters, and daughters. But when women are “unattached,” never married, widowed, or divorced, they face a myriad of barriers. Although single women in India have grown to a historic 71.4 million (2011 Census), in the popular imaginary they remain a “cultural anomaly.” Where women are primarily judged in terms of marriage and motherhood, societal scripts about proper female behavior continue to shape women’s lives – including their housing choices and outcomes.

This paper studies how gender mediates access to rental housing in India. In particular, we unpack the nature, scale, and scope of gender-based exclusion during the housing search, focusing on rental housing discrimination against single female young professionals in Bengaluru. Stably employed and high-income-earning, these women routinely face widespread rejection, intrusive questioning, and intense monitoring in their pursuit of accommodation. Discrimination against this group has received media attention because it is particularly pointed: the incongruence of

patriarchal gender norms and female aspiration for independence obstruct housing access for women who financially can afford to rent a place of their own. Due to its concentration of IT companies and aspiring tech workers - many of whom are female - Bengaluru emerges as a key site for this research.

To study gender-based discrimination in rental housing in urban India, we employ a mixed-methods research design. In particular, we combine quantitative evidence from paired testing with in-depth semi-structured interviews for grounded theory. Paired testing or audit studies are widely regarded as the gold standard in housing discrimination research. We adopt a telephone audit design where testers assume and enact prospective tenant profiles to contact landlords who list units for rent online. Tenant profiles vary only with regard to gender and marital status. Hence, documenting rates of success across profiles allows us to analyze the prevalence of gender-based discrimination in Bengaluru's rental market. To dig deeper into exclusionary housing practices against white-collar single women, as well as their responses, we also conduct semi-structured interviews.

Findings from this work contribute to the literature in several ways. While gendered housing vulnerability has mostly been framed through the labor market channel, focusing on gendered patterns of financial (in)dependence, our study shines a light on gender as a key variable for structuring access to housing through influencing the housing search. Additionally, our study joins a small but growing body of work that enriches what we know about the gender-housing nexus with much-needed evidence from the Global South. Finally, this study contributes methodologically to a literature that has drawn either from quantitative or qualitative data separately by demonstrating the synergies and gains from a mixed-methods approach.

GENDER, THE PLATFORM ECONOMY, AND THE DIVERSE USES OF HOME IN SOUTHEAST ASIA: THE LIVED EXPERIENCE OF ONLINE GIG WORKERS IN BANGKOK AND PHNOM PENH

Abstract ID: 1467

Abstract within Pre-Organized Session 47

JAMME, Hue-Tam [Arizona State University] Hue-Tam.Jamme@asu.edu, presenting author
DEWAN, Sabina [JustJobs Network] sabinadewan@justjobsnetwork.org, co-author

Despite significant improvements over recent decades, gender labor gaps persist in Southeast Asia due to prevailing social norms. As the primary homemakers, women remain far more homebound than their male counterparts. Therefore, women who do participate in labor markets are more likely to do so from home. Turning parts of their homes into a workspace allows for multi-tasking and flexible arrangements between home- and work-related responsibilities.

Against this backdrop, the rise of the platform economy may present enhanced opportunities for women to participate in labor markets. This paper focuses on the lived experience of online gig workers in Bangkok (Thailand) and Phnom Penh (Cambodia). In particular, how do home-based female platform workers adapt their spatial and temporal uses of "home" to support their remunerated online activity? Does working online from home promote women's empowerment? Only recently have the gendered aspects of the "new spatialities of work in the city" started to receive some attention in urban studies (Rodríguez-Modroño, 2021). In this regard, evidence from emerging economies is sparse.

This paper draws on surveys and in-depth interviews conducted with nearly 200 workers in Bangkok and Phnom Penh between July 2021 and March 2022. The composition of the convenience sample enables comparisons between different sub-groups, by gender identity; online vs. offline worker status; and type of platform work (online retail, meal preparation for food delivery apps, and freelancing jobs). The methods used for analyzing the data include

descriptive statistics of survey data and a thematic analysis of the interview transcripts. Measurements of women's empowerment are inspired by the work of Naila Kabeer (1999). The theoretical framework is infused with Martha Nussbaum's (2001; 2011) gendered perspective on the Capabilities Approach.

On the one hand, preliminary results are indicative of women's empowerment permitted by the platform economy. They confirm that the platform economy has facilitated participation in labor markets for many of the stay-at-home women interviewed. Working on an online platform has helped them gain better control over their personal schedules and finances. It has involved turning part of the home into a workspace. In some cases, a brick-and-mortar venue is under consideration if the online venture proves successful. Since they started working online, on average home-based female workers experienced a significant decrease in their time spent in transportation every day; their work-life balance has improved; and they have gained confidence in their career prospects.

On the other hand, online female workers might be even more homebound than before joining the platform economy. They claim that their leisure time has significantly decreased. When accounting for online and unpaid care work, they appear to work significantly more than surveyed men and women working more conventional jobs.

These findings add a Southern perspective and a focus on the role of the platform economy to a growing scholarship – especially since the offset of the Covid-19 pandemic – on the gender equity issues associated with working from home (Power, 2020).

NEGOTIATING VULNERABILITY: THE ROLE OF GENDER IN SHARED HOUSING

Abstract ID: 1468

Abstract within Pre-Organized Session 47

HARTEN, Julia [University of British Columbia] julia.harten@ubc.ca, presenting author
BOEING, Geoff [University of Southern California] boeing@usc.edu, co-author

As affordability has become a problem virtually anywhere, shared renting is receiving growing attention as an economical housing strategy. Aided by digitization, home sharing has grown to now house a wide range of demographics in numerous contexts. With the housing search moving online, digital platforms allow shared households to connect with a much larger audience of prospective tenants than when searches relied on social ties. This larger pool of potential matches matters for home sharing in particular because sharing entails matching not only on unit but also on personal characteristics. Despite home sharing's growing importance and the complexity of its search process, we know little today about how digital platforms mediate this housing strategy. In particular, first evidence from China and the UK indicates that women face gendered challenges when home sharing, particularly at the lower end of the rent spectrum.

This paper studies the role of gender in shared units for rent in Los Angeles, California, one of the least affordable housing markets in the United States. Drawing on thousands of online rental advertisements, collected between June 2020 and March 2021, we ask: as home sharing moves housing from shelter to entering relationships with strangers, does gender shape this decidedly social housing search process? We first compare references to gender in online advertisement titles and text bodies between full and shared rental offerings. Then, we employ qualitative coding-assisted natural language processing to mine descriptive advertisement texts for themes that come up in relation to gender. Preliminary results suggest that discourses revolve around female vulnerability – either women seeking other women as roommates, or advertisements offering mostly women housing in exchange for house, care, and sex work, or romance. Finally, we examine patterns in relation to these gendered themes by analyzing correlation with, price, location, and tract level socio-demographics.

This study contributes to the literature in several ways. First, this study contributes to an emerging literature that

documents how gender structures housing access. While gendered patterns of housing vulnerability are well-established, the role of gender in access housing, and shared housing in particular, is underexamined. More broadly, this work expands our understanding of the gender-housing nexus to include non-traditional living arrangements, here home sharing. Feminist scholarship theorizing the home as a site for competing power relations has by and large assumed family or romantic relationships within the home. Here, we extend this work beyond such relationships and highlight how gendered dynamics take shape in the context of sharing among unattached adults. Finally, tight markets increase the scope for discrimination. This study highlights the intersection of gender and rent-seeking that can emerge in such contexts. As women are the primary target of advertisement seeking house, care, and sex work, or romance in exchange for housing, planners are called to take seriously the (gendered) vulnerabilities created by the affordability crisis.

HOUSING CRISIS, HOUSING JUSTICE, AND DECOMMODIFICATION: SESSION 2 OF 2

Pre-Organized Session 55 - Summary

Session Includes 1292, 1293, 1294, 1295, 1296

COOPER, Sarah [University of Manitoba] sarah.cooper@umanitoba.ca, organizer

The crisis of affordability in housing is not new, but has been exacerbated by the COVID-19 pandemic. While historically interventions to address housing need have involved some form of removal of property from the market, today the market is increasingly seen as the solution to housing need. Many of the housing crises of the past few decades have been shaped by their relationship to the market: social housing is increasingly drawn into market practices, while rental housing is being snapped up by investors through Real Estate Investment Trusts and homeownership is becoming less accessible, especially for younger households. These processes do not occur without resistance, however: tenants, housing providers and, at times, governments have developed policies, strategies and actions to confront commodification and find new practices to enable access to housing. This session will explore both factors that are intensifying crisis, and strategies pursued by organizers, governments and others to address it.

Objectives:

- Ability to identify and assess factors that are intensifying housing crisis, and strategies pursued by organizers, governments and others to address it.

EXPANSIVE CITIZENSHIP: ENCAMPMENTS IN PUBLIC PARKS DURING COVID

Abstract ID: 1292

Abstract within Pre-Organized Session 55

KRAMER, Anna [McGill University] anna.kramer@mcgill.ca, presenting author

Usually hidden in ravines or under highway ramps, encampments experienced a moment of heightened visibility and public awareness during COVID. During the pandemic, bylaws were strategically unenforced and shelter capacity cut, and so encampments jumped boundaries from interstitial sites to more central and public spaces including urban parks. The fieldwork for this study spans more than a year when people were living in several public parks in the west end of Toronto, just as parks became one of the only safe social spaces during lockdowns. This challenged normal spatial relations and land use hierarchies in cities.

In this presentation, I look at how parks became a space of expansive citizenship in this time. In liberal capitalism,

property is connected with citizenship in ways that diminish the lives of houseless people (Przybylinski 2021). The implicit urban social contract is one of property taxes in exchange for public goods and infrastructure, and the disproportionate influence of ratepayers and homeowners is seen throughout urban planning practice, from land use policies to policing to public engagement to laws that criminalize homelessness in public space or that protect the rights of landlords over tenants.

Although the encampments arose organically and not with a deliberate political intent, they became a direct manifestation of the ongoing housing crisis as it collided with a global pandemic. There were two ways in which public parks with encampments exploded the concept of a citizenship via property relations. The first is spatial and the second interpersonal.

The presence of people living in tents in these spaces challenged the property relations of land use, whereby parks are reserved for people who can afford to live in residential areas. Parks thus become genuinely public space, and spaces of inadvertent protest through the visibility of living in public (Parker 2020).

The second part of expanded citizenship was realized between people. Bonds of solidarity, recognition and accountability were built between unhoused residents and housed neighbours, as people congregated in shared space. When police came to clear encampments, the crowd of witnesses and supporters standing with the remaining residents made it more difficult to evict that would otherwise be the case if the homeless were in a less visible setting. And the resistance prompted the city to start a pilot project in the next park to secure some residents affordable places to live.

In this way, encampments in Toronto parks during COVID became a space of inclusive, active citizenship resulting in real material gains (Miraftab and Wills 2005); a kind of planning that was centred around a citizenship not reliant on property (Dorries 2022); an urban citizenship as a mobile commons (Turhan and Armiero 2019). Although this expanded citizenship is incomplete and contingent, it points to a concept for reorienting urban planning practice.

HOUSING FIRST: THE PATHOLOGIZATION AND PRODUCTION OF LONG-TERM UNHOUSED PEOPLE

Abstract ID: 1293

Abstract within Pre-Organized Session 55

WITHERS, A. J. [York University] withersa@yorku.ca, presenting author

This paper examines how long-term unhoused people, called the "chronically homeless," are pathologized through housing and homelessness policy, which are instruments mediated by market forces. Housing First is a widely adopted homelessness policy approach. It is premised on the idea that individuals should be provided housing before/without undergoing mental health and/or drug treatments or other forms of socio-medical interventions. Housing First is a neoliberal program; the great promise of Housing First is that it can end homelessness within neoliberal capitalist economies. While this model has been shown to improve many individuals' lives, homelessness has increased in many jurisdictions that operate under Housing First policies. This paper uses Toronto and its Housing First program as a case study, drawing on evidence from policy documents, city reports and statements from government officials. In Toronto, housing creation for low(er)-income people has been streamlined into "affordable housing" and "supportive housing." "Affordable housing" is largely defined in relation to the market rate and excludes people on welfare. "Supportive housing" is not-for-profit housing for the "chronically homeless" – those who have

been unhoused for at least six months. Because Housing First promises to end homelessness without changing social relations, the change must occur at the individual level – at the level of the pathologized “chronically homeless” person. “Chronically homeless” people are disproportionately, and majority, Indigenous people, racialized and/or migrants. Supportive housing is understood as the only appropriate option for the pathological “chronically homeless” individual now cast as incapable of living fully independently. Housing First policy also produces “chronic homelessness”: because of the confluence of Housing First and the market, many individuals must become “chronically homeless” to access any housing at all.

HOUSING POLICIES IN GERMANY THROUGH THE LENS OF DECOMMODIFICATION

Abstract ID: 1294

Abstract within Pre-Organized Session 55

KOLOCEK, Michael [Research Institute for Regional and Urban Development] Michael.Kolock@ils-forschung.de, presenting author

The aim of the paper is twofold. First, I critically discuss two national instruments, established to increase housing affordability for middle- and low-income families in Germany through the lens of decommodification. Secondly, the focus is on homelessness. I present a theory of decommodification of land use for people affected by inadequate housing.

The paper answers the question: What does decommodification mean in the context of housing policies in Germany? In a broad understanding, decommodification occurs “when service is rendered as a matter of right, and when a person can maintain a livelihood without reliance on the market” (Esping-Andersen 2011: 22). Esping-Andersen (2011) had the decommodification of workers in mind and developed a decommodification score as one of three indicators to distinguish three ideal types of welfare states: In contrary to the United States as a liberal welfare-state regime with a low decommodification score, Germany is seen as corporatist welfare-state regime with a relatively high decommodification degree. The paper understands decommodification as emancipation from market forces (Kolock 2017) and evaluates which market forces have to be taken into account.

Prices for rental and owned housing have been rising in Germany for more than one decade. There are regional differences, but housing affordability has become an important political topic. Lower and middle-income groups have difficulty finding accommodation, especially in growing cities such as Munich, Hamburg, or Berlin; at the same time, vacancy rates are rising in some rural areas. The COVID-19 pandemic has affected German housing markets in different ways and fostered the affordability problem, particularly for certain types of housing. The demand for single family houses and larger apartments increased. Due to the shift to work from home during the pandemic, the criteria for locational preferences change: some experts forecast a revival of rural housing because many people will have the opportunity to work more days from home, even after the pandemic.

In recent years, various national programs and measures responded to the affordability problem on the rental and the home ownership markets. The paper evaluates two national instruments through the lens of decommodification. In 2015, the German government decided on new rules to slow down the increase of rents in tense housing markets. The so-called “Mietpreisbremse” (= rent-price-brake) prohibits landlords from increasing rents by more than 10 per cent compared to the local reference rent. The second instrument presented is called “Baukindergeld” (= construction-child-benefit). The Baukindergeld is a government grant scheme to support families building homes. For ten years, low- and middle-income families receive financial support of € 1,200 per year for each child when building or buying a home. Through the lens of decommodification, both instruments aim to emancipate people from market forces – in both cases, this emancipation has rarely worked. The paper explains why.

In a second part, the paper discusses findings of a case study on homelessness in Hamburg. I draw from a “concept of

being allowed to be in a place” (Waldron 1991: 297) and present a theory of decommodification of land use for people affected by inadequate housing. The theory explains why the City of Hamburg is one of the most expensive cities, but nevertheless a magnet for homeless people from all over Europe. Hamburg has not decommodified housing, but responded to many needs of homeless people – needs that are usually met at home. I show why the Covid-19 pandemic, despite various bad effects for homeless people, in the long term might also help to foster a paradigm shift when shaping the inclusive city.

CONVERTING CAPITALISM: THE CONTESTED GEOGRAPHY OF CONDO CONVERSIONS IN MONTREAL

Abstract ID: 1295

Abstract within Pre-Organized Session 55

RUTLAND, Ted [Concordia University] ted.rutland@concordia.ca, presenting author

Since the 1960s, condos have occupied an ever-larger place within processes of urban development, urban planning, and capital accumulation. The increasing importance of condos is registered in Rosen and Walk’s argument that a new regime of city-making, “condoism,” has emerged in Canada and around the world. While research on condos and condoism is relatively extensive, the literature focuses almost exclusively on new-build condos – ignoring processes through which existing rental housing is converted into condos. This paper focuses on condo conversions in Montreal. It examines how processes of condo conversion were enabled by various legislative changes since the 1960s, how it has created opportunities for profit by realtors, lawyers, banks, and small developers, and how tenants’ groups have organized against these processes and the displacement it causes. Condo conversions, the paper argues, are a highly contested element within a broader condoism regime, with tenants’ groups continually challenging the regime, achieving small but important victories, and gesturing toward a form of city making premised on collectivity rather than accumulation.

HOUSING IN TRANSITION: STRATEGIC POSITIONING OF NON-PROFIT HOUSING PROVIDERS IN CANADA

Abstract ID: 1296

Abstract within Pre-Organized Session 55

COOPER, Sarah [University of Manitoba] sarah.cooper@umanitoba.ca, presenting author

Change can take place gradually over time, as evolutionary change, but can also happen rapidly and suddenly as a result of a “perturbation” (Burke, 2018, p. 76). In the moment of transition, however, there is both uncertainty and possibility: it is in that moment that decisions may be made and actions undertaken. While Klein (2007) argued that moments of ‘shock’—especially various kinds of crises—made it possible for conservative governments to enact controversial policies, others have seen in recent moments the possibilities of ‘just transitions’ through the climate crisis (Heffron & McCauley, 2018) or ‘just recoveries’ from the COVID-19 pandemic (The Council of Canadians, 2021).

Canada’s community housing sector is currently in transition as a result of a number of factors: the expiry of decades-old funding agreements, an influx of new funding and policies from the 2017 National Housing Strategy, and changes

in provincial housing policies. These changes are set against a backdrop of climate change, a global pandemic, an aging population, increasing Indigenous resistance to colonialism and the ongoing dismantling of the social safety net. In this context, there are many potential moments of transition, including opportunities for both extraction of wealth and power by elites and new approaches to low-cost housing provision.

This paper examines the current and anticipated concerns of non-profit housing providers in relation to the emerging sectoral transition and broader Canadian context, and considers how these providers are positioning themselves for the future. Through a survey of non-profit housing providers in British Columbia, Manitoba and New Brunswick, it identifies the factors driving change, as well as how providers are positioning themselves to respond. In doing so, it begins to articulate the elements and processes shaping these moments of transition as observed by the housing providers themselves.

TRANSIT, GENTRIFICATION AND DISPLACEMENT: UNPACKING THE RELATIONSHIP IN CITIES ACROSS CANADA

Pre-Organized Session 62 - Summary

Session Includes 1385, 1386, 1387, 1388

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, organizer

FARBER, Steven [University of Toronto] steven.farber@utoronto.ca, organizer

One of the biggest challenges facing cities today is how to build and maintain affordable housing near good transit. Cities are becoming increasingly expensive places to live; in many neighbourhoods, gentrification is a dominant trend which sees the erosion of housing that is affordable to low- and moderate-income households. At the same time, cities across Canada are investing in new, higher-order public transit, such as LRT. While this infrastructure helps connect people and places, there is also a growing understanding that it can contribute to gentrification and displacement. This series of papers employs both quantitative and qualitative approaches to examine the relationship between new transit infrastructure and gentrification and displacement in cities across Canada. It draws on detailed case studies from Toronto and Waterloo, emphasizing spatial, non-spatial and experiential forms of displacement. The session includes studies that focus on the lived experiences of marginalized communities, as well national statistical and spatial analysis that examines the broader ways in which transit impacts the housing market.

Objectives:

- Understand the relationship between transit and gentrification/displacement

ARE LOW-INCOME RESIDENTS DISPROPORTIONATELY MOVING AWAY FROM TRANSIT?

Abstract ID: 1385

Abstract within Pre-Organized Session 62

ALLEN, Jeff [University of Toronto] jeff.allen@utoronto.ca, presenting author

HIGGINS, Christopher [University of Toronto] cd.higgins@utoronto.ca, co-author

SILVER, Daniel [University of Toronto] dan.silver@utoronto.ca, co-author

FARBER, Steven [University of Toronto] steven.farber@utoronto.ca, co-author

Public transit is immensely important among lower-income urban residents for daily travel (Sanchez, Shen, & Peng, 2004). While lower-income residents tend to live in areas of greater transit accessibility on average (e.g. Allen & Farber, 2019), some North American cities have undergone trends of inner-city gentrification and suburbanization of poverty over the past several decades (Grant, Walks, & Ramos, 2020). This means that in some places, lower-income households are increasingly living in areas with relatively lower levels of transit accessibility and thus have greater barriers to daily travel and are facing increased risks of transport-related social exclusion.

There are also growing concerns that some transit rich neighbourhoods are becoming unaffordable and are resulting

in the residential displacement and exclusion of low-income residents; but quantitative studies have mixed or inconclusive results about whether low-income residents move disproportionately out of gentrifying neighbourhoods or whether newly built transit lines directly leads to the displacement of low-income residents (Zuk et al., 2018; Padeiro, Louro, & da Costa, 2019). However, existing research that studies income inequalities of residential mobility in relation to public transit focuses on the outcomes of specific transit routes, which serve only a fraction of the population in a region, rather than comprehensively examining changes across an entire region. As such, there is needed research to assess whether there are social inequalities at a regional level pertaining to whether lower-income residents are unequally reducing their levels of transit accessibility when they move.

The objective of our paper is thus to answer the following: do low-income residents, on average, experience a reduction of their level of transit accessibility when they move within a region? If so, to what extent? And if so, do low-income movers witness a greater reduction in transit accessibility than higher-income movers? Specifically, we examine differences in transit accessibility resulting from intra-urban moves using an administrative dataset representing 20% of tax-filers across an entire region (Toronto) over a 30-year period (1988 to 2018). Findings of this study are important for understanding whether there is evidence of a disproportionate number of low-income residents moving away from much relied upon public transit service, and if so, how this has changed over time. Furthermore, findings about differences in individual residential mobility patterns by income and relative to transit accessibility can offer further explanations about how contemporary trends of urban socio-spatial restructuring, such as inner-city gentrification and suburbanization of poverty, unfold within a region over time. While our empirical analysis is focused on a single region, the types of data and methods described in our paper could be applied to other regions.

ASSESSING LARGE-SCALE IMPACTS OF PUBLIC TRANSIT INVESTMENTS: A NATIONAL SCALE ACCOUNTING OF LAND VALUE UPLIFT

Abstract ID: 1386

Abstract within Pre-Organized Session 62

ARKU, Robert [University of Toronto] rn.arku@mail.utoronto.ca, presenting author

HIGGINS, Christopher [University of Toronto] cd.higgins@utoronto.ca, co-author

FARBER, Steven [University of Toronto] steven.farber@utoronto.ca, co-author

Transportation barriers currently limit the opportunities for many Canadians to participate in jobs, healthcare and social services (Allen & Farber, 2021). To improve accessibility, policymakers often prioritize public investments in transit-oriented land use planning. However, in line with urban land economic theories, Debrezion et al. (2007) and Higgins and Kanaroglou (2016) identify that such a strategy can lead to changes in property values in some transit station areas as some property buyers (and renters) are willing to pay a premium for locations with high transit accessibility and enhanced environmental amenities. While land value uplift is often framed positively, particularly when analyzing transit projects from the perspective of land value capture, such changes in land and real estate values can potentially alter the socio-economic characteristics of transit station areas in terms of who moves into and out of the neighborhoods (Delmelle, 2021). By extension, this can reinforce existing spatial inequalities and may open new markets for re-entry of capital by the most-advantaged social class, resulting in gentrification (Rérat, 2018).

As a first step in a larger project that will examine the issue of transit-induced gentrification in Canada, this research utilizes real estate transaction data to examine the relationship between public transit accessibility and land value uplift. The objective of the paper is therefore to answer the following: are public transit investments enhancing the Canadian housing market? And if so, to what extent is the housing market enhanced? With access to a large Canada-wide real estate transactions database, this research is the first national-scale accounting of transit and land value uplift. We specifically examine changes in property values (or land value uplift) associated with public transit investments in the following regions: Toronto, Montreal, Vancouver, Calgary, Ottawa, Edmonton, Quebec City and

Winnipeg.

Our research objectives will be addressed through the adoption of several quantitative methods (e.g., spatio-temporal hedonic regression models) that respond to existing gentrification and econometric research challenges identified by Delmelle (2021) and others. We take advantage of available data including real estate transactions data from Real Property Solutions, a property appraisal company and census data from Statistics Canada.

The examination of changes in property values provides an empirical basis to understand whether gentrification might be occurring, and the extent to which it may be happening. Our work has important implications for planning practitioners. Concerns have been expressed over the lack of integration between transport, land use and the housing market. This work therefore provides critical information that will contribute to a greater understanding of the scope of transit-induced displacement in Canada, and further support efforts to incorporate affordable housing policy into more holistic and equitable transport planning practice.

MARGINALIZED SPACES: EXPERIENCES OF DISPLACEMENT IN KITCHENER, ONTARIO'S INNER SUBURBS

Abstract ID: 1387

Abstract within Pre-Organized Session 62

MCDUGALL, Emma [University of Waterloo] edmcDougall@uwaterloo.ca, presenting author

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, co-author

AUGUST, Martine [University of Waterloo] martine.august@uwaterloo.ca, co-author

PETROVIC, Aleksandra [Social Development Centre Waterloo Region] aleksandra@waterlooregion.org, co-author

Literature on gentrification focuses primarily on older, aesthetically-attractive inner-city neighbourhoods where residential and commercial spaces are transformed due to the influx of higher-income residents, and the subsequent displacement of lower-income populations (Hackworth, 2002). But displacement can still occur in neighbourhoods where upgrading is not the dominant trend, such as the inner suburbs, which lack both the newness of recently constructed suburbs or the architectural heritage and walkability of neighbourhoods within the urban core. Within Canada and elsewhere, these social and spatial peripheries have seen an increasing concentration of low-income individuals over the last few decades (Cooke & Denton, 2015; Grant et al, 2020).

However, little empirical research has explored the experiences of displacement in marginalized communities within the inner suburbs, particularly when these experiences intersect with new transit investment. Our research is guided by two goals: first, to understand tenants' experiences with spatial and non-spatial forms of displacement within downgrading inner-suburban neighbourhoods; second, to examine to what extent these forms and experiences of displacement differ from gentrifying neighbourhoods in the urban core.

Our research focuses on inner-suburban neighbourhoods in Kitchener, Ontario. The city is situated in Waterloo Region, which, in 2019, opened a 19km Light Rail Transit (LRT) line. While downtown Kitchener has been physically transformed with more than \$2 billion in investment, further along the line, new development is far less visible. However for communities living in these spaces, there are growing displacement pressures, particularly within apartment buildings owned by real estate investment trusts (REITs). For this research, we partnered with a local non-profit and conducted semi-structured interviews with residents living in these spaces. We also analyzed field notes that documented years of harassment and intimidation practices from landlords.

Our analysis reveals both spatial and non-spatial forms of displacement within these early post-war neighbourhoods.

In terms of spatial displacement, vacant units are leased for significantly higher rents (an incentive to push tenants out), property management companies apply for above-guideline rent increases (often resulting in displacement) and subsequently, higher-income residents are slowly moving in. Non-spatial displacement is driven by changes to buildings, residents, surrounding communities, and in some cases transportation access that have left tenants feeling unhomed (Elliott-Cooper et al., 2020), voiceless and disparaged. This is coupled with pressure from property management and landlords who are accused of under-maintaining buildings, neglecting safety and even harassing residents to either avoid spending money or push tenants out (August, 2020).

While gentrification and displacement are far more visible in the urban core, the lived experiences of powerlessness among low-income tenants are almost identical within the inner suburbs. With many new transit lines being proposed or under construction within Canada's inner suburbs, our research both amplifies the voices of these marginalized communities and stresses the need to look beyond the traditional aesthetics and localities when understanding the role that transit can play in shaping patterns of gentrification and displacement.

BEYOND MOBILITY: THE SYMBOLIC DIMENSIONS OF LIGHT RAIL IN CANADA'S WATERLOO REGION

Abstract ID: 1388

Abstract within Pre-Organized Session 62

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, presenting author
ELLIS-YOUNG, Margaret [University of Waterloo] mellisyo@uwaterloo.ca, primary author

Recent research into light rail transit (LRT) positions this infrastructure as much more than a mobility solution. Planners, policymakers, and elected officials consistently frame light rail systems as an image-building, growth management and development tool (Olesen, 2020). Because of this, the role of LRTs in shaping neighbourhood change, including processes such as gentrification and displacement, is also receiving more scholarly attention (Doucet, 2021). These dynamics bring to the forefront questions of light rail's significance beyond its transportation capabilities, recognizing these systems as complex "assemblages" of materiality and meaning implicated more broadly in the production of urban space (Ferbrache & Knowles, 2017, p. 105; Olesen & Lassen, 2016). However, as Ferbrache and Knowles (2017) assert, the transit literature does not adequately explore the symbolic dimension of light rail, including how various actors and inhabitants understand "what such a technology can and cannot do for the city" (Olesen & Lassen, 2016, p. 374).

Accordingly, this paper analyzes the different discourses surrounding a new LRT line to understand how residents and stakeholders position light rail infrastructure as more-than-transportation. Applying a Lefebvrian lens (Lefebvre, 1991), we more specifically interrogate how residents ascribe meaning to the LRT in relation to their spatial imaginaries and experiences (lived and perceived space), and the extent to which these meanings align with the conceived visions of decision-makers. The case study, Waterloo Region, has a population of approximately 625,000 and is located just over 100km (62 miles) west of Toronto. The first phase of its light rail system began operation in June 2019, following years of planning, construction, and visible investment along the corridor. This paper draws primarily on 65 semi-structured interviews with station-area residents in the months preceding the opening of the line, as well as twenty interviews with key stakeholders in the development of the LRT. We analyze how residents frame the LRT's impacts before the line opened and its role(s) in shaping changes in their community, as well as how their responses relate to the perspectives of local planners, policymakers and politicians.

For key stakeholders, the LRT was conceived primarily as a growth management tool to curb sprawl and encourage intensification. While the LRT also holds symbolism for residents in ways that extend beyond its transportation functionality, the discourses they construct often diverge from those of stakeholders. For residents, light rail's perceived impacts on mobility, material landscapes and social dynamics evoke different (im)possibilities that connect to their broader imaginaries of neighbourhood and (sub)urban life, both present and future. These findings, and our

analysis, enhance our knowledge of the meaning and impact of new transit infrastructure to reveal symbolic dimensions of light rail beyond the realm of mobility.

MANUFACTURED HOUSING AND MANUFACTURED HOME PARKS: SETTING AN AGENDA FOR PLANNING RESEARCH AND ACTION (PANEL 1: MHPS AND PLANNING)

Pre-Organized Session 65 - Summary

Session Includes 1372, 1373, 1374, 1375

LAMB, Zachary [University of California Berkeley] zlamb@berkeley.edu, organizer

Manufactured housing is the largest source of unsubsidized affordable housing in the USA. Yet, planning and housing research has focused relatively little attention on manufactured housing as a housing type or on manufactured home parks (MHPs, also called "mobile home parks") as a form of urbanism. The lack of research attention to this sector is all the more troubling given that MHP residents are especially vulnerable to the negative effects of two of the most critical challenges of contemporary housing and planning: financialization-driven housing precarity and mounting environmental hazard risks associated with climate change. This first of two panels brings together research exploring various dimensions of planning, policy, and urban design for manufactured home parks in the hopes of charting a research agenda to bring much needed attention to this important form of American housing and urbanism. Topics include: MHPs as housing for older people; methods for overcoming the 'invisibility' of MHPs in regulatory, census, and land use data; land use regulation and marginalization of MHPs; and morphological analysis of MHPs as a form of urbanism.

Objectives:

- Explore planning, policy, and urban design issues related to manufactured housing parks.

A BIG DATA APPROACH FOR PREDICTING THE LOCATION OF MANUFACTURED HOME COMMUNITIES

Abstract ID: 1372

Abstract within Pre-Organized Session 65

DURST, Noah [Michigan State University] durstnoa@msu.edu, presenting author

SULLIVAN, Esther [UC Denver] esther.sullivan@ucdenver.edu, co-author

Manufactured home communities (MHCs) are a key source of affordable housing in the U.S. The manufactured housing stock is highly segregated from other forms of owned and rented housing (Durst and Sullivan 2019) and a growing body of research demonstrates that MHCs are exposed to environmental inequalities (Pierce, Gabbe, and Gonzales 2018, Sullivan, Makarewicz, and Rumbach 2021, Pierce, Gabbe, and Rosser 2022). Yet systemic research on MHCs is hindered by a lack of state and national registries of these communities and their locations. A range of data sources have been used to create inventories of MHCs across single metropolitan areas, but national snapshots of MHC populations still rely on Census data (Brooks and Mueller 2020), which does not disaggregate between MH on land owned by the MH owner and MH clustered on rented land in MHCs. Prior research (Durst et al. 2021) illustrates that building footprint data and machine learning methods can be used to distinguish between distinct neighborhood typologies, including MHCs, based on the morphology of the neighborhoods' buildings. The unique size and shape of manufactured homes and the unique layout of manufactured housing communities lends itself to morphological analysis and computational methods, which can cover wider territories than existing methods of cataloguing this

housing stock. However, our previous attempt at this analysis was limited in scope due to the need for accurate neighborhood delineations in the form of county plat records. Efforts to implement a similar method over a broader geography are hindered by inaccuracies in the delineation of U.S. Census blocks and the lack of widespread plat map records delineating the boundaries of residential neighborhoods and commercial developments. In this paper, we examine the ability to predict the location of MHCs across a broad geography by using big data and ad hoc neighborhood delineations. Specifically, we use a national database of building footprints and a variety of neighborhood delineations derived from modified census blocks and grid-based delineations to measure neighborhood morphology. We then use machine learning methods (Support Vector Machines) to predict the location of MHCs across the Houston, Texas, and Panama City, Florida metropolitan areas. We use a novel MHC database created by the Manufactured Home Hurricane Action Research project to ground test and verify these methods (<https://mhharp.org/>). The results illustrate that neighborhood morphology can be used to predict the location of MHCs at a broad scale, perhaps nationally, but that the accuracy of these predictions is highly dependent upon the accuracy of the building footprints and neighborhood delineations used. We will discuss the implications for identifying MHCs as well as informal subdivisions, including colonia housing.

Land-use regulations contribute to regional housing segregation in the United States (Pendall 2000). Metropolitan areas – which house over 80% of the U.S. population – are composed of many local jurisdictions with the legal authority to regulate land-use. Metropolitan areas are increasingly segregated by income and race, in-part because of land-use measures that effectively exclude or limit certain housing types and tenure arrangements. Single-family zoning, which limits residential housing development to single-family, detached homes, has been at the center of recent debates about land use planning, housing affordability and segregation. Other land-use tools, like permitted densities, lot size and coverage, and infrastructure requirements, are also used by local jurisdictions to manage development. The fractured landscape of land-use regulation within metropolitan regions is an important issue for regional equity as it can contribute to inequalities of access to housing, infrastructure, social services, transportation, job opportunities, and natural amenities, and variations in exposure to environmental hazards.

Manufactured home parks (MHP) – sometimes termed mobile home parks or manufactured housing communities – are an important source of affordable housing for households with low-incomes in the United States. The limited research on MHPs finds that they are socially and culturally stigmatized and a 'locally unwanted land-use' (LULU) in many communities. Research on land-use regulation and housing segregation has overwhelmingly focused on conventional (site-built, renter- and owner-occupied) housing, however, rather than manufactured homes and manufactured home parks, specifically.

This paper compares the local government regulatory treatment of manufactured home parks in three metropolitan areas in Florida and Texas: Greater Houston, Miami-Dade, and the Panama City metropolitan region. We study the

land use regulation of manufactured home parks at two scales. First, at the local government scale, we collect data on land-use plans that shape the potential building, expansion and/or improvement of MHPs. At the scale of individual parks, we draw a random sample of 1,200 parks and gather data on the current zoning and land use categorization for those parcels. We then compare mobile home park regulation within, and between, our three metropolitan regions.

Across all three urban regions we see clear patterns of regulatory exclusion of manufactured home parks. We find that state and urban context matters, however, for determining which regulatory tools are used to manage the MHPs and where they are predominantly located. Our paper discusses these key similarities and differences and articulates a future research agenda that will allow housers to understand the dynamics of regional housing segregation as it applies to manufactured home parks nationally.

CHANGING HOUSING COSTS FOR OLDER ADULTS LIVING IN MANUFACTURED HOUSING

Abstract ID: 1374

Abstract within Pre-Organized Session 65

MAWHORTER, Sarah [University of Groningen] s.l.mawhorter@rug.nl, presenting author

Manufactured homes (MHs) are commonly advertised to low income older adults as an affordable means to achieve homeownership in retirement. MHs provide housing for nearly seven million households in the US, including two million with householders aged 65 or older, according to figures from the 2010 census. Prior research shows that MHs are generally more affordable than conventional housing, yet the costs vary by tenure. Durst and Sullivan (2019) find that MH owners who rent their sites and MH renters pay higher housing costs compared with MH owners who also own their sites. An emerging body of research describes an increasingly financialized mobile home industry, raising concerns that investment companies are buying up mobile home parks and raising site rents for residents who can ill afford to pay more (Sullivan 2018, Salamon & MacTavish 2017, Lamb et al 2022). Most existing research relies on in-depth case studies focused on specific manufactured housing communities (MHCs) or regions. Beyond Durst and Sullivan (2019), less is known about the role of MHs in the US housing system more broadly. And few MH studies center older adults, though they comprise a key demographic for MHCs and often live on fixed incomes, making housing cost increases especially difficult for them to bear (Fenelon & Mawhorter 2021).

In this paper, I examine changes in housing costs for older MH residents during recent decades. I address three main research questions: (1) How have older MH residents' housing costs changed over the period from 1998 through 2018? (2) How do older adults' housing costs change when they move from conventional housing into MHs? (3) How often do older MH owners/renters experience site rent increases, and how much are site rents raised? In addressing these questions, I compare housing costs for MH residents across three tenures: those who own both their home and site (MH owners), those who own their home and rent their site (MH owners/renters), and those who rent both their home and site (MH renters). I also compare MH residents' housing costs with those of renters and homeowners living in conventional housing.

This quantitative descriptive analysis relies on longitudinal Health and Retirement Study data. The HRS is a nationally representative survey with a wide range of questions on the finances and health of adults aged 51 and older. The HRS includes detailed information on older adults' housing situations as well. The survey has been fielded every other year since 1992. Around 1,000 HRS respondents live in mobile homes, depending on the survey year, of which 42% own both their MH and site, 49% own their MH and rent their site, and 9% rent both their MH and site. Preliminary results show that site rents rose faster than inflation over the study period, increasing from a median of \$220 in 1998 (\$340 adjusted for inflation) to \$412 in 2018. This research sheds light on housing affordability concerns facing older adults living in MH, offering insights for planners and policymakers looking to address the

challenges of housing insecurity among a vulnerable population.

MANUFACTURED URBANISM: THE MORPHOLOGY OF MANUFACTURED HOME COMMUNITIES

Abstract ID: 1375

Abstract within Pre-Organized Session 65

LAMB, Zachary [University of California Berkeley] zlamb@berkeley.edu, presenting author

Though manufactured home parks (MHPs) (also referred to as “mobile home parks” or “trailer parks”) are a common residential neighborhood type and a major source of unsubsidized affordable housing in the USA (Durst and Sullivan 2019), they receive much less attention from planning and housing researchers than other forms of affordable housing (Lamb, Shi, and Spicer Forthcoming). This research gap is especially glaring in the realm of urban design. This paper seeks to address this gap, treating MHPs as a form of urbanism and a legitimate subject of urban design research.

Recent planning research on MHPs has focused on sociological and policy dimensions of residents’ vulnerability to displacement, financial exploitation, and environmental hazards (Sullivan 2018; Rumbach, Sullivan, and Makarewicz 2020; Pierce, Gabbe, and Gonzalez 2018). The morphology of MHPs - the spatial and material configurations of homes, infrastructure, streets, and public spaces - has received little attention, in spite of the long-recognized importance of these considerations in shaping neighborhood social life, function, and hazard vulnerability (Southworth and Owens 1993; Sharifi 2019).

In 1993 Michael Southworth and Peter Owens published their influential paper “The Evolving Metropolis: Studies of Community Neighborhood, and Street form at the Urban Edge” in the *Journal of the American Planning Association*. The study compares the form of residential neighborhoods, housing types, and street patterns across the San Francisco Bay Area, from the “speculative gridirons” of late 19th century to the “loops and lollipops” of cul-de-sac oriented post-World War II suburbs. Even though the decades before the article’s publication saw the most rapid development of MHPs in history, Southworth and Owens ignore MHPs in their analysis, reflecting the invisibility of these communities among planning and design researchers more broadly (Wheeler 2008).

In this paper, we use geographic frames and methods that parallel those used by Southworth and Owens to analyze MHPs. Using a combination of GIS-enabled spatial analysis and typo-morphological analysis, we consider MHP urbanism in the San Francisco Bay Area at three nested scales. First, we assess the location of MHPs within the region. Next, we analyze a representative sample of MPHs in the region in relation to their immediate surroundings, including analysis of surrounding land uses, relative densities, and access and visibility from public roads. Finally, using the same sample of MHPs, we assess the internal morphological characteristics of MPHs, including their street patterns, public spaces, and relationships between homes and streets.

We find that even in one of the most expensive housing markets in the US, MHPs are widespread, appearing in all but one of the regions’ eight counties. Based on our morphological analysis, we consider how MHPs align with and depart from patterns observed in other post-World War II residential neighborhoods in the region. MHPs share many morphological characteristics with surrounding single-family neighborhoods, including limited access, fragmented land uses, and curvilinear street patterns. While MHPs provide a rare source of relatively dense and affordable housing in the Bay Area, their fragmentation, isolation, and dependence on private automobiles can create serious challenges for residents and negative social and environmental externalities. We close by considering urban design strategies for addressing these challenges while preserving the benefits of MHPs enjoyed by residents.

MANUFACTURED HOUSING AND MANUFACTURED HOME PARKS: SETTING AN AGENDA FOR PLANNING RESEARCH AND ACTION (PANEL 2: MHPS, HAZARDS, AND RESILIENCE)

Pre-Organized Session 67 - Summary

Session Includes 1378, 1379, 1380, 1983

RUMBACH, Andrew [Texas A&M University] rumbach@tamu.edu, organizer

Manufactured housing is the largest source of unsubsidized affordable housing in the USA. Yet, planning and housing research has focused relatively little attention on manufactured housing as a housing type or on manufactured home parks (MHPs, also called "mobile home parks") as a form of urbanism. The lack of research attention to this sector is all the more troubling given that MHP residents are especially vulnerable to the negative effects of two of the most critical challenges of contemporary housing and planning: financialization-driven housing precarity and mounting environmental hazard risks associated with climate change. This second of two panels features research on issues related to hazard and climate vulnerability and adaptation among residents of manufactured housing and MHPs, including: vulnerability to heat and flooding; barriers to accessing hazard mitigation and recovery resources; and participatory assessments of community vulnerability in cooperatively-owned MHPs.

Objectives:

- Explore planning and policy issues related to environmental and climate hazards for residents of manufactured home parks

THE IMPACT OF MANUFACTURED HOUSING TYPOLOGY ON POST-FLOOD RECOVERY IN THE COLONIAS OF THE RIO GRANDE VALLEY

Abstract ID: 1378

Abstract within Pre-Organized Session 67

LUCAS, Belury [Independent Researcher] lucas.belury@gmail.com, presenting author

Manufactured Housing communities throughout the US experience heightened vulnerability to environmental hazards and exclusion from finance systems (Rumbach et al. 2020; McCann et al. 2021). This twin-vulnerability, ecological precarity and economic exclusion, can have disastrous results as research shows refinance and rehabilitation loans are critically important to finance post-disaster recovery (Billings et al. 2019). This paper, by focusing on the colonias of the Rio Grande Valley, attempts to understand the direct impact of the Manufactured Housing typology on this specific form of twin-vulnerability.

The colonias of the Rio Grande Valley are a particularly useful example of understanding the economic exclusion and ecological vulnerability of manufactured housing because these communities experience heightened flood risk along with one of the most un- and under-banked communities in the US (Belury 2022). The Rio Grande Valley sits at the southern tip of the Texas-Mexico border and colonias, largely Mexican and Mexican-American informal settlements with a predominant Manufactured Housing typology, experience particularly acute forms of environmental, political,

and economic precarity (Rivera et al. 2021; Belury 2020). Not only are Manufactured Housing households excluded from economic systems to support post-disaster recovery, but in the colonias of the Rio Grande Valley the Federal Emergency Management Authority's (FEMA) policy of 'Deferred Maintenance', or denying post-flood claims due to low-quality housing, is often tied to racialized preconceptions of colonias and Manufactured Housing (Rivera et al. 2021). This 'Deferred Maintenance' policy became a legal battle when, in the wake of Hurricane Dolly in 2008, the Texas Rio Grande Legal Aid (TRLA) partnered with La Union Pueblo Entero (LUPE) to sue FEMA, arguing the policy was racist and discriminatory (Rivera et al. 2021).

Utilizing focus groups and interviews with colonia residents in the Rio Grande Valley, quantitative statistical analysis of Home Mortgage Disclosure Act (HMDA) data, and discourse analysis of court documents in LUPE et al. Vs. FEMA I detail how Manufactured Housing typology biases undermine the efforts of ecologically vulnerable residents to recover from flooding. In addition, this paper argues that the Manufactured Housing typology in the colonias of the Rio Grande Valley deepens environmental injustice and economic precarity. However, rather than essentializing Manufactured Housing as inherently low-quality and unhealthy, I frame the ecological vulnerability of colonias as sites of environmental racism and racial capitalism. Ultimately, this research aims to examine how policy-enshrined attitudes of Manufactured Housing typology (re)produce ecological and economic vulnerability in the colonias of the Rio Grande Valley with implications for how other marginalized Manufactured Housing communities experience environmental injustice and economic exclusion.

REDUCING HEAT VULNERABILITY IN AFFORDABLE AND MANUFACTURED HOUSING: POLICY INNOVATIONS, MOTIVATIONS, AND BARRIERS

Abstract ID: 1379

Abstract within Pre-Organized Session 67

GABBE, Charles [Santa Clara University] cgabbe@scu.edu, presenting author

PIERCE, Gregory [University of California, Los Angeles] gpierce@luskin.ucla.edu, co-author

BERNAL, Declan [Santa Clara University] dabernal@scu.edu, co-author

Extreme heat is the largest weather-related cause of death in the U.S. and the human impacts of heat are expected to worsen with climate change. Housing policy is important for reducing heat vulnerability because (1) lower-cost housing units, including affordable housing and manufactured housing, are disproportionately located in neighborhoods that are hotter and have greater social vulnerability; (2) some affordable housing programs are targeted at seniors, families with children, and people with disabilities – populations that may be more heat sensitive; (3) affordable housing is less likely to have air conditioning than other rental housing types; and (4) low-income residents may lack financial resources to pay utility bills. This study follows previous research indicating that affordable housing and manufactured housing residents in California are more vulnerable to extreme heat relative to residents of other housing types (Gabbe & Pierce, 2020; Pierce et al., 2022).

We answer three questions with a focus on state of California and federal policies related to affordable and manufactured housing. First, how do state and federal policymakers address heat risk for residents of these housing types? Second, what motivates housing policy interventions to reduce heat risk? Third, what are the largest barriers to reducing heat risk, and how can these barriers be overcome? Our research fills gaps in climate adaptation literature because there has been limited focus on housing policies, particularly related to heat (Gabbe & Pierce, 2020; Martín, 2022; Pierce et al., 2022). This research also informs broader debates about policies to enable health and climate resilience for low-income households.

Our approach includes a plan evaluation of existing documents, and semi-structured interviews with representatives from relevant public agencies and housing advocacy groups. We focus on four place-based housing programs or types that have been the subject of previous research in the context of heat: public housing, the Low-Income Housing Tax

Credit (LIHTC), the Affordable Housing and Sustainable Communities (AHSC) program in California, and manufactured housing. Our plan evaluation approach informed by methods and criteria from recent scholarship (Gabbe et al., 2021; Shamsuddin & Leib, 2021). The criteria used to evaluate housing programs include heat-related issue identification, data, and goals; specific policies and strategies (e.g. energy efficiency, green building standards, shade provision, air conditioning access); and implementation and funding. We then interview officials from state and federal agencies that fund, administer, and regulate these programs, along with representatives from major affordable and manufactured housing advocacy groups.

Preliminary results indicate that there are few explicit policies related to reducing heat vulnerability for residents of affordable or manufactured housing. There are few direct heat-related policies in the public housing and LIHTC programs, but these programs indirectly address heat vulnerability through energy efficiency. The most relevant heat-related policies for manufacturing housing pertain to energy efficiency and cooling system standards. One exception is California's AHSC program, which provides supplemental funding to transit-oriented affordable housing developments that reduce greenhouse gas emissions. As a secondary goal, the program includes criteria related to climate resilience, including heat resilience. Forthcoming interviews will allow us to better understand barriers to addressing heat, and map potential policy directions.

These results suggest several lessons for housing planners and policymakers. First, housing plans and policy documents should acknowledge and directly address relevant climate hazards, including heat. Second, there is a need for funding to reduce heat vulnerability for residents of affordable and manufactured housing. Third, these interventions may be most likely to be adopted if they are framed in terms of co-benefits, including residents' health and energy security.

CO-CREATING KNOWLEDGE FOR ACTION: A RESIDENT-DRIVEN RESEARCH AGENDA

Abstract ID: 1380

Abstract within Pre-Organized Session 67

SLABAUGH, Dani [University of Colorado Denver] DANI.SLABAUGH@ucdenver.edu, presenting author
PEIRCE, Michael [University of Colorado Boulder] dr.mapeirce@gmail.com, co-author

In an age of dire climate justice impacts for front -line communities, how might academics re-envision a research framework that supports the transformation of vulnerability rather than simply its codification? Manufactured housing communities (MHCs) sit at the confluence of social vulnerability and hazard- prone physical locations, positioning them as likely sites of disaster (Rumbach et al., 2020). For most manufactured housing residents, a significant aspect of their social vulnerability is the unique form of housing tenure found in MHCs. Residents own the mobile home itself, but pay rent on the lot underneath it, frequently to a for-profit landlord. This creates a power dynamic that leads to vulnerabilities and disadvantages for homeowners while favoring landlords, as well as creating more complex challenges to disaster recovery.

Resident-owned communities, or ROCs, are manufactured housing communities that have worked with national and local non-profit housing partners to purchase the land underneath their homes. This land is then owned by an affordable housing cooperative managed by the residents themselves. ROCs present many positive opportunities for residents to reduce their hazard vulnerability and reduce housing precarity (Lamb et al., 2022). Resident-ownership, however, is not a panacea. ROCs only partly resolve the split-ownership problem and, like all MHC's, remain sites where physical hazards and social vulnerability frequently meet.

Research on vulnerable populations in disaster-prone contexts provides an invitation for academics to reconsider existing research paradigms and commonly used methods and methodologies, including deficit narratives at the heart

of social vulnerability frameworks. Jacobs (2019) reminds hazard researchers and planners that disaster survivors are not defined by their vulnerability, but instead that they are made vulnerable through social and economic systems as well as histories of systemic oppression. Manufactured housing residents are not passive victims of their vulnerabilities. Advocacy efforts from within MHC's, including the resident-owned communities movement, and resident groups' organizing for policy changes, demonstrate the agency of would-be research subjects, whose situated knowledge and ongoing advocacy has the potential to improve research framing, relevance, and other aspects of research quality. As academics outline a research agenda regarding MHC's and climate change vulnerabilities, we ask residents themselves what contributes to their vulnerability, and what research they need to make change.

Critical methodologies such as participatory action research offer academics opportunities to improve research quality, relevance, and impact (Balazs & Morello-Frosch, 2013). Rooted in both Habermas's theory of communicative rationality as well as the work of Colombian sociologist Orlando Fals Borda and Brazilian educational philosopher Paulo Freire, participatory action research is predicated on the co-generation of research questions, often with marginalized research subjects. It proceeds with the inclusion of these participants in varying aspects of the research process, including data collection, interpretation, and dissemination. These approaches supplant the traditional researcher/research-subject relationship, and instead define empirical inquiry as a partnership, with academic and community researchers each bringing different skills, perspectives, and insights to knowledge production. Critical and participatory methodologies – be they the critical praxis driven tradition of participatory action research or work that interrogates institutions of power by “studying up” (Nader, 1972), open opportunities for academics to produce a wide variety of knowledge that dovetails with the needs of impacted communities.

Through semi-structured interviews with resident-owners of manufactured housing communities in Colorado as an initial step in the participatory action research process, this paper presents preliminary findings regarding resident's understanding of economic, political, and physical barriers to disaster mitigation, as well as opportunities for further research that may support their adaptive capacity.

‘LIVES IN A TRAILER’: EXTREME HEAT, ENERGY EQUITY, AND HOUSING JUSTICE

Abstract ID: 1983

Abstract within Pre-Organized Session 67

KEAR, Mark [University of Arizona] mkear@email.arizona.edu, presenting author
WILDER, Margaret O [University of Arizona] wilder@uaamail.org, primary author

In recent years, an extensive literature has developed on fuel (or energy) poverty (Bouzarovski and Petrova 2015; Walker and Day 2013). Led by U.K. scholars, energy poverty research has been dominated by a focus on household heating infrastructure in cold regions. This paper calls for critical attention to energy poverty in warm regions where increasing temperatures pose disproportionate risks to vulnerable populations, particularly acute for residents of older mobile homes. While energy poverty has evolved since its introduction by Boardman, in contemporary usage it refers to “the inability to attain a socially and materially necessitated level of domestic energy services” (Bouzarovski and Petrova 2015:31). We focus not only on energy poverty but also energy equity to encompass the adaptation and resilience of households and communities (Hall, Hards, and Bulkeley, 2013). Our research examines climate risk within a particular type of housing—manufactured homes—a sector that is the largest source of unsubsidized affordable housing in the United States (Rumbach, Sullivan, and Makarewicz, 2020).

Based on research in manufactured housing (MH) communities which constitute 10% of housing stock in the desert city of Tucson, Arizona, we seek to contribute to theoretical understandings and planning implications of energy

poverty in warm regions with exposure to chronic/extreme heat. This paper is based on two years of ethnographic research among institutional representatives and residents of manufactured housing communities. We use a three-tiered intersectional approach that brings together the subfields of energy equity, climate vulnerability, and housing justice to understanding multi-dimensional vulnerabilities of MH households. Our research team conducted a total of 85 interviews including 71 (in English or Spanish) with MH residents in geographically disparate and structurally heterogeneous settings and 13 with government officials and representatives of social service organizations. Of interview participants, 35% of MH residents were housing cost-burdened and 40% live in pre-1976 mobile homes, units that were not built to current construction and safety standards.

The average daily temperature in Tucson during the summer months is 94°F (34°C); the average temperature in July is 100°F (38°C) with average July low of 77°F (25°C). Unlike in the past, nighttime temperatures have continued to remain high in recent years meaning inside temperatures also fail to “naturally” cool down at night leading to increased health risk. Although 73% of MH residents in the study had at least some air conditioning (AC), 10% had neither AC nor swamp cooling, a traditional evaporative cooling system in the arid climate. We found that AC is not a guarantee of protection from heat. Nearly 40% of the MH residents we interviewed said they could not maintain comfortable indoor temperatures. Just as cooler climates can still experience the impacts of extreme heat (e.g., Oregon, Washington, and British Columbia in 2021), so too can warmer climates experience impacts from cold, with 16% of interviewees reporting having no heating in their unit.

Access to liquidity (e.g., money, credit, subsidies) shapes adaptive capacity to extreme heat. MH faces unique disadvantages in access to U.S. federal low-income housing assistance funding (e.g., LIHEAP), less access to credit (Kear et al., in review), and ability to navigate social assistance programs. We found that land tenancy matters, with co-ops more resilient to climate due to lower housing costs overall, relative to traditional lease arrangements.

MH residents are disproportionately exposed to heat risk and health impacts due to demographic and socioeconomic composition, financial precarity, and climate stress. The research highlights resilience measures of MH residents and concludes there is a compelling need to build energy equity in warm regions through greater attention to planning around intersectional characteristics of MH households and heat-related housing and poverty alleviation policies.

Track 6 Roundtables

SUBURBIA IN THE 21ST CENTURY: FROM DREAMSCAPE TO NIGHTMARE?

Abstract ID: 1520

Roundtable

MAGINN, Paul [University of Western Australia] paul.maginn@uwa.edu.au, moderator
 ANACKER, Katrin [George Mason University] kanacker@gmu.edu, participant
 KEIL, Roger [York University] rkeil@yorku.ca, participant
 GORDON, David [Queen's University] david.gordon@queensu.ca, participant
 HANLON, Bernadette [The Ohio State University] hanlon.42@osu.edu, participant
 GURRAN, Nicole [University of Sydney] nicole.gurran@sydney.edu.au, participant
 MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, participant

This roundtable focuses on the condition, typology and prospects of suburbia in the 21st century. Despite the prevalence of the suburbs within our geographical and sociological imaginations combined with the spatial and demographic scale of the suburbs, academic analyses of suburbia have long been overshadowed by "methodological cityism" within urban planning/geography. That is to say, the 'urban' has been privileged over the suburbs. This roundtable, which adopts the format of an author meet critics panel, takes it lead from the recently published book, *Suburbia in the 21st Century: From Dreamscape to Nightmare*, and calls for the suburbs to be recognised and placed at the analytical centre of urban/metropolitan studies within the Global North and Global South. The four core panellists in this roundtable will, firstly, critically reflect upon the issues at their heart of their chapters - fixing Toronto's suburbia from within; the extent and degree of suburbia within metropolitan Canada; mortgage delinquency amongst same-sex suburban households in the US; and COVID suburbanisms within Australia, the UK and the US - and their relevance to developing a critical understanding of the meaning and role of the suburbs within contemporary cities and into the future. Crucially, the panel will highlight the dynamic and complex nature of the suburbs in the 21st century as a space of/for the pursuit and realisation of the 'great suburban dream' whilst also simultaneously being a potential victim of economic, social and environmental nightmares. The panel will highlight that the suburbs are by no means a homogenous space (i.e. landscape) If anything, 21st century suburbs will be shown to be an increasingly diverse space (i.e. a blendscape) in morphological, demographic, social, cultural and economic terms. that. This roundtable will also several critics who will question the core panellists about their respective topics as well as their views on the future of suburbs and suburban scholarship. Members of the audience will also be offered the opportunity to ask questions of the core panellists. Ultimately, this roundtable is designed to advance understandings of the definitions, meanings, character, transformations and prospects of the suburbs.

YES, IN GOD'S BACKYARD! BUILDING AFFORDABLE HOUSING ON RELIGIOUS PROPERTY

Abstract ID: 1052

Individual Paper Submission

MIAN, Nadia [Rutgers University Bloustein] nadia.mian@rutgers.edu, presenting author

Religious institutions are generally left out of the conversation when it comes to community development unless they are providing a social service. They are "invisible" stakeholders rarely acknowledged by professional planners. This study provides an opportunity for planners to understand how they can work with houses of worship to address the affordable housing crisis.

In many cities and suburbs houses of worship are struggling with dwindling congregation sizes, dilapidated buildings, and underutilized and expansive parish property (Chaves and Eagle 2015; Hackworth and Gullikson 2013; Mian 2008). Municipalities are struggling with the rising cost of housing and property values leading to an affordable housing crisis across the country.

To adapt and evolve as the religious landscape changes in North America, many houses of worship have partnered with municipalities, developers, and non-profit organizations to build affordable housing on their own property.

By engaging in affordable housing construction, congregations are able to fulfill their religious mission, potentially expand their congregations, keep their properties, and remain vital members of their community. Municipalities gain the opportunity to construct much needed affordable housing that allows for a mix of incomes, residents and uses in their neighborhoods. However, restrictive land use and zoning regulations make it difficult for faith-based organizations to build affordable housing on their property (Garcia and Sun 2020; Shook 2012).

This paper asks the question: How have religious organizations succeeded in reforming restrictive land use and zoning regulations to build affordable housing on their property? Through a non-random sample of various municipal programs and policies, interviews and archival research, the key findings of this research reveal houses of worship

across the country are changing housing policy and zoning regulations through partnerships with municipalities, upzoning and advocacy and activism.

ANALYSIS OF SPATIAL CORRELATION BETWEEN ACCESSORY DWELLING UNITS (ADUS) AND AFFORDABLE AND FAIR HOUSING DEMANDS

Abstract ID: 1055

Individual Paper Submission

KIM, Do [California State Polytechnic University, Pomona] dohyungkim@cpp.edu, presenting author

Accessory dwelling unit (ADU) refers to a completely independent living facility on a lot with a proposed or existing primary residence. ADU has emerged as a policy alternative to increase housing stock and provide affordable options for areas impacted by housing shortages (CAHCD, 2020). Since ADUs can become a flexible infill housing type that provides housing units, creates a wider range of housing options, functions as low-maintenance housing for the elderly to stay near family as they age and facilitates better use of the existing housing fabric in established neighborhoods (Kim, et al., 2021), they are expected to increase the stock of affordable housing and contribute to fulfilling fair housing demands. However, whether ADU is a viable solution to the affordable housing crisis or not is still controversial (Chapple et al., 2017; Ramsey-Musolf, 2018; Pfeiffer, 2019). Some advocates for ADU argue that ADUs have the broad potential to increase the stock of market-affordable housing due to virtue of their smaller size and lower building costs, but some express concern that ADUs do not really increase the stock of affordable housing that is committed to low-income people. Furthermore, there have been limited research that analyzes how exactly ADUs serve fair housing demands.

To shed light on this research topic, this paper attempts to explore the potentials of ADU from the perspective of fair housing. This paper constructs a geographically weighted regression (GWR) model that examines the spatial correlation between ADU developments and affirmatively further fair housing (AFFH) indicators in the City of Los Angeles. The model indicates that ADUs tended to be built in the neighborhoods with more public housing units and redlined areas. However, the correlation between ADU developments and the socio-demographic characteristics of the areas do not represent a clear contribution of ADU to fair housing. The model indicates that ADUs tended to be built in the areas where more people of color live and median household income is lower, while there are fewer ADU constructions in the areas with a higher poverty rate and a higher number of limited English-speaking households. More surprisingly, ADU developments do not present a correlation with any opportunity indicators. This suggests that ADUs in the city probably were built in the areas with limited accessibility to jobs and public transit and poorer conditions of environmental health and school proficiency. These findings will help planners take appropriate actions and regulations that increase affordable housing production by promoting ADU developments in the areas where there are higher demands in affordable housing.

DOES THE LOW-INCOME HOUSING TAX CREDIT PROGRAM EXPAND ACCESS TO OPPORTUNITY NEIGHBORHOODS? TRACKING MOVEMENTS OF LOW-INCOME TENANTS IN CALIFORNIA

Abstract ID: 1056

Individual Paper Submission

KUAI, Yiwen [Fannie Mae] xavierk@ucla.edu, presenting author

The Low Income Housing Tax Credit (LIHTC) program can potentially help expand access to neighborhoods with low poverty and economic opportunities for low-income households. Prior studies have generally described that LIHTC units are sited in neighborhoods with relatively high poverty rates and limited opportunities, but with improvements in recent years. Beyond these cross-sectional analyses, scholars have not extensively looked at the movements of LIHTC tenants. It remains unclear whether the program creates opportunities for low-income households to move into better neighborhoods than they previously live in or reinforces residential segregation by encouraging moves to similarly disadvantaged neighborhoods. Using an extensive consumer database, I am able to track the movements of tenants who move into newly placed-in-service LIHTC properties in California. My result shows that tracked LIHTC residents on average experience increases, rather than decreases, in their neighborhood poverty exposure. A low-income household who moves into a LIHTC unit faces an increase in the neighborhood poverty rate for about 6 percentage points over other low-income renters when they move. These LIHTC tenants also see lower levels of neighborhood amenities than at their previous addresses. A low-income household may have to trade better neighborhood amenities with low rent offered by a tax credit unit. Despite the increased prioritization towards opportunity in California, the LIHTC program has not significantly changed tenants' exposures to poverty. The methodology in this paper can be replicated on a larger scale.

PREVENTING VACANT AND ABANDONED PROPERTY: THE ROLE OF HOMEOWNERSHIP PROGRAMS FOR VERY LOW-INCOME HOUSEHOLDS

Abstract ID: 1068

Individual Paper Submission

DEWAR, Margaret [University of Michigan] medewar@umich.edu, presenting author
EISENBERG, Alexa [University of Michigan] alexae@umich.edu, co-author
MEHDIPANAH, Roshanak [University of Michigan] rmehdipa@umich.edu, co-author

Numerous programs seek to increase low-income homeownership to enable more households to gain the benefits of owning a home such as increased wealth, control over their own housing, better health, and better education for children. Implicit in many of these programs in legacy cities is a goal of preserving properties and returning them to the tax rolls. No assessment exists of whether such programs can achieve these goals with respect to property. Property outcomes are in part a reflection of the sustainability of low-income homeownership, which previous

research has shown is precarious. A homeowner may sell to gain cash for emergency expenditures, leave a house vacant and therefore vulnerable to destruction, or lose the house to mortgage or tax foreclosure.

Research has evaluated the effects of a range of programs on preventing or remediating vacant and abandoned properties. Scholars, policy analysts, and planners have examined the externalities from reuse and local ownership of vacant lots, the work of land banks in addressing publicly owned property, the effects of demolition of blighted structures, and the impacts of large targeted neighborhood investments, for instance. No research has considered how programs to increase very low-income households' homeownership might affect property outcomes.

This research examines the property outcomes after nearly five years in two programs that sold houses to very low income households in 2017 in Detroit and in a comparison group of properties where such households were not successful in buying. One program sold houses to the renters living in houses their landlords had allowed to go into tax foreclosure. The purchasers had been recruited from a list of renters seeking to buy back their homes at the tax auction. The program provided almost no orientation to homeownership. In the second program, the Detroit Land Bank sold houses to the occupants of houses in their inventory in 2017. The occupants had had some claim to the houses before the properties went through tax foreclosure, failed to sell at the tax auction, and entered the Land Bank's inventory. Most were previous owners or renters or family members of previous owners or renters. The purchasers went through homeowner education and training over a period of more than a year and received their deed only after saving for and paying property taxes. A third group's properties serve as a comparison to examine what would have happened to properties without the program interventions. The occupants of comparison properties sought to buy the houses at the tax auction; some succeeded in doing so but most did not. The types of purchasers and houses in the two programs and at the tax auction were similar in 2017.

The research integrates data on property from numerous sources to investigate which properties are still occupied by the low-income purchaser, have had major repairs, are vacant or tax delinquent, have experienced tax foreclosure again, are back in Land Bank ownership, and have been demolished or now require demolition. I expect that the Land Bank program will show greater success in keeping properties occupied and out of tax foreclosure than the program that sold to households without homeownership education but that both of these will show much greater success in preserving property and keeping it on the tax rolls than the sale of properties at the tax auction which occurs without screening of the purchasers. In addition, I expect the property data to reveal a range of ways that very low-income homeownership might be reinforced for longer periods of ownership and identify how some purchasers find profit in advancing disinvestment, practices that city governments should seek to prevent.

SPEEDING UP THE COMMONS: COLLECTIVE TENURE AS MOBILE POLICY IN THAILAND AND BEYOND

Abstract ID: 1076

Individual Paper Submission

SHELBY, Hayden [University of Cincinnati] shelbyhm@uc.edu, presenting author

In recent years, collective forms of land tenure such as housing cooperatives and community land trusts have gained in popularity around the world. Collective ownership of land and housing presents the possibility of imagining diverse economies that preserve affordability in the realm of housing and in doing so also allow residents opportunities to engage in meaningful work and recreation beyond wage labor (Huron 2018). However, some authors have noted that in scaling up and moving around, collective tenure forms have lost their political ambitions and become a technocratic approach to affordable housing (DeFilippis et al. 2019). Research on the processes by which these models become mobile has just begun, though (Thompson 2020). In this paper, I ask, how do collective tenure become "fast policy" (Peck and Theodore 2015)? And when they do, are the lessons being learned from previous

successes the right ones?

To answer these questions, I analyze the case of the Baan Mankong collective housing program of Thailand, which has reached over 113,000 households and has served as a model for similar programs around the world. Relying on 18 months of ethnographic research with organizations that administer the policy, I illustrate how Baan Mankong has morphed from grassroots movement to global model. I focus particularly on how the program has been packaged for international audiences, and I compare this packaging to how the program functions on the ground.

My findings demonstrate a disconnect between the model's "sales pitch" and what actually makes for successful projects. On the ground, projects that endure are those in which leaders devote their time and labor out of a dedication to their fellow community members and a political commitment to a larger movement. Absent this commitment, the program is merely a lot of work. However, this labor and hardship is often erased in English-language "best practice" accounts, which instead emphasize a few discrete features of the model. These features include collective finance, self-enumeration and mapping, and federating communities into formal networks. My analysis demonstrates how each of these program design features originates in strategies of grassroots organizing, but as the policy has become mobile, their political content and social meaning has changed such that they are formalized and coincide with popular global discourses around "rituals" of self-empowerment and co-production (Watson 2014). Thus, attempts to scale up and spread this collective alternative have focused not on what actually makes the program successful, but rather on a set of procedures and institutional arrangements that are amenable to replication and fit neatly within existing development frameworks. Efforts to learn from successful alternative economic development models must therefore focus on the content and meaning behind models, not merely on their formal elements.

'DISPLACEABILITY' IN PUBLIC HOUSING CONVERSIONS: THE RENTAL ASSISTANCE DEMONSTRATION (RAD) AND DISPARITIES IN PRIVATIZATION INITIATIVES IN CALIFORNIA

Abstract ID: 1088

Individual Paper Submission

STAHL, Valerie [San Diego State University] vstahl@sdsu.edu, presenting author
MEDINA, Taya [San Diego State University] tmolina3361@sdsu.edu, co-author

Traditional public housing has been in retreat in the United States for several decades, with the HOPE VI program resulting in the reduction of social housing units by an estimated quarter million nationwide (Goetz, 2013). To date, relatively little scholarly work has focused on the impacts of Housing and Urban Development (HUD's) latest effort to change the form and function of public housing: the Rental Assistance Demonstration (RAD). RAD is an Obama-era program that outsources traditional public housing to external management while claiming protections for existing residents. Generally, the conversion provides residents with a project-based voucher to remain in their unit while allowing a private or non-profit operator to take over management and access debt for repairs that traditional public housing authorities cannot leverage (Reid, 2017). Journalistic accounts have shown how public housing residents nationwide have expressed concern that RAD conversions will result in their eventual displacement, yet minimal studies have focused on the impacts of RAD on residents (Hayes, Gerkin, and Popkin, 2021). More empirical work on RAD is necessary to critically consider how– and which– residents are weathering this quiet form of privatization that Hanlon (2017) has deemed the nail in the coffin of public housing in the United States.

In this paper, we employ mixed methods and use California public housing conversions to explore which communities are subject to privatization processes through RAD. We ask, do socio-economic disparities exist between traditional public housing and eventual RAD-converted housing prior to conversions in California? If so, what does

this reveal about whose homes were subject to privatization? And how do impacted residents interpret these changes? We focus on California because it has the second-highest number of proposed RAD transactions in the country. Rather than measuring potential displacement from converted public housing from the offset, we engage with what Yiftachel (2020) has described as a necessary shift from measuring displacement as it occurs to a critical consideration of “displaceability,” by focusing on the factors that make certain communities vulnerable to dispossession.

To address these questions, we use historical HUD’s Picture of Subsidized Households (POSH) data from 2010, two years prior to the introduction of the RAD initiative. We consider socio-economic disparities between residents living in traditional public housing that remained public as compared to communities that will eventually be converted to external managers via RAD. We will pair the quantitative findings with qualitative data from focus groups in projects undergoing RAD conversions to see how residents are interpreting the changes to their homes and communities, with a particular focus on fears of displacement.

When compared to traditional public housing communities that remained public, we find that on average, public housing communities that were eventually converted to RAD were larger and more populated, with a significantly higher rate of overhoused residents. In terms of socio-economic differences, residents in properties eventually converted to RAD had a significantly higher rate of disabilities among household members and heads of households, of Asian/Asian-American households, and of households with extremely low incomes. As RAD enters its tenth year and appears to be the future of public housing nationwide, it merits critical observation. In this research, we highlight the racial and socioeconomic disparities between which communities faced privatization, followed by a qualitative understanding of resident impressions and fears as their communities undergo change. Empirically and theoretically, we speak to the planning scholarship that considers various forms of displacement, including risks of community dispossession before the specter of potential physical displacement begins. We also contribute to a growing body of scholarship that focuses on the impacts of RAD on existing residents.

IMPACT OF DISASTER MITIGATION PROJECTS ON LOW- AND MODERATE-INCOME HOMEOWNERSHIP IN NEW YORK CITY AFTER THE 2012 HURRICANE SANDY

Abstract ID: 1093

Individual Paper Submission

KHAJEHEI, Sayma [University of Utah] sayma.khajehei@utah.edu, presenting author

Mitigation projects and policies are the popular responses to disaster resilience strategies. Yet, we have little knowledge about the impacts of these projects on various households, particularly low- to moderate-income homeowners. Using New York City (NYC) as a case study, this research explores the impact of city-wide mitigation projects on the percentage of low- and moderate-income homeowners. NYC is a diverse community that has faced various disasters in its history, such as Hurricane Sandy in 2012. Recently, the city has shifted to mitigation and completed 227 mitigation projects for various hazards, with another 473 funded and still ongoing projects. This paper applied differences in differences approach using data from the American Community Survey 5-year estimates for 2007-2011 and 2014-2019, before and after Hurricane Sandy, and the NYC Hazard Mitigation dataset of the post-Sandy mitigation projects. Findings show that the percentage of low- to moderate-homeowners has decreased when mitigation projects are being implemented or ongoing. Findings also provide a greater understanding of how changes in percentage of low- to moderate-income homeowners are related to tract-level market and socioeconomic changes. These results call into question whether the benefits of mitigation interventions are distributed fairly and whether they increase the community resiliency equally.

GARAGES AND DRIVEWAYS AREN'T JUST FOR PARKING: HOW SINGLE-FAMILY HOME RESIDENTS ARE ADAPTING THESE SPACES TO PEER, PLAY, AND PROSPER

Abstract ID: 1094

Individual Paper Submission

PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, presenting author

A common feature of the U.S. suburban landscape is the garage home, a kind of home where the garage and driveway dominate the front of the home. Garage homes use land efficiently, which offers profitability for developers and affordability to households; yet they are blamed for various neighborhood ills, like a lack of physical activity and socialization among neighbors. Despite their popularity and concerns about their social impacts, there have been few attempts to systematically explore the uses, prevalence, and geography of garage homes, including how their uses have evolved over the COVID-19 pandemic. Adapting garages and driveways for uses other than parking may help diverse households thrive in car-oriented neighborhoods and influence relationships between living in these neighborhoods and health.

This research helps to fill these gaps and explore links between adaptation of car-oriented spaces and wellbeing by using a mixed-methods and multi-scalar approach, triangulating English-language Instagram data with fieldwork and windshield survey data from diverse neighborhoods in Phoenix, Arizona, a quintessential suburban region, across the pre- and post-pandemic periods. First, I show how single-family home residents adapt their attached front garages and driveways to meet their needs by using content and visual analysis to develop a taxonomy of adaptations. These exhibit a range of functions, from health promoting (e.g., gyms and food storage) to habitation (e.g., garage bedrooms and RV parking) to socially generative (e.g., children's play and neighborhood gatherings). Second, I use data from the 2017 and 2022 Phoenix Area Social Survey and U.S. Census to explore links between these adaptations and neighborhood demographic, health, and housing market dynamics. Third, I show how adaptations vary over seasons and in the pre- and post-pandemic periods, highlighting two emerging post-pandemic trends: uses involving creative expression and surveillance.

Overall, this research helps to extend theories of how people adapt their built environments to thrive by identifying 1) how people use garage homes to meet their needs, 2) where different kinds of garage home adaptations occur, and 3) how adaptations change over seasons and after societal disruptions. These findings will help local practitioners and advocates develop targeted strategies to harness the opportunities and remedy the potential harms of garage homes for residents and envision their role in a more automated, post-carbon transportation future.

HOUSEHOLD RECOVERY FROM FORECLOSURE: EVIDENCE FROM PANEL SURVEY OF INCOME DYNAMICS (PSID)

Abstract ID: 1107

Individual Paper Submission

Despite policies and efforts to promote homeownership that have continued for decades (Herbert and Belsky, 2008), the homeownership rate dropped sharply to pre-1970 levels with the start of the sub-prime mortgage crisis. The National Delinquency Survey (2010) shows that the mortgage foreclosure rate increased to nearly five percent and nearly four million homeowners lost their homes between 2008 and 2011. Fortunately, the homeownership market has recovered from the aftermath of the recession and returned to its previous state. But, did households who lost their home regain homeownership? Does the housing market recovery result from the recovery of foreclosed households? Although studies on the housing market resilience after the Great Recession show a relationship between regional characteristics and neighborhood recovery (Wang, 2019; Wang & Immergluck, 2019), little is known about the recovery of individual households which can be characterized as regaining homeownership or wealth lost in foreclosure. If the housing market recovery is driven by high-income groups or those who have not been damaged during the crisis, foreclosed households are likely to face challenges such as cost burdened. Since foreclosed households are more likely to move to poor neighborhoods and may have fewer opportunities for new jobs or may have to spend more time commuting than before, it is not easy to recover economically (Niedt & Martin, 2013; Pfeiffer & Lucio, 2015). In addition, they sometimes experience unexpected physical and mental problems after the foreclosure which negatively affects health, stability, and educational opportunities of family members (Katz et al., 2013; Pollack et al., 2011; Williams et al., 2014). They have many hurdles to overcome, but at least some of them become homeowners again. This study brings attention to the area where they lived during their recovery. In addition to individual efforts, and assistance from the government, I expect that there are some advantages or disadvantages brought by the characteristics of the residential area.

This study primarily relies on the 2005 -2019 Panel Study of Income Dynamics (PSID). PSID tracks approximately 5,000 households across the country biannually, providing extensive information on foreclosure experience, familial relationships, homeownership status, locations where they live, life cycle events, socio-economic characteristics, and consumption patterns of the respondents. Since 2009, PSID has added survey questions about foreclosure; Whether a foreclosure process has begun, the year and month of the start, the result of the process, and whether a foreclosed home is a primary residence.

This study seeks to answer the following questions through the experiences of individual households who lost their homes. First, did foreclosed households regain homeownership? Second, is there a relationship between socio-demographic characteristics of foreclosed household and regaining homeownership? Third, where do homeowners who have lost their homes migrate? Finally, what characteristics of the neighborhood help foreclosed households recover? While previous studies have focused on the resilience of housing markets and regions, this study explores the link between regional characteristics and individual household recovery. The recovery of financially disadvantaged households is an important issue for communities and states. Identifying the mechanism that is responsible for household recovery has implications for implementing programs to aid household recovery. It helps determine which programs can give more benefits to recipients to achieve recovery: providing individuals with a monetary subsidy (e.g., covering relocation expenses) or encouraging and aiding them to move into a certain neighborhood. The findings of this study suggest that the government's recovery assistance program should aim to support relocation to areas with lower poverty rates and higher job and educational opportunities.

EVOLUTION OF HOUSING FINANCIALIZATION IN BRAZIL AND MEXICO

Abstract ID: 1116

Individual Paper Submission

REYES, Alejandra [University of California Irvine] lreyesru@uci.edu, presenting author

BASILE, Patricia [Indiana University, Bloomington] pdetoled@iu.edu, co-author

After defaulting on their foreign-debt obligations in the 1980s, several Latin American countries had to restructure their economies to boost market-led growth. Some ensuing housing reforms promoted mortgage expansion and mass housing production. Mexico was among the first countries to follow this logic and in a particularly aggressive manner. Credit liberalization allowed a handful of real estate firms in the country to undergo massive expansions in their operations in the early 2000s by building lower-middle-income housing at an accelerated rate while making use of pension and private equity funds. Brazil eventually appropriated certain aspects of the Mexican housing model, but not others. In the late 2000s, Brazil began providing deep subsidies to low-income households to connect the private supply of housing with a publicly subsidized demand. This paper discusses, challenges, and expands beyond prior analyses of these processes by contrasting their housing finance models and by examining the more recent (2010s) evolution and normative shifts of their housing and urban development policy agendas. Despite the policy transfer between both contexts, this south-south comparative analysis highlights the fluctuating and unstable nature of financialization processes given the diverse inclination of national governments to manage, promote or restrict them and in turn contain or accentuate capitalist crises and their implications.

This comparative analysis relies on an extensive review of the existing and relevant literature and on both primary and secondary data. Field research and semi-structured interviews with public entities, private developers, and civic organizations were carried out in two Mexican case studies (Tijuana, Baja California and Huehuetoca, Estado de Mexico), and financial data, public accounts, and policy and industry reports were analyzed for both countries.

USING STAKEHOLDER INPUT TO PLAN FOR THE DEMOLITION OF BLIGHTED, VACANT PROPERTIES IN FLINT, MICHIGAN

Abstract ID: 1139

Individual Paper Submission

MORCKEL, Victoria [Michigan State University] morckelv@msu.edu, presenting author

In legacy cities, public entities like land banks often select properties to demolish based on residents' complaints. However, a complaint-driven approach is unlikely to be equitable or to achieve broad community goals when the number of blighted, vacant properties vastly exceed a community's demolition capacity. While some cities target demolitions based on market potential or neighborhood conditions like high foreclosure rates, few have comprehensive strategies for planning for demolitions that extend beyond specific, target neighborhoods or the requirements of a current funding source.

While there are practitioner-oriented resources that describe how communities set demolition priorities (e.g., Mallach, 2017a), these materials tend to be descriptive, not inferential or evaluative. Perhaps more importantly, no materials outline a resident-driven or resident-informed comprehensive demolition planning process, since to the author's knowledge, there has been no such planning process undertaken in a U.S. city.

Academic studies of demolition activity are also lacking. Existing studies are often retrospective, focusing on topics like where demolitions occurred, the effects of demolitions on crime, what to do with vacant land post-demolition, and the historic outcomes of demolitions conducted as part of urban renewal. An exception is Morckel (2017) who described the use of suitability analysis to proactively assign every vacant property in a city a demolition score, with higher scores indicating priority for demolition. However, Morckel's work was hypothetical and did not include public input.

Therefore, to improve upon existing literature, this paper presents an example of using public input to conduct "demolition planning" in a legacy city. The author defines "demolition planning" as using a systematic process, guided by resident input and grounded in urban planning principles, to plan for the demolition of large numbers of vacant properties to achieve a desired outcome. The paper examines the results of a survey—created and administered by the Genesee County Land Bank Authority in Flint, Michigan—about the factors that stakeholders believed should be prioritized by the land bank when determining which properties to demolish. 399 Flint stakeholders rated and ranked seven potential factors, and their responses were analyzed using ANOVA models to test for statistically significant differences in means rankings, as well as geographical differences in responses by city ward.

Whether a blighted property was located next to an occupied home was by far the most important consideration to Flint residents when deciding what to demolish. The next most important considerations, of equal statistical importance, were burned-out homes, blighted properties near open schools, and blighted properties in highly occupied neighborhoods. The three remaining factors, which were of lesser importance than the prior factors, but of equal statistical importance to one another, were blighted properties located on major corridors, properties with fire insurance to cover part of the demolition costs, and blighted properties near parks.

The paper then covers how the land bank used these survey results to create a demolition selection model—that is, an algorithm that assigns vacant, blighted properties a demolition score, with higher scores indicating priority. In general, the more important a factor was to residents, the more heavily it was weighted in the model. In terms of geographic differences, a few wards differed slightly in their priorities, suggesting that some areas of the city could have separate demolition prioritization models.

The paper further considers how other communities can improve upon Flint's surveying and model-building efforts, and includes a more general discussion of the challenges of demolition planning that is applicable beyond Flint. Given that no prior study has examined what residents (anywhere) want to see demolished and why, our findings should be of broad interest, especially to researchers and policy makers working in legacy cities.

A CRITICAL JUNCTURE? CMHC'S ROLE IN CANADIAN SUBURBAN COMMUNITY PLANNING 1944-60

Abstract ID: 1140

Individual Paper Submission

GORDON, David [Queen's University] david.gordon@queensu.ca, presenting author

It is widely acknowledged that Canada is now a "suburban nation", but how did it make the transition from urban to suburban so quickly after World War II?

The Central Mortgage and Housing Corporation (CMHC; renamed Canada MHC in 1979) was established as a federal Crown agency to implement national housing objectives in the post-war recovery period. However, CMHC was also tasked with implementing the federal government's national community planning objectives. The agency facilitated a major change in Canadian urban structure, even though urban planning and development are within provincial and municipal jurisdictions.

This paper is based upon archival research conducted in the CMHC fonds at Library and Archives Canada and CMHC's National Housing Information Centre. A preliminary investigation indicates the suburbanization of Canada was a path-dependent outcome arising from a critical juncture in the post-war reconstruction period - with CMHC as the main institution responsible for the outcome. CMHC reinforced the suburban trajectory by publishing planning handbooks, funding a national advocacy network, establishing national standards, seeding a Canadian planning schools, importing planners and designing and developing lands owned by the federal government.

This paper informs current national debates on areas such as urban policy and infrastructure, where the federal government has spending power and resources, but the constitutional authority largely rests at the provincial and municipal levels. This paper will provide important insights about how a federal agency implemented national programs in two areas with almost complete provincial and municipal responsibility: improving community planning and expanding suburban development.

The project uses planning history research methods that have been developed, tested and adjusted in previous investigations of Canadian community planning and suburban development. The historical-institutional analysis will be guided by the latest theories on path dependency in public agencies, to determine whether the 1945-1955 decade was a critical juncture in Canadian urban policy, with CMHC as a key actor in the transformation to a suburban nation.

In Historical-Institutionalism terms, periods of major institutional intervention are identified as "critical junctures", when existing structures are not solving patterns such as a housing crisis, and change is less constrained than in the periods of path dependence that precede and follow them. We will consider whether the 1945-55 decade was a critical juncture in Canadian urbanism, when some early decisions (mandatory community planning; facilitating mortgages but avoiding mortgage interest deductibility) may have set Canada on a suburban path substantially different than the USA or UK.

EXPLORING WITHIN-METROPOLITAN AFFORDABLE HOUSING MISMATCH IN THE UNITED STATES

Abstract ID: 1155

KANG, Seungbeom [Yonsei University] sb.kang@yonsei.ac.kr, presenting author

JEON, Jae Sik [Konkuk University] jaesikjeon@konkuk.ac.kr, co-author

AIRGOOD-OBRYCKI, Whitney [Joint Center for Housing Studies of Harvard University] whitney_airgood-obrycki@harvard.edu, co-author

Despite various indicators to measure the shortage of affordable housing for low-income households, few studies have examined the potential geographical mismatch between affordable housing supply and lower-income demand within a metropolitan area. Most studies have focused on estimating regional affordability gaps, simply assuming that if there is a sufficient supply of rental units affordable to lower-income households, regardless of where those units are located within a local housing market, those units would be easily occupied by lower-income households. However, with long-standing racial and income segregation, job-worker imbalance, and market barriers that hinder the movement of certain subpopulations, the assumption may overlook potential within-metropolitan imbalances between low-income renters and rental units they can afford.

To fill the research gap, we explore the presence of neighborhood-level affordable housing imbalances, either the gaps or surpluses between the number of a certain low-income renter group and rental housing units affordable (and available) to them. Specifically, this study examines the following questions: (1) to what extent does the neighborhood-level affordable housing imbalance exist in the United States? (2) to what extent do the degrees of the rental affordability imbalances, measured by dissimilarity indexes calculated based on the number of low-income renter households and rental units affordable to them at a census tract level, vary across metropolitan areas and different low-income groups? and (3) under what metropolitan-level conditions are the imbalances likely to be severe?

We analyze the Comprehensive Housing Affordability Strategy (CHAS) data to measure tract-level affordable housing gaps and surpluses based on the largest 100 core-based metropolitan areas (CBSAs). On the demand side, we measured the numbers of three income groups at a census tract level: (1) extremely low-income (ELI) renters, (2) very low-income (VLI) renters, and (3) low-income (LI) renters. On the supply side, we categorized rental units into several groups and measured the numbers of those units at a census tract: (1) affordable (and available) rentals for ELI households, (2) affordable (and available) rentals for VLI households, and (3) affordable (and available) rentals for LI households. Based on the estimated numbers, we explore descriptive patterns of the estimated neighborhood-level affordable housing gaps and surpluses across the CBSAs. Then, we calculate dissimilarity index values as a proxy reflecting the overall degree of neighborhood-level housing affordability imbalances within each metropolitan area.

Then, we explore the CBSA-level conditions under which such imbalances are likely to be severe by estimating multivariate models.

We confirm that ELI households are, on average, exposed to affordable (and available) rental gaps. Especially, lower-income renter households face constrained housing and neighborhood options not just due to the low quantity of rental units affordable to them but also the fact that many of those units are already occupied by higher-income groups. However, we also find a large share of neighborhoods with remaining rental units affordable (and available) to low-income renter households, especially VLI and LI households. Across income groups, the dissimilarity index values have varying relationships with CBSA-level conditions. In the case of ELI and VLI households, the degree of racial segregation between White and African American households relates to the affordable housing imbalances. In the case of VLI and LI households, they are associated with the degree of low-wage job-worker imbalances and the proportion of rental units affordable to each group in suburban neighborhoods. In the case of LI households, we discover evidence supporting that the affordable housing imbalances are associated with the degree of residential land use regulatory restrictiveness. These results show that different approaches should be considered to expand affordable housing options for different income groups.

CLASS MONOPOLY RENT AND THE URBAN SUSTAINABILITY FIX IN SEATTLE'S SOUTH LAKE UNION DISTRICT

Abstract ID: 1171

Individual Paper Submission

ANDERSON, Matthew [Eastern Washington University] manderson22@ewu.edu, presenting author

HANSEN, Elijah [Eastern Washington University] echansen90@gmail.com, co-author

SCULLY, Jason [Eastern Washington University] jscully@ewu.edu, co-author

The paper contributes to the recent renaissance in Marxian land rent theory by examining the dynamics of rent in the context of contemporary urban sustainability policies and practices. It specifically examines the ways in which landowners, developers, and the local state work together to pursue class monopoly rent through a variety of policies and practices normally treated as separate, such as tax-increment financing, discursive-branding, urban growth boundaries, business improvement districts, and transfer of development rights. We implicate each of these practices as fundamentally linked insofar as they function as strategies for myriad invested actors in collaboratively pursuing class monopoly rent. In the process, we present a heuristic tool, what we call the “rent matrix,” to conceptualize how these policies converge to the benefit of myriad rent seekers in the context of Seattle’s rapidly redeveloping South Lake Union District. The study peels back the discursive and ostensibly progressive façade of urban sustainability to reveal a collaborative network of landowners, developers, and state actors whose goal is to increase rents. The multi-scalar dynamic of class monopoly rent is revealed and highlighted as a constitutive feature of an urban sustainability fix embedded within wider processes of uneven and exploitative neoliberal urbanization.

NEIGHBORHOOD LOCATION PATTERNS OF THE HOMELESS HOUSEHOLDS ASSISTED WITH HOUSING CHOICE VOUCHERS

Abstract ID: 1177

Individual Paper Submission

HAN, Hye-Sung [University of Kansas] hshan@ku.edu, presenting author
MCCLURE, Kirk [University of Kansas] mcclure@ku.edu, co-author

The Housing Choice Voucher Program was created to provide low-income families with affordable, accessible housing and to increase access to low-poverty, high-opportunity neighborhoods (McClure, 2010). Location outcomes of assisted households have been of interest to many scholars as a wealth of research has demonstrated that neighborhood environments greatly influence individual outcomes (Briggs, 1997; Ellen & Turner, 1997; Jencks & Mayer, 1990). What has not been previously examined in scholarship is the location outcomes of previously homeless low-income households who received federal rental assistance. Using 2017 HUD household-level data, this study investigated the extent to which homeless households given vouchers were able to move to high-opportunity neighborhoods compared to other renter households and other households given vouchers.

Households that entered the housing assistance program from homelessness are significantly less likely to reside in high or very high opportunity tracts compared to previously housed households. While the HCV program does a better job locating households in high or very high opportunity tracts than project-based programs, previously homeless HCV households are more likely to reside in very low opportunity tracts and less likely to reside in high or very high opportunity tracts compared to previously housed HCV households. Further, although minority households are overrepresented in very low and low opportunity tracts than white households, homeless households account for a larger share in very low opportunity tracts than previously housed households regardless of race and ethnicity. In addition, this study found that having children in the household and being a minority household decreases the odds of locating in high opportunity tracts, while being elderly, disabled, and locating in suburban tracts increases the odds of locating in high opportunity tracts.

UNDERSTANDING PUBLIC PERCEPTIONS OF AFFORDABLE HOUSING THROUGH PROMPTED AND UNPROMPTED WRITINGS

Abstract ID: 1178

Individual Paper Submission

DOUGLAS, Isabella [Stanford University] douglasi@stanford.edu, presenting author
CHAN, Deland [Stanford University] deland@stanford.edu, co-author
EICHSTAEDT, Johannes [Stanford University] eichstaedt@stanford.edu, co-author
BILLINGTON, Sarah [Stanford University] billingt@stanford.edu, co-author

There is a long-standing deficit of affordable housing in the United States and, even though there is a seemingly near-universal consensus that more affordable housing units are needed, actually getting those units constructed turns out to be a difficult and complicated undertaking. One of the major roadblocks for proposed developments is public opposition (Scallly and Tighe 2015). While current affordable housing projects are often indistinguishable—if not better designed and more strictly regulated—than market-rate housing, community complaints are nevertheless frequently targeted at the built design. Scholars have hypothesized that complaints around affordable housing being unattractive or poorly maintained are a more socially acceptable way to voice fears rooted in issues such as race (Nguyen, Basolo, and Tiwari 2013). Furthermore, the negative comments that dominate crucial planning meetings are mostly generated by a small, non-representational portion of the community (McNee and Pojani 2021). Past research has focused on understanding the broader public's attitudes on affordable housing through various survey methods (Tighe 2010). These surveys often present a highly specific definition for the term “affordable housing” (or avoid the term altogether) and ask closed-ended questions. Overall, the results from both industry and research surveys, which are framed around broad awareness statements and hypothetical support scenarios, report strong support but, even with an anonymous data collection method, findings can be skewed by social desirability bias because supporting affordable housing is seen as the more morally or socially acceptable option. Recent research has emphasized the importance of the emotional reactions to urban planning issues (Skrede and Andersen 2022), which cannot be determined from closed-end questions alone that probe only recognition, not recall, on the topic of affordable housing.

In an effort to better capture the emotional mindset of real communities, we deployed a nation-wide online survey ($n = 540$) consisting of closed- and open-ended questions that focused on public perceptions and personal exposure to affordable housing projects in addition to acceptance. This survey was designed to answer the main research question: What is the public's baseline understanding of affordable housing? And specifically, what is the public's mental imagery involving people, policies, and buildings associated with affordable housing? Our analysis approach combines statistical analysis of the quantitative survey questions with hand coding and natural language processing (NLP), including closed-vocab analysis, open-vocab analysis, and topic modeling of the qualitative free response answers. By triangulating among these three analysis approaches, a more nuanced understanding can be obtained. For example, while the closed-ended responses show an awareness of a broad range of affordable housing building typologies, in participants' free-responses, the typologies of single-family homes and apartments dominate. Participants' free-responses highlight that their mental images of affordable housing buildings have not yet caught up with current-day reality (i.e., participants often think of stark, modernist “projects” rather than examples of more recent affordable housing projects). Furthermore, there seems to be a dichotomy between how participants describe their current existing picture of affordable housing (mainly negative), and how they describe their ideal future picture of affordable housing (mainly positive).

To compare with these explicitly prompted opinions in a survey-setting, we will scrape social media data to generate a large text dataset and run NLP analyses to capture unprompted opinions. In addition to furthering knowledge about public perceptions of affordable housing and how these relate to demographics, exposure, and self-reported acceptance, this research highlights the potential of informal text data and emerging methods like NLP to efficiently probe the broader community often not present at planning meetings.

EXPLORING THE SPECTRUM OF SEGREGATED COMMUNITIES IN CHINA'S MEGACITIES WITH LBS DATA: THE CASE OF YANGPU DISTRICT, SHANGHAI

Abstract ID: 1208

LIU, Zhuyang [Tongji University Tongji University] 1911262194@qq.com, presenting author
WANG, Can [Yangtze Delta International Institute for AI-Assisted Planning] 525943582@qq.com, primary author
CHEN, Chen [Tongji University Tongji University] tjupchenchen@tongji.edu.cn, co-author

The socio-economic transformation in China has made many megacities home for millions of migrants, generating different social groups from less skilled labors to highly educated elites. Land resources and environmental constraints have led to soaring housing prices, and a layered structure is emerging in the housing market of China's mega-cities, leading to various kinds of segregated communities where housing owners may vary from others in occupation, income, family composition, etc. Due to data availability issues, extant research on residential segregation mainly rely on survey of a particular case, and a multi-case comparative study to exploring the spectrum of segregated communities is still absent. The filter theory believes residential segregation is a dual movement that high-income groups and low-income groups filtering in opposite directions. In pursuit of higher living standards and status symbols, people with higher-income gradually move away from their original communities and move to higher-quality communities. The left-behind housings were then keep filtering to the next level of the market with lower-income groups, until they were bought by the lowest level of the socio-economic groups. This residential filtering process is accompanied by the dislocation and relocation of both high-income with low-income classes, and would usually lead to spatially segregated communities. Therefore, residential segregation is a dynamic and evolving process, and a multi-case comparative study to explore the typology of residential segregation is possible, when ideal data is available. Taking Yangpu District in Shanghai as an example, the most common residential areas can be divided into four types, including shanty towns, workers' new villages, ordinary commercial residences, and high-end residences, and ask the questions: 1) Is there a spectrum of segregated communities represented by socio-economic status of their residents? 2) Is there significant disparities on where they commute in business days and go on weekends? Using mixed source of location based service (LBS) data and sample survey data, this research endeavors to :1) disclose the crowd portraits of the residents living in these different communities, including age, occupation, education level, income level, consumption level, property portfolio, life cycle stage, job and industry, etc. and other socio-economic attributes; 2) reveal the spatial pattern of the daily commuting and weekend leisure activities among residents living in different types of residential products in 8 time periods on a weekday day, a weekend day and a holiday day. Preliminary results reveal that the socio-economic status of the residents in each residential community type in Yangpu District is significantly different from one another and highly correlated with the value of the housing in the communities, suggesting that a spectrum of residential segregation in presence. In addition, there are also some sub-groups in the new workers' village and normal new commercial residence. However, in terms of leisure activities, there is spatial coexistence of residents from these segregated communities in different periods, demonstrating that residential segregation does not necessarily lead to segregated leisure space. Among the four focal types of communities, the workers' new village has demonstrated a typical transitional type with mixed socio-economic status of the residents and their travel behavior. Theoretical explanation may include: 1) the soaring housing price and increasing housing purchasing costs have undermined the filtering process of the housing market, leading to juxtaposition of different social groups in the same residential areas, represented by the new workers' village and normal new commercial residence; 2) the anonymity of the mass media, especially self-media dissolves group boundaries and builds a powerful virtual social network, and is automatically mirrored in real space. Finally, this research offers discussion on policy implications for the governance of megacities with similar contexts.

THE HOUSING AFFORDABILITY CRISIS: PROPERTY TAX AS PROBLEM-SOLVER OR TROUBLEMAKER?

Abstract ID: 1220

Individual Paper Submission

LO, Hsuan [Harvard University] hsuanlo@gsd.harvard.edu, presenting author

Since the housing affordability crisis has been breaking the major cities worldwide, the tax burden is also seriously overloaded. Thus, governments have sought solutions to relieve homeowners' cost burden. The property tax limit is one of the strategies that has been widely used in the U.S. to respond to the real estate boom and cap the tax payable. California Proposition 13, for instance, is an iconic case that restricts the maximum combined ad valorem taxes to 1% of the full cash value of such property and assessed values to 2% or the inflation rate. The initiatives have various unintended effects and consequences. Most extant studies focus on the impacts of property tax limits on local government fiscal conditions and residential mobility, such as the alternative revenue resources, public service, and the lock-in effect.

Conversely, Asian governments tend to raise property taxes in response to affordability issues since in many Asian countries, particularly those influenced by Chinese culture, the traditional mindset of "along with real estate comes wealth" is highly valued, which urges people to own, invest in, and hoard real properties. For example, 61.15% of homeowners in Taipei have more than two properties, and Taipei's vacancy rate reached 7.41% in 2019. Hence, Taipei initiated a "hoarding tax", which establishes progressive home tax rates for people who own more than one home, to curb excessive investment and speculative demand and try to cool off housing prices.

Starting from Tiebout (1956) and Oates (1969), we acknowledged that property tax is highly associated with housing value. Hence, assuming there is no change in public service and supply elasticity, increasing property taxes should reduce housing value; in contrast, capping property taxes would raise prices. However, the impacts of property tax on housing affordability have not received much academic attention. Thus, this research asks (1) how are property tax limits and hoarding tax associated with housing prices, and (2) how can property taxes be progressive to housing affordability? The paper uses the most recent property tax limit passage in New York and Taipei's hoarding tax as examples for an external validation comparative study.

To answer the research questions, both New York and Taipei's cases are conducted through interrupted time series (ITS) and Difference-in-Differences (DID) modeled with ordinary least square (OLS). While New York's levy limit took effect in 2013, the ITS model assesses the announcement and implementation effects, and the DID analysis compares Westchester, NY, with Stamford, CT, which does not have an actual tax cap in place, to identify whether the assessment limit affects housing prices. The data is collected from 2011 to 2015. Similarly, Taipei's data is collected from 2012 to 2016 to pinpoint the effects of the passage of the hoarding tax in 2014. The effect will be compared with other municipalities in Taiwan that did not have additional tax increments. Following the quantitative studies of two cities, we further probe into the rationale of property tax limits and hoarding tax through semi-structured interviews and surveys and expect to answer whether the property tax is a problem-solver or troublemaker in housing affordability.

STUDENTS' RESIDENTIAL MOBILITY DURING THE COVID-19 PANDEMIC: EVIDENCE FROM QUEBEC

Abstract ID: 1228

Individual Paper Submission

REVINGTON, Nicholas [Institut National de la Recherche Scientifique] nick.revington@inrs.ca, presenting author

Housing and the COVID-19 pandemic are inextricably linked. While the pandemic has forced many to spend increased time at home, it has also accentuated existing racialized and gendered housing inequalities, for example as those living in crowded conditions or unable to access stable housing are more susceptible to contracting the virus (Jones & Grigsby-Toussaint, 2020). Yet little is known about the specific housing challenges facing university students throughout the pandemic (Prada-Trigo et al., 2021), and students have garnered little attention in housing

policy before or during the pandemic, although student housing has recently begun to garner the attention of planning scholars (Revington et al., 2020). Many students face considerable housing precarity given their frequent moves, short-term stays in their city of study, and limited incomes, especially in Canada's most expensive housing markets and among international students (Sotomayor et al., 2022), which may make them more susceptible to pandemic-related disruptions to their housing situations. In response to the pandemic, universities across Canada transitioned to online teaching. As a result, students no longer needed to live near their university. For a variety of reasons including cost and perceived safety, many temporarily returned to the parental home. For students who did not return to their parents' home, their housing situation may have been disrupted, for instance if the departure of one or more roommates, or loss of income, left them unable to pay rent on their own. The need for better Wi-Fi and working space in their home environment may also have prompted students to move.

This research aims to uncover how the pandemic has affected students' residential moves in the province of Quebec, how these impacts differ between students, and the reasons for – and outcomes of – these moves. I draw on Quebec data from the pan-Canadian 2021 FLASH (Facilitating Learning and Awareness on Student Housing) survey of university students undertaken January-April 2021, during which time virtually all university programs in the province were delivered remotely. FLASH provides the most comprehensive dataset available on students' demographic and housing characteristics in Canada, and the 2021 edition includes questions related to the COVID-19 pandemic. I compare rates of pandemic-related moves by gender (male, female, or other gender identity), race (whether or not a student identifies as a "visible minority" according to Statistics Canada's appellation), and residency status (whether the student is a resident of Quebec, another Canadian province, or neither). I find that non-male respondents and non-Quebec residents were more likely to effectuate pandemic-related moves, and these tendencies persist when modeling moves as a function of other socio-demographic characteristics. While moving is not necessarily a negative outcome in itself, interpretation of model coefficients, subsequent analysis of movers' changes in housing conditions, and tabulations of movers' reasons for moving suggest many moves are associated with housing precarity. Indeed, the types of moves made differ between groups of students, with international students far less likely to return to the parental home, while students with a gender identity other than male or female as well as international students were more likely to experience a decrease in dwelling size as a result of their moves. This paper provides planners with insights into the housing vulnerability of the diverse but under-researched student population. Findings can assist municipal and campus planners, and urban policymakers more generally, in addressing students' evolving housing needs and offsetting the disparate impacts of the COVID-19 pandemic.

CONFRONTING PRECARIETY IN NORTH TEXAS: STORIES OF ADAPTATION AND INCREMENTAL HOUSING IN THE INFORMAL CITY

Abstract ID: 1232

Individual Paper Submission

REYES, Ariadna [University of Texas at Arlington] ariadna.reyessanchez@uta.edu, presenting author
 NEWTON, Josh [University of Texas at Arlington] joshua.newton@uta.edu, co-author

While informality is typically understood to be a problem of the Global South, emerging research is uncovering informal housing as a strategy utilized by low-income communities in the United States and beyond in the Global North. Because of the aforementioned presumption, informal housing in the United States has primarily been studied in rural, Mexican-descended communities along the Mexico-U.S. border (Durst & Ward, 2016). Yet, informality has increasingly been identified amongst low-income, peri-urban, unincorporated neighborhoods throughout the country (Durst, 2019). Because of underbounding or disregard on the part of municipalities, these communities often face multiple intersecting precarious conditions including low access to basic amenities and infrastructure, as well as poor quality housing. Lack of attention from planners likewise exposes these neighborhoods to multiple types of environmental injustices related to climate change, lack of infrastructure, and negative externalities (Durst, 2019).

Drawing from just sustainability literature that focuses on the relationship between environmental justice, equity, and sustainability (Agyeman & Evans, 2003), this study seeks to build on previous research on informality, migration, and precarity (Giusti & Estevez, 2011) outside the U.S.-Mexico border. This research will help understand the experiences of impoverished Latinx migrants who established and recently migrated to informal settlements on the fringe of US cities. The overarching research question is: How do the housing practices of low-income families of color in informal settlements, including Latinx migrants, enable solutions for sustainable and just communities in the United States? The supporting research questions are as follows: Q1) Who founded and currently lives in these communities? Q2) How does housing and infrastructure quality vary in informal settlements? Q3) How do residents improve housing and infrastructure quality over time? This study uses a mixed-method community-based assessment informed by spatial analysis of census data, satellite imagery, and ethnographic fieldwork to illuminate the characteristics of housing units, families, and water and sanitation infrastructure in three peri-urban informal communities in the Dallas Fort-Worth Metroplex. The fieldwork for this project will proceed in three phases. The first phase consists of attending community meetings to build trust with community members and community-based organizations. In the second phase, we will conduct walking architectural observations to produce a typology of informal housing. In phase three, surveys will be conducted with n = 278 households across the three communities to understand housing quality, water, and energy systems, and community infrastructure. To delve more deeply into community perspectives, oral stories produced through 15 interviews with community founders and residents help uncover community origin and self-help consolidation. This research will produce a more holistic and ethnographic understanding of the living conditions of informal communities from the perspective of residents while acknowledging building quality deficiencies as well as community assets. We expect the results to make the stories of these informal settlements visible and to redefine the role of informal housing consolidation as a strategy for supporting affordable housing, equity, and just sustainability in North Texas, which can serve as a reference for other US cities.

Background:

The 1930s Home Owners' Loan Corporation (HOLC) "residential security maps," have become a popular visualization of Depression era mortgage lending risk patterns across American cities (Rothstein, 2017). Numerous housing policies have since been instituted, including the Home Mortgage Disclosure Act (HMDA), but mortgage lending bias persists. The degree to which detailed spatial patterns of bias have persisted or changed along with urban change is not well understood.

Objectives:

We compare historic HOLC grades and contemporary levels of mortgage lending bias using spatially detailed HMDA

data. We propose two research questions: 1) Do HOLC lending risk grades predict contemporary levels of mortgage lending bias by race, ethnicity, or property location? 2) Do HOLC lending risk grades predict contemporary racial and ethnic settlement patterns, regardless of historical settlement patterns and contemporary levels of mortgage lending bias?

Methodology:

The study area is defined as cities with HOLC boundaries and area descriptions within the boundaries of today's 100 most populated U.S. Metropolitan Statistical Areas (MSAs) in 2013. The digitized HOLC maps and "area descriptions" were sought for each of these cities from Mapping Inequality (Nelson et al., 2016); 86 HOLC cities in 48 current day MSAs are included in this study.

Historical mortgage lending risk was measured using HOLC neighborhood "risk" grades: (A) "best" (green), (B) "still desirable" (blue), (C) "declining" (yellow), and (D) "hazardous" (red). Current day racial, ethnic, and property location-based bias in mortgage lending patterns were estimated for each HOLC neighborhood using Home Mortgage Disclosure Act (HMDA) data from 2007–2013. Racial and ethnic bias measures are estimated as the odds ratio of denial of a mortgage application from a Black (or Hispanic) applicant compared to a White applicant using a logistic regression model-based, spatial filtering approach (Beyer et al., 2016). Location bias is estimated as the odds ratio of denial of a mortgage application for local properties (within the spatial filter), as compared to the MSA as a whole, adjusting for the applicant's sex and the loan to income ratio.

Historical racial and ethnic settlement patterns were derived from HOLC area descriptions. U.S. Census Bureau data were used to measure contemporary population distributions by race and ethnicity in HOLC boundaries.

Results:

Results suggest that historical mortgage lending risk categorizations and settlement patterns are associated with contemporary mortgage lending bias and racial and ethnic settlement patterns. The relationship between HOLC grades and HMDA mortgage lending bias measures vary in magnitude, but not direction, across U.S. regions. Results also reveal clear gradients, as expected, such that decreasing HOLC "risk" grades correspond to increasing proportions of Black and Hispanic residents today.

Implications:

The findings suggest that the inertia in geographic patterns of housing investment and racial segregation is strong and will require concerted efforts to be reversed. Those efforts must include data transparency, empirical evidence, complex and multiple policy solutions, and a recognition of the presence of bias in factors adjacent to mortgage lending, ultimately resulting in persistent disparities in home ownership and economic investment.

COMPARING THE IMPACTS OF HOUSING MARKET REGULATIONS ON HOUSING PRICES BEFORE AND AFTER THE COVID-19 PANDEMIC IN SEOUL, KOREA

Abstract ID: 1262

Individual Paper Submission

BAE, Jin-Hee [Kangwon National University] bae_jinhee@hanmail.net, presenting author
LEE, Jae-Su [Kangwon National University] jslee25@kangwon.ac.kr, primary author
WON, Jaewoong [Kyung Hee University] jwon@khu.ac.kr, co-author
LEE, Sam-Su [Land and Housing Institute] l3water@lh.or.kr, co-author

Despite the COVID-19 pandemic, housing sales prices continue to rise in Korea. To stabilize the overheated housing market, the government implemented a variety of regulation policies before and after the pandemic. Demand control policies have been preferred such as property tax and loan-to-value and debt-to-income restrictions working in a

short period. However, it is necessary to investigate whether they are effective before and after the pandemic. In addition, the effects of the government's controls on housing prices could be varied in different submarkets or subregions.

This study intends to compare the effects of housing demand regulations on housing sales prices before and after the COVID-19 pandemic in Seoul, while considering market segmentation of both transaction price and subregion. In specific, this research examines whether the housing demand regulations have been working to lower apartment sales prices in the short period in Seoul; whether they have had an effect on decreasing short-term sales prices of houses more than 740 thousand dollars (900 million Korean won) that are subject to the regulations; and whether they have been effective to drop housing prices in all subregions of the Seoul metropolitan area, while showing some differences of the effect.

This study pays attention to the government's substantial regulations for stabilizing the housing market that have been enforced on December 17, 2019 and July 1, 2020 as the periods before and after the pandemic. Actual transaction data of apartments in Seoul which have been provided by the Ministry of Land, Infrastructure and Transport are used. In terms of the period of regulation effect, the policy effects from one to six months both before and after each regulation implementation are compared because the regulations are expected to work for a relative short period. The impacts of both before and after the pandemic are also compared in consideration of transaction prices and subregions. In terms of transaction price, the impacts of the regulations on houses with either lower or higher than 740 thousand dollars are compared as the latter are mainly subject to the regulations.

In order to present empirical results, both multi-level models and regression discontinuity designs are estimated mainly based on hedonic price theory. First, the multi-level hedonic pricing models are estimated to address the spatial autocorrelation problem inherent in housing price data. In addition, this study introduces the regression discontinuity designs to disentangle short-term policy effects. They are useful to analyze whether specific policy measure has an effect before (control group) and after (treatment group) its enforcement based on regression breakpoint. When regulatory policies have been repeatedly implemented in a short period of time as in Korea, it is difficult to apply either time series analysis or difference-in-differences method to unravel the effects of those policy measures.

It is expected based on the regression discontinuity designs that the impact before the pandemic would be significantly negative on the houses with both lower and higher than 740 thousand dollars. It implies that the housing demand regulations have effect on lowering housing prices in the short period, but the prices should rise after then. In addition, the magnitude of effect is expected to be greater in the houses higher than 740 thousand dollars. However, the effects of the regulations are expected to be insignificant after the pandemic. It is also expected that the housing demand regulations are effective in decreasing prices in the short run before the pandemic in all subregions in Seoul. The magnitude of effect is expected to be greater in the southeastern subregion including Gangnam. However, there would be no significant impact in all subregions after the pandemic.

REGULATING FOR OR AGAINST INFORMAL HOUSING? PLANNERS' PERSPECTIVES FROM AUSTRALIA

Abstract ID: 1265

Individual Paper Submission

SHRESTHA, Pranita [The University of Sydney] pranita.shrestha@sydney.edu.au, presenting author

GURRAN, Nicole [The University of Sydney] nicole.gurran@sydney.edu.au, co-author

NASREEN, Zahra [The University of Sydney] zahra.nasreen@sydney.edu.au, co-author

Informal housing options such as secondary dwellings are increasingly seen as a potential source of low-cost, affordable rental supply. Often prevented by restrictive residential zones, secondary dwellings, accessory dwelling units, or 'granny flats' have emerged as important sources of lower cost rental supply in high value housing markets,

and efforts to legalise and enable their production are becoming more widespread (Harris and Kinsella 2017, Chapple, Garcia et al. 2020, Gurran, Maalsen et al. 2020). This interest reflects rising concern about the availability of new and affordable housing supply, particularly in major cities where attempts to ‘densify’ suburban neighbourhoods while increasing rental accommodation has been a particular challenge (Mukhija 2014). More broadly, interest in secondary dwellings as a form of low-cost rental housing can be understood within the context of neoliberal policy settings including the retreat of the welfare state and an emphasis on ‘market solutions’ to policy problems. Within this context, not only are states reluctant to provide direct support for low-income earners through public housing or additional rental subsidy; they must also actively ‘roll back’ regulations seen to impede market activity (such as land use barriers to diverse housing types); and may also act to stimulate new market responses.

This paper examines state planning strategies in Australia which have sought to both remove restrictions preventing secondary dwellings in residential areas and encourage the establishment of a new market in secondary dwelling production. Our focus is the perspectives of local planners in the state of NSW, where state planning policy has sought to override restrictive local zoning controls to enable secondary dwellings as a source of lower cost rental supply since 2009. Through interviews with more than 25 local planners, we examine perspectives on (a) regulatory strategies for enabling or constraining secondary dwelling production; (b) trade-offs between housing quality, costs, and residential neighbourhood impacts; and (c) wider implications for affordable rental supply. We also examine the geographic spread of secondary dwelling production over a decade and review recent real estate listings to determine the nature and cost of such housing as a source of low-cost rental accommodation in the market.

Findings show that although secondary dwellings can potentially be an important source of lower cost rental supply in high value housing markets such as Sydney; local planners are concerned about the impact on amenities and dwelling quality produced. They also expressed concern about informally rented and/or illegally constructed secondary dwellings giving rise to a new, shadow rental market. Overall, the study sheds light on the conditions in which regulation can support or inhibit forms of secondary dwelling production, and the potential positive outcomes arising from more flexible approaches to residential zoning and development control. However, the study also highlights the limitations and risks associated with formalising secondary dwellings as a principal strategy for affordable rental supply within high value housing markets.

DOES POPULATION SIZE MATTER? ANALYZING MUNICIPALITIES THAT PERMIT INNOVATIVE AFFORDABLE HOUSING SOLUTIONS

Abstract ID: 1266

Individual Paper Submission

ANACKER, Katrin [George Mason University] kanacker@gmu.edu, presenting author

Over the past several decades, much research has been published about local governments that have dealt with the NIMBY (Not in My Backyard) movement, especially in the context of multifamily housing. Some researchers argue that jurisdictional population size matters, as local governments of large municipalities are influenced by politically active constituencies and interest groups whereas local governments of small municipalities are influenced by local homeowners. Not much research has been undertaken on the difference of jurisdictional population size of local governments that have permitted innovative affordable housing solutions, i.e., Accessory Dwelling Units (ADUs), tiny homes, mobile homes, and Recreational Vehicle (RV) homes. The goal of this study is to analyze demographic, socioeconomic, housing, and regional variation among jurisdictions that permit ADUs, tiny, mobile, and recreational vehicle (RV) homes, differentiating by population size, i.e., (a) 100,000, (b) 50,000, (c) 25,000, and (d) 10,000 people. The study's data set is the National Longitudinal Land Use Survey (NLLUS), conducted by the Urban Institute in collaboration with Rolf Pendall in 2019 (Urban Institute, n.d.) and the American Community Survey (ACS) 2015-2019 (5-year averages), conducted by the U.S. Bureau of the Census (U.S. Bureau of the Census, n.d.a). I utilize descriptive statistics and t-tests. Preliminary results indicate that a higher proportion of large jurisdictions allows ADUs, mobile homes, tiny homes, and RV homes and that a lower proportion of small jurisdictions allows mobile homes, ADUs, and tiny and RV homes. Large jurisdictions that permit innovative affordable housing solutions are more racially and ethnically diverse, have lower median incomes and a lower homeownership rate, have a modest

proportion of multifamily housing, and are disproportionately in Census region West. Small jurisdictions that allow innovative affordable housing solutions are less racially and ethnically diverse, have a modest proportion of small households, have lower median incomes and a lower homeownership rate and lower home values and are disproportionately in Census regions Northeast and Midwest. The paper will conclude with policy recommendations.

THE PERSISTENT DESIGN-POLITICS OF RACE: POWER AND IDEOLOGY IN AMERICAN PUBLIC HOUSING REDEVELOPMENT

Abstract ID: 1284

Individual Paper Submission

VALE, Lawrence [Massachusetts Institute of Technology] ljvale@mit.edu, presenting author

Subsidized housing for low-income residents is more than a matter of laws and policies; it entails controlling and redistributing space. Decisions about public housing reveal the confluence of ideological assumptions about social structure and environmental determinist beliefs about spatial order. This paper interrogates that socio-spatial convergence through the lens of 'design-politics,' applying this to the racialized redevelopment of public housing in the US since 1990.

My argument for a hyphenated design-politics is that if we uncover the political assumptions encoded into design, we will see that design itself – especially when the subject is public housing – is also wordlessly expressing views about such matters as community engagement, governance, policy, and finance. The forms and norms of this housing are products of complex cultural belief systems advancing moral judgments about the primacy of heteronormative family structures, supporting the aspirational aims of homeownership while demonizing renters, and naturalizing the operations of racial capitalism.

City leaders across the US constructed a great deal of the nation's public housing in the 1930s, 1940s and 1950s on a racially-segregated basis, rewarding and reinforcing an ideological ideal of the small white nuclear family – both explicitly through tenant selection criteria and implicitly through the sizing and design of apartments. Such ideological preferences – while largely unstated – continue to infuse 21st Century efforts by urban public housing authorities when they redevelop such projects. Once again, their design decisions combine space and race, linking the presumed panacea of 'mixed-income' redevelopment projects to an ongoing racial politics aimed at restoring mainstream ideological norms while resisting expressions of non-white identities.

Structurally and methodologically, this paper collects, repurposes and extends a set of analyses of public housing development and redevelopment that I conducted over the last 30 years in Boston, Atlanta, Chicago, New Orleans, San Francisco and New York City. Drawing on hundreds of interviews with public housing residents, designers, developers, lawyers, social service providers, community activists and housing officials, this larger body of work traced the evolving ways race and poverty have been managed by a variety of governance constellations in various American cities. These interviews are brought into dialogue with the drawings, representations and physical built realities of constructed places. I use this paper to connect my own work to others who study the redevelopment phase of these complex public housing sagas, introducing some of the mechanisms by which a design-politics lens can focus attention on the ways that racial and class hierarchies exemplified in public housing have been exacerbated through the silent power of architectural and urban placemaking.

In recent decades – accelerating recently – there has been belated but extensive attention given to ways the history

and current practices of architecture and planning are inextricably bound up with white supremacy and structural racism. Scholars and journalists excavate the motives of designers and their sponsors, and endeavor to ask ever more probing questions about how both monumental and quotidian aspects of the built environment are received by the diverse publics that encounter these ideologically-freighted products. In exploring public housing redevelopment through a design-politics lens, I emphasize five particular aspects:

1. The racialized design-politics of implementation: what changes along the way?
2. The racialized design-politics of welcome: who feels included?
3. The racialized design-politics of the unit mix: which households are wanted?
4. The racialized design-politics of curtailing vistas: whose views matter?
5. The racialized design-politics of incorporated exclusion: who feels resisted?

More optimistically, I conclude the paper by noting a few redevelopment efforts that have challenged this with more progressive forms of poverty governance, emphasizing not-for-profit organizations and valuing resident voices.

RACE, SPACE AND TAKE-UP: EXPLAINING HOUSING VOUCHER LEASE-UP RATES

Abstract ID: 1299

Individual Paper Submission

ELLEN, Ingrid [NYU Wagner] ingrid.ellen@nyu.edu, presenting author
O'REGAN, Katherine [NYU Wagner] katherine.oregan@nyu.edu, co-author
STROCHAK, Sarah [NYU Wagner] sarah.strochak@nyu.edu, co-author

The housing choice voucher program provides assistance each year to approximately 2.3 million low-income households (Center for Budget and Policy Priorities 2021). Unlike most other federal rental assistance programs, the voucher subsidy is not tied to specific housing units; rather voucher holders use the subsidy to help defray the cost of renting homes on the private market. Research shows that tenant-based rental subsidies reduce the rent burdens of low-income households, allow them to live in less crowded homes, help them to avoid homelessness, and improve children's performance in school (Mills et al., 2006; Schwartz et al, 2019).

Yet many voucher recipients fail to find suitable units and willing landlords. The latest study found that only 70 percent of voucher recipients successfully leased up with their vouchers. But the study is now 20 years old and only analyzed the outcomes of 2,609 voucher recipients across 48 housing authorities (Finkel and Buron, 2001). We use administrative data on voucher issuances to estimate voucher lease-up rates and search times for about 100,000 voucher recipients each year in over 400 urban housing authorities for the years 2015 through 2019. These new data allow us to analyze the variation across markets for a more recent period, and for a much broader set of housing authorities.

Even after controlling for market conditions and a host of individual factors, we show that race matters in this larger sample. Preliminary findings suggest that Black voucher recipients are significantly less likely to lease-up, and when they do, they take 12 days longer on average to do so than white recipients in the same metropolitan area. One reason for these longer search times and lower lease-up rates may be that Black voucher recipients are less able to lease in place.

Moreover, we find evidence that initial neighborhood location matters too, something not generally considered in the

literature on take-up. Specifically, voucher recipients are less likely to lease up and take longer to do so when they start in neighborhoods with older housing stocks, perhaps reflecting lower quality homes that may not pass inspections. Voucher holders initially living in neighborhoods with lower vacancy rates, smaller baseline voucher population shares, and larger Black population shares are less likely to lease-up and take longer to rent homes when they do (even after controlling for individual race). We suspect that the racial composition of the neighborhood may be picking up unobserved differences in the quality of housing, given longstanding disinvestment in communities of color and Black neighborhoods in particular, which make it more difficult for households to lease in place or find nearby homes that meet HUD's housing quality standards.

The housing choice voucher program is racially neutral on its face; there is nothing in its rules that treats one group differently from another. But our results suggest that race and space shape outcomes, and different racial and ethnic groups have divergent experiences in navigating the program, due perhaps to discriminatory barriers as well as deep-seated structural inequality. Future research should probe these differences, and housing authorities who administer voucher programs should scrutinize their data and consider adopting programmatic reforms, such as source of income discrimination laws and Small Area Fair Market rents, to address barriers to participation. Our results also provide suggestive evidence that such reforms can make a difference.

MIGRANTS' STRUGGLES AND ENDEAVOURS FOR HOMEMAKING IN SHARED HOUSING

Abstract ID: 1301

Individual Paper Submission

NASREEN, Zahra [The University of Sydney] zahra.nasreen@sydney.edu.au, presenting author
GURRAN, Nicole [The University of Sydney] nicole.gurran@sydney.edu.au, co-author

International migrants struggle to access formal rental markets as they lack references, income, rental history and knowledge of support services in a new country. Their difficulties to obtain decent private accommodation are further exacerbated by a lack of affordable housing supply more widely as well as limited knowledge of residential tenancy protections. In this context, many migrants are living in shared housing with non-related tenants so they can share rental and utility costs and receive social and cultural support (Maalsen & Gurran, 2021). These shared housing arrangements often emerge through informal pathways, such as sub-letting of properties into multiple room rentals without written tenancy agreements between landlords and tenants. These housing arrangements can put migrants at the risk of exploitation, health risks and homelessness (either physically or emotionally), especially those who live in overcrowded situations (Nasreen & Ruming, 2019).

This paper draws on interviews of 32 international migrants living in shared housing in Sydney. These migrants were sharing the bedroom with non-related roommates, along with sharing common areas such as the living room, kitchen, and laundry. By mobilising studies on migration and homemaking (Baxter & Brickell, 2014; Boccagni, 2017; Easthope, 2014), the paper answers important questions of how and to what extent shared housing provides tenants freedom of home to perform everyday practices and how migrants engage in the process of homemaking in these non-family households.

The findings highlight migrants often experience a limited sense of autonomy, unequal power relations, difficulties in performing day-to-day routines, lack of privacy and conflicts with other household members, all of which disrupt the meanings of home as a source of 'ontological security'. Despite the difficulties of sharing, many migrants go above and beyond to create a shared sense of belonging and feelings of home as they initiate cleaning the house, cooking for their households, arranging social media groups, caring at times of sickness and distress, and paying rents and bills on time. The shared home emerges as a practice of making, through simultaneous and multi-layered strands of tenancy conditions, spatial and material culture, temporal aspects, and social relationships between non-related residents. As these factors of shared dwellings vary across time, residents' feelings of home also vary in relation to these factors, leading to experiences of homemaking, unmaking and remaking.

The research contributes to planning scholarship and practice by explaining living experiences of a housing form that is often viewed as transitional, short-term and insignificant living arrangement and of the population group, including international students, permanent residents and refugees, that is often marginalised in the planning policies for their housing affordability and homemaking experiences. Shared housing provides migrants with early access to housing close to education and employment centres, yet there is a need for regulatory response to the challenges migrants experience in this housing form, such as tenure insecurity, overcrowding, exploitation and health and safety risks.

THE GEOGRAPHY OF RENTAL AFFORDABILITY IN THE US DURING THE COVID-19 PANDEMIC

Abstract ID: 1306

Individual Paper Submission

HERMANN, Alexander [Joint Center for Housing Studies at Harvard University] alexander_hermann@harvard.edu, presenting author

AIRGOOD-OBRYCKI, Whitney [Joint Center for Housing Studies at Harvard University] whitney_airgood-obrycki@harvard.edu, co-author

HERBERT, Chris [Joint Center for Housing Studies at Harvard University] chris_herbert@harvard.edu, co-author

WEDEEN, Sophia [Joint Center for Housing Studies at Harvard University] sophia_wedeen@harvard.edu, co-author

Renters have been disproportionately harmed by the financial fallout of the COVID-19 pandemic. In the third quarter of 2021, 23 percent of renters had lost employment income in the prior four weeks and 15 percent were behind on their rent. Airgood-Obrycki, et al. (2022) further find that renters who lost employment income since the start of the pandemic were three times more likely to fall behind on their rent, and that lower-income and renters of color were substantially more likely to miss payments.

Little is known about the geography of housing affordability challenges since the start of the pandemic. America's Rental Housing 2022 discusses the state-by-state variation in missed payments, finding that renters in the South were more likely to fall behind. Other research details renter hardships in a particular place but are limited in scope geographically. Reina, Aiken, and Goldstein (2021), for example, find that over 90 percent of renters in Los Angeles who had applied for rental assistance had experienced a reduction in income, and over 60 percent were behind on rent.

Because lower-income and renters of color were more likely to fall behind on rent and tend to be geographically concentrated, rent arrears have also likely disproportionately harmed the neighborhoods these households live, potentially compounding existing affordability challenges. Indeed, certain neighborhood characteristics were already associated with higher housing cost burdens. Hess et al. (2020) find that higher median rents at the census tract level are associated with a greater likelihood of experiencing cost burdens for both Black and white renters, while the tract poverty rate is associated with higher burdens among white renters. Moreover, Rutan and Desmond (2021) find that evictions in mid-sized US cities are heavily concentrated by census tract, and eviction burdens fall on low-income and predominately Black communities.

This paper will build on the existing literature by showing the detailed geographic pattern of housing affordability during the COVID-19 pandemic. Our research questions are as follows:

- To what extent are the financial impacts of the pandemic on renter households and the resulting housing insecurity geographically concentrated?

- What neighborhood characteristics are associated with a greater likelihood of falling behind on rent? We will use data from the Census Bureau's restricted-access Household Pulse Survey with geographic identifiers at the census tract level. Examining the period from August 2020 through February 2022, we will employ both descriptive statistics and logistic regression models to identify the neighborhood characteristics associated with rent arrears, including neighborhood poverty, race/ethnicity, median income and rent, and existing affordability challenges. Disclosure of preliminary findings are pending review from the Census Bureau's Disclosure Review Board.

Our research will have two primary contributions. First, it will advance scholarship on the geography of housing affordability, its concentration, and association with different neighborhood characteristics, specifically in the context of the COVID-19 pandemic. Second, our research will help local planners and policymakers identify the neighborhood contexts where renters are most likely to fall behind, allowing planners to evaluate if rental assistance and stabilization programs are reaching communities with the greatest need.

WHY DID THE "MISSING MIDDLE" MISS THE TRAIN? EXPLORING BARRIERS TO INTENSIFIED FAMILY HOUSING IN WATERLOO REGION, CANADA

Abstract ID: 1344

Individual Paper Submission

PARKER, Dawn [University of Waterloo] dcparker@uwaterloo.ca, presenting author
WEBBER, Kaitlin [University of Waterloo] kaitlin.webber@uwaterloo.ca, co-author
VALAEI, Shahab [University of Waterloo] svalaeisharif@uwaterloo.ca, co-author

In 2019 the Region of Waterloo (RoW) launched the ION light-rail transit (LRT) network, with two stated goals—to move people and intensify land use. Land-use intensification goals succeeded, with \$2.6 billion in building investments in the Central Transit Corridor (CTC) between 2011-2019, the majority 1-2 bedroom high-rise residential condos.

Concurrently, housing affordability in the RoW has steeply decreased. The pandemic strengthened these trends (van der Merwe & Doucet, 2021), with year-over-year single family home price gains of 33%, the second highest in Canada, representing loan-to-income levels similar to London, U.K.

How can a residential building boom and housing affordability crisis co-exist? An explanation is lack of supply of “missing middle” (MM) housing in the RoW, an issue seen throughout North America. The term “missing middle” describes medium-density housing types suitable for families (Parolek, 2020). As single-family house prices accelerate, MM housing is critical to ease housing market pressures—as rentals, for those who can't or prefer not to buy, and as a lower-cost means for home ownership.

In Canada, the construction of MM housing types has declined significantly since the 1950s, alongside the development of “exclusionary” single-family zoning. This MM gap is evident in the RoW. Simultaneously, MM housing demand is increasing with demand for urban living among family-sized households (Maharaj, 2020). However, limited supply has made urban MM housing unaffordable for middle-income families, forcing a choice between a small urban apartment or a single-detached house in the suburbs, seen also in the RoW (Huang et al., 2021).

Our discussions with local developers, government officials, realtors, and non-profit housing finance specialists highlighted key barriers to MM supply, including lack of local demand evidence, financing constraints, and high land costs. Discussions and in-depth literature review also highlighted the importance of price expectations and risk perceptions. Drawing on our findings, we developed a conceptual systems framework that maps the planning, land market, and price expectations dynamics driving housing development decisions, which hypothesizes how development dynamics can lead to lock-in of initially successful building typologies, explaining the cascade of high-rise small-unit condo builds in the ROW.

Developer's decisions about when, where, and how to develop lands are shaped through interactions with investors, sellers, buyers, homeowners, and municipal planners (Donner, 2012). High-level Official Plans signal a planning preference for high-density development, supported by up-zoning, leading to land value uplift—based on expectations of higher-density and thus more profitable development. Land value uplift leads to preference for projects with higher per-area values. A successful project reinforces expectations of the demand for this housing type by risk-averse developers, individual investors, and lenders, reinforcing land value uplift. A corollary hypothesis is that successful MM demonstration builds may lead to a similar cascade of MM builds by reducing perceived project risk and complexity.

Such builds, however, may need to be supported by zoning that limits height while allowing higher density, to facilitate high-density low-rise development while controlling land-value uplift. Political and stakeholder support for such broad zoning changes that remove “exclusionary” single-family residential zoning, called for in a recent Ontario housing affordability report, is growing across Ontario.

Our research sheds new light on barriers to MM housing supply by articulating the systemic feedbacks between the planning and land/housing market realms. It demonstrates that understanding of the complexity of these systems can reveal key leverage points that trigger non-linear responses, empowering planners to develop policies that catalyze hoped-for housing market supply responses to increase housing affordability. Additionally, increased MM supply will facilitate the desired “TOD lifestyle” of a growing number of families, which may then decrease automobile dependence and help TODs achieve a critical mass of intensification.

The needs for precise housing analysis are worth noting. On the one hand, the housing market is booming across the U.S., especially in Austin, Texas. According to a report from Freddie Mac House Price Index, the median housing prices in Austin increased by around 83% from 2016 to 2021. These increases lead to concerns about affordability, while implementations by local governments have been criticized for lacking precise investigations on factors affecting housing prices. On the other hand, previous studies have provided profound insights into the factors determining housing values. They concluded two groups of factors, including those correlated with the dwelling's characteristics (e.g., the year of housing, stories, property conditions, etc.) and those correlated with the surrounding environment (e.g., accessibility and built environment factors). However, recent studies raised concerns about nonlinearity and spatial dependency.

In terms of the needs from the practice and academic perspectives, this study examines the impacts of housing status and the surrounding environment on single-family housing prices through a machine learning approach based on housing transaction records in Austin from 2014 to 2017. This study aims to answer two research questions, *What are the global impacts of housing status and surrounding environment on single-family housing prices?* and *What are socio-demographic and economic disparities in these impacts?* In the analysis, first, we found that X-gradient

boosting decision trees (XGBDT) performed best among five machine learning approaches and developed a global model investigating the impacts on single-family housing prices. To explore the disparities, we categorized houses into five groups containing high-income neighborhoods, low-income neighborhoods, high rates of White-only neighborhoods, high rates of Hispanic American neighborhoods, high rates of African American neighborhoods, and vulnerable neighborhoods (i.e., high rates of minorities and low income) and developed local models accordingly.

In the results, the global model highlights the importance of housing status (e.g., year built and property conditions) in predicting single-family housing prices, while the surrounding environmental factors are insignificant. Besides, the local models confirm the importance of housing status and point out the importance of the surrounding environment. In detail, local models show that access to public transit plays a positive role in predicting single-family housing values among most groups except the high-income neighborhoods. Also, population density and household density are significant in all groups, but their roles are different across neighborhoods.

Based on these results, there are three implications for academia and practice. First, the interpretable XGBDT framework presents powers in housing analysis and can be used in other empirical studies. Second, decision-makers need to pay extra attention to the positive role of public transit service on single-family residential property values in case of displacements by transit improvements. Finally, housing policies should focus on ethnic minority and low-income communities to improve their housing resilience.

REVITALIZED OR GENTRIFIED? EXAMINING NEW HOUSING PATTERNS AND NEIGHBORHOOD CHANGE IN HISTORICALLY REDLINED AREAS IN MILWAUKEE

Abstract ID: 1390

Individual Paper Submission

WARSAW, Phillip [Michigan State University] warsawph@msu.edu, presenting author

CANCEL MARTINEZ, Yaidi [University of Wisconsin-Milwaukee] ycmartin@uwm.edu, primary author

The city of Milwaukee, WI is representative of ongoing urban revitalization efforts across major US metro areas. As a result of redlining and blockbusting, Milwaukee remains one of the most segregated cities in the country (Levine, 2020), with significant levels of poverty and disinvestment in majority Black, Indigenous and People of Color (BIPOC) communities. Over the last two decades, Milwaukee has pursued a strategy of urban revitalization with a particular emphasis on private-sector solutions (Kenny & Zimmerman, 2003). Over the last decade, some scholars have investigated whether these investments have resulted in upward pressure on housing prices, a key indicator of displacement and gentrification, with mixed results (Center for City Progress, 2015; Maciag, 2015). In 2019, Milwaukee adopted an anti-displacement policy to mitigate the ongoing risk of displacement of low-income BIPOC residents (City of Milwaukee, 2019). The policy requires that 20% of units in a city-funded affordable housing development be set aside for a limited amount of time for priority leasing by residents in targeted neighborhoods, most of which are in historically redlined areas. However, it is unclear the degree of neighborhood change these policies are responding to, and whether these new patterns fit the definition of gentrification, displacement or revitalization.

Our research will contribute to the urban planning and housing policy debate by providing insight into current changes in the housing landscape in historically segregated areas in Milwaukee and assess the extent to which these areas show indications of gentrification, displacement, or equitable revitalization. Using both spatial analysis and hedonic modeling of housing prices, we will study patterns of historic and current housing discrimination (residential segregation) in Milwaukee and identify areas of neighborhood change at the census tract level. We utilize secondary housing data from the City of Milwaukee, business records from ReferenceUSA, as well as redlining data from the Mapping Inequality project to answer the following key research questions: 1) To what degree have neighborhood

housing characteristics and economic indicators changed over the last 20 years in historically redlined areas? 2) What are key socio-demographic changes in terms of population size, household income, race and gender and household composition? 3) To what degree do the observed patterns of neighborhood change fit the definition of gentrification, displacement or equitable revitalization, and what is their relationship to neighborhood-level changes in housing quality and local amenities? Our preliminary findings reveal that some formerly redlined areas show early indications of risk of displacement. However, patterns vary by region in the city and by majority racial groups. Findings from this study will help inform policy to ensure equitable development and proper mitigation strategies should gentrification or displacement become more evident.

A NEW REDLINING IN THE DIGITAL ERA? A GEOSPATIAL AND STATISTICAL ANALYSIS OF REDFIN SERVICE LOCATIONS IN THE CONTEXT OF HISTORICALLY REDLINED AREAS IN THE U.S.

Abstract ID: 1399

Individual Paper Submission

KIM, Jongwoong [West Chester University] jkim@wcupa.edu, presenting author

In October 2020, the National Fair Housing Alliance (NFHA) and other local and regional fair housing agencies in the United States filed a lawsuit against Redfin, a national real estate brokerage and technology company based in Seattle, Washington (NFHA et al. v. Redfin 2020). The NFHA et al. asserted that the corporation may have discriminated against persons of color in multiple metropolitan regions by providing its full-service to select locations, in violation of the Fair Housing Act of 1968. Redfin responded promptly to this allegation, claiming that the decision was a foregone conclusion as a result of their business model (Kelman 2020). Historically, "redlining" refers to the U.S. federal government's involvement in creating and managing a set of discriminatory policies in mortgage lending to certain areas of residents who tend to be racial and ethnic minorities. Notably, the Home Owners' Loan Corporation's (HOLC) "residential security maps" indicate various levels of "desirability" for financing/lending in various portions of the country's metro areas, such as A ("Best"/green areas), B ("Still Desirable"/blue areas), C ("Declining"/yellow areas), and D ("Hazardous"/red areas). The racially segregated cities, communities, and neighborhoods we have today are historical products of the systematic and institutional discrimination (Rothstein 2017), effectively racist government policies (e.g., redlining), and the corresponding private sector practices and consumer behaviors in the housing market. Despite the Fair Housing Act of 1968 which prohibits discrimination by direct providers of housing and other public and private entities, housing discrimination based on race/color, and disability, has persisted throughout the country in various forms (Augustine, et al. 2020).

This project intends to investigate, and if possible, substantiate, the NFHA et al.'s legal claim (i.e., the company systematically fails to take on listings in certain localities) by conducting a series of geospatial and statistical analyses that compare and analyze the Redfin's full- and no-service home listing locations in relation to the historical HOLC residential security map's most-to-least desirable type (A, B, C, and D) areas throughout the 15 largest metro areas. Multiple studies and reports (Augustine, et al. 2020; Hoffman, Shandas and Pendleton 2020; Husain, et al. 2020; Nardone, et al. 2020) reveal that the people living in the previously redlined zones continue to experience more poverty, lower educational attainment, poorer health (including higher percentage of coronavirus-related hospitalization), and more severe environmental hazards (e.g., flooding and urban heat island), and these segregated residential patterns have exacerbated various social, economic, environmental, and health inequities, which frequently coincide with racial/ethnic divisions (Choi, et al. 2019; Hardy, Logan and Parman 2018). "Your zip code is your destiny," is a well-known saying in the planning and geography fields. According to the Robert Wood Johnson Foundation (2020), the location of one's residence can reasonably predict one's life expectancy. (For example, according to their Life Expectancy model, if you live in inner-city, West Philadelphia, you will likely 11 years

die young on average than those living in wealthier suburbs such as Wayne, Pennsylvania.) Housing choice is critical to the U.S. society because residential segregation has contributed to societal malice by exacerbating racial inequities that correlate many socioeconomic and health inequities. In this regard, it is still useful to compare what Redfin is doing today with HOLC's scoring system even if the latter is no longer used.

On any given night, around 600,000 people in the U.S. sleep outside unsheltered, a number that has increased steadily in recent years due to a rise in housing prices, stagnant wages, and exclusionary zoning (Shinn and Khadduri, 2020). The COVID-19 pandemic exacerbated this crisis by putting millions of lower-income households at heightened risk of eviction (Ring and Schuetz, 2021). Given the inability or lack of will to house those experiencing homelessness in permanent accommodations, a stop-gap solution emerged in the form of the sanctioned encampment (SE). SEs are formally-recognized, legally-permitted, outdoor areas for unhoused residents that provide temporary shelter. Typically, SEs are managed by non-profits and offer supportive services to their residents such as health care, employment assistance, and housing connections.

SEs have become increasingly common since 2020 as many congregate shelters closed due to high barriers to entry and new COVID-19 restrictions. Yet we know little about their success as a solution to homelessness and how they relate to the criminalization and control of the unhoused population. In this mixed-methods study, we address these gaps in three ways. First, we conduct a national web search to identify existing SEs. Second, we analyze these SEs to understand how they are sited, permitted, and managed. Third, we determine how this new land use, which many consider a less-punitive and more compassionate method of policing homelessness, may also serve to further “invisibilize” homelessness (Margier, 2021).

To build a national database of existing SEs in the U.S., we conducted an extensive internet search using a snowball search method (see Evans, 2020). We found relatively complete information on the organizational structure, partnerships with private or public entities size and capacity, zoning and site context, approximate costs, barriers to entry, and services provided in a total of 50 SEs. SEs vary widely in their management, funding, regulation, entry barriers, and locations. Around half offer case management services and nearly 1/3 offer mental health services; 1/3 of the encampments are located within 1/4-mile of a highway; and around half were created since the start of the COVID-19 pandemic.

We also uncover a key paradox. On the one hand, SEs provide secure, albeit temporary, shelter, supportive services, and basic necessities. On the other, they can make the unhoused population invisible, placing them behind locked fencing and in out-of-sight areas. Similarly, a number of SEs we examined control and pacify unhoused residents through around-the-clock security, strict rules, and high barriers to entry. The introduction of SEs has also been used to justify sweeps of unsanctioned encampments. We find that officials have relied on new SEs to skirt recent rulings

such as *Martin vs. Boise*, which makes it illegal for municipalities in nine U.S. states to enforce “camping bans” unless they provide adequate indoor or SE-style shelter space. As such, the SE model resists categorization as either a compassionate or a punitive solution to addressing urban homelessness.

This study makes several contributions to an emerging body of literature and policy. First, we describe some key challenges and opportunities related to the SE model for planners and policymakers to consider. Second, our findings help private entities, site managers, and caregivers understand the potential benefits and drawbacks of SEs, including how they help justify the criminalization of unhoused people. And third, because of this model's novelty, our findings suggests avenues for future research on SEs as a tool for managing homelessness.

Individual Paper Submission

GONICK, Sophie [New York University] sophie.gonick@nyu.edu, presenting author

A wealth of scholarship within planning and related discipline has paid attention to displacement, particularly as it relates to gentrification and the transformation of urban environments (Zuk et al 2018). Across myriad fields of urban inquiry, displacement is now a central concern. Its effects can be seen in diverse environments, from the inner cores of cities such as Paris or Berlin, to the suburban spaces of the San Francisco Bay Area. The causes are also diverse: the emergence and consolidation of vacation rental markets, the lingering effects of the subprime crisis, and the financialization of housing have transformed where and how people live (Christophers, 2021; Santos & Sequera, 2018). Displacement, critical urban scholarship has argued, is a key logic of the contemporary, unequal city, and urban life under current regimes of finance, property, and placemaking in increasingly precarious. Often such work is also attuned to the specificities of race, gender, and Indigeneity as they configure certain populations as more easily movable or readied for banishment (Roy 2019). Such scholarship, however, is primarily concerned with displacement and its myriad synonyms (banishment, eviction, expulsion, even uricide) as fundamentally contained within and pertaining to the city itself, perhaps with some consequences elsewhere.

What has been less explored is how forms of displacement—whether from the city or elsewhere—produce new (sub)urban spaces, sociality, and struggles (Hochstenbach & Musterd, 2021). Urbanists in the United States are keenly aware that gentrification in expensive coastal cities has provoked an exodus. Some head to exurban spaces such as the fringes of the Bay Area, where the metropolitan region meets the Central Valley, where the economic present and future meets its agricultural past. Others, however, have gone on to Denver or Minneapolis, New Orleans or Chicago, in an effort to find urban living that is more within their economic grasp. How do we think about these movements of people from one place to the next? How does displacement in one site produce emplacement in another? One means of understanding such displacement, mobility, and settlement, I contend, is through the lens of relationality as it has been advanced in transnational geographical analysis.

In this paper, I pay attention to the ways in which displacement from elsewhere also produces urbanism and urban communities. I argue we need to understand the city relationally with attention to previous displacement(s) across not only spatial fields but also temporal moments. Here I follow two divergent trajectories of displacement, each with their own temporalities and spatialities, to reveal how they contribute to the contemporary cities of San Francisco and Madrid. I deploy ethnographic analysis drawn from previous work within the Spanish anti-evictions movement and more recent research on artist homeowners in the Bay Area. In particular, I examine several key oral histories of mobility to demonstrate how displacement helps to produce new modes of urban living. I conclude by considering the ways in which historical logics of difference—race, class, ethnic background and migratory origin, indigeneity, and gender—ultimately produce more permanent forms of emplacement. Who is rendered displaceable in the city, I argue, is intimately connected to who can access whiteness and its links to property.

WATSON, Camille [NYU Furman Center] camille.watson@nyu.edu, co-author

As the nation's public housing has struggled with a funding crisis, many public housing units across the country have fallen into disrepair. Broken elevators, inadequate heating and cooling systems, and lead paint are some of the conditions faced by public housing residents, which can pose significant health hazards, particularly for children. Advocates debate the merits of the Rental Assistance Demonstration (RAD) program as a means to improve the condition of public housing. Administered by the U.S. Department of Housing and Urban Development (HUD), the program allows for the conversion of public housing developments from public housing support to project-based Section 8 contracts. Conversions also often involve a shift from public to private property management as well as physical renovations and additional flexibility in accessing private and public funding sources. While RAD conversions can improve the physical condition of subsidized housing developments, some advocates worry that giving control to private developers may harm tenants if they are stricter about rent collections and other rules and more likely to force residents to leave.

Our research seeks to understand the impact of RAD conversions on the health and well-being of children living in converted public housing developments in New York State. Using Medicaid claims data from the state together with RAD development data from HUD, we evaluate the impact of the 38 RAD conversions in New York State that took place between 2015 and 2018 on the physical and mental health and residential mobility of children living in these developments at the time of conversion. We match each RAD development to a similar public housing development that did not go through RAD conversion in order to identify the treated group (5,497 children) and a control group (4,460 children). We conduct an event study analysis to determine the effects of RAD conversion on housing-related health outcomes including asthma, anxiety, injuries, and upper respiratory infections, as well as hospital and emergency department visits, stratifying results by development-level renovation and relocation costs. We also examine whether children are more likely to experience a move after conversion and whether they relocate to higher- or lower-poverty neighborhoods. In addition, we track evictions at the building level before and after conversion in order to determine whether patterns of eviction changed as the result of the shift to private management.

In brief, our preliminary results show that in the year following conversion, children initially living in RAD developments were two percentage points less likely to have an asthma diagnosis than children in the control group. They were also about two percentage points less likely to visit the emergency department in the year following RAD conversion. On the other hand, we find that children in RAD developments were three to four percentage points more likely than children in the control group to move out of their developments in the year after conversion. We are in the process of merging in eviction records to shed light on whether these are voluntary or involuntary moves.

Houselessness has ascended to crisis conditions across urban America, which has worsened sharply since the onset of the COVID-19 Pandemic. The critical literature on houselessness is voluminous and transcends disciplinary boundaries. Emphasis has been placed on the adoption and expansion of anti-homeless laws (e.g., sit and lie ordinances) that have systematically eroded what little public spaces are left for houseless individuals to inhabit without committing a crime. Ethnographic research chronicles how these laws have worsened the experience of being homeless, forcing them to navigate a more intricate, onerous, and spatially expansive daily routine as part of their survival strategies. Other work points to the role of housing as a structural determinant in the (re)production of homelessness, identifying the mobilization of private property toward maximizing profits among private developers and major corporate landowners and property management firms. Conversely, the literature on the geography of displacement illuminates the reality of some (usually low-income) neighborhoods acting as centers of chronic eviction in the rental housing market. Scholarship that explicitly and directly examines the links between the geography of displacement and eviction and the production of houselessness is less than forthcoming. This study brings these two bodies of literature into closer dialogue in the context of a GIS analysis of houselessness, displacement, and rent in the context of Spokane, WA, USA. The study also represents a collaboration between Urban and Regional Planning faculty, graduate and undergraduate students, and professionals working with the City of Spokane to more deeply examine the impact of Spokane's red hot housing market on the recent surge of houselessness observed in recent years. The collaboration included designing supplementary questions on the survey implemented during Spokane County's 2022 Point-In-Time (PIT) Count, including questions designed to assess where houseless individuals last lived in Spokane before they became houseless. This data was then placed in a GIS data set of publicly available parcel data (including tax-paying entities for every property) joined with available data on rent, income, and the addresses of evictions (going back to 2018) organized by neighborhood. The analysis reveals a significant percentage of large and non-local property investment firms in evictions as well as four specific neighborhoods in Spokane as houseless production zones directly linked to contemporary capitalist housing market dynamics. We conclude by discussing the policy implications of the analysis more broadly. Enhanced funding for more shelter space is needed, but in terms of targeting the political-economic processes that render people houseless in the first place, substantially greater interventions in private property (e.g., conversion bans, displacement-free zones, expanding rent control, etc.) are needed as well as investment at the federal scale to enable local governments to more fundamentally address the ongoing and worsening housing affordability crisis unfolding across urban America.

DOUCET, Brian [University of Waterloo] brian.doucet@uwaterloo.ca, co-author

Measuring the pace and spread of gentrification is important to developing policies to mitigate its negative consequences. Typically, this is done through an analysis of census data. However, this approach has numerous shortcomings, including the homogenizing effect on differences within neighbourhoods and the infrequency of census data collection. Visual analysis helps show unregulated patterns of regularity (Rajčan & Burns, 2020) and can render visible fine-grained detail about spatial, economic and cultural changes within the urban landscape. As Elvin Wylie (2010) stresses, there is a need to add meaning and context to photographs so that they can begin and enhance conversations about cities. Google Street View (GSV) is emerging as a source of repeat photography; its regular coverage and publicly accessible images enables an immediate and fine-grained assessment of both capital investment and socio-cultural/class aesthetics, both of which are important to explaining and interpreting gentrification (Hwang and Sampson, 2014).

In this paper, we analyze GSV images taken between 2009 – 2021 within 10 census tracts spread across Hamilton, Ontario's Lower City. While neighbourhood downgrading has been the dominant trend for decades, and some neighbourhoods are among Canada's poorest (Harris, 2020), gentrification is occurring, not least because of the spillover effects from nearby Toronto. The aim of this paper is therefore to paint a detailed and fine-grained picture of urban changes that are not (yet) evident within statistical analysis. Specifically, we document the spread and nature of both capital upgrades (such as renovations and additions), as well as changes to the aesthetics of residential properties that reflect middle-class tastes, values and lifestyles.

Our approach differs from other studies that have employed GSV analysis; instead of selecting random sites within neighbourhoods using a simple coding scheme, our research systematically coded every parcel on one side of virtually every residential street within each of the 10 neighbourhoods with a detailed coding scheme that enabled us to document many different types of capital and aesthetic upgrading. The latter includes elements such as soft modernism colour palettes and horizontal fences associated with contemporary gentrification (Rosenberg, 2011).

Our analysis reveals distinct spatial and temporal patterns between neighbourhoods where there is little indication of gentrification in census analysis and neighbourhoods where there is already statistical evidence of upgrading. The former were characterized by higher rates of capital investment (new roofs, exterior renovations), while the latter saw the arrival of aesthetic and style changes reflective of middle class tastes. Mapping these changes both collectively and separately paints a complex, and fine-grained, block-by-block picture of gentrification that reveals why some areas are more conducive to gentrification than others. Our analysis is important for critical visual methodologies, theories of neighbourhood change and planning and policymaking.

IS MUNICIPAL PLANNING RESPONSIVE TO URBAN INDIGENOUS HOUSING NEEDS? AN EXAMINATION OF HOUSING PLANS AND POLICIES IN BRITISH COLUMBIA

Abstract ID: 1464

Individual Paper Submission

LOW, Maggie [University of British Columbia] maggie.low@ubc.ca, presenting author
BRETON, Cleo [City of Surrey] cleoibreton@gmail.com, co-author

This paper explores how municipalities in British Columbia, Canada are responding to urban Indigenous housing needs through municipal housing policies and plans. While large scale housing policies and programs remain in the provincial and federal purview, local governments are well positioned to leverage federal and provincial programs to address local needs and support the development of Indigenous-specific housing. Extensive literature exists regarding Indigenous housing conditions on-reserve and research continues to emerge articulating the disparity in access to adequate housing between Indigenous and non-Indigenous peoples (Walker et al, 2010; Belanger et al, 2012). However, an analysis of municipalities' response to urban Indigenous housing needs in BC through policies and plans remains elusive. This is surprising, as 80% of Indigenous peoples in BC reside off-reserve and 60% of this population live in urban settings.

Official Community Plans (OCPs) and housing strategies are two policy instruments used by municipalities to acknowledge housing needs and articulate priorities in addressing community needs. While OCPs typically consider long-term growth and needs (Baynham and Stevens, 2014), many local governments in British Columbia have created separate housing strategies which outline shorter-term policies and housing initiatives in response to current housing needs in their community. British Columbia has recently mandated all municipalities to produce a Housing Needs Report by April 2022 and every five years thereafter. The province has not required nor explicitly encouraged municipalities to include Indigenous-specific data within these reports nor address Indigenous-specific needs in accompanying housing strategies.

In partnership with the Aboriginal Housing Management Association (AHMA) in British Columbia, this study examines municipal responses to urban Indigenous housing needs within Official Community Plans (OCPs) and housing strategies to better understand the barriers municipalities perceive they face in addressing urban Indigenous housing needs. Using a content analysis, survey responses from twenty-four municipalities in British Columbia, and semi-structured interviews with eight municipal planners, this research finds most municipalities do not address urban Indigenous housing needs with their OCP or housing strategy, despite expressing a desire to engage in reconciliation efforts. The study identified three significant challenges for municipalities in addressing urban Indigenous housing needs: 1) lack of financial and human resources to identify Indigenous housing needs through their current planning processes, 2) ambiguity over whether Indigenous housing needs are distinct, and 3) uncertainty around the role and jurisdiction of municipal governments.

While municipalities are well positioned to address urban Indigenous housing needs, uncertainty and misconceptions around the identification of urban Indigenous housing needs limit effective municipal responses through OCPs and housing strategies. Municipal policies and programs that aim to respond to Indigenous housing needs must be developed through Indigenous-led and Indigenous-informed processes in order to uphold Indigenous rights as recognized by the United Nations Declaration on the Rights of Indigenous Peoples. By addressing urban Indigenous housing needs, municipalities can demonstrate their commitment to action on reconciliation efforts in Canada.

PARK, Han John [Rice University] john.park@rice.edu, presenting author
SUNG, Seyoung [Portland State University] seyoung@pdx.edu, co-author
PARK, Yunmi [Ewha Womans University] ymp@ewha.ac.kr, co-author
CHOI, Kwangyul [University of Oklahoma] kchoi@ou.edu, co-author

Texas is the second largest state by population, and it continues to grow at a fast rate. It has accommodated a substantial number of Asian populations domestically, which has fueled its Asian population growth recently, in addition to Asian immigrants from the Asian continent, which occurred more prominently at an earlier stage. However, in contrast to other racial and ethnic groups in the US (e.g., White, Black, and Latinx) and Asian Americans in some other states (e.g., California and New York), little information about where Asians live and what matters to Asians' homeownership in Texas has been known.

This study aims to examine the homeownership of the Asian population in Texas, with a particular focus on the state's largest metropolitan areas: the Dallas-Fort Worth, Houston, Austin, and San Antonio areas. In addition to their homeownership, neighborhood characteristics are evaluated to determine the key factors of the growing Asian homeownership. This study compares the 2010 and 2019 datasets to measure whether Asian communities are more identified in suburban areas and to assess the factors that influence growing Asian homeownership in Texas' large metropolitan areas in the 2010s, approximately after the Great Recession and before the COVID-19 pandemic outbreak.

This study employs quantile regressions to measure the association between Asians' homeownership rates and neighborhood features to capture varying levels of Asian clusters and understand the expansion of the Asian community in suburban areas. Specifically, this study divides suburban counties from core counties and exurban counties in each metropolitan region in the regression models. Main datasets are based on race-based US Census Bureau statistics. Additionally, public education quality records from the Texas Education Agency are used, which is the main interest of this study.

This research contributes to a better understanding of how the Asian population is growing in Texas' demographic profiles. Furthermore, by examining one of the least studied racial groups in the existing literature, this study allows recognition of racial diversity in the rising state. In addition, this study gives more up-to-date and accurate information about an under-researched minority population group to local, state, and metropolitan-level governments and agencies, which will help them in making appropriate policy decisions.

MOOS, Markus [University of Waterloo] markus.moos@uwaterloo.ca, presenting author
VINODRAI, Tara [University of Toronto] tara.vinodrai@utoronto.ca, co-author
COLLISHAW, Skye [University of Toronto] skye.collishaw@gmail.com, co-author

Housing affordability has become a major urban issue, especially in central areas due to gentrification. At the same time, compact urbanism is promoted to help curb carbon emissions to achieve climate change goals by way of reducing land consumption, trip distances and automobile reliance (Nieuwenhuijsen, 2020). Affordability and compact urbanism are linked in that more compact urban form and amenity provision can increase the cost of central locations in the absence of government involvement in housing (Moos et al., 2018). This paper contributes to the discussion on the need for renewed government involvement in housing. We examine if access to subsidized housing

facilitates shorter and less automobile-oriented commutes. To do so, our analysis uses empirical tests based on data from Canada's three largest metropolitan regions.

Policy solutions to affordability concerns often focus on market-based approaches aimed at stimulating housing supply. The counter argument is that affordability issues are fundamentally a structural problem related to financialization and other forms of neo-liberalization, so that market-based approaches alone are unlikely to improve affordability (Been et al., 2019). We contribute to this debate in the spirit of "strategic" post-positivist approaches that utilize quantitative evidence to make a case for progressive social and environmental policy (Wyly, 2009).

To examine how commuting is linked to access to subsidized housing, we draw upon data from the most recently available Canadian census (2016). Prior to 2016, data was not collected on subsidized housing, thus our analysis offers systematic, novel insight into these dynamics. We focus on the three largest metropolitan areas—Toronto, Montreal, and Vancouver—where historically subsidized housing was primarily although not exclusively located in the urban core and parts of the inner suburbs. Although local conditions vary, access to public transit and particularly the quality of service and frequency is generally highest in the core. It is also commonly deemed insufficient in areas with concentrated lower income populations in the inner suburbs; this is especially observed in Toronto. While employment remains centralized to varying degrees in these three metropolitan regions, nonetheless, employment has generally become more dispersed over time (Moos et al., 2020).

We develop logistic regressions that control for various labour, demographic, housing and metropolitan characteristics to determine whether individuals in subsidized housing have shorter and less auto-oriented commutes than otherwise similar populations, controlling for permanent and monetary income, tenure, gender, metropolitan area, occupation, and other worker characteristics.

We find that those residing in subsidized housing have shorter and less automobile-oriented commutes, as compared to their otherwise similar counterparts (e.g., lower income renters living in non-subsidized housing), at statistically significant levels. The magnitude of the difference is relatively small in terms of commute distance but more substantial in terms of commute mode. We argue that greater reductions in the magnitude of commute distance and automobile use may be possible if subsidized housing and transit is expanded to keep pace with decentralizing urban forms.

Although not entirely surprising, our findings provide another layer of important and novel evidence to help make a case for investment in subsidized housing as both affordability and climate policy (Moos et al., 2018; Nieuwenhuijsen, 2020). Although there is a common mantra for the need to coordinate land use and transportation planning, our work points to the need to coordinate affordable land use and public transportation planning efforts that could simultaneously help address affordability and carbon emission reductions.

PARK USE DURING THE PANDEMIC — INVESTIGATING THE RELATIONSHIP BETWEEN PARK USE AND HOUSING CONDITIONS DURING THE COVID-19 LOCKDOWNS IN TORONTO'S ST. JAMES TOWN

Abstract ID: 1484

Individual Paper Submission

COLLISHAW, Skye [University of Toronto] skye.collishaw@gmail.com, presenting author

The COVID19 lockdowns magnified the relationship between access to outdoor green space and housing type and tenure, as well as the inequalities embedded in that relationship. Yet, little is known about how citywide COVID19 public park restrictions impact different populations within the housing system, particularly the vulnerably housed, revealing a substantial gap in our understanding. Current academic and policy research on public park use

restrictions disproportionately focuses on individuals experiencing homelessness or privatization of public space. Left unexplored are the experiences faced by low income rental households. This paper addresses this gap, arguing that park use of low income renters in Toronto (Canada) is reflective of, and not separate from, the functions of the housing system.

I use the City of Toronto's COVID19 park restrictions as a case study to examine the relationship between park use and housing experiences, and specifically on St. James Town, a downtown neighbourhood well-documented as the most densely populated neighbourhood in Canada. The neighbourhood embodies three factors (housing tenure, income and ethnicity) most often found to be correlated with housing vulnerability in Toronto and other large North American cities. Drawing upon interviews with neighbourhood residents, as well as analysis of City of Toronto policies, I explore: 1) How do housing conditions inform how low-income rental households in Toronto's St. James Town neighbourhood utilize public park space?; 2) How did public park restrictions implemented in Toronto during the COVID19 pandemic change how residents of St. James Town access and utilize public parks?

Through a literature analysis, I explore a prominent argument, that the public park is one of the last public spaces offering "refuge" for individuals excluded from the housing system, exploring its applicability to low-income rental households. As the experiences of low-income rental households are often overlooked in this debate, my research is well-positioned to offer novel empirical and theoretical insights. Building on this analysis, the interviews with St. James Town residents and former residents offer first-hand accounts of residents' use of public park space within St. James Town, before, during and after the COVID-19 lockdowns. The analysis of City of Toronto planning policy documents and statements demonstrates the integrated relationship between public parks and the high-rise multi-family housing in the city. My analysis of park restrictions is scoped to those that are covered in the City of Toronto's Ombudsman report, looking only at municipal level park by-laws and use of space restrictions, such as the closure of playgrounds and public facilities.

This research provides insight for planners and policy makers into the impacts that universal public health policies have had on vulnerably housed populations within Toronto, a population often underrepresented in planning initiatives. Specifically, the research finds that COVID-19 park restrictions had disproportionate and discriminatory effects on marginalized and vulnerable rental households, offering lessons to planners in Toronto and beyond. Moreover, the findings demonstrate the interconnectedness of housing with parks and other urban infrastructures. Overall the findings reinforce the need to center housing conditions and vulnerably housed populations in urban public policy and planning decisions.

CLEAR AS REIT MUD: INVESTOR LANDLORDS IN HOUSTON'S FLOODED NEIGHBORHOODS

Abstract ID: 1497

Individual Paper Submission

SHERMAN, Stephen [Rice University] sas26@rice.edu, presenting author

Prior research into real estate financialization and consolidation has highlighted how real-estate investment trusts (REIT) like Invitation Homes and American Homes 4 Rent target discounted foreclosed properties at trustee auctions, turning what were once owner-occupied home into rentals, often accelerating racist dispossession. These companies have aggressive eviction practices (Seymour & Akers, 2020), how their technological tools represent a shift in real estate labor practices (Fields, 2019), and their specific racist acquisition strategies in the post-foreclosure context (Raymond et al., 2021).

For this Houston-focused research, I add an important contingency to the analysis of the foreclosure -> REIT -> eviction process: flooding and climate change, which has largely been absent from past research on REITs. Harris County has had at least three 500-year flooding events in the past two decades. In 2017, Hurricane Harvey dropped more rainfall on Harris County than arguably any measured rain event in U.S. history, while Tropical Storm Imelda (2019) and the Tax Day Floods (2016) also caused intense local damage. It remains to be seen how extensive flooding affects REIT purchases and future REIT-led evictions, which this research seeks to answer.

My preliminary research shows high correlation between REIT activity, foreclosures, and municipal utility districts (MUDs), a unique type of Texas local government which, in Harris County, often lack funds for storm sewer improvements. Using in-house parcel-level trustee foreclosure auction and deed recorder data in Harris County, along with parcel-level eviction and FEMA inundation polygon data, this research investigates if flooding is a significant interaction effect for each step of that three-part foreclosure->REIT ownership->eviction process detailed in past research. Findings will inform recommendations for reforming the MUD system, along with pointing towards potential issues (e.g., mold removal) for policymakers to address in the suburban areas where REITs operate.

JAKABOVICS, Andrew [Enterprise Community Partners] ajakabovics@enterprisecommunity.org, co-author

ORLANDO, Anthony [California State Polytechnic University, Pomona] aworlando@cpp.edu, co-author

Preservation of rural affordable housing continues to be a pressing policy area due to subsidy expiration, aging properties, encroaching exurban growth, increasing property management challenges, and ownership succession uncertainties. Yet this policy area is largely unexplored, and the potential issues above under-researched. Moreover, the role of owner and property manager concentration and type has been woefully ignored. This research sheds light on these topics by examining why properties exit the US' largest rural affordable rental housing program - USDA Rural Development's Section 515. These properties are a critical, and in some places, the only, source of affordable rental housing in rural communities. The Housing Assistance Council (HAC 2018) found that these properties account for more than 10 percent of the occupied rental stock in 250 counties across 36 states. Moreover, there is significant and growing risk of exit from the program either because owners can exercise a mortgage prepayment option or the Section 515 loans mature without any other subsidy programs mandating ongoing affordability. Another exit factor is the owner's desire to retire (HAC 2018), hence our focus on understanding ownership and management patterns. Some prior work has looked at exits from other US affordable housing subsidies, such as the low-income housing tax credit (LIHTC) and project-based section 8 (Lens and Reina, 2016), the Mitchell-Lama program (NY state affordable housing program) (Reina and Begley, 2014), LIHTC and mortgage-revenue bonds (Blanco et al., 2015). These studies find that properties were more likely to exit if they had high local property appreciation and for-profit ownership (Reina and Begley, 2014), improving lower-opportunity areas (Lens and Reina, 2016), and larger properties and those in weaker markets (Blanco et al., 2015). Only Blanco et al. (2015) include rural properties, but they make up a very small portion of their dataset. Our research builds on this body of work and focuses on the rural case and on including owner / manager characteristics. Combining data from USDA, the National Housing Preservation Database, and the US Census / American Community Survey, we estimate the probability of exiting Section 515 based on property-level, owner / manager-level, and surrounding county-level characteristics. Results indicate the importance of property level characteristics, owner type, manager type, and number of units owned / managed on exit probability. In contrast to expectations, local market trends do not appear to influence Section 515 exit probabilities. Better understanding what drives exits from rural housing subsidies enables clarity in planning for the future of rural affordable housing markets.

CAN 'EXPERIMENTAL GOVERNANCE' RESHAPE HOUSING PRACTICE? PILOTING 'INNOVATION' PROGRAMS IN AUSTRALIA

Abstract ID: 1529

Individual Paper Submission

GOH, Laura [University of Sydney] laura.goh@sydney.edu.au, presenting author

Frustration at the stagnation of an already 'broken' housing system has created an environment where experimentation and 'innovation' are seen as pathways to solving entrenched policy problems. In this context, 'experimental governance' has gained popularity across government agencies as a method for developing new solutions to longstanding difficulties by encouraging or enabling 'innovation'. As in the US, the Australian states have often sought solutions to longstanding housing problems through short term and 'innovative' programs. However, some question whether short term 'innovative' housing programs can deliver lasting change; or see claims about 'innovation' as ways to distract from system level policy failure.

This paper examines these themes, with particular emphasis on Australia. Appetite for innovation and experimental methods in the housing space can be seen across all three levels of government in Australia, with the National Government recognition of role of innovation and digital disruption in Australia was highlighted by the release of the Smart Cities Plan in 2016 and local government programs such as the Alternative Housing Ideas Challenge established by the City of Sydney Council. However, it is at the state level where the impact of experimental governance is most explicit, with both state housing policies and state-led programs, such as the Demonstration Housing Project in the Australian Capital Territory and the Future Homes Project in Victoria, exhibiting experimental features.

Experimentation is not a new concept in the housing space but what makes this new version of housing experiments unique is their status as a new method of policy production; the idea of 'hacking' established practice as a precursor to reform (Maalsen 2021). The COVID-19 pandemic has accelerated the 'experimental mood' of governments (McGiurk et al 2021), and this has been evident at the state government level in Australia, demonstrated firstly by the inclusion of experimentation in state housing policies and secondly by the operation of housing experiments outside these policies. This paper reviews these approaches, through an analysis of current state housing strategies and related policies in Australia (released between 2017 and 2021), revealing increasing references and instances of experimentation, extending beyond housing programs to target planning systems. For example, the Australian Capital Territory Housing Strategy released in 2018 connects the outcomes of the existing Demonstration Housing Project and wider policy reform: "the initiative will test future policy direction using real projects to deliver more innovative, sustainable and affordable housing". Comparative case study analysis of three state led housing experiments reveals

unexpected barriers to moving from experimental approaches to genuine policy reform. These barriers include intergovernmental tensions; unclear experiment pathways; stakeholder confusion; lengthy project timelines; and financial constraints. Findings from the Australian context may be pertinent for researchers and practicing planners in the US, where the increasing popularity of policy innovation labs and experimental programs focusing on housing is well documented (see Nesti 2020; Wellstead & Nguyen 2020; Yeganeh et al 2021). Overall, the paper highlights some promise in the recent willingness of state and local governments to disrupt established housing and planning practice, but entrenched obstacles to lasting change.

BARRIERS TO HOUSING PRODUCTION IN OREGON – TRACKING PERCEPTIONS OF PLANNERS

Abstract ID: 1543

Individual Paper Submission

LEWIS, Rebecca [University of Oregon] rlewis9@uoregon.edu, presenting author

PARKER, Robert [University of Oregon] rgp@uoregon.edu, co-author

National reports from the Urban Institute, Harvard’s Joint Center on Housing Studies, and Up For Growth point to a housing crisis – cost burden is rising and housing supply is not keeping up with demand. (Urban Institute, 2017; Harvard Joint Center on Housing Studies, 2021; Up For Growth, 2018) In Oregon, a 2020 analysis by ECONorthwest showed an underproduction gap of 110,000 units. (ECONorthwest, 2020) The lack of housing supply and affordability is an issue facing urban and rural areas alike. While there is robust literature on regulatory barriers to housing, much of the literature focuses on larger metropolitan areas. This study focuses on cities of all sizes in Oregon. In this study, we sought to understand 1) barriers described in academic, industry, and government literature on housing supply; 2) the perception of severity of the housing crisis in Oregon communities; and 3) planner perceptions of barriers to providing housing in their communities.

Our methods include literature review, policy review, and survey analysis. This study relies on survey data from 2017 and 2022 surveys of Oregon City Planning Directors Association email list including all 241 Oregon cities. In 2022, we surveyed market-rate and non-profit developers as well.

The survey includes perception of housing affordability, needed types of housing and barriers to producing housing. In 2017, we received 115 responses for a 48% response rate. The 2022 survey is currently in the field. The 2017 survey results showed that 44 percent of respondents indicated that housing was “more important or much more important” than other issues facing their communities. With respect to housing need, 88% of respondents indicated a “lack of market-rate, family-sized units” and “lack of affordable, market-rate rental units” in their community. Respondents identified a number of perceived barriers to housing affordability including lack of available vacant land (60%), lack of affordable housing provided by developers (59%), high land costs (58%), and lack of development ready land (50%). Infrastructure is an issue in many communities. Funding was the most frequently identified barrier to providing infrastructure (89% of respondents). This research provides insight into the factors affecting housing production and the change in perspectives of planners overtime. Our 2022 survey provides insights into how perceptions vary between planners and developers.

Digital, real estate platforms or 'PropTech' (Shaw 2020) are increasingly mediating how people seek and access housing (Boeing, Besbris et al. 2021, Ferreri and Sanyal 2021). They offer powerful tools for property owners, landlords, agents, and tenants, to market and search for accommodation meeting particular criteria – from price and tenure to dwelling and characteristics and location. The rise of online platforms has also seen new housing practices emerge, transforming once 'analogue' processes associated with finding a share home, or offering 'rooms to let', into an increasingly segmented, digital market place where users offer or seek a vast range of accommodation. Recognising that the increasingly fragmented ecology of real estate platforms targets distinct market segments (Costa, Sass et al. 2021), we uncover these diverse housing practices in this paper, through a detailed analysis of four digital, real estate platforms and the data they generate.

Our study is situated in Australia, where sustained house price inflation and a chronic shortage of affordable housing, offers an instructive context in which to examine how housing platforms are increasingly catering to those unable to access 'formal' rental markets. In Australia, as internationally, share housing has become increasingly prevalent as has dependence on marginal forms of accommodation, where conventional regulatory tenancy protections or housing standards are often traded for lower cost 'informal' accommodation (Harris 2018). Focusing on three of Australia's major cities (Sydney, Melbourne, and Brisbane), and examining over 40,000 property listing advertisements placed on Realestate.com.au, Flatmates.com.au, Gumtree.com.au and Airbnb.com; we unearth a housing system 'substructure' of informal dwellings, tenures, and landlords. The differences across these platforms and the range of listings and information they contain, necessitated mixed methods of data collection, combining automated web scraping as well as detailed manual extraction and review of listings texts and images; and GIS based spatial analysis.

With inadequate provision of social housing or rental subsidy for those on lower incomes, dependence on marginal, insecure and inadequate housing raised particular concerns in the context of the COVID-19 Pandemic. Our analysis showed that demand for informal housing advertised via online platforms persisted through the Pandemic period despite the closure of international borders, revealing deep unmet housing need and the importance of these often overlooked segments of the housing market.

Overall, our study shows that beyond the conventional housing units offered for sale and rent within the parameters established by planning and property regulation, platforms have enabled and exposed a vast 'substrata' of housing practices ranging from forms of self-organised share households and informal rental leases to illegally constructed units, subdivided apartments, and bed rentals on the one hand, and residential tourist accommodation on the other. Our findings have varying implications for platform users and wider urban systems. They raise dilemmas for planners and local officials seeking to enforce residential amenity and standards, including the basic health and safety provisions critical to protect vulnerable and low-income renters, in the absence of wider housing system reform.

USING MACHINE LEARNING APPROACHES TO EXPLORE THE ASSOCIATION BETWEEN ACTIVE TRAVEL AND AIRBNB LISTING PRICE

Abstract ID: 1599

Individual Paper Submission

YU, Chia-Yuan [University of Central Florida] chia-yuan.yu@ucf.edu, presenting author

WANG, Biyuan [Citigroup] biyuan.ella.w@gmail.com, co-author

A growing number of studies have investigated the influence of housing developments, Airbnb reviews, neighborhood and locational characteristics on Airbnb pricing. However, these studies only partially captured neighborhood and locational features by evaluating distance to popular destinations and nearby transit and crime rates. To address this research gap, the research question of this study is how will neighborhood characteristics including walkability, bikeability, transit accessibility and crime data (arrest counts) impact Airbnb pricing in New York City (NYC). Exploring the implications these neighborhood characteristics would enable city officials to make better policy in urban planning. Methods: Previous analyses often use regression or other basic statistical methods to analyze Airbnb listing price, this study will use machine learning approaches such as gradient boosting, extreme gradient boosting and random forest. This study will also use regression model as a baseline method for comparison. Through these advanced algorithms, this study produces better model fitness and more accurate feature importance analytic results than traditional feature evaluation schemes. Key Findings: For all the models besides linear regression, the most important variable is zip code. In contrast, the indicator variables for boroughs have the lowest importance levels for all models. The most important variable for linear regression is bike score; Bike score is the second most important variable for all the other models. And through our exploratory data analysis, we knew that bike score, walk score and transit score are highly positively correlated. This indicates that transit functions and flexibilities do impact room listing prices on Airbnb. The third important variable used by the three machine learning algorithms is arrest count. This means that in addition to transit functions, safety is another key consideration for customers when booking a room on Airbnb. The result of this study identifies the positive effects of walkable environments in promoting sharing economic benefit and inform planners and policy makers of the unmet demand for walkable community design. The policy makers should consider the potential impact of walkability on the sharing housing economy during the policy formulation. The result of this study could benefit real estate investors to explore the housing availability in walkable communities in the real estate market.

"THEY'RE JUST TRYING TO SURVIVE": THE RELATIONSHIP BETWEEN SOCIAL VULNERABILITY, INFORMAL HOUSING, AND ENVIRONMENTAL RISKS IN LOIZA, PUERTO RICO, USA

Abstract ID: 1609

Individual Paper Submission

GARCIA ZAMBRANA, Ivis [University of Utah] ivis.garcia@utah.edu, presenting author

Socially vulnerable households across the earth tend to live in informal settlements, which also tend to be in areas that might experience flooding. Given that climate change is leading to more frequent and devastating flooding events, this study asks what is the relationship between informal housing, social vulnerability, and environmental hazards in the context of a U.S. territory? Although most research on this topic has concentrated in the Global South, there are no studies within the U.S. disaster management system on these topics—primarily because informality is heavily understudied in the United States. With the purpose of understanding the connection we conducted a qualitative analysis of 28 interviews with stakeholders working on different facets of disaster recovery and mitigation in Loiza, Puerto Rico. The finding suggest that changes need to be made about how local and federal government entities such as the Federal Emergency Management Agency approach informal housing (e.g., not as illegal but as a

practice of those “just trying to survive” as an informant put it). It is also important for planners and other decision makers to educate the population and provide financial assistance so that long-term risks could be reduced without displacing the local population.

BROADENING EQUITABLE PLANNING: UNDERSTANDING INDIRECT DISPLACEMENT THROUGH SENIORS' EXPERIENCES IN A RESURGENT DOWNTOWN DETROIT

Abstract ID: 1610

Individual Paper Submission

MAH, Julie [University of Florida] julie.mah@ufl.edu, presenting author

As shrinking cities implement regeneration initiatives to recover from years of economic and population decline, planners have been struggling with how to promote more equitable development, such as ‘revitalization without displacement’. Yet, this approach often focuses on mitigating physical or direct displacement and often neglects to consider indirect displacement, which represents an under-theorization of displacement processes. Despite the large body of research, some scholars (e.g., Davidson, 2009) argue that displacement processes are still not well understood. Elliot-Cooper et al (2019) further argue that displacement is in danger of becoming a “‘chaotic’ concept: a notion that actually obscures as much as it reveals” (p. 3). Displacement is most commonly conceptualized as forced relocation or dislocation due to physical or economic reasons. However, this conceptualization reduces displacement to a simple spatial moment in time which strips out the social relations that produce that space (Davidson, 2009), and overlooks indirect forms of displacement. Yet, indirect displacement holds serious implications for equitable planning initiatives that seek ‘revitalization without displacement’, as these initiatives tend to only address physical dislocation. Incorporating a better understanding of the different dimensions of displacement will help inform equitable development efforts that are more inclusive and just.

Research has also tended to focus on the class-based dimensions of gentrification, with little focused attention on how age factors into this process and specifically how low-income older adults are affected by the process (Garcia and Rua, 2018). A body of work has examined indirect displacement by documenting the lived experiences of non-gentrifying residents who manage to ‘stay put’ in rapidly changing areas (e.g., Cahill, 2007). However, only a few studies have explored senior tenant perspectives (e.g., Weil, 2019). While these studies do call attention to the need for additional neighbourhood supports to accompany affordable ‘aging in place’ strategies, they do not examine how a better understanding of non-spatial forms of displacement could help inform equitable development approaches.

This paper examines the displacement effects of redevelopment initiatives in Detroit by exploring senior tenant experiences with indirect displacement in a rapidly gentrifying downtown neighborhood. These older adults reside in government-assisted housing and thus have managed to remain in place amidst intense redevelopment. By documenting how gentrification is experienced in quotidian ways by older adults, we can better understand the impacts of gentrification on seniors, which has been underexplored in the literature. In so doing, this research seeks to inform planning practice by incorporating a broadened conception of indirect forms of displacement in the design of more equitable planning interventions that can bring about a more just city.

Using a case study approach to deepen our understanding of how indirect displacement occurs and is experienced by older adults in a resurgent downtown Detroit, this paper addresses the following questions: (1) What are senior tenant experiences living in a rapidly gentrifying downtown?; (2) How can a better understanding of ‘perspectives from below’ concretely inform an equitable planning approach to proactively address indirect displacement? Based on

in-depth qualitative interviews and participant observation, the findings illustrate the material ways in which seniors have experienced indirect displacement through feelings of exclusion and non-belonging, diminishing social space, and fears of direct displacement – all of which contribute to an on-going loss of sense of place. These experiences suggest a diminishing ability to create place for some, which reduces their ability to assert their right to the city.

THE CRISIS IN AFRICAN-AMERICAN HOMEOWNERSHIP: MAGNITUDE, VARIATION, AND DIRECTIONS FORWARD

Abstract ID: 1612

Individual Paper Submission

PENDALL, Rolf [University of Illinois at Urbana-Champaign] rpendall@illinois.edu, presenting author

In 2020, the homeownership rate for African Americans was almost as low as it was in 1968, when the Fair Housing Act passed, banning discrimination based on race in private real-estate transactions. After a marked increase in the 1970s, Black homeownership declined in the 1980s, but bounced back in the 1990s to its highest level in the 20th century (Freeman 2005).

Since 2000, however, the favorable conditions of the 1990s have reversed. Incomes of Black Americans stalled in the 2000s even as the incomes of whites, Hispanics, and Asians declined. Mortgage sellers targeted Black neighborhoods with high-risk loans—including some clearly predatory ones—to established homeowners, leading many families to lose the only equity they had as housing values stalled and then plummeted in the market collapse of 2008 (Immergluck 2011). Younger households who had only recently attained homeownership, too, lost their homes disproportionately. What's more, whereas white, Hispanic, and Asian homeownership rates have recovered, Black homeownership rates have continued to lag. Consequently, hundreds of thousands of Black families will now see their elders enter retirement age as renters when they might otherwise be homeowners; hundreds of thousands of Black children and youth are growing up in homes their parents rent, whereas they might have become homeowners. This tragic retrocession exposes families to greater housing instability and housing poverty and bars access to countless neighborhoods where, if they had been homeowners, they might be able to choose.

When this story has been told, it has been largely from a national perspective (but with some exceptions, e.g., Flippen 2010). But while national policy clearly matters for the future of Black homeownership, state and local actions can also make a difference both for attainment and for retention of homeownership (see for example Phillips 2021 on policies relevant to the Detroit housing market). This paper makes a start at an intra-US comparison by reviewing the national story of Black homeownership from 1970 to 2020 but then looking more deeply at more recent regional trends in the metropolitan areas with the highest numbers of Black households. I will consider how these regions differ in their homeownership attainment (i.e., net transitions of younger Black households from renting to owning) and retention (i.e., net transitions of older Black households from owning to renting), which relate to one another but respond to different policy instruments (Ren 2020). After providing a broad overview of how these regions compare in their growth rates, incomes, nativity, age structures, and residential segregation (with no plans at present of conducting multivariate analysis), I will then compare two regions at the extremes: one in which Black homeownership remains closest to year-2000 levels and one in which Black homeownership stands well below year-2000 levels. These comparisons (both the broader and shallower one and 2-metro comparison) will set the stage for future research on state and local policies that may have mattered for homeownership attainment and retention.

STABLE MIXED-INCOME NEIGHBORHOODS AND THE ROLE OF PLANNING AND HOUSING POLICY: A COMPARATIVE CASE STUDY

Abstract ID: 1617

Individual Paper Submission

LEE, Yeonhwa [University of Pennsylvania] yeonhwa@design.upenn.edu, presenting author

Mixed-income neighborhoods have long been proposed as a policy ideal that contrasts with the racial and economic segregation that characterizes much of metropolitan United States. However, scholars of neighborhood change have theorized and empirically shown that, while poor and affluent neighborhoods tend to persist, mixed-income neighborhoods tend to transition into either low- or high-income neighborhoods, exiting their status as mixed income. However, stable mixed-income neighborhoods (SMINs) do exist in the U.S. This paper uses a case study approach to build on a prior paper, which assesses neighborhood income diversity and identifies SMINs in the 100 largest metropolitan statistical areas in the U.S., and addresses the following research question: How have stable mixed-income neighborhoods maintained their economic diversity over time, and what is the role of planning and housing policy?

Employing an embedded two-case study design, this paper focuses on San Francisco, CA, and Alexandria, VA, as the two case study sites, which were selected primarily based on their high shares of SMINs from 1990 to present and secondarily based on other factors of comparison such as differing regions, racial compositions, population sizes, and economies. The paper interrogates the various theorized drivers of stable neighborhood economic diversity--from historical and current housing and planning policy at the city level, to housing market and community dynamics at the neighborhood level--through the triangulation of multiple types of data. Specifically, the paper relies on the analysis of historical and current city plans and zoning ordinances and other relevant archival data, as well as in-depth semi-structured interviews with city planning departments, community development organizations and organizers, and real estate professionals.

In terms of analytic strategy, the case study is guided by the theoretical proposition that neighborhood income diversity is influenced by policy interventions, including local planning and housing policy and other urban programs such as affordable housing. This proposition not only reflects what scholars theorize as drivers of income-mixing and/or economic segregation in neighborhoods, but also belies the hope that, indeed, some policy interventions make a meaningful difference on the socio-spatial landscape and can be effectively leveraged for this purpose in the future. Against the study's null hypothesis that the observed stable income diversity in neighborhoods is a chance occurrence, the case study's expected findings include both converging and diverging narratives between San Francisco and Alexandria--some core similarities surrounding land use policies and affordable housing approaches and other differences shaped by dissimilar planning and market contexts. Ultimately, the analysis and findings provide theoretical and empirical insights into neighborhood change, income mix, and the various policies that influence both, with implications for planning practice.

EVALUATING THE IMPACTS OF WILDFIRES ON HOME VALUES IN WUI COMMUNITIES IN CALIFORNIA

Abstract ID: 1621

Individual Paper Submission

DONG, Hongwei [California State University, Fresno] hdong@csufresno.edu, presenting author

Climate change is causing record-breaking wildfires in the western United States, especially in California. According to the California Department of Forestry and Fire Protection (CAL FIRE, n.d.), eight of the ten largest wildfires in California's history have occurred since 2016. Wildfires cause significant loss of lives and properties and sky-rocketing fire suppression costs in the wildland-urban interface (WUI) areas. Wildfires can hurt property values in WUI and nearby communities as they are perceived to be unsafe and insurance companies charge higher premiums and, in some cases, decline to write insurance policies (Kiel, 2021).

The objective of this study is to quantify the impacts of wildfires on home values in California from 2016 to 2020. This study will adopt a quasi-experimental design to evaluate the impacts of wildfires on property values in California's WUI communities. We consider the occurrence of wildfires as a treatment and the communities that experienced wildfires as a treatment group. We then use propensity-score matching method to identify similar Californian communities as a control group. The communities in the treatment and control groups are almost identical except that the treatment group experienced wildfires in the study period while the control group did not. This research design allows us to estimate the impacts of wildfires on home values by comparing the changes of home prices in the treatment and control groups before and after a wildfire event.

The impacts of the wildfires will be estimated through staggered difference-in-difference and event-study models based on a 10-year (2011-2020) panel data set. The key outcome variable in the model is home prices, which can be measured by the monthly Zillow home value index (ZHVI) data, which are free to download. ZHVI is measured at aggregated spatial scales and the finest spatial scale is ZIP code. The information about the wildfires can be downloaded from CAL FIRE's website. The variables that describe community socio-economic characteristics can be measured by the Census data that are publicly available.

Population and housing in California's WUI communities will continue to grow quickly (Radeloff et al., 2018). The results of this study will provide an updated and much needed estimate of the impacts of wildfires on property values and municipal budgets based on the evidence from several recent record-breaking wildfires in California. They will also help WUI communities in California to re-assess the demand for housing and land in the future.

CENTERING NON-MARKET HOUSING IN MUNICIPAL AFFORDABLE HOUSING POLICY FOR AN INCLUSIVE CITY

Abstract ID: 1643

Individual Paper Submission

BALLANTYNE, Elizabeth [University of British Columbia] elizabeth@ballantyne.com, presenting author

In responding to the deteriorating housing affordability in both Canada and the United States, federal, provincial/state and municipal governments are focusing their policy interventions primarily on the market segment of the housing system. Regulations, incentives and subsidies to stimulate market supply are being introduced on the premise that producing more market housing will improve general affordability (Blumenthal et al., 2016). However, a growing body of research supports the proposition that continuing to expand the supply of market housing will not result in a sufficient stock of affordable housing, and that the non-market sector is central to a sustainable, long-term plan for a sufficient supply of permanently affordable housing tailored to all incomes (Underkuffler, 2020).

Alongside the continuing dependence by governments on market mechanisms to produce affordable housing, proposals for expanding the stock of non-market housing in solutions to address the growing affordability crisis are gaining prominence in policy debates, in public discourse, and in government policies aimed at building the capacity of the non-market housing sector (Been et al., 2019). California's proposed Social Housing Act, aiming to create a state housing authority mandated to produce housing for all incomes on a mixed-income model, and Canada's 2017 National Housing Strategy, providing funding to protect and expand community-owned social housing stock, are two examples of recent senior government policy action. At the local government level, many municipalities are adopting a wide range of approaches to enable non-market housing, often in innovative ways.

This paper examines the place of non-market initiatives in municipal affordable housing policy in Canada, with comparative references to municipalities in the U.S. and other countries. It is an inquiry into policy directions for municipal affordable housing planners who recognize the strategic importance of permanently affordable non-market housing within a vision of an inclusive city. The focus is on two types of municipal policy interventions to create, enable and protect non-market housing. One type comprises: measures that support the non-profit housing sector; financing tools that involve new kinds of partnerships and new funding sources; and municipal land management strategies that secure public land for non-market housing. An example of these land management strategies is found in innovative applications of the 'right of first refusal,' such as its expanded use for municipal acquisition of properties for social housing (Montreal and Barcelona) and for empowering qualified non-profit housing developers to acquire sites for social housing (San Francisco). The second type of municipal non-market policy interventions comprises three specific tools that are commonly associated with generating new market housing, but which are being applied innovatively by some municipalities and their community partners to generate non-market housing. The first tool is inclusionary zoning, being used by Montreal to require a mix that includes 20 percent social housing; the second is zoning densification, being used by Cambridge (MA) to generate permanently affordable non-market housing for tenants with below-media income; and the third is shared-equity ownership housing, being used by Whistler (B.C.) to create an expanding pool of permanently affordable, price-restricted non-market housing for ownership (Eberle et al., 2011; Mah & Hackworth, 2011).

The research suggests that sharing lessons from the growing body of municipal experience in expanding non-market housing stock could deepen understanding of the strategic importance of non-market housing as a source of permanently affordable housing. This analysis of innovative local government strategies to expand the supply of non-market housing forms part of doctoral research into proposals for systemic reform of Canada's housing system.

AN ANALYSIS OF HOUSEHOLD OUTCOMES AFTER LEAVING FEDERALLY ASSISTED HOUSING IN MULTNOMAH COUNTY, OREGON

Abstract ID: 1644

Individual Paper Submission

SUNG, Seyoung [Toulan School of Urban Studies and Planning, Portland State University] seyoung@pdx.edu, presenting author

SMILEY WOLFE, Taylor [Home Forward] Taylor.SmileyWolfe@homeforward.org, co-author

RUTZEN, Brian [Home Forward] Brian.Rutzen@homeforward.org, co-author

Due to limited resources, only a subset of low-income households that are fortunate enough to reach the top of the lengthy waiting list after years can receive subsidies (Turner and Kingsley 2008). Indeed, a recent empirical study discovered that the median duration of households receiving housing assistance is only three years for those in public housing and 4.8 years for voucher holders (McClure, 2017). However, families receiving federal housing aid

frequently exit the program for a variety of reasons, some voluntary or some involuntary. Since most households receiving housing assistance are extremely low-income, and housing is the largest expense for the majority of families, those who exit the assistance program may face economic hardship and housing instability due to increased housing costs in the absence of subsidies.

While myriad aspects of housing assistance programs have been studied, studies on housing assistance departures continue to paint an incomplete picture of why households leave and how those families fare afterward, given the subsidy's open-ended nature (Smith et al., 2015). Only a few studies have examined economic and housing outcomes in order to determine whether those who leave are actually better off or face housing instability (Smith et al., 2015; Kang, 2021).

This research examines the characteristics and experiences of families who left Home Forward, Public Housing Authority of Multnomah County, Oregon, from 2009 to 2021 through a racial equity lens, with the following research question: How does the economic outcome of households that left voluntarily compare with those of households that left involuntarily? The study takes advantage of the longitudinal dataset by combining Home Forward participant data with employment data from the Oregon Employment Department and self-sufficiency data from the Oregon Department of Human Services. This study explores racial disparities in a variety of outcomes for assistance leavers: economic mobility, employment stability, and participation in and engagement with self-sufficiency programs. In addition, this study investigates the associations between economic mobility outcomes and exit type by assistance programs.

The findings contribute to our understanding of what happens when families leave public housing assistance, with a focus on racial equity. Because re-entering housing assistance after leaving it is complicated, families who leave the program need extra care to prevent sliding into extreme poverty again. This research will provide insight into how to improve housing assistance programs and policies to support families that leave or lose their assistance by providing a safety net for economic mobility and housing stability. In addition, the research will highlight racially equitable strategies with a more focused approach that can mitigate racial gaps in economic outcomes of households at risk of leaving based on the exit type.

DOES DISCRETION DELIVER DELAY? IMPACT OF HOUSING APPROVAL PATHWAYS ON TIME TO PERMIT

Abstract ID: 1649

Individual Paper Submission

MANVILLE, Michael [University of California Los Angeles] mmanvill@ucla.edu, presenting author
MONKKONEN, Paavo [University of California Los Angeles] paavo.monkkonen@ucla.edu, co-author
PHILLIPS, Shane [UCLA] shanephillips@ucla.edu, co-author
GRAY, M. Nolan [ucla] mnolangray@gmail.com, co-author

Local governments often approve multifamily housing through a discretionary process: a public body must vote to entitle the proposal before it can seek a building permit. By-right entitlement, in contrast, allows developers to apply directly for a building permit.

This article tests the hypothesis that by-right approvals are faster. Faster approval can make multifamily development more feasible, which can in turn improve housing affordability. Approval pathways are often endogenous to project size and complexity, but we exploit a provision in the Los Angeles Transit Oriented Communities (TOC) program that allowed many large projects to use as-of-right approval. Using data from roughly 350 multifamily projects permitted in Los Angeles from January 2018 through March 2020, we compare approval timelines for both by-right and

discretionary projects.

We find that by-right projects are permitted 28% faster than discretionary projects, controlling for project and neighborhood characteristics. By-right projects also have less variance in their approval times, suggesting that by-right approval offers not just more speed but more certainty.

We conclude that planners should create more opportunities for multifamily housing to be permitted by-right. In spite of some selection bias in our study, the TOC program in Los Angeles shows that creating a by-right option can substantially benefit housing production. Its faster approval timelines have been accompanied by an increase in average project size and the number of units reserved for low-income households.

UNFOLDING THE DISCOURSE ON PATHWAYS INTO HOMELESSNESS: IMPLICATIONS FOR RESEARCH SCHOLARSHIP AND POLICY INTERVENTIONS

Abstract ID: 1657

Individual Paper Submission

BONAKDAR, Ahmad [York University] bonakdar@yorku.ca, presenting author
GAETZ, Stephen [York University] SGaetz@edu.yorku.ca, co-author

Homelessness has become a seemingly intractable challenge worldwide, particularly in the United States and Canada. In response to the growing concerns over homelessness, research efforts have investigated the root causes of homelessness in order to identify best practices and program interventions to reduce homelessness and improve the lives of individuals experiencing homelessness. Conceptualizations of the causes of homelessness often rest on the socio-ecological model, which posits that homelessness has essentially emerged as the outcome of a complex and intricate interplay between individual/relational risk factors (e.g., family conflicts, exposure to violence) (Nooe and Patterson 2010), structural determinants (e.g., poverty, unemployment, lack of affordable housing) (Piat et al. 2015), and system(s) failures (e.g., ineffective policy and service delivery programs) (Gaetz and DeJ 2017). These factors together play a profound role in the people's lived experiences of marginalization and homelessness.

However, accounts that solely focus on either individual pathology or structural factors appeared to have received criticism: critics argue that the attempts to frame individual factors within larger social and economic structures are underspecified, rest mostly on 'epidemiological' approaches, and that homelessness in the terms of social realist theory lacks an understanding of the fact that homelessness is socially constructed (Somerville 2013). Therefore, the pathways approach is argued to better reflect individual journeys into homelessness, considering the social construction of homelessness in which homelessness is understood as an episode or sequential events experienced in the larger context of a subject's life with a lived experience of homelessness (Clapham 2003; 2005; Somerville 2013).

This paper, building upon the scholarly contributions made by the pathways approach to homelessness, discusses how the pathways discourse departs from previous approaches and introduces the characteristics of the pathways approach that have remained largely unincorporated into the mainstream research and practice. Specifically, focusing on the social construction of homelessness, this paper treats temporality as a critical factor in the pathways approach and delves into the question of "how" the complex interaction between individual and structural factors contribute to and sustain homelessness—as opposed to a mere focus on "what" factors cause homelessness. This paper concludes that the pathways approach can contribute to research and practice on homelessness in two ways: First, by investing in the pathways approach, quantitative analyses can be supplemented by in-depth, qualitative interviews that chart individuals' life histories to inform current policy responses through the inclusion of a greater spectrum of culturally driven solutions to homelessness. Second, on the policy front, the pathways approach provides policymakers with knowledge about how and when intervention programs can work best. This requires an understanding that individuals experiencing homelessness are diverse and thus proposing culturally informed strategies, particularly for increasingly overrepresented youth subpopulations who are homeless including Indigenous and LGBTQ2S groups, is warranted.

THE ROLE OF NIMBYISM IN LOS ANGELES PRESERVATION POLITICS

Abstract ID: 1659

Individual Paper Submission

KINAHAN, Kelly [University of Louisville] kelly.kinahan@louisville.edu, presenting author
MAWHORTER, Sarah [University of Groningen] s.l.mawhorter@rug.nl, primary author

The nexus between historic preservation and anti-development Not In My Backyard (NIMBYism) is rooted in the application of preservation tools like local historic districts that manage the built environment. In local political discourse, these arguments often manifest as a combination of protecting existing historic resources from demolition and keeping out "incompatible development" (Buckman, 2011). Assumptions about what is valued as worthy of preservation underlie the practice of creating local historic districts, which in the U.S. context is widely driven by the National Register of Historic Place's 50-year threshold and an overwhelming focus on aesthetic standards tied to the architectural significance of buildings. This framework for determining what is historic is rooted in racism and classism, with White, upper-class narratives dominating what is deemed historically significant (Saito, 2009). Local historic districts are also critiqued from a land-use deregulation standpoint with economists pointing to their role in limiting new development and thereby constraining housing supply and increasing prices (Glaeser, 2012). However, historic districts can also be deployed as a means of halting the teardown-redevelopment cycle to protect incumbent residents in rapidly gentrifying neighborhoods (Podagrosi, Vojnoic, & Pigozzi, 2011; Ryberg-Webster, 2019) or preserving the existing urban fabric of smaller, affordable homes in (Abrams, 2016).

In this paper, we examine the local politics of historic preservation and demolition decisions in the context of Los Angeles, a city with extreme housing affordability challenges. We ask: How is Los Angeles managing preservation and demolition in the context of development pressures and extreme housing affordability challenges? Supporting this overarching research question is a series of sub-questions, including: (1) what is the policy context for the designation of local historic districts in Los Angeles? (2) do the narratives preservationists and anti-development groups use to argue for the designation of new historic districts hold up to empirical scrutiny? (3) how does the designation of local historic districts in Los Angeles either align with or contradict housing affordability goals?

We use a mixed-methods approach combining policy and media analysis to address the first two sub-questions and quantitative and GIS analysis to address the third sub-question. For the quantitative analysis, we examine City of Los Angeles building permit data on demolitions and redevelopment mapped onto local historic district boundaries and compared with buffer areas surrounding the historic districts. The period for our study is from 2013 to 2021, capturing four-year increments before and after the designation of five new local historic districts in 2017.

The context of local historic district designations during the period of the analysis is connected to two recently completed citywide initiatives which heightened the overall awareness of preservation among residents and policymakers. SurveyLA documented previously undesignated historic and cultural resources, and HistoricPlacesLA created a publicly accessible repository of the city's existing inventory of historic resources. Preservationists and local anti-development groups relied on dual narratives rooted in protecting the loss of historic resources against the processes of mansionization and overdevelopment. Preliminary findings from the spatial analysis suggest limited evidence for mansionization or overdevelopment occurring within local district boundaries before designation. This research provides a window into how historic preservation tools factor into development pressures and housing affordability challenges and offers lessons for planners and policymakers navigating these contexts.

IN SEARCH OF MISSING MIDDLE HOUSING: HISTORICAL TRENDS IN AND CONTEMPORARY CORRELATES OF SMALL MULTIFAMILY PRODUCTION.

Abstract ID: 1662

Individual Paper Submission

KUHLMANN, Daniel [University of Arizona] daniel.kuhlmann@gmail.com, presenting author
RODNYANSKY, Seva [Occidental College] srodnyansky@oxy.edu, co-author

Although still a large component of the US housing stock, production of new missing middle housing—which we define as small multifamily structures with 2 to 4 units—has been steadily declining over the last several decades. In the early 1980s, units in missing middle structures comprised around 9% of residential building permits nationally. Today, less than 2% of new building permits are for 2 to 4 units structures. In this paper, we document these trends and explore possible reasons for the current variation in new missing middle housing production. We build a national, place-level dataset combining data on building permits, current and historical census data, land use regulations, and supply characteristics. We then examine the association between three sets of community characteristics and missing middle production: supply, regulatory restrictiveness, and existing demand. We find supply and demand factors are the most consistent predictors of missing middle production. Our analysis suggests that a place's location (distance to the nearest CBD), the age of its population, the size of its existing rental housing stock, and its historical (as of the 1970 Census) share of housing units in missing middle structures are strong predictors of missing middle permitting. We end our analysis by considering how these findings can help cities that have recently passed or are currently considering zoning reforms that broadly legalize missing middle housing forms.

DEVELOPMENT FOR WHOM? SHANTYTOWN REDEVELOPMENT AND HOUSING AFFORDABILITY IN BEIJING

Abstract ID: 1663

Individual Paper Submission

WANG, Yi [University of Minnesota] wang8262@umn.edu, presenting author

Since 2008, the Shantytown Redevelopment Projects (SRPs)—a government-subsidized housing program—have been used extensively as an instrument to stimulate economic growth in Chinese cities. The SRPs, while being promoted as a welfare program that improves people's living conditions, could also lead to the decline of neighborhood housing affordability. First, the demolition of rental units in shantytowns potentially reduces the availability of affordable housing for low-income people. Shantytown rentals tend to have lower prices than other rental units in similar locations because of the tenure insecurity and the relatively deteriorated living conditions. The removal of those units may cause a significant loss in the affordable housing stock. Second, place-based investment can improve the physical environment of the neighborhood, but it can also generate higher rents. As redevelopment takes place, a general rent increase in the surrounding neighborhood is likely to happen in the absence of rent control. Low-income renters in these neighborhoods thus face the risk of being displaced.

Despite the potentially adverse impact of urban redevelopment, studies of the spillover effect of SRPs have been rare. Studies on urban redevelopment in China are mostly descriptive and very few have examined the causal linkage between urban redevelopment and housing affordability. Prior research has looked into the interplay between stakeholders, the spatiotemporal patterns of SRPs, and the association between SRP funding and average housing price in third-tier cities. Little attention has been paid to the influence of SRPs on housing affordability at the neighborhood level. What is more, none of the existing studies examine megacities, such as Beijing, where housing affordability problems are the most acute.

Using data from the real-estate brokerage Lianjia and the Beijing municipal government website, my paper contributes to the literature by answering the question: Do SRPs reduce rental affordability for the low-income population? If so, to what extent?

Data on housing affordability comes from Lianjia--the largest real estate brokerage in China which holds over 50% of the market share in Beijing. The python library "Beautiful Soup" is used to extract rental listing data in 2015, 2018, and 2021. The information collected includes the unit's geographical coordinates, monthly rent/sale price, floor area, number of rooms, year of construction, and other characteristics. The annual plans for SRPs from 2015 to 2021 are obtained from the municipal website and digitized using ArcGIS Pro. The dataset includes information on the project's location, boundaries, land area, and developer. The SRP dataset is unique and has never been used in empirical research.

I adopt the difference-in-differences (DID) approach to compare rents of nearby units before and after the announcement of an SRP, and rent trajectories for units closer to the SRP site (treatment group) with those for units further away (control group). The DID specification expresses the log monthly rent as a function of housing characteristics, locational amenities, a binary variable indicating whether the unit is located within the treatment zone, and a binary variable indicating whether the unit is listed after the SRP announcement. Instead of using a fixed distance buffer to delineate the treatment zone, local polynomial regression (LPR) will be applied to identify the treatment group and the control group. By allowing nonlinearity in the rental price gradient, LPR can demarcate the treatment zone more accurately so that the effect of SRPs can be better estimated.

The research findings will provide insights into how state-led redevelopment may shape the geography of urban poverty. If the study finds a negative spillover effect of SRPs, potential amendments to the redevelopment program should be considered to preserve the existing affordable housing stock for low-income renters.

LAND USE REGULATIONS, HOUSING SUPPLY, AND COUNTY EVICTION FILINGS

Abstract ID: 1724

Individual Paper Submission

DAWKINS, Casey [University of Maryland] dawkins1@umd.edu, presenting author

The US Supreme Court's decision to strike down the federal eviction moratorium and the expiration of state eviction moratoria both threaten to elevate eviction rates to pre-pandemic levels, yet little is known about the effectiveness of policies designed to stem the tide of evictions. A few have examined the effectiveness of state landlord-tenant laws and other policies that are targeted to those at risk of experiencing housing instability (Allen et al., 2019; Hepburn et al., 2021; Preston and Reina, 2021), but no studies have examined the impact of land use regulations and other policies that restrict the supply of affordable housing. Given Somerville and Mayer's (2003) finding that in highly regulated housing markets, existing affordable homes are more likely to filter up and become unaffordable to those earning low incomes, it stands to reason that when land use regulations restrict new housing construction in the face of rising housing demand, low-income renters will face increased competition for existing rental units, and landlords may seek to replace low-income renters with renters willing to pay higher rents.

This paper addresses this research gap and examines the impact of state landlord-tenant laws, land use regulations, and housing supply constraints on county eviction filing rates. The primary source for county evictions data is the national evictions database assembled by the Eviction Lab (Desmond et al. 2018), a data repository and research consortium led by a Matthew Desmond and a team of researchers from Princeton University. The results from ordinary least squares and random effects regression models suggest that restrictive land use regulations are positively associated with eviction filing rates, while housing supply elasticity and inclusionary zoning ordinances reduce eviction filing rates. Controls for housing supply constraints also dampen the influence of median rents on eviction filing rates. The prevalence of subsidized housing reduces county eviction filing rates, but only in ordinary least squares models that ignore county-specific random effects. I find no evidence that eviction filing rates are lower in states with pro-renter landlord-tenant laws. These findings suggest that the scope of anti-eviction advocacy efforts should expand to include an emphasis on local land use regulatory reform.

THE MUTED EFFECTS OF OPPORTUNITY ZONES ON AFFORDABLE HOUSING DEVELOPMENT

Abstract ID: 1737

Individual Paper Submission

SNIDAL, Michael [Columbia University, GSAPP] mjs2267@caa.columbia.edu, presenting author
HAUPERT, Tyler [NYU Shanghai] Tyler.haupt@nyu.edu, co-author

Established by the Tax Cuts and Jobs Act of 2017, Opportunity Zones promised to spur investment in undercapitalized communities. Early evaluations find OZ to have nominal effects on commercial real estate and business transactions. However, distressed community redevelopment has historically been driven by affordable housing. Moreover, the New Markets Tax Credit, which was also intended for business development, has become a critical source for affordable housing finance and developers can similarly leverage OZ by twinning it with the Low Income Housing Tax Credit. Has OZ spurred increased affordable housing development and why or why not? We use a difference-in-differences (DID) approach to compare low income housing tax credit project development in OZs with areas that were eligible but not designated. We find that OZ has had muted effects on LIHTC development. We interview national affordable housing experts to assess how and why the tax preference has failed in this regard. In conclusion, we outline how the incentive could be better designed to encourage affordable housing development.

CORPORATE LANDLORDS AND PANDEMIC AND PRE-PANDEMIC EVICTIONS IN LAS VEGAS

Abstract ID: 1750

Individual Paper Submission

SEYMOUR, Eric [Rutgers, The State University of New Jersey] eric.seymour@rutgers.edu, presenting author

Concern about - and research on - residential evictions has grown in recent years, particularly since the publication of Matthew Desmond's (2016) *Evicted*, and these concerns have understandably intensified during the ongoing pandemic, which has severely impaired the incomes of millions of renter households across the US. Federal, state, and local governments adopted policies to prevent evictions during the pandemic, including the Center for Disease Control and Prevention's (CDC) eviction moratorium, and Congress appropriated billions of dollars for rental assistance. Housing advocates and investigative journalists, however, reported evictions were continuing despite these protections. Large corporate landlords, in particular, were charged with filing large numbers of pandemic-period evictions, leading Congress to send letters to several corporate letters demanding explanation.

This paper addresses the question of whether specific large corporate landlords were more likely to both file for and actually evict tenants, both during the first year of the pandemic and the year immediately preceding. This work builds on pre-pandemic research finding that large and corporate landlords are more likely to file for eviction, even after adjusting for other factors (Immergluck et al., 2020; Raymond et al., 2018). Large landlords have an incentive to standardize their process for handling delinquency and automatically file for eviction. While these landlords may be responsible for a relatively large number of filings during the pandemic due to their scale, do they remain more likely to evict, or are they perhaps better equipped to obtain available rental assistance dollars?

This study examines trends in evictions and filings associated with two particular submarkets, extended-stay and single-family rentals, through an analysis of case-level data covering the Las Vegas metropolitan area. Both are rental submarkets that expanded after the Great Recession (Seymour & Akers, 2021). Through a series of multivariate analyses, I find that extended-stay properties are associated with higher eviction rates than other multifamily properties during the 12-month period immediately preceding the pandemic. Landlords operating extended-stay properties are even more likely to file and evict during the first 12-months of the pandemic. The results are mixed for single-family rentals. Corporate and other large single-family landlords are generally more likely to file and evict prior to the pandemic, but several are no more likely or even far less likely to evict compared to smaller landlords during the pandemic.

These results suggest the need for both immediate and longer-term policy interventions to reduce housing insecurity and displacement in these rental submarkets. With regard to extended-stay apartments, moratoria must be crafted to countenance the variety of actually existing rental arrangements. Despite landlords' desire to represent occupants of weekly rentals as "guests," tenants consider these places their permanent address. During the pandemic, however, there is significant variation in the filing and eviction patterns of corporate single-family landlords requiring additional study, for instance, to better understand the factors associated with rental assistance program participation in this submarket.

NON-LINEAR AND WEAKLY MONOTONIC RELATIONSHIP BETWEEN SCHOOL QUALITY AND HOUSE PRICES

Abstract ID: 1754

Individual Paper Submission

MATHUR, Shishir [San Jose State University] shishir.mathur@sjsu.edu, presenting author

Central theme/ planning issue

Many countries have adopted an attendance-area-based approach to school education. Under this approach,

households send children to designated neighborhood public schools to avail free education. This approach leads to school quality becoming a major factor in households' location choice and, in turn, to the capitalization of school quality on house prices and rents. The capitalization occurs because households try to outbid each other to locate in areas with high-quality schools. Since higher-income households can outbid lower-income ones, this approach can lead to the concentration of the latter in areas with good schools. Such household sorting could lead to educational, economic, and social inequities when left to market forces because high house prices or rents restrict children from lower-income households from accessing high-quality education. Furthermore, empirical studies have shown strong linkages between the measures of education quality and earning potential; therefore, such a household sorting could worsen economic disparities between the rich and the poor. Finally, to the extent race/ethnicity and income might be highly correlated in a region, such sorting would likely concentrate minority communities in areas with low-quality schools.

These inequities-related concerns have spawned a large body of empirical studies. While US-focused initially, the more recent studies are from other parts of the world, mainly China, as regions in that country have started employing school-attendance-zone-based policy for admissions into public schools.

Given the inequities' spatial nature and the fact that they are tied to the land, land-use-policy-related interventions might be required. Such interventions could include up-zoning in areas with high-quality schools. Indeed, empirical studies show that an inelastic housing supply increases school quality's house price premiums. Furthermore, targeted government subsidies might be needed to develop affordable housing for low-income households in areas with high-quality schools. Finally, land-use planners might need to address opposition from high-income property owners in such areas since these property owners are likely to resist up-zoning and the provision of affordable housing in their neighborhoods. However, the first step is to identify the school-quality-related house price premium.

Approach and methodology

The vast majority of empirical studies that estimate school quality's impact on house prices assume a linear relationship between the two. The few studies that account for non-linearity still assume a strong monotonic relationship, meaning that as school quality increases, so do the house prices. I advance this line of research by using Fremont, California, as the study area to explore the possibility of a non-linear and weakly monotonic relationship between school quality and house prices. For example, such a relationship might exist if house prices or rents do not increase if school quality increases from low to medium quality.

Specifically, I employ a spatial econometric modeling approach to answer the following research questions: a) Controlling for other factors, do the school quality and house prices have a weak monotonic relationship? b) Is the school quality's house price premium influenced by the interaction between the quality of different schools (elementary, middle, and high)?

Findings and relevance of work

This study provides evidence for a non-linear and weakly monotonic relationship between school quality and house prices. The regression analysis shows that homeowners are unwilling to pay a premium for an increase in school quality from low to medium quality. However, they are willing to pay a large premium when all schools are top-quality schools and for access to nationally-renowned schools, which is in addition to the premium for top-quality schools. These findings have important planning implications because they provide new insights into the homeowner's residential location choice and highlight the need to consider school quality in a jurisdiction's land use and zoning decisions.

THE ROLE OF HOUSING (DEVELOPMENT) IN ECONOMIC SEGREGATION: A NOVEL MEASUREMENT.

Abstract ID: 1775

Individual Paper Submission

SAFAROVA, Bara [University of Washington Tacoma] Bsafar@uw.edu, presenting author

Economic housing segregation has increased across metropolitan areas of the United States since the 1970, but has remained much less studied than racial segregation. Segregation based on income or wealth is legal, and due to the racial wealth gap (and other wealth gaps) can become the means for racial segregation, as well as other types residential segregation. Housing segregation has predominantly been studied with demographic data of the Census Bureau aggregated into tracts, even though scholars have criticized the boundary as arbitrary and disconnected from neighborhood conditions on the ground---which can bias analyses results. Moreover, many scholars have noted that it is the housing market and the real estate development that shape the distribution of housing prices, and by extension determine who can live where. Traditional methods of measuring housing segregation have not included many real estate and housing market factors. This study shows results from a novel approach to study economic segregation using data and spatial boundary related to housing markets, policy, and real estate development to assess their roles in economic segregation. House value data from the tax appraisal district were used as a proxy for household income. Such an approach has been tested before, but using census tracts as the spatial boundary, instead I aggregated housing data into subdivision plat boundaries. Subdivisions align with housing development practices and reflect neighborhood conditions on the ground. I calculated Entropy index scores of house value diversity across 359 subdivisions in the study area: Brownsville, TX. Using an exploratory multiple linear regression, I identified factors related to housing development and markets (such as urban growth, real estate development, planning policy, and hedonic modelling) associated with house value diversity (the inverse of segregation). Factors that showed a statistically significant relationship with house value diversity included housing production: house and subdivision size (p-value < 0.001); planning policy: lot size (p-value < 0.001), metropolitan fragmentation (p-value < 0.05); hedonic factors: school districts (p-values < 0.001 and < 0.05), adjacency to a water body (p-value < 0.05), and spatial configuration of subdivisions (p-values < 0.1 and < 0.05). The findings offer several implication for planning practice and research. I formulated several planning recommendations to increase house value diversity. For the purpose of analyzing house value diversity/segregation and its relationship with housing production, policy, urban growth, and hedonic characteristics, the benefits of using subdivision plat outweighed the limitations of the novel approach, but further development is needed, particularly in streamlining the process of subdivision delineation. With further methodological innovations, this approach could be developed to allow for cross-referencing detailed housing data with census data to provide more insights on the role of housing development practices and planning policy on various types of residential social segregation.

RENT RELIEF AND ITS IMPACT ON RENT ARREARS, DEBT, AND THE WELLBEING OF RENTERS IN PHILADELPHIA

Abstract ID: 1781

Individual Paper Submission

REINA, Vincent [University of Pennsylvania] vreina@upenn.edu, presenting author

LEE, Yeonhwa [University of Pennsylvania] yeonhwa@design.upenn.edu, co-author

The federal government has provided unprecedented support to households facing economic hardship due to the pandemic. Specifically, nearly \$46 billion was approved for states and municipalities across the country to develop rent relief programs designed to help households remain housed. In theory, these programs stabilize households during the pandemic itself as well as mitigating its long-term effects; in some cases, the programs may even outlast the pandemic and become part of an enduring housing safety net. Despite the scale and scope of these rent relief programs, there is no evidence yet on their impact on households. This paper seeks to fill this critical knowledge gap.

This paper focuses on the City of Philadelphia's initial COVID-19 Emergency Rental Assistance (CERA) Program. The paper uses data from two waves of surveys imbedded in the tenant application for rent relief. The first survey was presented to all households when they applied for assistance in May 2020, and a follow-up survey was administered eight months later in January 2021. We estimate the impact of rent relief on rent arrears, debt levels, and overall households wellbeing. Our analysis suggests that rent relief did have a positive effect on households, but that these impacts were complicated by pre-existing challenges around housing affordability.

TOWARDS COMMUNITY-LED HOUSING NEEDS ASSESSMENTS IN NORTHERN CANADA

Abstract ID: 1790

Individual Paper Submission

MCCARTNEY, Shelagh [Toronto Metropolitan University] shelagh.mccartney@ryerson.ca, presenting author

There is growing discussion of the potential for Housing Needs Assessments (HNA) to inform a more context-based approach to addressing the northern housing crisis. However, by ignoring the larger system of funding and governance, we risk undermining northern, Indigenous communities in assessing their own self determined housing needs, identifying housing priorities and ultimately ensuring the long-term sustainability of their housing plans (McCartney et al., 2018, Dorries, 2012). Using examples from across northern Canada of conventionally prepared and more innovative HNAs, we conceptualize how the elements of lived experience, intersectionality, connections to the housing ecosystem and scale of inquiry must inform the HNA process if it is to fully reflect the housing needs and priorities of northern communities (Christensen, 2017). Drawing on our respective experiences and knowledge produced through working within the constellations of housing, home, health and wellbeing, we conclude the article with a critical perspective of HNAs, their role in the use of housing as a tool of colonialism, and the ethics of conducting HNAs before advancing a conceptualization of a sustainable, community-led approach to HNAs in northern Canada. Sustainability here requires not only community leadership in HNAs, but the resources necessary to ensure the implementation of community housing plans. We suggest that such a critical reimagining of the HNA process in the North has much to contribute to the HNA process in other contexts, such as other rural or remote communities in Canada and globally.

Methodology We write this article from the perspective of housing researchers who collectively have a wide breadth and depth of experience working in the area of housing needs across northern Canada. We co-lead a pan-Canadian northern housing research partnership, At Home in the North with core objectives to reimagine HNAs to better reflect community experience in the North and provide a sustainable foundation to the development and implementation of community-led housing plans. Housing, within this partnership, is studied holistically, not merely as shelter but as a central organizing point of families' social and cultural lives. Our approach, therefore, aligns within Indigenous Planning theory which privileges community-based solutions over state-based planning and holds that Indigenous voices do not require translation; Indigenous peoples are enablers of their own communities (Hibbard & Lane, 2004; Jojola, 2013).

Findings

This article has four interrelated objectives:

- 1) To understand and share existing conceptualizations of HNAs from across Canada's North;
- 2) To describe and analyze community-based HNA projects and how they identify possibilities for contributing to change in the approach to conducting of HNAs;
- 3) To reimagine needed components of a culturally responsive Northern HNA; and,

4) To outline the role of HNAs as a tool in a colonial oppressive housing process and the ethics of requiring an HNA to access funding.

IMMIGRANT HOUSING AND CULTURAL PRACTICES AS A CHANGE FACTOR IN CURRENT DENSITY AND PRICE DISTRIBUTION OF NEW YORK

Abstract ID: 1802

Individual Paper Submission

GYAN, Kwadwo [University of Texas at Arlington] kojogyan992@gmail.com, presenting author

The metropolis of many nations is experiencing constant splintering of its districts. This splintering brings along housing and cultural diversity as well as distribution of density across the urban landscape. In most North American countries, it has been identified that these outcomes are triggered by two major forms of segregation as it is manifested on the ground: natural segregation and artificial segregation (including systemic segregation). Among three selected neighborhoods (at the suburb-Mount Vernon, the interstice -Parkchester and the city core-South Bronx) in New York City, this paper adopts the transect point analysis method to explore the formation of these two forms of segregation and how they can help us understand how the new diverse silicon-valley-like global nodes could look like. These nodes represent spaces of immigrants' livelihoods. Here, I argue that we may be presenting an inaccurate depiction of the housing density/price from the core to the periphery since immigrants' culture and housing practices could change our analysis of housing density. This could also enable us to plan the heterogenous, 'appropriately' compact and diverse smart city that could be developed bottom-up. Thus, my research question is: How does the housing practices of New York residents change our depiction of the housing density/price distribution?

EVALUATING THE ECOLOGY OF RENTAL HOUSING REGULATION IN ILLINOIS

Abstract ID: 1805

Individual Paper Submission

GREENLEE, Andrew [University of Illinois at Urbana-Champaign] agreen4@illinois.edu, presenting author

Housing code enforcement has been described as "law in action" (Ross, 1995). Within the local government context, municipal code enforcement involves decision makers operating across a highly uneven and diverse tapestry of neighborhoods and living situations (Diver, 1980). Implicit in code enforcement practices is a blending of objective

health and safety concerns with highly subjective social and cultural norms (Hartman, Kessler, and LeGates, 1974). While code enforcement activities are vital for protecting individual and collective public health, safety, and wellbeing, the potential harms caused by implicit bias and differential treatment are great (Hirsch, 1983), and the material consequences and stakes grow increasingly higher, especially as cities adopt stronger nuisance and crime-free housing ordinances (Vock, Charles, and Maciag, 2019). Understanding the potential for bias within code enforcement systems brings up two important areas of concern: uneven enforcement and uneven outcomes.

One set of concerns involves the discretion of local government code enforcement officials, who may enforce codes differently based upon the racial or socioeconomic status of tenants, landlords, or the neighborhood in which the property is located. In some cases, such differential enforcement may be desirable from an equity perspective – it may recognize and help to minimize the impacts of hardships for tenants and landlords. Conversely, such discretion may increase housing instability, eviction, and displacement. Policy evaluation can help to uncover when and where such regulatory discretion is racialized, the consequences for tenants, landlords, and government, and the ways in which such discretion addresses or exacerbates local government and neighborhood equity concerns.

The second area of immediate concern involves the contribution of code enforcement to housing instability. In the wake of the COVID-19 pandemic, public policy continues to engage ongoing concerns around housing instability, as well as the contributions of local regulations to the local eviction landscape. Landlords may turn to justifications that are supported by nuisance or code enforcement violations as opposed to non-payment of rent as a lever to remove tenants amidst a continually evolving housing crisis.

In response to these two domains of concern, we evaluate local government rental property regulation and the application of nuisance and crime-free housing ordinances to assess the extent to which discretionary enforcement increases affordability, housing stability, and access to resource-rich neighborhoods, especially for people of color. Our goal is to use evaluation methods to inform code enforcement approaches that avoid targeting based on race or income, avoid displacement, maintain affordable rental units, and provide landlords with opportunities to secure financial resources for property improvements.

In this paper, we describe a novel mixed-methods evaluation framework and present preliminary results comparing code enforcement actions and perspectives from code enforcement officers for 28 local governments in Illinois. Using a combination of quantitative analysis and documentary video interviews, we describe a highly uneven landscape made more uneven by evolving neighborhood and community concerns. The evaluation brings together code enforcement stakeholders' perspectives to contextualize local trends associated with racial segregation, housing instability, and eviction.

HOW MARKET ACTORS RESPOND TO UPZONING: QUALITATIVE EVIDENCE FROM DURHAM, NORTH CAROLINA

Abstract ID: 1835

Individual Paper Submission

JARAMILLO, Atticus [University of North Carolina at Chapel Hill] atticusa@live.unc.edu, presenting author
NGUYEN, Mai [University of California, San Diego] mainguyen@ucsd.edu, co-author

There is a planning movement underway to eliminate single family zoning and “upzone” residential neighborhoods – that is, enact zoning changes that permit the development of denser housing types such as duplexes, accessory dwelling units (ADUs), small-lot homes, and multifamily housing (Manville et al., 2020). However, only a handful of studies have examined the effects of upzoning on cities and even fewer studies have examined whether market actors (e.g., property owners, developers) respond to these upzoning in the ways that planners intended (Freemark, 2019; Kim, 2020). This is a notable gap because it is possible that market actors are driven to use upzoning changes for profit maximization, whereas planners want more affordable housing, to diversify the housing stock, and to stop gentrification pressures in vulnerable neighborhoods. Thus, this study advances the upzoning literature by addressing

the following research questions: (1) to what extent do, or do not, market actors respond to upzoning in the ways that policymakers intended? (2) what factors explain market actors' responses?

To answer these questions, we conducted semi-structured interviews with roughly 25 housing market actors in Durham, North Carolina, which recently implemented an upzoning reform to the city's unified development ordinance. Our results indicate that market actors, particularly developers and builders, are more likely to make use of upzoning reforms if they already specialized in infill development and building smaller dwellings. We also find that a variety of non-zoning city ordinances make it difficult to build dense, affordable homes under Durham's EHC initiative, such as parking and engineering requirements. Some market actors also noted that it is difficult to secure construction loans for ADUS, which is a major barrier to ADU development given the relatively high costs of building smaller dwellings. Finally, an unexpected finding of our research is that smaller building and design firms have been able to build their businesses, as the smaller-scope certain of duplex and ADUs is more manageable for these businesses.

These findings provide important insights to planning scholars and practitioners who are interested in the benefits and drawbacks of upzoning reforms. Namely, they highlight that zoning changes alone may not facilitate dense, affordable housing development, as other local ordinances (e.g., parking and engineering requirements) can create barriers to development. They also highlight that issues beyond the immediate control of planners, such as high construction costs and firm specialization, may influence whether market actors make use of upzoning as intended. These issues may make it difficult for upzoning reforms to achieve their underlying social goals, at least in the short-term.

HETEROGENEITY IN THE RECOVERY OF LOCAL REAL ESTATE MARKETS AFTER EXTREME EVENTS: THE CASE OF HURRICANE SANDY

Abstract ID: 1845

Individual Paper Submission

MELTZER, Rachel [Harvard University] rmeltzer@gsd.harvard.edu, presenting author

ELLEN, Ingrid [New York University] ingrid.ellen@nyu.edu, co-author

This paper examines the effect of Hurricane Sandy on local real estate markets in New York City. A natural disaster, like Sandy, generates two important shocks that can affect real estate markets: (i) it creates new (and often severe) physical blight and (ii) it provides new information about the risk of future damage. These shocks can manifest very differently across sub-markets, and policymakers need to understand this variation so that they can manage post-disaster recovery and plan for future events in a targeted way. Thus, we focus on heterogeneity in price recovery across neighborhoods, and conduct analyses of population shifts that help to unpack the sub-market responses. We surmise that pre-existing knowledge and beliefs about neighborhood risk and long-run expectations about a neighborhood's economic potential or quality contribute to the differences we observe. Differential access to resources for repairs may also play a role.

We rely on a combination of several longitudinal, micro-datasets on property sales transactions, property characteristics, and mortgage application activity in New York City. We overlay these data with spatial information on flood zones, to capture the perceived risk prior to Hurricane Sandy, as well as spatially detailed data on storm surge heights. Our results indicate that the prices of properties that saw high storm surges fell in the immediate aftermath of the storm. In the year after the storm, 1-3 family properties on high-surge blocks saw price declines of about 16 percent compared to properties on blocks without any storm surge. On average, values of these properties remained about 12 percent lower than pre-storm levels six years after the storm. We find that properties located on blocks in low-surge areas also saw a sustained, though more gradual, reduction in value, with property values falling to about 14 percent below pre-storm levels by 2018. Preliminary analyses of rebuilding activity suggest that any price decline is due more to new information about risk than persistent blight.

One of our core contributions is to illustrate significant differences in recovery inside and outside of official flood zones, or FEMA zones. Specifically, the prices of properties on high surge blocks located inside FEMA zones saw an

initial decline in prices but recovered quickly after the storm, perhaps because greater insurance coverage allowed for quick repairs, or perhaps because these areas were already considered risky before the storm, so the storm did not provide any additional information. Further, we see no evidence that the price discount from location in the flood zone increased after the storm. By contrast, prices of properties outside FEMA zones remained depressed six years after the storm, on both high- and low-surge blocks.

A second key contribution is our finding of differential recovery in high- and low-income neighborhoods. We find that properties in higher income neighborhoods that were hit by high storm surges experienced larger initial price shocks than those in low-income areas. Prices in higher income areas recovered over time, however, while those in lower income areas exhibited no sign of recovery and experienced further decline. Finally, the storm led to a change in the racial composition of homebuyers in low-surge areas. After the storm, homebuyers in those areas were more likely to be black and Hispanic.

BLUNT INSTRUMENTS: MUNICIPAL HOUSING BONDS CONFRONT THE AFFORDABLE HOUSING CRISIS

Abstract ID: 1846

Individual Paper Submission

TAPP, Renee [University of Illinois Chicago] ctapp@uic.edu, presenting author
WEBER, Rachel [University of Illinois Chicago] rachelw@uic.edu, co-author

Since the 2008 global financial crisis and the restructuring of housing markets, affordability has become a key challenge for cities. To respond to this crisis, municipalities and local housing financing agencies increased their housing bond issuance by 150% over the last decade, helping bump housing as a percentage of total municipal bond issuance to a 10-year high (Breckinridge Capital Advisors, 2019). However, even as cities and taxpayers committed more collateral and taxpayer funds than in recent past to solve the affordable housing crisis, there is growing concern around the use of these bonds.

These purported solutions to financing affordable housing reflect a shift in municipal planning and policy where the delivery of social goods is dependent on financial markets—or what have some have referred to as the “financialization of urban governance” (Weber, 2010). Housing bonds increasingly are issued by private actors, which are authorized under Joint Exercise of Powers Acts (Schiffrin, Contreras and Sandler, 2020). Municipal housing bonds offer institutional investors tax-free investment opportunities in rental housing markets. This creates a perverse incentive to maximize debt for the purchase of large-scale and just-under-market-rate units (see Schiffrin, Contreras and Sandler, 2020 and Tapp, 2020). Proceeds from the housing bonds frequently are used in conjunction with the federal Low Income Housing Tax Credit program, another vehicle for providing lucrative income tax deductions and benefits to investors in higher tax brackets. The LIHTC program has been criticized for being administratively inefficient, particularly because of the high transaction costs for counsel and syndicators involved. The opportunity and transaction costs associated with these forms of tax relief raise questions about whether these popular forms of finance are the best way to respond to the growing affordable housing crisis.

In this paper, we (i) analyze the overall volume of municipal bonds issued between 2010-2020, (ii) identify the volume, discount rates, interest rates, and collateral securing affordable housing bonds; (iii) evaluate the ratio of this debt vs equity in recent affordable housing construction; and (iv) identify new housing finance entities involved in debt issuance and the allocation of proceeds. To describe recent development in public housing finance this paper draws on municipal housing bond issuance data sourced from MSRB’s Electronic Municipal Market Access (EMMA) in five US cities: Atlanta, Boston, Chicago, San Francisco, and Washington DC. These geographically diverse sites illustrate a wide range of fiscal conditions—from surplus to distress—with which cities navigated to provide affordable

housing.

The findings of this paper provide planners with insight about the new financial tools used in relieving affordable housing crisis (see Kim et al., 2020). While particular affordable housing policies have been discussed in depth, scant research has examined the upstream forms debt and securities that fund those programs. Inspired by recent work on state capitalism and financialization, we explore whether funding sources influence policy choices on the ground and why certain municipalities rely more or less on debt to fund these policies and programs.

DO LOW-INCOME HOUSING TAX CREDIT (LIHTC) DEVELOPMENTS EXPAND OPPORTUNITIES? THE SPILLOVER EFFECTS OF LIHTC ON COMMUNITY RESOURCES

Abstract ID: 1924

Individual Paper Submission

WON, Jongho [Brown University] jongho_won@brown.edu, presenting author
LEE, Narae [The Pennsylvania State University] narael1@uci.edu, co-author

This study explores the relationship between the location of Low-Income Housing Tax Credit (LIHTC) developments and their access to community resources—such as facilities related to education, food, health, and social services—that are essential for residents' life chances and well-being. This study specifically focuses on whether LIHTC developments are located in neighborhoods that have better access to community resources than other neighborhoods which do not have them.

Previous studies have reported that LIHTC units are likely to be located in low-opportunity neighborhoods with substantial minority populations, high levels of poverty, weaker labor markets, and lower levels of safety and environmental quality (Ellen et al., 2018; Lens & Reina, 2016). Therefore, scholars often assume that LIHTC tenants have limited access to community resources. Although some studies explored the walkability score of subsidized housing to amenities (Koschinsky & Talen, 2016; Talen & Koschinsky, 2014), community resources still have been comparatively overlooked in terms of neighborhood opportunity; and scholars have provided evidences of the non-linear relationship between neighborhood socioeconomic status (SES) and access to resources (Small & McDermott, 2006).

At this point, a couple of important questions arise: What is the resource accessibility for LIHTC units? Is there any racial and ethnic inequality in access to resources among LIHTC tenants? What are the spillover effects of LIHTC developments on community resource distribution? To address these questions, I will measure the LIHTC units' accessibility to community resources and examine the relationship between the accessibility and diverse attributes at the tenant, neighborhood, and municipal levels by analyzing the following datasets: (1) the ReferenceUSA data; (2) U.S. Census Bureau data; and (3) the LIHTC database from the U.S. Department of Housing and Urban Development. This study specifically utilizes multilevel regression and propensity score method to explore the community resource distribution and the spillover effects of LIHTC developments on the fate of community resources. In general, the results suggest the unequal access to community resources based on neighborhood contexts. Moreover, LIHTC developments, especially located in high-SES municipality, increase the number of community resources.

This research will make contributions to diverse disciplines, including public health, urban planning, geography, and sociology. First, this study employs the urban political economy perspective to explore how local authorities bring about disparities in resource accessibility across space. Second, this study reassesses the concept of neighborhood opportunity by investigating the relationship between the accessibility of community resources and the traditional

SES indicators. This project, therefore, facilitates an advancement in measuring resource accessibility by applying spatial clustering as well as providing an essential base for future studies that examine the role of the built and social environment on individuals and neighborhoods.

ARE SUSTAINABLE AND AFFORDABLE MUTUALLY EXCLUSIVE? A CASE STUDY OF A ZERO NET ENERGY AFFORDABLE HOUSING PROJECT FOR FARMWORKERS IN WOODLAND, CALIFORNIA

Abstract ID: 1931

Individual Paper Submission

NEVAREZ MARTINEZ, Deyanira [Michigan State University] nevarez1@msu.edu, presenting author

In the United States there is a longstanding relationship between environmentalism and inequality. Too often those most affected are the poor and dispossessed. Environmental policy remains the domain of those who can afford the luxury of entertaining such concerns. This is especially true as the climate crisis begins to intersect with other public health and social crises like the COVID-19 pandemic and the global housing crisis.

Effective public policy concerning sustainability requires that those most vulnerable to the devastating effects of climate change are as protected as the privileged elite – environmental justice. This requires a mandate that local, state, and federal government protect the poor with the same rigor and resources as the elite. Environmental justice is increasingly important in all aspects of public policy but especially in housing. A prime example of a population that is vulnerable in this respect are immigrant farmworkers. The advocacy group Farmworker Justice has identified substandard and poor-quality housing as a major determinant of poor health for this community (Farmworker Justice, Issue Brief: Farmworker Housing Quality and Health, 2014), it makes sense then that because this population is concerned about having access to housing at all, that sustainability is not a priority. California is home to almost a third of the country's 2.4 million farmworkers (Farmworker Justice, 2021). These workers have been at the frontline of climate change and the COVID-19 pandemic and have continued to feed the country while being disproportionately adversely affected by the virus. UC Berkeley researchers found that 13% of study participants tested positive for COVID-19 as compared to 5% of the general population (Mora et al., 2021). As the COVID-19 pandemic continues and farmworkers struggle to find affordable housing, overcrowded dwellings have become COVID-19 clusters that severely affect the community. This exacerbates difficulties the community has accessing the housing services bureaucracy due to language barriers, fear of deportation, and migratory labor patterns that often hide housing precarity in plain sight (Adams and Simonsen-Meehan, 2013). Consequently, it is important to look for models that help this vulnerable community access affordable, safe, sanitary, and sustainable housing.

In 2015, the community of Woodland, California opened the Mutual Housing at Spring Lake (MHSL) development (PD & R Edge, An Online Magazine, n.d.). This development is a Zero Net Energy Affordable Housing development for farmworkers in the city. According to the project's page on PD & R's Edge Online Magazine, "[b]efore starting MHSL's design and construction, developer Mutual Housing California, an organization guided by principles of sustainable housing and resident engagement, surveyed its agricultural workers. The respondents indicated that rent and utility costs were their primary housing concerns, and the developer made addressing these concerns a priority in planning MHSL" (PD & R Edge, An Online Magazine, n.d.). With this in mind, the development was designed with a 209-kilowatt photovoltaic power system that greatly lowers the demand for energy and consequently reduces energy costs. This study delves into the MHSL case study and analyzes public engagement, design and outcomes in order to determine if this is a viable model for others to follow in their quest to advance both housing justice and sustainability in farmworking rural communities in California and potentially nationwide. Data collection includes analysis of newspaper articles, city planning documents, electronically available city council meeting minutes and agendas and interviews with subject matter experts (SME) like city planners and other government and elected officials.

WHEN IS STAYING NO LONGER AN OPTION? AN ANALYSIS OF SEQUENTIAL RESIDENTIAL MOVES IN THE NORTHERN CALIFORNIA MEGAREGION

Abstract ID: 1949

Individual Paper Submission

COMANDON, Andre [University of Southern California] comandon@usc.edu, presenting author

RODNYANSKY, Seva [Occidental College] srodnyansky@oxy.edu, co-author

BOARNET, Marlon [University of Southern California] boarnet@usc.edu, co-author

WANG, Bonnie [University of Southern California] wangbonn@usc.edu, co-author

Lower income people's ability to change home is highly constrained. The high cost of moving and lack of affordable alternatives can lead to people staying in their residence longer than they would, foregoing better opportunities and paying an increasing share of their income toward housing. When they do move, lower income people tend to locate in more disadvantaged locations, especially when the move is involuntary (Baker et al., 2016; DeLuca et al., 2019). People of all income tend to stay within the same type of neighborhood, contributing to the persistence of segregation and urban inequality (Greenlee, 2019).

This line of research has been limited by the lack of high quality data to examine people's entire moving history. We use tax records for all filers in the Northern California megaregion between 1994 and 2015 to analyze the relationship between income, frequency of moves, and the sequence of move. The Northern California megaregion, which includes the Bay Area and adjacent Central Valley, is one of the most expensive housing markets in the nation. It is also a divided region with home prices in the Central Valley between 2 to 3 times lower than in the Bay Area. Indirect evidence suggests that many lower income households and people of color move to the Central Valley, away from the main economic centers in the Bay Area in search of lower housing cost (Schaffran, 2018).

Our data includes all filers that at any point in the in the 20 year period filed income taxes within the region. We assigned the 135 million individual records to the 2010 Census Zip Code Tabulation Area geography to link the tax data to Census data from 1990, 2000, and ACS 2009-2015. We use the Census data to create an index of Zip Code socioeconomic status based on a ranking of all Zip Codes within the region. The analysis focuses on two aspects of people's move history. First, we examine whether lower income households move more frequently and how their income changes with each move. Second, we examine the progression of Zip Codes after each move and whether moves are between Zip Code of similar, worse, or better socioeconomic status.

We identify distinct trajectories. Many movers remain local, moving to adjacent or close to adjacent Zip Codes. This is irrespective of the trajectory of the Zip Code. Places that have gentrified like the Mission District in San Francisco and Central Oakland show patterns similar to more suburban areas at the edges of the Bay Area. Another group of movers has followed a trajectory that takes them further from their point of origin, usually ending up in areas with lower accessibility to the rest of the region. In both cases, there is substantial heterogeneity in income and neighborhood trajectory, suggesting that decisions are highly individualized. The results show that residential mobility and, likely, displacement often play out over the longer term and multiple moves.

REPURPOSING EVICTIONS DATA TO EMPOWER TENANTS: COUNTER-DATA ACTION DURING COVID19

Abstract ID: 1950

Individual Paper Submission

CONVILLE, Megan [Georgia Institute of Technology] megan.conville@gatech.edu, presenting author
 RAYMOND, Elora [Georgia Institute of Technology] elora.raymond@gatech.edu, primary author

Evictions data are comprised of administrative datasets created by civil courts system to document legal processes. These data are obtained and compiled by data brokers such as CoreLogic and Lexis Nexis, packaged into proprietary tenant rating algorithms, and routinely used to screen tenants out of housing, create risk-based-pricing fees, and to segment tenants into submarkets where substandard maintenance, high housing instability, and high rents are commonplace (Fields, 2019; McElroy & Vergerio, 2022; Teresa & Howell, 2021). These proprietary datasets have also been purchased by social scientists, and used to produce research on evictions; or to guide policy at the national level. While laudable, these efforts do not unsettle the political economy of evictions data, which is produced by the state courts system, then sold by the private data firms to surveil, price, and penalize tenants.

In 2020, in this participatory action research project, we sought to create an evictions dataset in conjunction with tenant organizers which would empower tenants facing eviction during the pandemic (D'Ignazio & Klein, 2020; Meng & DiSalvo, 2018; Smith, 2021). As founding members of the Southeastern Evictions Data Collaborative, we created an evictions data tool to scrape evictions data from county courts of three Georgia urban regions. Our goal was to create a data tool that could empower tenants and legal aid organizations. We used the high frequency of the dataset, spatial granularity and specificity of case-event information to support a multitude of local interventions to communicate to, and mobilize tenants facing eviction.

In one intervention, we encouraged tenant answers to help households stay in place. Unlike many states, Georgia did not have an evictions moratoria. Eviction filings remained high throughout the pandemic. However, during the summer of 2020, hearings were suspended for several months. While courts continued to accept filings and issue default judgments, any tenant who filed an answer secured the right to a hearing, effectively securing the legal right to stay in place until courts resumed hearings. Our team helped design an intervention to mobilize tenants and encourage households facing eviction to file answers. We worked alongside local tenants' organizers, Housing Justice League, to identify buildings with high numbers of tenants facing eviction for canvassing.

In this research, we describe the creation of an eviction data tool in conjunction with local government, tenants' organizers, and legal aid groups, and describe the frictions, challenges, and negotiations of resituating courts data as a tool to preserve access to shelter. We also evaluate the effectiveness of one intervention using a regression analysis, and calculate that the answer rate among tenants living in buildings which were canvassed was 7% higher than buildings which were listed but not canvassed. These findings show promising impacts of planners working in participatory research to mobilize tenants and empower community organizations.

HOUSING MARKET DYNAMICS AFTER HURRICANE SANDY

Abstract ID: 1965

Individual Paper Submission

HAUPERT, Tyler [NYU Shanghai] Tyler.haupt@nyu.edu, presenting author

CHUN, Yung [Washington University in Saint Louis] yungchun@wustl.edu, primary author

FOX-DICHTER, Sophia [Washington University in Saint Louis] sophiafox-dichter@wustl.edu, co-author

Accurately measuring the impact of hurricanes on housing dynamics is of great importance to planners and policymakers seeking to effectively distribute scarce post-disaster resources. A deep body of research assesses the impact of natural disasters on residential real estate prices, yielding mixed results. Studies of Hurricanes Andrew (Hallstrom et al 2004) and Floyd (Bin et al 2013) find short-term decreases in post-disaster housing values. In contrast, studies of Hurricanes Katrina (Vigdor 2008) and Andrew (Zhang & Peacock 2009) find evidence of post-storm increases in home values, especially among owner-occupied homes and those adjacent to damaged properties but not themselves damaged.

Hurricane Sandy, which struck New York City in October, 2012, brought severe damage to each of the city's five boroughs. The storm's impact was most acute in low-lying coastal areas, where over 90,000 buildings were in the storm's inundation zone (City of New York 2013). Resulting damage to residential real estate was significant. A scholarly consensus has not yet been reached regarding Hurricane Sandy's impact on storm-impacted housing values in New York City. Evidence that the storm led to short term decreases in values for properties with minor storm-related damage and more durable value decreases for those with major damage (Ortega & Taspinar 2018) and caused decreases in property values for homes that were undamaged but near flooded areas (Cohen et al. 2021) exists alongside seemingly contradictory findings suggesting Sandy spurred gentrification in affected areas (Chun 2015).

The present study brings additional evidence and methodological innovations to bear on this limited body of work. Over a time frame beginning four years prior to and ending seven years after Hurricane Sandy, we compare values in Brooklyn and Queens for properties in zip codes directly hit by a surge (surged), those adjacent to areas hit by a surge (near surged), and, due to the possibility that the surged group had spillover effects on the near surged group, we also assess all other non-surged zip codes. We use New York City microdata to estimate an Ordinary Least Squares (OLS) regression that measures average effects across each group of zip codes, and a hedonic model that is geographically weighted to account for spatial autocorrelation and is designed to detect more localized housing price differences.

Findings suggest that, overall, property values in Brooklyn and Queens increased dramatically in the years following Hurricane Sandy, regardless of whether a property was subject to, near, or un-impacted by the Hurricane's storm surge. However disaggregating neighborhoods by whether they are oriented toward the Atlantic Ocean or the East River reveals significant heterogeneity in the recovery of property values. These results suggest that aggregate findings from past studies may mask significant heterogeneity in value recovery across properties and neighborhoods in different sections of impacted cities. Future research focused on disasters' impacts on property values should take a geographically nuanced approach to measurement to ensure these patterns are observed, and can, in turn, inform policymakers in the development of more accurate and equitable response plans.

A HOUSING LADDER THAT HAS NO RUNGS: AN INVESTIGATION OF YOUTH TO ADULT PATHWAYS OF HOMELESSNESS IN CENTRAL IOWA

Abstract ID: 1966

Individual Paper Submission

RONGERUDE, Jane [Iowa State University] jrong@iastate.edu, presenting author

STOVER-WRIGHT, Ehren [Institute for Community Alliances] ehren.wright@icalliances.org, co-author

This study investigates the pathways of homelessness for individuals who experienced episodic family homelessness as a child and then later as an adult head of household. It builds from the understanding of homelessness as a structural problem where individuals and families have inadequate income to support stable housing within existing housing markets. While existing literature has demonstrated that residential instability and prior shelter use are strong predictors of future homelessness, we know little about how these factors play out within the specific experience of child to adult homelessness or the context of central Iowa.

The existing literature regarding homelessness provides few answers as to why some individuals who are homeless as children go on to become homeless again as adults with children of their own. We want to know what makes this homelessness pathway unique. The Housing Management Information System (HMIS) for the state of Iowa has more than 15 years of data from homeless individuals who have entered into the state's homelessness system. When data analysis failed to produce meaningful insights to this question, the team turned to qualitative inquiry for answers. For the study sample, our team identified female and non-binary individuals at least 25 years of age who were in the HMIS system as children and then were in the system again at a later date as head of household. The sample is divided in half between white and Black households.

For this study, the research team conducted and analyzed 10 semi-structured, in-depth interviews. The interview protocol used a timeline technique that focused on the housing histories and institutional experiences of the research participants over time. The research approach is inductive and phenomenological, investigating what the experience of homelessness means to the individuals experiencing it. By focusing on the daily lived experiences of these individuals over time, we were able to learn more about their interactions with systems that both assisted and created barriers as they struggled to stay housed. This research provided a richly detailed accounting of the pathways of homelessness for individuals who move across time from an unhoused child to a housing insecure adult. This paper identifies the shared themes and institutional experiences of participants in this study, ending with a discussion of the policy implications for planners and local governments.

WAIWAI HO'OPA'A: LEARNING FROM THE PAST TO INFORM THE HOUSING CRISIS

Abstract ID: 1970

Individual Paper Submission

MILLER, James [Western Washington University] james.miller@wwu.edu, presenting author

As the County of Hawai'i continues to recover from the 2018 Kilauea eruption and the Covid-19 Pandemic, complex issues concerning housing and food security have been highlighted. Through community-based research in collaboration with local nonprofits in the county and government staff, this project supports efforts to address pressing community development needs in Puna. The project discussed here focuses on the *ahu'pua'a* and *kauhale*, which are reflective of Indigenous intelligence in planning sustainable communities.

Indigenous intelligence in the production of the built environment represents generative codes. These systems provide an alternate epistemology to learn from in order to find solutions to our contemporary affordable housing crisis. To date, the *kauhale* system has been implemented as a culturally appropriate way to address the houseless issue in Hawai'i, showing promise in providing affordable housing. Yet, regulatory frameworks based on continental planning models of the United States hinder the expansion of Indigenous intelligence in the built-environment to meet the needs of low to middle income families that do not meet the requirements for public subsidized housing. While the research project focuses on the development of a *kauhale* housing model based on Moana epistemologies, it provides recommendations to address regulatory roadblocks of the settler colonial state, such as financing, construction processes, and building equity.

The research analyzes existing housing typologies and coinciding land uses, through a transect study of the Puna district of Hawai'i county. Dwelling is analyzed at the family scale, which is inclusive of multi-generational housing and nontraditional household structures; dwelling also takes into consideration the full scale of everyday activities and resource-use beyond the conventional single-family-home, land parcel. The field methods include the documentation of housing by typology, the documentation of agroforestry and agricultural uses at the family scale, household interviews, and a follow up survey. Kanaka 'Ōiwi organization, Ho'oulu Lahui and Vibrant Hawai'i are assisting in the identification of community participants in the research that provide a cross-section of Puna. Multi-layered mapping analysis will then be used to understand the spatial relationships of housing typologies and household-based land use to better understand their occurrences in relationship to land use and building regulations.

Framing housing as a land-based practice, the goal of the project is to emphasize Kanaka 'Ōiwi epistemologies within resilience frameworks that contribute to the recovery while addressing the contemporary housing crisis. Two projected outputs for the community-based research project are the development of educational material that translates complex planning issues into accessible information for residents and the development of a Kauhale toolkit that draws from millennia of Indigenous intelligence and takes in consideration the needs and preferences of a culturally diverse community, inevitably weaving Indigenous knowledge and technological advances in the built-environment disciplines. The toolkit will support the current code under review for the state legislature to allow for this type of development. The structure of a Kauhale development regulation allows for many smaller units to be developed on parcels, including structures that provide amenities such as meeting rooms, laundry facilities, health clinic, commercial 'imu, and more. The Kauhale model provides a promising response to the 15 minute village, but based on place-based knowledge of the environment that is integrated within ecologically sustainable principles of Waiwai (abundance).

MEXICAN HOUSING STOCK: UNDERUTILIZED?

Abstract ID: 1973

Individual Paper Submission

DEMÉRUTIS, Juan [University of Guadalajara] juan.demerutis@cuaad.udg.mx, presenting author
ALVAREZ, Luis [University of Guadalajara] luis.alvarez@cuaad.udg.mx, co-author

Among the multiple problems of housing in Mexico, there is a paradox that is morally unavoidable due to its social effects. Despite having the highest production of housing in the last 20 years, the housing deficit is not solved and yet the forms of expression of housing needs have diversified. It is a condition of staggering production in the market of low-income housing that leads to the paradox of having increasing housing needs, while having strong surpluses.

In this sense, the underutilization of housing is a current problem preceded by old cultural, cyclical practices and new demographic trends, as well as the intense Federal Housing Policy of the first decade of this century. The underutilization is observed in: large dwelling houses that have decreased their average of inhabitants, which at the national level maintain a downward trend of an average of 4.4 (INEGI 2000) occupants by housing units to 3.6 (INEGI 2020) occupants by housing units. Of the 41.6 million homes in the country, 19.2% are abandoned (INFONAVIT 2019), that is, 8.2 million homes (INEGI 2020).

However, in its origin the problem is more complex, since both underutilization and abandonment respond to multiple causes. In this paper these causes are traced in order to explain the phenomenon: the demographic cycles of both aging and the formation of new households; more cost-effective land-use pressures; the dynamics of social deterioration in some neighborhoods. Empty houses are usually linked to the poor functionality of remote urbanizations; financial problems linked to the unstable economy; problems of insecurity; problems of abandonment

of urbanizations in process; invasions; and legal problems.

As a result, there is a high population loss in central municipalities in tandem with the fact that cities with more houses built with federal housing funding are experiencing higher vacancy rates (Monkkonen 2019).

The problem is concentrated in metropolitan areas where population agglomerates. The metropolitan dynamics of housing markets do not recognize municipal borders, therefore in these conglomerates, the incipient municipal actions in the housing sector have immediate effects on neighboring territories, where they hold a fierce competition.

In this paper we attempt to characterize the low-income housing underutilization in metropolitan Mexico by conducting an analysis of Metropolitan Guadalajara, Mexico in both central and peripheral neighborhoods. In the analysis key stakeholders are interviewed in order to identify social, institutional, entrepreneurial and academic dynamics, as well as their perceived ways to solve the problem.

The paper concludes with recommendations for policy making for metropolitan areas involving stakeholders at the municipal, state and federal levels.

ADMINISTRATIVE BURDENS IN EMERGENCY RENTAL ASSISTANCE PROGRAMS

Abstract ID: 1974

Individual Paper Submission

AIKEN, Claudia [University of Pennsylvania] claudf@design.upenn.edu, presenting author

ELLEN, Ingrid [New York University] ingrid.ellen@nyu.edu, co-author

REINA, Vincent [University of Pennsylvania] vreina@upenn.edu, co-author

Since the onset of the COVID-19 pandemic, localities across the United States have been given unprecedented amounts of rental assistance funding for their residents and considerable flexibility in these funds' distribution. Emergency rental assistance (ERA) programs have varied widely in terms of how they conduct outreach, how tenants or landlords apply, the form the assistance takes, and to whom it is ultimately provided. The emergency nature of these programs—which are rendered urgent by the risk that unassisted tenants will be evicted during a pandemic—as well as the shallowness and temporary nature of the subsidy suggest that the administrative burden placed on participants should be lower than it is in typical housing programs such as the Housing Choice Voucher program. Yet ERA programs still face the “double take-up challenge” characteristic of programs designed to assist renters; they must engage both tenants and landlords. In addition, many ERA program regulators and administrators only have prior experience with non-emergency rental assistance, including vouchers, and may face challenges adjusting to a less burdensome model or accepting a higher risk of fraud.

This paper uses results from a national survey of over 200 ERA programs, as well as 15 case studies representing a broad cross section of ERA programs, to identify common sources of administrative burden for both tenants and landlords and to explore how these burdens relate to program outcomes, such as incomplete applications and landlord non-participation. The effects of federal funding guidelines and national and local eviction moratoria on the allocation of administrative burden in ERA programs are considered. We then use Census and publicly available administrative data to examine whether variation in administrative burden across jurisdictions correlates with political context, racial segregation or composition, the presence of immigrants, and jurisdiction size and governmental capacity. We pay special attention to the relationship between tenant and landlord administrative burdens, and how increased burdens on one party may increase or decrease burdens for the other. Finally, drawing on case study interviews with program administrators, we discuss strategies to alleviate administrative burdens on tenants and landlords without unduly heightening the risk of fraud.

In studying the sources of ERA programs' administrative burden, its consequences, and its drivers, this paper

provides information of immediate value to policymakers at the local and state levels as they continue to disburse federal rent relief funds. It also informs federal policymakers who must set parameters for future funding. More broadly, it takes advantage of a vast national experiment in the provision of rental assistance programs to shed light on how policymakers can increase equitable participation in housing programs by managing the burdens they place on both tenants and landlords.

DE TOLEDO BASILE, Patricia [Indiana University Bloomington] pdetoled@iu.edu, presenting author
REYES, Alejandra [University of California, Irvine] lreyesru@uci.edu, co-author

The appropriation of the housing sector by global finance has transformed housing policies worldwide while leading to new opportunities for capital accumulation. Market-based housing finance models have become increasingly prevalent in both the Global North and Global South. These models have promoted mortgage and household debt, the commodification of housing, and the liberalization of credit, as well as the socialization of its costs. In several Global South countries, this approach to housing production at a mass-scale has resulted in poor-quality housing in peri-urban locations with inadequate access to infrastructure, services, and other basic needs for low-income residents. Such policies have also excluded the lowest-income households unable to access credit. At the same time, and despite adversity, civil society organizations, as well as social movements, have worked within such contexts to address and challenge some of their consequences on the ground and advocate for housing rights. This study comparatively examines the repertoires of collective action and narratives of such civic and housing struggles and mobilizations in Mexico and Brazil in the face of varied housing financialization processes. In both countries, national housing policies have adhered to financial models to boost market-led growth and private means of housing production. Initial findings include discussions about critical differences and commonalities between the two countries and a reflection on the scope, scale, outcomes, significance, and limitations of housing mobilizations in the wake of financialized policies and processes. The accomplishments and constraints of housing movements and grassroots mobilization provide important lessons about the current state of urban change politics in the age of financialization.

FINANCIALIZING AUSTIN: TRACKING THE ROLE OF INSTITUTIONAL INVESTORS IN THE RENTAL HOUSING MARKET

Abstract ID: 1982

Individual Paper Submission

AZHAR, Awais [University of Texas at Austin] awais.azhar@utexas.edu, presenting author

Considering the growing financialization of the multifamily rental housing market in the United States and globally, it is critical to fully understand the scale of financialization and develop research methods that can help assess this phenomenon (Fields, 2017; Fields & Uffer, 2016; Wijburg, Aalbers & Heeg, 2018). There is limited research that explores financialization in the Southern and Southwestern United States, particularly in the market-affordable, multifamily rental market (Chilton, Silverman, Chaudhry, & Wang, 2018; Raymond, Miller, McKinney & Braun, 2021). Research in these parts of the country is critical to understand the full scale of financialization in the non-coastal United States and the geographic areas where this is occurring. It is key to assess this in cities such as Austin, where affordable housing regulatory tools like rent control, inclusionary zoning, and linkage fees are illegal due to laws created by the State of Texas. At the same time, defining and assessing the scale of the financialization of the multifamily housing market and its link to neighborhood characteristics poses specific issues with tracking the activities of institutionalized companies and investors within these contexts.

To address this issue, this paper presents an approach to identifying properties within the multifamily rental housing market in Austin that are under the ownership of institutional investors. This information is further combined with demographic and neighborhood-level data to present a full picture of the scale and geographies of financialization in the city. To achieve this, ownership data from the Travis County Appraisal District (TCAD) is combined with market data from Austin Investor Interests, a firm providing local data to investors, brokers, and other real estate professionals. Any gaps in information on ownership are filled with data from the Texas Secretary of State corporate filings and data from the Texas Public Utilities Commission. Information on ownership is then used to identify connections with investment firms and umbrella corporations, focusing on investors with multiple holdings and the ability of institutional landlords to access capital. This list of financialized multifamily rental housing properties in Austin is analyzed within the context of neighborhood characteristics, including demographics, susceptibility to gentrification, and income characteristics. The research highlights the prevalence of financialized investments in the multifamily rental housing market in Austin, linking it to areas facing rapid market growth and gentrification. This research lays out pathways for other communities to make similar assessments of the scale of financialized investments in their jurisdictions, particularly where publicly available ownership data is limited. Most importantly, this research is key to understanding the prevalence of the financialization of multifamily housing in Austin and the Southwestern United States more generally, as well as the demographic and social context in which this is occurring.

THE IMPACT OF LIVED EXPERIENCE ADVISORY GROUPS

Abstract ID: 2025

Individual Paper Submission

COOK, Taylor [University of Texas at Austin] taylormcook@utexas.edu, presenting author

In the last several years cities throughout North America have struggled with increasing levels of housing instability and homelessness. Some municipalities and programs have experimented with participatory methods, including methods borrowed from social sciences and service design, with people with lived experience of homelessness to help plan, design, guide, and evaluate projects (Hatch, 2014). These initiatives are typically motivated by a desire to improve services and programs by collaborating with people who have firsthand knowledge and experience (Norman et al, 2015). I propose that the actual impacts and benefits extend beyond direct program improvement by providing significant benefits for the participants themselves and building deep empathy that improves practice (Forester, 2021).

Since 2017, Austin's Downtown Community Court, a diversion court created to handle misdemeanor offenses that frequently are co-occurring with homelessness, has managed the Austin Homeless Advisory Committee (AHAC) to inform its operations and provide input on other projects throughout the City. As one of the initial organizers of this

advisory group I use reflection and hermeneutics, interviews with past and current City staff, and participatory research with the Advisory Group to understand the impact that AHAC has had for the City of Austin, staff, and advisory group members. This impact is theorized in four areas: shaping policy, as originally intended; mutual aid and support between members, an effect that emerged early in the program; improving the member's long-term housing stability; and embedding a reservoir of empathy and kindness within the City and which improves judgment.

I argue that these impacts come, broadly, from improvements in the advisory committee member's social capital which is a product specifically of building and participating in a supportive community, regularly engaging with program administrators, especially during the pandemic when the risk of isolation and alienation were high, and participants building a network of service providers and City employees who they can access and mobilize to their aid when needed. There are also enduring positive impacts for City staff to develop deep empathy and kindness which can then be applied in practice to improve programmatic judgment and sometimes bridge the marginalization and stigmatization that people experiencing homelessness often encounter in City services.

As a result of these benefits, I recommend that: 1) communities and programs consider ways to support the development or expansion of participatory advisory groups for their direct benefits to the City and the participants; 2) Cities and service providers invest in experimental projects that seek to build social capital for people experience or formerly homeless as a means to improve their long-term housing stability and outcomes; 3) Programs and staff who are not involved in direct service seek out and create opportunities to work with the populations they serve to improve their programmatic instincts and practice kindness in their planning activities.

THE DISCUSSION ON MISSING MIDDLE: IS IT REALLY WHAT WE NEED IN TORONTO FOR AFFORDABILITY?

Abstract ID: 2034

Individual Paper Submission

UCOGLU, Murat [York University] muratuc@yorku.ca, presenting author

The ongoing housing crisis in Toronto has become a significant case that everyone including politicians and the construction industry acknowledges existence. Even though the ongoing crisis has a severe impact on the socio-economic life in Toronto, there is still no proper policy choice that would reverse this process. The discussion is often linked to the problem of supply as many politicians and industry people argue that there is not enough housing inventory to cool down the prices (Üçoğlu, Keil and Tomar, 2021). In this context, a debate of what is coined the missing middle has emerged (Missingmiddlehousing, 2019), where the focus is on planning and zoning restrictions of the city within single-family home zoned areas. Meslin (2019), for instance, argues that historically Toronto has chosen to be a city of predominantly single-family homes and has disregarded the importance of apartments to create an affordable city. While between the 1960s and 1980s policies were pushed forward to build high-rise apartment towers along major traffic lines, complementing the single-family home zoned areas in the rest of the city, advocates of the missing middle argue that in order to overcome the current housing crisis, one needs to convert existing single-family homes into 2-4 story townhouses in areas where it is zoned for single-family home use (Bozikovic et al., 2019).

In a similar vein, Lorinc (2019) argues that the ongoing affordability crisis is due to the restrictive zoning policy where in many neighborhoods zoning allows the construction of only low-rise detached and semi-detached houses, which, he argues, has a direct impact on the housing supply. Instead, he suggests, there needs to be a new option in form of townhouses as this planning based on 2-4 story middle size housing would increase the supply while keeping the neighborhood landscape intact. Most recently, the provincial and federal governments came forward with policies to increase the supply of housing in order to alleviate the housing crisis.

In this presentation, I take a different position and argue that increasing supply would not be the key antidote to creating an affordable housing system in Toronto. In contrast to the advocates of the missing middle who support the market-oriented approach, claiming that more supply will decrease the housing prices, I see the neo-classical model,

which is based on the assumption to reach market equilibrium through an ideal supply-demand relation, as failing. In fact, housing is a unique type of product and even though the market finds an equilibrium, that equilibrium can still be unaffordable. For that reason, the discussions on the missing middle are still not able to find a proper response to the affordability crisis. At the same time, it is also important to point out that the construction of more high-rise condominium buildings will not bring affordability to the city. Therefore, based on this discussion I will seek to answer the following: 1) How to evaluate the discussion missing middle vis-à-vis the supply-demand restrictions. 2) Are 2-4 storey townhouses what we need in Toronto to create an affordable and inclusive housing system? 3) What kind of planning do we need to provide affordability while absorbing more middle-size and mid-rise housing models?

This work is based on a careful reading of the literature on densification and affordability, and in particular on the debate around the missing middle. I also will integrate the most recent policy documents that were put forward by both the provincial and the federal governments in order to address the affordability crisis. I will choose a case study in Toronto (the Danforth neighborhood), where I will conduct interviews with stakeholders in regard to the questions above.

MEJIA, Matthew [University of Texas] msamejia@utexas.edu, co-author

Until recently, little attention has focused on the conditions facing low-income renters unable to access housing assistance programs. Yet most low-income people live in unsubsidized rental housing that is affordable to them due to poor conditions or poor location rather than through access to a public program or subsidy. In many places, prior to the pandemic, residents were also easily evicted. The pandemic has highlighted the importance of both housing conditions and housing stability to the lives of low-income renters. Yet existing evidence on conditions, available through the US Census, continues to underemphasize the prevalence of poor conditions. And data being collected by local advocates for residents facing eviction, in addition to the US Census Bureau's Pulse data, suggest that the threat to housing stability posed by evictions is also widespread among low-income renters. In this paper we examine the prevalence and location of housing with conditions posing threats to health, and of evictions. Our central research question is: How are poor conditions and threats to stability facing unprotected low-income renters related to gentrification-induced displacement pressures? We hypothesize that in neighborhoods most vulnerable to such pressures (defined in previous research), owners of class c properties have little incentive to address such conditions and—when the time is right—will use evictions as a tool in repositioning buildings for higher rent market segments. Using locally collected data on eviction filings and proprietary data on building ownership and sales we will identify and describe the relationship between eviction filings, gentrification pressures and building ownership (by identifying high evictors and also by identifying the type of owners more likely to file evictions, especially in gentrifying areas). We will then overlay these data on information on housing related health problems, such as asthma. Since information on the incidence of asthma is only available in aggregate spatial form (census tract level), we will supplement this with information on the location of code violations related to asthma-inducing conditions. Together, our results will allow to describe the incidence of poor conditions and evictions in such properties/neighborhoods, and assess relationships between these factors and location in a neighborhood identified as in the process of gentrification.

jj.corcoran@uq.edu.au, co-author

Short-term rental (STR) has experienced remarkable global growth over the past decade given the rapid diffusion of the platform-based, on-demand sharing economy. In Australia, STR has emerged as a popular casual rental housing option for recreational, business, and social purposes. In the urban planning community, concerns over the unregulated growth of STR are often tied to (1) the substitution effect of STR on the long-term rental (LTR) sector (Gurran and Phibbs, 2017), and (2) transactional gentrification through real estate investment into STR (Sigler & Wachsmuth, 2020). Empirical evidence from the U.S. and Canada confirms that STR, during the early rapid market expansion phase, imposes significant pressure on rent, housing prices, and housing stock, especially in major tourist cities (Wachsmuth & Weisler, 2018; Zou, 2020). Covid-19 imposed an unprecedented impact on STR with a severe decline in bookings – a situation that has begun to shift in more recent months as countries begin to relax domestic and international travel restrictions.

In this study, we examine the STR market in Australia over a 5-year period (2015 to 2020) placing a particular focus on two cities in the state of Queensland, Brisbane and Sunshine Coast. Brisbane is both a major tourist city and a regional economic/activity center, and Sunshine Coast is a major coastal tourist destination. The two areas’ STR growth over time and space can be seen as a snapshot of STR’s unregulated growth in Australia. We are particularly interested in two perspectives: (1) the trend of professionalization in the Australian STR market, which is reflected by an increasing share of active listings, a growing reservation rate among active listings, and a steady revenue stream for professional hosts; and (2) the potential spillover effect of professionalized STR on the LTR housing market.

We apply an empirical framework in this study to examine monthly bookings from the largest global STR platform, Airbnb. The time trends of professional Airbnb listings, reservation growth rate, and average revenue growth are measured, along with the strong seasonal trend and heterogeneities among different listing and property types. Through averaging the reservation intensity and weekly revenue for professional STR listings at the postal code level and performing a spatial comparison to LTR transaction intensities and median rent level, we explore the potential interactions between the two rental markets, such as spatial (dis)similarities in locational choices, and make inferences on the intensifying competition between STR and LTR at desirable locations for both markets.

Initial findings reveal that, while the Australian STR market growth has slowed down since 2019 in terms of the number of active listings, a strong trend of professionalization in STR business arises, regardless of a major tourist destination or a major metropolitan area. Observed fluctuations in seasonal bookings and rent premium are more prominent in the Sunshine Coast compared to that of Brisbane. Intensified STR activities generate a substantial revenue stream for an average professional Airbnb listing. In many STR hot spots, the STR revenue level is competitive against the median LTR rent level. The housing market implication is that, potentially, a number of properties that could have accommodated long-term renters are used exclusively for STR business, triggering the

broader housing policy debate over the necessity of regulating the Australian STR market. Specifically, we would like to discuss whether the combination of the recovering tourism from the pandemic, the shortage of new housing constructions, and the decentralized 21st century economy would further boost professional STR activities. In such case, the housing policy discussion is needed to then justify a regulatory framework to disincentivize the overheated STR investment that could negatively impact the LTR housing market beyond the immediate future.

PUBLIC HOUSING REDEVELOPMENT AND RELOCATION: A COMPARATIVE CASE STUDY OF PUBLIC HOUSING TRANSFORMATION IN CHICAGO AND TORONTO

Abstract ID: 1727

Poster

ANDERSON, Derick [UIC] dander28@uic.edu, presenting author

Public Housing Redevelopment and Relocation asks the question "Does the border make the difference?" when it comes to public housing transformation. This dissertation research will look at the tenant relocation and site return processes of two public housing developments; Regent Park in Toronto, Canada, and Cabrini-Green in Chicago, United States.

This study looks to address the literature gap in policy studies and scholarship on the connection between relocation policies and how redevelopment outcomes are achieved. This study will also explore well-studied sites in Canada and the United States but often have not been studied in terms of their similarities and what policymakers and public housing practitioners can learn from their neighbors.

This study will use a comparative case study approach to understand how these two cities handled contentious public housing redevelopments when their respective national governments privatized their public housing and transferred the control of their sites to local authorities. This study seeks to understand why some contemporary public housing redevelopments relocate residents into the private housing market versus bringing tenants back to their home sites, why planners make such decisions, and what planners can learn from these redevelopment processes.

Background:

Elderly shared housing (EGL), which differs from general senior citizen facilities and housing, is a way of living where the loneliness of living alone is eliminated and people can lead a daily life with home cooking and conversation, and is characterized by the fact that it practices a different style of living from senior citizen facilities and housing that aim to provide efficient care. However, as residents have aged, the number of cases requiring care has increased. The need has arisen to expand options to continue living in EGL while maintaining the characteristics of EGL and collaborating with the local community supports. The aim of this paper is to provide insight into specific measures to address this need.

Methods:

The study conducted a survey among 50 residents and 7 operators of seven EGLs in Japan. We analyzed personal networks, the actual conditions of daily living and supports, how to solve problems of daily living, and cooperation with the local community supports. In addition, care support coordination was studied in depth in EGL A, where all residents indicated that they were not inconvenienced by activities of daily living, despite the relatively high in age, therefore, the most challenging. The research methods employed in the study, were a survey using a self-administered questionnaire, semi-structured personal interviews using interview schedules, and participation observation. Data collection was conducted during April and July, 2021. Out of a total of 54 questionnaires that were distributed, 50 were collected and 50 valid responses were recorded.

Result:

We discussed specific measures to expand the options for continuing to live in EGL, while maintaining the characteristics of EGL and coordinating with the local community supports.

Collaboration with life support providers, that can flexibly create supports and find other supports according to needs, do not only fill gaps in supports provided by long-term care insurance, but also improves the quality of life, which can lead to residents' peace of mind.

Through daily interactions, EGL staffs, residents, local care managers, helpers, and community members have passed on to the operators in EGL information about residents collected. The quality and quantity of information can be said to be based on daily communication. The gentle watchfulness of many people involved in EGL has led to awareness of residents' concerns and changes in their physical condition, and those awareness in turn have led to support to residents. This is thought to be due to the small scale of the EGLs and the mutual acquaintance of the residents.

It is also necessary to expand the network with residents and increase the number of supporters. One way to do this would be to encourage residents and community members to participate in hobby classes and events held at EGL.

In EGL, residents help each other on a daily basis. Over time, the care needs of the residents being assisted increase, and at the same time, the residents offering assistances also increase in age, and their physical and mental conditions change. Consideration must be given as not to place a burden on the caregivers, as well as not to place an emotional burden on the residents being supported.

Track 7 Pre-Organized Session Summaries and Abstracts for the Sessions

ADVANCING WATER INFRASTRUCTURE EQUITIES IN PRACTICE: CHALLENGES AND OPPORTUNITIES

Pre-Organized Session 50 - Summary

Session Includes 1274, 1275, 1276, 1277, 1278

CAROLINI, Gabriella [Massachusetts Institute of Technology, carolini@mit.edu, organizer]

Diverse water delivery stakeholders in low-, middle-, and high-income environments are struggling to meet the needs of the most marginalized communities in the context of growing urban inequalities, aging infrastructures, and climate change. Infrastructure planning in the water space across these environments is typically dominated by concerns around promoting efficiencies--in water use and in costs of delivery--through the introduction of new technologies, reform of regulations, and the benchmarking of performance. However, such a priority focus on efficiencies has often produced negative externalities from the viewpoint of advancing equities and reaching the most vulnerable residents across cities. In this session, we explore these challenges, as well as the promising potential address of them, across different income-level contexts including urban landscapes in South Asia, North America, and South America.

Objectives:

- Identifying obstacles to operationalizing equity in water infrastructure planning
- Highlighting conditions shaping plans to address water inequalities across different income contexts and geographies

URBAN UTILITY STRESS AND HOUSEHOLD VULNERABILITIES: UNDERSTANDING WATER AFFORDABILITY CHALLENGES IN US CITIES

Abstract ID: 1274

Abstract within Pre-Organized Session 50

Crises tied to drinking water affordability, quality, and accessibility are on the rise in the twenty-first century in locations and economies where we might not expect them: cities in high-income countries. Drinking water is unaffordable and inaccessible for surprisingly many households in U.S. cities, for example. A survey of 20 of the largest U.S. cities and 10 regionally representative cities revealed that in the period from 2010-2018, the average monthly cost of water for a family of four using 50 to 150 gallons per person per day increased by over 50 percent. Another recent study estimates that 471,000 U.S. households (or 1.1 million individuals) lacked a piped water connection—and that 73 percent of such vulnerable households were located in metropolitan areas. In the 50 largest metropolitan regions, 53 percent of those without access were people of color and 61 percent were renters. Indeed, based even on the U.S. Environmental Protection Agency's own 4.5 percent of income affordability benchmark, one in ten households in the U.S. were faced with unaffordable water bills.

Water utilities across U.S. cities, much like many of the vulnerable, low-income households they serve, are also facing financial stresses. Updates to aging water infrastructure require massive capital investments, with costs in the U.S. estimated to be more than \$1 trillion dollars over the next 25 years. Further, not only do climate uncertainties make it difficult to accurately forecast water management costs, investments in stormwater management and resilience measures are increasing utilities' long-term capital costs. Without other funding besides user fees, expenses translate into rate hikes or new stormwater fees. In both cases costs are passed onto users, regardless of their ability to pay.

In this paper, we explore the structural dimensions driving the water affordability crisis in US cities. Targeting the poor is a long-standing concern in development studies, but what structural drivers of the urban water affordability

crisis are most relevant for understanding how to reach the most vulnerable households in U.S. cities? In this paper, we explore the broad picture of utility finances and urban costs of living across the U.S. to understand the landscape of structural drivers leading to water affordability challenges among poor urban households. More specifically, we study water tariff trends in composition, rate of change, and typology across 84 U.S. cities, as well as housing, income, labor, and population trends therein during the period between 2011 and 2020. We then present a deeper case study analysis of the more contextual factors underlying costs of operations (from the utility perspective) and costs of living challenges (from the household perspective) experienced in two U.S. cities, namely Seattle and Louisville. The findings of this analysis contribute to current debates about how to best direct new federal funding from the Infrastructure Investment and Jobs Act toward the most local levels of need within the water infrastructure space.

UNDERSTANDING THE COMPLEXITY OF WATER EQUITY IN THE PITTSBURGH REGION

Abstract ID: 1275

Abstract within Pre-Organized Session 50

GONZALEZ RIVAS, Marcela [GSPIA, University of Pittsburgh] mag231@pitt.edu, presenting author

The concept of “water governance” has gained prominence since the early 2000s as the world faces growing challenges: climate change, vast socio-economic disparities and environmental racism, aging infrastructure, etc. (Neto, 2022; Swain et al., 2020, Warner et al., 2020; Mack, et al., 2017; Pierce, et al 2021). One of the key questions that emerges around water governance is how to provide adequate water and sanitation services without compromising its affordability and equity to guarantee access to all? (González Rivas and Schroering, 2021).

This paper examines the challenges of implementing equity centered water governance in the 36 water authorities in the Pittsburgh region (Allegheny County). The authors analyze the existing local programs, identify the key principles that guide current practice, and contrast them to the principles outlined by the human right to water framework. In assessing the fit between this internationally recognized framework and the local practices and political realities, the paper identifies the challenges faced by local water systems as well as the potential opportunities that exist at the local level to implement equity centered water governance practices.

PLANNING THE LIVED, IF NOT THE IDEAL: STREET-LEVEL OPERATORS' CONTRIBUTIONS TO PLANNING RESILIENT AND EQUITABLE WATER INFRASTRUCTURES

Abstract ID: 1276

Abstract within Pre-Organized Session 50

SUBRAMANYAM, Nidhi [University of Toronto] nidhi.subramanyam@utoronto.ca, presenting author

Cities worldwide are pursuing low-carbon, climate-resilient development to adapt to climate change. On the one hand, climate change impacts water availability, but on the other, water availability and security are also critical for communities to remain resilient and adapt to changed conditions. Plans for climate-resilient water infrastructures overwhelmingly focus on producing physical infrastructures that withstand biophysical stresses. Planning scholarship analyzes the gendered, racialized, classed dimensions of infrastructure production or their impacts (Siemiatycki et al., 2020). Both plans and analyses tend to overlook everyday operations and maintenance issues that unfold over water infrastructures' long-life spans, with implications for users' water access and security.

Given this background, this paper examines everyday water infrastructure operations and maintenance practices in the city of Tiruppur, India, to theorize operations as a form of planning, and discuss how operations and maintenance contribute to resilience as the city faces chronic stressors--water scarcity and rapid urbanization. I also reflect on the relationship of such resilience to entrenched urban inequalities. My methodology entails primary data collection using direct observations, plan analysis, infrastructure mapping, shadowing street-level operators, and in-depth, semi-structured interviews with 48 informants involved in water infrastructure production and operations in the city. Based on my findings and analysis, I contend that operations and maintenance activities are crucial aspects of water infrastructure planning. They exemplify planning as a form of incremental social learning (Friedmann, 1987), even if these activities and the labor involved are largely unrecognized in plans for producing the modern infrastructure ideal or get reduced to budget line items.

In Tiruppur, planning for operations occurs at the street-level, in propinquity with infrastructure users, and is disconnected from infrastructure production that occurs at a distance. It is highly contextual, contingent on socio-material conditions and relations, and draws on the embodied expertise, capacities, and social relations of street-level actors (watermen) to 'stretch' inadequate infrastructures and under-resourced bureaucracies to fashion resilience (Anand, 2017; De Coss-Corzo, 2021). Planning at the street-level also involves unique politics as the street-level is a key site for producing, maintaining, and contesting urban inequalities (Alda-Vidal et al., 2018). It reveals the aspiration and capacity of bureaucratic actors at the street-level to pursue progressive, equity planning goals through their practice (cf. Sotomayor and Danieri, 2018). In conclusion, this paper argues for re-centering operations and maintenance practices in planning just, climate-resilient water infrastructures and offers some recommendations.

WATER FOR WHOM? DECODING THE LINKS BETWEEN REGIONAL WATER PROVISION AND PRIVATE INVESTMENT IN THE BRAZILIAN NORTHEAST

Abstract ID: 1277

Abstract within Pre-Organized Session 50

CRUXEN, Isadora [Queen Mary University of London] i.cruxen@qmul.ac.uk, presenting author
CRISPIM, Fernanda [Universidade de Brasília] fernandap.crispim@gmail.com, co-author

In 2020, the Brazilian government passed a wide-ranging legal and regulatory reform of the water and sanitation sector largely designed to support greater private investment (Cruxên, 2022). One of the reform's pillars was the notion of "regionalization" (regionalização), or the creation of "blocks" of municipalities to facilitate the provision (and concession) of public services at regional as opposed to municipal scales. In addition to supporting economies of scale, regionalization was positioned as a solution to the problem of extending service provision to poorer and less potentially lucrative areas by enabling the combination of what some referred to as "combining steak and bone"

(juntar filé e osso). This study examines the socio-economic rationales shaping the political organization of regional water and sanitation delivery arrangements via a case study of the construction and concession of services in the Grande Maceió metropolitan region in the northeast of Brazil—a region beset with precarious service coverage and related public health challenges, particularly among vulnerable communities (Silva et al., 2017). Drawing on critical analysis of preparatory studies, business plans, and legal concession documents, we explore (a) how the construction of regional arrangements reflects investors’ risk-return calculations; (b) the extent to which equity and ecological considerations inform the organization of regional concessions. This analysis will offer insight into the encoding (Pistor, 2020) of different planning and market rationalities in the (re-)creation of water governance and service delivery institutions in the South.

IMPROVING WATER AND SANITATION AFFORDABILITY THROUGH LIFELINE PROGRAMS: SUBNATIONAL INITIATIVES IN COLOMBIA

Abstract ID: 1278

Abstract within Pre-Organized Session 50

RESTREPO-MIETH, Andrea [University of Pennsylvania] andream@upenn.edu, presenting author

Under what conditions do municipal governments develop and implement policies to improve the affordability by low-income individuals of water and sanitation services? Using mixed methods, I gathered data from ten Colombian cities to better understand the role of social movements, civil society organizations, and planners in pushing municipalities to adopt water and sanitation lifeline programs, how actors interact with city hall, city council, the courts, and the national government, and the characteristics of the municipalities that establish these programs. The literature on customer assistance programs (CAPs) such as lifelines has not looked at these issues in the global South comparatively from a subnational perspective (Cook, 2020; Cook et al, 2020). Instead, the existing literature on lifelines focuses on national-level mandates such as South Africa’s and Chile’s (Contreras et al, 2018; Muller, 2008) or case studies of municipal government initiatives (Vargas et al, 2018). The findings from this research contribute to our understating of the politics and institutions that structure the emergence and continuity of water and sanitation lifelines and the role of planners in mediating community demands for greater affordability.

EVERYDAY URBANISMS IN GLOBAL CONTEXTS

Pre-Organized Session 71 - Summary

Session Includes 1400, 1401, 1402, 1403, 1404

This session presents cases of everyday urbanism in a variety of urban settings throughout the Global South. We seek to explore the heterogeneous ways in which everyday urbanism may challenge dominant constructions of place, citizenship, and the urban. We show that community actors pursue everyday urbanism through assemblages of bodies, materials, and social systems, thus asserting their agency through relationships with places on their own terms and creating alternative geographies of urban form and forging innovative planning processes. We describe a range of everyday urbanism in a variety of urban settings in different world regions, including monumental spaces in Islamabad, Pakistan; formal public spaces in Beirut, Lebanon; gendered productive spaces in peri-urban Santo Domingo, Dominican Republic; community-developed public places in a consolidated informal settlement in Monterrey, Mexico; and Rohingya refugee settlements in Bangladesh. This diversity of cases allows us to demonstrate the ways in which everyday urbanisms emerge within specific, place-based contexts of violence, forms of governance, and material environments.

Objectives:

- Foster learning of everyday urbanism in informal contexts.
- Strengthen international dialogue about place-making.
- Provide critical insights into relations of power associated with place-making.

RE-IMAGINING COMMUNAL CITIZENSHIP THROUGH EVERYDAY PLACES IN ISLAMABAD

Abstract ID: 1400

Abstract within Pre-Organized Session 71

BAQAI, Aabiya [University of Texas at Austin] aabiya.baqai@utexas.edu, presenting author

“Faith, unity discipline”, “A planned, modern and Islamic nation”, “A modern day state of Madinah”: these are just some of the ways previous and current national governments have articulated a national direction for Pakistan and translated a vision of citizenship into the capital city’s built environment. In doing so, Islamabad has followed the pattern of other capital cities by paying homage to a single imagined national identity and community through their built form, conjured up by the designer/planner himself together with the leadership in power (Anderson, 1991; Vale, 2014). But, what does this mean for residents who are excluded from these neatly outlined national goals, particularly those living in neighborhoods that are non-Islamic, unmodern, and unplanned? Why are their spatial expressions of citizenship considered an intrusion on Islamabad’s development as Pakistan’s capital? I answer these questions by conducting a visual ethnography of France Colony, an informal settlement with predominantly low-income Christian residents located within a wealthy district in Islamabad.

France Colony has been a source of interest for many activists, scholars and the media, particularly because the community reflects broader intersectional religious, gender, and class disparities seen in the city and in the nation at large. In Islamabad, formally designed public spaces such as national monuments, parks, government housing, and places are constructed to serve Sunni Muslim-identifying men, while marginalizing other populations both in terms of representation and accessibility. As a result, women and religious minorities, including low-income Christian women from communities such as France Colony, have been targets of violence and crime in public spaces such as places of worship and gathering, storefronts, highways, and national monuments. Instead of incorporating representations of residents from such diverse communities as France Colony, official public spaces fail to reflect the intricate ways heterogeneous groups create and celebrate their identities in their vernacular spaces (Holston, 1998; Dovey, 2009; Mcfarlane, 2011).

To challenge this hegemonic discourse around national citizenship and its translation into exclusive public spaces, I am drawing on assemblage theory to build socio-spatial narratives of citizenship that refuse to be reduced to mere reactions to state inactions but instead constitute legitimate acts of agency (Mcfarlane, 2011; Dovey, 2009). Instead of understanding citizenship as a product of national, religious, or class ideals and narratives, I argue that alternative forms of citizenship emerge through the everyday urbanisms within cities like Islamabad. I use visual ethnography methods including photography and videography to capture some of these everyday spatial expressions of citizenship seen in places not considered spectacular or awe-worthy from the state’s perspective, such as churches, parks, storefronts, and other urban forms categorized as informal. I document places where residents gather, celebrate, and create, despite the state’s efforts to homogenize them as informal and unwanted.

By making visible communities facing intersectional vulnerabilities, this research seeks to create openings for their acceptance as legitimate citizens and political participants in Pakistan. This study also initiates conversations on ways plural and subaltern identities can be better represented in national spaces, while contributing to the broader discussion around how marginalized populations challenge national imagined communities and force states to rethink their definitions of ideal citizens and patriotism (Anderson, 1991).

RIGHT TO THE CITY AND INSURGENT PLACE-MAKING IN BEIRUT, LEBANON

Abstract ID: 1401

Abstract within Pre-Organized Session 71

MAKAREM, Rand [The University of Texas at Austin] rand.makarem@utexas.edu, presenting author

Much of Beirut has been inaccessible to lower-income groups due to the privileging of capitalist urbanization and private development following the 1975 Lebanese Civil War. However, beginning on October 17, 2019, the streets of Beirut saw a wave of protests following a cabinet announcement of new tax measures on Internet voice-call services such as WhatsApp and Facebook Messenger (Sullivan, 2019). The tax increase came at a time when the economic health of the country was deteriorating, prompting a multi-generational movement where citizens put their sectarian differences aside in a quest for basic human rights, including the right to public space.

The revolutionary movement manifested most notably through the re-appropriation and unprompted reconfiguration of public spaces, which have long been subject to privatization, gentrification, and demarcation (Lakrouf, 2020). This included the reclamation of downtown streets, spaces and facilities that have been inaccessible for most citizens (Sinno 2021). Downtown Beirut became a space for large public gatherings, a unifying platform for protests and activist-led marches, a stage for various civil society group meetings, an agora for public political debates and discussions, an open market for street vendors, and a canvas for exploration (Lakrouf, 2020). By participating in these activities and observing how they manifested in public space, I was able to witness the reclamation of downtown streets, spaces and facilities that had been inaccessible for most citizens. For instance, Riad el Solh Square and the Ring Intersection became the center stages for protest activities. The abandoned cinema “The Egg” and The Grand Theater of Beirut were reclaimed and used as community centers and performance spaces, and the Samir Kassir Garden and privatized public spaces such as the Zaytouna Bay were reclaimed and used as spaces for dialogue and gathering

The importance of this reclamation of public space lies in its manifestation of everyday urbanism, reflecting the social and spatial relations that marginalized citizens use to reclaim their city (Hillbrandt, 2017). The transitory activities of individuals in Beirut can be understood as tactics to reclaim public space, revealing the potential of ordinary spaces and informal encounters to facilitate the agency of citizens. This determination to reclaim public space in Beirut illustrates the challenges faced by Global South citizens when it comes to meaningfully participating in urban governance, demonstrating the need for a radical approach to planning. Thus, the case of Beirut invites planners to understand that planning is not done just by planners (Miraftab, 2009) and to recognize the power associated with innovative, oppositional practices.

VIOLENCE, REFLECTION, AND ATTENTION: THREE STAGES OF COMMUNITY-LED PLANNING ACTION IN AN INFORMAL COMMUNITY IN MONTERREY, MEXICO

Abstract ID: 1402

Abstract within Pre-Organized Session 71

STAINES-DIAZ, Leon [The University of Texas at Austin] leon_staines@utexas.edu, presenting author

In Monterrey, Mexico, the failed war against narco-trafficking between 2009 and 2012 left deep wounds among the city's most vulnerable residents, but at the same time, the violence triggered community reflection and action. In La Campana, a neighborhood located in the consolidated area of Monterrey, the community organized to reclaim the public spaces that until recently had been controlled by organized crime. This paper describes the three stages of community-led planning action in La Campana, beginning with violence as a trigger of community participation, followed by community reflection about the role of the public space for social relations, and culminating with new efforts by the state to initiate a traditional planning approach and infrastructure provision in the community. Drawing on methods of participatory action research (Wilson, 2019), I explore how the trauma stemming from the clash between the cartels and the community triggered new ways to interact with public space. To overcome the shock of the curfew imposed by organized crime, a group of female residents created an NGO that initially focused on the modification of the built environment to transform residual spaces into pocket parks for children. The notable benefits of these imaginative, community-based planning actions garnered the attention of local authorities, which have now designed a partial comprehensive Plan for La Campana area and its surroundings jointly with their allies in the private sector. However, this planning strategy reflects the state's interest in claiming control over public spaces in the community, thus threatening the community's planning practices and identity. To analyze the ways in which the community resists real state capital and formal state planning, I draw on Roy's (2011) concept of subaltern urbanism and argue, with Sandercock (2000), that the incorporation of actors that usually do not have a voice is one of the crucial planning challenges of the 21st century. However, I take a cautionary approach to participatory processes, cognizant that concepts such as decentralization, citizen participation, and the drive against corruption are vehicles used by imperialist domination in the neoliberal era (Bayart & Biekart, 2009: 819). This argument aligns with Miraftab's (2009: 33) discussion of citizen participation as a way to legitimize neoliberal goals through the perception of inclusion to achieve hegemonic power. Without a different approach from the city's authorities based on respect for local planning initiatives, community organizing will be increasingly at risk, leaving the community vulnerable to the several real estate interests currently in the area.

MEMORY, EVERYDAY URBANISM, AND PROJECT-INDUCED DISPLACEMENT IN INFORMAL SETTLEMENTS

Abstract ID: 1403

Abstract within Pre-Organized Session 71

SLETO, Bjorn [University of Texas at Austin] bjorn@utexas.edu, presenting author

Project-induced displacement due to stormwater upgrading and other major infrastructure projects is a major threat to traditional place-making in informal settlements. Even though such infrastructure upgrading pursues ostensibly participatory strategies in keeping with more horizontal forms of governance, such practices are often not valued or systematized (Sandoval and Sarmiento 2020: 742). In particular, attempts at participatory approaches to infrastructure upgrading often fail to account for the everyday urbanism in informal settlements and the ways in which these may serve as a foundation for in-situ, incremental slum upgrading approaches (Jiusto and Kenney 2016). Instead, infrastructure upgrades pursued without due attention to situated place-making practices may lead to

displacement, weaken social networks, undermine local economies, and disrupt the common sense of collectivity and attachment to place. However, this paper examines the often-overlooked role of memory in contestation over such infrastructure project and its potential in shaping recovery following such disruptions. Drawing on the case of stormwater development in the informal settlement of Los Platanitos, Dominican Republic, I seek to explore the potential of memory work (Crang and Travlou 2001) in “sensemaking” strategies (Weick et al. 2005) when residents are faced with such fundamental threats to the integrity of their social and material environment. Through performances of foundational narratives of struggle to build Los Platanitos on the site of a municipal landfill starting in the early 1990s and their success in constructing informal infrastructures and economies, residents articulated a connection between past repression and current impositions of state power (Moore 1998). This memory work thus allowed residents to “make sense” of the unexpected (Weick et al. 2005) and prompted new strategies to contend with the displacement, including a push for replacement housing and collective work to reimagine new uses of public spaces given the reconfigured geographies following the stormwater project. The paper presented here draws on interviews, surveys, and field observations conducted during the stormwater upgrading project in the years 2017-2018 complemented by interviews conducted virtually during the pandemic period and field research in June 2022. The research emerged from 14 years of community-engaged research and service learning pedagogy, which allowed for a longitudinal understanding of foundational narratives, deep insights into the impacts of the stormwater project on the lives of residents, and close proximity to the memory work conducted by residents.

CONFRONTING EXCLUSION: EVERYDAY PRACTICES OF ROHINGYA REFUGEES IN BANGLADESH

Abstract ID: 1404

Abstract within Pre-Organized Session 71

BASHAR, Samira Binte [The University of Texas at Austin] samira.proytee@utexas.edu, presenting author

Refugee camps have emerged as places delineated by extraterritoriality, exception, and exclusion (Turner, 2016), where refugees are consigned to a state of protection and relief. At the same time, humanitarian agencies manage refugee camps through neoliberal imperatives associated with ‘resiliency humanitarianism’ (Ilcan and Rygiel, 2015). In order to reproduce spaces that are at once impermanent and resilient (Ramadan, 2013), refugees are expected to become participants in the building and maintenance of the refugee camps without demanding any structural changes to ensure their needs, rights, and dignity as both human beings and citizens.

This is the situation facing Rohingya refugees in Cox’s Bazar, Bangladesh, a peri-urban hilly forest area that has become a mega refugee settlement characterized by impermanent shelters and infrastructures. Since August 2017, over 700,000 Rohingya, a stateless ethnic Muslim minority group from the Rakhine state of Myanmar, have fled and joined 200,000 more Rohingya refugees already living in Bangladesh to escape Myanmar’s state-sponsored persecution and violence. I employ ethnographic research methods to explore how the notion of impermanence is materialized through the planning of Rohingya refugee settlements, how refugees negotiate these development and management approaches, and what implications their agency provide for planning with refugees. I argue that by keeping refugees isolated and excluded as a ‘matter out of place’ (Malkki, 1992), refugee camps constitute transient spaces designed to reproduce a sense of impermanence and to depoliticize the refugee population.

However, the case study of the Rohingya refugee camp in Cox’s Bazar shows that the meaning of impermanence in the built environment changes depending on the planning context. Once the rule of exclusion of refugees from the immediate surrounding areas has been established, the line between permanence and impermanence becomes blurred. While refugees are perceived as passive recipients of aid, refugees situate themselves as active negotiating actors. By capitalizing on their individual capacity and social connections, refugees take advantage of the porous spatiality of the camps to shape their built environment and develop innovative forms of emergency ‘composite governance’ (Simone, 2008). In doing so, Rohingya refugees are transforming the politics of impermanence and

exclusion in order to achieve their rights and dignity as human beings. Their strategies of negotiation, adaptation, and appropriation of socio-spatial spaces do not necessarily translate into acceptance and belonging to the host community, but for refugees, these strategies serve to develop a measure of control over their unsettled future. Thus the case of Cox's Bazar contributes to planning theory by initiating conversations about alternative ways of planning in places where all dimensions of a plan – people, place, and time – are subject to continuous change and in the process of becoming.

LEARNING FROM THE GLOBAL SOUTH: LESSONS FOR INCLUSIVE AND EQUITABLE PLANNING INTERVENTIONS

Abstract ID: 1141

Roundtable

HOOPER, Michael [University of British Columbia] michael.hooper@ubc.ca, moderator
MALONEY, Keisha [University of British Columbia] maloney.keisha123@gmail.com, participant
BELKADI, Meryem [University of British Columbia] meryem.belkadi@alumni.ubc.ca, participant
MOHANDAS, Meghna [University of British Columbia] meghnamo@student.ubc.ca, participant
PENUMAKA, Mrinalini [Massachusetts Institute of Technology] mpenumak@mit.edu, participant

Communities and cities of the Global South are experiencing rapid changes that are further complicated by socio-economic inequalities and local political complexity. While urban and regional planning seeks to respond to these challenges, the blueprints on which policies and interventions are based have typically been disseminated from the Global North, often overlooking local political, economic, social contexts. Thus, the implementation of these policies and interventions is often inefficient and results in suboptimal outcomes. Given the urgent crises facing many cities of the Global South – including around access to housing, food, and infrastructure, it is vital to identify new and more appropriate planning and policy responses and it is into this space that this panel steps.

In this roundtable, we as planning researchers, will engage with three major questions:

- How can planners build truly democratic and equity-enhancing planning interventions and collaborations?
- How can planners ensure that interventions empower communities?
- How can planners work to decolonize knowledge?

Underpinning these questions is a recognition that it is important to prioritize and respond to communities of place while decolonizing planning interventions and knowledge in ways that ensure equity, inclusion, and a prosperous future for all.

The panellists' case-based research examines the complexity of planning in the Global South, with a focus on specific policies and interventions and the challenges that often arise in their implementation. The cases we examine include: the provision of financial tools in the context of the nationwide slum clearance in Morocco; participatory processes of social urbanism in Medellín, Colombia; disaster risk management and climate change adaptation in India; and participatory planning in indigenous communities in Malappuram, India. Drawing on these cases, we argue that despite these policies often having intentions that are presented as equitable and future-focused, in practice their impact is often deeply suboptimal due to a lack of engagement with local contexts.

Among other themes, the panel will discuss the importance of resisting reductionist and fabricated dichotomies between Global North and Global South. It will highlight the experimentation and innovations that have been active in communities of the Global South, as well as the importance of disseminating insights from these contexts. This approach builds on the empirical and theoretical work of Vanessa Watson (2014), AbdouMalik Simone (2017, 2019), and Arturo Escobar (2008, 2017), amongst others. In documenting and discussing a variety of diverse cases, the goal is to better understand and apply knowledge from communities in the Global South. Importantly, communities in the Global South can offer significant lessons as they are permeated by practices and rhythms of endurance which are organic and human-energy driven (Simone, 2019). As spaces of the South become more complex, they offer lessons that can support the development of inclusive cities worldwide. The cases we research, and which we will discuss, strongly suggest that success or failure depends on the degree of embeddedness in the organic, emergent realities of communities. Not only is this important in the Global South, but it is vital in the Global North as well.

AND FINANCING CLIMATE RESILIENT DEVELOPMENT IN DEVELOPING COUNTRIES: RECENT THINKING AND EXPERIENCE

Abstract ID: 1941

Roundtable

BIRCH, Eugenie [University of Pennsylvania] elbirsch@design.upenn.edu, moderator
 SMOKE, Paul [New York University] paul.smoke@nyu.edu, participant
 DAVID, Jackson [UN Capital Development Fund] david.jackson@uncdf.org, participant

The adoption of the Sustainable Development Goals (SDGs) and the Paris Climate Agreement among others, signal broad global commitment to sustainable development and coordinated/ supportive platforms for implementation. The SDGs cover a broad landscape of developmental issues, goals and actions, and individual countries must assess their own situation and determine priorities and the manner and sequence in which they will be addressed. Some SDGs, however, have particular global significance, even if their specific manifestations and required actions may differ across and within countries. Dealing with climate change (SDG 13) is certainly one of these areas of universal priority, and it has close linkages with multiple other SDGs and implications for inclusive development.

The latest assessment report of the Intergovernmental Panel on Climate Change (IPCC) highlights the urgency of pursuing climate resilient development (CRD). This is defined as the process of implementing greenhouse gas mitigation and adaptation measures to support inclusive sustainable development. The IPCC report frames climate action and sustainable development as highly interdependent and argues that effective CRD is most possible when this interdependence is leveraged. The implication is that that climate action should be more effectively incorporated into sustainable development planning. Equally important for action, development finance requirements and options are often considered separately and later rather than together and earlier in the process.

Infrastructure is a major priority for CRD, including in urban areas, and for dealing with other global challenges—poverty and inequality, energy shortages, food insecurity, and health crises, among others. Infrastructure deficiencies are particularly severe in lower- and middle-income countries. High-income countries tend to rely on cities to manage major public investments much more than middle- and lower-income countries. Subnational government investment averages 37% of total public investment, ranging from 43% in high-income countries to 13% in low-income countries. Infrastructure demands will intensify as global population growth—from around 7 to more than 9 billion people by 2050—will be largely absorbed by urban areas. Given the urgency of climate change, a significant share of urban infrastructure will need to be devoted to climate action, and even infrastructure not primarily targeted to mitigation and adaptation must be designed in a more climate friendly way.

How the required infrastructure can be financed is recognized as an essential consideration, but the role of urban governments and their options to secure and manage development finance has not received the level of attention it deserves, either generally (as highlighted in an ACSP roundtable in 2021) or specifically with respect to climate change response, the focus of this roundtable. Urban infrastructure, of course, must also be planned and financed in a way that promotes more inclusive decision-making and more equitable outcomes, which places additional demands on planners.

This roundtable will consider:

- What are the most promising options for increasing infrastructure development financing in urban areas and better linking these sources to sustainable development planning? What can cities do on their own and what assistance/cooperation is needed from higher levels of government and neighboring jurisdictions?

-Which options specifically target climate action investment or make general urban investment more climate friendly? Are there specific promising innovations being piloted—by international organizations, national governments and urban governments—to meet these goals?

-How can planning academics and practitioners better contribute to the research and action needed to improve development finance for more effective sustainable development planning and climate action? This panel brings together planning academics and practitioners from government and major development organizations who have been thinking about and working on these issues to share their ideas, findings and experiences. Brief comments from the panelists will be used to generate a robust discussion among the roundtable participants.

GLOBALIZED PERIPHERIES: SOCIAL URBANISM AND NORMATIVE NOTIONS OF URBAN PLANNING IN MEXICO CITY

Abstract ID: 1006

Individual Paper Submission

WHITNEY, Ryan [Tecnológico de Monterrey] ryan.whitney@tec.mx, presenting author

Urban planning "best practices" focused on creating more sustainable cities are becoming increasingly popular in cities around the world, including in Latin America. Best practices are the policies, programs, and projects that spark policy change in different cities from where they originally emerged (Montero 2020). Within Latin American cities, best practices focused on fostering urban sustainability - such as bike share systems, pedestrian streets, pop up parks, and central city "revitalization" approaches - have become common within central neighbourhoods, including in Mexico City (Whitney et al., 2020). Some scholars have suggested that these best practices are perpetuating inequity and exclusion through their focus on economic development and tourism (Delgadillo 2014). Less, however, has been said about the impact of best practices on neighbourhoods outside of the central areas.

This research explores the opening of an escalator in El Pirú in Mexico City, an economically marginalized neighbourhood geographically removed from the city's central areas. The escalator was directly inspired by social urbanism in Medellín, designed to improve accessibility in the neighbourhood (i.e., the neighbourhood is full of hills making walking difficult). Its conceptualization in Mexico City resulted from a study tour to Medellín where Mexican

government decision-makers were convinced about its local applicability.

While much of the literature in Latin America has focused on the implementation of best practices within areas of the city that are ripe for tourism and economic development, less has been said about their implementation in peripheral areas (Brand and Dávila 2011). What does the implementation of best practices in peripheral areas say about the evolution of best practices, not only via south-south transfers (Roy 2011) but also periphery-to-periphery transfers? Indeed, in addition to the escalator, two cable car public transportation systems have been inaugurated on Mexico City's urban periphery inspired by social urbanism. Therefore, this research asks:

- 1) What does the implementation of best practices on the periphery of the city suggest about the evolving dynamics of best practices and urban planning?
- 2) What exactly "travelled" to Mexico City? Did the pro-poor policy context of social urbanism also travel, or was it a one-off infrastructure investment?
- 3) How and why were these escalators chosen as the most appropriate infrastructure for the local context?

Data for this research will be collected using semi-structured interviews and participant observation. The author will situate themselves within Mexico City's planning milieu to observe how decision makers drew upon translocal and transnational knowledge upheld by powerful knowledge networks and study tours. Semi-structured interviews with decision-makers will unpack the history of the escalator investment in El Pirú. Participant observation will uncover the daily realities of how the escalators have impacted neighbourhood life in El Pirú.

The areas of the city where best practices are being adopted is changing. Specifically, best practice uptake is increasingly occurring on the peripheries of Latin American cities. Therefore, the conversation of the impacts of best practices in Latin American cities must expand beyond central neighbourhood to those that have been historically ignored by planning scholarship. The contribution of this paper then will be a more comprehensive understanding of the role of best practices in urban planning, situating the urban peripheries of the Global South at the forefront of the conversation in both academic and practitioner circles.

THE POLICY STRUCTURE AND PRACTICE ON HOUSING AND INFRASTRUCTURE PROVISION IN INFORMAL SETTLEMENTS: A COMPARATIVE STUDY ON ACCRA, GHANA, AND BUENOS AIRES, ARGENTINA

Abstract ID: 1021
Individual Paper Submission

WANG, Hsi-Chuan [University of Toronto] andrewwang@wustl.edu, presenting author

Climate change has led to countless challenges to coastal cities globally and pushed city leaders to adopt better strategies in dealing with unprecedented threats. An uncertainty that challenges cities in the Global South is the prolonged pressure of informal settlement management to cities. It has been well-acknowledged that these vulnerable communities often sit on the locations facing more significant climate crises. In this vein, the task of building a robust policy structure and delivering successfully informal settlement interventions is complex yet crucial.

These notions say that we need more comparative studies to show how the southern cities are dealing with their shocks and pressures, believing that the south-south collaboration provides meaningful insights for cities to learn and evolve collaboratively. From an urban government perspective, some critical and relevant questions are: (I) how have cities perceived informal settlements? (II) what national and local policies have been introduced to address relevant issues? (III) how are the concurrent projects moving these challenging areas toward different urban futures?

Methodologically, this study compares the aforementioned dimensions between Accra, Ghana, and Buenos Aires, Argentina, which have similarly accommodated significant informal dwellers and faced increasingly disruptive events associated with floods. This research draws the literature of academic papers, adopted policies, and institutional reports to respond to the first two questions while collecting the relevant citywide projects touching on informal settlement interventions to address the third question. The identified projects include the Metropolitan Buenos Aires Urban Transformation Project and the Greater Accra Resilient and Integrated Development Project.

Addressing these questions is essential to know what planning knowledge is transferable and what is not. This research will provide insights articulating the philosophical similarities on informal settlement interventions and the cultural context that differentiates the uniqueness of cities.

ENHANCING LAND READJUSTMENT PLANNING WITH ADDITIONAL PUBLIC FUNDS AND CREATING PUBLIC REALM VIA DENSITY BONUS, PRIVATELY OPEN PUBLIC SPACES (POPS), AND BUSINESS IMPROVEMENT DISTRICTS (BIDS)

Abstract ID: 1060

Individual Paper Submission

MITTAL, Jay [Auburn University] jzm0029@auburn.edu, presenting author

The paper is a case study from Surat, India that presents the use of market-based land-use tools in developing a regional-scale infrastructure – a 41.5 mile long Outer Ring Road (ORR) corridor was planned. It included planning and development of over 6,000 acres of private land parcels in the peri-urban fringe area of Surat – all in a self-financing way. The ORR corridor on completion is planned to be equipped with quality urban infrastructure, easy access roads, quality public spaces, and rich amenities at a total cost of \$654 million in four phases. This ORR case study employed four sources of funds in its financial modeling and generated surplus funds (\$). These tools are land readjustments (LR), a land-based financing and planning tool, which allows levying betterment charges (\$187 million), creating a public land bank for auction later (\$580 million). Additionally, the ORR case also utilizes a charge-based floor area ratio (FAR) as a density bonus to induce high-density developments and generates estimated (\$240-\$295 mill) funds, and even expects to collect additional toll revenues ((\$103 million) on completion of the ring road. It is estimated that the Surat ORR corridor would generate (\$1.1 to 1.2 billion) over the next 15 years via these four sources of funds.

The paper presents the above case with explanation on the process, where LR tool allowed the planners in creating a brand new green, blue, and grey infrastructure for undeveloped, rural, fringe-area land parcels, by pooling the private lands first, and then carving new roads, streets, public spaces, and installing physical infrastructure and urban amenities. It also presents costs, and potential non-tax revenues sources. The process unlocks the hidden development potential resulting into enhanced property values for planned private parcels.

the ORR case presents how a LR tool that is traditionally used at a neighborhood-scale in India was first scaled up to create a major road infrastructure by strategically mosaicking 11 different LR plans, and in the process, created planned development corridor and provided serviced developed lands abutting the ring road with urban infrastructure services. The paper As a second step, highlights the strengths of the LR tool, and also presents limitations especially in creating a well managed, accessible, and connected public spaces -- A public space plan (PSP). It then proposes two additional market-based tools to enhance the LR planning process to include public space plan (PSP) to improve the public realm. These are Privately Owned Public Spaces (POPS), to generate an additional supply of connected public spaces in the corridor, and Business Improvement Districts (BIDs) for quality

maintenance and management of public spaces and public realm in the LR plan area using market forces. The paper concludes with the process

URBANIZATION THROUGH RESETTLEMENT AND THE PRODUCTION OF SPACE IN HANGZHOU'S CONCENTRATED RESETTLEMENT COMMUNITIES

Abstract ID: 1078

Individual Paper Submission

YANG, Chen [University of Waterloo] chen.yang@uwaterloo.ca, presenting author

QIAN, Zhu [University of Waterloo] z3qian@uwaterloo.ca, co-author

In recent years, urbanization through resettlement in Asian countries especially in China has garnered increasing scholarly attention (Z. Qian, 2017; Shannon et al., 2018; Y. Yang et al., 2020). International development agencies like World Bank and Asian Development Bank have put heightened heed to achieving inclusive resettlement amid their funded development projects. However, post-resettlement adaptation still plagues the resettled, and governments who often lead the process are grappling with providing inclusive resettlement for the affected people (Arnall, 2019; Wilmsen & Webber, 2015; X. B. Xie et al., 2014). In China alone, 9.6 million farmers are resettled during the Thirteen Five-Year Plan (2016-2020) to alleviate poverty (Xinhua News Agency, 2020).

Building on Henri Lefebvre's conceptual triad of "the production of space", this research interrogates the production of CRCs in the "Orient" context (Lefebvre, 1991, p. 42). By investigating the interaction between resettled villagers' everyday activities and the planned space of state-led resettlement projects, this research further reveals how urbanization through resettlement unfolds in China and how resettled farmers are affected by the process. The creative destruction of rural space by resettlement inevitably carries Chinese characteristics. Rural-to-urban resettlement has become an important tool of the Chinese government to promote urbanization (Chan, 2012), and the notion of "resettlement with Chinese Characteristics" (C. Yang & Qian, 2021) points to a new chapter of resettlement as urbanization beyond the concept of "resettlement as development" (Rogers & Wilmsen, 2019) in China.

This research intends to contribute to the existing literature through the following aspects. First, it pinpoints an emerging development mode of urbanization through resettlement in China, which adds new knowledge to resettlement literature. Second, by focusing on post-resettlement communities, this paper expands the traditional application of space production theory to include a dynamic lens that contends the interaction between peoples' social relations and the imposed spatial planning is the main determinant of the space produced. This conceptualization can help address the longstanding issue of achieving inclusive adaptation for the resettled. Both the development mode and the deep understanding of inclusive post-resettlement adaptation can have positive implications on development policies and planning practices in China and the Asian context. This paper aims at the following research questions: 1) How has the production of CRCs evolved in the last decades and what are the key features of CRCs in different periods? 2) How have the resettled villagers adapted to the CRCs produced in different times and what are the primary hindrances for their adaptation process?

This research adopts a mixed-method approach to substantiate the arguments. The data were collected from various sources, including government statistical data, published papers, news articles, field visits, semi-structured interviews, and questionnaire surveys. Based on several months of fieldwork conducted in Hangzhou in 2021, this research offers an empirical lens on how have CRCs evolved and how have landless farmers adapted to the new living style over the last decade or so (2005-2017). This research first finds that CRCs in Hangzhou have three typologies. Secondly, resettled villagers in early CRCs are confronted with economic challenges but maintain well social relations. Their shared collectivism is conducive to their spatial adaptation. In recent CRCs, strict planning and community management have further limited resettled villagers' spontaneous attempts in reshaping space to support their

adaptation. These findings have important policy implications for achieving inclusive resettlement in China and the Asian context.

YUNDA, Juan [Pontificia Universidad Javeriana] yunda.j@javeriana.edu.co, presenting author

There are currently emerging challenges in participatory planning of global south cities. Planning practitioners face contradictory interests, distrust, and lack of communication among stakeholders, such as policy makers, developers, community activists and environmentalists. Often, this unproductive dialogue has immobilized the debate and implementation of sustainable urban policies and projects. There are many examples of this stalled projects in our case study city, Bogotá, Colombia: a new BRT corridor that cut across the wealthier parts of the city or an urban expansion Master Plan that include affordable housing but part of it is planned close to environmentally sensitive areas.

Academic research has proven that the introduction of innovative technologies in planning support systems (PSS) may help to improve communication among stakeholders. Rapid data analysis brings new data to the table, ameliorating the quality of the dialogue and potentially helping to reach consensus. However, despite the technological advances there is still skepticism of the use of PSS by planning practitioners, much of it caused by the inexperience working with them.

To cope with this challenge, we used in our graduate-level planning practicum an open-source urban planning scenario builder software, Envision Tomorrow (ET) developed in the United States. The purpose of using ET was contributing to the local participatory planning process, rapidly presenting to authorities and the different stakeholders several planning scenarios for a new city expansion with on-the-fly indicators that allow their comparison. These indicators include topics such as mobility, urban form, real estate, and sustainability.

Students developed three different scenarios using ET for an 1800-hectare Master Plan in the northern outskirts of Bogotá. One presented a continuation of the growing trend of the city: a mix of unplanned formal and informal neighborhoods lacking infrastructure; another, a mega-dense development made of residential high-rise building compounds; and a low-density neighborhood with single family housing. The objective of envisioning these scenarios was to improve the dialogue among stakeholders and facilitating a consensus about the urban form in the new urban area.

Findings of this practicum point first to a rising interest about implementing PSS in real life cases, students were able to formulate a Master Plan much faster and with more detailed indicators that when using more traditional tools. Secondly, students with architecture backgrounds informed their proposals with indicators beyond aesthetics, and the use of PSS encourage them to explore more typological housing alternatives during their design process. Thirdly, in terms of the analysis of locally built landscapes, we found that sustainability indicators of settlements developed informally are in some topics better than those indicators found in formal developments of residential high-rises. This puts into question the long-established view that cities in Latin America should incentivize the development of large mono-functional compounds with low-cost housing in peri-urban areas, instead of exploring other less formal alternatives to cope with the affordable housing shortages.

ARE “GLOBAL CITIES” REALLY MORE COSMOPOLITAN? EVIDENCE FROM THE WORLD VALUES SURVEY

Abstract ID: 1108

Individual Paper Submission

MORRIS, Eric [Clemson University] emorri7@clemson.edu, presenting author
 PFEIFFER, Deirdre [Arizona State University] Deirdre.Pfeiffer@asu.edu, co-author
 SAADAOU, Rababe [Arizona State University] rsaadaou@asu.edu, co-author

The world’s most developed urban agglomerations are often labelled “global cities.” These are held to be capitals of the world economic system due to being financial, production, and telecommunications hubs (Encyclopedia Britannica 2022). While they compete with each other economically, they also are interconnected and interdependent, leading some to argue that in many ways they are more similar to each other than to their national hinterlands.

Many argue that global cities are socially, culturally, and psychologically “different.” The world “cosmopolitan” is often used to describe them, and larger urban agglomerations in general. Warf (2014) opines that residents of bigger cities are more tolerant and empathic, and exhibit more universal humanism. “[C]osmopolitanism,” he argues, “has a long history of being generated and embedded in large, internationally oriented urban centers.” Our paper tests these propositions.

Our data are drawn from the 2017 to 2021 waves of the World Values Survey and European Values Study, which, when pooled, offer a sample of over 120,000 respondents in over 70 countries. We explore whether the population of residents’ cities is related to their likelihood of exhibiting cosmopolitan values. We do this using simple regressions without control variables and also with multilevel models that control for country-level and individual-level characteristics. We examine results weighting all countries equally and weighting by country population. We also observe residents in the metropolitan areas of some, though not all, of the “top 20” global cities (Kearney 2021). These are identified as cities that lead “across five dimensions: business activity, human capital, information exchange, cultural experience, and political engagement.” They include New York, Los Angeles, Chicago, Washington DC, San Francisco, Hong Kong, Singapore, Tokyo, Berlin, and Moscow.

In models without control variables, we find that residence in a larger city is negatively associated with trust in the UN, which we take to be a sign of less cosmopolitanism. However, city size is associated with greater feelings of being “close to the world,” is negatively related to feeling proud of one’s country (we assume nationalism is in some ways the antithesis of cosmopolitanism), is positively associated with trusting those of other nationalities, and is positively associated with having positive feelings about immigrants.

In models with control variables, we do not find a relationship between city size and appreciation of immigrants. We do, however, find some evidence that city size is negatively associated with nationalism. Also, people living in larger places are more likely to feel “close to the world” and tend to have more trust in the UN. In some models we find a link between living in a larger city and being more willing to trust those of another nationality.

We also specifically examine the residents of the “global cities” listed above. For the same dependent variables, we compare these cities to their individual national hinterlands, pool them and compare them with their pooled national hinterlands, and pool them and compare them with our entire global population. Considering our results in concert, we find little if any evidence of greater global city cosmopolitanism.

In sum, our results do not suggest that “global cities” themselves are indeed more cosmopolitan. This is particularly noteworthy given our large sample size, which should be able to show statistical significance even for relatively small effect sizes. But we do uncover fairly strong evidence that cosmopolitanism is associated with larger city size more generally. This outcome that may stem from cities’ greater connectivity to the global economy, communal diversity,

and exposure to cultural products, ideas, and people from abroad. Planners should seek to promote these characteristics, and urban living in general, to foster global understanding and solidarity.

EMERGING HOST CITIES REVEAL EMERGING ISSUES: A PRE-EVENT DISCUSSION OF SPACE EXCLUSION AND NEW CONFLICTS OF PUBLIC INTEREST IN FIFA WORLD CUP QATAR 2022™

Abstract ID: 1111

Individual Paper Submission

GOHARIPOUR, Hamed [The College of Wooster] hgoharipour@wooster.edu, presenting author

Beginning with the Japan/South Korea 2002 FIFA World Cup and followed by 2010 South Africa and 2014 Brazil FIFA World Cups, legacies of such events have been the main reason emerging economies and developing countries bid to host the most-watched sporting events. Since December 2, 2010, when FIFA Executive Committee awarded Qatar the rights to host the World Cup, this small Arab Muslim country has been preparing to make history by hosting not only the first FIFA World Cup but the first sporting event of this magnitude to be staged in Western Asia and North Africa. While political rhetoric has predominately focused on realizing long-term benefits, there is no doubt that this Islamic state faces severe challenges in creating inclusive urban space for about two million foreign visitors. This has provided a unique research opportunity beyond traditional topics about mega-events' legacy.

While most studies tend to focus on the short- and long-term post-event legacy of sporting mega-events, this pre-event legacy research, from the right to the city theoretical standpoint, raises critical questions regarding the definition and conceptualization of public interest. A vital component of the right to the City theory is the appropriation of urban space by different social and cultural groups. Although hosting such a mega-event by a small Muslim country is a historical turning point, inclusion and diversity activists have heavily criticized how an Islamic state will regulate the public life of non-Muslim visitors and minorities. Questions on the use of alcohol in public spaces, the presence and activities of the LGBTQ community, women's right to the city and public spaces, along with the reports on migrant worker deaths in Qatar, have been the most reasons human rights and social justice activists and scholars have criticized the hosting of World Cup in Qatar. On the other hand, in terms of alcohol consumption as an example of spatial challenges, the use of alcohol is especially a troubling issue for Muslims, who may be deeply offended if they are in the vicinity of alcohol. For many Muslim fans, even being in the same space where alcohol is being consumed or near drunk fans is a serious affront to their religious identity. These spatial contradictions are the motivators of this research.

Through a qualitative case study, this exploratory research primarily focuses on the "public life legacy" represented in the function and appropriation of public spaces. It discusses why the 2022 FIFA World Cup would open a new critical window into the practical challenges of implementing social justice theories in real-world spaces. As Islamic countries such as the UAE, Saudi Arabia, Egypt, Morocco, etc., emerge as potential hosts of future cultural and sporting events, new theoretical and practical challenges to explore the various dimensions of social justice open up for urban planners. This research aims to raise the importance of these emerging challenges and to explain why urban planners need to carefully consider the issue of the appropriation of urban space during the 28 days of the World Cup in Qatar.

HOUSEHOLD PREFERENCES FOR WATER SUBSIDY PROGRAMS AND PERCEPTIONS OF “FAIR” WATER PRICES: INSIGHTS FROM TWO FIELD EXPERIMENTS IN NAIROBI, KENYA.

Abstract ID: 1135

Individual Paper Submission

FUENTE, David [University of South Carolina] fuentes@seoe.sc.edu, presenting author

The effective pricing of municipal water and sanitation services plays an essential role in promoting efficient water use and enhancing utilities’ ability to deliver high-quality water and sanitation services.

Despite recent global attention to the affordability of water and sanitation services and subsidies in the sector, limited attention has been paid to household perceptions of affordability and their preferences regarding the design and delivery of subsidies. This paper examines customer perceptions of affordability, what constitutes “fair” water prices, and household preferences for different subsidy delivery mechanisms from two field experiments in Nairobi, Kenya. In particular, these studies test whether information on the capital intensity and cost of water infrastructure affects households’ perceptions of “fair” water prices. It also assesses household perceptions of affordability and reports their preferences for hypothetical subsidy delivery programs. We find that households preferred subsidy mechanisms that provided some form of autonomy over when and how to access and use subsidies. We also find that household perceptions of “fair” water prices are sensitive to elicitation mode (in-person vs. phone survey) and the content of the information treatments (verbal vs. verbal + images). To our knowledge, these are the first studies to examine household preferences for water and sanitation subsidy programs and test the impact of information treatments on customer perceptions of “fair” water prices. Overall, this paper contributes directly to the global discourse on the affordability of water and sanitation services, the design and delivery of smart(er) subsidies for basic infrastructure and services, and the challenge of getting water utilities on the path to financial sustainability.

“ACROSS THAT ROAD BUT WE CAN’T GO”: HOW ETHNICIZATION AND ORIGIN STORIES SHAPE HEALTHCARE DECISIONS AMONG DISPLACED AFGHANS IN QUETTA, PAKISTAN

Abstract ID: 1195

Individual Paper Submission

QAYYUM, Faizaan [University of Illinois] faizaanq@gmail.com, presenting author

The improvement of physical and mental health for residents has always remained at the heart of planning practice. Planning and policy outcomes, like the built environment, placement and quality of health facilities, transportation and transit facilities, and even racialized zoning and gentrification, influence people’s health and their ability to access

and utilize healthcare resources. Inequitable distribution of social, spatial, and economic resources (and even outright exclusion) interacts with socialized markers of identity like race and gender to shape both people's access healthcare facilities and ability to afford treatment. These interactions assume even greater significance for tens of millions of displaced people around the world who face physical, social, economic, and political exclusion and uncertainty in their host cities.

In this paper, I investigate how politicized subnational identities (ethnicized identities) influence displaced people's choices and decisions to access healthcare facilities in an urban setting. I use qualitative data, including in-depth interviews with displaced Afghans and georeferenced ethnographic observations from Quetta, Pakistan, for this study. I show that displaced people's ethnicized identities are closely connected to their narratives and experiences of displacement (I call these narratives "origin stories"). These origin stories interact with ethnicization of the city's local population to produce unique urban outcomes for subnational and even subethnic groups within the larger population of displaced Afghans.

Using the qualitative technique of process tracing, I find that ethnicized identities and origin stories influence healthcare choices and decisions by placing a different set of sociospatial constraints on different groups of people. Afghan Pashtuns, who speak the language of the city's majority population and reported no spatial constraints in accessing different parts of the city, based their decisions on eligibility to get treatment at public healthcare facilities or affordability of private facilities. Pashtun respondents reported visiting healthcare facilities further from their homes if they could afford the trip on available modes of travel. On the other hand, Afghan Hazaras reported feeling very vulnerable in much of the city and spatially restricted themselves to one of the city's two Hazara neighborhoods. Their choices of healthcare facilities were driven by proximity to these safe zones and concurrent availability of *Farsi*- or *Hazargi*-speaking staff at those facilities. This often forced them to travel longer distances, from one Hazara settlement to the other, despite the presence of multiple free public facilities closer to their neighborhood.

My findings speak to the challenges of planning for equitable access to healthcare in a world reeling from a global pandemic, increasing climatic challenges, and a growing number of involuntarily displaced people who move from one vulnerable context in the Global South to another. I show that, especially for marginalized communities, the presence of a healthcare facility alone may not improve access even if it is in close physical proximity and free for visitors. Minor paperwork requirements may exclude displaced people from healthcare facilities due to want of documentation; similarly, identity-based prejudice dissuades displaced people from these facilities even if they can fulfil administrative and documentation requirements. In cities that host displaced populations, addressing the social and linguistic barriers to access to healthcare therefore involves understanding displaced people's ethnicized origin stories, studying their interactions with the local population, and coming to terms with perceived sociospatial and linguistic constraints on their mobility.

URBAN REFUGEE HOUSING SPACES: AN ILLUSION OF SECURITY IN BEIRUT

Abstract ID: 1240

Individual Paper Submission

ABI-GHANEM, Maureen [Columbia University] ma3905@columbia.edu, presenting author

By the end of 2021, over 84 million people worldwide had been forcibly displaced from their homes as a result of conflict, violence, and other major events that disturbed the public order. To date, the vast majority of refugees – an estimated 22 million people – are hosted in countries of the global South (UNHCR, 2022). From WWII until the early

2000s, the UN and host countries have viewed physical planning and camps as effective tools to both aid refugees and assuage fears of local populations. Typical camp structures such as plastic tents and metal containers were easily assembled, enabling international organizations to quickly shelter and aid refugees, while simultaneously the fragile materiality of the structures, and their confinement to specific locations, both affirmed that the precarious situation was under control and only temporary. However, as conditions of forced displacement became more protracted – sometimes lasting for generations – a growing trend of refugee movement from camps to urban areas has been recorded (Sanyal, 2015).

Today, only 15 percent of refugees worldwide reside in managed camps while the rest seek affordable housing in urban areas. However, host cities in the global South are struggling as such movements place considerable pressure on resources and services that are already unable to meet the needs of the urban poor. This paper narrows down on the approximate 1 million refugees that fled the Syrian war into neighboring Lebanon. For over 11 years, they remain displaced and account for a quarter of the host country's total population, representing the highest proportions of refugees anywhere in the world. With an absent state and a weak economy, a significant pressure appears to be on already scarce affordable housing, and the displaced have sought informal ways to access – even produce – inexpensive 'housing spaces' to survive. These spaces have a wide typological range and include makeshift shelters, rooftop and basement units, apartments of all conditions, and re-configured substandard buildings for larger groups. Although many of these spaces were produced by, or for, refugees, a pattern of continuous eviction is apparent. As such, my main research question is: Why are urban refugees at a constant risk of eviction from housing spaces that were created for, or by, them? And what are the necessary conditions to achieve tenure security in the city?

While there is a growing body of research on the various facets of urban refugee life in the global South, there is a gap in the literature on the spaces that urban refugees produce and inhabit, as well as how this relates to contemporary debates on urbanization. As several scholars have claimed, this is no longer a refugee crisis, rather an 'urban' crisis (Fawaz, 2017), and addressing this issue is an urgent political, socio-economic and spatial question. Through a qualitative analysis of reports produced by international and local organizations, in addition to in-depth interviews with over twenty refugee households residing in various parts of Beirut, this paper explores the complex and informal ways urban refugees attempt to create and access housing spaces in the city. The research traces the various channels that lead to these housing spaces and investigates the underlying reasons beneath the constant threats of eviction. The research concludes that urban refugee housing are a form of "gray spaces" (Yiftachel, 2009) and questions how this is fundamentally different from sheltering in camps. Finally, the paper provides the foundation for a new urban concept that I continue to explore and dub "displacement within displacement".

CULTURAL INFRASTRUCTURES: PERFORMING CITIZENSHIPS FROM THE PERIPHERIES OF LATIN AMERICAN CITIES

Abstract ID: 1256

Individual Paper Submission

MOYA-LATORRE, Antonio [Cornell University] am3332@cornell.edu, presenting author

The last decades have staged a proliferation of cultural spaces and practices—from rap and funk, to dance, street art, theater, and literature—initiated and sustained by the youth in the peripheries of Latin American cities. Often raised amid long-lasting patterns of acute social exclusion, communities in these neighborhoods are no longer satisfied with simply seeking the fulfillment of their basic material needs—such a goal should be always taken for granted in any discussion on political, social, and cultural issues in the region. Nor are they just asking to be treated as equals within existing social systems and standards. Rather, these historically oppressed communities are demonstrating a growing appetite to thrive and flourish individually and collectively. Remarkably, they are performing their blossoming as a very real possibility. These communities are increasingly aware of their entitlement to cultural rights historically denied to them by political and social elites and are equally committed to inventing forms of citizenship beyond established understandings of civic, political, and social rights.

In this paper, I explore how this explosion of cultural production (Caldeira, 2015) in the peripheries of Latin

American cities has the potential to turn into a regionwide counter-hegemonic form of engaging in politics through the consolidation of what I call cultural infrastructures—a concept through which I conceptualize them as robust institutions comprised both by cultural spaces (physical infrastructure) and creative practices (social infrastructure (Simone, 2004)), which contribute to the collective capacity to pursue social and material change. Specifically, I discuss to what extent young cultural community leaders today aspire to build towards an ontological turn in formal politics that leads towards deeper systemic changes (Escobar, 2020). I equally reflect on what we can learn from grassroots cultural infrastructures in Latin America for other insurgent community planning practices (Miraftab, 2017) within and across other contexts of exclusion.

To undertake this analysis, first, I provide evidence of burgeoning art-based initiatives across Latin American urban peripheries, which constitute a widespread sociocultural phenomenon across the region. Second, I discuss the social and urban conditions that have sparked the cultural explosion in these urban peripheries. I argue that analogous conditions of inequality and diversity, exacerbated by massive migration processes, are behind the extended cultural response of the oppressed Latin American youth. Third, I introduce the concept cultural infrastructures in reference to youth-led pedagogic spaces and practices that mobilize the aspirations and claims set by peripheral communities. Fourth, through the idea of self-defined cultural rights, I suggest that such infrastructures both derive from and expand insurgent citizenships (Holston, 2008) that have taken shape over decades of urban exclusion (on top of centuries of social and racial oppression). I sustain that the culture-based nature of these infrastructures takes claims and aspirations a step further by enabling the performance of citizenships in creative and artistic ways. This performance not only challenges social stigmas and preconceptions over these communities, but also creates tangible opportunities for the youth to thrive. Lastly, I consider the relation between culture and politics through the lens of cultural infrastructures in Latin American urban peripheries, suggesting that the apparent apolitical nature of these initiatives is indeed a veiled form of resistance slowly reaching higher decision-making spheres. Methodologically, my paper brings together scholarly literature on political science, political anthropology, and southern planning theory seeking to provide a refreshing theoretical framework around this emergent sociocultural phenomenon in Latin American urban peripheries, which can inspire counter-hegemonic planning processes elsewhere. I conclude the essay reminding of the importance to attend to these everyday peripheral forms of performing cultures and politics as an endless source of creativity for the imagination of alternative social paradigms.
