

Connecting educators, researchers and students

ACSP2024 ANNUAL CONFERENCE

NOVEMBER 7-9, 2024 SEATTLE

This book includes the abstracts accepted for presentation at the ACSP2024 Annual Conference. This book was completed and posted to www.acsp.org 06/18/2024.

Notes about this Book

This book includes only the abstracts accepted for presentation at the 2024 Annual Conference. This book was completed and posted to www.acsp.org on June 18, 2024.

Abstract ID

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number authors should reference along with the presentation title to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

Indexes Available

Separate indexes for Author Name and Keywords. These indexes can be found at the end of this book. Use CTRL+F to search for Names and Keywords throughout the book.

Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract, then sorted numerically by abstract ID. All types of abstracts are not necessarily represented in all 15 tracks.

1. Pre-organized Session Summaries – the overview describes the intent of the session and lists the abstract ID numbers for the included abstracts.
2. Abstracts accepted within the pre-organized sessions
3. Roundtables
4. Workshops
5. Individual paper abstracts
6. Research in Motion abstracts

Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For papers (individual paper abstracts, and abstracts within pre-organized sessions) and Research in Motion -** Authors of abstracts in this book and in the final program will be indicated as presenting, or co-authors of the paper. The presenting author is always listed first. No more than eight authors for one abstract are included.
- **Roundtables and Workshops** will have an organizer and participants. The names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will have an organizer included with the summary abstract.

Multiple Program Placement Policy

Each abstract submission must be unique. You may not present the same research in multiple formats. If you have more than one appearance in one of the categories in this paragraph, in fairness to everyone, we will ask you to withdraw the additional appearance(s) prior to the scheduling of sessions. Presenters on the final program are limited to one of each of the following:

- Presenting author of one research presentation - whether in a paper session OR Research-in-Motion session (inclusive of pre-organized sessions of either format).
- Participant for one placement on a roundtable.
- Teacher of one Professional Development Workshop.
- One (or two max) placement(s) as a discussant or facilitator of a research presentation session.

Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the text within the abstracts will not be edited. This book has been edited only for formatting consistency. We do understand the importance of names; that paper titles change as time goes on; and authors are added or dropped. In these instances, any necessary changes for the program should be sent to abstracts@acsp.org.

Searching this PDF

This document will be over 1300 pages including the Author Index and Keyword Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard CTRL+F.

- **Search by Abstract ID:** Type the words Abstract ID: with one space followed by the number. If you try to search for just the number, you'll likely find it in many of the bibliographical references provided by authors. Sample search: "Abstract ID: 1112.0.0.570.2024"
- **To scan an entire track,** use the word Track followed by a track number 1-16. Sample: "Track 14". This will bring you to the beginning of the abstracts for that track.
- **To get to the Author Index,** search for "Author Index"
- **To search by keyword,** search for "Keyword Index" and then scroll alphabetically.

Quick Reference

Track 1 – Anti-Racism in Planning 7

Track 1 Pre-Organized Session Summaries and Abstracts for the Sessions 7

Track 1 Roundtables 19

Track 1 Individual Paper Presentations 21

Track 1 Research in Motion (RiM) 42

Track 2 – Community Development 53

Track 2 Pre-Organized Session Summaries and Abstracts for the Sessions 53

Track 2 Roundtables 85

Track 2 Individual Paper Presentations 88

Track 2 Research in Motion (RiM) 135

Track 3 – Economic Development 145

Track 3 Pre-Organized Session Summaries and Abstracts for the Sessions 145

Track 3 Roundtables 157

Track 3 Individual Paper Presentations 161

Track 3 Research in Motion (RiM) 192

Track 4 – Environmental Planning & Resource Development 202

Track 4 Pre-Organized Session Summaries and Abstracts for the Sessions 202

Track 4 Roundtables 207

Track 4 Individual Paper Presentations 209

Track 4 Research in Motion (RiM) 354

Track 5 – Inclusion an Accessibility in Planning 386

Track 5 Roundtables 386

Track 5 Individual Paper Presentations 388

Track 5 Research in Motion (RiM) 444

Track 6 – Housing 450

Track 6 Pre-Organized Session Summaries and Abstracts for the Sessions 450

Track 6 Roundtables 472

Track 6 Individual Paper Presentations 476

Track 6 Research in Motion (RiM) 572

Track 7 – International Development Planning 597

Track 7 Pre-Organized Session Summaries and Abstracts for the Sessions 597

Track 7 Roundtables 635

Track 7 Individual Paper Presentations 639

Track 7 Research in Motion (RiM) 675

Track 8 – Land Use Policy and Governance 684
Track 8 Pre-Organized Session Summaries and Abstracts for the Sessions 684
Track 8 Roundtables 707

Track 1 Pre-Organized Session Summaries and Abstracts for the Sessions

MARGINALIZATION AND RESILIENCE: IMMIGRANTS IN URBAN COMMUNITIES
Abstract ID: 1112.0.0.570.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.830.2024, 1108.0.0.659.2024, 1108.0.0.676.2024, 1108.0.0.750.2024, 1108.0.0.919.2024

Cathy Liu [Georgia State University] cyliu@gsu.edu, organizer

Understanding the experiences of immigrants, workers and businesses in urban and suburban communities remain a daunting task for planning. This pre-organized session examines this question through a collection of articles drawing from five case studies in different parts of the U.S.: Dayton, Ohio, Atlanta, Georgia, Los Angeles, California, Washington, DC., as well as Salem Massachusetts. Through various mixed methods approaches, the papers look into several aspects of immigrants' marginalization and resilience amidst recent economic, social, political, and environmental changes which include their "welcome" in local communities, labor force participation in the informal economy, their struggle in the gentrifying suburbs, their location mobility along ethnic corridor, and women's weathering of external risks. In particular, this collection emphases the importance of community leaders and local agencies in the process of planning for immigrant inclusion.

Learning Objective(s):

- Understanding immigrant experiences and planning efforts in urban areas

WELCOMING IMMIGRANTS IN A SEGREGATED CITY: CASE OF DAYTON, OHIO
Abstract ID: 1108.0.0.830.2024
Pre-Organized Paper Presentation

Stacy Harwood [University of Utah] harwood@arch.utah.edu, presenter
Debolina Banerjee [University of Utah] banerjee.d@utah.edu

Many U.S. cities have become “immigrant-friendly” as a humanitarian effort and local economic development strategy. These progressive local government initiatives encourage multiculturalism, promote inclusion, and even re-invigorate neighborhoods. How are these local initiatives received by the residents and implemented in cities with long histories of racial segregation? If we don’t question who engages in these activities and where they occur, we perpetuate an uncomplicated multicultural imagination that blinds us from structural inequalities. We used a mixed-method approach to examine this research question in Dayton, Ohio, a nationally recognized immigrant-

friendly city. We explore community attitudes about local immigrant-friendly initiatives and racial segregation through content analysis of 100 interviews with public officials, neighborhood leaders, community activists, focus groups, and public documents. Using US Census data, we conducted cluster analysis (Moran's I) to understand the spatial pattern of segregation and geospatial distribution of foreign-born (including country of origin) and native-born. Finally, we mapped out where immigrant welcoming activities occur. Putting all these narratives in conversation with each other begins to unfold a complex and nuanced story of embracing immigrants and neighborhood revitalization. At the same time, we found glaring omissions and contradictions about welcoming in a historically segregated city.

The vision of an immigrant-friendly town assumes that including immigrants will increase access and improve the quality of life for everyone because they are risk-takers and innovative drivers of economic growth in technology and science. This then justifies the entrepreneurial activity facilitated by the state, including risk-taking with public resources and giving the private sector more power to stage consensus, depoliticize social relations, and neutralize dissenting voices…" (MacLeod, 2011). Rust belt cities desperate to see economic growth, have jumped on the "welcoming" immigrant bandwagon; however, missing from the welcoming is any critical discussion about inequality, racial-ethnic segregation, social-spatial inequality, and poverty. This research project argues that the welcoming vision reinforces spaces of conflict and exclusion. Others have found such contradiction in state-led efforts. Centner (2009) explains that the contradiction between intentions and outcomes "result in a quagmire of neoliberal logic tangled and quarreling, which creates an environment quite unlike what the local state originally aimed.

COMMUNITY-LED DISASTER RELIEF FOR EXCLUDED IMMIGRANT WORKERS IN LOS ANGELES

Abstract ID: 1108.0.0.659.2024
Pre-Organized Paper Presentation

AJ Kim [San Diego State Univeristy] anna.kim@sdsu.edu, presenter

The COVID-19 pandemic exposed the precarious lives of many immigrant workers in the global city. Unable to do paid work during government-mandated shutdown periods and excluded from multiple sources of pandemic relief, immigrants who worked in low-paid, informal jobs–many of whom are undocumented and live in mixed-status households–were without access to the most basic forms of social protection. In Los Angeles, one of the largest immigrant-based economies in the United States, daily risks to livelihood and personal health took multiple forms. Immigrant workers faced hunger, the threat of eviction, and the inability to access essential medicine and other PPE provisions. This paper examines the role of CBOs in providing daily care for poor immigrants in the city.

LEAVE OR STAY: IMMIGRANT SMALL BUSINESSES ALONG BUFORD HIGHWAY

Abstract ID: 1108.0.0.676.2024
Pre-Organized Paper Presentation

Cathy Liu [Georgia State University] cyliu@gsu.edu, presenter
Colleen Hammelman [UNC Charlotte] colleen.hammelman@charlotte.edu
Dylan Turner [UNC Charlotte] dturne53@charlotte.edu

Immigrant small businesses in emerging gateway cities in the Sunbelt region are more likely to cluster along inner-suburban corridors where they contribute to economic development and the social and cultural capital of growing immigrant groups. These businesses also face numerous challenges in accessing government services and traditional financing, withstanding market shocks, and overcoming language and cultural barriers. This research examines immigrant retail patterns on the international corridor of Buford Highway in metropolitan Atlanta in order to better understand these trends. Through analysis of data regarding in/out migration patterns as well as in-depth key informant interviews and discourse analysis of economic development policies, we found that the interethnic concentration of businesses, long-standing demand, and cultural cache of the international retail corridor of Buford Highway has provided for a strikingly stable retail landscape despite changing population demographics and economic challenges (including during the pandemic). These findings demonstrate the continued possibility for place-based planning strategies to fortify immigrant small businesses against development pressures. This research

contributes to literature on immigrant entrepreneurship and place-based strategies for supporting economic development in immigrant commercial corridors.

THE RIGHT TO SUBURBIA: COMBATING GENTRIFICATION ON THE URBAN EDGE

Abstract ID: 1108.0.0.750.2024

Pre-Organized Paper Presentation

Willow Lung-Amam [University of Maryland, College Park] lungamam@umd.edu, presenter

In recent decades historical patterns of Black and Brown suburban settlement have been met with rapidly rising immigration and spiking poverty rates. At the same time, a slate of forces calling for the remaking of sprawling suburbs into more dense urban landscapes have converged. While presumably marginalized groups might benefit from more compact suburban neighborhoods, they often rightfully fear the impact of large-scale redevelopment. Projects that many urban planners and policymakers see as needed investments in underdeveloped neighborhoods are often experienced by communities as a recipe for displacement that spurs heated backlash and debate.

The Right to Suburbia investigates battles primarily waged by Black and Latinx communities in the Washington, DC, suburbs over the uneven costs and benefits of redevelopment. In case studies of three neighborhoods that have recently undergone a suburban renaissance, the book asks how those most likely to bear the weight of suburbia's transformation have tried to balance the scales. To what extent have the processes and products of suburban redevelopment disadvantaged marginalized groups? And how have these groups mobilized to assert a more equitable stake in their suburban futures?

The Right to Suburbia argues that the new urban renewal, which references the latest period of gentrification in US cities, does not fit tightly within the narrow bounds of our urban imaginary. Similar processes are also at work in suburbs, producing and reproducing patterns of uneven, racialized development. But the new suburban renewal has not simply added a prefix onto an old concept. With a new cast of characters and spatial dynamics at play, suburbia has reshaped urban redevelopment processes and politics. Suburbia's unique brand of redevelopment has added to, rather than alleviated, the challenges that marginalized communities, especially Black and Latinx

Americans, face.
It is also a highly disruptive process in which marginalized communities hold little power. Suburbia's consolidated and privatized land uses facilitate redevelopment processes that are often large in scale and deep in impact. Political fragmentation, increasing suburban segregation, and sprawl isolate communities and render the struggles of one neighborhood invisible to and unconnected to others. Struggling suburbs often lack high-capacity, established nonprofits and advocacy organizations that can readily engage residents in sustained redevelopment battles. Organizing and coalition building is further hampered by suburbia's changing composition. Compared to their urban counterparts, gentrifying suburbs tend to have more diverse residents dispersed across larger areas.

Black and Latinx suburbanites, particularly immigrants, often lack well-established organizing platforms. They often hold less political power and representation suburbia's traditional civic and business elite, and less than that which has been built over decades of struggle in central cities. When redevelopment arrives, residents in neighborhoods originally designed to exclude them, face an uphill battle to build the politics and policies to remain in place. But just as Black and Brown communities have always done, they are fighting not only for access to suburbia and its opportunities but also for more just and equitable communities in suburbs.

The Right to Suburbia reveals the vigorous organizing efforts emerging in one of the most rapidly and intensely gentrifying metropolitan regions in the United States. It tells the tale of how grassroots activists, community groups, and political leaders mobilized across race, ethnic, and class lines to fight for communities right to suburbia—their right to stay put and benefit from new neighborhood investments. This right, I argue, recognizes marginalized communities as important constituents in shaping suburbia's future. It advances a more equitable distribution of the risks and rewards of redevelopment and prevents vulnerable groups from being pushed farther beyond the urban edge.

WEATHERING: MIGRANT WOMEN FACING VIOLENCE IN MULTIPLE CLIMATE CRISES

Abstract ID: 1108.0.0.919.2024
Pre-Organized Paper Presentation

Elizabeth L. Sweet [University of Massachusetts Boston] betsy.sweet@umb.edu, presenter

In the context of our ever-worsening climate crisis and the simultaneous socio-political crisis caused by racist, xenophobic, hetero-patriarch and neoliberal capitalist systems, migrant women are paying a heavy price with their bodies which are weathered by it all. Scholars suggest weathering is a situated phenomenon embedded in social and political worlds (Walker 2023) and as a process that encompasses the physiological effects of living in marginalized communities, which bear the brunt of violence linked to racial ethnic, religious and class discrimination and environmental degradation (Geronimus 2023). Christina Sharpe (2016) uses the notion of weather as the totality of the physical and socio-political climate, which in-itself is anti-Black and documents how Black bodies weather such climate. In general, the weather is an important signifier of climate change. As a concept, it can indicate both deterioration/erosion as well as strength/endurance (Geronimus 2023).

In this paper, we are interested in viewing weathering as a framework to better understand the multiple types of violence associated with the socio-political and climate change crises, and its impact on migrant women's bodies. We use data from a study that documented the effect of climate change on the bodies of migrant women in the town of Salem, Massachusetts through body and community mapping (Sweet et al. 2022), to propose that weathering could be a useful way for planners and urban scholars to understand violence against women and to help move toward the creation of feminist cities. For instance, in their body maps about climate change, participants highlighted "physical pain and discomfort from the built environment, intense emotional distress linked to social and economic issues they faced including crime and police mistreatment . . . [but also] strength through individual abilities, and comradery through caring" (Sweet et al. 2022, P. 26). Here adopting weathering as a framework would not only highlight the negative impact of the environmental and socio-political systems on migrant women/marginalized population but simultaneously signal strength for repair/healing. Therefore, our paper is an opportunity to tease out the theoretical value weathering can add to our knowledge about the ways excluded communities are being impacted by the compounding violence of climate change and socio-political systems. In addition to the study in Salem, we engage with scholarship that discusses weathering as bodily experiences of constant stress and the associated health inequities faced by marginalized communities lining in a rigged and exploitative system (Geronimus 2023), material and affective impact of immigration politics on targeted communities (Walker 2023), and climate induced gender-based violence (Memon, 2020). Upon such engagement, our goal is to further develop the framework of weathering for urban scholars and planners to add to the understanding of violence against women located at the nexus of socio-political and climate change crises and ways such violent phenomena can be addressed.

RACIALIZED HOUSING AND CREDIT ACCESS: MEASURING CONTRIBUTORS TO DISPARITIES

Abstract ID: 1112.0.0.251.2024

Pre-Organized Session Summary

Session Includes: 1108.0.0.1152.2024, 1108.0.0.369.2024, 1108.0.0.257.2024, 1108.0.0.1156.2024

Tyler Haupert [NYU Shanghai] tyler.haupert@nyu.edu, organizer

Access to housing and credit is stratified across racial/ethnic lines in the United States in part due to racial discrimination and policies perpetuating inequities. The resulting uneven distribution contributes to differences in socioeconomic resources including wealth building, neighborhood amenity quality, and small business development. This session includes research on several underexplored contributors to stratification in housing and credit access. One study links eviction rates in Georgia to how credit and debt's use in predatory landlord-tenant relationships evolved through the institution of sharecropping in courts. Another explores detailed race/ethnic categories and access to brick-and-mortar banking. A third focuses on Asian mortgage applicants' likelihood of receiving subprime loans from different lender types, including ethnic group differences. A final study explores predatory practices targeting homeowners to enroll in solar panel programs in the Rio Grande Valley.

Learning Objective(s):

- The audience will learn about the connection between historical processes of dispossession and contemporary disparities in housing access
- The audience will learn about discrimination and disparities in access to credit and homeownership among members of under-studied racial and ethnic groups
- The audience will be able to identify potential planning interventions designed to reduce racial and ethnic stratification in housing and credit access

FROM SHARECROPPING TO EVICTION

Abstract ID: 1108.0.0.1152.2024

Pre-Organized Paper Presentation

Seumalu Elora Raymond [Georgia Institute of Technologhy] elora.raymond@gatech.edu, presenter

The summary eviction process in the US south is characterized by high volume, short case duration, and few of the turn-of-the century statutory tenant protections that were put in place in regions that urbanized in the 19th century. Where tenant protections exist, tenants are rarely able to exercise these legal rights (Summers, 2020), and court culture and judicial discretion are important contributors to high eviction rates (Sudeall & Pasciuti, 2021).

We draw on racial capitalism and critical legal scholarship of property to explore the historical antecedents to contemporary eviction systems in the US South. If the racialization of labor and property were integral to the formation of early capitalist systems in the colonial United States, subsequent capitalist accumulation grew by developing these racial formations (Robinson, 2000). We join this framework with institutional theory in order to understand how modern institutions carry and preserve these apparatuses. Legal scholars have argued that America's modern system of property exchange, for example, reflects the racialized colonial context from which it emerged (Park 2023; Bhandar 2018). We extend this critical legal scholarship on property to the practice of eviction.

In the US south, state courts and landlord-tenant law developed through the institution of sharecropping. The abolition of slavery left a vacuum in southern credit markets which was quickly filled by the crop lien system (Priest, 2022; Foner, 1982). The emergence of a distinctive, racialized system of sharecropping led to the legal and cultural erosion of common law landlord-tenant concepts such as tenant possession, and forestalled advances in tenant rights such as the implied warrant of habitability. Southern courts institutionalized the criminalization of rent debt to control African American labor mobility, and created a hierarchy of claims that minimized landlord risk for crop failure (Woodman, 1995).

Extra-contractual forms of control rooted in local custom and criminal law were commonly used in southern states to ensure agricultural landlords a secure return and a restricted rental base/labor force. We argue that these extra-contractual procedures were incorporated into the Georgia courts summary eviction process. The result is a set of contemporary courts which prioritize the security and efficiency of landlord returns and re-possession while diminishing ability of Georgia tenants to exercise statutory legal protections.

We examine these findings using mixed methods. In a series of regression models, we link the intensity of sharecropping in the 1920s to contemporary eviction rates, finding that counties with high rates of sharecropping in 1920s are associated with a 31% higher eviction filing rate a century later. In a separate analysis, we generate codes from histories on southern courts, including categories of rent debt, efficiency, security, possession, and hierarchy of claims. Using these codes, we analyze contemporary interviews with courts personnel. After identifying courts with practices, policies, and attitudes linked to these themes, we will perform a regression analysis examining the effectiveness of federal tenant protections extended during 2020 and 2021.

WHO HAS ACCESS TO PHYSICAL BANKS? A DETAILED ANALYSIS OF DISPARITIES

Abstract ID: 1108.0.0.369.2024
Pre-Organized Paper Presentation

C. Aujean Lee [University of Utah] aujean.lee@utah.edu, presenter
Andrew Van Leuven [Oklahoma State University] andrew.vanleuven@okstate.edu

Local brick-and-mortar financial institutions—banks, credit unions, and their respective branches—are valuable for residents of low-income neighborhoods and communities of color in the United States. Given their physical location, permanence, and stability within the community, physical lenders are better equipped to form interpersonal relationships and tailor their services to the needs of the local community (Lux and Greene, 2015). This approach, referred to as "relationship lending," allows financial institutions to consider soft information about local market conditions and borrower preparedness, often leading to the approval of loans that may not have been considered solely based on hard data (Scott, 2004). Thus, the presence of a local bank can be most beneficial to community members with low incomes or credit scores. In addition, local financial institutions are valuable for small businesses that rely extensively on cash transactions need a physical location deposit cash, reducing the risks and inconvenience associated with indefinitely holding large sums of cash (Federal Reserve Board, 2019).

Given the benefits with local brick-and-mortar financial institutions, it is vital to understand which communities have access to a local bank or credit union than others. These disparities have historical roots in policies and practices like redlining, which excluded communities of color from financial access and perpetuated concentrated poverty (Derenoncourt et al., 2022). Moreover, racial/ethnic disparities in banking persist, with higher rates of unbanked individuals among Black, Latinx, American Indian, and Alaskan Native communities (FDIC, 2021). Yet, few studies have assessed smaller racial/ethnic group access such as Indigenous groups with challenges such as geographic isolation and varying title statuses impacting banking on reservations. Asian Americans, as a whole, appear to have access to banking; however, more data is required to understand potential group differences given that low-income Asian Americans are more likely to rely on cash and are disconnected from financial institutions.

Our study seeks to understand the spatial distribution of access to financial institutions based on racial/ethnic, income, and neighborhood composition. First, we developed a neighborhood typology, which uses local Moran's I to identify statistically significant concentrations of racial/ethnic groups by census tract and captures smaller racial/ethnic clusters (Black, Latinx, Asian, American Indian and Alaska Native, Native Hawaiian and Other Pacific Islanders, and white). We then categorized tracts by income and nativity. This categorization allows detailed comparisons of what types of racialized neighborhoods have access to banks.

After, we used logistic regressions to model the relationship between neighborhoods and the likelihood of being located within a lending desert. After controlling for socioeconomic and demographic factors, Black neighborhoods are underbanked compared to racially integrated areas—regardless of class and income. High income Latinx areas had a positive relationship with banking locations, while low-income Latinx enclaves were underbanked. High income Asian areas and low-income Asian enclaves had access to banks. Native Hawaiian and Other Pacific Islander neighborhoods and American Indian and Alaska Native areas had a marginally negative significant relationship to banked areas. With a nuanced approach to understand the intersections of racial/ethnic concentration, income, and nativity, our results show granular differences and where groups have the highest gaps in banking access. The

findings also help to understand inter- and intra-community socioeconomic disparities within and between racial/ethnic groups and the importance of tailored approaches that focus on the intersections of race/ethnicity, class, and nativity.

SUBPRIME LOANS, ASIAN BORROWERS: TRADITIONAL, FINTECH, AND MINORITY LENDERS

Abstract ID: 1108.0.0.257.2024
Pre-Organized Paper Presentation

Tyler Haupert [NYU Shanghai] tyler.haupert@nyu.edu, presenter
C. Aujean Lee [University of Utah] aujean.lee@utah.edu

Subprime lending in the United States has long been unevenly distributed across racial and ethnic groups, and these patterns remain in the post-foreclosure crisis lending environment (Faber 2018). Stratification existed in the lending outcomes of Asian borrowers from different ethnic groups during the subprime boom and foreclosure crisis (Rugh 2015). The ensuing tightened regulatory oversight of subprime lending as well as the emergence of online mortgage lending alternatives changed the options available to minority borrowers, including Asians. However, recent research suggests subprime lending rates remain unevenly distributed across Asian communities depending on factors such as borrower immigration status and whether a lender operates online or in-person (Haupert & Lee 2024).

Against this backdrop, the role of Minority Depository Institutions' (MDIs) in subprime lending remains underexplored. MDIs, whose missions include providing credit and financial services to traditionally underserved communities, expanded mortgage credit access to non-white and immigrant communities during the subprime lending boom, but also suffered closures and a disproportionate amount of borrower defaults during the subsequent foreclosure crisis. While the majority of Asian borrowers utilize non-MDI lenders, research suggests Asian-owned MDIs play an important role in providing mortgages to the rapidly growing and highly segmented Asian community (Rugh 2015). This study contributes to a small but growing body of work investigating subprime lending by online fintech lenders (Haupert & Lee 2024) and Asian-owned MDIs (Zonta 2012) to Asian borrowers

and neighborhoods in the post-foreclosure crisis era. Specifically, we answer the research question, “What is the relationship between subprime lending to Asian borrowers at Asian-owned banks relative to traditional and online fintech mortgage lenders in 2018 and 2019 in the United States?”
To answer this question, we use loan-level Home Mortgage Disclosure Act (HMDA) data, the Federal Deposit Insurance Corporation’s MDI classification, and an original dataset categorizing lenders as fintech or traditional. In 2018, the HMDA was updated to include additional loan characteristics such as borrower age, loan to value ratio, and racial and ethnic differences. We leverage these updated data to specify a series of logistic regression models that control for borrower, lender, and neighborhood covariates to assess rates of subprime lending to Asian borrowers at traditional lenders, fintech lenders, and Asian-owned MDIs.
Preliminary results suggest Asian-owned MDIs offer significantly higher rates of subprime loans than traditional or fintech lenders to similarly qualified Asian borrowers. We also uncover variation in subprime lending rates to different Asian ethnic groups, with Chinese and Vietnamese borrowers receiving more subprime loans than other ethnic groups. Finally, we determine that fintech lenders offer Asian borrowers the most favorable loan terms relative to Asian-owned MDIs and other traditional lenders. These findings offer planners, advocates, and policymakers insights into the modern landscape of mortgage lending for Asian borrowers, informing Fair Housing law, mortgage lender regulation, and the administration of local support such as credit counseling offered to minority borrowers.

PREDATORY PRACTICES IN THE ENERGY TRANSITION: INDEBTEDNESS AND COMMUNITIES

Abstract ID: 1108.0.0.1156.2024
Pre-Organized Paper Presentation

Miriam Solis [The University of Texas at Austin] solis@austin.utexas.edu, presenter
Dalia Vazquez [The University of Texas at Austin] dalia.vazquez@ausin.utexas.edu
Veronica Jacome [Temple University] veronica.jacome@temple.edu
Salma Elmallah [Temple University] salma.elmallah@temple.edu

In spring 2023, a U.S. Department of Energy delegation arrived in the Rio Grande Valley, an increasingly urbanizing region along the U.S.-Mexico border. Officials discussed their commitment to remediate longstanding energy disinvestment in the Rio Grande Valley through clean energy initiatives that can spur equitable community economic development. A Resource In Serving Equality (ARISE) Adelante, a community-based organization, had

news: yes, the investments were needed, but the solar market roll-out was already causing some residents major harm. ARISE Adelante empowers residents living in colonias, or unincorporated communities that have long struggled with disinvestment, and the clean energy transition was repeating patterns of financial exploitation. Fueled by clean energy investments, businesses are enrolling homeowners in solar panel programs. Through high-pressure sales pitches and misinformation, residents were promised reduced electricity costs and rebates. They entered predatory contracts that them in insurmountable debt and sometimes even without any energy at all.

Many low-income residents in Central Pennsylvania are also facing increasing levels of energy debt. OnTrack, a fixed payment plan administered by the electric utility PA Power and Light and mandated by the PA Utility Commission for users behind on electricity bills, aims to protect so-called "responsible" bill paying customers from delinquent customers. Missing a payment or exceeding usage limits can lead to removal from the program and accrued debt (Marx, 2023). Residents, many of whom are tenants on fixed incomes or working in service jobs, experience a common debt narrative: enrollment in repayment plans with their electric utility, struggles to keep up with deliverable fuel payments, and the threat of disconnection or eviction due to unpaid bills that can total to tens of thousands of dollars. Some residents exceeded their allowance due to having inefficient baseboard electric heating, constantly running the heat to avoid frozen water lines, or shifting from costly kerosene or propane to plug-in electric heating. These reasons challenge the state narrative of "responsible" vs. "delinquent" ratepayers, and the linear natural gas-to-electric heating transition model.

This article draws on insights from exploratory research in the Rio Grande Valley and interviews with OnTrack participants to examine the local consequences of energy transitions. Environmental justice research and practice have long pointed out how sweeping environmental initiatives have created and reinforced inequalities. This argument is echoed by just transition scholars who caution against a low-carbon future that reinforces racial and economic inequalities. Labor movement leaders coined the phrase "just transition" to call for higher environmental standards for those employed in polluting industries, as well as for workforce supports for them to enter new lines of employment (Córdova, 2023). Although initially focused on the energy domain, just transition efforts have broadened in scope to respond more effectively and accurately to intersecting priorities held by working-class communities (Mulvayney, 2014; Kojola and Agyeman, 2021). The pursuit of a just transition is also contingent on reimagined states, ones that "move from technocratic, neoliberal actions to more globally focused, democratic institutions responsive to people's material needs" (Cha et al. 2022, pg. 80). Case study findings highlight the current role of predatory financing practices that have historically harmed communities, as well as the need for large-scale energy reforms to be informed by the experiences of local communities.

Track 1 Roundtables

CONSTRUCTING PLACE: A CONVERSATION ABOUT CULTURAL LANDSCAPES AND PLANNING

Abstract ID: 1109.0.0.562.2024
Roundtable Submission

Meghan Gough [Virginia Commonwealth University] mzgough@vcu.edu, organizer
Kathryn Howell [University of Maryland - College Park] klhowell@umd.edu
Andrea Roberts [University of Virginia] aroberts318@virginia.edu
Hannah Cameron [University of Maryland College Park] hmcam@umd.edu

This roundtable will discuss the theoretical constructions of "place" in planning, and ways that these different perspectives influence how and with whom planning sees, preserves, and memorializes cultural landscapes. Drawing on their research and practice, participants will share areas of tension in this work, specifically around questions of process and outcomes in centering cultural landscapes in the construction of place.

Discussion topics will explore challenges to and the critical nature of community engagement - including with descendants of sacred places, approaches for disseminating knowledge, and opportunities to inform changes to planning practice and policies (i.e., community-based decision-making, historic preservation, redevelopment, affordable housing, etc). Roundtable participants will consider the roles of scholars and planning educators in the understanding and social construction of place, and implications for how (certain) cultural landscapes in planning are made visible or invisible in practice. The roundtable will conclude with participants offering specific strategies for integrating socially constructed place identities and definitions (from local, grassroots leaders) into formal planning and preservation processes.

Pacific Islander communities are poorly served by formal state planning processes in the United States, Australia, and Aotearoa New Zealand. The housing, transportation, labor and environmental injustices that Pacific Islanders face in settler colonial cities are well documented. These injustices emerge out of the legacy of militarization, imperialism and colonization of the Pacific. Planning processes are often conducted with frameworks that are not culturally specific or appropriate to the indigenous and diaspora communities; and are organized into categories that defy an indigenous, or genealogical understanding of community and belonging (Hau'ofa, 1994).

Categorization and identity of Pacific Islanders within diaspora are defined by the legacy of colonial relations. For example, Kānaka Maoli in the continental United States are citizens, Kānaka Maoli in Aotearoa are foreigners. Samoans from one island of Samoa are indigenous to the US, and are US Nationals; Samoans from another island are foreigners to the United States. COFA act migrants from the Federated States of Micronesia, The Republic of the Marshall Islands and the Republic of Palau fall into yet another liminal legal status. Nonetheless, urban planners' definitions of the disparities Pacific Islanders face; and the remedies urban planners offer, such as access to resources, policies and programs, are governed through these categorizations and colonial identities.

This roundtable seeks to resituate our understanding of the urban planning challenges of Pacific Islanders by referencing indigenous Pacific ways of knowing, being, and planning. Within Pacific Studies, scholars have used indigenous concepts of travel to understand the complex mobilities of the transnational diaspora (Lilomaiava-Doktor, 2009; Thompsen, Lopesi & Lee, 2022); and have uncovered the linkages between indigenous understandings of place and shelter to describe how social housing has been used to secure Pacific Islanders' right to the city (Walker & Barcham, 2010). Other communities and scholars have delineated Pacific Islander intimacies, radical refusal, and world building.

This roundtable on Moana urbanism explores the issue of Pacific Islander identities, and the challenges of

reconceptualizing urban planning from the perspective of diasporic communities with strong ties to indigenous land. Bringing together Kānaka Maoli, Māori, Samoan and Chamoru scholars and bridging the fields of architectural history, urban planning, design, and geography, we draw on Pacific Studies approaches to understand the challenges that Pacific Islanders face within traditional urban planning, and explore ways to conceptualize land, mobility, and interrelatedness. We hope to address these questions:

How are Pasifika planners transforming practice?
How do we, as Pacific Islanders, see ourselves within urban planning across roots and routes?
What does it mean to plan for indigenous mobilities?
How do Pacific Islanders find solidarity across communities, and/or organize for liberation around categories of oppression?
What are the differences between Pacific frameworks of land?

Track 1 Individual Paper Presentations

BANK-SPONSORED PLANNING & LIBERAL ANTIRACISM: A CASE OF STUDY
Abstract ID: 1108.0.0.471.2024
Individual Paper Presentation

Andrew Born [University of Illinois at Chicago] aborn2@uic.edu, presenter

Historically, financial institutions have played a major role in the economic domination of racialized groups in the U.S. Through racist lending policies and practices, often made legal under U.S. law, financial institutions have economically excluded or exploited Black and Brown people and the places where they live (Taylor, 2019; Wyly et al., 2009). More recently, financial institutions and their philanthropic subsidiaries have become frequent sponsors of planning initiatives in these places. Some literature suggests that banks have been pressured into sponsoring these planning initiatives by social movement efforts and government regulations attempting to achieve a form of

distributive justice (Schwartz, 1998; Squires, 1992). However, more recent literature on philanthrocapitalism proposes that they sponsor plans in order to ensure the continuation of market practices in places where the market is failing (Mitchell & Sparke, 2016). This paper attempts to resolve these contrasting interpretations by asking what financial institutions achieve by sponsoring planning initiatives in places where Black and Brown populations reside. In order to address this question, I conduct a case study of the WORTH initiative, a Wells Fargo-sponsored planning initiative meant to increase BIPOC (Black, Indigenous, and People of Color) homeownership. I focus specifically on the planning process as it played out in Chicago from 2021-22. In order to describe the case in detail I use participant observation during planning meetings, key informant interviews, press releases, and documents produced from the initiative. Through an analysis of the case, I identify three achievements of Wells Fargo. First, by publicly promoting its goals of increasing BIPOC homeownership and its planning efforts through WORTH, Wells Fargo is able to present itself as an antiracist institution despite data and legal settlements that suggest otherwise. Second, by offering planning grants to regional collaborations competing for implementation grants, Wells mobilizes local community reinvestment expertise to create strategies that competitors think will appeal to Wells Fargo. Third, by sponsoring the planning process, Wells re-oriented the behavior of leaders of community development organizations to comply with bank interests rather than make more radical demands for reparations. Ultimately, this case demonstrates that by promoting liberal antiracist rationalities through planning grants, powerful financial institutions can avoid the type of reparative planning that Williams (2024) argues will truly produce just cities. Planners must be wary of participating in bank-sponsored plans that claim to be antiracist and instead focus their efforts on plans that begin by problematizing the policies and practices of institutions like Wells Fargo that result in the expropriation of surplus value created by Black labor.

BEYOND TRADITION: CO-CREATING AN ANTI-RACIST MENTORSHIP BLUEPRINT

Abstract ID: 1108.0.0.502.2024
Individual Paper Presentation

Anaid Yerena [University of Washington Tacoma] yerena@uw.edu, presenter
Sara M. Perisho Eccleston [University of Washington Tacoma] seccle@uw.edu

Academics and practicing planners have long grappled with fostering inclusivity, especially in attracting and retaining BIPOC individuals, to improve outcomes in planning education and practice. For example, Black planners have been pivotal since the civil rights movement to planning education and the profession (Mitchell et al, 1970; Thomas & Ritzdorf, 1997), yet, recent planning scholarship (García et al, 2021) indicates BIPOC faculty and practitioners continue to be underrepresented in planning practice and higher education environments. Specifically, Black individuals comprise only six percent of full-time faculty in degree-granting post-secondary institutions, despite constituting 13 percent of the overall population in the U.S. (NCES, 2023). This underrepresentation is partly attributable to predominantly white institutions, where the climate is often unsupportive and even hostile towards BIPOC individuals. Consequently, faculty mentoring programs become key in supporting the planning profession's landscape.

This work aims to describe the framework for a Multilevel Faculty Mentoring Program (MFMP). The MFMP is rooted in anti-racist mentoring models, emphasizes group mentoring, peer connections, and multilevel support, and is facilitated by a BIPOC faculty director. This equity-focused multi-leveled mentoring-partnership model redefines traditional mentorship in higher education while championing collective care, empowerment, and the intentional dismantling of hierarchical relationships (Endo, 2020; Chapman, 2018). The MFMP embraces mutuality and transformative relationships (Hinsdale, 2016), fostering dynamic networks of support within a community.

By prioritizing collective care, empowerment, and the intentional dismantling of hierarchical structures, the program fosters transformative relationships and mutual support networks. The adoption of dynamic networks within a community framework aligns with the evolving landscape of urban planning, where collaboration and inclusivity are paramount. Central to the program's success is the role of leaders across campus as conversation facilitators, guiding discussions around shared values, principles, and goals. The program cultivates a culture of trust and collaboration among faculty members and leaders.

The research questions that the work addresses are 1) how does the MFMP address the challenges faced by BIPOC faculty in academia, and 2) what are the implications for fostering inclusive environments and advancing social justice for faculty in higher education? This paper explores a conceptual model for how this innovative approach can reduce social isolation, enhance sense of belonging, and promote participant well-being, particularly within the context of planning faculty new to an institution of higher education. The conceptual model proposed in this project explores the interconnectedness between mentorship, community building, and individual well-being.

The work utilized a mixed-methods approach to comprehensively understand the Multilevel Faculty Mentoring Program (MFMP) and its impact on addressing challenges faced by BIPOC faculty. Three data collection methods were employed: semi-structured interviews with MFMP participants and program administrators explored their experiences, perceptions of effectiveness, and observed changes in sense of belonging and well-being; document analysis of program-related reports, emails, and other written materials to understand program goals, implementation strategies, and outcomes; and surveys to collect quantitative data on demographic characteristics, satisfaction with the program, and perceived changes in sense of belonging and well-being. Additionally, quantitative data on program metrics such as retention rates and participation levels were gathered.

The MFMP exemplifies a novel approach to mentorship in higher education, with profound implications for faculty with marginalized identities. By prioritizing equity, community, and collective empowerment, the program redefines traditional mentorship paradigms and fosters inclusive environments where faculty members can thrive. As urban planning faculty navigate complex challenges and opportunities, this model offers actionable strategies for fostering a sense of belonging, reducing isolation, and promoting holistic development. This paper serves as a call to action for leaders in higher education and faculty to embrace transformative mentorship practices and advance social justice within our academic communities.

BEYOND WICKED PROBLEMS: HOSPICING WHITE SUPREMACY FOR JUST TRANSITIONS

Abstract ID: unequal power relations
Individual Paper Presentation

Elizabeth Walsh [University of Denver, Center for Community Engagement to advance Scholarship & Learning]
elizabeth.walsh@gmail.com, presenter

As a field, we planners wrestle with our relationship to progress and creative, utopian visions (Sandercock, 2023).

On one hand, we understand that our past pursuits of "progress" - hindered as they have been by paternalistic hubris and adherence with modernist, technocratic rationality - have left a host of "wicked problems" in their wake (Rittel & Webber, 1973). Over time, we have increasingly defined our field by our responsibility to address the wicked problems of socially, ecologically, and technologically complex urban environments. Gone is the mirage of a singular public interest.

On the other hand, we know we cannot afford to give up on possibilities of progress. From our origins in the social and ecological crises of the 19th century, our field is deeply rooted in pragmatic reform traditions and social movements inspired by visionary possibilities for expanding social and ecological wellbeing. Today, Indigenous scholar-activists and other leaders of intersectional movements for social and environmental justice saliently observe that despair is a luxury of the privileged, while active hope is a life-giving discipline in apocalyptic times.

This paper explores two interrelated questions arising from these tensions:

(1) How can we move beyond wicked problems to dream and enact alternative hopeful visions together, responsibly?

(2) How can we cultivate the power and wisdom required to support just and enlivening transitions toward liberatory and regenerative futures for all?

This paper approaches these questions through two key tasks.

First, it explores the mutually reinforcing entanglement between "wicked problems" and "white supremacy." This includes a review of the 10 characteristics of wicked problems through the lens of the 15 characteristics of white supremacy culture (www.whitesupremacyculture.info/). This analysis concludes that our capacity to address wicked problems is directly related to our capacity to hospice white supremacy culture. Building on the work of Vanessa de Oliveira Andreotti, hospice is a verb referring to "acting with compassion to assist systems to die with grace and to support people in the process of letting go – even when they are holding on for dear life to what is already gone." (Machado de Oliveira, 2021).

Second, this paper draws upon Indigenous scholarship and thought leaders from intersectional movements to identify practices and processes that cultivate the kinds of wisdom and power required to support just and enlivening transitions, both through hospicing of dying systems and midwifing liberatory and regenerative futures into being (Walsh & Abell, 2023). Andreotti observes that formal education does not "prepare us well to address wicked challenges and the complexities

Individual Paper Presentation

Travis K. Bost [University of Toronto] travis.bost@mail.utoronto.ca, presenter

After Hurricane Betsy swept through New Orleans in 1965, inundating the Lower Ninth Ward, widespread allegations circulated in the nearly all-Black neighborhood claiming the levees had been intentionally destroyed at the direction of powerful white elites. While the allegations have been dismissed by elites and academics alike for decades, more recent scholarship has argued that such claims-making played an important discursive role at the time, constituting at times a strategy of rhetorical resistance and a perceptive analysis of structural power in the region. In emphasizing the rhetorical and the analytical, however, these readings leave unexamined the material life-worlds to which Black discourse is connected. This article, by contrast, situates residents' post-disaster response within the history of their community's tradition of autonomous development, its Blues development tradition, by

reconstructing the many geographies of one unexceptional resident of the neighborhood named Lucy Thomas (1923-2004). Reconstructing this historical geography reframes Black claims-making in the wake of disaster as a part of a robust and ongoing counter-narrative of development in the region, rather than reactive rhetoric alone. Moreover, this micro-historical perspective provides a tight-focused analysis of the concrete practices individual Black communities undertake in the region to create and maintain an alternative sustainable development tradition.

This analysis draws centrally upon an oral history provided to local community organizers by Thomas in 2003 in which she describes not only the story of her own life but also the story of the three all-Black village communities of which she was a member over the course of her life. These communities include two freeholder villages formed during Reconstruction, Fazendeville and "the Cutoff," as well as a latter-day community formed in the Lower Ninth Ward by those displaced from these villages. I pair this oral history data with a range of archival sources that both corroborate and enrich this account, expanding it from a narrative of one individual to a more complex analysis of practices of community development and resilience strategies of survival among a unique set of autonomous Black communities in the U.S. South. These data include Freedmen's Bureau records and reports, a systematic analysis of manuscript census records, plantation crop reports, the reported results of archaeological investigations, as well as present-day resident interviews. The strategies of autonomous Black organization and sustainable development discussed in this paper encompass a century-long process. In the first section of the paper, I demonstrate the ways that recently freedpeople organized to develop independent political, economic, cultural, and spiritual institutions during Reconstruction that, in turn, they used to gain control of land for themselves, despite the re-imposition of the plantation system in Louisiana after the Civil War.

In the second section, I demonstrate how dozens of nascent independent Black communities like Thomas' began, in the twentieth century, to forge constellations of connection with one another and, thereby, to develop the structures of a broader regional pattern of autonomous Black development. In the third section, I then demonstrate how, building on the strength of these constellations of community development, Black communities like Thomas' have succeeded in maintaining their political and economic autonomy well into the twenty-first century — even despite displacements by environmental catastrophe and state intervention. Even after Lucy Thomas' community was displaced from its original land titles into the Lower Ninth Ward, and even after that subsequent community was displaced in 1965 by Hurricane Betsy, the structures of her autonomous Black community persist still in the present. These strategies of autonomous, regionally specific Black planning pose, for planners, a potential basis on which to form the structure of more just and sustainable community development in an era of increasing climate catastrophe and injustice.

BLACK DEVELOPERS IN DETROIT: CHALLENGES COMPARED TO WHITE DEVELOPERS

Abstract ID: 1108.0.0.1105.2024
Individual Paper Presentation

Rayman Mohamed [Wayne State University] ar7347@wayne.edu, presenter
Allison Laskey [Nature Cities] ablaskey@wayne.edu
Mckenzie Macharia [Wayne State University] mckenziemacharia@wayne.edu

Pockets of residential and commercial development have sprouted in Detroit since the bankruptcy of 2013. Some of these are visible and sizeable developments and they have been completed by established, large well-capitalized, White developers. However, there has always been and still is a smaller constituent of Black developers. Not much is known about these Black developers.

The paper aims to establish a primarily qualitative, understanding of African American developers in Detroit. While we expect to learn enough from this exploratory work to support tentative policy suggestions, the primary objective of this paper is to understand the factors that hinder the ability of African American developers to succeed and how they approach development differently from White developers.

Our approach to obtaining data is interviews with developers. A reporter from Crains Detroit helped in making initial connections with developers. We also reached out to industry groups and a recommendation from a community group that has been engaging with developers. From these contacts, we used snowball referrals to speak to other developers. We interviewed 14 developers, nine Black and five White. We stopped our interviews when further interviews yielded no new information relevant to our research. After completing our analysis of the interviews, we interviewed an additional Black and White developer to confirm that our findings from the initial 14 interviews remained the same.

We present three major findings:

1. Black developers gain expertise from public service or private sector experience, whereas White developers enter through legacy connections to entrepreneurship, or direct connections to legacy real estate developers, or happenstance indirect real estate connections.

None of the Black developers we spoke with came with family connections to real estate, wealth, or upper middle-class parentage. In every instance, the nine Black developers we spoke with took a circuitous route to the business, building experience working for local elected officials, as public servants, as employees of other developers, in the banking sector, or some combination of these experiences, and leveraged these experiences to launch their businesses. On the other hand, White developers entered the industry through a traditional route of social capital. Four of the white developers came from upper-class backgrounds of either business or professional lineage. One entered the business through happenstance interaction with wealthy investors.

2. Bias in financing and incentives remains a challenge for Black developers.

Based on previous research about Black entrepreneurship, we expected that Black developers would face more constraints with respect to obtaining financing. Our research bore this out. Eight of the nine expressed frustration

obtaining financing from banks, and never being sure whether it was because of the color of their skin. On the other hand, the White developers had access to financing whether through banks or investors.

3. All developers seek profits, but Black developers are more likely to link their work to community. All developers we spoke to seek profits, but for all the Black developers this was accompanied by an interest in the betterment of communities in Detroit. This interest in communities was not shared by White developers. A representative quote from a Black developer is: “Many of us are Detroiters … we are active in our neighborhoods”. While White developers spoke about the potential to have a positive impact on the city or a neighborhood, their responses also focused on individual accomplishments of themselves.

In summary, our findings are part of a larger academic literature about the challenges that Black entrepreneurs face. Our findings point to the need to provide a more level playing field for Black developers in Detroit.

"In five years, there will be a dramatic difference that you will see," Mayor Brown said. "Not only will the community look different, but opportunities for the people that live in East Buffalo will be different."

After the racially motivated supermarket mass shooting on May 14, 2022 in Buffalo, New York that killed 10 people and wounded three others, the mayor of Buffalo anticipated a significant transformation within the predominantly black community on the East Side (Yin et al., 2022). Governor Kathy Hochul enacted legislation to bolster New York's gun laws. Once the camera departed, have the concerns regarding this community undergone any changes? If so, what were they and how did they manifest?

Social media data is now a valuable alternative to studying the topics of concern and their associated sentiments. It empowers planners and policymakers to expand their reach in communities and serves as "a new way of supplementing traditional methods of public participation that are often face-to-face and engage small groups of participants" (Lin & Geertman, 2019, p. 77). Large language models like ChatGPT can provide valuable insights and assist in the interpretation of social media data by extracting discussion topics and sentiments.

This paper investigates the prevailing semantic topics that have garnered the most discussion about Buffalo's East Side neighborhoods on Twitter since the mass shooting. We aimed to find out the major concerns or interests and associated sentiments expressed about this racially segregated neighborhood (Yin, 2009). Are there any changes and potentials evident within the communities? Are people there still struggling with racial segregation, gun violence, poverty, and limited grocery options? What sentiments and perceptions on these topics are? Whether and how sentiments have changed?

We carried out topic modeling and sentiment analysis on about 55,000 tweets after preprocessing and cleaning for posts between May 14, 2022 and June 1, 2023 within the United States that are related to this mass shooting. The latent Dirichlet Allocation (LDA) model (Blei et al., 2003) was applied to detect topics based on collected tweets. The OpenAI API was used to conduct multi-class sentiment analysis in eight emotion categories: anger, fear, sadness, surprise, hopefulness, solidary, advocacy, and neutral. The ChatGPT also helped categorize discussions into relevant topics or aspects.

The findings from the multi-class sentiment analysis and topic modeling will shed light on the community's apprehensions regarding this predominantly black community, which has faced decades of challenges. Additionally, it will reveal whether the public has seen any positive developments and opportunities, aligning with the promises made by the mayor. This study will further showcase the potential of the ChatGPT application in urban planning and contribute to advancing discussions around its use for planning and designing cities and communities.

DO SPEED CAMERAS DISCRIMINATE?

Abstract ID: 1108.0.0.505.2024

Individual Paper Presentation

Ji Soo Kim [Korea Advanced Institute of Science and Technology] jk1577@kaist.ac.kr, presenter

Speed cameras are widely implemented in urban planning efforts to improve safety, with automated enforcement systems often considered impartial alternatives to human policing. Despite their prevalence, there remains a gap in assessing the geographic distribution of speed camera installations through the lens of equity in planning. Employing spatial analysis across all census tract areas in the District of Columbia, Maryland, and Virginia, this study reveals a disproportionate concentration of speed cameras in predominantly black neighborhoods. The findings highlight correlations between socioeconomic factors and speed camera placement, notably with a twofold higher concentration observed in black neighborhoods in the District of Columbia. These results underscore persistent structural inequities within urban planning frameworks, necessitating proactive measures to address systemic disparities. Recommendations are proposed to integrate principles of equity and inclusivity into planning strategies.

EMBODYING JUSTICE IN THE BUILT ENVIRONMENT: CIRCULARITY AND PRACTICE

Abstract ID: 1108.0.0.1232.2024
Individual Paper Presentation

The building sector is responsible for nearly 37% of the world's carbon emissions and offers significant opportunities for mitigating climate change. Many local governments are working to reduce operational carbon, but fewer have begun to address the challenge of embodied carbon, which refers to the greenhouse gas emissions produced in the lifecycle of buildings and infrastructure. This lifecycle includes the extraction, processing, manufacturing, and transportation of building materials; the construction, maintenance, and adaptation of buildings over time; and eventual removal, disposal, or disassembly at the end of use. An alternative to this linear pattern is achieving circularity (Circularity, Reuse and Zero Waste Development, 2023). To effectively and equitably achieve carbon neutrality, considerations of justice and equity are essential.

The Embodying Justice in the Built Environment: Circularity and Practice guide and workbook was created to aid local governments and community organizations who seek to center justice and equity in their work toward building carbon-neutral futures to address climate change. To develop this workbook, a team of university researchers, with the assistance of community leaders, analyzed the City Policy Framework for Dramatically Reducing Embodied Carbon (Carbon Neutral Cities Alliance and One Click LCA, 2020). While the report provides critical information for achieving carbon reduction, it does not explicitly address opportunities for developing justice and equity goals. Injustices and inequities pervade the built environment, including efforts to achieve carbon neutrality. This guide aims to disrupt this pattern by centering and operationalizing embodying justice in the built environment.

Unjust practices have shaped the built environment, from land dispossession to discriminatory planning, to harmful material extraction and toxic production processes, to wasteful construction and consumption practices. From manufacturing to the end of life, the extraction, production, and use of materials have continued to cause harm to entire communities. Injustices take the form of exploitative labor practices, lack of local economic support, reduction in community hiring practices, loss of local material use, and lack of transparency in material development, transportation, and landfill management. Unjust displacement and disruption through manufacturing facilities, brownfield growth, and off-gassing of materials within the supply chain perpetuate injustices globally, as does material extraction, harvest, manufacturing, and assembly.

Injustices are not limited to the first stages in the building lifecycle but affect how buildings are maintained and preserved over time. The racial wealth gap and lack of access to capital mean that building maintenance, lead abatement, and access to weatherization and building energy retrofits are unequal, affecting the health of inhabitants and potentially the lifespan of buildings (for example, see Avrami, 2022). At the end of life, buildings are typically removed through demolition, which releases toxins into the surrounding neighborhoods. Critics of federal and local demolition policies point to the role that they play in reinforcing patterns of racial segregation and accelerating cycles of disinvestment (Hackworth, 2019).

The Embodying Justice framework requires cities to carefully and comprehensively examine regulations, programs, and practices that affect the built environment's design, construction, maintenance, repair, replacement, and end-of-life approaches and their impacts on justice. It can serve as a reference for policymakers and practitioners in developing, implementing, and evaluating initiatives related to circularity, waste diversion and recycling, climate justice, and action, and in considering regulations and city permitting, long-range planning, economic development, and historic preservation programs. It can also be useful for government agencies at all levels when addressing the reuse and construction sector. The workbook is also intended for community organizations to help identify opportunities for engagement and change in their cities, as transitions to more just, equitable, and circular cities will require action beyond what local governments can accomplish on their own.

EQUITY IN POLICE STOP OR USE OF FORCE?

Abstract ID: 1108.0.0.881.2024
Individual Paper Presentation

Weijing Wang [University of California, Davis] weijingw@ucdavis.edu, presenter
Jesus Barajas [University of California Davis] jmbarajas@ucdavis.edu

Despite the safety benefits of traffic enforcement, more than 1,000 US residents die each year in police encounters, and Black people are 3 times more likely to be killed than their white peers. Research efforts on understanding the key drivers of sociodemographic differences in police stop and use of force are in great need for new ways to improve policing equity. This study addresses the issue by asking and answering the following research questions: (1) What are the scope and scale of sociodemographic differences in police stops for a traffic reason (vs. others)? (2) What is the heterogeneity of sociodemographic differences in traffic stops by result of stop and action taken during stop, after controlling for other factors? (3) What are the associated stop, agency, and area characteristics of sociodemographic differences in police stop and use of force?

To answer the research questions, we analyzed more than 10 million police stops occurred in California from 2019 to 2021. We used indicators of whether one being stopped for a traffic or nontraffic reason, being cited, being searched, and being removed from a vehicle to evaluate sociodemographic differences in police stops by result of stop and use of force. We measured the police stop, person, and area characteristics using four data sources, the California’s Racial and Identity Profiling Act, the American Community Survey 5-Year, the California Statewide Integrated Traffic Records System, and the National Household Travel Survey. We used the descriptive summary statistics and multilevel logistic regression modeling.

The results reveal new evidence on sociodemographic differences in police stop, result of stop, and use of police force, after controlling for other factors. Compared to males, females are 1.5 times as likely to be stopped for a moving violation (vs. equipment) but are 70% less likely to be searched during traffic stop. Black and Hispanic populations are 2.5 times and 1.5 times as likely as their white peers to be searched during traffic stop, respectively, despite they are 50% and 30% less likely to be stopped for a moving violation (vs. equipment),

respectively. Age has an inverted U-shaped relationship with the likelihood of being stopped for a moving violation (vs. equipment). Compared to their younger peers (aged 18-24), people who are aged 25-34 and 35-44 are 1.5 times and 1.3 times as likely to be stopped, while elderly (aged 65+) are 10% less likely to be stopped for a moving violation (vs. equipment). People with limited English fluency are 1.2 times as likely as their peers to be stopped for a moving violation (vs. equipment).

Our findings highlight the police stop, person, and area characteristics that are associated with sociodemographic disparities in police, traffic stop, and use of police force, which merit attention and targeted policy interventions to improve equity in policing practices – for instance, traffic enforcement under the umbrella of safe system approach.

EXPOSING DISPARITIES IN FLOOD ADAPTATION FOR EQUITABLE FUTURE INTERVENTIONS

Abstract ID: 1108.0.0.76.2024
Individual Paper Presentation

Lidia Cano Pecharroman [Massachusetts Institute of Technology] lcano@mit.edu, presenter
ChangHoon Hahn [Princeton University] chhahn@princeton.edu

As governments race to implement new climate adaptation solutions that prepare for more frequent flooding, they must seek policies that are effective for all communities and uphold climate justice. This requires evaluating policies not only on their overall effectiveness but also on whether their benefits are felt across all communities. We illustrate the importance of considering such disparities for flood adaptation using the FEMA National Flood Insurance Program Community Rating System and its dataset of ∼2.5 million flood insurance claims. We use CausalFlow, a causal inference method based on deep generative models, to estimate the treatment effect of flood adaptation interventions based on a community's income, racial demographics, population, flood risk, educational attainment, and precipitation. We find that the program saves communities $5,000–15,000 per household. However, these savings are not evenly spread across communities. For example, for low-income communities savings sharply decline as flood-risk increases in contrast to their high-income counterparts with all else equal. Even among low-income communities, there is a gap in savings between predominantly white and non-white communities: savings of predominantly white communities can be higher by more than $6,000 per household. As

communities worldwide ramp up efforts to reduce losses inflicted by floods, simply prescribing a series flood adaptation measures is not enough. They must be accompanied by necessary technical and economic support to strengthen communities' resilience amid historical disenfranchisement, racism, and inequality. Furthermore, future flood adaptation efforts should go beyond reducing losses overall and aim to equitably support communities in the race for climate adaptation

FLYING UNDER THE RADAR: TRANSIT POLICE AND TRANSPORTATION SEGREGATION

Abstract ID: 1108.0.0.1124.2024
Individual Paper Presentation

Robert Pfaff [Cleveland State University] r.w.pfaff@csuohio.edu, presenter

The negative impacts of racialized policing practices have been well documented by scholars from across almost all social and humanistic disciplines, as well as from community organizers and private news agencies. Focus on crime and punishment has resulted in a thoroughly fleshed out body of research around the machination of the carceral state, with contributions from sociologists, historians, psychologists, political scientists, and criminologists. Recently, urban planners have also meaningfully engaged with research on policing, reparative justice, and abolition, advancing beyond older outmoded fixation on crime and safety. Yet these analyses are traditionally leveled at the larger structure of racialized policing, or in more local terms at the neighborhood level or within particular communities.

A commonly racialized practice of policing that remains understudied in these approaches is the role of Transit Police agencies. I argue these agencies, which exist in a unique and particular bureaucratic context, have largely flown under the proverbial radar of scholars investigating issues of racialized, and sometimes deadly, police encounters. In January 2009, San Francisco Bay Area Rapid Transit Police officers were involved in the fatal shooting of an unarmed Black man, Oscar Grant III, at the Fruitvale transit station while responding to a call about a fight on the train. They also are uniquely urban in their operation, usually within large metropolitan areas and decently funded infrastructural contexts. These usually public Transit Police often operate across wider geographies than local city agencies, stretching authority into any jurisdiction in which their agency operates, at a county-level, or even across state lines in the case of the MTA, WMATA, or Amtrak Police. Despite their extremely wide-ranging authority, which at times can rival federal policing agencies, there is shockingly little scholarship into their operation, and even less transparency and accountability or reporting for stops, arrests, and action. In 2020, NY Attorney General Letia James launched an investigation after preliminary, partially redacted data showed that 70% of fare evasion tickets, and 90% of arrests, were targeted at people of color on the NY Subway. 75% of those police

encounters were male, and more than half were under the age of 25 (Carter and Johnson, 2023). Data on racialized traffic stops is also correlated with higher percentage of incarceration, even for minor offenses (Detroit Justice Coalition, 2020).

I argue in this paper that the relative secrecy, and lack of study of Transit Police represents a unique opportunity to explore racialized transportation planning, and further probe the state-supported structure of transportation segregation. Urban Planners, and especially transportation planners, should more closely scrutinize transit policing, and agencies should be both accountable and transparent in their operations. This research advanced antiracist aims because data show that Black Americans experience elevated risk and likelihood for police encounters, especially while moving through predominantly white spaces. Public transportation is also a space where residents of different age, class, and ethnic background mix and meet, and has also been a site of racial struggle and protest. Understanding the impact of policing in this medium for mobility is paramount to advancing antiracist aims in urban planning, and ultimately dismantling structures that disproportionately target underrepresented communities.

IDENTITIES OF DISPOSESSION

Abstract ID: 1108.0.0.940.2024
Individual Paper Presentation

Ashley Hernandez [University of North Carolina Chapel Hill] ashleych@unc.edu, presenter
Walter Nicholls [University of California-Irvine] wnicholl@uci.edu

Title: Identities of Dispossession: Political Subjectivities at the Intersection of Deportation and Displacement

Immigrants with precarious legal status living in global cities are positioned at the intersection of three forces of dispossession: ethnonational deportation, criminalization, and displacement from gentrification. This triple threat structures the everyday lives of immigrants, shaping the ways they engage with the built environment and their

activism. Immigrant communities adopt routines and countless tactics to avoid deportation, contend with rapacious landlords, and organize to protect their communities from police violence, while watching their cities underwrite gentrifying amenities. Studies have demonstrated that despite increasing inequality and ongoing hostility, immigrant communities have traversed gentrifying urban contexts (Dávila 2004; Pérez, 2004; Pérez et al., 2010) and have served as important contributors to urban social movements (Nicholls, 2013; Nicholls & Uitermark, 2016; Nicholls, 2019). Under these circumstances, activists forge new identities to make sense of their urban contexts and strategies of resistance to dispossession.

This study explores how community organizers construct political identities in the Boyle Heights neighborhood of Los Angeles. In this predominantly working-class Latinx immigrant barrio, community organizers are often from immigrant families or immigrants themselves and engage in neighborhood activism in the face of ongoing territorial dispossession and forge new identities that elucidate such conditions. Drawing from forty extensive interviews and participant observations of Boyle Heights organizers, we suggest that under such conditions, they articulate an "identity of dispossession" that amalgamates experiences of displacement, criminalization, and deportation into a singular yet multivalent collective threat. Though housing precarity, gentrification, evictions, police repression, and deportations are different forms of repression, they are experienced as a common force of dispossession. This fosters a political subject whose identity and grievances mirror the multifaceted overarching process of territorial dispossession. This is exhibited in one organizer's reflection: "If you displace me from my hood, you might as well deport me."

Examining the ways in which organizers articulate and mobilize communities against the various issues they face offers important lessons as to how such threats work in relationship to belonging, activism, and political representation in the built environment (Beltrán, 2010). Rather than understanding inequalities in isolation from one another, this paper asserts that communities often have sophisticated frameworks and subjectivities that analyze and reflect the conditions under which they live in tandem. We argue that understanding communities also means understanding how they articulate the threats they face in their daily urban lives. These lessons have larger implications on the integration of marginalized voices in planning processes and civil society at large.

IN THE GAP: PROCEDURAL DUE PROCESS, REPARATIVE PLANNING, AND OUR FUTURE

Abstract ID: 1108.0.0.1144.2024

Individual Paper Presentation

Harley Etienne [The Ohio State University] etienne.21@osu.edu, presenter

Provocations for reparative planning and anti-racist planning futures present the field with new directions for creating vibrant and just communities. This paper explores the question: to what extent is reparative planning possible within the U.S.' current legal frameworks and jurisprudence? While recent work has brought the links between racism, zoning, and land use to the fore, the conclusions of that would suggest that large scale systemic change is needed. In the gap between the present precarious moment and the future is the reality that one of the underlying logics of the U.S. legal system, white supremacy, and capitalism is private property rights. The thesis of this paper is that constitutional interpretations that enable planning are not currently under attack but could become so in the very near future given recent decisions that roll back the power of government agencies and expand the power of private property owners from government regulation and intervention. Planning and legal scholars have paid scant attention to what current trends at the high court could mean for reinterpretations of long-accepted precedents such as Euclid and Kelo. This threatens to not only weaken planning but make the project of achieving an anti-racism future through reparative planning more challenging. To the extent that the U.S. Supreme Court has redefined substantive due process through the Dobbs decision, planning scholarship has yet to determine what this may portend for reinterpretations of the jurisprudence that underlies planning and land use regulations. In this presentation, the author will summarize what the Roberts Court's recent decisions could mean for procedural due process and explore the confluence of reparative justice with procedural due process and justice. To the extent that planning can be shielded from threats by the reinterpretations of canonical legal precedents, the real challenge is to determine if and how the law can be reconceptualized to help fulfill the promise of anti-racist futures and reparative planning. The paper concludes by revisiting the work of Derrick Bell and his proposition that the U.S. legal system may be incapable of reform and calls for greater engagement with legal scholarship and Supreme Court jurisprudence within planning scholarship.

INDIGENOUS COMMUNITY RESILIENCY IN THE COVID AGE AMONG TONGAN SAINTS

Abstract ID: 1108.0.0.860.2024
Individual Paper Presentation

Sarah Soakai [UCLA] sarahsoakai@ucla.edu, presenter

Application of indigenous ways, worldviews and values to disaster planning and management within post-welfare settler colonial contexts can be tricky and difficult. In better understanding how to plan with vulnerable indigenous communities though is needed in attempts to decolonize and apply indigenous knowledge and ways to practice. I apply Critical Race Theory (CRT) and Indigenous Planning Theory (IPT) as broad conceptual theoretical frames in understanding broader third sector civil society indigenous community-based faith-based organizations' place in society. I specifically use Brown Church Theory that stems from CRT, and indigenous Tongan theoretical approaches that include Hauofa's Oceanic Philosophy and Okusitino and Ka'ili's Tā-Vā (time space) theory as conceptual, theoretical frames of understanding the social interactions by Tongan Latter-day Saint (LDS) Mormon ward and stake faith communities in response to the COVID-19 pandemic. Vā is the space between, but not an empty space that separates, rather a social space that relates. In the geography of vā (space), distance does not separate kainga (kin, family), but only provides further interconnection social pathways. Nor does greater distance translate into diminishing commitment to families, because social connections constitute a significant part of identity and self-esteem. Nor does greater distance translate into diminishing commitment to families, because social connections constitute a significant part of their identity and self-esteem. Rather than geographical boundaries, vā (space) is a space that connects and relates people to one another. Tauhi vā (good socio-spatial relations) emphasizes the need for nurturing, sharing of, and caring for the human space and relationship between two or more persons or among groups. It (tauhi vā, good socio-spatial relations) is looking after the space between people – the relationship; it is nurturing the social space that relates people to one another. If space is a social product, the vā as it concerns the physical/mental, material/economic, educational, and social/spiritual health in the COVID age among indigenous Tongan LDS congregations overwhelming showcased community resiliency. Qualitative methods of talanoa (informal conversation, interviews), archival documents, and participatory observations were used to examine the vā (space) of Tongan LDS congregations in the COVID age. Existing faith-based and indigenous community infrastructure buttressed by varying socio-spatial support mechanisms (social, cultural, financial and spatial) enabled Tongans in the LDS Church the space to organize in the COVID age. This has implications for disaster preparedness, relief and recovery policies and practices in which faith-based organizations can play a more central and collaborative role with state-sponsored state agencies and efforts.

THE BAMBOO CEILING AND ASIAN DOCTORATES IN POST-DOCTORAL CAREER

Abstract ID: 1108.0.0.222.2024

Individual Paper Presentation

Yas Motoyama [Ohio State University] motoyama.1@osu.edu, presenter
Nayoung Ko [Ohio State University] ko.426@osu.edu
Cathy Liu [Georgia State University] cyliu@gsu.edu
Haifeng Qian [University of Iowa] haifeng-qian@uiowa.edu

While Asian Americans may have achieved high educational attainment (J. Lee and Zhou 2015; Nunes 2021), the completion of college degrees does not warrant larger social or economic success. Evidence has been emerging that Asian Americans are underrepresented in leadership positions in the private sector (Yu 2020; Chow 2023) and at law schools and legal professions (Lu 2021; Lu et al. 2022). The same issue applies to academic careers in which people obtain the highest educational degree and are supposed to be evaluated on a merit basis. Even though Asian Americans are overrepresented in general faculty positions at universities compared to their composition of the population in the U.S. (Wang, 2008), they have lower tenure rates despite higher research productivity and report lower levels of job satisfactions (Yan and Museus 2013). Multiple studies from nationally representative surveys also demonstrate that Asian Americans are less likely to serve in leadership positions (F. Lee 2019), such as endowed chairs and distinguished professors even within fields that Asian American are concentrated, such as science, engineering, and mathematics (Hartlep et al. 2016; Freeman and Forthun 2019).

While these findings are insightful, we shift our conversation from over- or under-representation to the process of selecting careers with particular attention to individual experience and thoughts over time. Our analysis with the process is critical because decision making for career is not a static decision at the end of the doctoral training, but evolves over time based on learning and experience in each year of doctoral training. We focus on Asian doctoral students and their career choice afterwards first because Asians are the largest group of doctoral students in urban planning, engineering, and science fields, and second because Asians are distinctively different from Asian Americans. Asian Americans are likely to find jobs in the U.S., while Asians face an important decision to stay in the U.S. or go back to home countries or else. Our main question is whether and how discriminatory or racial experience during the doctoral training have affected the career choice for Asians.

We conducted 20 semi-structured interviews with three stratified groups: 1) those who went into the U.S. academia, 2) those who got non-academic jobs in the U.S., and 3) those who went back to their home countries. We sampled graduates from University of California, Berkeley, University of Southern California, Ohio State University, Georgia State University, and other universities to make sure that our findings are not constrained to a specific university environment.

We found that most Asian students enjoyed a liberal environment during the doctoral programs, and did not find any evidence that negative experience during the doctoral programs forced their career choice. They made their career choice about staying in academia or not, or whether in the U.S. or home country based on social or personal reasons. However, their racial experience started to emerge in subtle forms after they landed on jobs and accumulated over years. All women reported some form of discriminatory experience, while one third of men did not. The most common type of discrimination was not being recognized for their ability or accomplishments in a context of publications, going through tenure review, serving as the department chair, or services to the department or university. Interviewees additionally reported that they were not identified as minority or their voice did not carry weight in the recent debates over diversity and inclusion initiatives.

THE STATUS OF SOCIAL AND MINORITY GROUPS IN PLANNING LONDON

Abstract ID: 1108.0.0.804.2024
Individual Paper Presentation

Orwa Switat [Tufts University] orwa.switatt@tufts.edu, presenter
Yosef Jabareen [Technion - Israel Institute for Technology] jabareen@technion.ac.il

Political theory extensively explores the relationships between the state and social and minority groups, yet the impact of these interactions on urban planning remains overlooked. This paper investigates the coevolution between the development of British constitutional rights and the status of social and minority groups in planning London since its first post-WWII comprehensive plan. The study employed a historical document analysis by scrutinizing major London urban plans, pertinent British legislation, and constitutional rights enactments since the 1940s.

Findings demonstrate that London's planning approaches to social and minority groups have evolved with Britain's constitutional attitudes toward minority rights. The early post-war British citizenship reflected libertarian values of individual freedoms. London's post-war city plans maintained the same libertarian discourse of “free choices” while defining minorities as "scattered other religions" and advocated for separated "self-contained communities." As the state embraced models of colorblind citizenship and individual equality from the 1970s to the 1990s, London's urban planning shifted to emphasize free-market regeneration and the well-being of the “Individual Londoner,” a change initiated by the 1976 London Plan. During the first decade of the 2000s, new British laws and policies enhanced liberal multiculturalism, reflecting London's 2004/08 plans emphasis on "ethnic and racial groups" within sustainable development policies. The recent decade's focus on civic cohesion in British rights has influenced the focus on the "socio-economic mixing" of "disadvantaged groups" in the 2011/16 London plans while evolving to prioritize intercultural inclusion of "equality groups" in the latest 2020 plan. The study concludes that the status of social and minority groups within London's urban planning is not solely a product of planning approaches but is significantly shaped by the prevailing political and constitutional frameworks regarding minority rights.

WILDFIRE, RESTORATION, AND STRUCTURAL INEQUALITY IN FORESTRY CONTRACTING

Abstract ID: 1108.0.0.935.2024
Individual Paper Presentation

Gerard Sandoval [University of Oregon] gsando@uoregon.edu, presenter
Carl Wilmsen [Lomakatsi Restoration Project] carl.wilmsen@tutanota.com
Reem Hajjar [Oregon State University] reem.hajjar@oregonstate.edu

Studies of labor markets in forestry have consistently found that white workers tend to fill better paying, higher quality jobs with higher social status than workers of color. Interviews we conducted with contractors and workers in a case study of forestry services contracting in southern Oregon and northern California echo these findings and suggest that there are not only segmented labor markets, but also a racially defined segmented contracting market in the case-study area in which the racial division of labor occurred at the scale of industry sector. Latino contractors and workers we interviewed were confined to the less prestigious, less lucrative reforestation sector of the forestry industry while white interviewees worked in better-paying, higher status technical forestry and heavy equipment operation. We identified three mechanisms of the state at work in this segmentation of the contracting market: production and reproduction of differential value, contracting practice, and immigration policy. Government policy contributed to the devaluing of reforestation work and relegating Latino contractors and workers, who are devalued as human beings, to that industry sector. While race may be the major social category around which capitalism is structured as an institutionalized social order (Fraser 2016), our case study included an instance of the state creating intra-racial divisions along the lines of immigration status. The resultant legal formalization of unequal power relations between Latino employers with secure legal immigration status and Latino workers with more precarious statuses (undocumented and viséd) creates conditions conducive to intra-racial expropriation of surplus value from vulnerable workers. In its capacity as a political actor the state produces and reproduces social structure, and in its capacity as an economic actor it cements and exacerbates inequities that it built into those social structures in the first place.

Track 1 Research in Motion (RiM)

CRITICAL RACE STUDIES: CONTENT, COMMUNITY, AND PLANNING PEDAGOGY

Abstract ID: 1110.0.0.720.2024
Research-in-Motion (RiM)

Nina Flores [California State University Long Beach] nina.flores@csulb.edu, presenting author

As planning education evolves, the increasing number of courses focused on race in planning is an exciting step in both advancing anti-racism and training planners to champion just, equitable, diverse, and inclusive cities. However, there are opportunities to complement race-focused courses and amplify class content by identifying the ways in which a course like Critical Race Studies allows us to hone a distinct approach to planning pedagogy. In this presentation, I explore what it looks like to use Critical Race Studies as both content and as informing planning education pedagogy and argue that training planners in critical topics requires pedagogies that reject the very hierarchy and power that created academic institutions that weren't designed for students and faculty of color. Indeed, we can't prepare future planners to address social challenges connected to race, spatial inequities, and communities unless we train them on critical analysis, offer chances to directly connect this analysis to their own communities, and give them in the skills necessary to make progress on these issues with the public and within the profession.

In this context, pedagogy begins with the syllabus and intentionally centering the voices of Scholars of Color each week. This course includes concepts such as Kitchen Table Planning (Sweet, 2015), Indigenous feminist planning (Dorries & Harjo, 2020), Cultural Humility (Sweet, 2018), as well as collections that draws on imagination (Bates, et. al., 2018) and scholarship about loving attachment (Porter, et. al., 2012). During class sessions we learn about and use dialogic methods versus lecture (Freire, 1970) to examine concepts in context of racialized experiences while also deepening rigor through intensive systemic analysis and engaged pedagogies (hooks, 2010). In terms of class structure, this means rejecting traditional academic hierarchies by sharing power with students through co-construction of syllabus topics and training them in session facilitation. It is imperative that students leave courses like Critical Race Studies with the ability to apply what they learn about spatial inequities to their academic, professional, and personal spheres, and as such the assessments in this course are based on several forms of application. Assessment includes a mix of action-oriented, personal reflection, and public writing assignments to intentionally move academic concepts from the classroom to the community, as well as using un-grading methods

that focus on qualitative feedback on student work instead of points. Importantly, this pedagogy relies on creating a collaborative class setting in which students can try on new ideas without fear.

This RIM presentation is based on six years of experience teaching a graduate-level Critical Race Studies planning course, student feedback, and instructor reflections during the course and following each term. The course was first developed 14 years ago, and in the six years I've taught it, my goals include advancing students' critical interrogation of race and planning, 2) making connections between their lived experiences and the course content, and 3) ensuring that they leaving with practical tools to apply this new knowledge in a variety of settings (i.e. skills in OpEd writing, critical dialogue, and designing and facilitating sessions about sensitive topics).

EQUITY IMPLICATIONS OF THE DIGITAL DIVIDE IN THE CITY OF DALLAS

Abstract ID: 1110.0.0.616.2024
Research-in-Motion (RiM)

Shadin Nimery [University of Texas at Arlington] shadin.nimery@uta.edu, presenting author

As the city of Dallas is addressing the Digital divide under the smart city umbrella, there needs to be a better understanding of the equity implications of the 3rd level of the digital divide. The 3rd level of the digital divide refers to "who benefits from the internet" (DiMaggio et al., 2001, Hampton 2010; Van Deursen et al., 2015; Scheerdet et al.,2017). This dissertation examines the strategies of inclusiveness Dallas City is using to bridge the 3rd level of the digital divide and achieve its smart city goal of creating an inclusive and equitable community and offering a better quality of life to its citizens utilizing Fainstein's just city theory, along with other theories of the digital divide using the public libraries in Dallas city as physical locations of internet access to the public to better understand the consequences of the 3rd level of the digital divide on the social and economic inclusion of poor low-income communities.
My research methodology includes semi-structured interviews, survey and content analysis of the city of Dallas's official documents. This dissertation proposes that planners engage early in the process of locating internet access points, such as public libraries and community centers, in

neighborhoods to ensure inclusiveness. The findings of this research reveal- will be added later once the research is completed.

HARMFUL BELIEFS AMONG URBAN PLANNING DECISION-MAKERS MAY REINFORCE INEQUITY

Abstract ID: 1110.0.0.1063.2024
Research-in-Motion (RiM)

Amanda Merck [University of Illinois Urbana-Champaign] merck2@illinois.edu, presenting author

Various systems of power, including urban planning elites (e.g. planning department heads, transportation department heads, planning commissions, transit agency executive leadership, city/county managers, elected officials, and planning scholars), have created unfair living conditions marked by segregation, auto-dependence, the concentration of poverty, underperforming schools, housing cost burden, food deserts, childcare deserts, limited employment opportunities, and inadequate transportation options (Turner and Greene, 2020). These living conditions contribute to inequities in social, economic, and health outcomes (HHS, 2020). Although urban planning elites often claim benevolence and rationality, they have done little to reverse unequal living conditions in U.S. cities (Spina, 2013).

Lack of action is partially related to debate among decision-makers regarding the status, causes, and consequences of unequal living conditions (Jost, Federico, and Napier, 2006; Kluegel and Smith, 2017). Political ideology explains some differences in acknowledgment of unequal living conditions and belief about change explains some differences in preferred solutions (Klein et al., 2022). However, while there is evidence of harmful beliefs and attitudes, such as biased beliefs and attitudes, in various other professional fields (Alexander, 2010; Liu, 2011; Maina, et al., 2018), there is little evidence regarding harmful beliefs and attitudes in the field of urban planning or how harmful beliefs and attitudes among urban planning elite may reinforce inequity and hinder equitable reform.

In this qualitative study, I used data from seven semi-structured interviews with urban planning elites in one mid-sized city. I conducted the three-step coding process in grounded theory research, open coding, selective coding, and theoretical coding (Jones and Alony, 2011), to explore what knowledge and harmful beliefs urban planning elites demonstrate when explaining inequity in their community.

Preliminary data analysis led to the identification of two emergent themes and one basic social process. The first emergent theme is despite acknowledgment of "good" neighborhoods marked by quality schools and housing and access to opportunity and of "bad" neighborhoods marked by underperforming schools, substandard housing, and limited opportunity, the urban planning elite did not acknowledge the root causes of these separate and unequal neighborhoods. The second emergent theme is harmful beliefs and attitudes regarding which groups of people deserve to live in which types of neighborhoods (i.e., beliefs regarding who deserves to live in a "good" neighborhood). The overarching basic social process I identified is the process by which local-level urban planning elites expect individuals to make enough money to escape "bad" neighborhoods rather than expect their profession and peers to support equitable reform to prevent separate and unequal neighborhoods.

These findings suggest that urban planning elites are susceptible to cognitive dissonance, system justification, belief in meritocracy, class-based social dominance orientation, moral disengagement, and/or lack of basic planning history. This study is also important because it points to potential pathways for future research to identify and prevent justifications rooted in the harmful manifestations of beliefs and attitudes and to modify education and information campaigns and profession-specific training, pedagogy, and learning competencies. Because urban planning stakeholders are in positions of power to change policies and practices that perpetuate inequity and to influence public perception regarding the policies and practices that perpetuate inequity, we need to understand the knowledge, beliefs, and attitudes. This study is important because it explores what is at the essence of how urban planning elites justify their work and decisions, particularly in the context of persistent social, economic, and health inequities and increasing polarization of urban planning issues.

At its best, planning aims to intervene in present systems to envision better futures. Ethical, transformative urban planning interventions integrate the aims and visions of the Right to the City, Black Lives Matter, Climate Justice, Land Back, Reproductive Justice, and other social movements into its practices. Consequently, the profession must assess the current moment regarding the myriad histories and trajectories these movements seek to transform. This exploration will critique the imperial-capitalist conceptions of time upon which planning relies and deeply engage frameworks originating from these progressive social movements, to challenge planning's relationships with time.

Detroit-based community activists, James and Grace Lee Boggs often began conversations with the question, "What time is it on the clock of the world?" This question both invited assessment of the emergent contradictions in the rapidly changing context of late modernity, and "recognized that these changes were creating new contradictions demanding that we think anew." (Boggs, 2011, p. 354) Drawing on their question, we investigate time in planning thought through consideration of clock(s) of the world. We consider how cyclical/ecological time, deep time, queer time, reparative time, diasporic time, racial time, and multiversal time interact with, challenge, or complicate frameworks around time commonly under the professional consideration of plannerly practice and teaching. We explore what thinking and expansion of the concept of time itself might offer a field currently bound by the time frames of municipal budget cycles, comprehensive planning processes, funding cycles, fiscal years, etc., in terms of expanded possibilities for systems change and transformation. This paper draws Bogg's framework into the present and the world of planning practice and education.

We argue that this capacious consideration of the world's clocks should inform the conceptualization and practice of "thinking anew" about the future in planning. We find that agitation in the current systems serves as a precondition for liberatory change. In James Baldwin's words, planners are situated at the intersections of complex systems, witnessing:

An old world is dying, and a new one . . . announces that it is ready to be born. This birth will not be easy, and many of us are doomed to discover that we are exceedingly clumsy midwives. No matter, so long as we accept that our responsibility is to the newborn: the acceptance of responsibility contains the key to the necessarily evolving skill (1972, p. 196)

How does planning's operating assumptions about time inhibit or advance re-birth? How should consideration of the clock of the world shape urban planning's appropriate role in birthing a new world? We look to thinking about systems change to find leverage points - places in complex urban systems where a small shift in one thing can yield big changes in everything (Brown 2017; Meadows 1999). We interrogate contemporary practice, including our respective approaches to planning and planning pedagogy, to detect possible leverage points that might enable us to shift patterns toward more just futures, offering the potential to change or transcend the "rules" of planning systems. Subfields in focus during our discussion include historic preservation, participatory planning, housing, and radical planning pedagogy.

RACIAL EQUITY AND TDR PROGRAMS FOR AGRICULTURAL PRESERVATION

Abstract ID: 1110.0.0.402.2024
Research-in-Motion (RiM)

Wendy Nevett Bazil [University of Maryland, College Park] wbazil@umd.edu, presenting author

Montgomery County, MD, a rapidly urbanizing “suburb” of Washington, DC, is known for innovative use of Transferable Development Rights (TDRs) along with zoning to protect agricultural land at its outer border while encouraging development in the parts of the county closer to DC. Other jurisdictions have modeled their programs on Montgomery County. This TDR program was born, in part, to address a perceived potential loss of financial equity by landowners caused by the complementary downzoning done to protect farmland. Now, recent memoranda from the legislative and executive offices have raised questions of another meaning of equity; specifically, racial disparity in its Agricultural Reserve (AR). In addition, data-based research has found that TDRs don’t adequately protect farmland, citing Montgomery County as a case study (Fang, et al., 2019).

This ongoing graduate school independent research project was inspired by this dichotomy in Montgomery County, MD. The first phase consisted of a literature review that initiated a broad look at TDRs and other agricultural land preservation and how to redefine their success using an updated definition of equity, marrying TDR literature, that does not directly address racial inequity, with racial justice planning theory that is more commonly applied to urban areas.

In addressing the dual questions of evaluating success and equity of agricultural land preservation policy and programs, the literature review concluded that evaluation of both must expand to include racial equity analysis and suggested looking to racial justice theory for guidance on adding this into the existing agricultural preservation policy frameworks. The general failure to incorporate racial equity into these analyses to date is surprising and should be remedied. How it should be remedied is the subject of continuing research, looking at the inverse questions: what is the impact of racial equity analysis on understanding TDRs and other agricultural preservation easements?; and, what is the impact of TDRs and other agricultural preservation easements on racial disparity in agriculturally protected areas?

Using legal research, document analysis, content review, and eventually interviews, this next phase of research will address some of these questions surrounding racial equity concerns--particularly given that TDRs might not even

be successful in protecting farming. The sub-areas for further research to better understand and answer these questions include whether TDRs can still be useful and usable in supporting equitable and resilient communities and if so, how; the equity and legal ramifications of terminating or sunsetting a TDR program; how TDRs and other easement and agricultural land preservation tools might or might not differ in result in relation to racial equity; the history of land tenure that informs current ownership; the best alternative means of preserving farming in an equitable way; and current legal issues creating barriers to racially directed reparative programs.

In addition to research into the intersection of racial equity and TDRs and other agricultural preservation methods and their ongoing utility and fairness, this project seeks to spark further conversation into smart growth's effects on rural areas more broadly, highlighting the needs and inequities in the TDR sending areas. The scope of the literature review only allowed for brief mention of the opportunity for smart growth to consider how a variety of issues—housing, transportation, climate, health, immigration, demographics, and more—impact the rural areas that are the flip side to the more urbanized areas that smart growth principles of growth management focus on. These are also questions deserving of further research. Further, this research is relevant to areas that have TDR programs in place or who are considering implementing them.

RESILIENT PLACE NARRATIVES AND ENVIRONMNTAL JUSTICE

Abstract ID: 1108.0.0.1007.2024
Research-in-Motion (RiM)

Rula Awwad-Rafferty [University of Idaho] rulaa@uidaho.edu, presenting author

“It is not difficult to sense the liveliness while walking in the vaulted stone alleyways, the low tunnels and the labyrinths of narrow lanes of the old town of Nablus. It is a sensual, interactive and mixed experience of optics, acoustics, and aromatics. … Since the invasion, people cautiously start every day with the fear and uncertainty that they might be unable to enjoy any of what used to be a normal day. (Bleibleh, 2012). Places are both heritage and lived experiences for those who call them home, encompassing geography, history, culture, flora and fauna, stories, and decisions made over time. They are remembered and imprinted into the collective consciousness, shaping group identity and individual well-being. Indigenous communities worldwide emphasize the intrinsic healing properties of their surroundings. They speak of a medicinal quality inherent in their places, where “food is medicine,”; “ritual is medicine,” and “stories are medicine.” Essentially, the land is medicine, providing a foundation for cultural resilience and representation.

This presentation focuses on what happens when the relationship between people and their homeplace is disrupted and the transformations of the narratives to maintain a connection to home. It seeks to nurture community empathy towards “everyday fundamentals” of heritage landscape practices, planting a seed of appreciation for the authentic and inherited wisdom embedded within these traditions and fostering a stronger bond with indigenous cultures and their profound connection to the land. Methods include presenters and audience participation, icebreaker activities, foundational premise, contextual Palestinian narratives, audience lived-experience reflections, and discussions.

An ethic of care, as places become intertwined with people’s lives, a legacy of inherited habits emerges—ways connecting land, plants, seasons, and memories, along with acceptable “habits/rituals/behaviors” that promote stewardship, land-people relationships, and harmony with the place. These attributes manifest in seasonal behaviors, rituals, and economies, persevering authenticity and integrity of the lived experience and ensuring continuity of culture and relational practices between community and place/land. The participants are prompted to explore and connect with the indigenous experiences of “making-do” and their everyday practices, deepening their understanding of the intersection between place, culture, and resilience.

In a time of massive change, global movement, migration, gentrification, infringements, and connectivity, the community (people)-Culture (ritual)-Place (land and its treasures) continuum is disrupted, targeted, and undermined. In many cases, access to the home place is restricted or denied. What was once a source of identity, resilience, and continuity now evokes pain, dissonance, and resistance. Gentrification, while having significant authentic potential, can inadvertently prioritize neglecting the collective perspective, enduring tapestry, and the cultural lens while it focuses on the singular goals and alters the relationship between people and place.

Healing and reconnection take many forms. Stories and sensorial experiences trigger memories of place and lived experience, despite the passage of time and geography, bringing us home to another time. In “We Are Water Protectors," inspired by Indigenous environmental justice and resistance, the story begins with the quote, "Water is the first medicine, Nokomis told me…It affects and connects us all.” (Lindstrom & Goade, 2020). Engagement in community, in place knowing and place keeping authentically across generations offer multiple venues for potentials for enduring sprit of place and resilience (Awwad-Rafferty, 2018). This interactive presentation offers a layered visual and storytelling narrative that emphasizes the significance of place, identity, and community in stewarding integrative cultures of resilience, responsibility, and authenticity in the face of massive change, exploring ways that honor people-environment relationships amidst complex, ever-changing world.

SOCIAL AND SPATIAL DISPARITY OF FEDERAL PAYCHECK PROTECTION PROGRAM

Abstract ID: 1110.0.0.695.2024
Research-in-Motion (RiM)

Qian He [Rowan University] he@rowan.edu, presenting author
Deb Niemeier [University of Maryland] niemeier@umd.edu

The global pandemic severely affected small businesses across the U.S. with disproportionate effects on communities of color. Black, Indigenous, and People of Color (BIPOC) small businesses suffered disproportionately, especially when located in communities of color (Couch et al., 2020; Montenovo et al., 2020; Ong et al., 2020). During the pandemic, small business employees experienced disproportionately high unemployment rates, especially among lower-wage workers (Cajner et al., 2020). In the trillion-dollar Coronavirus Aid, Relief, and Economic Security Act (C.A.R.E.S) initiated by Congress, the Paycheck Protection Program (PPP) provided financial support to qualifying small businesses. Black-owned businesses are nearly 50% less likely to receive PPP loans compared to White-owned businesses, especially during the early phase where private lenders have yet to join the program based on zip-code level demographic analysis in the U.S. (Atkins et al., 2022). Although early evidence shows procedural equity concerns (Fairlie & Fossen, 2022; Liu & Prilla, 2020), no study has yet to identify social and spatial disparity of loan distributions among small businesses with regard to neighborhood characteristics. In this work, we ask: did the type of neighborhoods with small businesses receiving higher loan amounts vary? Based on a set of geographically weighted models using negative binomial and logistic regression using PPP loan distribution point data in the U.S. Northeast region, we find that small businesses within Black and Hispanic/Latino neighborhoods were disproportionately underfunded unless located within an Opportunity Zone. Neighborhoods with better walkability, transit accessibility, and employment density were associated with better loan performance. The association between loan-receiving performance, place-based policy, built environment, and racial/ethnic disparity shows a mismatch with the primary program incentive in helping those with the greatest needs for economic opportunity. Based on the research findings, cities should pay more attention to historically disadvantaged neighborhoods outside opportunity zones to ensure parity. Planners can and must advocate for the Black and Hispanic/Latino neighborhoods in accessing financial aid and economic opportunity beyond the areas of designated opportunity zones, especially during the time of crisis.

UNSETTLED ACCOUNTS

Abstract ID: 1110.0.0.116.2024
Research-in-Motion (RiM)

Lily Song [Northeastern University] l.song@northeastern.edu, presenting author

"Unsettled Accounts" is a participatory action research project that seeks to advance understanding of Black land ownership and unjust takings in 20th-century Boston. Collaboratively undertaken by university-based urban history and planning researchers and Boston-based anti-racist and reparations activists, the oral history component gathers stories from Black Bostonians whose family homes, businesses, and lands were unjustly taken by government authorities through urban renewal and highway projects—as well as those who lost their properties as a result of tax liens, speculative lending, and bankruptcy court proceedings.

The research uncovers past events that have critically shaped contemporary urban landscapes of racial segregation and inequality, captures stories and memories of community resistance and resilience, and invites reflections and discussions on what repair and redress could and should look. In addition to sharing the oral history accounts with the City of Boston Task Force on Reparations (more specifically the research teams that are leading the study on the legacy of slavery in Boston and its present impact on descendants), the project is developing a digital archive and cohosting public programming with community-based partners to share the data and findings with most-impacted communities and advance reparative policy initiatives.

This research-in-progress presentation on "Unsettled Accounts" overviews the research design and methods, and shares initial results and analysis of the oral history interviews with 11 individuals from six families (all of whom arrived in Boston from the southern states in the first half of the 20th century). It additionally presents the digital archive and public programming components, the latter incorporating youth engagement and developed in collaboration with a restorative housing program that seeks to leverage affordable housing ownership

opportunities to enable Black Bostonians, who have disproportionately experienced housing discrimination, to build intergenerational wealth.

The research not only connects past and present injustices but also seeks to inform planning for anti-racist futures—for instance, addressing racial homeownership and wealth gaps, gentrification and displacement, and the suburbanization of poverty. It also bears on reparative planning theory and practice, whether related to the formation and deliberation of reparations commissions, task forces, studies, and pilot measures at local, state, and national levels or infrastructure planning and construction projects such as Reconnecting Communities. Both require firsthand accounts from disproportionately-impacted groups and frontline communities—whether to trace the cumulative drivers, forms, and impacts of harms over time or determine needed recourse.

Track 2 – Community Development

Track 2 Pre-Organized Session Summaries and Abstracts for the Sessions

BUILDING SUSTAINABLE COMMUNITIES
Abstract ID: 1112.0.0.260.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.541.2024, 1108.0.0.444.2024, 1108.0.0.997.2024, 1108.0.0.1241.2024, 1108.0.0.1081.2024

Lin Lin [Xi'an Jiaotong - Liverpool University] lin.lin@xjtlu.edu.cn, organizer

The rising interest in 15-minute city concepts and walkable neighborhoods underscores the urgency of building sustainable communities. This pre-organized session at the ACSP delves into the multifaceted nature of this endeavor, fostering scholarly exchange, innovation, and the sharing of best practices.

Our aim is to contribute meaningfully to the ongoing dialogue and practical efforts in this field. We encourage a holistic approach to sustainable community development, welcoming submissions that reflect the rich tapestry of perspectives and experiences in building a more sustainable future.

Learning Objective(s):

- To showcase cutting-edge research and innovative practices in the development of sustainable communities.
- To foster interdisciplinary dialogue among researchers, practitioners, and policymakers in the field of sustainability.
- To highlight the challenges and opportunities in implementing sustainability initiatives at the community level.

OPEN SPACE EVALUATION METHOD USING HUMAN EMOTIONS BASED ON SNS ANALYSIS
Abstract ID: 1108.0.0.541.2024
Pre-Organized Paper Presentation

Norihiro Watanabe [Division of Architecture, Faculty of Engineering, Hokkaido University] n-watanabe@eng.hokudai.ac.jp, presenter
Tsuyoshi Setoguchi [Faculty of Engineering, Hokkaido University] setoro@eng.hokudai.ac.jp
Aki Watanabe [Graduate School of Engineering, Hokkaido University] watanababy0930@eis.hokudai.ac.jp

Open spaces play a crucial role in creating vibrant and interactive urban spaces. They function as places for gathering, relaxation, and community engagement. However, the planning of such spaces frequently overlooks the direct consideration of the emotions of users.

The proliferation of platforms for social networking services (SNSs), such as Instagram, has revolutionized the manner in which people express feelings and experiences. Through social networking posts, emotions related to various aspects of life are easily communicated and visually represented. This wealth of data can be used to gain insight into the emotional states of people and explore the connection of such states to urban open spaces.

Among the existing SNSs, Instagram offers a unique combination of visual and written contents. Users share not only engaging photos of cities and landscapes but also descriptive text, which provides a rich dataset for analysis.

This study aims to quantitatively evaluate open spaces that evoke positive perceptions in people using a large collection of Instagram posts. Toward this objective, we used Instagram post data about AKAPLA Plaza in Sapporo, Japan, as a case study.

First, the study uses KH Coder to extract and categorize positive emotion words from the posted text data to create six groups of emotion words (beauty, good, great, happy, like, and enjoy).

For each posted photo belonging to each group of emotion words, the study used Google Cloud Vision API to extract the spatial elements as labels, which represent features such as light, tree, road surface, and building.

Using KH Coder, the study then conducted co-occurrence analysis of the spatial element labels for each group of emotion words to elucidate the co-occurrence relationships among the labels in the network.

Afterward, the relationship between positive emotions and spatial elements at Sapporo AKAPLA Plaza was elucidated. The study identified four items as spatial design elements of the open space that induces positive emotions.

(1) Blue and purple illumination on tree branches in winter is strongly related to beauty, great, like, and enjoy. Sapporo is a city with a cold and snowy climate; thus, designing spaces that are attractive at night during the winter season is important. (2) The combination of buildings and green trees is strongly related to emotion words good, like, and enjoy. (3) A view with good visibility and a wide view of the sky and ground surface is strongly related to emotion words like and enjoy. In Sapporo, the spatial design of streets (trees arranged in a straight line to emphasize the axial line according to the grid pattern of the city) is considered related to emotion words good, like, and enjoy. (4) Eating and drinking behaviors are strongly related to the emotion word happy. Installing street furniture that can be used for eating and drinking and improving eating and drinking functions adjacent to the plaza are considered related to the emotion word happy.

This study contributes to an in-depth understanding of the influence of urban open spaces on well-being and satisfaction. By incorporating the emotional considerations of users into urban planning, further user-friendly and enjoyable environments can be created for everyone.

CREATING WALKABLE CITY THROUGH THE TSUNAMI DISASTER RECOVERY PROCESS

Abstract ID: 1108.0.0.444.2024
Pre-Organized Paper Presentation

Toshihiko Abe [Ritsumeikan University] abetoshi@fc.ritsumei.ac.jp, presenter

In this paper, I want to introduce the Naiwan area(=inner bay) which is the central city of Kesennuma City, Miyagi Prefecture, where Walkable City was implemented through the reconstruction of an urban area damaged by the 2011 Great East Japan Earthquake and Tsunami. I have been directing the urban design of this reconstruction as a coordinator of the council where citizens and the local government have discussed about reconstruction plan after the earthquake.

After the relocation of the fish market in 1956, industry and commerce moved out from Naiwan area, and the population began to decline. On the other hand, many commercial facilities with parking lots and easy access by car have built in the suburban area, located about 15 minutes by car from the Naiwan area, and the population tended to increase accordingly. However, the beautiful scenery of the harbor town ”Naiwan”, where the sea and the town are in continuity, was still present and an attraction for tourists to visit.

In 2011, the tsunami up to 7.0m high swept away Naiwan’s 344 buildings out of 410 (population of 1,080 people). The Kesennuma mayor’s idea was to take this opportunity to move the center of Kesennuma to a suburban area that was not damaged by the tsunami. However, the residents of the central city opposed this idea. They demanded that the Naiwan area continue to be positioned as the central city area and be rebuilt after the disaster. In the Naiwan area, a council was established to discuss between citizens and the government, and recovery policies and projects were planned. First, a central facility was built in the waterfront, and the street as central axis connected the waterfront to public facilities on the top of the mountain. Secondly, a network of existing shopping areas, city hall, and other urban functions were to be networked together to rebuild the area into a walkable town. However, the Naiwan area was inundated by the tsunami, the question arose as to whether public housing for disaster victims should be built here. In many other disaster areas, public housing was built on top of mountains or in suburban areas that could only be accessed by car. But in Naiwan, they wanted to build public housing in a place that could be accessed on foot. Therefore, in the Naiwan area, public housings were built in flooded areas, but the ground floor, which was at risk of flooding, was used as stores, and a total of 150 dwelling units were built on the second floor and above. In addition, although the citizens were initially opposed to the construction of a seawall that would obstruct the view to the sea, a minimum height seawall was designed as a landscape to minimize the damage from flooding.

Since the completion of the reconstruction project, the Naiwan area has been conducting social experiments to realize a walkable city. For example, events utilizing open spaces such as the waterfront quay and parks, shut out vehicular traffic on the central axis street, and small mobility such as bicycles and electric scooters for touring around the Naiwan area and surrounding tourist facilities.

Kesennuma City has become a car-oriented society, but in the Naiwan area, an environment is being created where tourists visiting there and local residents living there can live conveniently on foot.
The key points for implementing a walkable and sustainable city in disaster recovery are as follows: first, in order to solve the problems of population decline and ageing that existed before the disaster, the reconstruction plan concentrated on the central city area instead of unnecessarily expanding the target area; second, reconstruction was rushed to secure housing and jobs for the affected people, but reconstruction was carried out slowly and carefully, with more than 100 workshops and discussions with people living in the inner bay area; and third, even after the completion of the reconstruction project, social experiments were carried out to promote the use of public space and sustainable management.

EXAMINING THE SPATIAL EFFECTS OF PSFS FROM THE PERSPECTIVE OF EQUITY

Abstract ID: 1108.0.0.997.2024
Pre-Organized Paper Presentation

Jiayun Zhao [College of Architecture and Urban Planning, Tongji University] jiayunzhao2002@gmail.com, presenter
Zitong An [Tongji University] 2153240@tongji.edu.cn
Yifei Sun [Tongji University] 2153785@tongji.edu.cn
Xudong Wang [Tongji University] 2153023@tongji.edu.cn
Fan Yang [Department of Urban Planning, College of Architecture and Urban Planning, Tongji University] fanyangsh@tongji.edu.cn

Shanghai has proposed the planning principle of the "15-minute community living circle" to actualize the ideology of "people-oriented" and "fair sharing". Existing researches have primarily focused on the spatial distribution of public service facilities (PSFs) to achieve uniformity, while neglecting the responsiveness to individualized resident needs. The discrepancy between the public service supply and diverse demands has not been effectively addressed.
This study selects the central urban area of Shanghai with 104 subdistricts as the basic units to analyze the spatial pattern of PSFs and shed light on disparities in PSFs equity and accessibility among different age groups to explore the optimal spatial configuration patterns of PSFs.
The population data is raster data with a spatial resolution of 100m x 100m sourced from WorldPop, depicting the age structure of the Chinese population in 2020. We obtain street boundaries and Point of Interest/Area of Interest (POI/AOI) data, including cultural facilities, sports facilities, medical health facilities, elderly care facilities, and others, from the AMap API Network Open Data Platform.
Firstly, based on the distribution of three groups of people (children, adults, and the elderly) , we use kernel density

estimation and Riley's K function to analyze the spatial correlation between PSFs and elements such as population and public space. Furthermore, based on the spatial correlation features and strengths, we classify the spatial pattern of PSFs across the 104 subdistricts.
Moreover, we employ the enhanced Gaussian two-step floating catchment area method to conduct an analysis on the accessibility of PSFs. Referring to existing research conclusions, we set children and the elderly's walking distance of 900m and adults' walking distance of 1500m as spatial buffering thresholds. We calculate the sum of weighted supply-demand ratio to obtain the accessibility rating for PSFs.
Thirdly, We employ the Lorenz curve and spatial Gini coefficient to quantitatively analyze the relative inequality to the same PSFs among children, adults, and elderly individuals. This analysis serves as a measure of fairness in facility allocation.
Fourthly, We select representative subdistricts(Jiaxing Road Subdistrict, Juyuan New Area Subdistrict, and Xinhong Subdistrict)to validate the aforementioned quantitative research conclusions. We conduct questionnaire surveys and in-depth interviews to authenticate the quantitative analysis results regarding the accessibility and equity of PSFs.
Finally, we use Spearman's correlation analysis to explore the association between different spatial patterns and the equity of PSFs. Combining qualitative research content, we analyze the social mechanisms, influencing factors, and pathways of spatial effects of PSFs.
The research findings reveal the following insights:
(1)The spatial effect of PSFs objectively demonstrates an augmentation corresponding to population concentration, gradually diminishing from the urban core outward on count of the transformation of individual mobility within high-density urban areas. (2)Elderly individuals demonstrate a heightened specificity in their perception of the provision of PSFs, frequently evaluating the availability of PSFs lower than the average ratings observed among children and adults. (3)A spatial nesting phenomenon exists among PSFs of different hierarchical levels. When higher-tier PSFs are situated within subdistricts, they tend to attract a larger number of non-local residents. Consequently, examining the accessibility, mobility, and equity of PSFs across multiple spatial scales presents greater challenges.
This study systematically summarizes the spatial configuration patterns of PSFs,examines spatial effects in neighborhoods, and delves into optimal configuration strategies to cater to the diverse needs of residents. As China's mega-cities experience pronounced trends towards aging and declining birth rates, there arises an increasing imperative for the allocation of PSFs to consider the differing needs of various age groups. This study is dedicated to aligning with the concept of "longevity-ready cities" and initiates preliminary attempts towards a more thorough exploration of these issues.

15-MINUTE NEIGHBORHOOD AND HAPPINESS OF SENIOR RESIDENTS

Abstract ID: 1108.0.0.1241.2024
Pre-Organized Paper Presentation

Mingxi Zhou [Peking university] m.zhou.21@alumni.ucl.ac.uk, presenter
Lin Lin [Xi'an Jiaotong - Liverpool University] lin.lin@xjtlu.edu.cn

Enhancing happiness is essential for improving the overall well-being of the population, especially for seniors. The concept of the 15-minute neighborhood has gained widespread recognition and promotion worldwide. However, limited studies have examined the association between the 15-minute neighborhood and the happiness of senior residents. This study aims to bridge this gap by focusing on the concept of the 15-minute neighborhood as a manifestation of geographic factors affecting the happiness of the elderly.

This study leverages the Social Satisfaction Survey conducted in Qingdao City, China, in October 2023, to explore the subjective and objective measures of the 15-minute neighborhoods for individuals aged 60 and above. Subjective assessments were derived from survey responses, capturing personal demographics such as gender, income, education level, household registration, housing situation, and frequency of exercise, alongside self-reported happiness and health status. Objective measurements were obtained using Point of Interest (POI) data, through the geocoding of respondents' home locations, to evaluate the infrastructure within their 15-minute living circles, including but not limited to bus stops, community service centers, and green parks. Employing a binary logistic regression model, while controlling for individual socio-demographic characteristics, this research investigates the impact of perceived and objective attributes of the 15-minute neighborhoods on seniors' happiness. Our methodological innovation lies in the integration of subjective survey data with objective POI data, offering a comprehensive framework for assessing the determinants of urban senior citizens' happiness.

A total of 894 respondents, with 53.1% of females aged 60 and above, were included in the study. 81.6% of respondents are reported to be happy and very happy. The preliminary survey findings reveal that the proximity to bus stations and access to parks and open spaces significantly contribute to the happiness of the elderly. The regression model results underscore the positive relationship between the 15-minute neighborhood design and elderly life satisfaction.

These findings highlight the potential and limitations of the 15-minute city concept as an effective urban planning strategy to improve living environments and elevate happiness among the elderly, offering significant insights for guiding future urban planning and policy formulation.

20-MINUTE CITY, SPATIAL LABOR AND JOB RELATIONS IN AUSTRALIA

Abstract ID: 1108.0.0.1081.2024
Pre-Organized Paper Presentation

Tiebei Li [Centre for Urban Research, RMIT University, Australia] simayina@hotmail.com, presenter
Yina Sima [UNNC] yina.sima@nottingham.edu.cn

Most 20-minute city studies focused on livability and neighborhood accessibility to local services but rarely included primary employment. This paper extended the scope of the studies by examining the urban employment structure and transport dynamics of an Australian city under the 20-minute city concept framework. Specifically, the paper posed three principal research questions: 1) What was the status of employment access in a large dispersed city under a 20-minute planning model; 2) How would the 20-minute city model work under spatial economic settings in an exemplar large dispersed city; and 3) What spatial strategies could support a 20-minute city planning agenda for employment in a large dispersed city?

We developed comprehensive method to model residents' job access time using the census-based journey to work (JTW) data, and detailed household activity and travel survey. The main datasets used to assess the time duration of worker job access at the neighborhood scale were the 2016 journey to work (JTW) origin-destination matrices obtained from the Australian Bureau of Statistics (ABS). The assessment of residents' job access time was carried out by analyzing worker commuting patterns. The datasets reported the number of commuting trips from an origin to a destination, sorted by travel mode (car, bus, tram, train, walk, or cycle)
Analyzing JTW time stepping down to diverse industry and occupation sectors and transport modes allowed profound insight into the disparity in residents' job and housing locations and transport choices. By evaluating the distribution of working residents, types of employment, and transport performance, this paper examined possible policy responses and challenges of change in achieving the 20-minute planning target.

It was suggested that housing infill development could be a more feasible approach to reduce JTW time for residents experiencing longer time for work travels. The advancement of the research lied in the following aspects: workers' commuting time was modelled using Journey-to-Work data and a household travel survey; the analysis of diverse labor markets provided insight into residents' locations and transport costs; the opportunities of achieving

20-minute job access would be challenging but practical.

This paper contributed to the knowledge of international planning, transport and urban economic geography literature. It extended the 20-minute city discussion to include employment access. More importantly, we developed the first-ever comprehensive dataset to evaluate residents' job access through a novel 20-minute city lens. The research offered an innovative method to model journey to work time using the census-based JTW data combined with detailed travel survey data. The findings of this research could be applied, when considering more effective approaches, to government investment in transport and housing infrastructure, and to inform policy debates and investment decisions to optimize employment and housing locations and minimize transport costs.

INDIGENOUS COMMUNITY PLANNING IN THE NORTHWEST

Abstract ID: 1112.0.0.485.2024

Pre-Organized Session Summary

Session Includes: 1108.0.0.1160.2024, 1108.0.0.789.2024, 1108.0.0.1227.2024, 1108.0.0.1188.2024

James Miller [Western Washington University] james.miller@wwu.edu, organizer

Indigenous community planning in the Northwest focuses on building healthy communities through Indigenous planning frameworks. In this session we will cover a range of studies with Indigenous communities in the region that foreground strength. These studies demonstrate the importance of Indigenous planning frameworks in addressing critical issues communities are facing today, such as climate change, housing shortages, and the opioid crisis. Coming from a strengths-based approach, the session illustrates the significant contribution Indigenous community planning provides to the broader field of community development. In the session, participants will learn how Indigenous governance provides value-based systems that guide community planning and development that support wholeness. We provide examples that demonstrate how an approach to coastal adaptation or housing reflects the importance of overall community wellbeing. Indigenous Community Planning in the Northwest

provides holistic approaches that consider social, cultural, and environmental factors to support thriving communities.

Learning Objective(s):

- Communicate strengths-based approaches to community development.
- Identify how Federal Indian Policy informs Tribal Planning.
- Understand the role of language revitalization in community wellbeing.

MANAGED RETREAT VS. UPLAND EXPANSION: UNDERSTANDING AN INDIGENOUS APPROACH

Abstract ID: 1108.0.0.1160.2024
Pre-Organized Paper Presentation

Daniel Abramson [University of Washington] abramson@uw.edu, presenter
Dylan Stevenson [University of Washington] dylste@uw.edu

People associate “managed retreat” -- the prevailing term for community adaptation in the face of coastal hazards and shoreland loss -- with the surrender of local autonomy to insensitive bureaucracy, and an adversarial relationship with natural forces. Actual implementation is dominated by a narrow set of property buyout-based strategies that fragment communities, worsen social inequality and vulnerability, and reduce collective adaptive capacity. In discourse and impacts, these problems have hampered just, sustainable coastal development. For Indigenous communities restricted to territories much smaller than those that supported their cultures prior to colonization – typically on land that is especially hazard-prone – the term ‘managed retreat’ and its property-focused implementation also evokes historical trauma, and expresses a colonizing attitude towards human-environmental relations. What planning practices and developmental policies would be more supportive of socially just, long-term, culturally informed, and collectively adaptive anticipation of changing coastlines?

Of the very few cases in the U.S. of communities acting to ‘relocate together’, as opposed to vacating vulnerable land piecemeal with individual buyouts, the largest concentrations are in Washington and Alaska, where Tribal and Indigenous communities have taken the lead. We present observations from over a decade of values-driven community planning for coastal change in the Pacific Northwest, most recently an on-going partnership between the Shoalwater Bay Indian Tribe (SBIT) and the University of Washington.

SBIT planners promote ‘upland expansion’ as the community’s best response to coastal hazards. The Tribe is extremely vulnerable: its reservation includes the most rapidly eroding stretch of Pacific coastline in the lower 48 states; storms and landslides threaten its access and power supply; and its only currently buildable land will be inundated by a Cascadia megaquake tsunami. SBIT has responded to the tsunami threat by building the first free-standing vertical evacuation tower in North America. SBIT has also purchased higher elevation land back from timber interests adjacent to the reservation and put it in trust for upland development. The land will provide sites for housing and services including elder assisted living, a justice center, administrative buildings, museum, health clinic, and “edible trails” for food sovereignty, active living, and retention of cultural traditions according to the principles that “culture is health” and self-reliance is key to their resilience. The planning does not assume the immediate abandonment of low-lying houses or shoreline activity, but instead prepares a space for refuge and recovery should a disaster strike quickly; guides the gradual transformation of coastal function and relocation of

the community as shoreland is lost; and treats "home" as spanning multiple sites, recovering and reinhabiting previously expropriated upland forests. Housing is being designed both for minimum impact on ecosystems and for disassembly and reassembly on multiple sites.

These approaches highlight how SBIT's indigenous approach brings multiple co-benefits, turning a bad situation into a positive one; emphasizes local agency; and holistically views resilience as well-being. While "managed retreat" may express what coastal communities ultimately must do when the shoreline itself is "retreating," the term does not adequately express the indigenous recognition that all habitation exists with, and in, a dynamic environment. Beyond the Tribal context, "upland expansion" better expresses a planning that accommodates the nuances of place attachment, community cohesion, and social-ecological relationships, through evoking the redirection of growth. It presents directions for policy, including programs and funding to put land in trust for collective relocation and affordable housing; design infrastructure and building systems that are modular and disaggregated to minimize impacts on sites and ecosystems and be capable of relocation themselves; and allow for gradual incorporation of activities on new sites into daily community life, prior to vacating existing home sites as they become uninhabitable.

PLANNING WITH CONTEXT AND THE ALASKA NATIVE CLAIMS SETTLEMENT ACT

Abstract ID: 1108.0.0.789.2024
Pre-Organized Paper Presentation

Meghan Holtan [University at Buffalo] mtholtan@buffalo.edu, presenter

In this paper, I unpack the many narratives surrounding the 1971 Alaska Native Claims Settlement Act (ANCSA) to understand the challenges of teaching Indigenous sovereignty and planning to diverse classrooms and audiences. The largest land claims settlement in the United States, ANCSA involved the titling of 45 million acres of land and the transfer of nearly 1 billion dollars by the U.S. government to Alaska Native organizations. A new approach to land claims in the U.S., ANCSA created 13 regional for-profit Native corporations that hold the cash settlement from the 1971 act, subsurface land rights for the greater region, and the potential for ongoing return of profits to shareholders. ANCSA also created 245 for-profit village corporations with surface rights to land within community boundaries at the time of ANCSA. All reservations in Alaska, except Metlakatla, were extinguished.

How is the story of ANCSA told, why, and by whom? This paper opens a series of considerations developed through the author's learning to teach and share about the Alaska Native Claims Settlement Act. I include reflections on my work as a practicing planner in Alaska and the relative lack of knowledge and ability to articulate this complexity in planning processes. This paper looks at multiple stories of ANCSA and what this means for teaching, planning, and communicating research about Alaska and beyond. The stories about the history and implications of ANCSA intersect and conflict and include narratives such as:

- ANCSA as part of a global circumpolar north movement for Indigenous self-determination in the 1960s and 70s
- ANCSA is a necessary departure from the American Indian reservation system
- ANCSA as a product of the residential schooling system
- ANCSA as a product of the increasing neo-liberalization of the welfare nation-state

Sandy Grade defines "Red Pedagogy" as "not a method or technique to be memorized, implemented, applied or prescribed. Rather, it is a space of engagement. It is the liminal and intellectual borderlands where indigenous and non-indigenous scholars encounter one another, working to remember, redefine, and reverse the devastation of the original colonialist "encounter" (Grande, 2008, page 234). I hope to use my ongoing understanding of ANCSA to contribute to a "space of engagement" for planners working or hoping to work with Indigenous communities and organizations in both practice and academic spaces.

INTERSECTIONS OF COMMUNITY PLANNING, HEALING, AND LANGUAGE REVITALIZATION

Abstract ID: 1108.0.0.1227.2024

Pre-Organized Paper Presentation

Jessica Barudin [University of British Columbia - School of Community and Regional Planning]
jessica.barudin@ubc.ca, presenter

Indigenous communities face unique challenges that stem from historical and colonial trauma and ongoing systemic inequities, resulting in displacement and loss of traditional lands. This influences the physical spaces and landscapes as well as the cultural and linguistic continuity, cultural identity, and spiritual connections of individuals, families, and Nations. Trauma healing and language revitalization are critical and interconnected components of Indigenous community planning, as they offer pathways to address historical injustices and empower communities to reclaim their identities, ancestral knowledge, and (re)connections to land.
This research paper explores how the process of language reclamation and revitalization in Indigenous communities contributes to resilience and wellness, and how these processes may be systematically incorporated into the planning and development of healthy, vibrant Indigenous communities. Grassroots examples of First Nations community wellness initiatives that embed language revitalization and ancestral healing practices to promote trauma recovery will be shared. Specifically, a Kwakwaka'wakw example will be used to describe a tribal-specific Indigenous Research Paradigm to highlight strategies and wise practices for engagement, multigenerational collaboration, and leadership from Kwak'wala-speaking elders, women, and language practitioners.
Preliminary findings share community-centered applications, underscoring the importance of safe spaces for transformative changes that prioritize Indigenous voices and knowledge. The paper aims to provide insights and recommendations to inform the co-creation of land-based, language education, as well as wellness programs through culturally responsive, strengths-based, and healing-centered community planning approaches with Indigenous communities.

INDIGENOUS HOUSING: HOLISTIC APPROACHES TO MEETING MULTIPLE CRISES
Abstract ID: 1108.0.0.1188.2024
Pre-Organized Paper Presentation

James Miller [Western Washington University] james.miller@wwu.edu, presenter

In the Pacific Northwest, we are seeing a surge of growth among the unhoused population with few resources available to help break the cycle. However, Indigenous communities are providing innovative solutions that address these issued head-on and provide models for all to learn from. The need for safe, supportive housing among Native American Tribes in Washington State is immediate. Native Americans comprise 3% of the overall population in Whatcom County but make up over 15% of the identified houseless population. The opioid epidemic adds an additional layer of complexity to the existing housing crisis, and Lummi Nation recently declared a fentanyl crisis. On the Lummi Nation reservation, housing supply is insufficient to provide adequate and safe housing to all tribal members; this is due in part to the legacy of colonial systems of oppression and Federal Indian Policy (Zaferatos 2015).

Responding to the growing number of unhoused tribal members, Lummi Stepping Stones (LSS) initiated proposal for addressing individuals and families that were not being serviced through the Tribal Housing Authority's program. The largest barrier for entry to housing was the requirement to be clean and sober in addition to agreeing to abide by strict rules. LSS, a program of the Lhaq'temish Foundation, began to develop a program focused on creating housing solutions for the Lummi Community. Currently, Lhaq'temish Foundation, a Lummi Nation nonprofit, is developing Eagle Haven Village, a permanent supportive housing project that will serve Lummi tribal members and other Native Americans in the region who are experiencing houselessness. Eagle Haven establishes partnerships with Lummi Health and Human Services to create a true wrap-around supportive village for Native Americans who have struggled to attain stable housing through traditional options and for tribal members with co-occurring mental health and substance-use disorders. The development places Lhaq'temish values at the heart of housing policy.

This paper provides a policy analysis of Tribal Housing Policies and Federal Indian Policy to demonstrate the continued influence of settler colonial systems on the sovereignty of Native American Tribes. Through the policy analysis, it is evident that land-use governance, building codes, and housing finance have significant impacts on the housing availability within Lummi Nation and equitable access to housing. Through a case study analysis of the Eagle Haven Village development in addition to comparative analysis of other Tribally led housing projects among Coast Salish communities in Washington State, the paper demonstrates how Native American Tribes are leading the way in innovative housing solutions that provide models for other communities. Indigenous, value-centered approaches provide holistic solutions to the housing crisis, seeing it as a complex whole, inclusive of people, the environment, and culture.

Indigenous housing is an asset that supports the cultural practice and ontology of the community. In conclusion, Eagle Haven Village exemplifies how Indigenous housing can positively impact the wellbeing of individuals, families, and communities. By prioritizing cultural values, community connections, and sustainability, this project serves as a beacon of hope for Indigenous Americans facing housing challenges, fostering resilience and healing within the Lummi Nation.

SETTLER STATES' (MIS)RECOGNITION AND INDIGENOUS PLANNING RESPONSES

Abstract ID: 1112.0.0.200.2024

Pre-Organized Session Summary

Session Includes: 1108.0.0.219.2024, 1108.0.0.302.2024, 1108.0.0.423.2024, 1108.0.0.201.2024, 1108.0.0.439.2024

Margaret Ellis-Young [University of Waterloo] margaret.ellis-young@uwaterloo.ca, organizer
Joaquin (Am'aj Q'in) Lopez-Huertas [University of Utah] joaquin.lopezhuertas@utah.edu

This session explores the multiple spaces in which Indigenous People(s) experience planning and its colonial legacy. On the one hand, it analyzes the efforts that settler states are developing to reconcile the colonial entanglements of planning and the limitations that result from prescribed frameworks that do not respond to Indigenous People(s) needs, priorities, or claims. On the other hand, it explores how Indigenous People(s) respond and challenge settler state planning while reasserting their forms of sovereignty and self-determination. By discussing experiences in Canada, the US, Aotearoa|New Zealand, Chile and Guatemala, the presenters provide a critical perspective on the colonial narratives of public interest, sense of belonging and identity, Indigenous legal orders and decolonial praxis that unveil the complexities Indigenous People(s) navigate within settler state planning.

Learning Objective(s):

- To understand how Indigenous People(s) reinvent and adapt their planning systems under the coloniality of power
- To critique the colonial legacies of planning and how they impact Indigenous People(s) from different geographies

RECONCILING RECONCILIATION WITH THE PUBLIC INTEREST?

Abstract ID: 1108.0.0.219.2024

Pre-Organized Paper Presentation

Janice Barry [University of Waterloo] janice.barry@uwaterloo.ca, presenter
Joelle McNeil [University of Waterloo] jcmcneil@uwaterloo.ca

Settler-colonial planning is challenged to reconsider and repair its relationships with Indigenous peoples. In the Canadian context, this challenge is often framed as one of reconciliation, in reference to the work of the Truth and Reconciliation Commission of Canada. The Commission's final report described reconciliation as "not an Aboriginal problem" but "a Canadian one", in which "[v]irtually all aspects of Canadian society may need to be reconsidered" (2015, p. vi). For the planning profession, this reconsideration will demand quite foundational shifts in how it conceptualizes its work. As Campbell and Marshall (2002) observe, the normative foundation and justification for professional planning have long been the 'public interest' – a concept that is difficult to pin down in all contexts but that is particularly vexing in an era of reconciliation.

Our paper begins by examining how the professional planning institutes across Canada (the Canadian Institute of Planners and provincial/territorial institutes) are publicly framing their commitments to reconciliation and the relationship to their various codes of ethics, conduct, and practice. We find that, despite growing discussion of reconciliation as a key element of 'responsible planning practice', it has not yet translated into any formal changes to the ethical principles and values that are meant to guide Canadian planning practice. Issues related to reconciling the planning profession's relationships with Indigenous peoples presumably fall under broader commitments to the public interest, which is defined to include respect for diverse peoples and values. This finding aligns with the lead author's own experience as a former member of the Ontario Professional Planners Institute's Indigenous Planning Perspectives Committee, where discussions about revising Ontario's Code of Practice centred on expanding the concept of the public interest to include issues related to reconciliation.

Having established the empirical context, we then move to a more conceptual discussion of the inherent limits of attempts to reconcile Indigenous interests within existing constructs of the public interest. We develop this argument in two parts. First, we outline a methodological concern with how the public interest is determined. We examine how both utilitarian and procedural approaches are ill-positioned to produce just outcomes for Indigenous peoples. The deontic, or rights-based, approach is equally flawed as it centres the settler-state as the bestower and arbiter of rights and, thereby, reproduces the "colonial politics of recognition" (Coulthard, 2014). We use critiques of recognition to transition to the second part of our argument, which is a more discursive interrogation of the words "public" and "interest" and the deeply colonial onto-epistemologies that underlay them. Having established the methodological and conceptual problems with the public interest, we conclude that it is an inappropriate tool for establishing the ethical foundations for responsible planning practice for Indigenous peoples. Instead, ethical planning practice needs to be based on a more relational form of reconciliation that holds space for Indigenous resurgence and nationhood, or what Tully (2018) has termed "transformative reconciliation".

CARING FOR LIFE: REFRAMING LEGALITY THROUGH GRASSROOTS TERRITORIAL CONTROL

Abstract ID: 1108.0.0.302.2024
Pre-Organized Paper Presentation

Magdalena Ugarte [Toronto Metropolitan University] magdalena@torontomu.ca, presenter

Since 2018, a team of Mapuche and Chilean researchers of which I am part has partnered with a Mapuche association in order to explore questions of Indigenous planning, land-based knowledge, and territorial reconstruction in Tirua, coastal Mapuche territory. Through an approach similar to Participatory Action Research (PAR) adapted to Mapuche knowledge production protocols (Melin, Mansilla, and Royo 2019), the work is premised on the continued existence of Mapuche forms of planning the territory that the state has attempted to subjugate and eradicate. The goal is to gather systematize, and visibilize this planning knowledge base that still lives in the collective memory but is at risk of being lost, reinstating such practices as a political statement and praxis that confronts the legitimacy of dominant forms of spatial organization and existence (Ugarte, Melin, and Caniguan 2022).

This paper discusses one of the projects emerging from this ongoing collaboration, which at the request of community members documented audio-visually the spontaneous rise of community checkpoints led by Mapuche and civil society organizations in Tirua at the beginning of the COVID-19 pandemic. For six months, Indigenous communities, civil society organizations, and the local government collaborated to restrict access to the area through strict protocols defined locally. Thanks to these measures – labeled by the Chilean government as illegal– the community was able to keep the spread of the disease under control and prevent COVID-related deaths, particularly among Elders.

The paper considers this experience – both the establishment of the community checkpoints and the process of documenting it through community-engaged digital ethnography (Sandercock and Attili 2010) – through the lenses of radical planning (Beard 2003, Miraftab 2009), legal pluralism (Ugarte 2019), and Indigenous planning and resurgence (Harjo 2019, Jojola 2008, Matunga 2013, Simpson 2014). Although they emerged as an emergency response during a public health crisis, the deeper driver for the community checkpoints had to do with ensuring the territory as a whole was protected according to local forms of territorial control grounded in Mapuche legal orders and local knowledges, which exceeded and challenged dominant state parameters. In doing so, this initiative is an exercise of self-determination.

Through in-depth interviews with people directly involved in the actions and analysis of official public health data, the documentary sheds light on the rise, evolution, and effectiveness of this local response, reframing questions of legality, authority, and wellbeing in planning by centering Mapuche notions of caring for life in all its forms. Better understanding experiences of this kind not only sheds light on the power of community-led public health efforts

that are culturally relevant in places where state action is insufficient or inadequate. More deeply, in a context of internal colonialism and Indigenous dispossession, the project begins to shed light on how/if these kinds of responses strengthen community cohesion, both among Indigenous communities and with non-Indigenous people in the area, which might have implications for Mapuche struggles for Indigenous territorial control and justice more broadly.

INDIGENOUS KINSHIP, IDENTITY, PRACTICES: REPLANNING SETTLER-COLONIAL CITIES

Abstract ID: 1108.0.0.423.2024
Pre-Organized Paper Presentation

Michelle Thompson-Fawcett [University of Otago] michelle.thompson-fawcett@otago.ac.nz, presenter
Kaila Tawera [University of Otago] tawka106@student.otago.ac.nz

Urban environments worldwide are dynamic landscapes symbolizing progress and innovation. However, these sites of human significance are also commonly steeped in rich histories of genocide, displacement, and dispossession of Indigenous populations. Contemporary settler-colonial cities not only occupy Indigenous lands but effectively alienate the notion of Indigeneity that inherently exists within them. Aotearoa New Zealand cities are no exception. In Aotearoa, cities continue to reinforce colonial narratives through the fragmentation, dilution, and exclusion of Indigenous Māori geographies and identities (Puketapu-Dentice et al., 2017). Colonialism and urbanisation in Aotearoa have engendered the atrophy of everyday Māori traditions, practices, and social structures, resulting in disproportionately negative health, education, and economic impacts (Ryks et al., 2014).
Urban spaces profoundly impact the identity and experiences of the people occupying them. In Aotearoa New Zealand, our urban milieu might reasonably be expected to reflect the Treaty based biculturalism shared between New Zealand Māori and non-Māori cultures. However, urban spaces, alongside policy and decision-making, continue to deliver a one-sided Western narrative that does not reflect the diversity in the nation (Akena, 2012). This research paper critiques such Western oversight within settler-colonial cities. It does so by exploring the

experiences of New Zealand Māori young people, both those living within and beyond their tribal territories, in two urban locations: Dunedin and Gisborne. These small cities offer unique case studies that are distinct from larger urban areas. By focusing on the smaller urban centres, the research articulates potential opportunities and insights to inform more inclusive and equitable approaches to urban planning in a settler-colonial context on the global periphery. In addition, the exploration of how Māori young people perceive and encounter their respective urban environments provides insights into identity and sense of belonging for Indigenous citizens. This investigation contributes to a nuanced understanding of Indigenous experiences within place and how place attributes can be conducive to facilitating identity formation and contemporary placemaking.
A Kaupapa Māori methodology (Smith, 2012) has been used to ensure that the research, from its inception to its dissemination, is firmly grounded in Māori philosophy, epistemology, and ontology. Upholding a Kaupapa Māori perspective provides an avenue to mainstream Indigenous knowledge and aspirations alongside Western-based research, while also ensuring that the research is conducted by Māori, with Māori, and for the potential benefit of Māori.
Throughout the research, iterative engagement with Indigenous research collaborators and Indigenous communities about the initial work and preliminary findings has enhanced the ongoing direction of the research and its relevance and accountability to Indigenous people. The research outcomes create new understandings and applications of Māori practices and innovations to help transform urban environments in ways that Indigenous communities of various types prioritise in terms of living well and sustainably in globally peripheral towns and cities.

DECOLONIAL CRACKS IN PLANNING: BETWEEN NAVAJO AND IXIL RE-EXISTENCES

Abstract ID: 1108.0.0.201.2024
Pre-Organized Paper Presentation

Joaquin (Am'aj Q'in) Lopez-Huertas [University of Utah] joaquin.lopezhuertas@utah.edu, presenter

Indigenous People(s) experience daily challenges with the legacy of colonization and modernity/coloniality, including dispossession and denial to control their territories, rejection of their forms of knowledge, and circumscribed forms of development that do not recognize their needs, values, or priorities. As a result, they are one of the most vulnerable global minorities suffering extreme poverty, malnutrition, diseases, discrimination, and

high rates of landlessness. The struggles Indigenous People(s) face to reclaim their lives, Land, and Knowledges under the oppression of the settler states have induced the reinvention of forms to exist and re-exist in different aspects of life, including planning.

In this research, I focus on decolonial praxis to understand the mechanisms Indigenous People(s) draw upon to challenge, refuse, and transform settler state planning. Forms of re-existence occur in the decolonial cracks, namely, spaces provided by settler states or taken by Indigenous communities. Farther from being a solution to decolonizing planning, decolonial cracks are alternatives to redefine Knowledges, relationships, and identity with the Land from the community terms. To place a decolonial journey in a spatiotemporal window where cracks are noted and used to disrupt planning, I follow the instances where Indigenous People(s) challenge settler states: within, against, and beyond. I study the applicability of re-existence and decolonial cracks as a conceptual framework to understand the conditions of two Indigenous communities in contrasting geographies, epistemologies, and identities: Tolikan (Diné, Navajo) in the US and Chajul (Maya Ixil) in Guatemala. The particularities of each community enhance a better understanding of the conditions that create or dissolve decolonial cracks, including policy framework, forms of governance, and access to Land. I apply a relational approach through critical place inquiry as a form of data collection of the Knowledges continually shared and maintained by Indigenous People(s) describing how space is experienced, understood, and practiced. I conduct an iterative process between data collection and data analysis through member checking and relational validity. Then, I apply narrative analysis to present stories depicting the successes and struggles the communities consider essential to report and the elements that enhance maintaining and advancing their ways of being, thinking, feeling, and doing.

This research advances the literature on Indigenous planning while presenting novel forms of understanding how Indigenous People(s) crack the coloniality of settler state planning in their own terms. Moreover, it expands the boundaries of planning theory and practice by paying attention to re-existences emerging from conditions of struggle and crisis, but also from a place of celebrating life, dignification, restoring relationships with Land and being sovereign. Planning in re-existence through the decolonial cracks unveils the processes of adaptation and reinvention through the accumulated inter-generational Knowledge systems that inform Indigenous People(s) in their decolonial journey.

MUNICIPAL PLANNING FOR RECONCILIATION? REFLECTIONS FROM TWO CANADIAN CITIES

Abstract ID: 1108.0.0.439.2024
Pre-Organized Paper Presentation

Margaret Ellis-Young [University of Waterloo] margaret.ellis-young@uwaterloo.ca, presenter

Following national-level dialogue on Indigenous-settler reconciliation, Canadian municipalities are increasingly involved in efforts to redefine their relationships with Indigenous communities and respond to growing recognition of past and present colonial injustices. Although state-led reconciliation efforts often favour symbolic or performative actions that maintain the settler colonial status quo, Indigenous scholars underline the need for conceptions of reconciliation that uphold Indigenous political authority, land rights, and connections to place (e.g., George, 2020). This imperative positions urban planning, which concerns "the use, management and future of place", as a crucial domain for municipal actors to engage with questions of reconciliation (Porter & Barry, 2016, p. 2; Sandercock, 2019). While state-led planning within settler colonial contexts consistently fails to reckon with the reality that settler urban development has taken place, and continues to take place, on Indigenous lands (Porter & Barry, 2015), planning is also a site where new types of relationships and mentalities may be fostered to disrupt settler colonial continuity (Porter & Barry, 2016; Sandercock, 2019).

Building on this premise within a new context of municipal-Indigenous reconciliation, this paper examines how municipal planning staff understand their responsibilities and opportunities to advance reconciliation while planning for urban change at different scales. I analyze how these planners implicitly and explicitly connect municipal planning practice to reconciliation and position their roles and abilities therein, and those of their planning projects, at the nexus of colonial continuity and disruptive possibility. To explore these questions, I focus on four long-range planning projects in Vancouver and Montréal: two municipal comprehensive plans (the Vancouver Plan and Montréal's Land Use and Mobility Plan 2050) and two area redevelopment plans (Vancouver's Broadway Plan and Montréal's Lachine-Est eco-neighbourhood). I draw primarily on interviews with municipal planning staff (n=17) significantly involved in at least one of these four projects. I also analyze project documents, engagement reports and transcripts, and interviews with other planning actors involved in the projects (n=2) to supplement and contextualize municipal planners' reflections.

I use critical discourse analysis (e.g. Fairclough, 2003) to identify how municipal planners portray approaches to planning practice in a context of reconciliation in ways that express, reproduce and/or challenge state-led planning's normative modes of representing and being. While there are important contextual differences between the two cities and planning scales, planners consistently recognize the importance of reconciliatory action within their field. However, some avoid unsettling their practices by placing this action outside of their role and/or project, including through discursive siloing of reconciliation work, deemphasizing an Indigenous stake in the project, and invoking particular understandings of a "reconciliation project". Other planners position reconciliation action as a more widespread responsibility grounded in planning's central preoccupation with (Indigenous) land, emphasizing shifts to normative planning mentalities, approaches, and relationships while recognizing constraints therein within the context of their projects. These findings identify both structural (political, procedural) barriers and mental barriers that limit municipal planners' ability to disrupt settler colonial planning norms toward "a practice and ethic of coexistence" (Porter & Barry, 2016, p. 5).

SHIFTING GROUNDS FOR COMMUNITY LAND TRUSTS

Abstract ID: 1112.0.0.191.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.684.2024, 1108.0.0.199.2024, 1108.0.0.202.2024, 1108.0.0.490.2024, 1108.0.0.915.2024

Margaret Haltom [MIT] mhaltom@mit.edu, organizer

This session explores the evolving dynamics of the Community Land Trust (CLT) movement, spotlighting new strategies for CLTs to support indigenous autonomy, prevent evictions, and achieve scale and financial solvency while preserving grassroots governance. Action research projects collaborate with CLTs that are acquiring affordable housing at risk of gentrification, advancing decolonial land-back efforts, and establishing regional networks for strategic capital access and simultaneous neighborhood control. The session also scrutinizes CLT financing, comparing CLT financial health relative to other community development entities and identifying pathways for CLT funding. Taken together, the research initiatives tackle the ethical dilemmas and financial challenges facing CLTs as they pursue housing decommodification amid escalating land values and historical land dispossession.

Learning Objective(s):

- Understand strategies CLTs are employing to build community control by 1.) advancing indigenous self-determination and land back movements, 2.) safeguarding the lowest-income housing and preventing tenant displacement, and 3.) mobilizing for national capital investment to bolster neighborhood governance.
- Learn about avenues for CLTs to achieve financial stability and scale, drawing from new financial health analysis. Understand the investment needs expressed by CLT organizers nationally, such as patient capital, flexible financing, reduced barriers to state funding and enhanced government subsidies tailored to the CLT model.
- Examine the ethical conflicts that arise between building community control and pursuing financial solvency and scale, including the challenges of assimilating into traditional affordable housing finance networks and operating on land dispossessed from communities of color and from indigenous people. Understand how CLTs preserve their core values of neighborhood control and racial justice amidst their efforts to broadly decommodify housing.

Financing CLTs
Abstract ID: 1108.0.0.684.2024
Pre-Organized Paper Presentation

James Defilippis [Rutgers University] jdefilip@rutgers.edu, presenter

The financing of community land trusts (CLTs) is complicated and defies easy descriptions, but this talk will summarize the diversity of funding and lending options typically used by CLTs for housing and commercial development, as well as organizational administration. To some extent the diversity of funding options is due to the variety of the types of developments and activities that happen on CLT lands. Like most forms of community practice, CLTs get much of their funding from various kinds of direct or indirect public subsidies. The talk begins by discussing those sources, but these are fairly well known in affordable housing circles, and thus the talk is not specifically focused on them. But CLTs are also becoming more innovative in their approaches to financing developments. CLTs such as Oakland CLT, East New York CLT (Brooklyn), and others have created forms of community crowd sourcing and private securities offerings to finance their work. As such, CLTs are part of a much larger embrace of forms of non-extractive finance that has emerged in the last decade (Armeni and Lyon, 2021; Shatan and Williams, 2020), as well as new forms of community ownership that are providing inspiration for CLTs (Abello, 2023; Theodos and Edmonds, 2020). The talk therefore discusses these new forms of finance and how they are being utilized, and often created by CLTs. Finally, although the CLT model in the US emerged with the principle of self-determination, the talk will discuss the question of whether or not CLTs could ever become "self-sustaining" by virtue of their ground lease fees and, for homeownership CLTs, sales of the homes already in their portfolios. This a scale question that directly impacts the financial well being of CLTs (Martin, et al., forthcoming).

EXAMINING THE FINANCIAL HEALTH OF COMMUNITY LAND TRUSTS
Abstract ID: 1108.0.0.199.2024
Pre-Organized Paper Presentation

Vince Wang [University of Washington] vrwang@uw.edu, presenter

As communities across the United States face increasingly entrenched housing affordability crises, community land trusts (CLTs) – entities aimed at keepings homes and other types of spaces permanently affordable and community controlled (Davis, 2010) – have seen a surge in interest, evidenced by an increase in the number of CLTs in operation (Wang et al., 2023). CLTs offer an innovative model for affordable housing, sustainable development, community engagement, and long-term stewardship of land, contributing significantly to the field of urban planning (Ehlenz & Taylor, 2019). The effectiveness of CLTs, along with their potential for scaling, hinges on financial sustainability and requires a comprehensive understanding of the factors that affect CLT finances. This study contributes to that knowledge by exploring the conditions and determinants of the financial health of CLTs. Specifically, it addresses two research questions: (1) How does the financial health of CLTs compare with that of broader community-based development organizations (CBDOs)? and (2) What organizational and environmental factors are associated with the financial health of CLTs?

Using Internal Revenue Service From 990 information from 2000 to 2019, I will construct a longitudinal dataset for 144 CLTs that participated in the 2022 national CLT survey (46% of all CLTs in the U.S.). I plan to develop a set of financial health measures based on a recent study by Lo et al. 2022, which examined the financial health across the entire sector of CBDOs. The first research question will examine critical financial measures for the CLT field, such as debt-to-equity ratio, self-sufficiency ratio, asset change, and current ratio, and compare these with those for the broader CBDO sector. To address the second question, I will employ the methodology from a widely cited paper on nonprofit financial health by Prentice (2016), applying principal component analysis to develop a CLT financial health index. This index will serve as the dependent variable in a multivariate regression model, with independent variables including organizational characteristics derived from both the Form 990 data and the national CLT survey data (Wang et al., 2023). Additionally, I will adopt a more open-systems approach to the study by incorporating several environmental variables, such as median household income, population density, and state, regional, and national revenue shares.

Preliminary data analysis finds that CLTs outperformed other CBDOs in 2018 in key financial health indicators, such as being less likely to report negative net income, face insolvency, or experience financial disruption. The empirical evidence generated by this study will be fundamental in ensuring that CLTs can continue to effectively fulfill their missions, delivering essential services to communities amidst the complexities of funding, regulation, and operational challenges. This evidence will also guide the practices of various stakeholders, including policymakers, funders, lenders, and administrators of CLTs, aiding in the expansion of the field. Successful expansion will ensure the provision of essential, permanently affordable housing opportunities and other community assets to lower-income communities.

COMMUNITY LAND TRUSTS: AN EMERGING MODEL FOR DECOLONIAL PRACTICE?

Abstract ID: 1108.0.0.202.2024
Pre-Organized Paper Presentation

Maggie Low [University of British Columbia] maggie.low@ubc.ca, presenter

In collaboration with the Canadian Network of Community Land Trusts (CNCLT) and the Balanced Supply of Housing Node at the University of British Columbia (BSHN), this paper explores land governance through emerging Indigenous-led Community Land Trust (CLT) models in Canada. By remaining in community control, CLT model(s) provide more equitable access to land and housing, especially for low-income and marginalized communities. CLTs are becoming an important part of addressing the housing crisis and supporting rural and urban Indigenous housing needs. At the same time, CLT's operate on land with complex histories, including lands stolen from Indigenous peoples through colonial planning processes. However, in recent years Indigenous governments and organizations have turned attention and resources towards adapting the community land trust model to support Indigenous self-determination, including advancing the land back movement. This research asks: How can CLT's support the development and growth of Indigenous-led community land trusts, and build better relationships with Indigenous peoples, communities and organizations? What tensions and opportunities arise from CTL models in the context of decolonization and reconciliation efforts in Canada?

Given Indigenous Nations' strength and persistent calls on Canada to fulfill its commitments to the Truth and Reconciliation Commission of Canada's Calls to Action, housing scholars and practitioners are beginning to realize their role in supporting reconciliation, decolonization and Indigenous self-determination in their work. Drawing on interview data with Indigenous and non-Indigenous CLT and housing practitioners (n=8), initial findings tell us CLT's have the potential to redefine the concept of 'land ownership' to better align with Indigenous worldviews that emphasize the intergenerational responsibility to protect and steward the land for future generations. Further, CLT's have the potential to address historical injustices by facilitating dialogue and partnership between Indigenous and non-Indigenous organizations.

PLANNING CONDITIONS FOR COMMUNITY-LED HOUSING PRESERVATION BY CLTS

Abstract ID: 1108.0.0.490.2024
Pre-Organized Paper Presentation

Kuni Kamizaki [University of British Columbia] kuni.kamizaki@ubc.ca, presenter

The financialization of housing has resulted in heightened pressures of eviction, displacement, and homelessness among low-income and racialized communities. Financialized landlords have targeted existing affordable rental housing—often unsubsidized with no affordability covenants—for acquisition and asset consolidation (August and Walks, 2018). In response, community-led housing preservation has gained considerable attention from grassroots organizers and progressive planners (Crowder, Schidt, and Jacobus, 2021). Above all, community land trusts (CLTs) mobilize housing preservation as a strategic terrain from which to promote anti-displacement and produce community-controlled non-market housing. CLT's housing preservation thus has the potential to serve as a progressive alternative to the mainstream response to the housing crisis that revolves around market-led housing supply (Kipfer and Sotomayor, 2024).

Despite this transformative potential, housing acquisition in a competitive real estate market is a complex undertaking that requires CLTs to develop technical capacities and access to financial resources. In doing so, they could run a risk of undermining overall goals of anti-displacement and racial justice as they are pressured to prioritize organizational financial health and project feasibility (Williams, 2018). This becomes more challenging for CLTs in cities and regions where supportive public policy and programs for acquisition are absent. Against this backdrop, this paper asks: what planning strategies and community-based action can CLTs use to create enabling conditions for community-led housing preservation? What are ethical conundrums and limits of community-led housing preservation to pursue anti-displacement and housing justice?

To answer these questions, this paper uses the case study of the Parkdale Neighbourhood Land Trust (PNLT) in Toronto and their work on the preservation of at-risk rooming houses, the least expensive housing option for low-income and racialized tenants and people with the experience of mental health in the Parkdale neighbourhood. This paper is based on the action research project that includes the analysis of policy documents and PNLT's organizational documents, as well as over 20 interviews and focus groups with PNLT staff, tenants, board members, stakeholders and city staff.

Specifically, this paper examines two cases of successful preservation of rooming houses at-risk of conversion, upscaling and gentrification. In doing so, it shows how PNLT developed a three-pronged approach to rooming house preservation: tenant-led eviction prevention organizing; acquisition planning; and policy advocacy. Three activities constitute the basis of PNLT's community-driven policy making that contributed to the creation of City of Toronto's non-profit acquisition program in 2021. The paper concludes with reflection on how housing preservation

can contribute to broader objectives of housing and racial justice in light of tensions between project feasibility and tenant needs, and government programmatic constraints on tenant selection. These findings are of relevance to crucial debates on the transformative potential of CLTs (DeFilippis et al, 2019).

SHIFTING GROUNDS: GROWTH, GOVERNANCE, AND GRASSROOTS VALUES IN CLTS

Abstract ID: 1108.0.0.915.2024
Pre-Organized Paper Presentation

Margaret Haltom [MIT] mhaltom@mit.edu, presenter

How can Community Land Trusts (CLTs) scale to promote widespread housing decommodification while preserving community control? Community Land Trust (CLT) advocates aim to boost their market share beyond their estimated .03 percent of U.S. housing (Wang et. al, 2023) to address national housing affordability. But CLT expansion and assimilation into traditional affordable housing finance networks paradoxically risks weakening their core values of neighborhood control and racial justice (DeFilippis, 2017). This research explores changes happening within the CLT movement and promising policies for action as CLTs seek scale and financial solvency while remaining true to their grassroots values. We employ a mixed-methods, community-engaged approach, combining data from the Grounded Solutions Network and the Lincoln Land Institute Census of CLTs and Shared Equity Housing Entities with insights from fieldwork and semi-structured interviews with 36 actors across 17 CLTs nationally. Shaped in partnership with CLT organizers and resident researchers at the emerging Klondike Community Land Trust in Memphis, Tennessee, the action research includes observations of CLT board meetings, network dialogues and community events. We also facilitated national CLT “learning circles,” bringing together 15 CLT practitioners to discuss challenges and strategies most salient to CLTs seeking to access capital and build community power.

We find CLTs are innovating within their tripartite dimensions–community, land and trust–to address broader housing needs while preserving the ethos of the model. In the context of community, CLTs are expanding from neighborhood-based to city and county-wide coalitions to improve access to land, capital and government partnerships. Efforts to establish citywide CLTs have encountered resistance from residents and organizers, who fear diminished grassroots involvement in CLT decision making. As an alternative, robust CLT networks are facilitating collective organizing and advocating for favorable financing, while maintaining neighborhood CLT

governance structures. In terms of land, CLTs are shifting from single-family homes to multi-family rentals, addressing rising land costs, but introducing new maintenance issues and imbalanced power dynamics. We highlight promising practices from CLTs building tenant control and improving property management. Regarding trust, a gradual shift from ground-lease models to alternatives including deed restrictions and co-ops is expanding financing and addressing distrust in historic communities of color, where external ownership of land echoes legacies of racialized land control.

As CLTs shift to scale, each change introduces new challenges for maintaining community control. Still, we find CLTs are striving to both scale and preserve grassroots governance by organizing coalitions, transitioning to multifaceted forms of tenure and trust, and building power among tenants. But scaling demands equally innovative and flexible financial support from lenders with the capital needed to support CLT growth. We surface requests from CLT organizers seeking access to investment, including patient capital and flexible financing, along with reduced barriers to state funding and enhanced government subsidies tailored to the CLT model. We spotlight examples of CLTs and CLT coalitions who have successfully organized to access acquisition financing and new forms of credit. While some view these adaptations to the CLT model with concern, we argue that these shifts are part of a longstanding evolution within the CLT movement. Just as CLTs have progressed from securing cooperative farming to addressing urban real estate speculation (Davis, 2010; Cahen et al., 2022), so are they now responding to the demands of financialization and the need for widespread housing decommodification. By spotlighting promising policies for action, we aim to show how these changes can be navigated without losing the core principles of the CLT movement.

UPHOLDING INDIGENOUS KNOWLEDGES AND PRACTICES THROUGH PLANNING

Abstract ID: 1112.0.0.278.2024

Pre-Organized Session Summary

Session Includes: 1108.0.0.746.2024, 1108.0.0.331.2024, 1108.0.0.368.2024, 1108.0.0.556.2024

Sarah Cooper [University of Manitoba] sarah.cooper@umanitoba.ca, organizer

Indigenous knowledge systems are grounded in place-based and reciprocal relationships with lands and waters. Each Indigenous nation has its own distinct knowledge system developed over thousands of years. Today, although colonialism has disrupted these systems in many ways, Indigenous peoples continue to assert their rights and responsibilities to make decisions about their lands and communities, and to pass on their knowledge systems to future generations. Moreover, these knowledge systems are integral to Indigenous planning practice and to what Harjo (2019) has called "community futurity work" (p.11). This session highlights various ways that Indigenous and Western planning can support Indigenous knowledge systems. It offers applied and theoretical engagement with themes relating to land-based and intergenerational knowledge, ethics and pedagogy. It asks "How can planners and planning contribute to the upholding of Indigenous knowledge systems?"

Learning Objective(s):

- This session will identify challenges and opportunities for planners who are working with (or would like to work with) Indigenous knowledges and knowledge systems.

PLANNING FOR INDIGENOUS FOOD PRACTICES & FOOD SOVEREIGNTY IN URBAN SPACES

Abstract ID: 1108.0.0.746.2024
Pre-Organized Paper Presentation

Robin Quigg [Ōtākou Whakaihu Waka/University of Otago] robin.quigg@otago.ac.nz, presenter

Indigenous Māori communities are bound to their environment through genealogical relations, and thus are deeply tied to the natural world (Huambachano, 2024). Such connections between Indigenous peoples and their environments shape practices and ways of life. Of significance for Māori in relation to the environment are a variety of Indigenous food practices (Hanna & Wallace, 2022). However, since European colonisation of Aotearoa New Zealand, access to food sources and practices has been limited or completely eradicated due to large scale land loss and dispossession. Tollan et al. (2023) explain that this has had intergenerational impacts on Māori, contributing to poor physical and mental health, as well as increasing stress levels. This begs the question of how Māori might re-gain the ability to access and revitalise food sovereignty, particularly in the urban spaces where most Māori live.

Concomitantly, contemporary unsustainable food production methods, coupled with the climate crisis, deepen issues of food security and food sovereignty for Māori (Tollan et al., 2023). Thus, notions of reinvigorating Indigenous food practices in urban spaces is gaining traction in various Māori communities. For Māori, food is regarded as part of the 'woven universe', and therefore maintaining reciprocity between lands, waters and humans is fundamental (Hanna & Wallace, 2022; Hutchings et al., 2020). Māori knowledge and worldviews underpin such holistic appreciation, alongside ideas of environmental guardianship, spiritual health, self-determination, vitality, and enlightenment (Hanna & Wallace, 2022; Tollan et al., 2023). These understandings of the world manifest in Māori food systems, meaning that the related food practices are strongly focussed on sustainability and wellbeing. Genealogical connections to physical and metaphysical elements beyond humans are reinforced through place-based food cultivation, which is tied to intense obligations to the environment. In comparison to the general notion of food sovereignty, Indigenous food sovereignty takes a more interconnected and relational ethic of care towards food. Indigenous Food Sovereignty highlights a recognition of non-human relatives and environmental personhood, and the need for human kin to love and nourish the non-human. Understandably, as Miltenburg et al. (2023)

explain, introducing Indigenous food sovereignty initiatives into urban settings can also aid in reclaiming a sense of belonging and cultural identity in the city. In this overall context, investigating Indigenous Māori food sovereignty opportunities in urban environments is a priority as part of decolonising the planning of urban spaces.

In undertaking this research, we have adopted a Kaupapa Māori approach. A Kaupapa Māori approach uses a methodology that is founded in Māori culture, history, knowledge, language, values, and worldviews. It facilitates the research being focussed on Māori interests, with an aim of the research being of direct benefit to Māori communities. Our research has been centred on the activities of Māori communities in the city of Ōtepoti Dunedin, New Zealand.

Taken as a whole, the topic of Indigenous food sovereignty is still in its infancy. Research is needed to extend the knowledge base. Hence, our investigation of Māori food sovereignty, through the use of Indigenous food practices and how this can inform spatial planning and planning systems in Ōtepoti Dunedin, is a welcome contribution to reconfiguring planning futures. Knowledge generated from our research is assisting a variety of Indigenous communities to work alongside each other to encourage urban restoration, enhance urban biodiversity, and fulfil Indigenous urban futurities. Furthermore, this research informs planning practitioners and local, regional, and national authorities as to how they can transform ways of thinking about urban spaces through the integration of Indigenous-led planning practices.

(K)NEW SPACE FOR RECONCILIATION? ETHICAL DILEMMAS FOR PLANNING CONSULTANTS

Abstract ID: 1108.0.0.331.2024
Pre-Organized Paper Presentation

Joelle McNeil [University of Waterloo] jcmcneil@uwaterloo.ca, presenter

Across Canada, Indigenous communities are planning, and many First Nations hire planning consultants to support diverse planning needs. Changes in policy and legal frameworks, growing populations, funding opportunities and

capacity deficits influence this growing area of planning practice. Planning firms across the country offer services to First Nations, and some firms specialize in planning with and for Indigenous peoples. Although many consultants support Indigenous engagement and consultation on behalf of industry or settler governments, this paper focuses on the work of planners who are hired by and represent the interests of First Nations clients. The Canadian Institute of Planners, an organizational body that represents professional planners across the country, recently integrated reconciliation with Indigenous peoples into its strategic priorities. Yet, little is known about the impact and approaches used by consultants in their relationships with First Nations clients, and the implication of this growing field of practice on reconciliation at the individual and organizational scales.
What are the unique ethical challenges and frameworks used by consultants in this field? Through a series of interviews with "exemplar" consultants and key informants, this paper examines the ethics of planning consultants that work for First Nations in Canada. The initial findings show that while consultants actively engage in a communicative ethics that prioritizes respectful and trusting relationships with their clients, few have developed rigorous ethical frameworks to address the unique ethical considerations of Indigenous sovereignty, structural racism, and Indigenous legal and ethical frameworks. This paper considers the implications of these findings through the theoretical frameworks of Indigenous/non-Indigenous relationality (Maddison & Nakata, 2019) and robust and transformative theorizations of reconciliation to provide insight into the opportunities for the planning profession to (re)develop approaches to reconciliation with Indigenous peoples.

SAFEGUARDING INTANGIBLE CULTURAL HERITAGE WITHIN INDIGENOUS PLANNING

Abstract ID: 1108.0.0.368.2024
Pre-Organized Paper Presentation

Dylan Stevenson [University of Washington] dylste@uw.edu, presenter

In 2003, member states of the United Nations Educational, Scientific and Cultural Organization (UNESCO) overwhelmingly passed a new international treaty aimed at combating the homogenizing effects of globalization on the world's living cultural diversity through the Convention for the Safeguarding of the Intangible Cultural Heritage (hereby Convention). This new normative instrument focuses on Intangible Cultural Heritage (ICH), or "the practices, representations, expressions, knowledge, skills – as well as the instruments, objects, artefacts and cultural spaces associated therewith – that communities, groups and, in some cases, individuals recognize…" as embodying living cultural heritage (United Nations Educational, Scientific and Cultural Organization, 2003), building on UNESCO's historical efforts in protecting tangible cultural heritage as in the case of its World Heritage List program (Kurin, 2007). In 2006, the Convention became international law and signatory member states accepted

the responsibility to safeguard ICH by working with cultural communities to ensure their traditions flourish and are transmitted to future generations (Kurin, 2014).

The United States was one of the few countries that abstained from passing the Convention and is not obliged to follow the requirements outlined therein. However, it has developed a series of laws, policies, and programs that set out to accomplish similar goals as part of its internal historic preservation activities (Kurin, 2014), albeit with an emphasis on historic structures and properties. Tribal Governments have expressed their sentiments that while historic sites and structures are indeed important to ensure the integrity of their cultures, other cultural components such as language revitalization, traditional uses of plants and lands, and other forms of Intangible Cultural Heritage are essential for their communities' sense of cultural continuity and survival (National Park Service, 1990). As a matter of tribal historic preservation interest, ensuring the preservation and retention of Indigenous ways of life includes both the expansion of existing efforts that protect historic sites and structures, and safeguarding intangible cultural heritage. Without domestic or international requirements to safeguard ICH by/with Indigenous communities, I ask: How can planners and other cultural resource professionals contribute toward safeguarding intangible cultural heritage within Indigenous Planning?

Drawing from Native American and Indigenous Studies, Historic Preservation, and Indigenous Planning, I offer three interdependent elements to help guide communities and practitioners in safeguarding intangible cultural heritage within Indigenous planning. These three elements are Personhood, Place, and Practice, representing key considerations in developing planning and preservation activities that support communities' work in practicing and transmitting their cultural forms to the next generation. I also expand on the interdependent relationships among these elements as well as implications for safeguarding intangible cultural heritage more broadly within planning practice.

DECOLONIZING PLANNING AND DESIGN PEDAGOGY THROUGH CEREMONY

Abstract ID: 1108.0.0.556.2024

Pre-Organized Paper Presentation

Sarah Cooper [University of Manitoba] sarah.cooper@umanitoba.ca, presenter
Dani Fenn [University of Manitoba] umfennd@myumanitoba.ca
Jillian Seniuk Cicek [University of Manitoba] jillian.seniukcicek@umanitoba.ca
Honoure Black [University of Manitoba] honoure.black@umanitoba.ca

Alixa Lacerna [University of Manitoba] alixa.lacerna@umanitoba.ca

Many scholars and advocates have pointed to the importance of transformation in addressing planning's colonial histories and presents (Dorries & Harjo, 2020; Walker et al., 2013). For planners, this means learning to plan in ways that respect Indigenous self-determination and the nation-to-nation relationships between Canada and Indigenous nations. It means planning in ways that uphold treaties, that ensure that Indigenous rights are addressed, and that recognize and support Indigenous planning knowledges and practices.

Many Canadian universities have launched Reconciliation Action Plans, or begun to undertake actions to recognize and address the historical and contemporary harms caused by settler colonialism. Although the concept of reconciliation has often been applied in limited and even neocolonial ways in the academy (Lavallee, 2020), the recent attention to reconciliation has also opened possibilities for transformation through new ways of research, teaching and learning. At the University of Manitoba's Faculty of Architecture—where the Department of City Planning is located—a group of Indigenous and non-Indigenous faculty, staff and students, led by Elder-in-Residence Valdie Seymour (Hollow Water First Nation), has been working to re-envision teaching and learning through ceremony. Through a process of collaborative autoethnography (Chang et al., 2016), we are examining and reflecting on our own experiences as emerging and practicing professionals and educators working to find new ways of teaching and learning towards reconciliation.

This paper asks "How can ceremony inform teaching and learning about planning and design?" Elder Seymour teaches us that ceremony is both a process and a practice; it is grounded in relationships between people, and between people and the more-than-human world. It reminds us of how we should be in the world, and of our gratitude for the world that sustains us (Seymour, 2022). Through this project, we are developing new pedagogies and processes that seek to transform how emerging planners and designers learn about the lands on which they live, as well as how Canadian universities relate to the Indigenous nations on whose lands they sit. This requires critical attention to how individual and collective experiences are shaped by external systems, including privilege and marginalization generated through settler colonialism, and to creating new systems and ways of doing that centre Indigenous knowledges and practices.

CARE AS REFUSAL: INDIGENOUS VALUES IN PLANNING

Abstract ID: 1109.0.0.734.2024
Roundtable Submission

Maggie Low [University of British Columbia] maggie.low@ubc.ca, organizer

Indigenous values represent an intrinsic component of Indigenous planning systems. In this roundtable, Indigenous planning scholars and practitioners will use a facilitated discussion to explore the application of cultural values practiced within Indigenous communities to foster, protect and maintain forms of sovereignty. Particularly, we pay attention to the politics and practices of care and activism as acts of refusal in settler state planning systems. With experience grounded within their work with communities from different geographies, the participants discuss the importance of care while engaging in social movements, trauma healing, governance, community engagement, and health and well-being planning. After the facilitated discussion the audience will be invited to participate in a broader discussion about "care as refusal" in planning.

IMAGINATION AND INNOVATION IN UNIVERSITY-COMMUNITY PARTNERSHIPS

Abstract ID: 1109.0.0.597.2024
Roundtable Submission

Katherine Idziorek [University of North Carolina at Charlotte] kidziorek@charlotte.edu, organizer
Branden Born [University of Washington] bborn@uw.edu
Marc Schlossberg [University of Oregon] schlossb@uoregon.edu
Jaimie Masterson [Texas A&M University] jmasterson@arch.tamu.edu
Samina Raja [University at Buffalo School of Architecture and Planning] sraja@buffalo.edu

University–community partnerships have been recognized for their potential to advance urban innovation by leveraging institutional resources to address real-world challenges while facilitating immersive service learning experiences for students (Schlossberg et al. 2018), building community capacity (Whittaker et al. 2017), and increasing participant agency (Meyer et al. 2018). However, university-community partnerships are not without their challenges, which include conflicting partner timelines, lack of adaptability, unrealistic objectives, inadequate accountability structures, and mismatch of resources to purpose (Baum 2000). In this roundtable session, we explore the promise and challenges of university-community partnerships in building community capacity and enhancing community resilience. Specifically, we address the following questions: 1) What kinds of partnership structures best address the challenges of university-community collaborations?, 2) How can such partnerships leverage innovative planning methods and technologies to foster knowledge sharing and co-creation?, and 3) What are best practices for designing service learning opportunities in the context of university-community partnerships?

We frame this discussion by drawing upon scholar and action researcher Leonie Sandercock's 2004 JAPA essay entitled "Towards a Planning Imagination for the 21st Century." In the essay, Sandercock identifies four key qualities of an approach to urban planning that could respond meaningfully to an increasingly pluralistic society and the diversifying communities comprising 21st-century cities. In her appeal to practitioners and educators to exercise the planning imagination, Sandercock challenged planners to conceptualize a planning culture that aspires beyond the acquisition and application of technical skills and regulatory modes of practice. Such a culture would embrace the political nature of planning, with intentionality toward for whom and for what to work; it would be audacious in its invitation of the public into the decision-making process; it would be creative in its use of methods that encourage lateral thinking and foreground lived experience; and it would be therapeutic in its ability to bridge differences and enable transformation (Sandercock 2004). Twenty years following Sandercock's call to action, these four overlapping and intertwined qualities of political, audacious, creative, and therapeutic remain relevant to the challenges faced in urban planning practice, research, and education.

The roundtable panelists comprise community-engaged researchers who serve as leaders in facilitating university-community partnerships and service-learning opportunities at their respective institutions. Participants will share their perspectives as illustrated through a series of place-based case studies involving collaboration across research, practice, and pedagogy: a Texas Target Communities initiative to engage communities in mitigation planning to address air pollution and future flooding; an application of augmented reality to engage a more diverse public in the design of streets for people; public engagement in food system policy development through the Food Systems Planning and Healthy Communities Lab; and a public policy hackathon event organized in the context of an interdisciplinary NSF-funded research project examining resilience and public space. While the panelist case studies will be leveraged as illustrations of different partnership models and foci, the session will be structured as a forum for discussion. We invite audience participants to share their own experiences with community-university

partnerships and will reserve substantial time for facilitated Q&A and discussion.

This session will explore the innovative potential of co-creative partnerships facilitated by institutions of higher education and their potential to expand the planning imagination to be more political, audacious, creative, and therapeutic. Participants will learn about best practices for ethical community-engaged research, creative methods for facilitating public engagement in the planning process, and different models for developing opportunities for place-based service learning. In our focus on university-community partnerships that seek to enhance community capacity and resilience, we examine innovative methods of integrating research, practice, and pedagogy to meet the urban planning challenges of the 21st-century.

THE ARTS AS A PLANNING RESEARCH METHOD

Abstract ID: 1109.0.0.618.2024
Roundtable Submission

Meghan Holtan [University at Buffalo] mtholtan@buffalo.edu, organizer

Planning scholars employ a range of research methods to understand questions of importance to the planning field. While some methods have a robust and documented tradition of use, arts-based research methods are less formalized and often deeply personal. How do planning scholars integrate their creative practices into their research? Inspired by the facilitator's own exploration of the role of her creative practice as a circus artist, this roundtable asks panelists to reflect on their creative practice and how it has informed their research questions, methods, and relationships. We will also discuss how and if the arts intersect with their interpretation and communication of findings and the role of the arts in community-based research. The panelists represent scholars at multiple career points, from PhD student to full professor. Their creative practices include filmmaking, community theater, textile art, dance, zine-making, and photography. We will also discuss how panelists and audience members have brought the arts into teaching planning and the theoretical implications of this approach.

Attendees are encouraged to bring their reflections, projects, and ideas to the discussion. Panelists include Bjorn Sletto, Luciana Barretto Lemos, Magdalena Novoa Echaurren, and Riah Joseph Lange

Track 2 Individual Paper Presentations

A YOUTH-CENTERED FRAMEWORK FOR COMMUNITY ADAPTATION AND CLIMATE RESILIENCE

Abstract ID: 1108.0.0.1126.2024
Individual Paper Presentation

Laura OConnell [University of Minnesota] l.katieoconnell@gatech.edu, presenter
Nisha Botchwey [University of Minnesota] botchwey@umn.edu

Youth are among the most exposed to climate change's short- and long-term impacts on physical and mental health as well as the erosion of social support systems. This is a compounding effect for youth who are also from frontline communities disproportionately comprised of indigenous peoples and people of color. Yet, planners and policymakers frequently exclude youth during climate and disaster planning processes. This paper examines the impact of climate change on youth and the importance of integrating youth perspectives in fostering community resilience. By incorporating international research from a broad set of disciplines, including planning, social work, and public health, we develop a conceptual framework that provides a structured approach to understanding the dynamic role of youth in climate change adaptation and argues that youth act as more than vulnerable community

members. Due to their experiences and local knowledge, they should be seen as vital contributors to broader community resilience.
The framework finds that both adult-led and youth-led initiatives that emphasize the importance of education, resources, and support systems help support youth dealing with the fear of future disasters and those living post-disaster. Key inputs such as peer-to-peer programs, partnerships, and youth leadership programs empower individuals that foster youth proximal outcomes like healthy behaviors, optimism, leadership, and participatory competence. These youth outcomes, in turn, support inputs necessary for community resiliency, including preparedness for future events, strengthened local knowledge, and expanded community networks.
By developing a youth-centered conceptual framework, this paper advocates for a holistic approach to climate resilience involving youth in both learning and leading roles. It underscores the importance of a balanced partnership between adults and youth in shaping resilient communities capable of responding to and proactively preparing for the challenges posed by climate change. By reframing youth as indispensable community assets rather than merely as passive recipients of adult-led initiatives, this paper contributes to participatory planning scholarship and practice. Our framework emphasizes the need for an integrated approach in resilience planning, recognizing the inclusion of youth must move beyond placation to the higher levels of citizen partnership and power. By recognizing youth perspectives and contributions to disaster planning, planners expand their capacity to build more sustainable and just communities in an era of climate change.

AN INNOVATIVE GOVERNANCE MODEL FOR CHILD-FRIENDLY COMMUNITY DEVELOPMENT

Abstract ID: 1108.0.0.550.2024
Individual Paper Presentation

Ye Zhan [Tongji University] zhanye@tongji.edu.cn, presenter
Yifan Yu [Tongji University] yuyifan@gongji.edu.cn

Background: Since China proposed the goal of building 100 child-friendly cities by 2025, many Chinese cities such as Shanghai, Beijing, Shenzhen, Changsha and other places have focused on creating child-friendly urban environments for children. Due to the characteristics of children's physical and mental development, the community space environment is often an important carrier of children's daily activities. In Shanghai's central

urban areas, where the characteristics of high-density human settlements are prominent, many built community environments have entered the stage of being old and waiting for renovation. In response, in the new round of urban renewal actions of local governments, letting child-friendly concepts drive community environment improvement is currently one of the highly recommended practices. At the grassroots level in Shanghai, agencies like neighborhood offices and community committees lead child-friendly community development efforts. However, these entities often lack professional expertise, highlighting the crucial role of local "community planners" with specialized knowledge. At the same time, in order to return to true humanistic design and avoid "government authoritarianism" or "planner dictatorialism", children's voices should be listened to and children should be fully involved in all aspects of child-friendly community creation.

Methods: Existing international research emphasizes that effective governance is essential to translating children's rights into tangible environmental improvements. This study aims to: (1) explore a multi-stakeholder collaborative governance approach integrating local government, planners, and child participation for child-friendly community development, offering innovative toolkits; (2) to use local governance in specific communities in Pudong New Area, Shanghai Practice, prove and explain how this collaborative governance method and tool can help communities achieve refined spatial problem diagnosis, assist in the prioritization of child-friendly projects, local decision-making and evaluate project effectiveness; (3) Optimize and extend this multi-faceted collaborative governance model , returning community space creation to humanism and realizing the transformation of children's rights into a child-friendly material environment.

Results: Based on the on-the-ground practices in Zhoujiadu Community, Pudong New Area, Shanghai, this study introduces an innovative framework, methods, and technical tools for multi-stakeholder collaborative governance in child-friendly community development. On the professional guidance front, a novel " Child-Friendly Neighborhood Microscopic Built Environmental Audit Tools " is proposed. Unlike traditional environmental assessments, this tool includes aspects of supervising and evaluating the effectiveness of public policy implementation. Its focus on micro-level built environment elements within communities, such as pedestrian and cycling path designs and children's activity space layouts, facilitates precise identification of spatial issues and suggests more practical renewal measures. On the child participation front, methods such as children's cognitive maps, photovoice, and child-friendly workshops empower children as "junior community planners," involving them in the early planning, mid-stage construction, and post-implementation management of child-friendly community initiatives. Local grassroots governments have clearly defined the leading role in the construction of child-friendly communities, coordinated the efforts of all parties, and were supervised by all stakeholders to ensure the implementation of public policies.

Conclusions: The study presents a multi-stakeholder collaborative spatial governance model that tightly integrates local government, planners, and children, aiming to transform children's rights into tangible child-friendly environments. At the same time, making "creating child-friendly cities" no longer a hollow slogan, enabling the construction of community spaces to return to humanism, holds illuminating and promotional significance for urban areas with similar high-density living environments to Shanghai.

ANALYSIS OF THE LEGAL FRAMEWORK OF FLORIDA'S CRAS

Abstract ID: 1108.0.0.652.2024
Individual Paper Presentation

Stephen Buckman [Clemson University] stbuckm@clemson.edu, presenter

On July 5th, 1969, the Florida Legislature passed the Florida Redevelopment Act of 1969 (Act). This law allows counties and cities to create community redevelopment agencies (CRAs) to identify, plan, and remove or reduce slums, blighted areas, and crime, provide low to moderate-income housing, revitalize coastal resort and tourist areas, and rehabilitate or conserve a redevelopment area with the legislative CRAS having helped shape economic development in the state of Florida.

There are two hundred and twelve CRAs across the state that, according to a 2015 Florida Legislative survey, collected $594.4 million in revenues and held $714.5 million dollars in debt. Despite the prolific use of these special districts, Florida redevelopment critics question CRA's ethics, outcomes, equity, politics, and accountability. Criticism of CRAs has come from the heavily conservative state legislature which sees CRAs as a waste of taxpayer money.

Understanding the criticism that is foisted upon CRAs as an economic and real estate development driver this study looks to see if these criticisms hold merit. In looking to answer this criticism in this paper we present 7 main questions that look at the structure of CRAs and how they administer the funds they have at their disposal. To get at these questions we employ a qualitative content analysis of the websites of CRAs in the state of Florida. We follow that with a random sample of interviews with CRA directors in the state.

The importance and implications of this study is embedded in the ideas of public private partnerships and affordable housing. If it is shown that CRAs are economic development and affordable housing drivers the programs should hold steady. If it is proven otherwise that will give continued fodder to an anti-tax, anti-spend and anti-subsidization of developer wing of the Legislature thus enabling grounds to disband CRAs in the state of Florida.

ASSESSING THE ROLE OF CBOS IN CULTIVATING CHILD-FRIENDLY COMMUNITIES

Abstract ID: 1108.0.0.843.2024
Individual Paper Presentation

Nazmun Akter Pia [University of Texas at Arlington] nxp8336@mavs.uta.edu, presenter
Karabi Bezboruah [University of Texas at Arlington] bezborua@uta.edu
Ariadna Reyes Sanchez [University of Texas at Arlington] ariadna.reyessanchez@uta.edu
Evan Mistur [University of Texas at Arlington] evan.mistur@uta.edu

Dallas-Fort Worth (DFW) stands out as the largest and one of the fastest-growing metropolitan areas in the United States. Between 2010 and 2020, DFW witnessed higher inbound migration than any other metropolitan area in the country, and this surge in population included a significant influx of young families (Kotkin & Clark, 2021). This demographic shift underscores the necessity for strategic planning efforts aimed at cultivating environments conducive to child-friendly living. Globally, as cities strive for inclusivity and diversity, there's a growing recognition of the importance of crafting urban spaces to meet the distinct needs of children. By prioritizing children's needs in urban planning and governance cities can create an inclusive, supportive, healthy, and democratic society for all residents (UNICEF, 2013).

Building child-friendly communities necessitates the mobilization and connection of existing agencies and actors. While local governments hold primary responsibility for realizing children's rights in urban environments, it is crucial to involve a broader network of non-governmental actors, including children themselves (Cordero-Vinueza, et al. 2023). Riggio (2002) stresses that collaboration between diverse stakeholders such as local government, children, families, community-based organizations (CBOs), civil society organizations, media, and academic institutions is critical to effectively address the multifaceted needs of children and families in complex urban environments. CBOs, in particular, are essential stakeholders in implementing child-friendly planning and policies, as they strive for the highest level of community involvement, in contrast to the tendency of local governments to focus on lower levels of citizen participation (Arnstein, 1969). Despite their significance, the specific role of CBOs in cultivating child-friendly communities remains largely unexplored in the literature. This research aims to fill this gap by addressing the lack of attention given to the pivotal role of CBOs in establishing child-friendly neighborhoods in the DFW Metroplex.

We argue that CBOs have a great potential to serve as intermediaries among stakeholders, facilitating collaboration and coordination to address the complex challenges related to urban development and children's rights. Our study investigates the impact of CBO involvement on various outcomes, including community engagement, access to

resources, and the overall well-being of children and families. Additionally, we examine how CBOs are either enabled or undermined by government entities in their efforts to safeguard children's rights. This study addresses the following research questions:

1. How do nonprofits contribute to the creation of child-friendly communities in the DFW Metroplex?
2. What strategies and programs do nonprofits employ to engage and serve families with children?
3. In what ways do nonprofits collaborate with local stakeholders, including government entities, to advocate for child-friendly urban policies and projects?

We aim to comprehensively understand CBOs' contributions in establishing child-friendly communities in the DFW Metroplex. To achieve this, we will conduct a comparative case study analysis of three cities in the DFW metroplex: Dallas, Fort Worth, and Arlington. We will utilize a purposive sampling approach for CBO selection to ensure diversity across CBO sectors, sizes, and their focuses within the community. We will employ qualitative content analysis (Yin, 2009) and semi-structured interviews with representatives from selected CBOs. Specifically, we will critically analyze CBOs' mission statements, annual reports, impact reports, and interview transcripts to gain insights into the multifaceted contributions of CBOs, including the nature of their programs, collaborations with local stakeholders, challenges faced, and the overall impact of their initiatives on children's well-being. Our findings will demonstrate how CBOs build community connections and how their specialized services can complement efforts by government and other stakeholders. This study will serve as a valuable resource for various stakeholders involved in advocacy efforts for child-friendly urban planning and community development, including CBOs, local government, urban planners, policymakers, researchers, and community members.

COMPARISON OF CITY STRUCTURES, FUNDING, AND TOOLS FOR COMMUNITY ENGAGEMENT

Abstract ID: 1108.0.0.1141.2024
Individual Paper Presentation

Carrie Makarewicz [University of Colorado Denver] carrie.makarewicz@ucdenver.edu, presenter

Achieving equitable and robust community engagement remains a challenge for most cities in the U.S. Despite the availability of online tools, guidebooks, consultants, and greater awareness of its importance, most cities find they reach the same few people with their outreach. City agencies and elected council members also struggle to

facilitate two-way communication with neighborhoods for routine administrative processes or city services, such as minor zoning variances, alcohol permits, building permits, road closures, and trash pick-up. Some cities with official neighborhood organizations have invested in their official or registered neighborhood organizations (RNOs) to help facilitate notifications and input into planning processes. Conversely, others have disbanded their long-standing neighborhood organizations, recognizing the outside influence of their white, wealthy, homeowners.

It remains unclear what the best practices are for large cities, but the need is increasingly important given the affordable housing and climate crises, constrained city budgets, and increasing distrust of, or disregard for, government. This study analyzes the results from a yearlong study for the City of Denver, Colorado on how to redesign their engagement processes, including whether to create a dedicated Office of Community Engagement, and how and if to reform and/or support their system of RNOs created in the 1970s.
The study used multiple methods, including a citywide survey of RNO members; 144 interviews with 13 city council members, 70 city staff, RNO leaders and members, nonprofits, and small businesses; geospatial statistics of the RNO boundaries relative to resident demographics and RNO resources; participant observation of 25 RNO meetings; a focus group of BIPOC and LGBTQ+ members of small organizations; and case studies of 13 other cities.

The results show an underfunded and disconnected system of engagement within the City of Denver, for many reasons, yet a strong desire to do better. There are also deep inequities across Denver's 190 RNOs, from RNOs with thousands of dollars in their bank accounts, active websites, and highly active and professional boards, to RNO in less resourced neighborhoods with no funding, few outreach mechanisms, and struggling volunteer leaders, and everything in between. While some council members and survey respondents wanted to "blow up" the RNO system, even RNO members with fewer resources were strong believers in the system's value. They argued for better governance, funding, and staffing, rather than destruction. Across the 13 case studies, no city has discovered the magic pill in terms of a centralized Office of Engagement with adequate staffing, funding, and tools, or the perfect system of neighborhood organizations, each with sufficient finances, staff, meeting spaces, and communication tools. Still, there were useful strategies among the cases that could collectively fill the gaps and address the barriers to inclusive engagement.

The findings overall show major cities in the US continue to place the burden for engagement on neighborhoods. While some may argue this promotes neighborhood autonomy, allowing flexibility in design, participation, and voice, the ongoing result is those with financial resources and volunteer capacity continue to have more input and sway over neighborhood and citywide decisions. There was disagreement, however, among Council members whether a weak RNO translated into poor representation for a neighborhood and inequitable treatment. The paper explores these assertions and what other protections and opportunities allowed for equitable treatment.
To our knowledge, this study is unique in its rich mix of methods and the combined topics of internal and external systems of engagement. It is particularly relevant at a time of disengagement, misinformation, and threats to our democracy. We offer several high- and low-cost recommendations for how cities can improve their engagement structures.

CONSTRUCTIVE COMMUNITY-LED JOURNALISM IN RIO'S MARE FAVELA AMID COVID-19

Abstract ID: 1108.0.0.1009.2024
Individual Paper Presentation

Vanessa Guerra [University of Virginia] vguerra@virginia.edu, presenter
Max Stephenson [Virginia Tech] mstephenson@vt.edu
Cathy Grimes [Virginia Tech] cathg14@vt.edu

This research assesses the journalistic approach of the community-led newspaper Maré Online in Rio de Janeiro's Maré favela during the emergence of the COVID-19 Pandemic. We conducted a qualitative content analysis of the stories published by the newspaper to assess the framing orientation and development of their editorial coverage from March to August 2020, a defining period during the pandemic's emergence after the World Health Organization declared COVID-19 a pandemic on March 11, 2020. We employed Lindsay H. Hoffman (2006)'s framework for Constructive Journalism in Online Newspapers to analyze our data. We found that the stories portrayed in the newspapers proactively sought to mobilize information and promote residents' engagement to confront the challenges of the COVID-19 crisis, two roles defined as the essence of constructive journalism (Howley, 2009; McIntyre, 2019 and Wenzel, 2020). We argue these roles demonstrated the two newspapers' commitment to supporting community agency by providing residents with the knowledge necessary to navigate the emergency and encourage proactive behavior. This orientation reflected the newspaper's deliberate choice and organizational ethos to foster collective agency. We contend the journalism approach portrayed in the Mare Online community-led newspaper provides evidence of the community's efforts on continuous advocacy for changes that can reduce vulnerability and enhance social change over the long term. Our findings deepen our understanding of community-led practices' role in marginalized populations' struggles to assert their right to the city, particularly during crises such as COVID-19.

COVID-19, GENTRIFICATION, AND COMMUNITY INEQUITY: A CASE STUDY OF NANJING

Abstract ID: 1108.0.0.336.2024
Individual Paper Presentation

Jintu Xu [Southeast University] tayhsu@outlook.com, presenter

The COVID-19 pandemic, as a sudden public health crisis, has exposed and exacerbated existing structural inequalities, disproportionately affecting marginalized communities. These inequalities manifest in various forms, such as unequal access to healthcare, job insecurity, and housing instability, which have been further amplified by the pandemic. In the post-pandemic era, changes in work patterns, such as the rise of remote work, have altered the traditional gentrification model in central districts, where the concentration of commercial office buildings once drove the influx of gentrifying populations. This shift presents an intriguing research opportunity to explore the intensification of gentrification and the potential emergence of super-gentrification in such areas. This study investigates how the pandemic has unevenly impacted the process of commercial gentrification in the Xinjiekou central district of Nanjing, China, and its implications for community equity and inclusion. The research addresses the following questions: (1) How has the pandemic amplified the unequal effects of commercial gentrification on different socio-economic groups? (2) What are the mechanisms through which the pandemic has accelerated or reshaped the commercial gentrification process? (3) How have marginalized communities experienced and responded to the dual pressures of the pandemic and gentrification?

To address these research questions, the study employs a mixed-methods approach that integrates quantitative and qualitative data to provide a comprehensive understanding of the intersections between the pandemic, commercial gentrification, and community inequity. Quantitative methods include spatial analysis of changes in business composition, rent levels, and socio-economic indicators across pre-pandemic, during-pandemic, and post-pandemic periods. These analyses aim to identify the unequal effects of the pandemic on different socio-economic groups and the mechanisms through which the pandemic has accelerated or reshaped the commercial gentrification process. Qualitative methods, such as in-depth interviews with diverse stakeholders (low-income residents, minority groups, community organizations, and local businesses) and participant observation, capture the lived experiences and coping strategies of marginalized communities facing the dual pressures of the pandemic and gentrification. By triangulating the quantitative findings with qualitative insights, the study seeks to uncover the complex dynamics of the pandemic's impact on gentrification and its consequences for community equity and resilience.

The case study of Nanjing's Xinjiekou district is particularly suitable for this research. Not only has the area experienced significant impacts from the pandemic while undergoing intensified commercial gentrification, but the author has also conducted a seven-year longitudinal study (2012-2022) on the development characteristics and spatial displacement effects of commercial gentrification in Xinjiekou. This rich contextual knowledge and longitudinal data will provide a solid foundation for analyzing the pandemic's uneven impact on the gentrification

process and its consequences for community equity.

This research contributes to the critical understanding of how public health crises can compound existing urban inequalities and calls for anti-racist, equitable, and inclusive planning practices. By revealing the mechanisms through which the pandemic has unevenly affected communities undergoing gentrification, the study provides insights into developing targeted policies and community-driven initiatives that prioritize the needs of marginalized groups in the face of multiple crises. The longitudinal perspective on Nanjing's Xinjiekou district will offer valuable lessons for building resilient and inclusive communities in the post-pandemic era.

DISASTER MANAGEMENT AND CULTURAL ASSETS: INDIGENOUS PLANNING IN OAXACA

Abstract ID: 1108.0.0.1076.2024
Individual Paper Presentation

Deni Lopez [Massachusetts Institute of Technology] deni@mit.edu, presenter
Betzabe Valdes Lopez [Digital Ready] betzabev@mit.edu
Tomas Chiñas Santiago [Tona Taati'] tonataati@gmail.com

In the face of escalating socio-environmental disasters globally, this study delves into the transformation from reactive disaster risk reduction to proactive disaster risk management. Emphasizing the need for integrated, interdisciplinary governance, we contrast conventional disaster risk planning with Indigenous-led insurgent risk management practices within Zapotec communities along the Los Perros River in Oaxaca, Mexico. Our research advocates for a paradigm shift that not only anticipates disasters but integrates risk management into everyday governance, highlighting the critical role of community-driven approaches and cultural assets in fostering resilience.

Through a participatory action research project, "Pasa La Voz," involving semi-structured interviews, surveys, and workshops, we collected qualitative and quantitative data on disaster risk planning. The contrasting approaches to the 2017 earthquakes (a failure of top-down disaster risk reduction) and the proactive flood risk management led by Zapotec communities illustrate the potential and efficacy of Indigenous knowledge and practices in disaster risk

management. The latter, characterized by communal work (tequio), collective decision-making, and sustainable environmental practices, represents a successful model of disaster risk management that leverages cultural strengths and community solidarity.

Our findings underscore the limitations of technocratic and specialized disaster planning, which often overlooks the socio-cultural dynamics and existing capabilities within communities. The Indigenous Zapotec approach to disaster risk management, rooted in insurgent and radical planning principles, exemplifies how cultural assets and community-driven initiatives can significantly enhance disaster resilience. By integrating these insights into planning scholarship and practice, we propose a reimagined framework for disaster risk management that prioritizes equity, community agency, and cultural integrity.

This research contributes to the broader discourse on advancing anti-racism in planning by demonstrating the importance of acknowledging and incorporating Indigenous and marginalized communities' knowledge and practices. It challenges the prevailing disaster planning paradigms by showcasing the effectiveness of community-based approaches in achieving just, equitable, diverse, and inclusive cities. Through this study, we aim to inspire critical conversations and collaborations that recognize the value of cultural assets in shaping resilient communities and fostering a more inclusive and equitable future in disaster risk management.

ENVIRONMENTAL JUSTICE & INFORMAL HOUSING: SOLAR SUBSIDY BARRIERS IN PACOIMA

Abstract ID: 1108.0.0.987.2024
Individual Paper Presentation

Silvia Gonzalez [UCLA Latino Policy and Politics Institute] sil.rgonzalez@luskin.ucla.edu, presenter
Vinit Mukhija [UCLA] vmukhija@ucla.edu
Jessica Bremner [California State University, Los Angeles] jbremne@calstatela.edu

Green public subsidies have become an important policy tool for confronting climate change in the US. Over the years, these programs have become more comprehensive in California, and more integrated with advances in

technology and through public investment such as with California's cap-and-trade program. These subsidies, however, are also routinely called out for disproportionately benefiting wealthy households. In Pacoima, a working-class neighborhood in Los Angeles, homeowners have access to generous solar panel subsidies, yet uptake has been minimal. Our research, conducted over three years in collaboration with community-based organizations working to implement a solar subsidy program in Pacoima, highlights the challenges residents face in accessing these subsidies.

We argue that in working-class neighborhoods like Pacoima unpermitted or informal housing units are common and make it difficult for homeowners to take advantage of available public subsidies which are oblivious to the prevalence of informal housing. Previous research has shown that Black and Latino households are less likely to have installed solar panels, but the disparity is attributed to differences in household income and homeownership rates. Homeownership does not explain the difference in Pacoima, where most of the housing stock is single-family housing and a majority of households are homeowners. Further, since solar panels are fully subsidized, household income should not make a difference. Pacoima is a moderate-income community of Latinx residents with predominantly single-family zoning. But Pacoima is significantly denser than most single-family neighborhoods because of the common prevalence of informal second and third units on single-family zoned lots. Such informal housing additions and conversions are common throughout working-class communities in Southern California. While they have transformed the fabric of urban neighborhoods to make housing affordable and more accessible, they are ignored by planners and policymakers. As a result of informality, most homeowners in Pacoima cannot take advantage of typical green public aid, including solar panels. Almost half the single-family-zoned lots in Pacoima have an unpermitted second unit, and several have more than one unrecorded dwelling. Many of the units are in poor structural condition and cannot accommodate a solar roof's extra weight. Even more significantly, since many of the units are unpermitted, homeowners are afraid of drawing enforcement attention to them and are reluctant to allow building and safety inspectors on their properties to approve the installation of solar panels.

Drawing from the Pacoima case, we also argue that the formal imaginary of single-family housing across Los Angeles is inadequate, misleading, and discriminatory. Neighborhoods like Pacoima need green public subsidies and investments but the prevailing subsidies privilege and direct support to more advantaged households. Policymakers need to acknowledge residents' informal additions and conversions, and public subsidy programs and policies need to change to support disadvantaged families.

EQUITABLE ENERGY EMPOWERMENT: UNCOVERING CRITICAL NEEDS IN SEATTLE

Abstract ID: 1108.0.0.1014.2024
Individual Paper Presentation

Chin-Wei Chen [University of Washington, Seattle] cchen83@uw.edu, presenter
Andrea Harder [University at Buffalo] amharder@buffalo.edu
Susan Clark [University at Buffalo] sclark1@buffalo.edu
Jan Whittington [University of Washington] janwhit@uw.edu

Energy infrastructure and systems support human health and well-being by providing us with the power needed to fulfill our basic needs, and these systems are not immune to disruption or even complete failure. Disruptions to our power supply will likely become more common moving forward as climate change increases the frequency and intensity of extreme weather-related events. However, marginalized communities are more likely to be impacted by climate change and energy disruptions, and disadvantaged groups are often disproportionately vulnerable to shocks and stressors.

Over the past several years, the City of Seattle has taken multiple actions to advance equitable development in the Duwamish Valley. Community members are exposed to air and noise pollution, and the area is also vulnerable to flooding and extreme heat. To address this environmental injustice and systemic inequity, community-informed energy planning could advance equitable energy provision and development. Therefore, this research employs equity-focused resilience metrics and uses surveys to understand residents' clean energy and critical needs and evaluate the social benefits of renewable-based investment in Seattle, Washington.

The survey is translated into six speaking languages, except English, and expects to engage 300 households across different household income, gender, racial and ethnic compositions, and language proficiency to participate. We expect our clean energy and critical needs survey to have three-folders of insights: firstly, households from different socio-demographic and socio-economic compositions would have different perspectives on the community goals and energy affordability. We assume the community members would care more about the financial impact on their spending and costs, rather than community engagement to enhance climate resilience. Secondly, the survey will have a deeper understanding of what are the important community locations from community members' life experience and daily needs, instead of top-down facility allocation planning. The research will identify the potential mismatches between public resource investments and residents' preferences and daily behaviors, and re-orient future community climate and energy investments. Thirdly, we expect that most of the households have experienced power outages but have little preparation for supplies and resource accessibility (such as water, food, money, and backup power).

Ultimately, we suggest that future resilience and just transition policy could improve community energy resilience and include diverse voices of residents using the SCORE equity-focused resilience metric, and have the opportunity to reduce the disproportionate burden of power disruptions while advancing sustainable development.

ETHNIC BUSINESS PRECINCTS AND PLANNING IN THE MIGRANT SOCIETY OF AOTEAROA

Abstract ID: 1108.0.0.470.2024
Individual Paper Presentation

Junyang Liu [The University of Auckland] jliu987@aucklanduni.ac.nz, presenter
Kai Gu [The University of Auckland] k.gu@auckland.ac.nz

Like many cities around the world, ethnic communities in Auckland, Aotearoa New Zealand, have been advocated as catalysts for cultural diversity, economic vibrancy, and urban revitalisation. According to the report of the First EthnicBiz Forum organised by the Ministry for Ethnic Communities in 2023, about 30 per cent (NZ$ 33 billion) of Auckland’s economy can be attributed to ethnic communities. While achieving recognition as significant nodes of urban space over the past two to three decades, the poor integration of ethnic business precincts into the wider urban area, with particular disconnections at the cultural and social levels, and top-down development that neglected the needs of ethnic communities remain persistent in New Zealand. The ethnic business precinct spontaneously formed by immigrants may be viewed as an optimal example demonstrating the bidirectional relationship between the cultural landscape and ethnic communities. Despite the increasing assimilation of overseas immigrants and their dispersal into outer suburbs, the ethnic business precincts in the inner city or inner suburbs are still characterised by distinctive ethnic symbols, structures, amenities, social institutions, and businesses. The majority of Auckland’s ethnic business precincts include small-scale, low-rise buildings. These buildings are usually aged and located in inner suburbs, providing affordability and adaptability for emerging ethnic businesses.

As a unique typology of cultural landscape, an ethnic business precinct can be viewed as a dynamic and synergistic geo-system comprising interdependent economic, cultural, social, and environmental components. These components influence each other, co-evolving in a dynamic process of morphogenesis. Cultural landscape theory has been proposed for over 100 years as opposition to environmental determinist interpretations. The scope of the

cultural landscape concept provides a solid foundation for a comprehensive understanding of ethnic business precincts and supports comprehensive planning practices towards sustainable development without compromising spatial characteristics and historical traits. In the cross-cultural context, its morphogenetic framework comprises two main dimensions: tangible structural-generative and intangible lived-socialised. The structural-generative study defines spatial units and their generative models. It consolidates a deep understanding of the urban landscape by establishing structural relationships and contextual and processual transformations. The lived-socialised analysis clarifies the relationship between communities and ethnic business precincts in terms of the way that the two sides are intertwined and mutually shaped. It delves into the lived-socialised values of such landscapes and reflects on how they are perceived and promoted by social agents. Lending itself to a more synergistic alignment between the components of an ethnic business precinct, the effective morphogenetic approach provides a valid basis for place- and community-based community planning and design, such as the Business Improvement District (BID) programme.

Taking this physical and cultural complexity into account, this research adopts a people-centred and morphogenetic-based approach relating to space, time, and human society. It consists of two separate research paths: in-depth semi-structured interviews with involved social agents and detailed micro-morphological mapping of key streets and precincts. The former may contribute to identifying the relevant ethnic elements and their boundaries and how people's lived experiences translate a location into a meaningful place. The latter may capture the changes and adaptions in the micro-scale spatial setting, as well as the distribution and visualisation of spatial manifestations related to ethnic identity. Such fact-based research methods can compensate for the arbitrariness of the current top-down development model. This combined theory-practice framework can contribute to cross-cultural urban management by bridging interpretation and representation to tackle complex situations. The expected findings, which emphasise cultural diversity, social inclusion, and economic vitality, will contribute to better design and manage the cross-cultural urban landscape for an increasingly diverse multicultural society in both New Zealand and internationally.

FROM ANTI-RACISM TO CAPITAL ACCUMULATION: CULTURAL PLANS IN THE US CONTEXT

Abstract ID: 1108.0.0.751.2024

Individual Paper Presentation

Carolina Sarmiento [University of Wisconsin--Madison] carolina.sarmiento@wisc.edu, presenter
Genesis Liriano-Terrero [University of Wisconsin—Madison] gliriano@wisc.edu

More and more cities are investing in developing cultural plans to outline the ways in which cultural planning plays a role in their community and economic development strategies. Using a range of frameworks including creative placemaking and creative economies, cities illustrate how art and community development play a range of roles in a city's strategic future (Kovacs, 2011; Ashley et al, 2021). Like master (comprehensive) plans, cultural plans present a formal public process with a range of data collection and community engagement methods, an official municipal vote, and a commitment to certain goals and objectives for a specific period of time. Previous research on art and cultural plans seeks to improve the current state of cultural planning and demonstrates the importance of inclusivity and social justice. Previous research shows that contemporary cultural plans (from 2016- 2019) and more diverse cities strongly emphasized diversity and equity, while cities with lower median household incomes more strongly emphasized equity and inclusion (Ashley et al, 2022). Cultural plans that did mention equity and diversity, often failed to specify what that meant or identifying the communities they referred to.

Originating from a partnership with a city's art and cultural council in search for more "socially just cultural plans," this research examines 65 comprehensive art and cultural plans from across the United States as extensions of the state's cultural planning discourses and their historic and political progression. Taking a critical planning approach (Marcuse 2009), this research builds on progressive planning to improve cultural plans, but also builds on critiques of municipal arts and cultural planning as a tool for inequitable development and achieving citizenship in terms of capital accumulation (Stevenson, 2004). Considering the limitations of studying a cultural plan as a political archive, this research analyzes the various discourses around ant-racism, diversity, inclusion, and equity considering the Movement for Black Lives and the murder of George Floyd, both of which have shifted the cultural and politics of diversity in cities. While previous research demonstrates that diversity and equity are seldomly a guiding principle that frames the engagement process, data collection, and community conversation, this research demonstrates how cultural plans are a reflection of the national "state of cultural planning" from the perspective of municipalities. This research shows how cultural plans can advance or deter equity and social justice and considers the various political and economic regional and national contexts. While some cities have started incorporating words like anti-racism and land acknowledgments as part of their cultural plans, for example, their explicit mention of displacement, inequality, unemployment, homelessness, has also changed."

HOUSING FACTORS AND HEAT-RELATED HEALTH: MODERATING ROLE OF TREE CANOPY

Abstract ID: 1108.0.0.1000.2024
Individual Paper Presentation

Kanghyun Lee [University of Idaho] kanghyun@uidaho.edu, presenter
Sungmin Lee [Texas A&M University] sungminlee@tamu.edu
Inseo Park [Texas A&M University] inseo0323@tamu.edu

Background: Urban areas are facing serious health issues due to extreme heat (Lee and Brown, 2022). Housing factors such as homeownership and the year of construction, as key urban components, are related to access to air conditioning (AC), which in turn affects heat-related health. Renters typically have lower possession rate of AC compared to homeowners, potentially leading to an increase in heat-related health outcomes (Guirguis et al., 2018). Similarly, older housing, as indicated by the year of construction, often lacks central AC systems or efficient ventilation and cooling mechanisms found in modern buildings, thus increasing the risk of heat-related illnesses (Baniassadi et al., 2020). Meanwhile, urban tree canopies not only provide various ecological, social, and health benefits to urban residents but also help mitigate urban temperatures, serving as moderator variable that alleviate the impact of urban components on heat-related health (Graham et al., 2016). While numerous studies have investigated the relationship between heat exposure and health outcomes, few studies have paid attention to the impact of housing factors such as homeownership and year of construction on heat-related health. Furthermore, there is limited research on the impact of urban tree canopies on the relationship between housing factors and heat-related health.
Purpose: This study aims to investigate if 1) there is any association between housing factors (i.e. homeownership &year of construction) and heat-related health outcomes during the heat days and 2) urban tree canopies can moderate the relationship in the urban areas of Marin County, California.
Method: Negative binomial regression was used to identify block-based tree canopy cover associated with heat-related illnesses at the census block level (n=2,437). Additionally, spatially lagged variables were constructed based on the control variables. We created a row-standardized, distance-based spatial-weights matrix (W). This matrix was calculated within a one-mile radius of the focal blocks (with inverse-distance decay). The dependent variable was heat-related illnesses that occurred on heat days when the maximum temperature exceeded the 85th, 95th, and 97th percentiles between May and October (2013-2019), as determined using emergency medical services data. The potential heat-related illnesses included emotional upset, psychiatric disorder, cardiac arrest, chest pain, dehydration, dizziness, hyperthermia, respiratory distress, and stroke during these heat days. The major independent variables were homeownership and year of construction. Finally, urban tree canopy coverage, which was created at 1-meter spatial resolution from 2018 National Agriculture Imagery Program aerial imagery, was included as a moderating variable.
Results: Housing factors, such as homeownership and year of construction, were significantly associated with heat-related health. Specifically, areas with lower homeownership rates and higher old building rates exhibited significant associations with increased heat-related health outcomes. Additionally, urban tree canopy cover showed a significant moderating factor in influencing the relationship between housing factors and heat-related health. Although lower homeownership and higher old housing rates tend to typically pose lower access to AC, which can lead to more heat-related health outcomes, this finding suggests that greater urban vegetation in the areas with lower homeownership and higher old building rates can help offset the negative aspects of housing factors.

Discussion: These results have significant implications for the benefits of urban tree canopies as a means of neutralizing heat-related illnesses, especially the heat comfort that potentially prevents those vulnerable to excessive heat days. As tree canopies have the benefits of alleviating heat-related illnesses, more attention should be paid to those living in areas with lower homeownership rates and higher old building rates to maximize the buffering role of urban tree canopy cover against heat-related diseases.

HOW DOES SCHOOL CHOICE IMPACT COMMUNITY SOCIAL SUSTAINABILITY?

Abstract ID: 1108.0.0.427.2024
Individual Paper Presentation

Maria Conroy [The Ohio State University] conroy.36@osu.edu, presenter

Communities across the United States have adopted school choice programs which provide educational alternatives beyond the public neighborhood school. These alternatives are varied and ostensibly form a market-based system where schools compete for students, enhancing the quality of their services. While the educational merits of these programs are hotly debated, there have been few investigations into the impacts of such options (as distinct from school closures) on the social sustainability of surrounding neighborhoods. Makris (2018) presents a specific investigation of school choice and gentrification. The planning literature more broadly addresses schools as a destination in an urban design and/or in a transportation mode choice context. Good (2019) and others have considered the impact of school closures on community development and revitalization. Schools as a location for community gardens, and as a contributor to social capital more generally, have also been discussed in the literature. However, there has been little investigation into the question of how school choice systems affect measures of community social sustainability. In this research I explore the different bonding, bridging, and linking of social capital evidenced in communities with neighborhood schools/choice schools (Osborne et al. 2016). I also evaluate how schools shifted (or did not shift) their relationship with neighboring communities due to the pandemic.

Social sustainability as an element of the broader sustainable development concept is considered by many to be

the most nebulous of the three sustainability pillars. Even so, Shirazi and Keivani's (2017) meta-analysis of the social sustainability literature highlights a coalescing around seven defining principles among which are "social networking and interaction" and "livelihood and sense of place." These principles form the basis in this work for measuring social connectivity between schools and their surrounding neighborhood. Schools have held key positions in community engagement through athletics and arts performances, supporting a sense of place and providing opportunities for broad community interactions. These enhancements to social sustainability may provide lasting impacts with respect to school fundraising and levy support, as well as increased social capital supporting student achievement (Warren 2017). Additionally, heightened engagement and identity may increase broader sustainability efforts related to, for example, school-based community gardens benefiting the surrounding neighborhood.

This study uses the city of Columbus and its School District (CCS), the largest school district in Ohio, as the focus of inquiry. Columbus and CCS provide a somewhat unique opportunity to explore a variety of school choice alternatives. While traditional neighborhood schools remain in the CCS repertoire, the district also includes lottery admission (up to 100% of school enrollment) in traditional, alternative, and specialty schools. Lottery based schools, therefore, may have few if any students from the immediate surrounding community. Moreover, the state of Ohio has a school choice system where taxpayer-funded assistance means CCS students can attend private schools. There are twenty-one public and nine private high schools within the CCS district boundary.

This paper uses surveys of CCS high school principals as well as their private school counterparts to give a comparative understanding of the relationship of high schools within the CCS district boundary with their associated neighborhood. I also survey surrounding suburban high school principals whose school population is geographically bound though the state choice system remains. The surveys along with community demographic data are used to measure the school's identity and connections with the surrounding community as well as the perceived role the school plays in the surrounding community. Results of this work provide insight regarding how school choice influences social sustainability principles related to sense of place and social interactions and suggest fundamental issues of communication and trust provide policy directions moving forward.

INFRASTRUCTURES OF CARE AND SUSTAINING SAN FRANCISCO CHINATOWN

Abstract ID: 1108.0.0.40.2024
Individual Paper Presentation

Deland Chan [University of Oxford] deland.chan@kellogg.ox.ac.uk, presenter

Community development has predominantly emphasized physical infrastructure, overlooking the people whose human capacity and labor serve to bring these projects to fruition. Drawing from infrastructural labor as the 'work that creates, sustains, and performs infrastructure' (Gidwani, 2015; Stokes & De Coss-Corzo, 2023), this research examines the roles and contributions of people at the forefront of implementing key projects like the Central Subway, Ping Yuen, and Sustainable Chinatown, which taken together, contribute to the post-1990s era of sustainable urban infrastructure and a community-led vision of sustainability for Chinatown.

Drawing on twenty months of fieldwork involving interviews, participant observation, and archival research, I ask how individual motivations, identities, family backgrounds, and personal experiences of people involved with sustaining Chinatown have shaped their responses to these projects. Gendered expectations emerge as a prominent theme, influencing the types of roles these individuals undertake in the workplace and influencing their approach to their work. Many of the respondents were women employed by community development organizations, whose family histories of displacement compelled them to defend and protect Chinatown for clients who reminded them of their own family members. Their professional endeavors in Chinatown often blurred the lines between home and workplace, exacerbated by the gendered expectations they brought into their roles. Viewing Chinatown as an extension of home infuses their professional duties with a level of attachment that ultimately led to the project's implementation. While their labor achieved community goals and personal fulfillment, it also set the stage for individual burnout due to the demanding and unsustainable nature of these roles.

Findings suggest that this labor is a critical form of infrastructure to sustain societal well-being. Here, 'social infrastructure' encompasses not only people as inputs and labor driving such projects (Simone, 2004) but labor as an output and a form of infrastructure itself, including the maintenance of social life (Graham & Thrift, 2007) and as an infrastructure of care (Alam & Houston, 2020). Specifically, care as infrastructural entails providing mental and emotional labor to residents facing mental or medical challenges, as well as facilitating the relocation of such populations during rehabilitation. Despite its invisible nature, this form of labor is as vital, if not more so, than the physical aspects of project implementation. The success of such endeavors relies heavily on the degree of community support garnered during project execution. However, the emotional and mental labor required to establish the necessary social infrastructure for project success often remains overshadowed by the tangible outcomes, such as the preservation of housing units. These outcomes tend to take center stage in public narratives and press conferences, leaving the behind-the-scenes efforts largely unnoticed.

This research suggests that Chinatown's vision of sustainability may be unsustainable in the long-term without intervention to support the individuals whose labor constitute infrastructures of care and recognizing their vulnerability to burnout. For the community development field, it highlights threats to the overall pipeline of human capacity of those in the profession, as sudden departures exacerbate the loss of institutional knowledge

and hinder leadership development. This research highlights the importance of recognizing and supporting the human infrastructure necessary in sustaining community development as not to jeopardize the field's long-term sustainability. Preventing this fate requires acknowledging the people whose labor constitutes the social infrastructure that is needed to make the physical infrastructure possible.

LOCATING EVERYDAY ENTREPRENEURSHIP WITHIN ASSET-BASED COMMUNITY DEVELOPMENT

Abstract ID: 1108.0.0.760.2024
Individual Paper Presentation

Michael Frisch [University of Missouri Kansas City] frischm@umkc.edu, presenter
Jacob Wagner [University of Missouri Kansas City] wagnerjaco@umkc.edu
Dina Newman [UMKC Center for Neighborhoods] newmandi@umkc.edu
LaMonica Upton [UMKC Center for Neighborhoods] lmupton@umkc.edu

At first glance, many poor and minority neighborhoods in Kansas City seem to be entrepreneurship deserts. Fewer businesses appear within their boundaries. Disinvestment and population decline has left these areas with high rates of residential vacancy accompanied by vacant commercial corridors. Yet, we find that there is a reserve of entrepreneurial activity in these areas. An expanded entrepreneurship definition is necessary to capture this reserve. We define everyday entrepreneurship as inclusive of business activity that is both formal and informal (Salvi et. Al. 2023). Everyday entrepreneurs include folks whose businesses are less established – often without a brick-and-mortar location. Think of folks working a side-hustle out of their homes – in areas such as catering, building trades, consulting, hairdressing, etc. Most artists, creatives, and musicians fit into this category as well. Everyday entrepreneurship shares a fuzzy boundary with social enterprise and community entrepreneurship (Fortunato and Alter 2015). This paper explores the role of everyday entrepreneurship within a framework of neighborhood community development in Kansas City. We explore how businesses and entrepreneurs add to the assets of a neighborhood (Kretzmann and McKnight, 1996).

Our analysis is based upon a combination of quantitative and qualitative methods. First, we examined the data on entrepreneurs and enterprises at the local level. Then, we report on the results of a series of structured conversations about everyday entrepreneurship held with entrepreneurs operating or living in Black and Hispanic neighborhoods of Kansas City. These entrepreneurs were predominantly Black or Hispanic. Based upon the evidence from these sources we develop a series of policies to encourage entrepreneurship and to link business

development to neighborhood community development.
Established businesses add to neighborhoods by providing the typical economic development measures of earnings, jobs, and sales. Business directories and Bureau of the Census datasets such as Zip Code Business Patterns and Enterprise Statistics well capture these data. Aggregating establishment data mostly shows businesses with brick-and-mortar locations. Exploring the location, socio-economic characteristics, and industry of the self-employed is another approach (Markusen and Schrock 2006). Yet, this method is limited to the primary occupation of the survey respondent and will not capture the "side-hustle." We also checked local databases such a business licenses available from Kansas City and/or the State of Missouri. These include some of the home-based businesses – but it is hard to sort the location question from the initial enterprise filing.
Our discussions with everyday entrepreneurs provided a richer collection of evidence than the secondary data. We found that everyday entrepreneurs have motivations common to formal entrepreneurs: they want to control of one's own destiny, to provide for one's family/household and to make a difference in society. They are frustrated by the lack of capital available to start-ups. They are self-financing their businesses through their own familial networks and even using credit cards. The barriers and opportunities faced by everyday entrepreneurs in Kansas City align with those identified by Bates et. Al (2022).
We find that several local planning actions could assist everyday entrepreneurs. Everyday entrepreneurs need a path of forgiveness for operating without a license. Undercapitalized businesses need to operate to generate funds to support the formalization process. Neighborhood organizations might be able to assist in providing reputational standing for these formalizing businesses. In return, increased neighborhood connections might facilitate networking and market development. Cities need to invest in these commercial corridors while incentivizing owners to also reinvest. Planners may also work to focus the actions of business development intermediaries toward areas left behind.

MEASURING THE EMBEDDEDNESS OF BUSINESSES IN GENTRIFYING NEIGHBORHOODS

Abstract ID: 1108.0.0.925.2024

Individual Paper Presentation

Will Payne [Rutgers] will.b.payne@rutgers.edu, presenter

As housing costs and displacement pressures have risen in many urban core neighborhoods in the United States over the past several decades, housing activists and social scientists have pointed to the important role of consumption businesses in both signaling and accelerating processes of gentrification (Smith 1996, Newman and Wyly 2006, Lees et al. 2008, Zukin 2010). New retail businesses targeting affluent consumers are often contentious signs of change in the urban built environment, as fixtures of the neighborhood are replaced with upscale coffee shops or boutiques. The rate of growth in retail businesses has been particularly high in areas experiencing high housing price appreciation relative to their metropolitan context (Meltzer and Schuetz 2011). Tensions arise between municipalities dependent on property and sales tax revenue, businesses looking for new customers, and the multiple publics that live and work nearby, many of whom find that the new retail landscape does not meet their needs or anticipate their continued residence in the neighborhood (Zukin 2010, Brown-Saracino 2010, Burnett 2013, Tissot 2015). These businesses may be located spatially within a given community, but they are embedded in more far-flung networks of financial and cultural capital, serving first as "signaling hinterlands" (Rosen and Alvarez Léon 2023) for elites located elsewhere, before the process of residential gentrification can catch up to the upscaling of the local retail landscape (Ocejo 2014).

At the same time, the way that city dwellers access information about retail businesses has changed drastically during this period, especially for the younger, wealthier, and more educated demographic at the leading edge of gentrification (Gottlieb 2015, Hyde 2014, Zukin et. al 2017). Millions of people rely on location-based services (LBS), digital mapping and local review platforms that aggregate and display “crowdsourced” (Brabham 2012) reviews, to make decisions about where to spend time and money. The two main local review companies in the United States, Yelp and Google, each have hundreds of millions of user- contributed reviews of local businesses, with a focus on consumption businesses like restaurants, coffee shops, bars, and upscale grocery stores (Payne 2021), especially in gentrifying urban areas, which studies have shown are disproportionately targeted by urban digital platform companies and amenities (Leszczynski and Kong 2022). While social media data has become foundational to both scholarship and management of “smart cities” (Barns 2018, Rose and Willis 2018) and “sharing economy” and “platform real estate” firms like Airbnb (Wachsmuth and Weisler 2018, Shaw 2020, Payne et al. 2020), local reviews are still underexplored sources for studying urban redevelopment and conflict over space (Arribas-Bel 2014, Thatcher 2014, Wilson 2014, Silva et al. 2019).

Scholars still know relatively little about the broader temporal and spatial patterns of retail-led gentrification, and to what extent changes in the retail landscape of an area anticipate or follow changing demographics, though recent work on social media and gentrification can help to serve as a model for how to tackle some of these questions (Chapple et al. 2022). Untangling the complex problem of whether affluent new residents pre- or post-date the arrival of upscale new businesses can help cities and community groups shape equitable development. This paper uses previously unexamined data from the local review platform Yelp and novel spatial analytic methods to analyze the changing geographic distributions of customer-reviewers for consumption businesses across two urban neighborhoods in the United States from 2010 to 2020: Bushwick, Brooklyn and downtown Asbury Park, New Jersey. By demonstrating the extent to which businesses in these two settings draw outsiders into gentrifying neighborhoods, these quantitative localness metrics and cartographic consumption footprints can provide a more nuanced assessment of the impact of changing retail businesses on urban development than existing approaches.

NEIGHBORHOOD REVITALIZATION AND CRIME: EVIDENCE FROM WATTS’ REDEVELOPMENT

Abstract ID: 1108.0.0.16.2024
Individual Paper Presentation

Lizhong Liu [University of Southern California] lizhongl@usc.edu, presenter
Ashlesha Datar [University of Southern California] adatar@usc.edu
Nancy Nicosia [RAND Corporation] nicosia@rand.org

Public housing in the U.S. has been a symbol of concentrated poverty and crime. Beginning in the early 1990s, large-scale federal housing programs sought to address these concerns by redeveloping distressed public housing into vibrant mixed-income, mixed-use communities. How such redevelopments would impact crime depends upon several factors, including the extent, duration, and location of displacement of original residents and how that relates to criminal activity; the crime-reduction features of the redeveloped housing and its surrounding community; and the social and economic conditions in the community. Evidence from the first generation of federal redevelopment grants (HOPE-VI) indicated a reduction in crime in the HOPE-VI sites over time, which was closely associated with large-scale displacement of public housing residents and gentrification of the redeveloped neighborhood. HOPE-VI’s successor - the Choice Neighborhoods Initiative (CNI) - was a new generation of federal-housing redevelopment grants that provide better safeguards for original residents and ensure investment in housing, people, and the broader neighborhood. Whether this new generation of public housing redevelopments had different impacts on crime than its predecessor is an open question.

We focus on the Jordan Downs Public Housing Redevelopment in Watts, Los Angeles (LA), and assess its impact on crime. Jordan Downs (JD) is one of the largest public housing sites in LA with high rates of crime. The redevelopment of Jordan Downs is a decade-long process initiated in 2018. A unique feature of this redevelopment is its “build-first” strategy, which effectively ensures zero displacement of residents. Two other key features of this redevelopment include the influx of new mixed-income neighbors and the mixed-use focus. The redevelopment encompasses the demolition and construction of housing for original residents as well as additional housing for new mixed-income neighbors, effectively doubling the housing density. Other built environment improvements included shared recreation spaces, walkable-tree-lined streets, cameras, and lighting. Lastly, the program includes a 120,000 square foot retail plaza with a supermarket, restaurants, gym, and other amenities.

We analyze crime data from the Los Angeles Police Department and LA County Sheriff’s Department from 2010 to

2022 to assess the impact of this redevelopment on property and violent crimes overall, as well as separately by offense type. Our paper makes two important contributions to the literature. First, assessing the impacts on crime prospectively as the redevelopment unfolds has been previously understudied and provides unique insight into how crime evolves during this process. And second, the focus on minimal resident displacement along with mixed-use focus is a departure from previously studied redevelopment efforts and may impact crime differently.

We employ an event study framework to analyze crime trends in Watts over 2010-2023, utilizing data from LA Police Department and LA County Sheriff. We construct multiple comparison groups, comparing crime (overall and by subcategories) in Watts to different groups of census tracts in rest of LA (e.g. all tracts, >40% poverty, have public housing). We also utilize the synthetic control method as robustness checks. To understand the mechanisms and heterogeneity in crime changes within Watts, we conduct a hotspot analysis to examine crime in JD versus rest of Watts pre- versus post-redevelopment. Preliminary findings indicate a significant reduction in property and violent crime rates in Watts in the 4 years following the redevelopment's groundbreaking. These findings are consistent across all the methodologies employed. The decline in property crime in Watts is predominantly attributed to reductions in burglary and motor vehicle theft.

Nevertheless, these findings mask considerable heterogeneity within Watts in crime changes. Prior to the redevelopment, crime rates in Jordan Downs were among the highest among all tracts in Watts. Yet, the crime improvements in Watts were concentrated in tracts other than Jordan Downs. After the redevelopment began, both property and violent crime rates in Jordan Downs increased, ranking it the top tract for property crime and the second highest tract for violent crime in Watts. Motor vehicle thefts, larceny theft, and robberies in Jordan Downs increased, and the reduction in burglaries was the smallest among all tracts. These results suggest potential displacement of crime from other tracts within Watts to Jordan Downs, coinciding with the opening of the new retail plaza in JD, which arguably presented more opportunities for crimes.

Our findings present a more nuanced picture of how redeveloping distressed urban neighborhoods may influence crime. In contrast to prior studies which linked reductions in crime to the dislocation of residents, our results show that maintaining the resident population alongside construction activities and the addition of several commercial/retail opportunities likely created significant opportunities for property and violent crimes, both which increased in Jordan Downs. But the increased crime in Jordan Downs was more than offset by crime reduction in the rest of Watts. This was possibly due to the spillover investments for infrastructure improvements in the rest of Watts, such as installing solar roofs, urban food gardens, public transport electrification, enhancing street safety for walking and biking etc. that may have made the other areas in Watts safer without creating opportunities for crime.

PALACES FOR THE PEOPLE: REIMAGINING LIBRARIES AS MIXED-USE DEVELOPMENTS

Abstract ID: 1108.0.0.1132.2024
Individual Paper Presentation

Laura Delgado [Trinity College] ldelgado@trincoll.edu, presenter

Public libraries are a unique form of social infrastructure. What distinguishes them from other organizations that provide similar services is that public libraries do so for free and are open to all. The services they provide are not means-tested benefits that are targeted to only those who qualify. Rather, their services and resources are available to everyone regardless of age, familial status, income, employment status, place of birth, citizenship status, race, ethnicity, religion, or any other ascriptive characteristics. They are third spaces that offer a place to relax or socialize without having to buy a coffee. Historically, public libraries in the US have been housed in stand-alone structures, thanks in part to Andrew Carnegie's funding of thousands of such public libraries across the country, but this is changing.

From Brooklyn to Chicago to Boston, cities are calling for the redevelopment of public library branches that are part of mixed-use developments. This research asks how cities are changing the development model when it comes to public library branches and how they are reimagining public libraries as forms of inclusive and accessible social infrastructure. Through a review of public library requests for proposals, development plans, and news media across the country, I document the evolving nature of public libraries and to what extent they advance planning goals of creating cities that are more equitable, diverse, and inclusive. I find that these mixed-use developments often combine public libraries with affordable housing, but the mixed uses also extend beyond this pairing. Similar to the first public library Carnegie built in 1890, which was located in a five-story building along with an art gallery and a twelve-hundred-seat music hall, cities are finding creative partners for public libraries, from health centers to retail. This research contributes to larger discussions within the field of urban planning about social infrastructure, inclusive and equitable development, and public services.

PERSPECTIVES AND PERCEPTIONS OF UNIVERSITIES' COMMUNITY ENGAGEMENT

Abstract ID: 1108.0.0.1184.2024
Individual Paper Presentation

Seungbin Park [The Ohio State University] park.2897@osu.edu, presenter

Universities' community engagement aims to generate mutually beneficial outputs and relationships, but actual impacts are often beneficial only to the university while harming the community (Hains & Hains, 2023). An assessment of the impacts of a university's community engagement initiative thus varies depending on the perspective. Previous research highlights the importance of community perspectives and perceptions in evaluating t university-led community engagement initiatives (e.g., Etienne, 2012). However, considering that a university is a decentralized and fragmented organization (Baum, 2000), individuals involved in designing, implementing, and managing the initiative would have their own perspectives and perceptions.

In this context, I ask two questions: (a) how do different stakeholder groups view the university's roles in its community engagement initiative in urban neighborhoods, and (b) how do these groups perceive the impacts of the initiative differently? I examine the cases of The Ohio State University's Partners Achieving Community Transformation and the University of Minnesota's University Northside Partnership, interviewing university leaders, community leaders, and community residents to document their perspectives and perceptions.

I demonstrate (a) disparities in perspectives regarding what universities can achieve in their community engagement initiatives, and (b) perception gaps regarding the impacts that universities have brought since their inception. In terms of the roles of universities, university stakeholders generally believe universities bring about neighborhood changes through research, collaboration with community organizations and residents, and place-based development. In contrast, community stakeholders tend to expect universities to act as social service organizations, directly addressing significant community issues and providing resources and direct aid to those in need.

The disparities in perspectives about the university's roles lead to different perceptions of the impacts, although participants overall agree on the value of the university's efforts and the long-term vision of the initiatives. University stakeholders emphasize metrics such as the number of research projects, faculty and student involvement, and the financial investment in infrastructure, retail, and housing development. However, community stakeholders may not recognize these projects or see them positively unless they are directly visible or may view place-based development as harmful, potentially causing displacement in some cases.

In joining conversations about how to assess a university's community engagement initiative, I highlight the value of subjective assessments and the reflection on various stakeholders by revealing diverse perspectives and perceptions among stakeholders. Beyond university-community partnerships, the variance in expectations of universities' roles in urban neighborhoods empirically confirms the multiple aspects of community development, casting the need for further discussion of what counts as community development. Practically, I provide comparisons of perspectives and perceptions among stakeholders so that the case universities and communities use them as a basis to discuss their achievements and challenges, calibrate current goals, and design future initiatives.

PLANNING FOR WHOLENESS: YOUTH, BEAUTY, AND ENVIRONMENTAL JUSTICE

Abstract ID: 1108.0.0.1107.2024
Individual Paper Presentation

Katherine Pérez Quiñones [The University of Texas - Austin] kathyperezq@utexas.edu, presenter
Miriam Solis [The University of Texas at Austin] solis@austin.utexas.edu
Shawn Tat Chern Lee [The University of Texas- Austin] shawn.leetc@utmail.utexas.edu
Freddie Kirk [The University of Texas in Austin] freddiekirk@utexas.edu

Despite being often underestimated, youth possess a nuanced understanding of their needs that extends beyond basic necessities, encompassing elements of social, emotional, and cultural significance. In this article, we argue that the pursuit of a just community development, transcending the fulfillment of basic needs requires the integration of beauty, joy, and wonder, with youth being a central part of this transformative process.

While planning practices and discussions have traditionally paid less attention to concepts like beauty, joy, and wonder, research indicates the importance of incorporating these elements more frequently into practice (Elbaz and Alfasi 2023; O'Brien and Tranter 2006), as they are critical to the overall well-being of individuals. Rather than a utilitarian exercise, planning should adopt a holistic approach, considering not only fundamental requirements but also the aspirations of youth, fostering creativity, joy, and community flourishing.

This article is inspired by youth from the Rio Grande Valley in Texas who participated in a 3-day photovoice workshop as part of a larger community-based research collaboration between the University of Texas in Austin and a local coalition (including city staff, environmental nonprofits, social justice organization, and two high schools). In this article, we draw on the experience of a participatory inquiry exercise, that employed a walk-along method with the youth to experience and assess a local park's qualities. We also include reflections about participants' photo-narratives and experiences shared in focus groups with the research team to suggest that the youth's observations encompassed concerns about the planet's future, alongside a firm commitment to the significance of beauty and access to nature in promoting overall health and well-being.

Having done this work in a border community that has been historically deprived of the planning they need, we advocate for a reimagined environmental justice in planning that goes beyond correcting historical environmental

injustices to creating environments that engage the imaginations of the historically marginalized, in this case, those of the youth. Aligning with the ideas of Iris Marion Young (1990), planners need to move beyond a distributive approach into one of procedural justice (Mattila 2002) in which people have the ability to plan, design, repair (Song and Mizrahi 2023), and create the city they desire (Pinder 2002). In the spirit of advancing social and environmental justice in all its aspects, the article hopes to enrich discussions on community-engaged research and practice, proposing initiatives that transcend standard participatory methods which often place youth in pre-established frameworks of power and participation.

PLAYFUL PUBLIC PARTICIPATION OF UNDERREPRESENTED AND MARGINALIZED RESIDENTS

Abstract ID: 1108.0.0.934.2024
Individual Paper Presentation

Alenka Poplin [Iowa State University] apoplin@iastate.edu, presenter

Engaging underrepresented and marginalized communities in urban planning processes continues to be a challenge for the planning profession. These communities may include minorities, elderly, children, LGBTQQ, African American or other individuals. Currently used engagement methods such as city hall meetings or surveys do not attract many residents to participate. Planning profession experiences what has been described as rational ignorance (Krek, 2005). Residents rationally decide to ignore engagement processes due to the high investment needed to study the materials presented to them. Novel ways of community engagement and public participation are needed to attract underrepresented and marginalized residents and engage them in discussions about the future of their living environments.

This research reports the findings of a 3-years long collaboration between the city xy and the university research team. The focus is on methods, strategies and technologies that may attract more residents to contribute to urban planning related topics. Research questions are: Which engagement methods, strategies and technologies can attract more residents to participate in urban planning processes? Can playful public participation that includes

geogames be efficiently implemented? Geogames are games that focus on spatial representation and often strive for a realistic visualization of the real-world in the game environment. Theoretical principles of playful public participation (Poplin, 2012) and including games and playful activities in community engagement (de Sena et al. 2021; Poplin at al. 2020; Gordon et al. 2011) were tested and are summarized in this contribution.
The research team initially interviewed 34 community engagement experts across the nation collecting ideas of what constitutes successful engagement that can attract diverse communities in the dialog about the future of their living environments. The main findings suggest successful methods to be those that enable officials to meet the residents in their neighborhoods. They propose bringing engagement to the residents and to their living environment. An additional characteristic of successful engagement was found to be in offering a combination of engagement modalities that can target different preferences and abilities of the residents. A variety of multi-modal participation techniques needs to be developed for public officials to be able to reach diverse groups of residents. Based on these findings, the research group organized a community engagement festival at four locations in the city and developed a set of innovative, engaging, and playful activities. Some locations were selected in neighborhoods with low-income and low-educational levels of their population. The festival attracted over 250 residents and was very successful in engaging families with children. Some other underrepresented and marginalized groups attended mostly in the selected neighborhoods that brought engagement close to the place in which they live.
In the next step, a pop-up mobile community engagement idea was developed and tested. The engagement team set up tables and activities in the identified neighborhoods and presented innovative and playful engagement activities. This idea proved to be difficult to organize and did not lead to the expected results. In the last experiment, the team engaged the Korean community through their church and organized an engagement event tailored specifically for this community. Some materials were translated into the Korean language. Semi-structured interviews provided valuable information to the city officials, children played and contributed to a map-based discussion, and everybody could get engaged in the playful and creative activities. In the last step, the research team conducted a rational ignorance survey in the pre-selected neighborhoods to better understand why residents choose to not get involved in the community engagement activities organized by the city officials.

POST COUNTERCULTURE COMMUNITIES: MILES FROM BOWLING ALONE

Abstract ID: 1108.0.0.579.2024
Individual Paper Presentation

John Gaber [Clemson University] jgaber@clemson.edu, presenter

Similar to Mark Twain's experience concerning reports of his death that have been "greatly exaggerated", so to American communities per Robert Putnam's "Bowling Alone" conclusion that their continued collapse for the last 50 years are equally exaggerated. Putnam defines community vitality as a function of social capital and makes the distinction that as social capital rises, so does community capacity and vitality (Putnam, 2020, p.49). Conversely, if social capital declines, so does community vitality. Per an extensive analysis of purposefully sampled longitudinal secondary data slices of membership in "social organizations" (churches, bowling leagues, bridge clubs), he measures the rise and fall of his data driven definition of social capital over time. He pin-points the "collapse" of American communities starting in the mid 1960s. "On average, across all of these organizations, membership rates began to plateau in 1957, peaked in the early 1960s, and began the period of sustained decline by 1969" (Putnam, 2020, p. 55). And, American communities have never recovered since.

Like Mark Twain, community advocates, planners, and progressive scholars mark the same mid 1960s moment in time as the beginning of a new era of community growth and development (Bach, 2020). How can American communities be both collapsing and thriving at the same time? Putnam's Bowling Alone research has been extensively vetted for over 20 years and his empirical conclusions are sound. So, if Putnam is not wrong in his conclusion, what is going on? The answer I posit in this paper is that starting in the mid 1960s, American communities started to evolve into a new post counterculture community organizational structure and started to fall through Putnam's empirical cracks of tracking. American communities are not declining, they are thriving and are showing up in different data slices not captured by secondary organizational membership data sets.

This paper is organized into four sections. It begins with an overview on how communities are connected (not defined) to social capital. Next, Putnam's "bowling alone" thesis is reviewed in relation to longitudinal variance of membership-based social capital data slices. Third, three characteristics that define post counterculture communities (communities after the 1960s) are introduced: a.) place specific (you know where it is), b.) individualized community identity (you know when you are there), and, 3.) small in numbers (you have a strong sense of we). Lastly, a review of longitudinal U.S. hippietown data is discussed documenting how they got started in the 1960s as "destinations" for individuals in search of community. Post counterculture communities; miles from nowhere, and too busy for bowling leagues.

REGULATING THE EDGE: SHIFTING GEOGRAPHIES OF ROCK COMMUNITIES IN BEIJING

Abstract ID: 1108.0.0.82.2024
Individual Paper Presentation

Tongwei Xu [Tianjin University] tongweixu1999@tju.edu.cn, presenter
Mengyao Chen [Columbia University] mc5469@columbia.edu
Jie He [Harbin Institute of Technology, Shenzhen(HITSZ)] hejie2021@hit.edu.cn

In response to of 'creative turn' in the Global North, China has embraced a top-down approach of making creative cities as a key driver for urban renewal. However, the state-led creative industrialization risks the harsh institutionalization of marginalized cultural communities. Few empirical studies have studied transforming subcultural communities from a Global South perspective. In this article, we employed geovisualization and network analysis to examine the spatio-temporal dynamics of rock music communities in Beijing from 2000 to 2020. By GIS-based maps, we illustrated the venues' geographic shifts over two decades. Using UCINET, we analyzed the core-periphery structure of human-place network to identify core influential communities and their connectivity to specific places. To further reveal the underlying mechanisms, this paper analyzed how cultural and economic policies influenced these changes. The findings indicate that: 1) The locations of music spaces have changed from informal underground venues and urban villages to upscale areas due to gentrification; 2) Informal spaces once dominated by subcultural musicians have nearly vanished; while current spaces are planned or monitored by the government, preventing artists from claiming alternative identities; 3) The social network of local artists has been detached from specific venues over time. Our findings reflect how subcultural communities were excluded from urban areas through the collision of capitalism and state power. Specifically, to facilitate the commercialization of urban space under the guise of creative culture, government and private entities drive music venues to gentrified areas, boosting property values and closing core subcultural places. This process limits the space for self-expression and social gathering of grassroots communities, and denies low-income communities' equal access to cultural resources. As a result, it exacerbates social inequality and further marginalizes already disadvantaged groups. Our article contributes to the understanding of urban inequality from a cultural perspective. It also stresses the need for policy interventions that protect and cultivate marginalized cultural communities. By fostering grassroots participation in policy-making and changing development incentives, we can lessen the deleterious effects of gentrification and commercialization and develop a more inclusive and vital urban cultural landscape.

SHIFTING ROLE OF COMMUNITY IN EQUITY AND SUSTAINABILITY PLANNING

Abstract ID: 1108.0.0.436.2024
Individual Paper Presentation

Helen Pineo [University of Washington] hspineo@uw.edu, presenter
Rachel Berney [University of Washington] rberney@uw.edu

Urban planning for equity and sustainability has largely been theorized and operationalized in parallel, with notable intersections (Agyeman, 2013), particularly related to environmental justice (Anguelovski et al., 2016) and health (Pineo, 2022). Cities face complex challenges characterized by environmental and equity concerns, such as structural racism, insufficient housing and climate change. Given historic failures to garner positive development outcomes for low-income and BIPOC groups (Knapp et al., 2022), there is a new focus in many U.S. cities on equitable planning and community engagement, yet practitioners' knowledge on how to operationalize just, equitable, and anti-racist policies is low (Jackson et al., 2023).

This paper discusses research findings about current practices of sustainable and equitable urban planning, focusing on areas of strength and weakness at this time of change. We conducted semi-structured interviews with 23 individuals in community development, planning, transportation, housing, and other sectors (primarily in local government and non-profit organizations). Online interviews occurred with participants across 11 states (August to September 2022). Participants voluntarily reported their racial identities as White (12), Black or African American (5), American Indian or Alaska Native (2), Asian (1), and Some Other Race (3). Ethnicity was reported as Not Hispanic or Latino (15) and Hispanic or Latino (3). We used purposive and snowball sampling. Participants were primarily senior in their level of professional experience (19/23), assessed through job titles. Transcriptions were pseudonymized before an iterative process of thematic analysis.

We identified five themes through our analysis. First, U.S. cities are "designed for exclusivity," with numerous participants identifying redlining and more recent policies contributing to disparities across multiple outcomes. There was a notable shift in understanding among planners of the effects of their work on structural racism; one said, "frankly our down-zoning in the [year removed] map perpetuated that redlining. (…) We didn't realize it." A second theme related to participants' work was to change narratives, shift mindsets and enable solutions, a strategy particularly used by community and non-profit organizations. Participants identified cultural mindsets that ran counter to their work, highlighting the need for "dispelling some of the harmful prevailing narratives." Third, in the face of opposition (or lack of buy-in) to equity and sustainability initiatives, such as inclusionary zoning, participants described the importance of building trust to enable dialogue and collaboration, particularly with community groups previously harmed. One participant explained the perception of BIPOC communities as feeling that they have been "planned to death" and "over-promised", leading to "a massive trust deficit." Fourth, capacity-building ecosystems supported actors in overcoming obstacles. Organizations leading capacity building included community-based organizations (CBOs) supporting peers, and philanthropic or government funding used to support non-profits and CBOs. Working against the status quo to support equity was seen as difficult combative work. Individuals required support in terms of changing organizational culture, bringing people together in coalitions, and giving space and support for healing. The difficulty of advocating for equity was expressed through participants' use of warfare terms like "battle," "fighting," and "adversary." Finally, we identified that community-

led efforts are transforming possibilities for equity and sustainability. For instance, a public sector participant spoke of how new funding was made available after a community-led project “elevated it for them” and “showed what was possible”, notably claiming that “this wouldn’t have happened” without the community initiative.

Planners are increasingly aware of the need for equitable and sustainable planning approaches with meaningful community involvement, but there is a need for tangible examples of practice. This research demonstrates the need for planners to develop better ways of supporting community-led initiatives in service of equity and justice outcomes, including strengths and weaknesses of current practice to guide those efforts.

SOCIO-SPATIAL EFFECTS OF BASIC EDUCATIONAL FACILITIES IN MEGA-CITIES

Abstract ID: 1108.0.0.509.2024
Individual Paper Presentation

LINXI XU [TONGJI UNIVERSITY] xulinxi000@163.com, presenter
Fan Yang [Department of Urban Planning, College of Architecture and Urban Planning, Tongji University] fanyangsh@tongji.edu.cn

There are ten mega-cities in China with more than 10 million population. In densified urban areas, human behavioral patterns, spatial and temporal perceptions, and social interactions differ from other areas. The provision of basic education for school-age children becomes an important social link; it not only lays the foundations of human growth, but also reflects the city's approach to educational equity, which in turn has an impact on the distribution of population.

We choose the central city of Shanghai, one of the ten mega-cities in China as the scope, and explore whether the “Chinese school district system” creatively solves the educational inequity and enhances or dissolves spatial

segregation through the distribution of basic education facilities and school districts.

First, we take the central area of Shanghai and some peripheral areas (about 600 square kilometers area within the A20 expressway road) as the study area, which covers the most central and densely populated area of the Shanghai, and parts of the peripheral districts. There are about 638 elementary schools and 506 junior high schools.

Second, basing on AOI and high-resolution satellite imagery data, we identify the campus boundaries of the schools above. The latest school district boundaries, district boundaries, street boundaries and neighborhood boundaries are obtained based on information from official government websites.

Third, we analyze and cluster 1,144 schools according to educational stage, school nature and educational resource level. Schools are divided into two categories, public and private, based on the main fund source for construction and operation. There are 573 public elementary schools， 65 private ones, 420 public junior high schools and 86 private ones within the area. Among them, junior high schools are classified into different levels according to the teacher quality.

Fourth, we reveal educational inequity basing on multi-source data. As a result of the long-term intervention of government policies and financial inputs, schools within this area show differentiated levels of education quality, and differentiate attraction and acceptance of different sources of students and families. Therefore, we take the 439 school districts as the unit to conduct an in-depth investigation. We obtain the price, house type and size of second-hand houses traded of each district from the major real estate trading websites, as well as the population statistics and forecast data in the past years. By constructing a model of house price dynamics and population mobility, we reveal the 439 school districts in central Shanghai that have abnormally high house prices and frequent population mobility.

Finally, we select school districts with housing prices and population mobility to conduct further qualitative research. By combining the quantitative analysis results with the qualitative findings, we verify the correlation between the quality of teaching, promotion rate and tuition fees of schools in 439 school districts, as well as the level of characteristics above, so as to reveal the mechanism of the distribution of basic education facilities and the influence of the school districts on the residential space segregation.

We point out that educational resources quality interact with urban social demand, and that abnormal fluctuations in housing prices and population mobility combine to drive resources to continuous spatial polarization, thus exacerbating the spatial segregation. The trend of low birth rates bring new impacts on the spatial allocation of basic education resources. When implementing urban regeneration, it is an challenging issue for Chinese urban planning to maximize basic education resources for the most needy ones through spatial planning. This study not only has the theoretical value of revealing the socio-spatial structure of high-density urban areas, but also has the practical value of providing a reference for the planning of educational facilities.

STRATEGIES FOR UNIVERSITY-BASED CIVIC ENGAGEMENT: A CASE STUDY ANALYSIS

Abstract ID: 1108.0.0.1213.2024
Individual Paper Presentation

Camden Miller [University at Buffalo, SUNY] camden@acsp.org, presenter
Robert Shibley [University at Buffalo, SUNY] rshibley@buffalo.edu
Libertad Figuereo [University at Buffalo, SUNY] libertad@buffalo.edu

Town-gown partnerships, also called university-community engagement and service learning, are not new. The topics have been explored since the Middle Ages, but substantial scholarship relevant to the modern university has been a serious subject for over a century (Marshall 1957; Perry 2005). Since the emergence of this scholarship, there has been criticism over how the relationship between universities and communities can quickly become extractive, prescriptive, and not focused on the community's needs (Martin et al. 2005). However, if structured correctly, this type of partnership has the power to become symbiotic: residents can lead, enhancing the neighborhoods they live in; agencies and municipalities can work with residents; and universities can facilitate and provide expert knowledge – all while valuing experiential learning and community-engaged research (Perry 2005). Despite the long history of university-community engagement dynamics, the specific processes and institutional structure of the relationships are understudied and undertheorized.

While there is scholarly work that explores town-gown relationships from a range of disciplines, including but not limited to public administration (Bruning et al. 2006; Emerson et al. 2012), social work (Gerstenblaatt et al. 2014; Wertheimer 2013 et al.) economic development (Massey et al. 2014), and service-learning/education (Buys et al. 2007; Eyler et al. 2001; Saltmarsh 2011), there is still a need for more scholarship that explores how partnerships situate expert knowledge in particular place, time, and social circumstances. The challenges faced by partners require careful planning, communication, and stakeholder commitment. Our research analyzes the various forms university-community partnerships take in award-winning project case studies from the Rudy Bruner Award for Urban Excellence (RBA) collection.

For this research, we conducted a comparative study across 88 award-winning RBA projects between 1987 and 2019, employing a case study methodology outlined by (Yin 2009). The collection, comprised of over 1,000 applications from 956 unique places geographically spread throughout the United States, is a unique award for

several reasons. The first is that no pre-determined criteria limited what project could apply, except it had to be a built project in an urban area. No typology, scale, or cost-constrained selection; large projects competed against small projects because excellence is possible in various place types, scales, and budgets. Another distinctive aspect is that detailed self-report application forms were consistently administered over 34 years and required perspective sheets, including, but not limited to, community members, not-for-profit community-based organizations, public agencies, developers, architects or designers, professional consultants, and municipalities.

We then compared this to the work of the University at Buffalo's Citizen Planning School (CPS) program. Compared to the RBA cases previously explored, the CPS case provides a different kind of university-community partnership. This type of partnership has garnered more attention recently due to the American Planning Association (APA) publication about community planning academies (Carner 2023). Rather than the university coming in with a commission for a specific project, CPS worked to equip community residents with the tools and knowledge needed to take on a project that they deemed most critical within their neighborhoods, ultimately increasing the self-sufficiency of those within the community.

The assessment and comparison across the RBA cases and CPS program revealed a range of approaches taken by universities that are all viable in the pursuit of best practices in urban place-making. After our analysis, four types of university-community partnerships emerged: the university as consultant, the university as investor, the university as scholarly advocate, and the community as driver. Within each typology we noted different levels of design, municipality support, community engagement, politics, vision, university engagement, and investment. Each project and partnership offers different levels of emphasis on expert-based collaborative practices, supporting citizen champions for change, and the nexus of leadership on projects.

SUPPORTING PLACE- AND COMMUNITY-MINDED SMALL BUSINESSES THROUGH CRISIS

Abstract ID: 1108.0.0.150.2024

Individual Paper Presentation

Flavia Maria Lake [University of California, Los Angeles] fmlake@ucla.edu, presenter

Migrant entrepreneurs play an outsize role in “Main Street” businesses like restaurants, laundry, and salons but few studies have examined the impacts of such businesses (Kallick, 2015). These kinds of businesses not only support local economic development but they also shape a neighborhood’s character and residents’ connection to place (DeFilippis and Saegert, 2012). The traditional literature on migrant entrepreneurship primarily characterizes business owners as atomistic individuals seeking economic and social mobility. Conversely, recent scholars of migrant entrepreneurship have used an intersectional lens to identify more-than-economic motivations, illustrating how motivations are gendered, raced, and classed (Valdez, 2011). In this paper, I employ an intersectional approach to identify a particular subset of migrant entrepreneurs that are ‘place- and community-minded’. The tendency of scholars to only examine businesses through an economic lens obscures the communal contributions of these spaces. In contrast, this study highlights the community-centered practices that live underneath existing accounts of entrepreneurship. This study draws on two years of ethnographic fieldwork with the Brazilian community in Somerville. Starting in September of 2021, I not only regularly dined in these restaurants and interviewed owners, staff, and customers, but I also served as a Portuguese-language interpreter, technical assistance provider, and liaison between restaurants and local community development organizations.

Through the case of Brazilian restaurants in Somerville, Massachusetts, I argue that place- and community-minded small business owners cultivate networks of community care through their business spaces. This is a gendered process, with mostly women taking on the role of community caretakers. Furthermore, even when faced with an unprecedented economic crisis due to the Covid-19 pandemic, these place- and community-minded restaurants took on substantial debt and continued to nourish their networks of community care–countering economistic utility maximizing perspectives that would assume these restaurants would close their doors. Finally I argue that street-level bureaucrats are key to supporting these restaurants during crisis. Street-level bureaucrats will continue to play an important role for these spaces as they face ongoing challenges related to gentrification since the Covid-19 pandemic made even clearer the precarity marginalized communities face (Harper-Anderson et al., 2023).

THE FAILURE OF URBAN TRIAGE IN THE SHRINKING CITY OF YOUNGSTOWN, OHIO

Abstract ID: 1108.0.0.989.2024
Individual Paper Presentation

Shuqi Gao [Southeast University] shuqigao@seu.edu.cn, presenter
Brent Ryan [MIT] bdr@mit.edu

Planning for shrinking cities invariably involves grappling with resource constraints. Planners operating within these contexts must adeptly navigate through scarce resources that are in high demand. Among the plethora of challenges faced by planners in shrinking cities, urban vacancy stands out as particularly vexing. This issue is exacerbated by its sheer abundance, tangled legal ownership, public safety hazards, neighborhood decay, and economic downturns (Mallach, 2006). In many American shrinking cities, code enforcement and tax foreclosure represent two primary methods by which public sectors attempt to combat urban vacancy (Accordino & Johnson, 2000; Dewar et al., 2015). However, both approaches require substantial public funding, limiting the capacity of most Rustbelt municipal governments to address vacancies comprehensively due to their deteriorating fiscal circumstances. This brings about a question for municipalities, how to prioritize some urban vacancies for public intervention.

Urban triage offers a potential solution to complex urban resource allocation challenges. Essentially, it involves the prioritization and distribution of resources within urban environments, especially during emergencies or crises when resources are scarce and demand is high. While the concept of urban triage has faced criticism in planning literature (Kirkpatrick, 2015), it remains a central principle guiding planners, particularly in addressing spatial priorities in shrinking cities. Moreover, significant federal funding initiatives such as the Neighborhood Stabilization Program and the Hardest Hit Fund also adopt the principles of urban triage in their resource allocation strategies.

This study examines the implementation of the urban triage concept in the shrinking city of Youngstown, Ohio. From 2014 to 2015, collaborated with Youngstown Neighborhood Development Corporation, Youngstown City Government selected 13 out of its 34 neighborhoods, to have Neighborhood Action Plans (NAPs). We hypothesize that NAP neighborhoods were tipping points in Youngstown, which means that their conditions were in the middle among all the neighborhoods. We also hypothesize that, when compared with non-NAP neighborhoods, NAP neighborhoods would have a treatment effect after NAPs' implementation.

In order to testify these hypotheses, we analyzed longitudinal data from local property survey, county land bank and city government's demolition, American Community Survey (ACS) through difference-in-difference analysis. We have two major quantitative research findings: 1) among NAP neighborhoods, only a few qualified the tipping point criteria, some NAP neighborhoods are much better off than most other neighborhoods in Youngstown; 2) there is no significant treatment effects on NAP neighborhoods, when comparing with non-NAP neighborhoods.

We conducted interviews with informants in Youngstown to inquire their views on the quantitative research findings. We summarized four major explanations for our quantitative findings: 1) the selection of neighborhoods for NAPs was driven by political egalitarianism, aiming to appease constituents from various city wards, which resulted in a dispersed spatial distribution across the city; 2) the presence of a functional neighborhood association emerged as a crucial factor influencing the decision-making process regarding NAP allocation; 3) non-NAP neighborhoods developed alternative strategies to secure public resources to address urban vacancies,

demonstrating self-sufficiency in resource mobilization; 4) policymakers exhibit distinct priorities in addressing urban vacancies, which may not necessarily align with the focus on NAP neighborhoods.

THE IMPACT OF CLIMATE CHANGE ON RESIDENTIAL MOBILITY DECISIONS

Abstract ID: 1108.0.0.493.2024
Individual Paper Presentation

Yanmei Li [Florida Atlantic University] yli22@fau.edu, presenter
Annabelle Campbell [Florida Atlantic University] annabellecam2013@fau.edu
Diana Mitsova [Florida Atlantic University] dmitsova@fau.edu
Dylan Delaney [Florida Atlantic University] ddelaney2016@fau.edu

In recent decades, climate change has led to increasingly unpredictable and extreme weather patterns, stronger El Niño and La Niña phenomena, and a rise in the frequency and severity of natural disasters (Stott, 2016). The impacts of these events on housing and households have resulted in rising utility costs in certain regions, additional investments in disaster preparedness and retrofitting, higher premiums for homeowners' insurance, and increased home repair and maintenance costs (Martin, 2022; Perera et al., 2020). Increased financial burdens may negatively impact residents' physical and mental health, and/or motivate households to move to more affordable places regarding utility, maintenance, and insurance costs.

Research in displacement due to natural disasters is abundant, as is research related to adaptation and mitigation strategies responding to climate change. However, little is known of the impact of disasters and disaster perceptions, and rising financial costs on residential preferences in choosing a place to live, and whether extreme events play a role in influencing households' intent to move. To contribute to the literature on how climate change affects residential mobility decisions, the study starts with exploring the American Housing Survey (AHS) data between 2011 and 2021. Using the AHS, changes in electric utility expenses and homeowners' insurance cost shares among representative income brackets between 2011 and 2021 are calculated for the housing units occupied consistently by the same households. The 2021 AHS data for these households are then merged with the American Community Survey (ACS) 2018-2022 five-year estimate to take into consideration neighborhood characteristics. The temperature anomaly data at the county level since 1905 is then merged with the AHS and the ACS data. Correlation analysis between changes in utility and insurance costs and temperature anomaly is

conducted to account for the impact of climate change on these costs. Housing attribute variables, household demographic variables, neighborhood characteristics, utility costs and change in utility costs, insurance costs and their changes (if homeowners), and temperature anomaly are used in a series of logistic regression models to measure how utility and insurance costs relate to the mobility decisions of households by tenure status.

Preliminary results indicate that insurance and utility costs strongly correlate with county-level temperature anomaly. The results also indicated that there was a statistically significant association between insurance costs and homeowners' intent to move at the 0.10 significance level, while the effect of utility costs was not found to be statistically significant.

This study is a comprehensive review of how climate patterns relate to the mobility decisions of households. The study fills a gap in the existing literature on residential mobility, where the climate factor is not traditionally considered (Li, 2012). Residential mobility influences urban planning decisions and community stability, and identifying the climate change factors will help planners and politicians better prepare for population change in local communities.

UNEVEN URBAN PROCESSES & PLACEKEEPING IN MINNEAPOLIS

Abstract ID: 1108.0.0.709.2024
Individual Paper Presentation

Evan Davis [Humphrey School of Public Affairs, University of Minnesota] davi3739@umn.edu, presenter

Placemaking reflects a planning approach which often centers planners and developers as the stewards of urban space. Placemaking advocates may engage with community members and try to address their interests. But top-down revitalization plans can lead to an "unmaking" of places, which recreates racialized and socioeconomic inequality (Moran & Berbary, 2021). By contrast, placekeeping, a concept drawn from Indigenous planning and urban ecology, offers an alternative approach to redevelopment (Marceau et al. 2023; Tuck & McKenzie, 2015). I draw from scholarship that demonstrates how communities maintain deep connections to the places they come to

know (Jojola & Shirley, 2020) and how they work to prevent displacement from speculative reinvestment and rising property values (Davison, 2013). A placekeeping approach looks at how shared ownership, collective governance, and an equitable distribution of the benefits of redevelopment can be realized.

I look to the East Phillips neighborhood of Minneapolis as a case study to understand how community organizations use the logics of placekeeping to rectify past and ongoing environmental injustices. In East Phillips, a site called the "arsenic triangle" due to high levels of contamination and industrial polluters have subjected the primarily Latine, Black, and Indigenous communities to disproportionate environmental hazards and unequal health outcomes. East Phillips-based organizations are engaged in efforts to protect the communities against polluters and repurpose the contaminated site to become a community hub and urban farm. As communities struggle with ongoing redevelopment, East Phillips provides insight into how communities might restore past losses, protect against present threats, and build towards more just futures. Specifically I ask:

How have past planning decisions and development processes shaped the landscape of East Phillips?

How do East Phillips-based organizations and activists use the logics of placekeeping to navigate contemporary redevelopment efforts?

I use document analysis, interviews, and participant observation, as complementary methods to examine these questions. I first evaluate planning reports, maps, news articles, meeting transcripts, and website content to help trace past planning decisions and development processes in neighborhoods to the contemporary conditions of community redevelopment. I then draw on interviews and participant observation to explore how community-based organization staff and neighborhood activists understand placekeeping and use associated strategies and tactics to advance their redevelopment plans.

This research first draws a structural link between past uneven urban development and present conditions in racialized communities. I suggest that industrial siting decisions and racialized urban development processes created the environmentally hazardous landscape that makes up the East Phillips neighborhood. Secondly, I demonstrate how communities resist and disrupt planning processes to assert their own visions for their neighborhoods. I find that the East Phillips Neighborhood Institute (EPNI) serves as a place-based organizing hub for multiple movements in the neighborhood. By occupying, litigating, and eventually purchasing the contaminated site from the city, EPNI has inspired other placekeeping initiatives across the neighborhood. East Phillips organizations are now engaged in ongoing processes to structure their redevelopment in a way that shares ownership with community members and minimizes displacement. Thus, placekeeping serves as an alternative way that communities may maintain their connections to place and defend against further environmental injustices.

URBAN REGENERATION AND GENTRIFICATION OF THE CREATIVE COMMUNITY

Abstract ID: 1108.0.0.249.2024
Individual Paper Presentation

Lexun Wang [Tongji University] 2330278@tongji.edu.cn, presenter
Tongyu Sun [Tongji University] sty@tongji.edu.cn

Urban regeneration, a major task in China's current stage of urban development, will inevitably lead to gentrification with the enhancement of the living environment, spatial quality, and urban culture. It has been a vital challenge for authorities and developers how to achieve social equity, safeguard the interests of aboriginal people, and realize win-win benefits for stakeholders in urban regeneration. Towards this issue, previous studies focus on the causal inference of gentrification in urban regeneration programs in terms of political and economic laws. Still, there are research gaps in theory-practice transformation driven by the dynamics of communities for coping with gentrification. This study takes as a sample case the Ceramic Art Avenue Taoxichuan in Jingdezhen, a revitalized compound in the downtown area of a Chinese city that once flourished for the collective ceramic industry before the 1990s. With analyses of its industrial heritage transformation, this research aims to explore the implantation of cultural and creative industries with comprehensive consideration of the public service for the surrounding community, especially for young creators' entrepreneurship and accommodation, to protect the interests of most stakeholders, and to propose relevant regeneration strategies dealing with the negative impacts of gentrification from planning to design.

This study adopts a combination of qualitative and quantitative research methods. On the one hand, semi-structured interviews and field surveys are used to obtain the demands of multiple stakeholders in the creative community and to analyze the social network. On the other hand, pre- and post-urban renewal data from existing policies, social media reports, and other research are quantitatively analyzed to form a cognition of the political, economic, and spatial conditions at different stages of gentrification. By logical reasoning in multidisciplinary fields, this research explores the phenomenon of gentrification in the creative community to support the foundation of a replicable coping method for urban regeneration.

There are findings through this research. The creative class represented by Jingdezhen drifters promotes the transformation of Jingdezhen's ceramic industrial structure, which reveals the unitized production mode matches cultural and creative industries. However, through gentrification in Jingdezhen's urban regeneration process, some unexpected upscale development leads to the marginalization of the ceramic creative class. Accordingly, community vitality is affected by the transformation of the social production network structure, dominance of the commercial industry, and implantation of middle-class culture. Based on these laws of spontaneous operation of the creative community in Jingdezhen, it is effective to cope gentrification tendency with a "market-assisted state-led mode" by methods from planning to design: small-scale capital participation in the frame of the state-led economy to avoid homogeneity; enhancement of local culture in the process of spatial quality improvement to restrict the development of luxury; promotion of the industrial chain of the production-oriented community, highlighting the creative class as the "direct producers" in industrial and social manipulation. These strategies effectively intervene in the process of gentrification, improving the economic efficiency of the industry while optimizing cultural identity, spatial quality, and social engagement from the perspective of most stakeholders.

This research provides a theory-practice transformation on responses to the development tendency of the creative community in urban regeneration. It establishes a new systematic design method for coping with the negative

influence of gentrification in developing countries. At the same time, from a perspective of social equity, it further discusses the phenomenon and mechanism of gentrification in communities verified by solid foundations from investigation into urban regeneration programs, which supplements the theoretical system of gentrification in a broader sense.

WHAT CAN RURAL PLANNING LEARN FROM COMMUNITY DEVELOPMENT?

Abstract ID: 1108.0.0.280.2024
Individual Paper Presentation

Kathryn Frank [University of Florida] kifrank@ufl.edu, presenter
Michael Hibbard [University of Oregon] mhibbard@uoregon.edu

"In their Introduction to the Routledge Companion to Rural Planning, Scott, Gallent, and Gkartzios (2019, 1) point to "an urgent need to reinvent rural planning for the 21st century," yet the challenges facing rural areas have not been much reflected in planning scholarship, practice, or institutions (Hibbard and Frank 2021). As one aspect of that reinvention we have called for the field of planning to pay greater attention to rural communities and to "take a more broad-based view of development, to include not only economic growth but also social, cultural, environmental, and political equity and well-being" (Hibbard and Frank forthcoming).

Planning widely understands itself to be a derivative field that borrows and synthesizes from other fields. As a result, these fields have been rich sources for assessment, innovation, and expansion. Here we examine lessons and opportunities that can be drawn from one such cognate field that has particular relevance for rural planning: community development.

According to Rios et al. (2021), the planning field's connection to community development has primarily been for urban equity concerns. However, they noted that the other significant branch of community development is rural community development, which "grew out of self-help activities of late-nineteenth-century rural life…[with] ties to the U.S. Department of Agriculture, land-grant institutions, and educational associations" (2). This branch is still going strong within the nation's Cooperative Extension System, among others. Similarly, we have found through explorations of planning history that creating and strengthening rural communities, with associated rural cultures and ways of life, was a prominent focus of American planning in the early 1900s, but largely disappeared from the field by the latter half of the century (Hibbard and Frank 2021). In this paper we thus search further, surveying the field of community development and its cognates for possible sources to strengthen today's rural planning and reunite the fields.

Our paper begins with a background discussion of the definition of planning and its possible openness to lessons from the field of community development. We also present a conceptual framework for analysis. Planning theorists have noted key dimensions of the field, such as Hightower's (1969) classic dichotomy of planning entailing substantive and procedural aspects. Expanding on this and others, we explore the planning and community development fields through a framework of three recursively linked elements: disciplines, professions, and institutions.

We then apply this framework to assess the current state of rural community development in the fields of community development, planning, and cognate fields. We ask: What is the current state of the community development field with respect to rural communities, particularly its knowledge, practices, and institutions? How does the field of rural planning connect with rural community development? What other cognate fields connect with rural communities and community development, and how do they conduct rural community development? To answer these questions, we conducted literature reviews and thematic analyses of web-based information about rural community development, rural planning, and cognate fields.

Next we examine a set of US-based case studies to understand the rural planning/community development nexus. The range of cases emphasize each field acting separately and together, drawing on concrete instances to illustrate and clarify the substantive knowledge, practices, and institutions involved, and their recursive relationships.

Finally, we offer to rural planning the lessons and opportunities from community development, to leverage and connect each field's strengths in terms of disciplines, professions, and institutions. To further facilitate self-reflection within the planning field, we compare and contrast paradigms drawn from theories of planning and community development."

WHAT GOOD IS A GOOD? HOW THE CAPABILITIES APPROACH INFORMS EQUITY PLANNING

Abstract ID: 1108.0.0.1117.2024
Individual Paper Presentation

Michael O'Malley [University of Florida] omalleym@ufl.edu, presenter

For the last several decades, planning theory's focus has begun to shift away from neutrality and efficiency and toward value-based approaches that prioritize just and equitable outcomes. In this vein, one major equity-oriented framework relating to distributional justice is the Capabilities Approach (CA) developed by Amartya Sen. The CA can be used as a measurement tool that looks beyond a traditional ends-evaluation process of cataloging and measuring resources (what Rawls calls "primary goods"). Instead, it seeks to identify the real freedoms and capabilities people have to convert their resources in pursuit of a life of human dignity and flourishing, in this way sharing a common goal with equity planning.

By design, the CA is a non-prescriptive framework meant to involve a community of stakeholders in deliberative processes to help decide which capabilities should be prioritized and measured. Therefore, application of the theory requires a translative process of operationalization. In a planning context, it has been deployed in divergent ways that are often fragmented and inconsistent with the spirit of the CA, often neglecting key aspects required to maintain a priority focus on measuring (and increasing) capabilities. In this context, this paper will consider the following question: how can the CA be operationalized in a way that both honors the intent of Sen's focus on increasing well-being through a capability lens and allows room for researchers and communities to have context-specific flexibility in their application of the approach?

To help answer this question, a comparative case study analysis of three research projects will serve to illustrate distinct applications of the CA. In the first project , Biagi, et al.'s 2018 study in the city of Alghero, Italy combined mainstream Qualify of Life empirical modeling with the CA in order to investigate residents' perceptions of well-being. In the next project, Speak (2012) examined the Bhalaswa relocation colony in Delhi by applying a "real life" methodology based on a feminist approach that privileges the voices of marginalized groups and local knowledge. Finally, Cooke, et al (2022) set out to make transportation-policy recommendations for planners in three African cities, but they ended up shifting their focus because of the unexpected complexity of the results of their interviews which were conducted using a CA-based methodology.

The case study analysis identifies both possible pitfalls to be avoided and exemplars to be expanded upon and further investigated in the operationalization of the CA. The elements of these studies which most closely follow the CA employ data collection methods that seek to understand the authentic, lived experiences of their research participants, focusing on substantive freedoms available and motivations behind actions taken in order to identify the factors involved in converting primary goods and available resources into a form of well-being. This sort of CA-based methodology serves to complement and extend the use of aggregated indices and other similar approaches often used to measure quality of life and happiness. Sen and others have pointed out that while these methods produce readily actionable data points, they can also obscure crucial information relating to motivations, to the presence or absence of genuine choices, and to often detrimental opportunity costs.

A key implication of adopting a CA-based methodology for which this paper argues is the potential to provide more relevant information and clearer understanding to planners and policy makers so that they can direct resources to further equity. Additionally, data from this methodology may lead to an expanded scope of the planner's role as they recognize that their work will not "end with the provision and maintenance of [a] good" but instead could extend to increasing capabilities (Basta 2016, p. 204).

YOUTH KNOW THEIR PLACE: LESSONS FROM WALK MY BRICKS PROJECT

Abstract ID: 1108.0.0.1250.2024
Individual Paper Presentation

Dian Nostikasari [Drake University] dian.nostikasari@drake.edu, presenter
Katie Krueger [Drake University] katherine.krueger@drake.edu
Leif Klarqvist [Drake University] leif.klarqvist@drake.edu

Youths are a powerful but rather untapped resource regarding community change and in co-producing knowledge of inclusive spaces in communities. Youth-centered participatory action research provides more than just where they go to play or socialize, but further challenges the production of knowledge involved in producing visualizations and delineating socio-spatial assemblages (Baker et.al., 2019). Youth engagement may uncover how our historical past is intertwined with decisions of the present and future investments and what constitutes a just future (Swords et al., 2019). In doing so, youth participants can take an active role in utilizing storytelling as a critical approach to reimagining alternative visions of the future of the community (Ortiz, 2022). The article seeks to answer the following questions: 1) How might we engage youth in a storytelling approach to making sense of their environment? 2) To what extent can storytelling through a youth-centered participatory approach uncover alternative knowledge of communities? and 3) In what ways can a youth-centered storytelling approach contribute to planning and designing intergenerational public spaces?

We draw from the experience of co-developing a youth-led community walk and tour program in Oakridge Neighborhood in Des Moines, Iowa. This includes working with undergraduate students in a Sustainable

Transportation class to conduct neighborhood walking assessments with youths in the community, subsequent participatory mapping and storytelling workshops, and interviews with program coordinators spanning two years. Youth leading the tour participate in a collective healing potential by telling their stories (Ortiz, 2022). In response to a tragic loss in the community, youth share how they make stronger connections to memories through caring for their treasured spaces within the neighborhoods–potentially furthering a call for 'therapeutic planning' practices (Sandercock, 2023). Further understanding of youth-centered spaces also contributes to producing intergenerational spaces (Nelisher and Sideris, 2023) as an outcome of planning and designing inclusive public spaces.

Track 2 Research in Motion (RiM)

CHILDREN'S FOUND PLAYSPACES IN VARIOUS HIGH-RISE GATED COMMUNITIES IN CHINA

Abstract ID: 1110.0.0.817.2024
Research-in-Motion (RiM)

Rui Wang [University Of Sheffield] iamruiwang@outlook.com, presenting author
Yueshan Ma [Henan University of Science and Technology] yma51@sheffield.ac.uk

Rapid urbanization in China has resulted in an increase in high-rise buildings as a response to rural-urban migration. High-rise residential communities are the most common form of urban development in most first-tier and second-tier Chinese cities (Karsten, 2015). As of the end of 2019, there were over 260,000 high-rise residential buildings in China, making high-rise living typical for families. The transition from traditional low-rise to high-rise communities has resulted in changes to the private spaces and lifestyles of Chinese families, particularly children (Ekblad, 1990). Housing areas are among the most accessible spaces for children's play, and as they tend to spend most of their time in their communities, their outdoor play environments and experiences have also been affected.

Children's play in gated communities usually takes place in constructed or found play spaces. The constructed play spaces are designed specifically for children and often consist of a kit, a fence, and a carpet: a kit of fixed play equipment; a fence ostensibly to keep children within the space; and a carpet of rubber surfacing (Woolley, 2008). However, these sorts of play spaces experience limited use and are often occupied only at peak times. There is evidence that children do not only play in constructed spaces; they also play in found spaces, which might reflect that children will play anywhere and that children's preferred spaces go beyond these constructed ones (Whitzman & Mizrachi, 2012). In past traditional neighborhood communities, identified found play spaces include roads, pavements, car parks, paved areas, public grass, gardens, wild areas, planted areas, access areas as well as walls, fences, and the flat roofs of garages (Hole, 1966). This raises the question: Within high-rise gated communities, where do children play beyond constructed play spaces?

This research critically examines the intersection between children's needs and the urban planning practices that shape their play environments in high-, medium-, and low-income high-rise gated communities in Nanjing, China. Informed by 368 interviews with adults and children from various families, as well as informal observations, the findings reveal that over 50% of children engage with found play spaces—areas often overlooked in the urban context. The study investigates how children discover and interact with found spaces, and how their selves, and familial attitudes influence their use of found play space. Additionally, the research develops an assessment tool designed to identify and categorize the typologies of found spaces, evaluating their play value from a designer's perspective.

This research critically examines the intersection between children's needs and the urban planning practices that shape their play environments in high-, medium-, and low-income high-rise gated communities in Nanjing, China. The findings, informed by 368 interviews with family adults and children and informal observation, reveal over 50% children have their found play spaces but which are often overlooked areas within the urban context where children play. The study investigates how children discover and interact with found spaces, and how their selves, and familial attitudes influence their use of found play space. Furthermore, the research creates an assessment tool to identify typologies of found spaces and evaluate their play value from a designer's perspective.

Both qualitative and quantitative findings suggest that these intentionally designed spaces may not sufficiently cater to the spontaneous play behaviors and preferences of children. The interviews indicate that children rely heavily on found spaces, highlighting a discrepancy between the constructed play environments and the actual needs of children. This challenges the common belief that constructed playgrounds should be the only or primary venues for children's play.

To develop communities in a more child-friendly manner, this research encourages urban planners and designers to broaden their perspectives beyond merely constructed play areas. It advocates the consideration and integration of found play spaces into urban planning strategies. This shift aims to acknowledge and value children's needs and voices within urban planning. Adopting this approach not only enhances the quality of life for young residents but also fosters a more inclusive and engaging community for all. This research seeks to influence the guidelines of the Standard for Urban Residential Community Planning and Design in China, steering them towards a more child-friendly direction.

COMMUNITY-DRIVEN RESILIENCE HUB PLANNING: A MULTI-CRITERIA APPROACH

Abstract ID: 1110.0.0.514.2024
Research-in-Motion (RiM)

Suwan Shen [University of Hawaii at Manoa] suwans@hawaii.edu, presenting author
Kinzang Dorji [University of Hawaii at Manoa] kdorji@hawaii.edu

Amidst the escalating threats of natural disasters and extreme weather events, community resilience hubs have emerged as pivotal in enhancing localized resilience efforts (Shea, 2018). The significance is pronounced in geographically isolated regions, such as the Pacific Islands, where the logistics of emergency aid delivery are notably challenged by distance and accessibility, underlining the criticality of localized resilience efforts. Leveraging community assets (George et al., 2022), resilience hubs serve dual roles: as community resource centers during normal times and as emergency aid nodes during disasters (Roode & Martinac, 2020). Despite the acknowledged importance of community engagement in the development and operational phases of these hubs, research predominantly focuses on physical components such as the infrastructure and utility of these hubs, overlooking the social dynamics and community perspectives (USDN, 2019). This study addresses this gap by exploring community perceptions and preferences on the functionality and siting of resilience hubs on O'ahu, Hawai'i, using a GIS-based multi-criteria framework that integrates Multi-Criteria Decision Making (MCDM) with insights from a survey of 416 residents and 129 identified potential hub sites. The framework, enhanced by expert opinions and community workshop findings, evaluates factors such as community support, hazard vulnerability, and accessibility to prioritize sites for resilience hub development.

Findings suggest a heightened reliance on resilience hubs during emergencies, with a marked preference for their development among rural communities as opposed to their urban and suburban counterparts. The support level and preference factors also differ by location. The distinctive preference of rural communities for the development of resilience hubs underscores the necessity of tailoring hub functionalities and services to accommodate the unique needs and challenges of different community settings. This differentiation highlights the importance of

inclusive planning processes that engage a broad spectrum of community stakeholders, ensuring that resilience hubs are both accessible and responsive to the diverse needs of urban, suburban, and rural residents alike. These insights carry profound implications for the design and operational strategies of resilience hubs, shaping their infrastructure, functions, and offerings to better meet community needs.

By presenting a systematic framework for evaluating potential resilience hub sites, this research offers valuable insights and tools for policymakers, urban planners, and community organizations, aiding in informed decision-making to enhance community resilience. Given the increasing threat of natural disasters, the framework and findings from this study provide a scalable model for resilience hub development that could be adapted by other regions aiming to strengthen their disaster preparedness and response strategies.

EXPLORING THE ROLE OF SOCIAL INFRASTRUCTURE IN FOSTERING ECONOMIC TIES

Abstract ID: 1110.0.0.825.2024
Research-in-Motion (RiM)

Sagar Hiware [University of Massachusetts Amherst] shiware@umass.edu, presenting author

Income inequality and social polarization hinder economic mobility. Research shows that differential opportunities in residents' neighborhoods impact upward income mobility (Chetty et al., 2014; Chetty & Hendren, 2018). There is a growing recognition of the role that social infrastructure in the built environment can play in addressing such disparities (Florida, 2017; Latham & Layton, 2019; 2022; Nelson et al., 2022). In this context, public land grant universities in the US are uniquely positioned with a pivotal mission: to ameliorate social inequalities and foster economic mobility, especially among individuals from lower-income strata. One of the strategies to achieve this mission is to invoke the role of the local state through the deliberate creation of infrastructural opportunities that catalyze connections between individuals across income levels, thus facilitating the dissemination of information via social capital channels (Warner, 1999; 2001). Despite the importance of this goal, more research is needed on how public land-grant universities can create an environment that promotes diverse interactions and learning experiences. It is still being determined whether campus design can be used to enhance connectedness in these

institutional-built settings. Therefore, there is a strong need for further investigation into the specific elements of the built environment that either hinder or facilitate interaction opportunities (Chetty et al., 2022a; b).

To address the literature gap, this study is a qualitative research inquiry complemented by the method of data triangulation, which centers on the hypothesis that strategic campus planning plays an instrumental role in promoting interconnectedness among campus users. I use five public land grant universities as the case studies. Social capital measures used in the study are drawn from the Social Capital Atlas, an open-ended data source. I begin with the institutional master plans as artifacts for inductive reasoning strategy to answer the first research question: 1) How are public universities using campus design to enhance user connectedness? Next, with an online questionnaire survey and semi-structured interviews with administrators, university architects, and planners, I focus on the second research question: 2) What difficulties do administrators and planners encounter in their campus planning endeavors to encourage user connectedness? Considering the value proposition of the concept of 'third spaces' in campus planning endeavors (Butler & Diaz, 2017; Kane & McDuffie, 2018), with the third research question I explore 3) How are 'third spaces' incorporated into campus design and what role do they play in enhancing connectedness?

Through a rigorous qualitative comparative analysis, the research findings are anticipated to yield actionable insights, informing strategic campus planning initiatives that bolster social equity and educational efficacy within the context of public land-grant universities. The study endeavors to arm campus planners and capital improvement project managers with empirical evidence to guide investments in creating inclusive campuses that transcend social class divides. Further, it delineates the decision-making processes that underlie strategic planning; the study seeks to reconcile institutional ambitions with public expectations, aligning infrastructural development with the overarching goal of social integration. Thus, the implications of this research are manifold, extending beyond the academic discourse within the planning practice. Lastly, the insights gleaned from this study are anticipated to enrich our comprehension of how planning initiatives can be effectively harnessed to enhance social inclusivity and diversity, thereby contributing to the broader discourse on educational equity and community engagement within higher education settings.

GRASSROOTS VERSUS INCLUSIVE INNOVATION: LESSONS FROM NEW YORK CITY, USA

Abstract ID: 1110.0.0.1236.2024
Research-in-Motion (RiM)

Manju Adikesavan [The Graduate Center, City University of New York] madikesavan@gradcenter.cuny.edu, presenting author

Refashioning city centers and commercial districts into innovation-igniting urban developments (Zandiatashbar and Kayanan, 2020) such as creative clusters, technology zones, clusters of innovation, and innovation districts for boosting economic competitiveness and growth in the knowledge-based economy is a widely adopted urban development practice. Innovation districts (Katz and Wagner, 2014) that host clusters of knowledge-based organizations (firms, universities, research institutes, etc.) in mixed-use, amenity-rich, and transit-served settings for facilitating encounters and interactions across diverse knowledge workers and networks and boosting innovation have emerged as a popular 'traveling planning concept' (TPC). In addition to attracting external economic investment and high-skilled technology workers, innovation districts are also considered desirable from a sustainable mixed-use urban development perspective.

However, studies of Silicon Valley and other cities such as Boston, MA, St. Louis, MO, and Buffalo, NY (Zandiatashbar and Kayanan, 2020) have demonstrated that innovation-fostering mixed-use and amenity-rich clusters erode affordability and displace and exclude underserved people and communities in their vicinity. Gómez and Oinas (2022) suggest that 'landing processes'—the interventions through which a TPC is adjusted to suit local conditions and developmental objectives—are key for ensuring local innovators, small businesses, and underserved communities and residents are included in innovation-oriented economic development initiatives typically designed for embedding external investors and high-skilled workers into the local economy.

In this research, I employ mixed methods (observation, semi-structured interviews, and secondary data analysis) to document place-based and grassroots innovation initiatives in New York City, such as collectives and cooperatives that connect and support local innovators and businesses and facilitate innovation-in-place. I compare and contrast the grassroots innovation processes of worker cooperatives affiliated with the New York City Network of Worker Cooperatives (NYC NOWC) with the innovation district "landing processes" commonly used to mitigate adverse effects such as vulnerable community displacement and economic exclusion. Examples of commonly used landing processes include school-to-work programs, resident upskilling to unlock access to low-to-medium skilled job opportunities within innovation districts, and allocating affordable workplaces for local businesses and start-ups within innovation districts.

Since over ninety percent of NYC NOWC's 70 members are women-, immigrants-, and people of color-owned worker cooperatives, NYC NOWC is a robust site for collectively examining NYC-based grassroots innovation-in-place practices. NYC NOWC members' grassroots innovation practices include leveraging community assets such as social capital and place identity of underserved communities and locations, expanding business-grade broadband infrastructure, micro-financing, and incubating home-based businesses in marginalized locations to facilitate innovation-in-place, among others. I conclude by discussing intersections between grassroots innovation initiatives and asset-based community development initiatives (Gomez, 2021; Kretzmann and McKnight, 1993), and the need to foster both grassroots innovations and inclusive landing processes that facilitate access to jobs and economic opportunities in innovation districts.

RACIAL DISPARITY IN NEIGHBORHOOD ASSOCIATIONS: ASIAN PORTLANERS PERSPECTIVE

Abstract ID: 1110.0.0.665.2024
Research-in-Motion (RiM)

Minji Cho [Portland State University] minji2@pdx.edu, presenting author

As the United States becomes more culturally diverse due to globalization and an increase in immigration, the strategies of community engagement based on deliberation face the challenges to inclusion for people with diverse cultural backgrounds (Bernstein and Norwood 2008; Melendez and Martinez-Cosio 2019). Therefore, many scholars and practitioners have made an effort to mitigate exclusion by including people with marginalized identities in decision-making. For example, Community Connect (2008) suggested “an increase in the number and diversity of people involved in their communities” as the first goal of a “comprehensive road map for strengthening Portland’s civic life”. Then, the Office of Community & Civic Life in the City of Portland, practically, has contributed to organizing and capacity building of historically under-engaged groups, and training for the staff and leaders who are working with people of color, immigrants, and refugees (De Morris and Leistner 2009).

Despite these efforts, community engagement in the United States is still dominated by white middle-class males (Melendez and Hoff 2022). This is because people focus more on quantifying how many under-engaged groups participate in community engagement, but do not pay attention to giving them substantial power (Goetz et al. 2020). Indeed, Meléndez and Martinez-Cosio (2019) observed a participatory budgeting process, which mainly used English, and claimed that the role of a translator is not enough to give Spanish-speaking Latino immigrants power in decision-making. Since translation takes time, Spanish-speaking participants should speak shorter than English-language participants, and the flow of communication puts them be a position that respond to Ensligh-speaking participants rather than lead the conversation (Meléndez and Martinez-Cosio 2019).

East Asians in the United States, especially, could encounter barriers to community engagement due to the stereotypes against them, their cultural characteristics, and their identity as a marginalized group. In terms of

stereotypes against Asian Americans, for example, the perpetual foreigner stereotype can make Asian Americans appear ineligible to participate in the "American" decision-making process (Lee et al. 2009; Lee et al. 2021). In addition, the model minority stereotype can lead Asian Americans to be excluded from discussions about the inclusiveness of community engagement by presupposing that they are already well engaged (LAAUC 2021; Lee et al. 2009). Furthermore, since the deliberative democracy discipline is Western-centric (Dissanayake 2003), the studies on community engagement tend to lack consideration of the cultural characteristics of non-Western countries.

In this regard, this study aims to explore the racial disparity of community engagement from the perspective of East Asians. This study especially focuses on neighborhood associations and East Asians who live or work in Portland, Oregon to answer two research questions: (1) How many East Asian Portlanders are actively involved in neighborhood associations? (2) What factors influence their participation or non-participation? Using the mixed method approach, this study found that East Asian Portlanders are underrepresented in neighborhood associations. A significant barrier to initial participation was the mismatch between the characteristics of neighborhood associations and those of Asian Portlanders, such as language, culture, socioeconomic factors, and values. The initial exclusion from neighborhood associations not only precludes individuals from achieving the positive benefits, such as self-efficacy and social bonds that can be derived from community engagement, but it also fortifies neighborhood associations to be more favor to the interests and needs of the current participants, thereby perpetuating the exclusion of Asian Portlanders.

THE IMPACT OF CULTURAL REGENERATION ON PLACE IMAGE AND REVISIT INTENTION

Abstract ID: 1110.0.0.435.2024
Research-in-Motion (RiM)

Sang Suk Lee [Kangwon National University] yss2032@korea.kr, presenting author

In 2023, South Korea's total fertility rate is 0.72, the lowest among the 38-member countries of the OECD. In response to the population decline crisis, the Korean government enacted a special law in 2023 and designated 89 local governments as depopulation areas, providing administrative and financial supports. The declining local cities are investing in culture and tourism, and are making various efforts to improve living conditions and revitalize their cities through diverse regeneration projects.

The Ministry of Culture, Sports and Tourism is promoting the Cultural City Project to create a city brand by utilizing the unique cultural assets of the region. Cultural and artistic assets are important to revitalize local areas and improve their competitiveness in conjunction with local tourism projects. However, cultural tourism development projects that are proposed without comprehensive understanding of places are producing negative results such as budget waste and abandoned place.

Yeongwol Y Park, located in Yeongwol-gun, Gangwon-do in South Korea, is a complex cultural space that recreated an unused space that had been neglected due to the failure of a public tourism project into a space that utilizes local cultural assets. This study intends to examine the impacts of cultural regeneration factors using an unused space on visitors' place image and revisit intention with a case of Yeongwol Y Park, and to suggest implications for cultural regeneration projects.

This study has reviewed previous studies to organize the constructs and indicators of cultural regeneration, place image, and revisit intention. Cultural regeneration factors include the factors of cultural facilities, cultural events, and local cultural industries. Place image consists of the factors of attractiveness, friendliness, and interest in the place. Revisit intention encompasses personal revisit, family and coworker revisit, and intention to prioritize the place over other places.

The sample of visitors who visited Yeongwol Y Park more than once is stratified to consider the proportion of visitors by gender and age. The proportion of the population by gender and age is calculated utilizing the big data provided by Korea Tourism Data Lab of the Korea Tourism Organization. As a result of the survey, the number of respondents consists of 316 men and 234 women, totaling 550 respondents. A structural equation modeling is employed to investigate the direct and indirect relationships between cultural regeneration factors, place image, and revisit intention.

Among the cultural regeneration factors, the factor of cultural facilities shows a significant positive effect on three factors of place image and revisit intention. The factor of cultural events is expected to have a significant effect on place image and a marginal effect on revisit intention. The factor of local cultural industries is expected to have a positive impact on place image, but no direct impact on revisit intention. Cultural facilities factor shows the highest impact on revisit intention among three cultural regeneration factors, while other factors have marginal impact on revisit intention.

It is evident that cultural facilities that are culturally recreated utilizing neglected places are perceived as friendly, interesting and attractive places, which creates a new image of the places and increases the intention to revisit. Both the factors of cultural events and local cultural industries, however, have a positive effect on place image, but it does not seem to have significant impact on revisit intention mainly due to the limitation of a local small city and the lack of tourism infrastructure.

Track 3 – Economic Development

Track 3 Pre-Organized Session Summaries and Abstracts for the Sessions

NEW INDUSTRIAL PATHWAYS, PARTNERSHIPS, PROCESSES, AND PLANNING CHALLENGES
Abstract ID: 1112.0.0.166.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.317.2024, 1108.0.0.296.2024, 1108.0.0.176.2024, 1108.0.0.417.2024

Carl Grodach [Monash University] carl.grodach@monash.edu, organizer

This pre-organized paper session brings together scholars from the US, Canada, Germany, and Australia to explore the pathways and challenges to low-carbon and socially inclusive industrial policy. There is an urgent need to identify routes toward more inclusive and climate-resilient industries and industrial spaces. How can planning forge new pathways, partnerships, and processes for low-carbon and socially inclusive industrial development? Existing industrial policy agendas lean toward technological innovation and high skilled jobs. Simultaneously, competing priorities particularly around housing provision put pressure on retaining and growing key industrial lands, functions and workforces (Aderneck 2023). These conditions neglect important segments of industrial activity and threaten sustainable industrial transitions.

Emerging adaptations to industrial lands and core industrial activities in cities, and particularly those along coastlines or in low-lying coastal zones (Witte et al. 2020), intersect with mounting social, ecological and economic imperatives and their industrial legacies. Planning, management, and governance policies for contemporary industry require better understanding of the diverse activities, workforces, and paths toward more climate adaptive infrastructure (Chang and Förster 2023). At the same time, decarbonizing industrial sectors must confront the realities of planning and development politics and planning regulations, which are often out of step with new equitable industrial futures (Dierwechter and Pendras 2023; Grodach and Martin 2021).

This session will examine the planning and policy challenges toward socially just, decarbonized industry development alongside the emerging partnerships, processes, and solutions from an international comparative perspective. The papers presented in this session draw on a range of methods including qualitative case-based approaches, mixed-methods research, and policy analysis.

Learning Objective(s):

- Identify planning challenges toward more equitable and sustainable industrial policy.
- Identify potential planning strategies for more equitable and sustainable industrial policy.

VIABILITY OF MISSION-BASED MODELS FOR INDUSTRIAL LANDS IN VANCOUVER (CA)

Abstract ID: 1108.0.0.317.2024
Pre-Organized Paper Presentation

Robin Chang [Chair of Planning Theory & Urban Development, Faculty of Architecture, RWTH Aachen]
chang@pt.rwth-aachen.de, presenter

This contribution discusses the challenges faced by tenants of the productive processes following mission-based models of land use management and economic development for industrial functions in the context of the Canadian city Vancouver. The city of Vancouver confronts challenges like many other urban centres and grapples with forces that gentrify or displace industrial uses (Sprague & Rantisi, 2019). Despite attempts to address these concerns through spatial measures such as updated planning processes and zoning plans at municipal and regional levels (MVRD, 2020), local businesses are still under pressure.

To help illustrate experiences of local industrial business operations enabled through the portfolio-oriented efforts of the non-profit called Community Impact Real Estate Society (CIRES), this presentation builds on a pilot project exploring sustainable adaptation of urban and industrial lands (Chang & Foerster, 2023) and draws on content analyses from interviews, policy, and report documents from 2022 and 2024 to provide examples and deeper insights. The aim of this work is to discuss opportunities and challenges resulting from approaches aiming to balance the integrity of industrial functions and local demands for housing. Not only does this approach nod towards an emerging and social type of mixed-use approach to developing industrial lands, but it also shines a spotlight on the question: Which alternative and productive processes are possible to balance the economic and social sustainability of industrial lands? What differences or similarities are reflected in the perspectives of tenants that benefits from socially impactful or mission driven local economic development processes or programs? What spatial or planning policy considerations arise from these alternative and productive processes?

Beyond sharing ongoing experiences in Vancouver, this contribution aims to engage in ongoing debates on how communities might could “make green-city strategies bluer” (Dierwechter & Pendras, 2023, p. 163). The combination of practical and policy insights will interrogate and invite other scholars to consider what their public administrations are already doing or could also do to enhance the benefits of portfolio-oriented but spatially sensitive approaches in their communities. By doing so, we contribute to building awareness for means towards lowering thresholds for local industrial business and initiatives wishing to anchor social value through productive functions on industrial lands.

PLANNER PERCEPTIONS AND IMAGINARIES OF INDUSTRIAL LAND USES IN AUSTRALIA

Abstract ID: 1108.0.0.296.2024
Pre-Organized Paper Presentation

Joe Hurley [RMIT University] joe.hurley@rmit.edu.au, presenter
Hugh Stanford [RMIT University] hugh.standford@rmit.edu.au
Liz Taylor [Monash Organisation] liz.taylor@monash.edu
Carl Grodach [Monash University] carl.grodach@monash.edu

In this research we interrogate the changing nature of urban industrial activity and the role of urban planning in shaping new industrial futures. Urban planning policy is a critical and yet often neglected factor in the landscape of urban industrial activity. Historically, policy aimed to protect and facilitate industrial activity largely to minimize conflict with other land uses and maintain viable spaces for industrial activity (Hurley et al 2023). However, the nature of industrial activity and work are changing, with new modes of production, hybridized business models, and increasing competition for land that have implications for urban sustainability more broadly (Grodach et al 2023). In this context, we focus on the ways in which planning professionals conceptualize, grapple with, and manage changing industry, investigating how they imagine the needs of current and future urban industrial land. Planning imaginaries are normative concepts of the way things are and should be. They are constantly negotiated and reconstructed within and between communities and are often tacit and taken-for-granted, at times escaping critical reflection (Davoudi et al. 2018). Interrogating planning imaginaries provides insight into how planning professionals and urban elites conceive of desired futures and how they may wield the power of planning in achieving this (Jensen et al 2013).

We examine the dominant narratives, tensions, and conflicts behind planning imaginaries through the lens of contemporary industrial activity and planning in Brisbane, Sydney, and Melbourne, the three largest cities in Australia. Through 32 semi-structured interviews with planning professionals, we aim to explore the professional understanding of industrial activity and its dynamics, and imaginaries of the particular role of industrial land planning and management. Thematic analysis is deployed to identify latent themes invoked by interviewees when discussing planning for industrial land uses, specifically focusing on instances where planning imaginaries were expressed (Xu and Zammit 2020; Davoudi et al. 2018).

Professionals characterize the landscape of industrial planning in varied ways including a traditional focus on protecting and containing industry; revitalisation and diversification of industrial landscapes; embracing the future of new industry; and looking at industrial land as obsolete. There is also considerable conflict and competition between narratives in practice. The combination of imaginaries directly impinges on how different cities pursue industrial land use policy with varying implications for moving toward low-carbon and socially inclusive urban industry. The research reveals the particularly unsettled nature of industrial land imaginaries in planning. It highlights the risks of applying uncritical norms and the need for more committed engagement with the role of urban policy in supporting industrial activity in the context of change, aspirations of sustainability and economic competitiveness, and competition for land.

CONCRETE: MAPPING THE PATH TO DECARBONIZATION

Abstract ID: 1108.0.0.176.2024
Pre-Organized Paper Presentation

Nichola Lowe [University of Minnesota] nlowe@umn.edu, presenter
Natasha Iskander [New York University] natasha.iskander@nyu.edu

Concrete—a dense, rough building material made from a mix of cement, broken stone or gravel, sand and water—is everywhere. This human-made substance is second only to water as the most widely used resource on the planet. But in its current form, concrete is also one of the most environmentally destructive. The production of cement, which is the binding factor in concrete, is the source of nearly ten percent of the world's carbon dioxide emissions, releasing more carbon annually than any single country save China and the United States.

There are no workable substitutes for concrete. Globally, the use of cement has been increasing by 3 percent a year, and global reliance on cement and finished concrete is only projected to increase in coming decades. According to the climate advocacy group Architecture 2030, the global building footprint is set to double by 2060, adding floor area equivalent to present-day New York City each month for the next 40 years. On top of that, the expansive need for climate adaptive infrastructure—everything from sea walls and raised foundations to wind turbines and networked clean energy transmission towers—will further increase global concrete demand. Alternatives like mass timber and steel have been proposed for some structures, but neither can match concrete's functionality for load-bearing structural elements, its malleability for building features, its resilience to environmental pressures, and its cost. The path to decarbonization must include further development of low-carbon concrete alternatives and with it, the need to also identify and resolve existing barriers that prevent rapid and widespread use.

This paper illuminates a potential pathway for concrete decarbonization through an in-depth study of two urban areas that have positioned themselves as national low carbon concrete leaders. One case involves the San Francisco Bay Area, home to several pioneering ready-mix and aggregate suppliers that have gained a national following as material innovators. Using a highly collaborative model of business engagement, in addition to well-resourced R&D operations, these firms work closely with structural engineers, commercial builders, construction and labor contractors and various public agencies to develop and supply low-carbon concrete mixes in support of

multiple “net zero” or “low carbon” construction projects, including at showcase Silicon Valley ‘tech’ headquarters. Additionally, these material suppliers have worked with local planners and environmental advocacy groups in Marin County to develop the nation’s first low-carbon concrete building code, inspiring larger California jurisdictions, including Los Angeles, to follow their lead.
The second case involves a long-standing public research facility in the Minneapolis-St. Paul metro region which conducts in-situ concrete tests in order to improve the durability of highways, roads, sidewalks and other large-scale transportation infrastructure. Research scientists and engineers, along with regional industry partners and trade associations, have leveraged the facility’s national reputation and robust Federal-funding source to build cross-sectoral support for enabling legislation. The result was the inclusion of low carbon concrete provisions within Minnesota’s historic 2023 Buy Clean procurement law, rather than industry lobbying for concrete’s exemption as happened in other states like California.
Combined, these cases illustrate the need for bottom-up industrial policy that can strengthen Federal leadership by mobilizing local support for material deployment through situated and collaborative engagement. But equally, these cases illuminate deep tensions and frictions that stem from entrenched power imbalances and poorly connected industry practices that forcefully push against material innovation and adoption. In this regard, these cases reveal the generative tools that industry actors within the US construction industry use to engage and rework long-established industrial and institutional practices that hinder the adoption of low-carbon alternatives, in turn providing other jurisdictions with an adaptive roadmap for advancing material transition through institutional redesign.

BLUING THE GREEN: MANUFACTURING SUPPORT AS GREEN CITY STRATEGY

Abstract ID: 1108.0.0.417.2024
Pre-Organized Paper Presentation

Mark Pendras [University of Washington Tacoma] pendras@uw.edu, presenter
Yonn Dierwechter [University of Washington Tacoma] yonn@uw.edu

Under conditions of global climate change and impending environmental challenges, green city policies and other expressions of urban sustainability have assumed a central place in urban planning practice. While welcome and necessary, such policies typically situate urban manufacturing as a problem to be solved and as antagonistic to desirable green urban futures. The result is mounting pressures on an already beleaguered sector of the urban

economy, threatening the survival of manufacturing firms and introducing a political wedge that both reinforces perceptions of elitism in the environmental movement and generates resistance to urban sustainability. The purpose of this research is to approach urban industrial planning from a different perspective, asking not how urban manufacturing can become 'greener' (reducing carbon output, managing emissions, shifting product outputs), but rather how green urbanism can become 'bluer' by recognizing, incorporating, and nurturing blue collar lives and livelihoods. Central to this perspective are an understanding of underappreciated contributions that manufacturing already makes to green urbanism and an interest in expanding those contributions. Drawing on an extended case study of the Puget Sound industrial region, centered on the widely recognized 'emerald city' of Seattle, this paper explores existing and potential strategies for creatively weaving manufacturing into more dominant urban sustainability initiatives, especially in the land-use planning, transport,

and economic development arenas. Analyses of existing regional manufacturing landscapes and industrial planning and policy documents, and interviews with key participants in the manufacturing ecosystem, reveal common barriers to progress in this area even as openings for progress are also emerging. The goal of this work is therefore to identify and suggest new approaches to planning practice that can maintain and potentially expand the role of blue collars in green cities.

RECONSIDERING THE FISCAL IMPERATIVE FOR ECONOMIC DEVELOPMENT

Abstract ID: 1112.0.0.160.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.164.2024, 1108.0.0.990.2024, 1108.0.0.265.2024, 1108.0.0.183.2024, 1108.0.0.1010.2024

Joshua Drucker [University of Illinois Chicago] jdruck@uic.edu, organizer

After the Great Recession and COVID-19 pandemic, municipalities began reevaluating their traditional sources of revenue as well as how to spend those revenues to achieve their goals. This panel explores ways in which new

development patterns and local government priorities have been shifting the dynamics of the public finance-economic development relationship in the U.S.

Learning Objective(s):

- Learn about the relationship between local economic development and public finance in the U.S.
- Learn about shifts in municipal revenue strategies and implications.
- Learn about changes and experiments in local economic development strategies and their implications.

PUSH-&-PULL OF PROPERTY TAX RELIEF: WHO PAYS FOR EXEMPTIONS AND INCENTIVES?

Abstract ID: 1108.0.0.164.2024
Pre-Organized Paper Presentation

Joshua Drucker [University of Illinois Chicago] jdruck@uic.edu, presenter
Rachel Weber [University of Illinois Chicago] rachelw@uic.edu

Champions of the property tax endorse its reliability in funding local governments, its effectiveness for redistribution, and its capacity to balance the adverse aspects of other taxes (e.g., Youngman 2016). Local governments attempt to govern and achieve a diverse range of public goals through the property tax system. The many advantages of the tax aside, no one likes paying their property tax bill; its visibility and volatility make the property tax among the most unpopular taxes. Therefore, local governments adopt measures to relieve some property owners of part or all of the burden of paying their property tax.

Municipalities regularly offer exemptions to homeowners, often targeted to those for whom the tax is especially onerous or who they believe deserve special treatment (e.g., seniors, homeowners with disabilities, veterans) (Ihlanfeldt and Rodgers 2022). Homestead exemptions reduce the assessed value of property by a fixed amount, percent, or amount of growth above a set base. Municipalities also commonly provide property tax relief to owners of commercial and industrial properties to attract or retain their ventures or to support the redevelopment of distressed areas. Such economic development incentives reduce the assessment ratio or tax rate, or return some property tax revenues to select taxpayers in the form of development assistance (as with Tax Increment Financing). Despite the potential to accomplish public objectives, providing property tax relief to certain property owners incurs opportunity costs for local governments, and may increase the tax burdens on taxpayers, both those who do and do not receive tax relief. Moreover, exemptions and incentives can reallocate the property tax burden among different land uses, with homestead exemptions pushing the tax burden onto business property owners and economic development incentives shoving that burden back onto homeowners. This raises practical questions about how different property tax relief efforts interact and the best ways for local governments to structure tax relief to achieve particular goals.

We examine the incidence and consequences of homestead exemptions and incentives, the two primary forms of property relief offered by municipalities in Cook County, Illinois. Using information obtained from the county assessor's office, we measure the extent and spatial distribution of property tax relief. We construct simulation models that permit us to compare various empirical and hypothetical scenarios, including the current situation and a baseline scenario that eliminates both types of property tax relief. Applying these data and models, we assess the interactions between exemptions and incentives within jurisdictions, with a special focus on distinguishing their separate and combined (net) effects on property tax burdens. We draw implications regarding the effective distribution of the property tax and the implications for achieving property tax relief and other municipal financial goals.

Our research derives from a project assessing the system of property taxation in Cook County, Illinois (e.g., Drucker et al. 2023). The key purpose is to investigate how the system components interact to complicate the tax burdens and outcomes for taxpayers and local governments. Cook County is a fitting location for studying property tax issues: the second most populous U.S. county includes the City of Chicago and more than 130 smaller municipalities with a diverse mix of property tax and land use profiles. We extend the literature in public administration and economic development investigating the strategic use and implications of property taxation, including recent studies of Cook County (Drucker et al. 2020; Funderburg et al. 2021).

MUNICIPAL ORIENTATIONS TOWARD WAREHOUSE DEVELOPMENT AND SUBSIDIES

Abstract ID: 1108.0.0.990.2024
Pre-Organized Paper Presentation

Lauren Nolan [Rutgers University] lauren.e.nolan@rutgers.edu, presenter

This paper examines municipal orientations toward large-scale warehousing and distribution facilities and the use of economic development subsidies for their construction. The past decade has been marked by a boom in large-scale warehousing and distribution facility construction, driven by growth in e-commerce, changing technology, and logistics consolidation (Giuliano et al. 2013), accelerated by the COVID-19 pandemic. Much of the existing research on the warehousing boom has focused on the negative environmental impacts and infrastructure challenges these facilities present. Accordingly, many municipalities have sought to limit construction of these facilities within their bounds, going so far as to institute construction moratoriums. Paradoxically, other municipalities in the same regions have used tax abatements and other economic development programs to attract these facilities (Lippert & Moore 2020). This paper dissects this paradox to ask: what factors drive divergent municipal responses to warehouse development?

Evidence of spatial clustering of tax abatements suggests local governments use such incentives strategically, warranting further investigation to discern possible motivations and intentionality (Funderburg, et al. 2021). This paper examines these motivations in the industrial warehousing context, drawing from interviews of municipal actors, triangulated with longitudinal data on warehousing square footage growth and other sources for the Chicago region. Findings suggest that historic patterns of disinvestment, political pressure to demonstrate job creation, and municipal fiscal stress in light of a taxation structure heavily reliant on property tax revenue drives appetites for warehouse subsidies. Indeed, since the start of the COVID-19 pandemic, municipalities with high effective tax rates added three times the amount of warehousing square footage per square mile on average than their lower rate counterparts. Consistent with previous research (Weber & O'Neill-Kohl 2013), municipal orientation toward incentives is mediated by consultants and other outside actors, particularly in cases of small municipalities with limited planning capacity.

This work furthers our understanding of the changing geography of goods movement and how local governments are approaching economic development subsidies in the post-pandemic era. Yet, it also prompts equity concerns. Warehousing and the "diesel death zones" that result from concentrating freight activity disproportionately impact low-income and minoritized communities (Yuan, 2021), raising important questions about who benefits, who bears the costs, and who gets to make these planning decisions.

FISCAL POLITICS IN CALIFORNIA: CITY COMPETITION FOR SALES TAX REVENUE

Abstract ID: 1108.0.0.265.2024

Pre-Organized Paper Presentation

Laura Schmahmann [University of California, Berkeley] laura.schmahmann@berkeley.edu, presenter

The rise of e-commerce has not only shifted where consumers buy goods, but it has also reshaped the competition for sales tax revenue in California. Following the introduction of Proposition 13 in California in 1978, which capped property tax rates, sales tax became an important discretionary source of local revenue for cities, facilitating the "fiscalization of land use" (Misczynski, 1986; Wassmer, 2002). The fiscalization of land use occurred as part of a broader shift in local government away from urban managerialism and towards urban entrepreneurialism (Harvey, 1989), promoting city competition for jobs and investment. In California, a 1% local sales tax is allocated to the local jurisdiction in which the sale occurs and has provided incentives for cities to zone land for retail uses. For online sales, the point-of-sale location has become a site of political contestation. In 2019, new regulations were introduced in California requiring out-of-state online retailers, such as Amazon, to pay sales tax to a local jurisdiction based on the location of the fulfillment center. Sales tax income for cities with a concentration of e-commerce distribution warehouses has increased substantially since these changes were implemented. For example, sales tax revenue per capita in the City of San Bernardino has doubled from $211 per capita in 2020, to $485 per capita in 2022. However, retail companies have the discretion to designate where the order was fulfilled. As a result, some cities have also been utilizing sales tax abatements agreements to provide incentives to attract distribution warehouses to their city or retain companies that threaten to leave, promoting a race to the bottom (LeRoy, 2005; Schragger, 2016).

In this paper, I explore how e-commerce has created a new fiscal-jurisdictional politics in California. Competition for sales tax revenue is no longer confined to local retail catchments and is now occurring on a regional scale. There is an emerging tension between cities that benefit from these new sales tax regulations and those that feel disadvantaged by it, raising important questions around inter- and intra-regional inequality. These tensions have been exacerbated by the impact of the COVID-19 pandemic on bricks-and-mortar retail expenditure in urban downtowns. Politicians representing large metropolitan cities such as San Francisco and Los Angeles are pushing for new sales tax regulations (SB 1494) which would prohibit sales tax abatement agreements, while others, such as Ontario and Fresno, see it as vital to their economy.

Through analysis of city revenue data, I compare trends in sales and property tax revenue between 2003 and 2022. I find that the "redistribution" of sales tax revenue associated with e-commerce has had a significant positive impact on the fiscal position of e-commerce cities. For the urban cities (such as San Francisco and Los Angeles), property tax is the primary source of tax revenue and thus shifts in sales tax revenue have had a negligible impact on their tax revenues, despite the vocal nature of these cities in policy arenas. Through a review of media articles and policy documents, and semi-structured interviews, I identify the narratives which are utilized to support the policy positions of cities and politicians advocating for and against sales tax abatements, and the potential policy implications for local economic development. This study makes a valuable contribution to broader debates regarding which cities have the economic and political power to influence state policy, particularly in the face of fiscal austerity.

EXTENDING ARPA: POLICY FEEDBACK IN BASIC INCOME TRIALS

Abstract ID: 1108.0.0.183.2024
Pre-Organized Paper Presentation

Marc Doussard [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu, presenter

The American Rescue Plan Act provided U.S. localities with more than $300 billion in unrestricted aid and instructions to experiment with novel policies and programs (Rocco and Kass 2022; U.S. Senate Democrats 2021). With reporting requirements that ran to just a few sentences, cities and counties obliged by undertaking experimental programs that ran from buying out residents' medical debt to, most prominently, financing dozens of basic income trials (Doussard 2023). ARPA-funded trials of regular, no-strings-attached cash payments to citizens join hundreds of equivalent trials worldwide, all of which face the same question: How can short-term experiments be converted into standing policy change (Kelly and Rocco 2019)?

This paper examines the potential for basic income trials to yield permanent policy change through the process of policy feedback. Typically applied to questions of national policy change, policy feedback frameworks reverse the common supposition that politics yields policies, asking instead how policies change politics (Mettler and SoRelle 2018; Moynihan and Soss 2014; Pierson 1993). Drawing on more than 100 completed and coded interviews with the basic income program administrators, elected officials, policy entrepreneurs and participating not-for-profit organizations, I identify four key policy feedback mechanisms that convert basic income trials into political change. First, bureaucratic policy entrepreneurs respond to basic income trials by adding cash stipends to other programs. Second, basic income trials create professional communities of interest, including think tanks, evaluation teams, vendors supplying cash-transfer infrastructure and a rapidly growing ecology of basic income advocacy organizations. Third, the high visibility of basic income trials in local media, where they stand out vis a vis other initiatives, creates openings to renew, revise and expand the policy. Fourth, receiving no-strings-attached cash payments enhances low-income citizens' capacity to participate in the political process.

These findings reveal distinctive features of both basic income programs, and the mechanics of experimental urban policy. Where the nascent and limited literature on experimental policies focuses on large-scale federal programs, these results reveal distinctive mechanisms of and stimuli to policy development and extension when cities undertake experiments. This in turn suggests that ARPA's influence on the policies, people and issues involved in urban politics will outlast the policy's pending expiration date.

"HOUSING IS WHERE JOBS SLEEP": HOUSING AS AN ECONOMIC DEVELOPMENT TOOL

Abstract ID: 1108.0.0.1010.2024
Pre-Organized Paper Presentation

Haegi Kwon [Lincoln Institute of Land Policy] hkwon@lincolninst.edu, presenter

Recent debates that focus on both housing and economic development have typically explored how land-use policies (i.e., zoning) may facilitate or detract from a city’s ability to grow its housing stock, its labor force, and its economy. For instance, some suggest that large cities should continue to relax land-use regulations to boost housing production which would, in turn, facilitate the in-migration of workers (Hsieh and Moretti 2019). Further, once such barriers are mitigated, innovators could, in theory, move to cities with bigger high-tech clusters which are associated with more robust agglomeration economies to become more productive, contributing to aggregate economic growth in the US (Moretti 2021). However, the story may not be so simple. Stacy et al. (2023) find that loosening land-use restrictions increases the supply of rental housing in many US cities but does not necessarily help to lower rents to address the housing needs of lower-income individuals and families. Ultimately, Rodríguez-Pose and Storper (2020) suggest that such blunt, one-sized-fits-all approaches to improving the housing stock in many cities may exacerbate inequalities, running counter to many economic developers’ goals. But there is little in the academic literature that demonstrates what other alternatives exist. This presentation helps to fill this gap.

I present findings, primarily from two small and midsized cities (i.e., populations less than 500,000), demonstrating how economic development professionals try to navigate these concerns as they use housing as a means to achieve their city’s economic development goals. These findings are a part of a larger qualitative study featuring over 50 semi-structured interviews with economic development professionals representing over 20 small and midsized cities in the US.

I offer three preliminary findings: First, economic development professionals in these cities sought to increase housing production in tandem with redeveloping their downtowns to create “live-work-play” environments that would attract college-educated workers with “creative class” preferences. At the same time, interviewees tried to balance these goals by emphasizing the need to preserve and produce more affordable housing. However, much of

their focus was on the development of “workforce” housing (e.g., 60% to 120% AMI) instead of more deeply subsidized units (e.g., 30% AMI). Economic developers’ preference for workforce housing stemmed from their desire to fill labor needs in specific industries (e.g., health care), aspirations for their cities (and especially their downtowns) to be economically and socially diverse, and hopes to be more competitive with other locales by boosting the city’s inventory of “starter homes.” Finally, practitioners expressed varying levels of concern about the residential displacement of lower-income residents and displayed varying levels of commitment to its prevention despite significant infrastructure investments which may facilitate gentrification and residential displacement.

Ultimately, these findings provide more nuanced understandings of how economic development professionals in some small and midsized cities are treating housing as a tool to achieve fiscal health and broader economic development goals. Further, this study points to how the preferences of economic development professionals are shaping the development and availability (or lack thereof) of certain opportunity structures in communities, cities, and regions.

Track 3 Roundtables

ECONOMIC DEVELOPMENT 30 YEARS AFTER REGIONAL ADVANTAGE

Abstract ID: 1109.0.0.30.2024

Roundtable Submission

Xiaohong Quan [San Jose State University] xiaohong.quan@sjsu.edu, organizer
AnnaLee Saxenian [anno@berkeley.edu] University of California, Berkeley
Matt Zook [zook@uky.edu] University of Kentucky
Peter Hall [peter_hall@sfu.ca] Simon Fraser University

Yas Motoyama [motoyama.1@osu.edu] Ohio State University

It has been 30 years since the publication of AnnaLee Saxenian's seminal work, Regional Advantage (1994), which documented Silicon Valley's model of continuous innovation and contrasted it with the corporate sclerosis of Boston's Route 128. How has the field of economic development evolved since then? Which questions have we answered, which remain unanswered? Some larger debates in the past include, though not exclusive, clusters and industrial studies, regional innovation (including innovation districts), entrepreneurship ecosystems (including maker space), and the creative class, as well as the importance of certain forms of global connection (Bathelt, Malmberg & Maskell, 2004). While the economic development field has always been interdisciplinary, the last 30 years opened up larger frontiers with disciplines including geography, economics, business, political science, and sociology.

Silicon Valley itself, the icon of an economically successful region, has transformed in the past three decades as well. While it was the epicenter of many successful startup and scaleup companies in collaboration with existing industrial players, the Valley may increasingly be crowded out by monoliths exerting market dominance. Antitrust cases are emerging and concluding (Berk and Saxenian 2023), while unicorns are chased. Despite many national and regional governments attempt to emulate the Silicon Valley model, arguably none have succeeded (Storper, 1997). Then, what is the implication of the field if our extracted theories have no place to be implemented? Is it the policy implementation problem, the weakness of our theories, or the limits of intentional action?

In our roundtable, we try to focus on the 'big' debates and directions of the field. We strategically recruit panelists who are insiders yet semi-outsiders of the economic development field: AnnaLee Saxenian became the dean of School of Information. Matt Zook and Peter V. Hall are geographers. Iris Quan is at a business school. The session will be facilitated by Yas Motoyama who has gone to the non-academic sector, but returned as a planning professor.

Panelists:

AnnaLee Saxenian:	Professor. School of Information. University of California, Berkeley.
Peter Hall:	Professor and Vice-Provost. Simon Fraser University.
Xiaohong (Iris) Quan :	Professor. School of Business. San Jose State University.
Matt Zook:	Professor. Geography. University of Kentucky.
Yas Motoyama:	Associate Professor. City and Regional Planning. Ohio State University.

POLITICS OF ECONOMIC DEVELOPMENT: GOALS, GOVERNMENT, GOVERNANCE, GRIEVANCES

Abstract ID: 1109.0.0.360.2024

Roundtable Submission

James Defilippis [Rutgers University] jdefilip@rutgers.edu, organizer
Marc Doussard [University of Illinois at Urbana-Champaign] mdouss1@illinois.edu
Miriam Solis [The University of Texas at Austin] solis@austin.utexas.edu
Laura Schmahmann [University of California, Berkeley] laura.schmahmann@berkeley.edu

Economic development planning scholarship has typically focused on the importance of equity, reflected in the rise of "inclusive" economic development. Economic development planning is inextricably tied to politics, and achieving these equity goals thus requires an engagement with the politics of economic development. We propose a framework for unpacking the political economy of economic development: goals, government, governance and grievance politics. Acknowledging that economic development goals carry embedded values and political preferences, draws attention to the likelihood of economic development programs being captured by interest groups. The category of government includes the actual and imagined motivations of political actors and how they shape the behavior of participants. Additionally, governance covers the capacity of institutions and power dynamics. Existing research highlights that metropolitan institutions lack the capacity or authority to develop and implement policies which address equity (Lester & Reckhow, 2013), and large firms have more power and resources to influence decisions, particularly compared to small firms (Christopherson & Clark, 2007). Finally, grievance politics encapsulates the role of economic development as a political platform (for example, the revenge of the places that do not matter – see Rodríguez-Pose, 2018). This topical discussion panel brings together planning scholars who study the political economy of economic development to highlight the importance of unpacking these dimensions of politics.

Building from their own fieldwork, each panelist will address the following questions:

- What are the core goals of economic development in the regions/ places you have studied?
- What were the actual and imagined motivations of key political actors?
- Who has the capacity and power to shape economic development decisions?
- How did working in networks aid or impede the attainment of economic development goals?
- Whose voices were excluded from economic development?
- How have economic development issues been mobilized as political platforms?

Each panelist will briefly address these questions, based on their current research. The moderator will then incorporate audience members into the discussion by asking them to share experience from their own research or practice and provide examples of the role of politics in economic development.

PRACTICE AND RESEARCH TO EMPOWER COMMUNITIES FOR EQUITABLE ECONOMIC GROWTH

Abstract ID: 1109.0.0.681.2024
Roundtable Submission

Sua Kim [University of Califorina, Riverside] sua.kim@ucr.edu, organizer
Qingfang Wang [UC Riverside] qingfang@ucr.edu
Margaret Cowell [Virginia Tech] mmcowell@vt.edu
Edna Ely-Ledesma [University of Wisconsin-Madison] eledesma@wisc.edu
Michael Verchot [the University of Washington's Consulting and Business Development Centerent Center] mverchot@uw.edu
Lyneir Richardson [The Center for Urban Entrepreneurship & Economic Development, Rutgers University] lrichardson@business.rutgers.edu
Mark Little [NCGrowth at the University of North Carolina at Chapel Hill] mark_little@unc.edu
Wil Tutol [University of Washington, Foster school of business] wtutol@u.washington.edu

The proposed panel discussion seeks to explore the intersection of entrepreneurship-led economic development and equitable community wealth creation in marginalized and underserved communities. Drawing on the expertise of practitioners from multiple economic development centers and researchers in the field, this panel aims to uncover innovative practices, research findings, and policy implications that contribute to inclusive community wealth creation through entrepreneurship. By examining various models and approaches that support entrepreneurship-led economic development in communities often overlooked by traditional economic development strategies, the discussion will highlight successful frameworks and identify key challenges and opportunities for fostering an economy that provides opportunities for all to prosper. Attendees will gain a comprehensive understanding of the synergies between academic research and practical initiatives, and how these collaborations can drive significant contributions towards equitable and sustainable economic growth in different types of urban settings.

Questions for Discussion
1.Highlight their roles and/or research areas related to economic development in marginalized or underserved communities (self-presentation)
2.Reflecting on the experiences and research shared by the panelists, what are the most significant barriers to equitable economic growth and inclusive community wealth creation that still need to be addressed?
3.Considering the varied approaches to entrepreneurship and economic development in marginalized communities, what are the key factors in ensuring these initiatives not only start but thrive over the long term? How do factors like local policies, community engagement, and access to resources play into the sustainability of these ventures?
4.How can partnerships between universities, private sectors, and communities work together to overcome these challenges?

Track 3 Individual Paper Presentations

BARRIERS TO COLLABORATIVE ROBOT ADOPTION AMONG SMMS IN THE U.S.

Abstract ID: 1108.0.0.773.2024
Individual Paper Presentation

Nancey Leigh [Georgia Institute of Technology] ngleigh@design.gatech.edu, presenter
Chaneum Park [Georgia Institute of Technology] cpark390@gatech.edu
Heonyeong Lee [School of City and Regional Planning, College of Design, Georgia Institute of Technology] leehy@gatech.edu

In the rapidly evolving domain of robotics, collaborative robots—popularly known as 'cobots'—emerge as a revolutionary breakthrough. Tailored to work alongside humans within shared workspaces, cobots offer considerable promise for adoption across a broad spectrum of industries that could increase firms' success and competitiveness. In particular, Small and Medium-sized Manufacturers (SMMs), given their focus on small-batch and short-term production, stand poised to benefit from cobot deployment. Despite existing research corroborating the advantages of cobots in enhancing productivity, augmenting quality control, and improving workplace conditions, their uptake in the United States has been slow to reach its full potential. In this study the authors identify eleven primary barriers to cobot adoption within SMMs and then elucidate the complex interplay among these barriers.

The eleven barrier categories are categorized into six groups: technology, knowledge, skilled workforce, perception, cost and profitability, and external relationships. A panel of experts were recruited to explore these barriers through a three-round Delphi survey. The panel included executive or senior representatives from 25 SMMs located in Georgia, North Carolina, and Washington State. The authors also employed Interpretive Structural Modeling (ISM) and Matrice d'Impacts Croisés Multiplication Appliquée à un Classement (MICMAC) analytical techniques to explore the interdependencies among these barriers.

This study provides important implications for a regional robotics and economic development policy approach. In particular, a comprehensive strategy is vital for fostering a conducive environment for successful cobot integration. The strategy should extend beyond intra-firm dynamics to encompass the cultivation of a robust regional robotics

ecosystem. Key to such an approach would be promoting robust public-private partnerships like those exemplified by the Manufacturing Extension Partnership (MEP), which plays an essential role in bridging the gap between technology providers and SMMs.

BEYOND CHARITY: FOUNDATION GRANTMAKING FOR URBAN ECONOMIC DEVELOPMENT

Abstract ID: 1108.0.0.691.2024
Individual Paper Presentation

Jeeson Oh [University of Louisville] jeeson.oh@louisville.edu, presenter
Thomson, D. E. 2019. “Donor-driven democracy? Governance implications of foundation-dependent revitalization.” Journal of Urban Affairs Journal of Urban Affairs, 41(4), 551–569. [Yujin Park] Mallach, A., & Brachman, L. 2013. Regenerating America’s legacy cities. Lincoln institute of land policy.
Chung-Ang University []

This research longitudinally investigates large foundations’ grantmaking for Urban Economic Development (UEcD) in the United States. It aims to uncover the types of development funded by prominent U.S. foundations and identify factors that affect foundation decision-making with regard to UEcD grantmaking. A number of high-profile foundations in the United States have long provided financial and technical assistance to various community institutions and intermediaries focused on neighborhood-level development. Over the past two decades, however, a growing body of major foundations have shifted away from merely providing resources toward more directly addressing city- or regional-scale economic challenges (Giloth 2018; Thomson 2019). These foundations have redirected their grants and investments away from charitable giving to support and even create new and different strategies for UEcD.

Planning scholars have noted this shift and suggested the emerging role of foundations in UEcD, particularly as economic development assets (Mallach and Brachman 2013). While these studies draw scholarly attention to foundations and their operations in American cities, they lack a systematic analysis of foundation grantmaking from the perspective of foundations as organizations driven by organizational interests and constrained by institutional structures (Graddy & Morgan, 2006). As a result, planning scholars’ understanding of the specific development

initiatives funded by leading foundations, the changes in their grantmaking for UEcD over the years, and the factors driving these changes is still limited.

In this paper, I seek to address this gap in planning scholarship by conducting an in-depth analysis of foundation grantmaking for UEcD. Integrating trend and time series analyses of grants data, document analysis, and semi-structured interviews, this research answers the following questions: (1) What types of development have large foundations focused their grant and investment dollars on? (2) What factors influence foundation grantmaking in the context of Urban Economic Development (UEcD)? I focus on the top 100 foundations ranked by grant and investment amount allocated for UEcD as of 2020. For the purpose of this paper, UEcD grantmaking encompasses grants and investments in five key development areas—economic (business recruitment, retention, expansion, and entrepreneurship), workforce, community, housing, and real estate developments (Hill 2023). I analyze individual UEcD grants and investments awarded by these foundations in 2005, 2010, 2015, and 2020, paying particular attention to the direction and extent of grantmaking shifts for these five key development activities over the study period. The subsequent time series analysis uncovers factors associated with a specific type of development. Documents and interview analysis sheds further light on the findings from the grants data analysis, enabling a more nuanced understanding of foundation grantmaking for UEcD.

Longitudinal analysis of grants data shows a decline in grantmaking for housing development across the 100 foundations between 2005 and 2020. Conversely, grant and investment allocation toward more comprehensive community development, encompassing (creative) placemaking, community organizing, youth development, and advocacy has been on a steady rise. Only a handful of foundations, most of which have assets exceeding $1 billion, allocated their grant and investment funds toward workforce and economic development. Foundations with missions closely tied to specific geographic areas are more likely to fund real estate development compared to those operating nationally and internationally. Furthermore, the expertise and interests of foundation CEOs play an important role in determining grantmaking priorities among different areas of development. This research contributes to planning scholarship and practice by enabling theoretically informed and contextualized understanding of foundation interests and constraints in grantmaking for Urban Economic Development.

BUILDING BRIDGES BETWEEN BLACK BUSINESSES AND ANCHOR INSTITUTIONS

Abstract ID: 1108.0.0.589.2024
Individual Paper Presentation

Jakob Kendall Schneider [The Graducate Center, City University of New York] jschneider1@gradcenter.cuny.edu, presenter
Laura Wolf-Powers [Hunter College, City University of New York] aw2416@hunter.cuny.edu
Sigmund Shipp [Hunter College, City University of New York] sship@hunter.cuny.edu

Anchor institutions, including hospitals and healthcare centers, have the potential to promote economic development in their host communities through diversifying their supply chains to include local, often smaller, minority-owned businesses. Yet, this potential to promote economic development is beset by a number of practical challenges that can hinder efforts to increase local purchasing. Among these challenges, local businesses are often unaware of contracting opportunities with healthcare institutions, healthcare procurement officers have a hard time finding qualified local vendors, and healthcare procurement processes are often complex and difficult to navigate for businesses. Thus, successful efforts to promote economic development through anchor institution procurement must address these fundamental challenges. In this paper, we explore one effort to promote local supplier diversity in Brooklyn, New York: Brooklyn Communities Collaborative's (BCC) Health Enterprise Local MWBE Accelerator Program which aims to demystify the procurement process for local businesses, provide business development support, and foster relationships between local businesses and healthcare procurement officers. The Accelerator Program is the third phase of a three-year Participatory Action Research (PAR) project undertaken by researchers at Hunter College, City University of New York and BCC. The program is informed by our earlier research with Black entrepreneurs and the subsequent formation of the Brooklyn Health Enterprise Advisory Council, composed of business development intermediaries serving businesses in East and Central Brooklyn.

This paper assesses the design and implementation of the Accelerator Program in order to identify areas of success and those in need of improvement for future iterations of the Program, and to assess its viability as a strategy to foster minority procurement with healthcare anchors. As a collaborative, action-oriented research project, the authors have been involved in the development of the Accelerator. As such, we will draw on participant observation along with interviewing and short periodic surveys of program participants to determine the degree to which the business owners feel the Accelerator is preparing them to contract with healthcare anchor institutions in Brooklyn. In addition, we will engage with anchor institution staff to understand the degree to which the Accelerator Program has prepared businesses to work with them.

We expect that the Accelerator will be an effective strategy for building relationships between businesses and anchor institutions and will provide businesses with the support necessary to navigate healthcare procurement. The lessons learned from this research will be of use to economic development planners and others working to build bridges between anchor institutions and local, minority-owned businesses by offering an inside look into program design and implementation — areas of critical importance to the development of successful supplier diversity programs.

CAN INDUSTRIAL REDEVELOPMENT BENEFIT DISTRESSED CENTRAL-CITY NEIGHBORHOODS?

Abstract ID: 1108.0.0.1072.2024
Individual Paper Presentation

Andrew Guinn [Wayne State University] ha3487@wayne.edu, presenter

Under what conditions can urban planning and economic development policies and planning mitigate the social and economic impacts of deindustrialization on working-class communities? Since the 1970s, industrial communities across North American have suffered the impacts of industrialization (Bluestone and Harrison 1982). In subsequent decades, research has turned from documenting processes of urban restructuring to assessing its relationship with broader metropolitan social and demographic trends, including shrinkage, as well as the ways that local and regional economies have adapted to restructuring (Wolman et al 2013, Audirac 2018, Ganning and Tighe 2021).

In this paper, we join the discussion about how places can mitigate and adapt to the pressures of deindustrialization. Through a comparative study of Detroit, Michigan and Windsor, we argue that national, regional, and local action can mitigate or exacerbate deindustrialization and its negative effects on the social and built environments. Detroit-Windsor is a transnational metropolitan area situated along the north and south banks of the Detroit River. It is a region whose economic development has been dependent upon the automotive industry for more than a century; both core cities are recognized as the “birthplace of the auto industry” in their respective countries. Since the 1950s, the threat and reality of deindustrialization, in terms of both a relative and absolute decline in manufacturing employment, has devastated metropolitan communities on both sides of the international border. Yet Detroit’s actual experience of deindustrialization has been both longer in duration and more severe. Detroit’s manufacturing employment has declined by 92% since the city reached its peak manufacturing employment in the late 1940s. In Windsor, meanwhile, manufacturing employment peaked in 2000 and has since declined by 25%. Whereas neighborhoods in Detroit that surround current and former automotive

facilities exhibit extreme population loss, in Windsor such places remain in-tact. What explains these differences? How have urban planning and economic development policies and practices mediated community responses to deindustrialization in different ways?

This paper explains these divergences in local performance and draws lessons about public responses to deindustrialization in North American communities at both the regional and the neighborhood scales. It utilizes a nested, comparative case study of automotive manufacturing districts in Detroit and Windsor, drawing on news archives, interviews, gray literature, academic reports, and public databases. We examine performance at the regional and local (municipal) levels as well as at the level of specific industrial districts. At the district-level, we focus on the Conner Corridor on Detroit's east side, which has retained a Chrysler/Stellantis assembly context yet exhibits extreme housing loss, and Ford City in Windsor, which has retained a Ford engine manufacturing complex and continues to support an in-tact, though high-poverty, neighborhood, the Douillard Road community. Our case narrative emphasizes economic and community development initiatives since the 1990s, placing these within longer-term legacies of industrial and urban restructuring.

We find that industrial retention efforts, when pursued, effectively retained investments in each geography. Yet the impacts on adjacent residential communities is starkly different, and these were mediated by different approaches to managing community benefits arrangement (Wolf-Powers 2010). In Detroit, planning efforts have exacerbated housing loss through aggressive land assembly actions and environmental regulatory failures. In Windsor, economic retention policies have emphasized cash transfers rather than complex "deals," and a combination of community organizing and planning programs have mediated the impacts of reinvestment. We further argue that racial stigma, which existed on both sides of the border but was more relevant in Detroit, contributes to divergences in both interventions and outcomes.

CASE STUDIES OF REMOTE WORKER ATTRACTION PROGRAMS IN THE UNITED STATES

Abstract ID: 1108.0.0.1092.2024

Individual Paper Presentation

Katelynn Conedera [University of Michigan] conedera@umich.edu, presenter

Since the first program was announced in 2018, over 70 towns, cities, regions, and even states have implemented their own remote worker attraction (RWA) programs offering relocation incentives to workers with full time remote jobs. Though the incentives vary from welcome baskets of local goods to $10,000 cash, the common goal shared across RWA programs is to attract new residents by leveraging monetary incentives, place marketing, and the increased mobility that comes with jobs detached from a firm's physical location. These programs, however, are increasingly used as a solution to a wide range of migration-related issues from brain drain in small towns to labor shortages in major metropolitan areas. Without empirical testing, it is still unclear whether these programs work and where they may be most effective. Regardless, they are most commonly used to combat the negative effects of regional economic divergence in low-growth regions.

In this paper I explore RWA programs as an emerging economic development policy phenomenon, asking the question: how and to what extent do RWA program administrators individualize their policies to maximize their effectiveness in different types of places? I answer this question through case study research I conducted in the state of Indiana, whose economic development corporation has provided matching funds to any municipality or economic development corporation seeking to develop their own RWA program since 2022. I use content analysis of public documents, such as meeting minutes and budget proposals, alongside key informant interviews with program administrators and others involved in the development of these programs. Because of the state-level matching, Indiana vastly outpaces any other state in raw number of programs, with 27 programs active at some point between 2018 - 2024. The programs vary from small, relatively inexpensive programs to large regional efforts and include both active and inactive programs. This variation allows me to explore a wider variety of programs while maintaining a cohesive geography and policy climate to allow for comparability.

This research demonstrates how both effective and ineffective RWA programs are developed. I found that common reasons for discontinuation often stem from unintended challenges and consequences, such as disagreements over funding continuation across multiple stakeholders to new or worsening housing shortages. I also found that the administrators reporting success based on their own internal metrics are more likely to have integrated the RWA program with other concurrent economic development strategies. This paper does not determine the impact or effectiveness of RWA policies, but instead examines RWA programs as a policy phenomenon in economic development. There is little research published on them as of yet, and through this paper I seek to further the conversation on an interesting emerging topic.

CITY OR REGIONAL PROBLEM? SHIFTING SCALE IN INDUSTRIAL LAND PRESERVATION

Abstract ID: 1108.0.0.279.2024
Individual Paper Presentation

Karen Chapple [University of Toronto] karen.chapple@utoronto.ca, presenter
Laura Schmahmann [University of California, Berkeley] laura.schmahmann@berkeley.edu

In recent decades, as housing prices in global cities have rapidly increased, residential developers have begun competing for the last sites left in the urban core – industrial land. Developers consider urban industrial sites "low-hanging fruit" because of the low value of their built improvements and dearth of neighborhood resistance to residential conversion. Given low industrial rent revenues, many industrial landowners are eager to sell at a premium.

Yet, this industrial land plays a vital role in local and regional economies by providing middle-wage jobs, accommodating back-office activities and city services, and supporting startups with low-cost space, among other functions (Chapple, 2014; Howland, 2010). Low vacancy rates and steady employment levels attest to the continued viability of these sites. Although cities have generally been slow to understand the importance of industrial land (Leigh & Hoelzel, 2012), some have used economic development policies, zoning, and even narratives to protect and promote industrial land (Davis & Renski, 2020; Grodach, 2022).

In this paper, we argue that industrial land preservation is overdue for a regional turn. Using the case of three global city-regions – the San Francisco Bay Area, Greater Sydney, and the Greater Toronto-Hamilton Area – we show how preservation debates are shifting to the regional scale, with mixed results depending on the institutional context. Based on economic and cell phone data, we document the regional importance of production, distribution, and repair industries. Fifteen key informant interviews across the three regions shed light on the development of regional policies in each case: Priority Production Areas in the Bay Area, the Greater Sydney Region Plan's "Retain and Manage" policy framework for industrial lands, and Ontario's A Place to Grow policies for employment lands. Regression results from the Bay Area case suggest that industrial preservation zone designation is associated with employment and firm growth.

Our preliminary results suggest that designing and implementing industrial land preservation policies at the regional scale can succeed with the right mix of carrots and sticks. Most importantly, the regional shift helps circumvent local political pressure to convert industrial land to residential use, in part by demonstrating the value of local industrial land to regional competitiveness, but also by helping municipalities access infrastructure funding and other economic development resources.

COMMERCIAL GENTRIFICATION-LED COMMUNITY DISPARITIES: IN THE CASE OF YEONNAM

Abstract ID: 1108.0.0.1230.2024
Individual Paper Presentation

Namji Jung [Seoul National University] pinkclouds00@snu.ac.kr, presenter

Despite the recent surge in research on commercial gentrification, its impact on local residents has been largely overlooked by scholars and policymakers. Most studies tend to focus on the drivers, processes, and economic outcomes of commercial gentrification.

A few studies exploring the effects of commercial gentrification on local residents present divergent findings. One study, centered on a low-income neighborhood, suggests that the transformation of the commercial landscape brings much-needed retail diversity, including drug stores and supermarkets, and is generally welcomed by local residents as long as displacement is mitigated (Freeman, 2006). Conversely, a case study conducted in a high-income neighborhood reveals that the process often diminishes overall quality of life for local residents due to increased noise, air pollution, and traffic congestion (Forouhar et al., 2022). While these insights are valuable, they predominantly focus on long-time residents, neglecting the experiences of newcomers and how the rapidly evolving commercial environment impacts them.

To address this gap, this study undertakes a comprehensive analysis of the multifaceted changes associated with commercial gentrification, including shifts in land use, alterations in business composition, changes in employment opportunities, and demographic transformations. This approach enables us to untangle the intricate and dynamic effects brought about by commercial gentrification. This investigation is situated in Yeonnam-dong, Seoul, South Korea, a small residential neighborhood characterized by compact parcels and narrow alleyways. Until 2010, Yeonnam-dong remained relatively underdeveloped due to its isolation by railways and major roads. The retail landscape primarily catered to essential local services such as laundromats, barbershops, and traditional Korean eateries. Compared to the Seoul average, Yeonnam-dong exhibited a higher proportion of vulnerable groups, including foreigners, individuals in their twenties, and single-person households.

In the absence of significant development momentum, efforts to revitalize the area were initiated through targeted public investments, such as the establishment of a transit station in 2011 and the creation of a park in 2015,

undertaken in collaboration with higher-level institutions. These investments enhanced accessibility to and amenities of he area, and spurred a rapid conversion of residential spaces into commercial establishments, particularly evident since 2015. The share of commercial usage surged from 20% to 50% between 2011 and 2018, with a predominant focus on food and beverage businesses, leading to the displacement of essential retail services for local residents, including laundromats and drug stores.

Commercial gentrification also precipitated a notable population decline of 2.5% between 2011 and 2022, exceeding the decrease observed in adjacent neighborhoods, which stood at 1.5%. Of particular concern is the threefold acceleration in the increase of economically challenged individuals in their twenties compared to neighboring areas between 2022 and 2024. This trend suggests that the proliferation of low-end service jobs in food and beverage establishments may have attracted young job seekers to the area.

These findings indicate that while business owners and visitors benefit from enhanced transportation and amenities, local residents often experience diminished job prospects and deteriorating living conditions. Furthermore, the adverse effects of commercial gentrification extend beyond mere displacement or environmental degradation, potentially exacerbating inequality within the neighborhood. Despite the superficial appearance of prosperity with the emergence of new businesses and an influx of affluent visitors, the underlying socioeconomic disparities persist, unnoticed to many.

These findings underscore the need for more systematic investigations into the impact of commercial gentrification on local residents to gain a comprehensive understanding of its consequences. Policymakers should pay more attention to changes occurring from the ground to enhance neighborhood sustainability and foster inclusive growth to address the complex challenges posed by commercial gentrification effectively.

DEMOGRAPHICS & DONUTS: PARSING TELEWORK'S INFLUENCE ON URBAN OUTMIGRATION

Abstract ID: 1108.0.0.1237.2024
Individual Paper Presentation

Marley Randazzo [University of Southern California] marleyra@usc.edu, presenter

"The digitalization of work has been a relevant planning topic for decades, producing tantalizing visions of a commuter-less future, enhanced worker autonomy, and the 'electronic cottage'. This utopian ideal never materialized, however, as remote work remained a marginal practice until Covid-19. The pandemic permanently dislodged the workplace and CBD as fixed points of orientation in daily life for millions of workers worldwide. Numerous scholars have noted a locational shift for workers and firms away from the densest urban neighborhoods and towards peripheral areas and smaller cities; most notably, Ramani and Bloom (2021) termed this pattern "the donut effect

DIVERSITY PERSPECTIVE ON THE HISTORY OF REMOTE WORK: A MIXED METHODS STUDY

Abstract ID: 1108.0.0.1059.2024
Individual Paper Presentation

Elizabeth Joun [University of Southern California] ejoun@usc.edu, presenter

The COVID-19 pandemic became an unexpected catalyst for the adoption of remote work and caused an explosion of interest in the rapidly changing nature of the workplace. Technological advances have enabled work and home locations to be geographically decoupled en masse for the first time in modern history and scholars note that the effect could be as big as the "next Industrial Revolution".

This study traces this revolution among different metropolitan areas from a diversity perspective. Although there is much ongoing research on the educational and racial disparities in the opportunities to remote-work, little research exists on the different experiences and preferences among remote workers. Generational framework, feminist planning theory, and reports of pandemic experiences suggest that an individual's identity profoundly impacts their remote work experience. Understanding these differences is increasingly important for advancing workplace equity, as well as understanding diverse workers' residential choices which affect the urban landscape (Delventhal, Kwon, and Parkhomenko 2020; Stiles 2019; Krasilnikova and Levin-Keitel 2022).

I focus on how workers' age, gender, and race impact their choice to work from home (WFH). The age and life stage of the worker affect whether they prioritize in-person networking with colleagues or the flexibility that telework gives them to devote more time to family (Twenge 2023; Kahn 2022). Feminist planning theorists argue that because cities have been designed by men, as well as gender norms and fear of sexual assault, women's freedom

and sense of safety when commuting tend to be more limited (Day 2011; Markovich and Hendler 2006; Parker 2016). This, in addition to the conventionally heavier childcare burden, may mean that women are more likely to choose WFH than men. Lastly, during COVID-19, racial minorities reported feeling relieved by the ability to work at home because they had more control in dealing with microaggressions (Robinson 2022; Onwuamaegbu 2021). Are older workers, women, and minorities more likely to choose WFH than younger workers, men, and whites? Do these choices shift as the option to WFH increases and the composition of WFH jobs shifts from agriculture and shops to knowledge work? I answer this using the U.S. census, ACS, and qualitative narratives.

In order to chronicle the evolution of who worked from home, I first use the decennial census data from 1960 to 2020 to examine the history of working from home in the U.S. and map how the demographics of WFH workers changed since the mid-20th century when current remote work technology had not yet been available. I supplement these findings with a narrative of the lives of WFH workers in the mid-20th century.

Then I show the shift in demographic characteristics and residential locations of WFH workers as technological advances introduce a new form of WFH and COVID-19 accelerates its adoption. Using ACS 1-year Public Use Microdata Sample from 2018 to 2022, I analyze the effect of COVID-19 on WFH takeup by diverse workers and supplement these with documented experiences from remote workers today.

Preliminary results show that controlling for education, women, minorities, and older workers are more likely to work from home, and that the uptake of remote work due to COVID-19 was concentrated on larger metropolitan areas. Further analysis and archival records will shed light on the reasons behind these patterns.

DO CO-PATENTING NETWORK STRUCTURES AFFECT REGIONAL ECONOMIC RESILIENCE?

Abstract ID: 1108.0.0.214.2024

Individual Paper Presentation

Yijia Wen [Florida State University] yw20bn@fsu.edu, presenter
Kerry Fang [Florida State University] lfang3@fsu.edu

In an age when knowledge is highly specialized, innovations are more likely to occur in collaboration across geographical boundaries (Breschi & Malerba, 1997). Inventors collaborate and exchange resources across regions, strengthening the regional adaptive capability to combat external disturbance (Bristow & Healy, 2014). Different structures of collaborating networks indicate different resilient capabilities. For example, a region collaborating with various regions receives more diverse external information and resources than regions only frequently collaborating with a single hub region. In contrast, strong connections facilitate frequent interactions and rich information flows, thus speeding up information exchange (Aral & Van Alstyne, 2011). However, whether structural characteristics of inter-regional collaboration networks affect regional economic resilience is understudied. We take on the task and aim to answer the following research questions:1) Do regions maintaining sparse connections with various regions have a better ability to develop new growth paths? 2) Do regions owning strong connections with hub regions have a better ability to recover in the pre-shock growth path?

The paper contributes to economic resilience literature from network theory's perspectives. A tension exists between recovering the old path (i.e., adaptation) and developing a new path (i.e., adaptability) (Boschma, 2015). Existing quantitative empirical studies examining the relationship between economic network structure and economic resilience don't consider the trade-off relationship between adaptation and adaptability (Kurth et al., 2020). Our paper fills the gap by examining the trade-off dimensions of economic resilience simultaneously, using the inter-CBSAs innovation-collaboration network as a contextual example.

Our data come from three main resources. We use patent inventor data from the U.S. Patent and Trademark Office to construct inter-CBSAs' co-patenting networks. Meanwhile, employment data from the U.S. Bureau of Labor Statistics are collected to calculate the measurement for regional economic resilience. Regarding external disturbance, we collect natural hazards from the Spatial Hazard Events and Losses Database for the U.S. The study time period is from 1990 to 2012.

We adopt social network analysis to create each CBSA's inter-CBSA collaborating ego network. The ego network maps all the connections associated with a single agent. Our study treats each CBSA as the "ego" to create a network. Nodes are CBSAs with inventors participating in co-patenting activities with the "ego" CBSA, and ties reflect the frequency of co-patenting that inventors from one CBSA collaborate with inventors from the "ego" CBSA. Degree centrality and density of each CBSA's ego network are calculated and used in the seemingly uncorrelated regression to examine the influence of network structure on adaptation and adaptability.

We have cleaned all the co-patenting networks, natural hazards, and employment data and calculated the network structure indicators. Next, we will use regression to quantify the influence of network structure. Results will verify whether regions with higher degree centrality are more capable of developing a new growth path, whereas regions with higher ego network density are more capable of recovering in a pre-shock growth path.

Practically, this study will guide policymakers to strategically cultivate inter-regional innovation-collaboration networks and improve regional economic resilience. For example, policymakers could establish online forums, utilize social media to share information, and reduce long-distance collaboration costs. Also, providing financial support for innovators and entrepreneurs from different regions to have face-to-face networking helps to create new collaborations.

EVALUATION INDICATORS FOR SUSTAINABLE PUBLIC-PRIVATE SMART CITY PARTNERSHIP

Abstract ID: 1108.0.0.466.2024
Individual Paper Presentation

Yoona Cho [Seoul National University] jenna0011@snu.ac.kr, presenter
Justin Lim [Seoul National University] justinlim@snu.ac.kr
Saehoon Kim [Seoul National University] skim5@snu.ac.kr
Jae Seung Lee [Seoul National University] js.lee@snu.ac.kr

This research examines the success and failure of public-private partnerships (PPPs) for smart city projects, such as the Sidewalk Toronto project in Canada and the Sejong 5-1 Living Area project in South Korea. The case study explores the multifaceted dynamics of PPPs in implementating smart city initiatives. Through comprehensive stakeholder interviews and an extensive literature review, this study aims to uncover both the tangible and intangible elements that have affected the sustainability of these partnerships.

The methodology adopted for this research is twofold. First, a detailed literature review provides a foundational understanding of the business models, organizational structures, strategic objectives, and regulatory frameworks underlying the PPPs in the cases. This literature review spans both domestic and international sources, including the MIDP report for Sidewalk Toronto and public data sets from South Korea.

Second, the study employs in-depth interviews with stakeholders such as urban planners and public officials involved in the Sidewalk Toronto and Sejong 5-1 Living Area projects. These interviews are aimed at extracting insights into the complexities of project implementation, the challenges encountered in partnership dynamics, and the strategies devised to overcome such challenges. The objective is to derive a set of qualitative indicators that could guide the assessment of PPPs in the future smart city projects, focusing on sustainability, efficiency, and mutual benefit.

The findings from the Sidewalk Toronto project highlight the innovative approach of involving private partners from the project's inception, emphasizing the critical role of trust, communication, and mutual respect on contractual obligations. This early and planning-stage involvement, however, showcased a lack of clarity in pre-agreements on

roles and responsibilities, leading to potential conflicts and confusion. The research underscores the importance of regulatory frameworks and compliance mechanisms to mitigate these challenges, ensuring that decision-making processes are streamlined and transparent.

In contrast, the Sejong 5-1 Living Area project underscores the necessity of a sophisticated, integrated system for managing the complexities of smart city operations. Furthermore, the study emphasizes the importance of establishing a solid legislative foundation for data sharing and authority in smart city projects, suggesting the innovative PPP models.

Conclusively, the research proposes a comprehensive framework for the sustainable development of smart cities through PPPs. It advocates for clear and detailed contracts that outline the responsibilities and roles of all parties involved, the importance of discussing authority in technology-driven projects, and the need for stringent government oversight. Additionally, it highlights the significance of securing public consensus on privacy and operational aspects, ensuring that smart city developments are inclusive, transparent, and aligned with broader societal expectations.

FISCAL FEDERALISM, ARPA AND THE POLITICS OF REPAIR

Abstract ID: 1108.0.0.415.2024
Individual Paper Presentation

Mildred Warner [Cornell University] mew15@cornell.edu, presenter
Yuanshuo Xu [Zhejiang University] xuyuanshuo@zju.edu.cn

The American Rescue Plan (ARPA) represents a shift in federal politics toward local government since the COVID-19 pandemic (Rocco and Kass, 2022). The unprecedented size, scope and timeliness of ARPA enables local governments to address the structural inequities laid bare by the pandemic. US Federalism was broken before the pandemic (Xu and Warner, 2022), with states exerting a triangle of pressures that created a tightening vice on local government through revenue restrictions, downloading expenditure responsibilities and restricting local policy authority. In contrast to theories of austerity urbanism, we point to the potential of ARPA to ease the pressure on

cities and create a moment for more progressive action.

We analyze US local government expenditure and revenue trends from 2002-2022 to show how this tightening vice has eased under ARPA. Doussard and Schrock (2022) have used Kingdon's (1984) policy streams framework to explore how windows open for policy change. We use this framework to show how ARPA represents a politics of repair that may lead to a more cooperative federalism. ARPA is larger, longer and more expansive than the American Rescue and Recovery Act (ARRA) after the Great Recession. This enables the potential for progressive local action that can spur creative democracy (Lake 2017) at the local scale. Even if it does not last, it represents a layer in the palimpsest of federalist policy toward more cooperative federal-local relations, and the potential for a broader "politics of repair" called for by planners (Williams 2024).

GENDER DYNAMICS OF ENTRY INTO SELF-EMPLOYMENT DURING PANDEMIC

Abstract ID: 1108.0.0.347.2024
Individual Paper Presentation

Annie Lee [University of North Texas] annie.lee@mail.mcgill.ca, presenter

As self-employed individuals faced economic challenges and some were compelled to close their businesses during the pandemic, much of the research on self-employment has leaned towards investigating changes in the wages of the self-employed and their exit behaviors. There has been relatively less research on how the pandemic influenced people's decisions to enter self-employment. Using statistical methods and Current Population Survey data from 2018 to 2023, I examine the entry behaviors of various demographic groups and by their geographical locations. Here, entry into self-employment is classified into two types: transitioning from paid work to self-employment and transitioning from unemployment to self-employment.
Interestingly, I find that married women entered self-employment more frequently after the COVID-19 pandemic. Furthermore, they displayed a greater likelihood than their male counterparts to transition from paid employment to self-employment during this period. In the early stages of the COVID-19 pandemic, childcare facilities and schools closed down, which inevitably exaberated working parents' challenges. My results suggest that married

women with children tend to choose self-employment as a way to manage the dual roles of paid labor and childcare.

GLOBAL EVIDENCE ON IMPACTS OF URBAN RESTRICTION UNDER PANDEMIC ON RECOVERY

Abstract ID: 1108.0.0.306.2024
Individual Paper Presentation

Miu Endo [The University of Tokyo] endo-miu0802@g.ecc.u-tokyo.ac.jp, presenter
Hironori Kato [The University of Tokyo] kato@civil.t.u-tokyo.ac.jp

Introduction

The COVID-19 pandemic has globally caused serious health risks since 2019. In response to the risks, heterogenous actions were made by governments. Some governments introduced social distancing and requested people stay home to reduce the spread of infections while other governments applied no/weak restrictions on daily activities even during the pandemic (Hale et al., 2021). Some governments with restriction policy may have successfully reduced infection risks but suffered from plummet in urban socio-economy due to poor business/commercial activities (Naseer et al., 2023); and their economic performance has still stayed at a substandard level. Meanwhile, other governments without restriction policy may have experienced many cases/deaths caused by the pandemic; however, some of them smoothly recovered their economic performance after the pandemic (Wu et al., 2024). However, no evidence is available regarding the association of government's pandemic policy with post-pandemic economies. To what extent did the government's restriction policy affect the level of post-pandemic economic activities? To answer this question, this study shows global evidence by empirically analyzing the impacts of movement-restriction policies on post-pandemic urban-activity levels in major cities. This study establishes a hypothesis that cities with office-disclosure policy have lower urban-activity levels than those without policy. This is verified with empirical data covering the period from 2016 to 2022.

Data and Method

Three kinds of data are used: (1) socio-economic, demographic, and geographical data of urban centers, collected from Global Human Settlement Layer of European Commission, Urban Research Centre; (2) Nighttime light (NTL) data (15 arc-seconds, approximately 500 m grid cell size), produced using monthly cloud-free radiance averages obtained from low-light imaging day/night band data collected by the National Aeronautics and Space Administration/National Oceanic and Atmospheric Administration Visible Infrared Imaging Radiometer Suite (Elvidge et al., 2021); and (3) government's responses to the pandemic, collected from the Oxford Covid-19

Government Response Tracker. Using the above data, a global dataset was developed where representative data of central business districts (CBD) are summarized for 304 cities with 1.5 million or more population. The CBD is defined as an area with top 10% of NTLs in 25km-radius circle in each city.
Then, a difference-in-differences (DID) model is employed where the urban-activity level is a dependent variable, which is represented by NTL. It is formulated as:
〖lnY〗_ct= β_0+ β_1 〖treat〗_ct+ u_c+ λ_t+ ε_ct
where Y_ct: average NTL in CBD in city c at year t; 〖treat〗_ct: dummy that equals 1 if the office-closure policy is introduced in city c at or before year t and 0 otherwise; u_c and λ_t: city- and year-specific fixed effects, respectively; and ε_ct: error term. Our main concern is β_1; if it is significantly negative, the office-closure policy reduced the urban activities.

Results
The model was successfully estimated with adjusted R-squared of 0.983. The estimation results show that the office-closure policy reduced urban activities by 5.89%; however, its statistical significance is weak (p=0.052). The robustness tests are also performed including a parallel trend assumption test and a placebo test, suggesting our results are quite robust.

Conclusion
This study revealed that the office-closure policy reduced the urban economic-activity level after the pandemic although its statistical significance was weak. This suggests that policy makers should carefully examine a trade-off between reducing cases/deaths caused by infections during the pandemic period versus economic recovery in the post-pandemic period when they would face the pandemic in the future.

INNOVATION ON STREETS: STREET VIEW AND SPATIAL DISTRIBUTION OF INNOVATION
Abstract ID: 1108.0.0.422.2024
Individual Paper Presentation

ZHE HUO [The University of North Carolina at Chapel Hill] zhehuo@ad.unc.edu, presenter
Meixia Meng [Shanghai University of Finance and Economics] meng.meixia@mail.shufe.edu.cn

Innovation occurs within cities and clustered on the streets, where a favorable street view quality fosters a positive atmosphere for enterprise innovation. As Shanghai strives to become an excellent global city, both its street view quality and enterprise innovation capabilities serve as exemplary representations. Against this backdrop, this paper employs machine learning algorithms based on object detection and semantic segmentation, using the big data from Baidu Street View of Shanghai, to analyze the spatial distribution characteristics of street view indexes around enterprises and empirically examine the impact of diverse street view characteristics on the spatial distribution and concentration of enterprise innovation. The study reveals significant disparities in the spatial distribution characteristics of diverse street view indexes within a 1 km radius around enterprises in Shanghai. Moreover, different street view indexes have varying effects on enterprise innovation. Positive and significant influences are found from indexes such as the presence of cars, bicycles, green view rate, sky view rate, sidewalk rate, and street view diversity index. However, the presence of pedestrians and the building rate have a significant negative impact on enterprise innovation. Furthermore, we find the spatial heterogeneity in the results. Enterprises located in the core areas and Open Economic Zones of Shanghai are more affected by street view indexes. This paper emphasizes the important impact of enhancing urban spatial quality, represented by street view quality, on fostering the agglomeration of enterprise innovation. In urban planning, efforts should be actively directed towards transforming streets into attractive spaces with an innovative atmosphere.

PARALLEL NARRATIVES OF LAND ACQUISITION IN THE NATIONAL CAPITAL REGION

Abstract ID: 1108.0.0.1211.2024
Individual Paper Presentation

Anand Khatri [Department of Architecture Jamia Millia Islamia, New Delhi] architectanandkhatri@gmail.com, presenter
Jay Mittal [Auburn University] jzm0029@auburn.edu

The unsurmountable pressure of urban growth in the National Capital Region (NCR) of Delhi, India has consumed over three thousand villages in just the last two decades. Urban agglomeration is infringing upon inhabited villages in peri-urban areas covering over 21,270 sq. miles area (NCR 2018). Cities grow expand and invest in major land-intensive economic infrastructure projects such as metro rail, airports, Ports, and industrial areas including servicing land for housing and supporting other urban development activities. Indian public agencies have employed various land appropriation mechanisms to assemble large swaths of land.

This paper will focus on the NCR area and compare two land assembling models used there – a participatory land pooling model and a coercive land acquisition-based assemblage. The land pooling in the NCR is used by the Delhi Development Authority (DDA), a public land development agency focusing on housing in the Delhi region to increase the supply of affordable housing, while another model is used in assembling land for the Noida International Airport (NIA) in GB Nagar district of Uttar Pradesh within NCR. This research will present the two models as used in the NCR area and will showcase how the assemblage was conducted, the role that the public agencies (DDA and NIA) and the private land owners played while focusing on two villages – the Narela village in the DDA's land pooling area and the Rohi village in NIA area. It provides insights into the advantages and shortfalls of the two land assemblage models and proposes policy recommendations for future assemblage that recognize impacted families as partners in the development and are cognizant of their needs.

Appropriating land from the villagers in the presence of democratic media requires justification, which is built differently in two distinctly different approaches adopted by the administration at DDA through its DDA Land Pooling Policy and the Right to Fair Compensation and Transparency in Land Acquisition, Rehabilitation, and Resettlement Act, 2013. Exploration of two strategies adopted within the NCR by the administration in two locations separated by less than a hundred kilometers can explain the struggles toward a common future while bringing the discussion on the people's agenda to the center. Using plans, policies, and other related documents procured from the NIA, DDA, and other public agencies involved in the NCR, we conducted a semi-structured questionnaire survey of the impacted families and also mapped the physical, social and economic features as provided in the new homes and areas developed during the R&R areas in the two villages.

There was a change in the acquisition strategy by the Delhi Development Authority, through the Land Pooling Act in notified areas of Narela. The Right to Fair Compensation and Transparency in Land Acquisition, Rehabilitation, and Resettlement Act, 2013, nearly 3,300 Acres of land was acquired in phase 1 of the NIA in 2020. There are 8,000+ affected families of which 3,074 were displaced (R&R reports). Of the five displaced and relocated for the first phase of NIA, Rohi is studied in detail. This R&R is backed by a Social Impact Assessment and Environmental clearances from the Ministry of Environment Forest and Climate Change. The Delhi Development Authority's Land Pooling policy to lower the cost of acquisition, by entering into a 60:40 partnership with the farmers who own the land. Acquisition under the land pooling policy under the Delhi Development Act is remarkably different and brings new transformation challenges that could include economic isolation of areas and the accumulation of land into bigger parcels that bring different forces into play. This research is dialectic. It argues that the use of two land acquisition strategies requires improvisation.

RACIAL INEQUALITY IN THE BENEFITS OF BUILDING A CAREER IN A BIG CITY

Abstract ID: 1108.0.0.120.2024
Individual Paper Presentation

Max Buchholz [UC Berkeley] mbuchholz@berkeley.edu, presenter
Michael Storper [University of California, Los Angeles] storper@ucla.edu

Big cities offer many benefits including, on average, higher wages for the workers who live in them. One reason for this “urban wage premium” is that bigger cities provide greater opportunities for workers to accumulate skills and experience that are valuable in the labor market (De la Roca & Puga, 2017). At the same time, racial wage inequality is also higher in bigger cities (Ananat el al., 2018; Buchholz, 2023). In this paper, we examine whether part of this greater inequality in bigger cities is due to racially uneven returns to building a career in a big city. We use restricted-access data from the National Longitudinal Survey of Youth 1979 cohort, which allows us to follow workers over their entire careers and match their work experience to big and small cities. Our main finding is that big city work experience is worth about one quarter to half as much for Black and Latinx workers as it is for White workers. We consider to what extent these disparities might be due to racialized occupational differences, as high-skill occupations in particular have a large urban wage premium. Our main results are very stable even after accounting for racialized disparities in occupational sorting (i.e. are Black and Latinx workers less likely to work in certain high-wage occupations), and racially disparate remuneration in certain occupations (i.e. does the pay within certain occupations depend on a worker’s race). However, we do find that a significant portion of the disparity in the benefits of big city work experience can be explained by racial disparities in the benefits of high-skill work experience, which are significantly lower for Black and Latinx workers. Finally, we provide some suggestive evidence that high cost-of-living in big cities may underlie these inequalities (Bunten et al., 2023). Overall, this research identifies a heretofore unknown source of inequality that is distinctly urban in nature.

REAL-ESTATE SPECULATION AND THE OBAMA PRESIDENTIAL CENTER IN CHICAGO

Abstract ID: 1108.0.0.679.2024
Individual Paper Presentation

Matt Wilson [University of Illinois Chicago] mwilso25@uic.edu, presenter
Sofia Dermisi [University of Washington] sdermisi@uw.edu
Elham Pilegar [University of Illinois Chicago] elhamp2@uic.edu
Ahmed Rachid El-Khattabi [University of North Carolina at Chapel Hill] arelkhattabi@sog.unc.edu

Establishing anchor institutions in low-income communities as a spatially targeted economic revitalization strategy is a common practice in US cities. These anchors seek to bring social and economic stability to neighborhoods through job creation, making sustained community investment, creating sites of community organizational collaboration and governance, and often contain education and workforce development capacities to upskill a local workforce. These anchors differ from smaller-scale satellite offices of universities and health care institutions in that their scale reflects an effort to be more transformative for communities. Established anchors can also exert new influence on adjacent communities through new involvement in urban development initiatives.

The role of anchor institutions as developers and collaborators in processes of shaping neighborhood development trajectories poses specific accountability challenges for communities. While anchor institutions may have broad social missions, they now constitute an outsized source of development for neighborhood revitalization as they garner support from city governments to advance their own institutional interests without needing to adhere to formal accountability measures such as transparency and clearly defined community benefits (Fennelly 2023; Rich and Tsitsos 2018). City governments support these 'third-sector' actors in what has been coined the 'third wave' of gentrification, marked by heightened government support and entrepreneurialism in enabling larger-scale investments for urban revitalization that gentrifies neighborhoods (Hackworth and Smith 2001).

On May 12th, 2015, the Barack Obama Foundation announced that the future Barack Obama Presidential Center (OPC) would be located on Chicago's South Side in either Washington Park or Jackson Park. In a recorded video announcing the Presidential Center's future South Side home, President Obama discussed the project's ability to change the South Side in stating, "[w]ith a library and a foundation on the South Side of Chicago, not only will we be able to encourage and affect change locally, but what we can also do is to attract the world to Chicago" (Obama Foundation 2015). And there is no question the greater South Side's residents can benefit from new jobs and economic activity, education and workforce development opportunities, youth programming, and world-class community spaces. However, tension exists within the duel aims of creating world-class physical structures and amenities in a place, and the ability to localize impacts when local residents are subjected to land and property markets that will reflect the speculation of an actual increased desirability of spaces that increases rent prices and property values.

Measures to ensure incumbent populations benefit from new developments can take many forms, such as local hiring guarantees with living wages, creating and preserving affordable housing, small business supports, and dedicated access to new facilities for community members and organizations, and are often included in a formal CBA. With the wide variety of aims, and associated benefits and burdens that different anchors can bring to a community, each project should be judged differently by its community impacts and ability to deliver on its goals

which can be codified into formal agreements or left to less- or un-structured commitments with no enforcement mechanisms.

This paper will focus on the OPC as an anchor currently under construction within Jackson Park on Chicago's South Side through an examination of the announcement effects of the Center on property sale and rent values in the surrounding communities using a regression discontinuity in time research design. Through the case of the OPC, we will compare housing market impacts to community organizing efforts, paying specific attention to their sequencing, to illustrate the comparative swiftness in which the market responds to a perceived increased desirability of an area in relation to housing affordability preservation efforts.

REGIONAL HIGH TECH INNOVATION GROWTH AND TRADITIONAL KNOWLEDGE STRUCTURE

Abstract ID: 1108.0.0.409.2024
Individual Paper Presentation

Ruoran Liu [Ball State University] ruoran.liu@bsu.edu, presenter
Joanna Ganning [Cleveland State University] j.ganning@csuohio.edu

Despite aspirations for sustained economic competitiveness, regions rarely experience perpetual growth. A primary factor contributing to a region's economic downturn is its specialization in specific industries that subsequently decline, as evidenced in the Rust Belt regions of the United States (Glaeser, 2005; Martinez-Fernandez et al., 2012). In response to industry-driven decline, regions adopt various economic revitalization strategies to reinvent their export base, enhance innovation, and restore competitiveness. A prevalent approach involves cultivating specializations in emerging, high-tech industries such as computer technology, pharmaceuticals, and biotechnology, which diverge from the regions' traditional industrial specializations.

Significant progress in agglomeration research has shown that the industrial or knowledge structure of a region's economy drives innovation growth (Feldman & Audretsch, 1999; Glaeser et al., 1992). Relevant theories include the theory of Marshall-Arrow-Romer externalities, Jacobian externalities, and related and unrelated variety (Frenken et al., 2007). However, prior studies have predominantly examined the impact of a region's overall or

sector-specific industrial structure on either aggregate or sector-specific innovation growth. The link between preexisting industrial structure and the emergence of new industrial strengths, critical for regions seeking to reinvent their export base, has received less attention. This essay shifts the focus towards the processes of economic restructuring, investigating whether a region's innovation growth in high-tech industries correlates with the knowledge structure of its traditional industries.

This study employs the US Patent and Trademark Office (USPTO) technological classification and patent data to define high-tech and traditional technological fields. Through regression analyses, the paper tests whether a more specialized or diversified knowledge structure of traditional technological fields better encourages high-tech innovation growth from 1986 to 2014. The findings indicate that regions with greater diversity across both related and unrelated traditional technological sub-categories demonstrated higher levels of innovation in high-tech fields, thus exhibiting a stronger capacity to restructure their knowledge base. In contrast, a high degree of specialization in specific traditional technological sub-categories negatively impacts a region's ability to undergo restructuring. The trend remains consistent across multiple time periods from 1986 to 2014.

This study further elucidates how knowledge diversity can lead to innovation within technological fields that significantly diverge from a region's historical specialization. It suggests, first, that regions with a broad array of traditional technologies provide a fertile ground for high-tech companies to identify new market needs and integrate emerging industry knowledge. Second, such diversity, often seen in larger economies, facilitates the support of high-tech start-ups, including those that deviate from their initial technological specializations. Third, while scholars may argue that regions historically focused on specific traditional technological fields have successfully integrated high-tech expertise, this study challenges this view, positing that most of these regions actually exhibit a high degree of related variety rather than a high degree of specialization.

For policymakers, the findings advocate for a diversified industrial strategy, especially emphasizing broader sectors that encompass a variety of related sub-industries to enhance economic resilience and facilitate the adoption of new technologies and emerging opportunities. Policy measures could include creating incentives for adopting and developing technologies adjacent to but outside the traditional economic stronghold of the region, and investment in education and training programs that equip the workforce with versatile skills applicable across various sectors.

REIMAGINE THE INFORMAL ECONOMY THROUGH OUTDOOR MARKETS USING BIG DATA

Abstract ID: 1108.0.0.568.2024
Individual Paper Presentation

Bingyu Luo [University of Hong Kong] bl515@connect.hku.hk, presenter
Anthony Yeh [The University of Hong Kong] hdxugoy@hku.hk

The urban informal economy has been extensively conceptualized as encompassing activities that lack official recognition or regulation, and it has been linked to issues of income inequality and job insecurity (Castells & Portes, 1989; Chen & Carré, 2020). Nevertheless, there is an increasingly acknowledged perspective that the informal sector can also encompass dynamic and entrepreneurial endeavors, particularly in creative industries and knowledge-based economies (Sassen, 2006; Webb et al., 2009). Moreover, the trend towards formalization of the informal economy further fosters integration between the informal and formal economic sectors (Dell'Anno, 2022). While the outdoor markets in China can be situated within the purview of the informal economy due to their higher adaptability for the market, lower cost for entry, and deficiencies in protecting consumer rights, they have received much more regulation by the government.

Viewing the outdoor markets as signifiers of the urban informal economy under this new paradigm, this research aims to address three questions: (1) how the visibility, convenience, and attractiveness of outdoor markets are revealed through the combination of multi-source data, (2) what the spatial-temporal patterns of social media exposure for the outdoor markets are in the past five years, and (3) what the relationship between the digital presence of outdoor markets and the spatial attributes of its surrounding environment is.

Prior scholarly literature examining the informal economy and its relationship with the environment has predominantly focused on empirical analyses involving street vendors (Igudia, 2020), underground economic activities (Kristianto et al., 2021), and informal employment (Webb et al., 2020). However, limited attention has been given to exploring the interconnections between outdoor markets and the physical environment. By leveraging multi-source data, this study addresses these research gaps and hypothesizes that (1) the social media exposure of outdoor markets varies across cities and over time, (2) the attributes captured by street views exhibit variations across cities and over time, and (3) the social media exposure of outdoor markets is influenced by the presence of nearby points of interest (POIs) and distinctive street views of the surrounding environment.

This study capitalizes on the inherent tendency of outdoor markets to stimulate social media sharing by leveraging Weibo, a prominent digital platform that combines social networking and microblogging functionalities in China. Drawing upon Weibo posts pertaining to outdoor markets from 2019 to 2023, a total of 18,320 geographical coordinates corresponding to these markets were identified from 76,335 geotagged posts. To enhance the analytical framework, this study integrates point of interest (POI) data and employs the K-Means method to identify outdoor markets with four geographical tags: "shopping malls nearby," "main streets nearby," "tourist attractions nearby," and "parks nearby." Additionally, the Random Forests method is utilized to classify outdoor markets into three thematic categories: handicrafts, food, and lifestyle. Leveraging the street view images sourced from Baidu Map, this study assesses various aspects of the surrounding environment of outdoor markets, including greenery, openness to the sky, building height, and traffic infrastructure. These assessments are conducted using a semantic segmentation model and a transfer learning approach.

This study makes noteworthy theoretical contributions by shedding light on the intricate dynamics between the

physical environment and the emerging paradigm of urban informality. Theoretical frameworks employed encompass the theory of the production of space (Lefebvre & Nicholson-Smith, 2009) and state entrepreneurialism (Liu & Yau, 2020). Moreover, the study introduces a novel approach to capture the interplay between the urban informal economy and spatial considerations, utilizing a cutting-edge amalgamation of social media posts, POI data, and street view data. This innovative approach holds significant potential in informing decision-making pertaining to the location choices of outdoor markets and facilitating government support.

THE COASTAL FRINGE TRAP IN CATCHMENT VULNERABILITY OF SMALL BUSINESSES

Abstract ID: 1108.0.0.699.2024
Individual Paper Presentation

Ziyi Guo [University of Florida] ziyiguo@ufl.edu, presenter
Yan Wang [University of Florida] yanw@ufl.edu
Maria Watson [University of Florida] maria.watson@ufl.edu

Anticipated climate change poses a significant threat to coastal communities in the United States, exacerbating environmental shocks and highlighting their vulnerability to storm- and hurricane-induced hazards. Recent events, such as the heavy precipitation and flooding in Southern California, underscore the urgent need to address these growing threats. These threats can disrupt human activities and impede the overall well-being of coastal communities. Despite their importance as social infrastructure and pivotal entities of the local economy, CSBs are under-affected. Community-based Small Businesses (CSBs) are particularly vulnerable to coastal hazards due to a combination of internal characteristics and the sensitivity of customer demand to disturbances. To improve their resilience, it is necessary to develop strategies that take into account their unique vulnerabilities. Due to the fact that CSBs rely on customer visitation to ensure their economic and social roles within the community, the vulnerability of the customer catchment area and the CSBs are two sides of the same coin.

Studies in the field of small business vulnerability have deeply engaged business owners and have focused on business-centered attributes while lacking a thorough mapping of demand-side vulnerability. Additionally, the variability in vulnerability among different sectors and sizes of businesses, as well as among different coastal

regions, remains underexplored. Without a holistic understanding of how environmental disturbances, such as floods and extreme winds, impact customer visitation and business continuity, local and regional planners lack essential information for equitable planning that facilitates CSB vulnerability. Leveraging large-scale customer visitation and mobility data is a promising approach that expands the opportunity to account for interdependence between CSBs and catchments. This research aims to bridge these gaps by quantifying the demand-side vulnerability of CSBs through a comprehensive assessment of visitation-based catchment areas. Specifically, it seeks to understand how the vulnerability of CSB catchments varies, highlighting disparities across spatial areas and industrial sectors among coastal communities, thereby contributing to a more nuanced understanding of CSB vulnerability in the face of climatic hazards.

We introduce the CSB-Catchment Vulnerability Index (CCVI), a novel approach that aggregates the vulnerability of catchment areas to CSBs based on visitation data. This index combines the Social Vulnerability Index (SVI), assessing the socio-economic vulnerability of customers, with the Hazard Vulnerability Index (HVI), evaluating exposure to hazards within catchment areas. By applying the CCVI across 17 coastal metropolitan areas in Florida, USA, this research maps demand-side vulnerability and identifies spatial, community, and sectoral disparities in CSB catchment vulnerabilities. The findings highlight a spatial inequity effect, termed the “Coastal Fringe Trap,” indicating that CSBs on the fringe of coastal areas are generally more vulnerable but receive less attention in hazard-related planning. The finding contributes to the intersection of spatial planning and economic development that balance economic benefits and vulnerability concerns. A comparable analysis of CCVI across communities and sectors reveals the major metrics that contribute to place-based distinction, while also identifying three types of demand-side vulnerability among CSBs in different sectors. The CCVI informs local and regional planners with generalizable and comparable metrics, identifying vulnerable spatial areas, key local industrial sectors, and specific root causes. Recognizing the dual role of CSBs as both social infrastructure for communities and economic entities, we intend to suggest planning strategies that not only address customer vulnerability for CSBs but also facilitate resilient CSB service to vulnerable neighborhoods.

THE EFFECT OF ROBOT ADOPTION ON FEMALE EMPLOYMENT

Abstract ID: 1108.0.0.800.2024
Individual Paper Presentation

Chaneum Park [Georgia Institute of Technology] cpark390@gatech.edu, presenter

Amidst a technological renaissance characterized by significant productivity gains and cost efficiencies through advanced technologies like robotics, the narrative of technological displacement has raised alarms, especially regarding its demographic-specific impacts on employment. Women, often marginalized in the traditionally male-dominated manufacturing sector, emerge as a particularly vulnerable group in this technological transition. This study aims to rigorously examine how the integration of robotics influences female employment trends in manufacturing firms across South Korea.

The foundational theory of "Creative Destruction," as proposed by Schumpeter, underpins the study's theoretical framework, juxtaposing the economic vitality of innovation against its potentially disruptive consequences on labor markets. The literature review scrutinizes the dichotomy within scholarly debates surrounding technology innovation—where product innovation spurs labor demand by expanding markets, while process innovation, including robotics, might reduce labor demand, particularly impacting low-skilled jobs. Recent scholarship, however, presents a contrasting view, suggesting that technological advancements, while displacing some jobs, also create new employment opportunities through mechanisms like the price compensation effect, which lowers production costs and stimulates demand for skilled labor.

Employing a robust methodological framework, the study leverages data from the Survey of Business Activity of Korea, focusing on a sample of manufacturing firms from 2017 to 2021. It combines Ordinary Least Squares (OLS), Fixed Effects (FE), Propensity Score Matching (PSM), and Difference-In-Difference (DID) estimations to dissect the causal relationship between robotics adoption and female employment. This multifaceted analysis allows for a comprehensive exploration of the issue, mitigating potential biases and confounding variables to ensure the reliability of findings.

The empirical findings reveal a complex picture. Initial analyses suggest a general increase in employment following robotics adoption. However, deeper investigations using FE and PSM methodologies uncover a more troubling trend—a significant reduction in female employment in firms that have embraced robotics, compared to those that have not. This gender-disparate impact is further corroborated through DID estimations, which illustrate a marked decrease in female employment in robotics-adopting firms over the study period.

In conclusion, the advent of robotics in the manufacturing sector, while heralding efficiency gains and technological progress, poses significant risks of exacerbating gender disparities in employment. The study calls for proactive policy measures to address and mitigate these disparities, advocating for an inclusive technological advancement strategy that safeguards against the marginalization of female workers. The research underscores the imperative for regional and industrial policies that promote gender equity in the workforce, including educational and vocational training programs tailored to equipping women with the skills necessary to thrive in an increasingly automated industry.

The Impact of Industrial Variety on Social Spatial Segregation

Abstract ID: 1108.0.0.1058.2024
Individual Paper Presentation

Shijia Lin [Tongji University] llyn07@163.com, presenter
Zhan Cao [Tongji University] 1989caozhan@tongji.edu.cn

Alleviating social spatial segregation is essential for promoting inclusive urban development. While extensive research has concentrated on the spatial segregation of residents with varying socio-economic characteristics, only a few studies have examined the formation processes and underlying mechanisms behind social spatial segregation. In the context of economic globalization and technological innovation, urban and regional economic structures have experienced significant transitions, thereby reshaping industrial compositions and concurrently affecting the labor markets. This study aims to explore the impact of industrial variety on the social spatial segregation of workers, thereby addressing the aforementioned gap.

Industrial variety, viewed as a novel dimension for understanding local economic development paths, offers a fresh theoretical perspective for examining workers' social spatial segregation. Related variety is characterized by knowledge spillover and collaborative innovation within industries, which could potentially exacerbate inequalities. In contrast, unrelated variety focuses on enhancing the economy's resilience to external shocks and on the provision of diverse employment opportunities, indicating a potential for inclusive development. Investigating how these two types of industrial variety affect the socio-economic attributes of workers and their residential choices requires systematic examination.

This study seeks to explore the influence of related and unrelated varieties of industrial development on workers' residential spatial distribution, and how this either contributes to or mitigates social spatial segregation. By incorporating industrial variety into the analytical framework, this study is enabled to uncover new trends and mechanisms of social spatial segregation within the context of economic development, thus promoting a vision for a more equitable and sustainable urban spatial development.

The study is centered on Shanghai, China, which plays a pivotal role in the country's efforts towards globalization. Accompanying adjustments in economic structure are social transformations and spatial reconfigurations that occur simultaneously. Utilizing subdistricts as the spatial research units, this study assesses the related and unrelated varieties of newly established enterprises using corporate registration data from 2018 to 2022, and analyzes the residential locations of workers through mobile phone signaling data from 2017 and 2023. The entropy index and the COV (coefficient of variation) of housing prices are employed to uncover the heterogeneity in residential spatial distribution and socio-economic attributes of workers. Subsequently, an OLS regression model has been constructed, using changes in the two heterogeneity indices as dependent variables, and related and unrelated varieties as independent variables, to ascertain the impact of industrial varieties on social spatial

segregation.
This study has found that unrelated variety displays a significant positive correlation with both the entropy index and the COV of housing prices, indicating that an increase in unrelated variety is associated with more diverse residential distribution and a broader spectrum of workers' socio-economic attributes. Conversely, related variety is observed to have a significant negative correlation with both the entropy index and the COV of housing prices, suggesting that an increase in related variety leads to more concentrated residential spatial distribution and a more homogeneous socio-economic attribute profile among workers. In other words, combinative development within industrial sectors poses a risk of exacerbating social spatial segregation, while combinative development across unrelated industrial sectors contributes to alleviating social spatial segregation.
By utilizing multi-source big data, this research has achieved a quantified measurement of workers' social spatial segregation and has revealed the intrinsic link between economic development and social spatial segregation. This study contributes to enhancing the quality of local economic development by integrating a social dimension, striving for a development trajectory that is both sustainable and inclusive.

UNRAVELING REGIONAL ECONOMIC RESILIENCE: MEASUREMENT AND DETERMINANTS

Abstract ID: 1108.0.0.500.2024
Individual Paper Presentation

Heonyeong Lee [School of City and Regional Planning, College of Design, Georgia Institute of Technology] leehy@gatech.edu, presenter
Giwoong Park [Pusan National University] gwpark@pusan.ac.kr
Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr
Chanyong Kim [Korea Research Institute for Human Settlements] chanyongkim@krihs.re.kr

The concept of economic resilience within regions has become increasingly prominent in the discourse of urban planning and regional economic development. This heightened interest is fueled by the challenges posed by economic recessions, the Covid-19 pandemic, and climate change, offering a fresh lens for understanding regional economic dynamics through frameworks such as vulnerability to disruptions and adaptive capacities. Despite the rapid adoption of the resilience framework, criticisms have emerged regarding its conceptual fuzziness and the lack of consensus on metrics and operationalization methods, potentially leading to misguided policy interventions.
To address these concerns, this study employs the minimum business continuity objective framework and the resilience triangle, commonly utilized in scholarly works focusing on an engineering perspective of resilience. Our conceptualization of economic resilience revolves around regional work capacity, highlighting a region's ability to maintain and recover its production capacity and employment base against enduring cyclical economic fluctuations and transient disruption. Applying this approach, we evaluate the economic resilience of 229 administrative units in South Korea, revealing significant variations in their ability to maintain and recover employment levels amidst recessionary shocks.
Furthermore, we conduct a comprehensive exploration of the regional characteristics associated with economic resilience. Initially, we select potential variables from theoretical studies and empirical evidence, followed by the identification of key regional characteristics exhibiting robust correlations with economic resilience through rigorous statistical analysis. These identified characteristics are systematically categorized within the established framework of the "4R's of Resilience" – robustness, redundancy, rapidity, and resourcefulness. Moreover, we extend our analysis to explore how 4R's of resilience interact and influence each other, offering a nuanced understanding of the multifaceted nature of economic resilience within regional contexts.
Our study yields not only to the advancement of widely applicable metrics for evaluating regional economic resilience but also have substantial implications for policy development and regional planning practices. By contextualizing factors linked to regional economic resilience within the popular 4Rs concept, practitioners and decision-makers can readily identify areas for improvement and translate insights into bespoke policy goals and strategies tailored to the unique needs of regions. Furthermore, our study underscores the importance of cohesive policy frameworks aimed at bolstering regional economic resilience, acknowledging the intricate interplay among factors of economic resilience.

BROWNFIELDS JOB TRAINING: PROBING CHALLENGES FOR WORKFORCE INTERMEDIARIES

Abstract ID: 1110.0.0.757.2024
Research-in-Motion (RiM)

Charles Warnken [The University of Oklahoma] cwarnken@ou.edu, presenting author

Workforce development is a term used frequently across economic development literature and is emerging as a key component of community economic development programs. Formally, Workforce development programs encompass programs, policies, practices and institutions that help labor market actors create, sustain and retain a skilled workforce (Schrock 2013, Leigh and Blakely 2013). Demographic transitions, globalization and rapid changes in technology have created a changing landscape within which individuals, employers, public-sector and non-profit workforce development agencies operate within. Workforce development programs are often viewed as "people centered" economic development strategies and as a path to more equitable economic development (Tan et al. 2016; Garmise 2006) but reviews of current workforce development programs suggest that mainstream approaches to designing and implementing programs are dated and this may contribute to a "skills gap" between many in the workforce and potential employers (Lowe 2021; Zaber et al. 2019). In addition, questions exist about the effectiveness and efficiency of various workforce development programs (Hollenbeck and Huang 2016; Simons 2013; Eberts, Bartik and Huang 2011).

This Research in Motion paper examines the contextual (local economic and employment trends, changes in program design or size, changes in local policies, etc.) and organizational factors (staff and board capacity, changes in organizational missions, changes in funding organizations and programs, challenges with grant administration and project management, etc.) that affect job training practices and policies for organizations that have been recipients of US EPA sponsored Brownfield Job Training Grants between 2018-2022. 72 different workforce development agencies have been recipients of 80 brownfield job training grants during this time. Through surveys, semi-structured interviews and working with key program informants this paper is aimed at exploring the experiences these organizations, termed "workforce intermediaries" (Lowe 2021) in that they work to directly match employer needs with a trained workforce, have had when implementing job training programs aimed at providing training activities that support assessment, cleanup, and preparation of brownfield sites for reuse.

FOSTERING INCLUSIVE INNOVATION DISTRICTS THROUGH COMMUNITY ENGAGEMENT

Abstract ID: 1110.0.0.421.2024
Research-in-Motion (RiM)

Ladan Mozaffarian [University of Oklahoma] ladan.mozaffarian@ou.edu, presenting author
John Harris [University of Oklahoma] johncharris@ou.edu
Yasaman. S Lashgari [University of Oklahoma] yasamansadat.lashgari-1@ou.edu

Over the past two decades, the concept of “Innovation Districts (IDs)” has emerged as a pivotal urban economic development model aimed at fostering innovation and creativity within urban areas while enhancing cities' economic competitiveness. IDs have gained popularity among urban and economic scholars, policymakers, and urban planners. While they hold promise for delivering economic, physical, and social benefits, there are indications of potential negative impacts associated with their implementation. Zandiatashbar & Kayanan (2020), in their examination of innovation-igniting urban developments, identify significant adverse effects such as polarized labor division, housing unaffordability, unequal access to opportunities, and socio-spatial polarization. Similarly, Morisson & Bevilacqua (2019) highlight that IDs may exacerbate economic, social, and racial polarization within urban areas. Additionally, Griffith (2015) discusses the displacement of existing residents and the deepening of socioeconomic divides as other negative consequences of IDs, particularly affecting low-income and minority communities, leading to spatial segregation. Furthermore, Kayanan (2022) argues that while IDs initially attract entrepreneurs with smaller space needs, driving development where larger corporations are not investing, a shift occurs once the economy improves, focusing on securing higher rents, which can result in the displacement of smaller entrepreneurs.

While there is a consensus among experts that innovation districts should prioritize inclusivity and accessibility for all urban residents, particularly those with lower incomes, there are apprehensions regarding whether these districts genuinely lead to inclusive development (Kayanan, 2022). There is a risk that if real estate development interests take precedence, affordable housing for lower-income workers and essential public services might become secondary concerns, or worse, be entirely overlooked. Esmaeilpoorarabi et al. (2020) conducted a study on public interaction with IDs in Sydney, Melbourne, and Brisbane, revealing that although these districts are acknowledged, actual public engagement remains limited, mainly involving younger, educated individuals. Despite aspirations to promote inclusive urban development, these districts struggle to attract diverse public involvement, prompting concerns about their impact on social and economic inequality. While there is evident interest from local communities, suggesting potential for neighborhood revitalization and resource sharing, underscoring the necessity to engage local communities in IDs, the evaluation of community engagement and inclusivity within IDs has been lacking both in practice and scholarly research.

Although numerous studies have explored the adoption of innovation districts as drivers of economic growth, their current impact on local communities remains poorly understood. There is a notable lack of research on how these districts benefit local communities and the level of public engagement within them. This study seeks to address two primary questions: 1) How are communities engaged throughout the various phases of IDs development and operation? 2) How do policymakers respond to the negative social consequences of innovation districts on local communities? Employing qualitative methods, including content analysis, community surveys, and focus group interviews (triangulation), this study focuses on the Oklahoma City Innovation District (OKC-ID) to investigate these questions. Additionally, socio-spatial analysis is conducted to assess the impact of OKC-ID on marginalized communities within the district boundaries.

This study offers planners and policymakers invaluable insights into the development of effective strategies aimed

at mitigating negative consequences within IDs development. By delving into the analysis presented herein, planners and policymakers can gain a deeper understanding of the specific needs essential to engaging all community members within IDs. This heightened awareness will facilitate the formulation of more robust policies geared toward fostering social inclusion within these districts. Moreover, by identifying the factors that contribute to community engagement and inclusivity, policymakers can tailor interventions to address the unique challenges and opportunities presented by IDs, thereby enhancing their overall effectiveness and impact on local communities.

RECOVERY FOR ALL? WORK, GENDER, MOBILITY AND POST-COVID ECONOMIES OF CARE

Abstract ID: 1108.0.0.1255.2024
Research-in-Motion (RiM)

Tamara Kerzhner [University of Toronto] t.kerzhner@utoronto.ca, presenting author
Karen Chapple [University of Toronto] karen.chapple@utoronto.ca
Shauna Brail [University of Toronto] shauna.brail@utoronto.ca

Matt Zook [University of Kentucky] zook@uky.edu

As cities and economies around the world re-opened after the COVID-19 pandemic, economies, forms of mobility and work changed, perhaps permanently. Work-from-home rates rose, and transit ridership fell, as new constellations of economic activity emerge. However, these changes were neither consistently beneficial nor evenly

distributed. Many cities have undergone economic transformation, with particularly acute impacts on the employment and health of women and youth. COVID-19 mitigation has had disproportionate impacts on women and youth employment in specific economic sectors, and these groups have also been at high risk of adverse mental health outcomes given disruption of family supports, and school closure. Even as overall employment recovers, many women and youth struggle with the ongoing effects of these disruptions that create barriers to pre-pandemic levels of labour force participation.

This mixed-methods analysis of post-pandemic recovery in Toronto is focused on women and youth's employment, access to services, and labor participation and quality of work. We particularly focus on the notion of the "economy of care", considering access and engagement with household, social and community needs for women and those entering the workforce for the first time during and immediately post-covid.We rely on novel access to primary health care data held by public healthcare systems in the three cities of the study to track the recovery of basic, local health care services; interviews with staff at local clinics; fine-grained cell-phone mobility data; neighbourhood-level analysis of the built environment; and gendered changes in employment through and after covid to develop a model for changes in labor-force participation across urban geographies post-covid. We will examine the long-term recovery patterns in the three global cities to understand why some cities and neighbourhoods have better supported a resilient recovery – bounce back or adaptation leading to positive and equitable health and employment outcomes.

We identify interventions to reduce negative impacts of large-scale shocks and global events, based on innovative temporal and spatial data, mediated through individual, family and community factors. We generate evidence to inform policies for resilient urban recovery from the COVID-19 pandemic and protect vulnerable urban populations in future pandemics.

REMANUFACTURING THE BROWNFIELDS CHALLENGE

Abstract ID: 1110.0.0.643.2024

Research-in-Motion (RiM)

Sarah Coffin [Saint Louis University] sarah.coffin@slu.edu, presenting author

Brownfields are a spatial consequence of both environmental hazards associated with industrial development and an outcome of deindustrialization. Historically, we considered these as separate policy challenges. In the 1990s, researchers identified land contamination left behind by heavy industry as a primary driver for vacancy and blight in urban core neighborhoods. Early work by Coffin and Shephard (1998) identified four key barriers to the redevelopment of brownfield properties; fear of liability associated with laws governing brownfield cleanup, lack of funding for brownfield identification and cleanup, lack of brownfield information, and lack of demand for brownfield properties.

Meanwhile, during the same era, deindustrialization was (and in many ways still is) studied as an economic outcome of changing technology and shifting location patterns in manufacturing. In Bluestone and Harrison's 1982 study of US deindustrialization, they point to the loss of over 30 million jobs in the 1970s as a direct result of plant closings, restructuring, or relocations.
What came to be known as the Rustbelt in the US signified disinvestment on a large scale, topping off the white flight and suburbanization of the 1950s and 60s. Urban core areas in what were once powerful manufacturing regions in and around the central Midwest, Great Lakes, and Northeast had become relics of an industrial past that few wanted to resurrect (Leigh and Coffin 2000). Many of these regions continued to see growth in the outlying areas, only to be plagued by the hollowed-out centers of their primary cities. St. Louis, Cleveland, Detroit, and Buffalo all stand as reminders of our industrial heritage but also classic examples of the brownfield challenges facing legacy manufacturing cities.

Cities have historically responded to brownfield challenges by focusing on removing redevelopment barriers. As a result, new land uses often diverge considerably from past land using activity in these locations. The rustbelt chic becomes an aesthetic that developers market to gentrifying urbanists as former manufacturing buildings become fashionable condos or food halls. Little attention is paid to what was lost; the jobs and tax revenue once generated by an active industrial sector.

This paper examines impacts of past brownfield redevelopment activity on industrial land in urban core areas by examining brownfield redevelopment practices in the city of St Louis. In particular, the research explores how brownfields serve as drivers of land use change, focusing on former and current industrial uses, and what impacts those changes are having on the economic and fiscal health of the city. Drawing on findings from other industrial land use studies like Grodach's work (2022) in San Fransisco and the Lester et. al. (2013) study in Chicago, IL and Charlotte, NC, this paper will explore whether brownfield redevelopment strategies still yield a more resilient and sustainable future for core urban areas? Specifically, how do the drivers of industrial land use change intersect with brownfield redevelopment activities in the urban core?

RESHAPING THE FIELD: WOMEN/NON-MEN/WOMXN IN ECONOMIC DEVELOPMENT

Abstract ID: 1110.0.0.985.2024
Research-in-Motion (RiM)

Margaret Cowell [Virginia Tech] mmcowell@vt.edu, presenting author

A growing literature documents the importance of gender in the physical design of spaces (Navarette-Hernandez et al., 2021) and urbanism in general (de Duren et al., 2020). Gender mainstreaming scholarship has shed light on the many ways in which gender relates to both how public spaces are designed and how they are experienced by users (Ryan, 2019). While the planning field continues to prioritize the creation of just, equitable, diverse, and inclusive cities, the field of economic development has been slower to focus its efforts on inclusivity, especially from an intersectional and gendered perspective. To do just that, this research explores the history of women/non-men/womxn in the field of economic development and the myriad ways in which they have shaped and are reshaping the field. The research asks how the field has changed in recent decades and how gender shapes the work that economic developers do. It also documents the practical experiences of womxn working in the field today.

In 2001, Andre and Wesinger found that women's representation in economic development organizations (EDOs) at the state level increased by 56.6% during the 1990s (p. 71). However, that same study also found that the number of women in EDOs was still small (11.9% of all memberships) and concluded that "future research should focus on the extent to which women's agendas for economic development differ and whether women's influence is sufficient to advance an agenda" (ibid). As poignant as these findings are, that call was not heeded and there remains very little scholarship that addresses the influence of womxn in the economic development field. This research seeks to reinvigorate that conversation by analyzing current data from national organizations and stakeholder interviews. Demographic data on practicing economic development practitioners come from the International Economic Development Council, the Economic Development Division of the American Planning Association, and the Economic Development Track of the Association of Collegiate Schools of Planning. Qualitative data come from stakeholder interviews with practitioners and academics working in the economic development field, as well as sentiments conveyed in conversations with academics who participated in a roundtable on the topic at the ACSP Conference in 2021.

The research starts from the premise that, since its inception, the field of economic development has traditionally reproduced existing power dynamics. As the world changes and the field of economic development becomes increasingly diverse, it is important to understand intersections of identities and the potential for such identities to shift the practice of economic development. The research thus focuses on the ways in which an increasingly diverse economic development field may afford the opportunity to better identify and rectify historical injustices and discriminatory practices that have shaped our communities. More specifically, it considers the impact that

economic development decisions made by a more representative field of economic developers may have on different communities, especially womxn and others who have historically been marginalized within the development process. Preliminary findings suggest that the number of womxn practicing and teaching in the field of economic development continues to grow. However, the findings also show that the pace with which womxn's participation has grown differs substantially by race and ethnicity. Stakeholder interviews further suggest that womxn practicing and teaching in the field possess multiple identities that shape their experiences within the field, the ways in which they approach their work, and how they envision the future of the economic development field as the demographics of the field continue to change.

THE EFFECT OF JOB PROSPECTS AND CAREER MOBILITY CHOICES IN KOREA

Abstract ID: 1110.0.0.548.2024
Research-in-Motion (RiM)

Hanna Kang [Yonsei University] hannakang@yonsei.ac.kr, presenting author
Up Lim [Yonsei University] uplim@yonsei.ac.kr

Recent studies conducted in South Korea have shown that employment opportunities and job growth are predominantly concentrated in the metropolitan areas of the capital region. This phenomenon has led to significant disparities in employment rates and job sizes across regions. Despite the high cost of living and housing in the capital region, this study empirically analyzes the extent to which job prospects influence individuals' decisions to change jobs within the Korean capital region. Previous research suggests that factors such as young people's work values, job satisfaction, job prospects, and working conditions significantly impact job mobility decisions in the capital region.

The present study examines the impact of job prospects on voluntary job relocation decisions to metropolitan areas in Korea by addressing the following two research questions: (1) Is there a noticeable shift toward occupations with high job prospects? (2) Is there a significant turnover trend for the Korean capital region? The study used data from Korea's Graduate Occupational Mobility Survey and the Youth Panel. Furthermore, the study

used regression analysis and multilevel modeling to draw causal inferences.

Research trends suggest that job prospects influence labor market supply and demand, leading to regional imbalances. In addition, industries or occupations experiencing growth see high labor demand, often leading to population movements. For example, the tech industry's rise has increased the demand for jobs like programmers and data analysts, especially in the Pan-gyo area of the capital region, known for its concentration of IT companies. Recent literature extensively explores the implications of automation on the labor market, with studies confirming declining employment rates in manufacturing jobs due to automation, causing a structural shift toward service industries, which are less vulnerable to automation.

From a methodological standpoint, the present study's theoretical model draws upon prior research on turnover models, adapted to fit the Korean context. Regression analysis results indicate that age and job prospects positively influence the decision to change jobs, with the younger population exhibiting a greater tendency to relocate to the capital region, preferring jobs with better prospects. Furthermore, lower job satisfaction and higher wages were found to encourage migration to the capital region. Although the regression analysis verified causal relationships between key variables, multilevel modeling was employed to address inconsistencies in the unit of analysis. Multilevel model results confirmed that individual turnover decisions are positively influenced by job prospects.

In conclusion, the study finds a high turnover rate toward the capital region in Korea, necessitating a detailed examination of the underlying causes of this migration for urban planning strategies that encourage population inflow into experiencing outflow. The high rate of voluntary job-hopping among young individual suggests a pressing need for both companies and the government to enhance job opportunities and working conditions. This should include offering flexible work arrangements, career development and education opportunities, and making workspaces safer to support the growing trend of individual-driven job-hopping.

THE IMPACT OF OUTDOOR SEATING ON COFFEE SHOP VISIT VOLUME

Abstract ID: 1110.0.0.955.2024

Research-in-Motion (RiM)

Xuanyu Zhu [Florida State University] xz23c@fsu.edu, presenting author
Kerry Fang [Florida State University] lfang3@fsu.edu

Urban third place refer to social surroundings separate from the two usual social environments of home and the workplace. (Oldenburg & Brissett, 1982) These spaces play a crucial role in urban living by providing settings for community engagement, relaxation, and social networking outside the structures of home and work. (Jacobs, 1992) Given the importance of urban third place, planners have responsibility to create policies to facilitate desired characteristic of it. Previous studies have identified outdoor seating as a specific characteristic for street setting to increased pedestrian traffic volumes and vibrant city environment. (Mehta & Bosson, 2021, Ringsberg et al., 2023) Another study found a positive relationship between retail sales and pedestrian infrastructure improvement such as outdoor seating. (Volker & Handy, 2021) However, the potential of outdoor seating to contribute to the visit volume of urban third place is understudied. This paper studies the following research questions: (1) does outdoor seating increase visit volume of urban third place? (2) if so, what characteristics of outdoor seating, such as quantity, density, material, and shape, lead to a greater increase?

This study uses coffee shops, as an example of urban third place, in New York City to examine the impact of outdoor seating on urban third place visit volume. Known as a bustling metropolis, New York City boasts a vibrant sidewalk cafe culture, which make New York City a particularly good testing ground to examine the impact of outdoor seating on third places.

I employ five sets of data from 2022 to 2023: location, rating, and characteristics of coffee shops, characteristics of coffee shop outdoor seating, visit volume of coffee shop, surrounding land use pattern, and surrounding demographic characteristics. The sample space, businesses that labeled as “coffee shop”, are located through the Google Maps’ Points of Interest (POI). The data for dependent variable, weekly visit volume of coffee shops, will be collected from Advan, a data provider. The data for independent variables, which include the number of outdoor seating provided, the seat density of outdoor seating area, and whether shade is provided, will be captured by image recognition process from google satellite map and google street view. Control variables capture (1) rating and interior design characteristics of coffee shops from google review, and (2) development and demographic characteristics of immediately adjacent blocks, which can be collected from New York City Automated City Register Information System (ACRIS) and Census Bureau respectively. Next step I will use regression to examine the impact of outdoor seating on the visit volume of urban third places.

After regression analysis, I expect to see (1) outdoor seating has a positive impact on visit volume of coffee shops (2) the impact of each characteristic of outdoor seating on visit volume of coffee shops.

This study contributes to urban third place literature by demonstrating the feasibility of utilizing outdoor seating to empower urban third place. Practically, this study can guide planners to encourage more outdoor seating, and suggest specific characteristic such as quantity, density, material, and shape of outdoor seating, to enhance social activities in urban third places for a better urban life.

Track 4 – Environmental Planning & Resource Development

Track 4 Pre-Organized Session Summaries and Abstracts for the Sessions

IMPROVING CLIMATE ADAPTATION THROUGH INFORMED ENVIRONMENTAL PLANNING
Abstract ID: 1112.0.0.262.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.281.2024, 1108.0.0.286.2024, 1108.0.0.592.2024

Andres Urcuqui Bustamante [University of Illinois Chicago] aurcuqui@uic.edu, organizer
Yao Wang [Louisiana State University] yaowang@lsu.edu
Zhuowei Li [Kansas State University] zhuowei@ksu.edu
Nawshin Tabassum [University of Utah] u1424030@utah.edu

Urban green spaces are increasingly considered essential attributes for improving both public health and wellbeing, while also playing a key role in mitigating climate change impacts. Advocates for green space planning seek to improve access to urban natural areas among historical disadvantaged communities to address longstanding environmental injustices and spatial segregation. Yet, planning of green spaces within cities often face undervaluation and controversy. Different perspectives among city planners, urban designers, policymakers, and community leaders further complicate these efforts. In this session, we will present a range of case studies showing the complex dynamics surrounding green space planning. We will delve into cross-disciplinary insights and pioneering approaches. We will explore the benefits of planning green spaces for people, while also addressing the inherent challenges of environmental planning across diverse contexts. The session will highlight policy implications for sustainable urban development by examining the nuanced relationship between environmental justice, climate change, and green space development.

Learning Objective(s):

- We aim to foster a deeper understanding of how to navigate the complexities surrounding green space planning for more inclusive and sustainable urban futures.
- Session participants will learn about qualitative and quantitative methods used in studying human dimensions of green space planning.

LINKING ENVIRONMENTAL JUSTICE AND GOVERNANCE IN UGS EQUITY RESEARCH
Abstract ID: 1108.0.0.281.2024
Pre-Organized Paper Presentation

Zhuowei Li [Kansas State University] zhuowei@ksu.edu, presenter

Environmental Justice (EJ) is a framework that has been employed to examine various kinds of inequitable issues related to the "environment". It is argued that the "environment" should not only be conceived as the wilderness or the "big outside", but rather the environmental conditions in which people interact. This indicates the pluralistic interpretations of EJ are necessary and the environment we interact with daily is not deterministic as it encompasses more than just the physical and tangible environmental characteristics, but the socially constructed ones as well. In addition, EJ itself has gone through significant expansion in its research scopes with progress in normative justice theory and its engagement with other frameworks, including 1) moving beyond distributive patterns to include deeper institutional and structural conditions of recognitional and procedural justice. 2) carrying identity beyond political and cultural boundaries and expanding across spatial scales.
Characterized by the different stakeholders' notions of Justice in a specific context, the effectiveness of EJ policies varies. The relationships between government agencies, civil society, and nature are greatly reconstructed across geographical scales under neoliberal capitalism, thus, indicating the deliveries of EJ policies are affected by the governance structures and decision-making mechanisms greatly. Environmental Governance (EG) is about both the social organization of decision-making regarding the environment, as well as the production of social order via the administration of nature, individually and collectively. It is also concerned dearly about justice as it has always had moral implications from distribution, participation, and recognition.
To this day, limited empirical evidence is present that assesses the mechanisms that lead to the current UGS distribution over time regarding UGS governance. Therefore, we ask what the role of civic participation is in promoting Environmental Justice. To answer this question, the case study investigates the governance structure and institutions of UGS in Austin, TX, and utilizes identified conditions of interest, including proximity to the nearest UGS, per capita size of green space, and the civic participation values, to test census block-group-level UGS equity using Crisp Set Qualitative Comparative Analysis. The anticipated result will produce a truth table for each decade showing configurations comprised of different conditions of interest. The parameter of fit of consistency shows whether there exists empirical set relations of being necessary or sufficient. The findings will shed light on expanding the pluralistic understandings of EJ, the messy issues concerning governance practices beyond neighborhood scale, and the opportunity of EJ as a framework to integrate and frame new challenges and methodologies by engaging both spatial and temporal scales.

EVALUATING THE INTEGRATION OF NATURE-BASED SOLUTIONS IN LOUISIANA PARISHES

Abstract ID: 1108.0.0.286.2024
Pre-Organized Paper Presentation

Yao Wang [Louisiana State University] yaowang@lsu.edu, presenter

Climate change presents critical and immediate challenges, as highlighted in this investigation, both globally and in specific regions such as Louisiana, United States. Louisiana is particularly at risk from the consequences of climate change, including rising sea levels, extreme weather occurrences (such as hurricanes, floods, and heatwaves), and shifts in energy consumption and water supply. For example, in the forthcoming decades, Louisiana is projected to undergo increased temperatures, thereby escalating the risk of intense floods and droughts. In excess of 107,201 properties in New Orleans are at a high risk of flooding, with a probability surpassing 26% over the next 30 years, which constitutes 99% of all properties in the city. Addressing the diverse needs and challenges encountered by various societal actors impacted by climate change is the immediate responsibility of governments.

The objective of this study is to assess the integration of nature-based solutions (NBS) policies and actions at the local level in Louisiana, with an emphasis on their potential to strengthen climate resilience. NBS can provide multifaceted benefits, encompassing environmental, social, and economic dimensions, while proficiently addressing and adapting to the localized impacts of climate change, thus enhancing local resilience. However, the degree to which parishes in Louisiana incorporate NBS policies and actions to mitigate climate change is not yet understood. Due to the intricate nature of planning decisions, this research scrutinizes the current nature-based initiatives at the parish level in Louisiana. The specific aims are: (1) Identify the presence of NBS policies and actions incorporated into parish plans. (2) Investigate differences in the prioritization of NBS policies and actions across parishes. (3) Assess the degree to which NBS policies and actions tackle issues of systemic racism and inequality.

This study utilizes content analysis to scrutinize the plans of 64 parishes in Louisiana, exploring the conceptualization and execution of NBS policies within established parish-led planning initiatives. The process of identifying plans that address NBS involves the systematic gathering of formal plans/policies associated with official parish budgets, excluding those without endorsement from parish governments. These encompass topics such as nature-based solutions, green infrastructure, sustainability, climate resilience, hazard mitigation, all within comprehensive plans and other relevant planning documents at the parish level. We employ thematic and open coding techniques via Atlas.TI to systematically classify NBS. The classification framework encompasses the typology, functionalities, and advantages of NBS.

The expected results of this study can provide a comprehensive understanding of the integration and effectiveness of NBS in mitigating the impacts of climate change at the local level in Louisiana. Additionally, the investigation into how NBS policies address systemic racism and inequality could shed light on the social equity dimensions of climate adaptation efforts. The impact of these findings could be significant for policymakers, planners, and community stakeholders. By highlighting best practices and gaps in the implementation of NBS, the study could inform the development of more effective and equitable climate resilience strategies. Moreover, the insights gained could contribute to the broader discourse on sustainable urban planning and the role of nature-based approaches in addressing climate change. Ultimately, the results could pave the way for more resilient and inclusive communities in Louisiana and beyond.

CLIMATE CHANGE ADAPTATION STRATEGIES FOR ACTIVE TRANSPORTATION IN US CITIES

Abstract ID: 1108.0.0.592.2024
Pre-Organized Paper Presentation

Nawshin Tabassum [University of Utah] u1424030@utah.edu, presenter
Reid Ewing [University of Utah] ewing@arch.utah.edu
Alessandro Rigolon [The University of Utah] alessandro.rigolon@utah.edu

Introduction. Climate change-induced hazards such as extreme heat, floods, and wildfires are affecting transportation in US cities. Cyclists and pedestrians are more exposed to these extreme weather events. For example, people might avoid biking, and pedestrians might choose longer but shaded routes during hot days. US cities are promoting active transportation as a mitigation measure for climate change. Therefore, it is necessary to explore the efforts taken by US cities to provide comfortable walking and biking facilities, considering extreme climate events.
Research goal. We examine how US cities include climate change adaptation strategies for pedestrians and bicyclists in their climate action plans, active transportation plans, bike plans, pedestrian plans, and urban forestry plans. This is the first national-level study to examine climate adaptation for active transportation.
Methods. We focused on the 100 largest US cities based on population in 2022. Understanding that climate adaptation for active transportation includes efforts by several planning sectors, we collected a variety of different plans for those cities. In total, we identified 75 climate action plans, 69 urban forest management plans, 32 active transport plans, and 88 bike and pedestrian plans. We then used combinations of keywords (e.g., adaptation, heat, cycling) to identify relevant paragraphs about climate adaptation for active transportation within those plans. Subsequently, we conducted content analysis for such relevant paragraphs, seeking to identify various types of adaptation strategies.
Results. The content analysis of the collected plans shows that most US cities have recently started including climate adaptation for active transportation issues. The plans noted the major climate change-induced hazards affecting active transportation, such as heat events, sea level rise, flooding, wildfires, cold weather, and others. Overall, more content in plans focused on climate mitigation strategies that aim to reduce motor vehicle miles

traveled by promoting active travel than on climate adaptation for active transportation.
Among the content focusing on adaptation, most strategies focus on addressing extreme heat threats and flood risk. Specifically, almost all cities are working to create more green infrastructure to reduce the heat island effect, such as increasing tree canopy and creating cool corridors. Many of these initiatives, such as San Diego's Green Street project, include green infrastructure strategies to reduce urban heat and flood risk, and thus, green infrastructure can address multiple adaptation issues. However, some cities face challenges in planting and managing street trees as trees cause conflict with utility lines and can damage sidewalks. Thus, plans report that planting street trees requires coordination among property owners, non-profit organizations, and city departments. Flooding is another threat that climate adaptation strategies are addressing. Some cities suggest interventions to reduce stormwater runoff, such as using permeable paving, improved drainage systems, de-paving parking lots, and modifying minimum parking requirements. For example, Tucson's Green Stormwater Infrastructure Program can potentially reduce the flooding impacts on neighborhood streets and provide shaded bikeways and walkways. Many cities often include equity considerations (e.g., the needs of low-income people, people with disabilities, and people of color) in these planning documents. Specifically, plans mention community input in expanding the active transportation network, prioritizing investments in majority-minority neighborhoods and low-income areas, Americans with Disabilities Act (ADA) compliant designs, and equitable access to transport facilities.
Implications. This research can help policymakers and planners understand the major climate change-induced hazards US cities face and their associated impacts on the active transportation sector. Our findings provide an overview of the climate change adaptation strategies for comfortable active transportation in cities around the US, and how these vary in different US regions. Planners can learn about funding opportunities and barriers to implementing climate adaptation for active transportation.

PREPARING A PLANNING WORKFORCE FOR THE ENERGY TRANSITION

Abstract ID: 1109.0.0.714.2024
Roundtable Submission

Sarah Mills [University of Michigan,] sbmills@umich.edu, organizer

An energy transition is underway. Technological advancements and reductions in costs for renewable energy, as well as huge federal tax incentives and billions in funding for infrastructure deployment, mean that is it is no longer "demand" for the technology that is the limitation; instead, the key hindrance is the ability to deploy (i.e., "supply") it fast enough.

While some of this infrastructure will certainly go into urban environments, most will be located in rural areas which have plenty of open space, low property costs, and low tax rates to host wind and solar farms. [For scale, most wind farms stretch over 25,000+ acres; the average size of a solar farm proposed in the Midwest is 1,600+ acres.] Indeed, more than 95% of the existing wind energy projects in the country and over 70% of the solar energy projects are in rural areas. That presents both a real economic opportunity to these communities but also challenges when not all members of a community are supportive of this change to their landscape, or when it is incompatible with other land use goals.

The need for planners to help communities—and private renewable energy developers—navigate this change has never been more urgent.

In this Roundtable we'll have a topical discussion with planning faculty engaged in teaching either energy planning or rural planning courses—or faculty who are interested in joining this small-but-growing crew—to discuss opportunities and challenges to preparing more students to be effective in the space. We'll start with pre-seeded questions including how to prepare "urban planning" students to be effective in the rural space, how to provide appropriate technical content without getting bogged down in the details, and discuss how to navigate the conversations which can be highly polarized. But the conversation will draw heavily upon the questions of roundtable attendees.

THE EVOLUTION OF ECOLOGICAL THOUGHT IN PLANNING

Abstract ID: 1109.0.0.25.2024

Roundtable Submission

Steven Richter [East Carolina University] richters22@ecu.edu, organizer
Marina Alberti [University of Washington] malberti@uw.edu
Catherine Brinkley [University of California, Davis] ckbrinkley@ucdavis.edu
Theodore Eisenman [University of Massachusetts Amherst] teisenman@umass.edu
Katherine Lieberknecht [University of Texas at Austin] klieberknecht@utexas.edu
Stephanie Pincetl [University of California Los Angeles] spincetl@ioes.ucla.edu
Shruti Syal [Virginia Commonwealth University] syals@vcu.edu

The interplay between environmental planning and ecology has been complex and, at times, inconsistently integrated. Historically, planning has predominantly focused on human ecosystems, often overshadowing the broader ecological context, despite environmental legislation and the undeniable ecological dimensions of contemporary environmental challenges such as climate change, disaster resilience, environmental justice and human health. This discrepancy highlights a gap between the theoretical underpinnings of planning as an applied form of human ecology (Steiner, Young, and Zube 1988) and the broader, often non-human (or more-than-human), ecological considerations.

Despite the ecological essence of many planning issues, the incorporation of ecological principles into planning has been relatively limited. Since 2002, each ACSP conference has featured at least one paper with "ecology" in its title, averaging around 4.5 per conference. However, the interpretation of "ecology" varies significantly, extending into interdisciplinary realms like "political ecology" and "social-ecology," with varying degrees of depth in engagement. Moreover, ecological concepts, such as the Tragedy of the Commons, permeate planning education and research (Brinkley, 2022), though Elinor Ostrom's Nobel prize winning work on collective resource management presents a critical evolution of this concept, emphasizing the potential for sustainable and equitable commons governance.

This roundtable aims to critically examine how ecological concepts and tools have been utilized and evolved within planning. The discussion will trace back to the integration of human ecology, as seen in Zipf's (1950) systems theory, and the influence of landscape architecture, notably through McHarg's (1971) regional analysis. The emergence of urban ecology (Alberti 2008) and the focus on urban resilience further exemplify the shifting dynamics between planning and ecology, emphasizing the integration of human, ecological, and technical dimensions. Yet, the field of planning, even within the environmental specialty, often lacks rigorous ecological training, hindering effective interdisciplinary collaboration and potentially leading to conflicting approaches in crucial research areas.

By reflecting on historical perspectives and exploring the potential for a more integrated future, this roundtable seeks to address past shortcomings and envision a path towards a more cohesive interdisciplinary approach. The discussion will explore opportunities for meaningful engagement between planning and ecology, aiming to enhance the resilience and sustainability of human settlements through informed and integrated planning practices.

Track 4 Individual Paper Presentations

A META-ANALYSIS OF GREENSPACE AND MENTAL HEALTH AFTER COVID-19

Abstract ID: 1108.0.0.1216.2024
Individual Paper Presentation

Jou Young Park [Yonsei University] jullie1052@yonsei.ac.kr, presenter
Jae Hyuk Hyun [SH Seoul Housing & Urban Innovation Corporation] flipandflap@naver.com

The COVID-19 pandemic emphasized the benefits of natural greenspace on mental health in pandemic situations. The effects of greenspace on reducing mental health disorder is detected, but limitations impede highlighting the overall effectiveness of greenspace on mental health to be valid and significant. Therefore, this study aims to comprehensively and quantitatively analyze the effaectiveness and significance of greeenspace on reducing mental disorders after COVID-19 outbreak.

This study adopted systematic review to select adequate, necessary studies with significant association between greenspace and mental health after COVID-19. Meta-analysis is performed using the selected studies for calculating and analyzing the combined effect size of greenspace on reducing mental disorder, difference of effect size in various factors of greenspace or mental health, and variables' effects on greenspace or mental health. Also, correlation test using MQRS and effect size is performed to determine significant correlations of factors in greenspace and mental health.

The analysis confirmed the combined effect size of association between greenspace and mental health to be interpreted as large enough(medium effect size, 0.565). Various factors consisting greenspace or mental health had considerable effect sizes, with heterogeneity exists between studies of different greenspace and mental health aspects(subgroups). Significant correlation of factors in greenspace and mental health was identified, with correlations satisfying both reliability and effectiveness are used for suggesting necessary greenspace policies with mental health benefits during pandemic situation.

Different variables of study period, female proportion, and mean age significantly affected certain factors of greenspace or mental health, while the increase in effects of greenspace on mental health was detected as the COVID-19 period prolongs. Also, the regional heterogeneity of effects on association between greenspace and mental health is recognized in all factors consisting greenspace and mental health except for visitation of greenspace.

In conclusion, valid and significant effects were detected in various associations between greenspace and mental health. Based on the results of this study, conducting elaborated research and establishing adequate and necessary greenspace policies and strategies are recommended to effectively benefit mental health of citizens in future pandemic situations.

A MULTI-FACETED ANALYSIS OF CLUSTERING PATTERNS OF RENEWABLE ENERGY FARMS

Abstract ID: 1108.0.0.1013.2024
Individual Paper Presentation

Anton Rozhkov [New York University] anton.r@nyu.edu, presenter

The transition toward renewable energy sources is critical in addressing global climate change and ensuring sustainable energy security both at the local and regional levels. By understanding the relations between physical characteristics, policy frameworks, and regional dynamics, planners can incorporate these findings into policy formulation and facilitate the implementation of targeted incentives and regulations to incentivize renewable energy adoption and foster more sustainable urban landscapes (Stokes and Warshaw 2017).

This research uncovers the clustering patterns of renewable energy farms (wind and solar photovoltaic) across the United States, encompassing both individual land-based and offshore wind turbines and large-scale ground-mounted solar photovoltaic (PV) installations with a capacity of 1 megawatt or more. By examining these patterns through multifaceted lenses, including physical/environmental characteristics and policy perspectives, this study explores the complex interrelationships of factors influencing the spatial distribution of renewable energy infrastructure.

Through the geospatial analysis performed with methods including spatial autocorrelation, spatial regression, and hotspot analysis (Rauner et al. 2016; Tercan et al. 2021), at the core of this investigation lies the examination of physical and environmental attributes such as solar radiation intensity and wind speed at different heights, which significantly impact the viability and efficiency of renewable energy installations. However, in addition to physical factors that are easy to explain and predict (Ko 2013), this study transcends the realms of environmental analysis to encompass policy perspectives, recognizing the central role of governmental regulations and incentives in driving the adoption and deployment of renewable energy technologies (Rozhkov 2023). By inspecting state-level policies and incentives, we attempt to define how different regions and individual states promote and support renewable energy development and how it is correlated with the clustering we identify. Through comparative analysis, we aim to uncover differences in policy frameworks and their implications on the spatial distribution and clustering patterns of renewable energy infrastructure, thereby providing insights into the effectiveness of policy interventions in fostering renewable energy adoption at the regional level.

Furthermore, this research explores the synergistic effects of physical/environmental characteristics and policy frameworks on the clustering patterns of renewable energy farms. By employing a comprehensive analytical framework that integrates both environmental and policy dimensions, we seek to unravel the complex interdependencies and feedback loops between these factors, shedding light on the drivers and barriers influencing the spatial distribution of renewable energy infrastructure in the United States.

In summary, this research offers a holistic understanding of the clustering patterns of renewable energy farms in the United States, encompassing both physical/environmental characteristics and environmental policy perspectives. By unraveling the multifaceted dynamics shaping the spatial distribution of renewable energy infrastructure, this study seeks to inform policymakers, stakeholders, and researchers alike, facilitating evidence-based decision-making and fostering the transition toward a more resilient energy future.

ACCEPTABILITY OF URBAN PLANNING ELEMENTS FOR CARBON REDUCTION

Abstract ID: 1108.0.0.307.2024
Individual Paper Presentation

Taehyun Kim [Korea Environment Institute] kimth@kei.re.kr, presenter

This research aims to contribute to the establishment of carbon-neutral policies in response to the global decarbonization transition by comparing the public acceptance of urban planning elements and policies aimed at reducing carbon footprints in South Korea and Germany. The study encompasses a comprehensive review of carbon footprint (CF) reduction research and policies within both nations, emphasizing sector-specific planning elements for food, housing, transportation, waste, and water consumption. Through the analysis of public acceptance and perception types towards these CF reduction planning elements and policies, the study aims to uncover actionable policy utilization methods. The research methodology involves an initial investigation of policy issues and research trends, followed by the delineation of the research scope and direction with expert consultations. Subsequent steps include the examination of CF reduction planning elements and policy initiatives, the derivation of sector-specific CF reduction elements using LangChain technology, and the validation of CF reduction plan elements and policy acceptance assessment items through expert consultations. The study further conducts an analysis of resident acceptance and perception types regarding sector-specific CF reduction planning elements and policies through online surveys targeting 500 individuals in South Korea and Germany, complemented by Q-methodology for perception type investigation and analysis. The comparative analysis of the survey results aims to identify the differences in determinants of acceptance based on perception types, leveraging descriptive statistical analysis and structural equation modeling. The ultimate goal is to propose policy utilization strategies informed by the comparative analysis of acceptance and perception type survey outcomes.

ADAPTING IN PLACE:THEORIZING THE GROWTH OF SMALL TOWNS UNDER CLIMATE CHANGE

Abstract ID: 1108.0.0.1223.2024
Individual Paper Presentation

Sridipta Ghatak [University of California, Irvine] sridipta2016@gmail.com, presenter

This paper studies the role of community-based climate adaptation in contributing to the emerging pattern of in-place growth of small towns in India. Combining a multi-sited qualitative case study with a representative survey, the paper examines the institutional conditions under which adapting to decarbonization through ground water management results in successful local adaptation, and an increase in the rate of urbanization in the adjacent small towns. Centered around the long-standing theory based on the urban-rural dichotomy, the paper proposes an alternative theorization of a growth continuum between and around smaller urban centers. The paper asks: how does locally based climate adaptation planning influence regional growth pattern? Further, the paper inquires how local market economies determine the outcome of adaptation planning.

The paper uses empirical evidence from a community-based adaptation program in West Bengal state in India, implemented by the West Bengal Accelerated Development of Minor Irrigation (WBADMI) project. The WBADMI project implements community-based groundwater management schemes by creating project location specific community-based organizations called Water User Associations (WUA). Currently, 2695 WUAs manage ground water use by small-time farmer communities across the state. The World Bank funded project is in its second phase starting 2024, with a plan to expand its WUA formation scheme. This paper uses evidence based on strategic comparative case studies of two such WUAs located in the peripheries of the nearest urban centers. Demographically similar in nature, the two WUAs vary in their proximity to metropolitan regions, thus varying in having access to large market infrastructure to sustain the benefits generated by the WBADMI adaptation scheme.

The paper hypothesizes that access and proximity to urban centers determine the success and long-term sustainability of the adaptation schemes, primarily due to the role of spatial access in sustaining the change these interventions are able to bring to the environmental and economic ecosystem of the project locations. Based on preliminary findings, the study claims that the benefits of adaptation projects located within the urban-rural continuum, and closer to urban centers exceed that of projects located away from urban centers. The former location of localized adaptation then leads to the process of urbanizing in-place much faster than the latter. This urbanization process is marked by a shift in the existing agrarian economy, household prosperity measures and intrahousehold investment decisions. Data is collected through qualitative case study comprising of focus group discussion, stakeholder interviews and shadowing community leaders, and through a representative sample survey.

The study poses that adaptation projects located in the peri-urban interiors of metropolitan regions growing under the conditions of neoliberal environmental governance demonstrate a peculiar form of growth, wherein these smaller, semi-rural towns grow in-place, showcasing the characteristics of urbanization through new economic activities stemming from planned adaptation, while retaining their inherent unurbanized, visibly rural characteristics. This seemingly ‘unurban’ appearing development brings into a place the other characteristics of urbanization, such as an increase in population density, influx of floating population of informal sector workers, increased land prices, shrinking of cultivable land, and a marked decrease in agricultural activities.

The paper contributes to existing theories on climate adaptation, community-based organizations, peri-urban development, and place-based climate justice. From a planning implementation perspective, the findings directly inform the policies looking to find long term strategic planning solutions for sustaining state-interventions in assisted climate change adaptation.

AN ANALYSIS OF LAND USE AND LAND COVER NEAR HIGHWAY PROJECTS IN CALIFORNIA

Abstract ID: 1108.0.0.93.2024
Individual Paper Presentation

Serena Alexander [Northeastern] se.alexander@northeastern.edu, presenter
Bo Yang [San Jose State University] bo.yang02@sjsu.edu
Owen Hussey [San Jose State University] owen.hussey@sjsu.edu

Highway capacity expansion has wide impacts on land use and land cover (LULC). Cost-benefit analyses and environmental review processes for roadway capacity expansion and maintenance decisions do not comprehensively consider the LULC impacts. This study examined land cover changes directly associated with highway expansion in California, and the relationship between land use and the vegetation impacts of highway projects using satellite remote sensing data. The methodology involves a geospatial analysis of Normalized Difference Vegetation Index (NDVI) data in 18 sites across California before and after highway expansion project completion. We accounted for seasonality and included a set of control sites. Findings indicate that the impacts of highway expansion on changes in NDVI are diverse, stressing the importance of the environmental context around each individual project site. Sites that are located near less-developed areas with more extensive natural vegetation (e.g. sprawled areas or exurbs), show a significant decline in NDVI values. Virtually all sites with insignificant changes in NDVI after highway expansion are located in areas that already exhibit heavy urban development (e.g.,

Los Angeles, San José) or are otherwise located near large expanses of bare, non-vegetated earth. Also, project sites that experienced multiple types of construction (i.e., adding more lanes, widening sections, bridge renovation, etc.) were more likely to exhibit decreasing NDVI values compared to project sites that only experienced one type of construction. Decisions about highway construction and capacity expansion should consider the context and the full environmental impacts, including land use and land cover changes over time.

AN EVALUATION OF QUEENSLAND LOCAL COASTAL HAZARD ADAPTATION STRATEGIES

Abstract ID: 1108.0.0.908.2024
Individual Paper Presentation

Aysin Dedekorkut-Howes [Griffith University] a.dedekorkut@griffith.edu.au, presenter

Approximately 85 percent of Australians live in the coastal region. Coupled with rapid population growth and increasing development pressure, climate change impacts such as rising sea levels and the increasing intensity of storms and cyclones pose growing risks to Australia's lifestyle, environment, and economy. Prior research provided a comparative analysis of adaptation to sea-level rise and coastal flooding in all Australian states and territories (Dedekorkut-Howes et al. 2021); however, no such assessment at the local level exists.

Queensland is one of the most vulnerable states to the coastal climate change impacts in Australia with the highest number of residential and light industrial buildings and the greatest value of existing road infrastructure at risk from a sea level rise (DCCEE 2011). More than 80 percent of Queenslanders live on the coast. The level of vulnerability and risk is well-known; however, action to date has been limited by all levels of government (Howes and Dedekorkut-Howes 2016). In 2016 Queensland state government launched the QCoast2100 program which funds Queensland coastal local governments to prepare Coastal Hazard Adaptation Strategies (CHAS) (Torabi et al.

2022). Of the 31 coastal local governments participating in the first phase of the program 26 of them released a draft or final strategy to date and the remainder are in the final stages of the process.

This project aims to examine local level coastal climate adaptation through the example of Queensland's QCoast2100 program. The research focuses on strategies for managing the consequences of sea-level rise in Australian coastal settlements and aims to answer the following questions: "What are local governments in Queensland doing to adapt to coastal flooding and sea-level rise? Are current initiatives sufficient to manage the risks? How can they be improved?" These questions are answered through an evaluation of the CHAS documents completed to date in terms of their comprehensiveness, implementability, transparency, stakeholder engagement, and inclusion of best practice coastal adaptation strategies and practices. This is supported by 47 semi-structured interviews with key stakeholders involved in strategy preparation and implementation. The interviews collected data on how sufficient these strategies are for adapting coastal hazards, barriers to preparing and implementing adaptation plans and what can be done to overcome them.

Findings indicate that the program was invaluable in putting coastal hazards on the agenda of local governments. The documents produced are viewed as a starting point and provide an understanding of the coastal risks and timelines. In most cases, they are used as basis for funding applications for implementation of the adaptation actions identified. Without this additional funding most local governments do not have the necessary resources to implement the strategies. Majority of the councils do not have dedicated staff for this program and lack of capacity and expertise are also hampering the implementation.

ANALYZING INTRA-URBAN SPATIOTEMPORAL CO2 PATTERNS USING MULTISOURCE DATA

Abstract ID: 1108.0.0.560.2024

Individual Paper Presentation

Yuyan Huang [Tongji University] huangyuyan@tongji.edu.cn, presenter
Liu Chao [Tongji University, College of Architecture and Urban Planning] liuchao1020@tongji.edu.cn

The pressing challenge of global warming highlights the need for monitoring carbon emissions. Urban planning can play a critical role in reducing carbon emissions at the intra-urban level. However, current carbon-related urban planning lacks empirical data to support it due to the lack of valid high-precision monitored data. This study aims to examine the spatiotemporal distribution of carbon concentrations in Shanghai, a megacity, by utilizing a multi-source monitoring data approach. The study uses six monitoring station data and satellite inversion data from Shanghai to analyze the spatial distribution of carbon concentrations. The time-series analysis from central urban and background monitoring sites is used to analyze the temporal distribution. The research employs Geometry Weighted Random Forest Classification (GWRFC) to perform spatially correlated analysis concerning built environment and social activity in grids. The study identifies preliminary factors, including industrial heat sources, population, and land use. This approach can provide empirical data to support carbon-related urban planning, which can help in reducing carbon emissions in Shanghai.

Background: Understanding the total and distributed characteristics of carbon emissions is crucial, especially within urban areas where traditional carbon monitoring methods may not accurately reflect internal temporal and spatial distributions. While the IPCC's top-down method offers a framework for estimating greenhouse gas emissions, it falls short in accounting for hidden emissions from consumption processes. Therefore, real-world monitoring can provide more accurate results and refine estimates. In 2022, Shanghai let out 131m tons of carbon dioxide, omitting 10.9% of carbon dioxide with only 2% land in the Yangtze River Delta agglomeration. In this circumstance, understanding how factors affect carbon concentration may help cities, especially megacities, reduce their carbon emission through an overall planning perspective.

Methods: High-precision carbon concentration data are from real-time monitoring at 6 ground stations including the central station (Jing’an), the background station (Chongming), and four other stations located in Shanghai Center, Jiading, Qingpu, and Fengxian (separated over Shanghai) continuously for a year in 2023. The monitoring stations also capture wind speed, direction, temperature, and humidity data. Spatially satellite inversion results from 2023 are corrected using ground-monitored data and inverted 3km×3km resolution carbon column concentration grid data in Shanghai. The study also analyzed full-year temporal sequences from Jing'an and Chongming sites and monthly averages at various altitudes from a central Shanghai site for vertical comparison. Machine learning techniques, GWRFC for example, were applied to attribute spatial variations gridded correlation with carbon concentrations to specific influencing factors.

Results: Spatially, the study identified distinct distribution characteristics, with the highest carbon dioxide levels in Jing'an (downtown) and the lowest in Chongming (suburban seashore and background station). Temporally, the comparison of background sites with urban sites reflected human activity changes, with significant diurnal variability observed in the urban environment during summer and early autumn. At altitudes between 225-335m, average monthly carbon concentrations were some 470ppm, significantly higher than the surface and upper atmosphere levels of approximately 430ppm. Machine learning analysis of spatial grids, incorporating industrial heat source data, population data, and land use types, explored preliminary influencing factors to figure out the contribution of built environment and socio-economic factors in Shanghai, from which the pattern would be introduced to other cities.

Conclusion: This research offers a cutting-edge analysis of carbon concentration patterns within Shanghai's urban landuse, leveraging a combination of monitoring datasets, high-resolution satellite inversion column data, and urban built environment factors. It reveals the potential of urban planning to mitigate emissions through spatial

optimization. Identifying high-emission zones and their drivers—such as industrial operations and population density—enables targeted planning interventions. Prioritizing mixed-use development and expanding green spaces not only reduces commuting-related emissions but also leverages the carbon sequestration benefits of urban greenery. These findings advocate for a strategic integration of technology, policy, and sustainable development to significantly decrease CO2 levels in metropolitan regions.

ANALYZING PARTICIPATORY PLANNING MEETINGS USING LARGE LANGUAGE MODELS

Abstract ID: 1108.0.0.917.2024
Individual Paper Presentation

Dan Milz [University of Hawai'i at Mānoa] dmilz@hawaii.edu, presenter
Jennifer Kagan [University of Hawaii at Manoa] jkagan@hawaii.edu
Mahdi Belcaid [Unversity of Hawai'i at Mānoa] mahdi@hawaii.edu

How can generative artificial intelligence be used to improve public input on planning outcomes? Recent research has demonstrated the potential for Large Language Models (LLMs), like ChatGPT, for improving how planners review and synthesize public input data. However, written testimony submitted through online portals and/or social media are one small component of how the public engages in plan-making. A large portion of public participation actually occurs in face-to-face and virtual public meetings. There are an array of challenges faced by trying to analyze user-submitted, textual feedback, including contextual knowledge, local vernacular, emotional content, and sarcasm, using LLMs. These and other challenges are amplified during interactive public meetings and hearings. Moreover, multi-party dialogue is much more difficult to parse, as well, and the volume of text-based transcripts that could be produced from a single planning process might dwarf user-submitted, textual feedback. Nevertheless, the potential for using LLMs to analyze public meetings should not be understated.

Because public meetings represent one of the most crucial elements of participatory planning process, accurately capturing and synthesizing what is said, by whom, and to what effect is critical. Most participatory planning process rely on informal, handwritten notes, or formally adopted meeting minutes to capture a record of what occurred during public meetings. These reflections can introduce distortions into the record that may influence how plans are composed or what policies are considered. To counteract these distortions, we have pioneered a method for analyzing participatory planning meetings using audio/video recordings. These methods have provided unique insights into how participants in planning meetings reason about complexity and space and scale, for instance, and also how facilitators and planning technology influences stakeholder judgment.

In this paper, we draw the trend of using LLMs for planing purposes into our ongoing research using audio/video recordings to analyze public meetings. The purpose of this paper is to demonstrate how LLMs and other natural language processing tools might be used to analyze public meetings. For this paper, we focus our analysis on how public input impacted water policy in Maui County, Hawaii leading up to and following the disastrous wildfires which occurred in August 2023. We accessed publicly available meeting recordings, transcribed them, and analyzed the transcripts using several commercially available LLMs. We focus our analysis on identifying shifts in topics discussed and the sentiment of the discussion. Our preliminary findings suggest that, prior to the August 2024 wildfires, the public had little to no influence on the water resources policy in Maui. However, the public response to the wildfire triggered a temporary and observable shift in water policy, in terms of the topics considered and the decisions made by public officials. We discuss the value of using this analytical approach and outline its potential impact on planning practice and research.

ASSESSING EXPOSURE TO URBAN HEAT THROUGH HOUSING AND THE BUILT ENVIRONMENT

Abstract ID: 1108.0.0.1104.2024
Individual Paper Presentation

Shiva Sheikhfarshi [University of Illinois at Urbana-Champaign] shivas4@illinois.edu, presenter
Andrew Greenlee [University of Illinois Urbana Champaign] agreen4@illinois.edu
Fang Fang [University of Illinois at Urbana-Champaign] fangf@illinois.edu

Extreme summer temperatures have negative environmental, social, and health impacts (Cianconi et al., 2020; Kalisa et al., 2018). Previous studies found that extreme heat is associated with neighborhood characteristics. Housing characteristics, spatial composition of land cover and land use, building form and street network affect the temperature of the surrounding environment (Hart & Sailor, 2009; Zheng et al., 2019). Also, in the United States cities, changes in housing characteristics and land cover are associated with neighborhood income level and demographic characteristics (Mitchell and Chakraborty, 2015).

In this paper, we examine the relationship between urban housing types and neighborhood land surface temperature (LST). Using Washington D.C. as a heuristic, we measure the variation of summer LST among different housing types, identify the prevalence of heat exposure disparities for different socioeconomic groups, and discuss strategies for policy makers regarding the use of housing policy to address disparities in heat exposure. We answer two questions: First, how does summer warmth as measured by land surface temperature (LST) vary across housing types and socioeconomic groups? Second, what are the effects of the spatial structure of housing types in relation to the intense summer heat? Our findings reveal that detached single-family housing experiences the lowest heat exposure while large multifamily developments experience the highest heat exposure. These disparities overlap with neighborhood sociodemographic characteristics, with low-income households and people of color being more likely to live in neighborhoods that experience higher temperatures on average during the summer.

Findings from our study point to the potential for inclusionary housing policies and zoning reforms to be incorporated in heat mitigation strategies in residential settings and contribute to improving health equity and the mitigation of adverse health outcomes associated with urban heat exposure.

ASSESSING THE ECONOMIC VALUE OF URBAN PARKS WITH MOBILITY DATA IN AUSTIN,TX

Abstract ID: 1108.0.0.114.2024
Individual Paper Presentation

Zipeng Guo [Texas A&M University] guo7501@tamu.edu, presenter
Yang Song [Texas A&M University] yangsong@tamu.edu

Background and Research Question:

Urban parks are crucial for community and environmental well-being, offering significant ecological, social, and health benefits. To effectively prioritize funding for reconstruction and maintenance, the Parks and Recreation Department needs to quantify the benefits of urban parks. This quantification is vital for justifying investments and funding, shaping policy and planning, and directing maintenance and enhancement efforts (Harnik, 2009), which can lead to significant improvements in social equity and quality of life. However, traditional methods of measuring park benefits present several challenges. 1. Quantifying the non-economic values of parks is challenging. 2. The data used often suffers from low reliability and small sample sizes. 3. These methods struggle to accurately capture the complex dynamics of tourist behavior.

Utilizing a case study, this project will explore the long-term economic benefit of urban parks in Austin, TX, quantified through public welfare using the Travel Cost Method (TCM). It will also examine how the economic benefits of two urban parks, identical in size and year of construction, differ when analyzed longitudinally over time (annually, monthly, and weekly).

Methodology and Findings:

This research is driven by human-based data, it utilizes mobility data from SafeGraph and Advan, which is valued for its precision and the timely updating of various ground truth datasets, enhancing data reliability. Ethical concerns were mitigated through privacy measures like the Laplacian noise algorithm. (SafeGraph： Places Accuracy, 2023). This dataset encompasses Garrison District Park and Gaines Creek Neighborhood Park, two parks in Austin, Texas, that share similar characteristics—both span approximately 39.5 acres and were constructed in the mid-to-late 20th century. It includes detailed information on roughly 1.8 million Points of Interest (POIs).

This study quantifies the economic benefits of urban parks using the TCM. It provides objective insights into travel behavior and associated costs and enhances the accuracy of economic valuations for park-related activities. The application of TCM in assessing park economic value is particularly beneficial as it: TCM provides empirical data on park valuation from a user perspective (Iamtrakul et al., 2005). Also quantifying the economic value of parks through visitor travel costs can aid in justifying park budget allocations and balancing public spending, ultimately contributing to public welfare by ensuring that investments in green spaces reflect community values and needs.

Utilizing data on time spent in the park, visitation rates, and travel distances, the study applies TCM to calculate the Consumer Surplus of parks, with a focus on comparing Garrison District Park and Gaines Creek Neighborhood Park in Austin. The preliminary analysis suggests that significant differences in economic benefits between parks are observed when accounting for control variables such as park size and construction time. The total estimated economic benefits from recreational uses of Garrison District Park amount to $2662,360, while for Gaines Creek

Neighborhood Park, the figure is $728,480. The next phase of the research will concentrate on investigating how park facilities and the surrounding urban environment influence these economic benefits.

Relevance and Implications:

By enhancing the accuracy and efficiency of public welfare valuations(Jaung & Carrasco, 2020), this study equips Austin's park management with valuable tools for aligning park maintenance and recreational use with conservation goals. The findings advocate for a data-driven approach to resource allocation for urban green spaces(Engin et al., 2020), providing policymakers with a robust justification for investing in park development and maintenance. It also can be a useful method to assist local government in planning multiple uses of public lands and prioritizing the budget based on benefit value to support public welfare.

ASSESSING THE U.S. 50 STATE-LEVEL WETLAND CONSERVATION PROGRAM PLANS

Abstract ID: 1108.0.0.52.2024
Individual Paper Presentation

Zhenghong Tang [University of Nebraska-Lincoln] ztang2@unl.edu, presenter
Rao Nargis Jahan [University of Nebraska-Lincoln] rjahan3@huskers.unl.edu
Risha Singh [University of Nebraska-Lincoln] rsingh17@huskers.unl.edu

Rabah Khan [University of Nebraska-Lincoln] rkhan7@huskers.unl.edu

Wetlands, renowned as vital ecological hubs, serve as essential "biological supermarkets," sustaining diverse wildlife through abundant food resources. In the United States, federal laws and regulations provide a robust framework for wetland protection. However, the extent to which state-level planning efforts align with national missions, particularly regarding the imperative of "no-net-loss" of wetlands, warrants examination. This study evaluates the status of state-level wetland program plans across all 50 states from 2015 to 2023. Through a comprehensive analysis of the current available EPA-approved plans, employing a framework of 30 indicators spanning five categories, this research scrutinizes the strengths and weaknesses in state-level wetland conservation

management and planning. Our findings reveal promising trends: while state plans demonstrate varying degrees of focus on wetland conservation, integration with broader environmental protection efforts is notable. However, the crucial national goal of "no-net-loss" of wetlands is inconsistently reflected in state plans, signaling a clear gap between overarching mandates and on-the-ground realities. Particularly concerning is the limited attention paid to addressing wetland degradation, indicating a pressing need for more targeted and proactive conservation strategies at the state level. This study underscores the importance of states adopting explicit and concerted approaches to wetland conservation, emphasizing the integration of environmental considerations across governmental agencies. Ultimately, it provides valuable insights and a practical roadmap for enhancing wetland conservation within state and local planning frameworks.

Michelle Meyer [Texas A&M University] mmeyer@arch.tamu.edu

Background and Research Question:

Cancer has long been recognized as a cause of death in the US (Siegel et al., 2022). Social vulnerability Index (SVI), which consists of non-medical factors such as socioeconomic status (SES), race, and ethnicity that influence health outcomes, are known to contribute to disparities in cancer incidence and mortality. In various societal domains, one of its key drivers to persist structural racism is racialized residential segregation (Moazzam et al., 2023). Notably, the Home Owner's Loan Corporation (HOLC) was a government-sponsored body created as part of the

1930s New Deal era that refinanced home mortgages and graded neighborhoods based on mortgage security risk. These maps encouraged mortgage lending in predominantly White and affluent neighborhoods (A, B) and discouraging investment in neighborhoods whose residents were disproportionately low income, foreign born, or people of color (C, D) (Wright et al., 2022).This discriminatory practice leaded to reduced access to education, employment, income mobility, healthcare, and ultimately contributing to increased present-day social vulnerability. In essence, discriminatory policies such as redlining can continue to have a severe impact on healthcare even decades after having been discontinued (Moazzam et al., 2023).

While the previous studies have analyzed only a specific kind of disease site in isolated geographic regions, limited studies have investigated the comprehensive association between historical redlining and cancer-related hospital utilization. Research question of this study is belowed: to explore the complex relationship between environmental risk, cancer-related hospital utilization, Social Vulnerability Index (SVI), and historical redlining using Structural Equation Modeling (SEM).

Methodology and Findings:

This study conducted three path models to confirm relationships between variables with ZCTA level in Texas State: (1) Path model 1 – Environmental risk, cancer-related hospital utilization and Social Vulnerability Index (SVI) (n=1,935); (2) Path model 2 – Including Redlining for Model 2 (n=1,935); (3) Path model 3 – Only for county having a Redlining (n=608). Then, we analyzed spatial association to compensate for spatial autocorrelation, utilizing spatial statistical models (SEM and SLM) and ordinary least squares.

The results revealed that there are significant relationship between Environmental risk, SVI, cancer-related hospital utilization, also the relation of each variable with redlining. When redlining is included in the model 2, the association of hospital utilization, environmental risk is getting weeker than model 1. However, focusing on the area that had a redlining, the association of (1) environmental risk with SVI; (2) SVI with redlining became stronger. This means that redlining affects the local SVI, which affects the local environmental risk. As a result, the environmental risk where redlining existed in the past tends to be large, which also affects cancer incidence and contributes to the US health quality.. The results suggest that cancer-related hospital utilization is affected not only by the individual's socio-economic status but also by the residential segmentation due to structural discrimination.

Relevance and Implications:

Recognizing and comprehending health disparities among cancer patients can guide efforts aimed at reducing excessive cancer incidence and mortality, lowering economic burdens on society, and advancing health equity. Our research findings bolster the need for further investigation into the enduring health consequences of past redlining practices, as well as other historical injustices, both individually and in conjunction with contemporary legacies of these policies. Such insights also hold significance for informing policy decisions and healthcare strategies at both local and state levels.

AUSTRALIAN URBAN PLANNERS' PREPAREDNESS TO ACT ON CLIMATE CHANGE

Abstract ID: 1108.0.0.837.2024
Individual Paper Presentation

Anna Hurlimann [The University of Melbourne] hurac@unimelb.edu.au, presenter
Sareh Moosavi [The University of Melbourne] sareh.moosavi@unimelb.edu.au
Alan March [The University of Melbourne] alanpm@unimelb.edu.au
Judy Bush [The University of Melbourne] judy.bush@unimelb.edu.au
Georgia Warren-Myers [The University of Melbourne] georgia.warrenmyers@unimelb.edu.au

In an increasingly urbanised world, which is facing significant climate change impacts in the coming decades (Intergovernmental Panel on Climate Change, 2023), the capacity of urban planners to address climate change will be critical. Rapid decarbonisation of cities is required (Hsu et al., 2022), as is new ways of planning to avoid hazards that climate change is presenting (Meerow & Ladd, 2022). Yet research indicates that even when climate change is indicated as a priority in planning documents, and the need for a paradigm shift is acknowledged, in practice climate change is subordinate to other priorities such as economic growth (Hrelja et al., 2015). Thus, ensuring urban planners have the awareness of climate change and it's impacts; the analytical capacity to apply this to their decision making in practice; and the ability to enable actions to address climate change – will be critical to minimise loss and damage associated with climate change. Yet, there has been limited research conducted to understand how prepared urban planners are to address climate change. This work builds on previous research, by exploring the preparedness of urban planners to act on climate change using Moser and Luers (2008) climate change preparedness framework which comprises: awareness, analytical capacity, actions (AAA). The aim of this paper is to explore how prepared Australian urban planners are to act on climate change. It explores this through the following research questions: Are Australian urban planners aware of climate change risks? Do they have the analytical capacity to understand climate change and translate that into their practice? What actions are they taking to address climate change? To answer these questions, in depth interviews were undertaken with 21 Australian urban planners in a diverse range of public and private sector roles across the country.

The research found that most respondents were able to identify key climate change risks for urban planning (awareness), including flooding; heat; sea level rise and coastal erosion. However, fewer were able to identify skills they personally had to assist with climate change risk (analytical capacity). Many in large organisation relied on other colleagues or departments to provide such skills and capacity. The main ways in which risks were cited as being assessed were through planning tools such as 'overlays' informed by flood modelling and other risk assessments, and ESD and water sensitive urban design controls. The most frequently stated action taken by respondents to address climate change was the development of policies and strategies within their own organisation – ranging from development of climate adaptation plans for those working in government, to organisational sustainability plans for those in the private sector. Another key action was lobbying or advocating for

change. The results from each of the AAA components will be brought together to present a framework of climate change 'frontrunners'. The details of the framework can inform the development of more advantageous urban planning practice for climate change action.

The full paper will present a review literature on the climate change preparedness of urban planning professionals, before providing context to urban planning in Australia. Details of the research method will be provided before results are presented and discussed, including implications for theory and practice.

BARRIERS IN INTEGRATING ECOSYSTEM SERVICES INTO THAI ENVIRONMENTAL POLICIES

Abstract ID: 1108.0.0.131.2024

Individual Paper Presentation

Sauvanithi Yupho [Department of Geography, Rutgers University] s.yupho@rutgers.edu, presenter

Concerns regarding climate change and biodiversity loss have elevated discussions around integrating ecosystem services (ES) or ecosystem-based solutions into environmental planning (IPBES, 2019). Simultaneously, climate impacts have spurred the development of large-scale grey infrastructures such as dams, dikes, and diversions as responses to climate uncertainty. While these infrastructures offer promising technological solutions, various studies have highlighted their potential for irreversible environmental degradation and adverse effects on communities with lower socio-economic status (IPBES, 2019; Shi et al., 2021).

In Thailand, situated in the monsoon belt like many other Asian countries, addressing climate impacts and incorporating ecosystem-based solutions into environmental planning presents significant challenges. Thailand was among the first Southeast Asian countries to receive substantial financial and technical support from multilateral organizations such as UNDP and GIZ to explore and incorporate ecosystem services into environmental planning and natural resource management sectors like the Royal Irrigation Department, Royal Forest Department, and Department of National Parks, Wildlife, and Plant Conservation. Yet, the Thai government often defaults to familiar technological solutions, favoring grey infrastructure like floodwalls and manmade canals to mitigate floods and

droughts, even though the repeated implementation of this strategy has proven ineffective in safeguarding many Thai cities (Marks & Elinof, 2020). Despite international facilitation targeting several Thai agencies, a global focus on adopting ecosystem services concepts, and the growing scholarly literature supporting this concept, over the past decade, Thailand has struggled to fully integrate these approaches into comprehensive policy frameworks (Huu Loc et al., 2020). The implementation of ecosystem services remains largely confined to pilot projects, failing to achieve broader adoption.

This study aims to investigate the reasons behind the apparent disconnect between international support for ecosystem services and their recognition in Thai governmental policies. By examining both perspectives of ecosystem services and policymakers, the research seeks to uncover practical implications and on-the-ground impacts. Employing a multi-method approach including ethnographic observations, case studies, 30 in-depth stakeholder interviews (both on-site and online), and an extensive review of governmental documents and literature, the research sheds light on institutional and governance barriers hindering the mainstreaming of ecosystem services into policy frameworks and on-the-ground implementation. This research methodology enables a better understanding of the impacts of climate change policy and socio-environmental interactions. It provides holistic views and broader insights into policy and its implementation within communities (Barnes et al., 2013).

Findings reveal how rigid institutional structures have evolved into bureaucratic and political boundaries, fragmenting responsibilities and hindering cross-sectoral coordination necessary for mainstreaming ecosystem services. Other key obstacles include policymakers' unfamiliarity with ecosystem services, challenges in quantifying ecosystem service values compared to traditional cost-benefit analyses, discontinuity of external ecosystem services support across siloed agencies, and misalignment between ecosystem services principles and specific departmental mandates. Moreover, the prevalence of grey infrastructure has entrenched path dependence in infrastructure development, reinforcing institutional inertia that prioritizes economic growth over environmental sustainability. By focusing on the context of the global South, rather than challenging the ecosystem services literature, this study contributes to the limited body of literature on integrating ecosystem services into environmental policies and implementation. By examining place-based practices in Thailand, the research offers insights into the institutional factors and policy disconnects that have hindered the mainstreaming of ecosystem services, which are relevant not only for Thailand but also for other nations seeking to adopt ecosystem services for sustainable climate adaptation pathways.

CAUSAL PATHWAYS TO JUST OUTCOMES IN URBAN NATURE-BASED SOLUTIONS

Abstract ID: 1108.0.0.1222.2024
Individual Paper Presentation

Raphael Ayambire [University of Manitoba] raphael.ayambire@umanitoba.ca, presenter
Cynthia Musah [University of Waterloo] cimusah@uwaterloo.ca

Recent interest in nature-based solutions (NbS) has catalyzed significant momentum toward a new paradigm of urban climate action centered around emulating nature and amplifying nature's capability to address sustainability crises. Proponents of NbS highlight their dual potential to address environmental challenges and enhance human wellbeing. However, there is a risk that NbS could be used to perpetuate new forms of displacement, marginalization, and other environmental injustices in urban settings. Despite these well-documented concerns, strategies for planning and implementing NbS in a socially just manner are still not fully developed, particularly within urban contexts. This article aims to bridge this gap. Employing the Fuzzy Set Qualitative Comparative Analysis (fsQCA) method, we pinpoint the causal conditions contributing to social justice outcomes in 14 global NbS case studies, thereby answering the critical question: What combinations of planning and governance factors contribute to social justice outcomes in the implementation of NbS? Drawing on Fainstein's framework of justice as equity, democracy, and diversity, three causal conditions are hypothesized to influence justice outcomes: the level of participation, the inclusion of justice considerations in project design, and the degree of public/community control. Cases were calibrated for condition and outcome membership via qualitative comparative methods, and truth table analysis was performed using fsQCA 3.0 software. Tests of necessity find no single condition is fully required on its own to produce just results. However, fsQCA solutions point to purposefully designing NbS to promote justice as the most important core pathway, featuring in the complex and intermediate solutions for all four outcome variables: distribution, process, recognition, and overall justice outcomes. Additional peripheral pathways emerge depending on the specific justice dimension. For distributive, recognition-based, and overall justice outcomes, a lack of public control combined with deeper community engagement fostered more equitable outcomes. This suggests that where public control of NbS projects is absent, deeper levels of community engagement are required to foster justice outcomes. This fsQCA advances theoretical and applied understandings of enabling just outcomes in NbS. Key findings suggest planners and practitioners should prioritize inclusive decision-making processes that embed disadvantaged communities, coupled with an intentional focus on justice issues from project inception. While no single approach guarantees justice, these multi-causal pathways offer transferable policy insights supportive of a just cities agenda centered around sustainability, equity, and community wellbeing.

CHARACTERIZING NIGHTTIME URBAN HEAT DYNAMICS: A STUDY OF PORTLAND METRO, OR

Abstract ID: 1108.0.0.868.2024
Individual Paper Presentation

YunJae Ock [Portland State University] yunjae@pdx.edu, presenter
Vivek Shandas [Portland State University] vshandas@pdx.edu

Urban Heat is an ongoing and growing climate-related concern that significantly impacts human health. As heat is not static and varies over the day – by time and space -- evaluating how its distribution is mediated by built environment factors is important. Of particular interest for cities with materials that retain and radiate heat, temperatures at night have been a prominent factor in safeguarding communities. Nighttime heat is projected to become greater, and it would have a significant health impact on both heat-related death and well-being. Perhaps because of limited access to multiple time periods of high-resolution temperatures, fewer studies currently examine the relationship between the built environment and nighttime heat or the temporal cooling occurring at night.

The study draws on a novel high-resolution dataset of urban heat collected over three periods of the day – morning (6-7am), afternoon (3-4pm), and evening (7-8pm) – in the Portland metropolitan region during 2023. We use the multi-temporal dataset to understand nighttime temperature dynamics: afternoon to evening cooling and evening to morning cooling, both of which correspond to the gaining of heat and the overnight cooling. We refer to both of these phases as (1) the resistance phase (afternoon to evening) and (2) the recovery phase (evening to morning). The resistance phase is the period that resists heat absorption by urban structures, and the recovery phase is when the heat is released from the urban texture, and overnight cooling occurs.

The use of the resilience framework allows us to understand how heat changes through an urban region using established concepts such as resistance and recovery. Of particular interest is aligning the resilience framework with characteristics of the built environment and sociodemographics. Specifically, we ask: (1) Do urban neighborhoods with different urban characteristics have different diurnal and nocturnal UHI? (2) Does the nighttime heat resistance and recovery differ among those neighborhoods, and (3) To what extent is nighttime heat release associated with socioeconomic conditions? We anticipate that addressing these questions will support theoretical, methodological, and practical developments in the field of climate adaptation.

We develop a set of neighborhood-scale built environment indicators and classify neighborhoods by them. The classified neighborhoods are used to identify differences in nighttime heat dynamics using statistical ANOVA and

post-hoc tests. The results identify the difference in nighttime heat resistance and recovery measures by classified neighborhoods. Lastly, regression analysis with socioeconomic variables identified the association with these resilience measures.

The result of the study reveals that urban heat varies significantly by neighborhood during the day, though go further to highlight the implications of built environmental characteristics on nighttime resistance and recovery. By establishing a link between nighttime heat dynamics and urban characteristics, the research illuminates how different areas within Portland Metro, OR, respond to heat throughout the day, especially at night, and identifies factors contributing to effectively releasing heat. The study also identified the association between nighttime heat resilience and socioeconomic conditions, which help to inform outreach efforts for those specifically exposed to extreme temperatures. Given that socially marginalized populations face greater exposure to urban heat, developing planning strategies aimed at lowering nighttime temperatures could lead to improved public health outcomes.

Though no direct measures of public health, the findings highlight the critical importance of designing urban environments that are responsive to heat, especially at night, when temperatures are known to have a significant impact on human health. The investigation into nighttime heat resilience is also particularly timely, given the increasing frequency and intensity of heat waves. Based on the findings we offer examples of targeted interventions in urban designs and green infrastructure strategies that prioritize thermal comfort and health.

CITY RESILIENCE TO CLIMATE CHANGE: AN EVALUATION OF CLIMATE ACTION PLANS

Abstract ID: 1108.0.0.526.2024

Individual Paper Presentation

Joowon Ahn [Yonsei University] a_joowon@yonsei.ac.kr, presenter
Mijin Choo [Yonsei University] alwls2599@yonsei.ac.kr
D.K. Yoon [Yonsei University] dkyoon@yonsei.ac.kr

As the impacts of accelerating climate change become increasingly tangible, numerous countries and cities worldwide are establishing climate change action plans (CCAPs) to address climate risks. Alongside goals for carbon neutrality and efforts to mitigate climate change, these plans aim to enhance adaptation to climate change risks. The goal of CCAP is to make cities safer from the risks posed by climate risks and to reduce damage from climate change, thereby constructing a more resilient city. This is akin to the idea of resilience, where cities withstand, adapt to, and even improve upon their pre-existing conditions in the face of external disturbances. In other words, efforts to adapt to climate change ultimately contribute to enhancing a city's resilience to climate change, assuming climate change as an external disturbance. Indeed, it is essential to question whether current CCAPs reflect the characteristics of urban resilience and whether they are suitable for enhancing both climate change adaptation capacity and resilience simultaneously. Therefore, interpreting and evaluating CCAPs from the perspective of resilience is crucial. Existing studies evaluating CCAPs traditionally categorize plans based on fact base, goals, policies, and implementation. Additionally, depending on the climate risk sectors, mitigation, and adaptation measures, previous studies assess which risk categories have been addressed, who the implementing agents are, and what the effects are. However, these evaluations typically do not interpret action plans or assess their essence from a resilience perspective. Thus, this study aims to develop evaluation indicators based on the transformative approach to resilience characteristics and to evaluate the local climate action plans from the perspective of city resilience.

This study evaluated climate action plans from the viewpoint of nine city resilience attributes, focusing on 30 cities that are members of the C40 network both with CCAP written in English and with over 3 million people. The main city resilience attributes were drawn from existing studies that crucially address the attributes of urban resilience: Flexibility, Inclusiveness, Integration, Redundancy, Resourcefulness, Robustness, Reflection, Diversity, and Transparency. To assess whether CCAPs reflect each city resilience, we developed several indicators from nine attributes such as 'Sufficient affordable food supply' and 'Effective emergency response services' from Flexibility. The evaluation was conducted in two main ways. Firstly, the evaluation was based on the alignment between the vision, goals, and sector-specific strategies of the plan and the indicators for each resilience attribute they aim to address. For instance, if adaptation policies aimed at providing climate change-related education to various groups such as gender, race/ethnicity, or targeted support policies for vulnerable groups, the plan was evaluated as having high inclusiveness and integration. Secondly, the evaluation was based on the formal structure of the plan, such as the number and diversity of plan strategies. In evaluating the plans based on these criteria, qualitative content assessment was performed using multiple coders, along with the utilization of text mining techniques.

The analysis revealed that the nature of goals and strategies considered important in CCAPs varies depending on the country, and the attributes of resilience pursued also differ. While most cities effectively address redundancy, robustness, and resourcefulness, differences were observed among cities regarding inclusiveness, flexibility, and integration. Moreover, policies aimed at reducing damage from climate risks, such as physical-related policies or retrofitting infrastructure, are mostly associated with robustness. On the other hand, climate action strategies related to enhancing accessibility to infrastructure, empowering vulnerable groups, or education are more closely linked with inclusiveness. This study contributes to providing policy implications for building more resilient cities in the face of climate change risks.

CLIMATE ACTION PLANNING IN AN OIL TOWN; THE LONG BEACH CASE STUDY

Abstract ID: 1108.0.0.1097.2024
Individual Paper Presentation

Jeannine Pearce [University of California Irvine] jeannimp@uci.edu, presenter

In the past 15 years, Long Beach, CA has become known for implementing progressive policies ahead of other cities, including raising the minimum wage, introducing hero's pay, and banning polystyrene. However, significant climate policies have faced more significant challenges.

In 2019, the city's mayor embraced the governor's call for bold climate policies to achieve carbon neutrality by mid-century. Elected officials directed staff to design a sweeping Climate Action Plan for carbon neutrality by 2045. A network of environmental organizations mounted a support campaign. Despite optimal political conditions, the final plan approved by the city council removed the core carbon-reducing instruments (i.e., Community Choice Aggregation, phase out of oil operations). Experts, including select city staff, believe that the plan will not achieve the 2045 emission goal.

Given vocal support from elected officials, a robust campaign to hold these officials accountable, and the policy's popularity among key constituents, the robust policy should have passed easily (Amenta, 2022). Its failure to do so presents the central puzzle of the paper. What other factor not addressed in the literature is responsible for this disappointing outcome?

Drawing on urban regime theory, social movement literature, and political mediation theory this paper suggests that Long Beach reflects a city divided between an older, yet embattled oil and business regime, on the one hand, and a nascent yet still amorphous regime powered by progressive organizations, unions, and foundations. The still-emerging progressive regime commands overwhelming approval from the electorate, but the growth regime maintains ultimate power, with financial resources to lobby elected officials. Municipal bureaucrats rely on the growth coalition for expertise (Stone, 1989). Consequently, progressive officials were pitted between the battling regimes. Wishing not to alienate voters or the money and bureaucratic pull of the other, their only viable option was a Climate Plan free of the tools needed to achieve its primary goal.

The paper contributes to regime theory by suggesting that this is a case of "interregnum" governance: the old regime is dying, however, its ongoing control over resources and its strategic alliances within the bureaucracy block a new regime from fully being born. Progressive elected officials find themselves limited to implementing aspects of progressive policies that do not risk alienating this fading but still powerful block of stakeholders. Lastly, we suggest that “interregnum governance” is not unique. It characterizes many progressive cities as unable to pass policies necessary to address the climate crisis effectively.

This interregnum governance is one explanation not yet addressed in climate policy literature, where a growing body of research found many urban climate plans were not comprehensive, excluded stakeholders, and lacked integration with other plans. (Aboagye & Sharifi, 2023). Municipalities are where the rubber meets the road, their land use and regulatory powers over environmental policy are required to stop or reduce the effects of climate change (Logan and Molotch, 1987).

By employing these theoretical frameworks, this paper provides a viewpoint not discussed in traditional climate policy research and provides a comprehensive analysis of the challenges and complexities involved in governing for climate change, where the stakes are higher, but the cost to play remains the same.

Qualitative and Quantitative methods include; content analysis of climate action plans, sustainability meetings, council meetings, letters of support and opposition, city budgets, voter records, and political contributions. The paper includes a power analysis map.

Positionality statement: I had the pleasure of serving as the second district city council member (2016-2020), and authored the Community Choice Aggregation Agenda item, I worked closely with all stakeholders. I work closely with advisors and mentors to ensure I consider all data points and theories in this work.

CLIMATE ANXIETY AMONG STUDENTS: IMPLICATIONS FOR URBAN PLANNING EDUCATION

Abstract ID: 1108.0.0.683.2024

Individual Paper Presentation

Debolina Banerjee [University of Utah] banerjee.d@utah.edu, presenter
Adrienne Cachelin [University of Utah] adrienne.cachelin@health.utah.edu
Jennifer Shah [University of Utah] jennifer.shah@envst.utah.edu
Sara Yeo [University of Utah] sara.yeo@utah.edu
Monika Lohani [University of Utah] monika.lohani@utah.edu
Andrea Brunelle [University of Utah] andrea.brunelle@geog.utah.edu
Lynne Zummo [University of Utah] lynne.zummo@utah.edu
Abbie Nistler [University of Utah] abbie.nistler@utah.edu

In recent years, the pervasive threat of climate change has precipitated a growing phenomenon known as ecological grief. Ecological grief can manifest in a range of negative emotions, e.g., sadness, anxiety, and hopelessness (Cunsolo & Ellis, 2018). 'Climate grief' or 'climate anxiety' is a specific form of ecological grief often seen in young adults engaged in climate change education. A recent study of climate anxiety found that eight out of ten young adults understand climate change as an existential threat (Hickman et al., 2021). Recognizing that students experience anxiety that can impair academic performance and emotional well-being or motivate action and engagement, educators must find the pedagogical sweet spot that enables a practical and motivating anxiety (Cachelin & Nicolosi, 2022; Consulo et al., 2018; Ojala et al., 2021). Given recent calls for climate change education to be more integrated into planning programs, research in this area is crucial (Infield et al., 2023).

The purpose of this study is to examine effective pedagogies that foster healthy responses to complex psychological phenomena and elicit strategies for urban planning educators. Delving into key climate anxiety drivers (sources of climate news, political ideology, demographics, etc.), examining potential disparities in anxiety levels across academic disciplines, and evaluating student suggestions for climate change pedagogy offer valuable insights for educators aiming to enhance climate literacy.

Our research questions include: a) What are the primary determinants of climate anxiety among students within higher education settings? b) Does the prevalence of climate anxiety differ significantly among students pursuing majors centered on climate change compared to those in other disciplines? c) What insights do students offer for optimal climate change pedagogy?

Our study uses a mixed-method design with a combination of open-ended and Likert scale questions aimed at gauging students' sentiments regarding climate change and the impact of various pedagogies. Participants included 700 undergraduate students, most of whom were environmental studies (ENVST) majors. We created two latent constructs, viz. Climate Anxiety Index (CAI) and Generalized Anxiety Disorder (GAD-7) from the survey responses. A standardized major axis regression demonstrated that even with a baseline level of GAD-7, the predicted levels of CAI are relatively high. A multi-variate regression further demonstrated that CAI is higher among 'liberal' students with ENVST majors who 'more than frequently' (5-point Likert scale) obtain climate change news from various sources like classrooms, print, or online media. Further, a qualitative data analysis revealed that many students feel an overwhelming sense of powerlessness and are very concerned about the future. Many students are frustrated with political inaction, and several emphasize the need for more solution/action-oriented lessons as well as co-curricular campus support groups.

Drawing parallels between the impacts of climate change education for ENVST students, who arguably have the most comprehensive and long-term exposure to this topic, and curricular challenges faced by planning educators, this study can provide valuable insights. Research-informed climate change content and pedagogy integrated into urban planning curricula can equip future planners with both the motivation and tools to address complex

environmental challenges. Specifically, results suggest an integrative approach to climate education that attends to the practical and pedagogical skills needed by both urban planners and planning educators.

This study's main contribution is to share the prevalence and complexity of responses to climate change education as well as pedagogical techniques that can foster practical, motivational anxiety. As an applied and solution-oriented field, planning educators are well positioned to lead the charge in effective and motivating climate change education.

Climate Infrastructure Inequality and Housing Market Dynamics

Abstract ID: 1108.0.0.72.2024

Individual Paper Presentation

Yichun Fan [Massachusetts Institute of Technology] ycfan@mit.edu, presenter

Decisions and financing of climate resilience infrastructures heavily depend on local property value, leading to income inequality in the quality of climate infrastructure. There is limited quantitative evidence on the distribution of climate infrastructure quality and its long-term economic consequences. This study combines inspection records from National Levee Database (NLD) with daily satellite imageries at 250-meter resolution to examine the residual risk behind US flood protection levees. I find that lower income communities disproportionately reside behind levees with low protection level and poor maintenance quality, particularly when municipal governments serve as local sponsors. Consequently, these communities are more likely to have experienced levee failures in the last two decades as revealed by satellite imagery. This infrastructure inequality creates diverging housing price trajectories as the residual risk has become increasingly realized over the past two decades. Using event study approach based on recent econometric literature, I find housing prices drop by 5-10% (from any flooding to large flooding events)

when levee-protected communities being flooded, with no evidence of recovery within ten years post-disaster. This is in contrast with the modest and temporary impacts of flooding on housing prices for communities without levees. The negative shocks to housing market have important local public finance implications. Using data from Census of Government, I find that levee failures lead to a 5.6% decrease in total revenue of municipal governments, even after factoring in increased revenue from intergovernmental transfers. This is primarily owing to a significant 23.2% reduction in property tax revenue. The resultant decline in total revenue causes a decrease in total expenditure and constrains a municipalities' capacity to increase capital outlay after a disaster. The profound financial consequences of levee failures on municipal finance can risk perpetuating infrastructure inequality, rendering cities with low-quality infrastructure to be even more susceptible to residual flood risk. These results highlight the need to consider the feedback relationship between municipal finance and climate justice through the channel of infrastructure investment.

CODEVELOPMENT OF AN ENVIRONMENTAL DATA PLATFORM TO SUPPORT COMMUNITY ACTION

Abstract ID: 1108.0.0.887.2024
Individual Paper Presentation

Daniel Engelberg [Northeastern University] dengelberg2@gmail.com, presenter
Moira Zellner [Northeastern University] m.zellner@northeastern.edu
Daniel O'Brien [Northeastern University] d.obrien@northeastern.edu
Amy Mueller [Northeastern University] a.mueller@northeastern.edu
Dean Massey [Northeastern University] de.massey@northeastern.edu
Michelle Leboy [Northeastern University] m.laboy@northeastern.edu

Public data infrastructure, such as the EPA Environmental Justice Screening and Mapping Tool, is valuable for communities seeking to identify environmental justice (EJ) concerns and redress environmental harms. Yet, for many communities, the existing tools neither address community-specific concerns, nor do they have the block-by-block spatial scale of the environmental hazards that impact their lives. Co-created environmental data platforms

have the potential to support EJ communities in connecting scientific and lived expertise to address the socio-environmental complexity that creates and exacerbates the injustices. Given the historical and contemporary inequalities, building data platforms with EJ communities needs to incorporate procedural and epistemic justice concerns. To that end, this paper seeks to answer the following two questions. 1) How have researchers considered procedural and epistemic justice in the development of public data platforms? 2) How can EJ communities and researchers co-develop an environmental monitoring system that is informed by residents understanding of environmental challenges in their community, supports relevant and usable tools and knowledge at various stages of the process, and generates valid scientific and experiential data to guide action?

To examine the state of the practice, we review the literature concerning procedural and epistemic justice in data development for decision-making, with a specific focus on data platforms that are co-developed with EJ communities. Since written articles often miss key details in complex projects, we perform semi-structured interviews with a dozen prominent EJ researchers selected for their participation in the 2015 Environmental Justice Analysis workshop series and as emerged in the literature review. We ask each interviewee to select a project that they consider particularly successful. The questions then focus on how stakeholders were selected, the role of stakeholders in defining data collection, and how the researchers considered the different socio-economic positions of participants in the early phases of their project. We analyze interview responses to identify prominent practices for procedural and epistemic justice as well as potential new practices.

The strengths and gaps identified in current EJ data platforms inform our approach to answering question two. We present self-reflection on the initial phases of the Common SENSES project, a collaboration between environmental justice communities, government agencies, and academic researchers to address micro-spatial inequities relative to climate hazards. In initial co-design conversations, community and academic partners identified data needs that were specific to the community organizing and advocacy needs. This phase included community members identifying the environmental hazards impacting their lives, researchers repackaging publicly available data for easier resident interpretation, and collective identification of sensor locations through a process in which residents identify areas of concern, scientists recommend sensor locations, residents provide feedback, and all partners iterate to the final placement. These data sources were all developed in a series of environmental hazards mapping workshops, a data portal training, and discussions with community partners. Geospatial and quantitative resources were matched with resident stories to provide compelling tools for demanding a healthier environment. All this data comes together in a community-accessible environmental data platform. We conclude by comparing the data platform development process and results in the Common SENSES project to the practices observed in the literature and interviews.

COMMUNITY ENGAGEMENT FOR AN URBAN HEAT ADVOCACY TOOL IN NEW YORK CITY

Abstract ID: 1108.0.0.461.2024
Individual Paper Presentation

Haijing Liu [The University of Texas at Austin] hjliu@utexas.edu, presenter
Mehdi Heris [CUNY] mp5160@hunter.cuny.edu

In the face of escalating urban heat events, exacerbated by climate change and urban infrastructural configurations, New York City (NYC) has been at the forefront of initiating and implementing heat mitigation strategies. These initiatives are vital in addressing the disproportionate impact of heat on vulnerable populations, intensified by historical injustices such as redlining. This study aims to delve into the dynamics of advocacy and policy-making in urban heat management within NYC, emphasizing the pivotal role of advocacy groups and the utilization of the Advocacy Coalition Framework (ACF) to understand coalition behaviors and policy development.

NYC's approach to combating urban heat includes a suite of mitigation strategies like the establishment of tree planting programs and cool roofs. Legislation has further reinforced these efforts by mandating sustainable roofing practices that incorporate cool roofs, green roofs, and photovoltaic panels. Despite these progressive measures, the transition from policy formulation to implementation has encountered significant barriers, underscoring a gap in empirical research focused on the execution phase of urban heat policies. Advocacy groups have been instrumental in pushing for more robust legislation and its enforcement, highlighting the necessity of advocacy alongside legislative action in addressing urban heat.

The study utilizes the ACF to explore how advocacy coalitions within the extreme heat policy subsystem in NYC navigate the policymaking process. The non-adversarial nature of coalitions, led by Environmental Justice Alliance (EJA) and WeACT, presents a unique case for investigation under the ACF, which traditionally explores adversarial settings. This research seeks to broaden the application of ACF by examining collaborative and non-adversarial coalition dynamics in urban heat management, offering insights into the roles and interplays of various actors within the policy subsystem, including advocacy groups, community-based organizations, and expert contributors.

Central to the discussion is the role of expert-based information and how it facilitates policy learning and the development of interventions. The establishment of a data portal by the City University of New York (CUNY) exemplifies the critical role of expert and technical knowledge in supporting advocacy efforts. This initiative aligns with one of the ACF's hypotheses concerning the significance of expert-based information in fostering policy learning, emphasizing the necessity for accessible, evidence-based data in crafting effective urban heat mitigation strategies.

This research underscores the complex interplay of historical legacies, policy, and informational barriers that challenge effective climate adaptation and urban heat planning. The fragmentation across governance structures

and the lack of comprehensive, multidisciplinary data have been significant hurdles, limiting cross-governmental and interdisciplinary collaboration essential for contextual heat resilience strategies.

In conclusion, the study highlights the indispensable contributions of advocacy groups to the legislative and enforcement processes regarding urban heat mitigation. It reveals the limitations of applying ACF in its traditional form to the nuanced context of NYC's urban heat policy subsystem, advocating for a refined framework that acknowledges the role of government agencies as coalition members. By examining the collaborative efforts of advocacy groups, community-based organizations, and expert contributions, this study provides a nuanced understanding of the policy-making landscape for urban heat management in NYC, pointing toward a more integrated and evidence-driven approach to addressing one of the most pressing climate challenges of our time.

COMMUNITY LISTENING FOR JUST URBAN TRANSITIONS: AN EXPERIENCE IN TORONTO

Abstract ID: 1108.0.0.864.2024
Individual Paper Presentation

Elisa Privitera [University of Toronto] elisa.privitera@utoronto.ca, presenter

The challenge of rapidly accelerating low-carbon transitions in cities and preventing this widespread transformation from exacerbating urban inequalities is the core of the urban just transitions debate both in academia and the political realm (see the discussion around Green New Deal in the US and Europe). Albeit techno-driven solutions for transition have been widely explored, the democratic dynamics underpinning them are less scrutinized. According to Hughes and Hoffmann (2019: 7-8), the co-production of knowledge with urban communities and networks within a community-based research framework can play a significant role in developing more concrete indicators and strategies for pursuing, recognizing, and measuring just urban transitions.

The Listening Project (LP), carried out by the Urban Just Transitions cluster at the University of Toronto Scarborough in collaboration with a steering committee of local groups, represents an emblematic experimentation in this

direction. Inspired by a participatory action research approach (see Cornish et al., 2023), the LP aims to understand how climate actions towards "net-zero" futures intersect with people's everyday concerns and hopes in Scarborough. Situated in the Eastern outskirts of the Great Toronto Area, Scarborough is a popular destination for newcomers. It is one of the most diverse and multicultural areas in Toronto, but it is also one of the neighborhoods with the highest levels of poverty and food insecurity. Several organizations are active and advocate for improving the life quality and social services for the residents. In partnership with some of them, the LP supports a series of listening activities, including neighborhood walks, art workshops, and community mapping. The conversations in each listening session intend to build a deeper understanding of participants' visions of just transition while strengthening communities' capacity for collective action.

This presentation focuses on the first reflections from the listening session carried out in partnership with the Malvern Family Resource Centre (MFRC), a multiservice agency providing a variety of multicultural and multigenerational programs and services, with a focus on food justice. One of its pilot projects to reduce food insecurity is an urban farm where 16 resident families access and cultivate fresh and culturally appropriate foods. The surplus of vegetable production creates opportunities to generate supplemental income and has stimulated the organization of a summer Km Zero farmers' market. The listening sessions have conceived the market as a meeting and aggregation space for residents, wherein creating convivial conversations around the intersections between climate change and daily life. From June to October 2023, a group of researchers together with the MFRC has organized several initiatives including passing-by interactive activities (e.g. post-it, two itinerant-raffle-based conversations, art-based moments, posters), 2 workshops, and a final event. The entire process has emphasized participants' feedback through a circular and community-based peer review process on the produced knowledge. The two workshops are an example of this process. The first has been a community mapping workshop (Saija & Pappalardo, 2022) which involved residents in identifying on map strengths, issues, what people used to like but is not there anymore, and how these identified places are interconnected with climate change/impacts. The second was a Future Scenario workshop (see Robinson's works) titled "Scarborough 2043" and meant to connect the strengths, priorities, and climate change problems identified during the previous community mapping workshop with the capability to envision and multiply the possible desirable futures and organize to attain them.

In light of this collaborative research experience, the presentation offers both a theoretical and empirical contribution to the potential and limitation of community listening-based research to co-produce knowledge and formulate policy indications from the bottom aimed at facilitating inclusive and just transitions to low-carbon cities.

COMMUNITY PERCEPTIONS ON ECOSYSTEM SERVICES VALUE FOR WETLAND CONSERVATION

Abstract ID: 1108.0.0.1012.2024
Individual Paper Presentation

Aaron Julius Lecciones [University of Washington, Seattle] aaronl24@uw.edu, presenter
Karen Ann Jago-on [University of the Philippines Diliman] kbjagoon@up.edu.ph

This study investigates community perceptions regarding the valuation of wetland ecosystem services for land use planning in the Las Piñas - Parañaque Wetland Park (LPPWP), situated along the coasts facing Manila Bay, Philippines. Rapid urbanization, threats of reclamation for development, pollution, and shifting community attitudes towards the environment have transformed the land use of this coastal region, underscoring LPPWP's status as the last coastal frontier of southern Manila Bay. The LPPWP and similar protected areas situated in built environments are not alone in facing these uncertainties that affect how nature contributes to people's wellbeing and consequently influences how community's assign value to the environment (Scholte, et al. 2016, Pascual, et al. 2017). Many coastal cities across the world are experiencing these very same challenges. Wetlands, in particular, are important ecosystems that provide a long list of provisioning, regulatory, cultural and supporting services to human populations and are, in many cases, difficult to value and are sometimes unknown to the communities they serve (Chan, et al. 2016). Encompassing mangroves, salt flats, lagoons, and ponds, and hosting over 80 bird species, the LPPWP's roughly 182 hectares highlight the urgent need to align land use planning with community values to preserve the area's critical ecosystem services (Scholte, et al. 2016). The primary questions this study addresses are: (1) How does the community perceive and value the wetland ecosystem services provided by the LPPWP, and (2) how can these perceptions inform and improve land use planning approaches within the area?

Employing both quantitative and qualitative data collection and analysis methods – including household surveys, key informant interviews, direct valuation, and narrative analysis – the study reveals a strong community preference for provisioning and cultural ecosystem services. Furthermore, it finds that the community is willing to support these services financially, through mechanisms such as an annual barangay tax (PHP 492), a per-use fee (PHP 130), or an annual entry fee into the park (over PHP 1,000). The study also finds that members of the community with more knowledge about wetlands were also those who could more readily identify and assign value to wetland ecosystems services. To ensure the conservation of the LPPWP's wetlands, the study recommends strategies aimed at enhancing community engagement in the land use planning process, prioritizing the cultural and provisioning ecosystem services valued by the community, making access more democratic for marginalized community members, and integrating the protected area's management plans with ongoing master planning efforts in Manila Bay.

COMPARATIVE ANALYSIS OF THE USE OF LOCAL KNOWLEDGE IN CLIMATE ACTION PLANS

Abstract ID: 1108.0.0.738.2024
Individual Paper Presentation

Mattijs van Maasakkers [Ohio State University] vanmaasakkers.1@osu.edu, presenter
Donggyu Lee [Ohio State University] lee.8563@buckeyemail.osu.edu
Madie Strauss [Ohio State University] strauss.154@buckeyemail.osu.edu

The increasing attention to climate change has prompted many U.S. cities to proactively develop their climate action plans to adapt to or mitigate its potential impacts. At the core of these efforts is the integration of local knowledge with formal expertise, the latter often based on model-based predictions of climate change impacts. This integration is crucial for ensuring these plans engage the actual needs and concerns of the communities they serve while reflecting the best available understanding of climate change-related risks. This process frequently emphasizes community engagement, ranging from traditional face-to-face interactions to online platforms. Given that local knowledge can often be unstructured, decentralized, and dynamic, planners are frequently tasked with collecting diverse community insights and combinging those into coherent sources of information that inform and decisions. Therefore, understanding how to effectively gather and interpret community input is crucial for empowering communities and facilitating the co-production of climate action plans.

This study aims to analyze the various tools and techniques planners employ to gather and analyze community input for climate adaptation plans and how these efforts inform the final plan. Literature in both academia and practice has outlined different methods for collecting local knowledge through various sources, from using sticky dots to identify “hot spots” at a community meeting to more formally analyzing video recordings of public meeting, semi-structured interviews with key stakeholders to mass surveys which allow for statistical tools to be used in analyzing community sentiment(s). However, despite the extensive literature on methods for gathering community input, there has been limited attention paid to the effective analysis of the information gather through these tools, particularly in the context of climate action plans. Planners, through their education, are often equipped with a range of analytical tools and techniques that encompass both qualitative and quantitative approaches. These methods enable the organization of feedback into thematic categories that reflect the communities’ concerns and priorities. Considering there is no single method for effectively examining these aspects, further study is required to understand how planners in different cities strive to gain a deeper insight into local knowledge within the unique contexts they face.

To answer these questions, we analyze the specific community engagement strategies employed in the creation of Climate Action Plans in 14 U.S. cities. These cities were selected because they are part of the C40 Cities Climate Leadership Group, a global network of local leaders who have long been concerned about climate change. We collect the most recent climate action plans completed by these cities and identified relevant actors who managed the community engagement processes in those plans. First, we analyze plan documents to highlight the various communication, participation and inclusion methods utilized by planners and the specific types of local knowledge each plan emphasizes. Following this, we conduct semi-structured interviews with specific actors who were responsible for coordinating community engagement to delve more deeply into how they collect local knowledge, summarize the collected inputs, and the techniques and tools they use to analyze them.

Our findings reveal a range of analytical tools and techniques that facilitate the effective collection and analysis of public input. By detailing the specific practices utilized by planners, this research provides valuable insights into the current landscape of urban climate planning and its use of local knowledge. It highlights the importance of a systematic and thoughtful approach to public engagement and data analysis, demonstrating that community voices are not just heard but are instrumental in shaping urban climate resilience. Building on these key findings, we also explore educational implications for planning curricula focused on public participation and qualitative data analysis in planning practice.

DECIPHERING MUMBAI'S STRESSED MITHI RIVER: SPATIAL AND SENSORY INSIGHTS

Abstract ID: 1108.0.0.1240.2024
Individual Paper Presentation

Richa Vuppuluri [University of Virginia, Independent Planning Consultant] richa.vup@gmail.com, presenter
Ellen Bassett [Georgia Institute of Technology] ellen.bassett@design.gatech.edu

This paper investigates the complexities of Mumbai's Mithi River, an urban waterbody battling pollution, developmental pressures, and urban flooding. It examines the river's environmental history and current challenges through spatial and sensory analyses against the backdrop of climate change, with Mumbai facing rising sea levels and increased extreme rainfall events. Anthropogenic factors, such as pollution and inadequate infrastructure, have significantly compromised the natural and functional integrity of the seasonal Mithi River and its floodplain. This study aims to provide a holistic understanding of the Mithi River's urban water management challenges by integrating archival research, mapping analysis, field observations, and the lived experiences and memories of the community, which are integral to the river's ecosystem.

Key data for this study include geospatial and historical maps, photo documentation, and insights from seven months of fieldwork in 2022, alongside semi-structured interviews with 30 participants. These resources, combined with mapping analysis of developmental history, land use, and governance and complemented by on-the-ground

experiences, offer a comprehensive view of the Mithi River's role within Mumbai's urban ecosystem, which consists of biophysical, built, and social systems (Nagendra & Ostrom, 2014; Pickett et al., 1997).

Significant land reclamation over the past 150 years has transformed the Mithi River watershed into Mumbai's most dynamic inland landscape. The findings illuminate the river's crucial role within the urban ecosystem and its future under climate change, while also highlighting the community's perceptions and experiences. The findings also underscore why governing this seemingly manageable 17.84-kilometer (11-mile) stretch has evolved into a remarkably complex and unsustainable endeavor (Ghosh et al., 2020; Kamath & Tiwari, 2022). Insights from oral histories and participant observations reveal a multifaceted narrative of land transformation, the impact of global city ambitions, and the community's diminishing value due to flooding and constrained real estate redevelopment opportunities.

Notably, participants' reflections on crossing the river without recognizing the true nature of this resource underscore a prevalent perception of the Mithi as a neglected and polluted waterbody, often referred to as a nullah or a drain. This perception highlights the urgent need for efforts to not just restore this urban river but also redefine its status as a vital natural resource in the city, not just providing critical ecosystem services and maintaining ecological habitat but also creating opportunities for "positive feedback" for urban revitalization and fostering community cohesion (Groffman et al., 2003)

A key insight from this study is the Mithi River's embodiment of the tensions between natural conditions, development pressures, and institutional demands within Mumbai. By providing a nuanced understanding of urban water management issues, this research reflects broader concerns applicable to cities in the Global South. It explores the community's vision for the river's future and the potential for integrating nature-based solutions and decentralized systems and engages with secondary discussions from planning, landscape, and urban design perspectives (Dunlop et al., 2023; Manzo & Perkins, 2006). This paper seeks to contribute to the discourse on sustainable urban water management by combining spatial insights with the sensory and social dimensions of human-environment interactions, aiming to influence both current and future restoration efforts for this essential urban ecosystem.

As a distributed energy resource, solar photovoltaic (PV) energy reduces reliance on fossil fuels for residential energy consumption, especially in places with an abundance of sunshine. While rooftop solar PV has grown more popular among single-family homes, household uptake and installation of residential solar panels is limited by upfront costs as well as barriers for renters and multi-unit residential spaces. Community solar energy (CSE) projects overcome these barriers by sharing the costs and logistics of solar generation within a neighborhood. While the motivators for participation in CSE are well studied, less is known about the most effective timing for engaging participation. Work in behavioral science points to moments of change, such as moving home, to be effective intervention points in encouraging switches to sustainable behaviors, but the uptake of rooftop PV and CSE appears to happen primarily after residence is established. Online media sources have the potential to capture moments of readiness by both expanding the population coverage and providing freeform text for qualitative analysis of resident feelings towards their own residential energy provision. Paired with emerging machine learning techniques, such as natural language processing (NLP), semantic analysis of the content of large corpora of online posts can identify ideal moments for planners to engage communities in making the switch to solar energy.

This paper leverages a large collection of online complaints against electric utility companies to ask: When and why might residents be ready to install rooftop PV or participate in CSE? We aim to identify ideal moments for interventions with customer segments based on discontent with current systems. We operationalize this approach through a case study in Los Angeles County, a place with high annual solar radiation ideal for solar energy. Drawing on a variety of sources including 20 years of complaints from Consumer Affairs for local large-scale utility providers, historical data on blackout events and utility service costs, as well as locations of existing and potential community solar projects, we test and validate a framework for continuously identifying customer segments primed for solar adoption.

Through the application of state of the art NLP techniques, we identify the main topics in the complaints to be unexpectedly high bills, lack of clarity around charges, and power outages. 7% of the complaints mention switching to rooftop solar due to high costs. Paired with service disruption and changes in retail prices of energy, we determine customers are most primed immediately following a service disruption lasting longer than a day, at the beginning of the year, or after a 3-6 month lag from a price increase, likely due to billing cycles.

This paper offers three primary contributions to urban planning research and practice. First, it furthers methodological advancements on the use of user-generated online content for a deeper understanding of sentiments and pain points for change. These reviews offer qualitative experiences collected at scale and over long time periods, providing an extension to small-n qualitative methods. Conceptually, it deepens our understanding of the most prolific pain points in traditional energy distribution as energy infrastructure and policy grow to be increasingly critical areas of practice for planners. Finally, this paper provides a framework for continuously

monitoring and acting upon ideal location and market share pairs for rooftop PV and CSE projects. The use of near real-time responses to utility issues provides planners with a tool to capitalize on moments of readiness while furthering equitable access to energy. As we look to transition to renewable energy for our electricity production at scale, leveraging qualitative experiences alongside quantitative markers offers an efficient and effective path forward to shifting the market share of residential energy consumption.

DISASTER DEBRIS MANAGEMENT AND THE MAINE FLOODS OF 2023

Abstract ID: 1108.0.0.268.2024
Individual Paper Presentation

Julia Crowley [University of Missouri-Kansas City] jcc45g@umkc.edu, presenter

Disaster debris is commonly generated from large-scale disaster events, and frequently hampers the efficiency of the response and recovery phases (Brown et al., 2010). Moreover, the complexity of the debris management process often requires the involvement of several different agencies and levels of government (Luther, 2017). Past research has highlighted the importance of pre-disaster debris management planning as an effective tool for promoting an overall more efficient post-disaster process (Crowley, 2017; Trivedi et al., 2015). While there is a body of literature that looks at the impacts of disaster debris on response and recovery as well as the effectiveness of pre-disaster debris management planning, most of this research focuses on geographic locations that have long histories of past large-scale disaster events. There is a gap in the literature pertaining to the debris management of areas that do not have a long history of debris-generating events. Understanding the debris management needs of these locations is crucial given that climate change-induced disasters have brought more intense events to areas, some of which have not had frequent experiences with responding to and recovering from such events (Cappelli et al., 2021). The Maine floods of December 2023 provide an example of such an area. The floods reached historic levels and generated substantial quantities of debris across several counties.

The purpose of this research is to examine the debris management process and needs in an area that does not have a frequent history of debris-generating events. The following research questions were examined: How does pre-disaster debris management planning impact the response and recovery phases of historic flooding events? What are the most significant debris management challenges in historic flooding events? The research questions were applied to the context of the Maine floods of 2023 due to the small number of debris-generating events throughout the area's history. Interview protocols were designed with questions pertaining to the debris management process in the preparedness, response, and recovery phases. Structured interviews were then conducted with local emergency management personnel and others who took on an active role with the debris management process. Interviews were recorded, transcribed, and coded using initial and focused coding. Results suggest that more preparedness is needed for debris management in the area. Furthermore, the debris management training model that is provided for local governments from the Federal Emergency Management Agency (FEMA) is not sufficient for many of the impacted counties in Maine because it is designed for mostly urban and suburban areas. Maine contains several unorganized territories that do not have local, incorporated municipal governments. Further research and training development are needed to address the debris management needs of these areas.

DO GREEN GENTRIFICATION CONCERNS AFFECT MENTAL HEALTH AND WELLBEING?

Abstract ID: 1108.0.0.379.2024
Individual Paper Presentation

Rexford Osei Owusu [University of Utah] rexford.oseiowusu@utah.edu, presenter
Alessandro Rigolon [The University of Utah] alessandro.rigolon@utah.edu

Introduction: Urban green space provides important benefits such as microclimate regulation, air quality improvement, and improved human health and wellbeing. Hence, community advocates often call for increased green space provision, especially in areas with limited access. However, the construction of new green spaces in underserved areas might lead to "green gentrification", describing the influx of wealthier new residents to formerly low-income communities of color due in part to new green spaces. Recently, studies have shown that gentrification might also precede greening, in what has been named the "green gentrification cycle".

Several studies have assessed why gentrification might precede and/or follow greening and what measures could be put in place to prevent its negative impacts, such as displacement. However, despite some research about the influence of green gentrification on human health and wellbeing, very little is known about the potential health and wellbeing impacts before green gentrification occurs in already gentrifying neighborhoods. Integrating knowledge and methods from urban planning and public health, we assess how perceptions and concerns about future green gentrification might shape residents' mental health and wellbeing.

Research questions: 1) How do residents in gentrifying neighborhoods describe the potential impacts of future green gentrification on their mental health and wellbeing? 2) How do these perceptions vary between longtime low-income residents and more affluent recent in-movers? and 3) To what extent does knowledge of future green space investment add to the stress that some people might be already experiencing due to ongoing gentrification?

Methods: We focus on Salt Lake City's West Side, an underserved community in the city that is experiencing some gentrification. In the next few years, Salt Lake City will build the Glendale Regional Park (a 30-acre regional park) and revitalize the Jordan River Parkway Trail (part of a 45-mile greenway). We used a mixed-method approach including a survey with residents (200) and in-depth interviews with residents and project stakeholders (20). The survey includes validated scales describing attitudes toward green spaces, neighborhood change perceptions (e.g., neighborhood preservation, development support, social integration), mental health and wellbeing measures, and control variables. For the survey analysis, we use regressions and structural equation models to test associations between the residents' perceptions of the new green space investments, gentrification, and their mental health and wellbeing. We analyze the interview transcripts through content analysis, including deductive coding based on content from the existing literature and inductive coding.

Results: The survey analysis shows a negative significant association between mental health outcomes and development support. On the other hand, there is a positive significant association between wellbeing outcomes and development support. In interaction tests, we found that these results are stronger for more recent in-movers and residents with insecure housing. Moreover, homeowners with high mental health outcomes show positive attitudes toward new green space investments. Residents with insecure housing that are already experiencing stress show a positive association with social integration. Results of the interviews show that most of the residents are in support of the new green space investments, but there are major concerns about potential gentrification, especially from low-income renters. These future greening processes increase the stress they are already experiencing.

Implications: Our results suggest that planners seeking to add new green spaces to underserved areas should consider strategies that will help address any potential gentrification and displacement outcomes. This will help make such investments fulfill their intended purpose to advance environmental justice. Also, because we find differential health impacts between gentrifiers and longtime residents, planners could work with public health professionals to identify groups that might need mental health support during green gentrification processes.

DOES THE PRESENCE OF OSDS MATTER? EVIDENCE FROM THE HAWAIIAN HOUSING MARKET

Abstract ID: 1108.0.0.430.2024
Individual Paper Presentation

Tanya Dreizin [University of Hawai'i at Mānoa] tdreizin@hawaii.edu, presenter
Makena Coffman [University of Hawai'i at Mānoa] makenaka@hawaii.edu
Joseph Eshun [University of Hawai'i at Mānoa] jeshun@hawaii.edu
Nori Tarui [University of Hawai'i at Mānoa] nori@hawaii.edu

On-site sewage disposal systems (OSDS), such as cesspools and septic tanks, have negative environmental and public health impacts. Although OSDS' have been linked to higher instances of viral and bacterial infections (Fleisher et al., 2010), along with coral reef eutrophication and toxic algal blooms (Nepf et al., 2022), approximately 18% of all households in the United States are served by OSDS (EPA, 2021). This includes areas with high density concentrations of residences along the coast, including Delaware, New York, Florida and Hawai'i.

Rapid development and growth in Hawai'i led to over 100,000 cesspools on five of the Hawaiian Islands (Hawai'i Island, Kaua'i, Maui, Moloka'i and O'ahu) (Whittier & El-Kadi, 2014). To encourage the transition away from cesspools, the Hawai'i State Legislature passed in 2016 a statewide ban on new cesspools by 2050, followed by a law requiring homeowners to convert cesspools to a treated wastewater technology (including septic systems) or attach to existing sewage systems. However, the uptake of conversion has been low, likely due to financial barriers and access to site appropriate technologies. To date there has been little research on the financial implications of cesspools (and other OSDS) further the purpose of informing policies that might better prompt conversion. This study examines the impact of cesspools and other OSDS on the value of housing, to understand whether and the extent to which OSDS are being capitalized into housing decisions. Following Tarui et al. (2023), whose study found that coastal properties exposed to future sea level rise up to 1 meter were transacted at a lower value if on OSDS than sewered, this study expands on their findings to assess OSDS across the entire archipelago. Using a hedonic model, we determine whether the presence of OSDS impacts property values across O'ahu, Hawai'i Island, Kaua'i, and Maui. We utilize housing transaction data, FEMA flood zone data, OSDS inventory and parcel attributes. Preliminary findings show that residential home values decline by 17% due to the presence of OSDS, particularly cesspools, relative to similar properties but on the sewer. Another interesting finding is that housing located in FEMA flood zones also decreases property values by 15%, demonstrating the potential compound nature of physical risk that becomes financial risk.

The implications of these findings are particularly relevant to inform policy and planning relating to wastewater system upgrades, in Hawai'i and beyond. Our findings suggest that home sellers and buyers are indeed aware of negative impacts (value) of OSDS, and that homeowners with OSDS are effectively compensated for this negative attribute upon sale. As such, mandating conversion upon sale is likely both an effective and fair means to moving toward the State's 2050 goal. Homeowners who convert their cesspools prior to sale will increase their home's value significantly.

Drinking water system consolidation potential, governance and equity

Abstract ID: 1108.0.0.463.2024
Individual Paper Presentation

Gregory Pierce [UCLA] gpierce@luskin.ucla.edu, presenter

Drinking water is one of our two most fundamental human needs. Unlike the need for clean air, however, drinking water consumption requires the physical planning of service to communities via infrastructure networks. Yet across the United States, poorly-performing, often very small drinking water systems operate poorly under nominal public oversight in spatial patterns that neither cohere well with utility or city planning geographies nor follow a logic which yields positive environmental, efficiency, or equity outcomes. This is due both to patterns of overt environmental racism, administrative oversight as well as proactive planning support for sprawl.

My previous work has thus laid out the case for planning intervention to address the over-dispersion of drinking water systems, or water system sprawl. In parallel, consolidation of the nation's ~ 50,000 community water systems is a policy that has grown in favor in recent years a means to enhance water equity in the United States. Yet empirical support for most, but not all common, theoretical claims about water system consolidation in the literature is scant, especially regarding governance, as well as equity and inclusion with respect to both procedural and distributive outcomes. In my proposed presentation, I focus on my collaborative, recently published research which explores answers to several pressing, related questions regarding drinking water system consolidation.

Namely:

- What are the common local governance planning pathways for water system consolidation?
- Does consolidation advance procedural inclusion & equity at the system scale?
- Does consolidation improve distributive (Human Right to Water) outcomes for customers?

I answer these questions using results of a comprehensive analysis of the prevalence and governance pathways of drinking water system consolidations in California over the period 2015-2021, as well as a pre-post household survey and water quality sampling effort in the context of water system consolidation in New York (2015-2022), along with insights from several ongoing projects.

I find empirical support for certain, but not all common, theoretical claims about consolidation in the literature. Generally, I find enormous diversity in local governance planning pathways (over 30 different transition types across 200 cases, with the most growth in special district representation). I also find that residents served by consolidating and receiving systems tend to be similar, but among consolidated systems, low-resource communities are underrepresented. Finally, using the New York case, I found positive changes in customer level quality and accessibility, but variance in perceived versus realized affordability impacts. I close by outlining implications for future research, policy and advocacy on drinking water system consolidation.

Dynamic Visual Assessment of Urban Streetscapes: Hengshan Street

Abstract ID: 1108.0.0.315.2024
Individual Paper Presentation

Xueling Wang [Tongji University] 1713221686@qq.com, presenter

Objectives: By investigating the relationship between the urban street environment and human perception under "dynamic" walking situations, this study seeks to improve the urban street landscape and maximize the walking experience for the public. Using a combination of qualitative and quantitative research methods, a dynamic visual assessment system with subjective, objective, and interactive components is created. In order to examine the dynamic visual perception mechanism, system is quantified by using scientific and professional techniques.

Methods: Based on previous research on the subjective and objective evaluation of urban streets, a dynamic landscape visual objective evaluation system is chosen and built, including spatial elements (sky view factor, architectural visual proportion, green view index), spatial configuration (mean horizontal visual depth), and spatial vision (color richness). The following are the definitions of subjective indicators: clarity (vague-clear), transparency (enclosed-open), richness (monotonous-rich), and relaxation (suppressed-relaxed). Based on the subject-object interaction principle, dynamic visual subjective and objective evaluation indicatorshave been developed, including dynamic viewing frequency, landscape preference offset degree, and spatial vitality index.

Results: Data on surface elevation, building elevation, and road elevation are gathered from open-source platform OpenStreetMap and the geographic spatial data cloud, with an emphasis on Shanghai's Hengshan Road. In addition, 80 example photos are taken using fixed-point photography on the spot. The green view index, building area percentage, and sky area proportion of the sample sites are computed using image semantic segmentation algorithms. The mean horizontal visual depth is calculated using GIS spatial analysis. Color richness is calculated by analyzing the RGB values of the image colors using Colorimpact software. Subjective assessment indicators of the sample points are computed on the basis of these results and the subject-object linear regression equations that are currently available. In order to ascertain dynamic viewing frequency based on 40 sets of two-step path trajectory data, landscape preference offset degree based on 21 two-step path positioning photographs, and spatial vitality index based on 26 Baidu heatmap data, the study also employs GIS overlay analysis and inductive statistics methods.

Conclusion: The study examines correlation between the dynamic visual perception mechanism and visual assessment system using the Partial Least Squares Regression in SPSS. Moreover, a scatter plot in three dimensions is created. According to the study, "dynamic viewing" behavior influences how people perceive their surroundings while they are in cities significantly. Reduced desire for space and pedestrian flow are caused by a decrease in dynamic viewing frequency. The public's impression of street space is enhanced in terms of clarity, transparency, ease of use, and richness when there is a greater range of spatial hues within the field of view, a smaller building area, and more translucent and clear spaces. These results emphasize the significance of subject-object interaction, or "dynamic viewing" behavior indicators, in enhancing street scene perception and visual quality. Planning and designing urban streetscapes should focus on elements including viewing frequency, viewing preferences, and spatial vitality in dynamic visual environments.

ENHANCING URBAN BIRD HABITAT FRAGMENTATION: INSIGHTS FROM SHANGHAI, CHINA

Abstract ID: 1108.0.0.1115.2024
Individual Paper Presentation

Jianqi Yu [NYU Shanghai] jy5132@nyu.edu, presenter

Shanghai, as China's premier international economic and financial hub, faces significant challenges in balancing economic growth with environmental conservation. The rapid pace of development has led to habitat fragmentation, particularly impacting urban bird species. Moreover, the existing land communal system undermines effective ecological conservation efforts by depriving policymakers of clear land conservation values, thereby prioritizing economic interests over environmental concerns. Numerous studies, including the SLOSS Debate, demonstrate that small patch assemblages may harbor more species than individual large patches of similar size. Building on this understanding, this study explores the possibility of optimizing the conservation potential of highly fragmented, hot spot-distributed bird habitats in cities at a landscape scale. It aims to delineate metrics for reconciling economic development and ecological conservation with minimal cost and maximum efficiency. This paper focuses on Shanghai as the study area, employing Fragstats software to categorize landscape elements (Metrics) and utilizing the dual modeling research method (MaxEnt+Marxan) within the Systematic Conservation Planning (SCP) approach to quantify bird distribution and habitats. The main objectives are as follows: 1. Evaluation and planning of hot spot distribution areas for 527 species of wild birds in Shanghai, spanning 22 orders, 82 families, and 255 genera. Subsequently, hotspots for bird distribution are assessed and mapped. 2. Targeting 108 areas in Shanghai, including urban parks, school greenspaces, and villages, identified for their conservation benefits using official E-Bird data. Research results are categorized into two main types: Single Large/Several Small, and the SLOSS biodiversity conservation framework is applied to study species conservation patterns. Our hypotheses are as follows: (i) Within the same area, 'Several Small' and 'Single Large' habitat types exhibit comparable average conservation benefits for bird diversity, yet they differ in preferences for birds of various residency types. Moreover, positive effects on bird survival exist within certain thresholds of human activities in both habitat types, influenced by distinct human use preferences and behaviors. (ii) There is no absolute disparity in conservation benefits between the two habitat types ("Single Large" and "Several Small") for

bird diversity. Urban bird conservation potential is heightened under a certain level of fragmentation and landscape connectivity, extending conservation benefits to neighboring areas. The study aims to investigate bird conservation strategies amidst rapid urbanization and unclear management of land commons. It seeks to conduct foundational research to understand how fragmented small patches of habitat at the urban scale can be optimized to maximize biodiversity conservation benefits.

EQUITABLE MANAGEMENT OF THERMAL COMFORT IN MULTI-FAMILY BUILDINGS

Abstract ID: 1108.0.0.1093.2024
Individual Paper Presentation

Miriam Giottonini [California State University Northridge] pgiottonini@csun.edu, presenter

Indoor thermal comfort serves as a catalyst for health and quality of life. In cities with moderate weather like Los Angeles, indoor thermal comfort can be achieved through architectural design principles such as orientation and ventilation, and minimal intervention of mechanical systems (Chai & Fan, 2022; Taleghani et al., 2013; Omer, 2008). However, like many other urban areas, Los Angeles faces heat risks from a warming environment, aggravated by the urban heat island effect. In recent years, the city has experienced hotter and longer summers, putting the population at risk of health complications which are particularly dangerous to vulnerable populations such as the elderly, children, and those with pre-existing health conditions. City governments and civil organizations explore efficient ways to mitigate these risks with cooling centers, tree-planting initiatives, and heat emergency plans to protect public health during periods of extreme heat. However, these may not be accessible to everyone who needs them, and a better approach would be to improve thermal comfort in existing residential buildings. To achieve this, the county's Department of Public Health recommended the amendment of the Los Angeles building code to require indoor temperatures of less than 82 degrees Fahrenheit in housing outfitted with air conditioning (County of LA Public Health, 2023). This mandate is comparable to existing regulation that requires landlords to provide renters with adequate heat. Following this recommendation, the LA County Board of Supervisors passed a motion to require cooling measures in rental housing. A subsequent proposal by the LA County Department of Public Health seeks to enforce the installation of A/C units in multi-family housing units to ensure on-site thermal

comfort, without any mention of the necessary insulation retrofits in these buildings. Extensive research unequivocally underscores the necessity of installing insulation in buildings to attain optimal thermal comfort efficiently. Without the proper insulation, operating an A/C unit is cost-inefficient at achieving indoor thermal comfort, and due to increasing electricity consumption would impose an additional cost burden to many families in Los Angeles. Additionally, greenhouse gas emissions could increase due to an increment in electricity demand to power these A/C units. If California aspires to reduce its GHG emissions by 40% before 2030 and achieve further climate goals, the state must focus its efforts on reducing emissions created by millions of housing and commercial buildings.

This study aims to assess the cost-effectiveness of providing A/C units to occupants of multi-family housing for achieving thermal comfort, compared against the expenses associated with retrofitting their dwellings with the necessary insulation. Using a GIS (geographical information systems) model, I will map multi-family buildings in the City of Los Angeles and organize them by year of construction to estimate the number of units that lack insulation. Los Angeles is characterized by multifamily buildings (about 56% of the housing stock); and the majority of those were built before 1975, the year that insulation requirements were included in the building code. Using the city's records, I will generate a ratio of units that have not been upgraded since the regulation passed. Using the same model, I analyze the required capacity (number and capacity of A/C units) to compare against the estimated insulation required to retrofit these units. Later, I analyze the costs associated with the provision of the A/C units, costs associated with the usage of these units and how these costs may contribute to the energy burden on users, and the consequences of these additional costs on thermal comfort and equity. The analysis concludes with an evaluation of the potential effects in relation to the concept of energy justice as defined by Sovacool & Dworkin (2015).

ESTIMATING WATER CONSUMPTION UNDER DIFFERENT DEVELOPMENT SCENARIOS

Abstract ID: 1108.0.0.907.2024

Individual Paper Presentation

Philip Stoker [University of Arizona] philipstoker@arizona.edu, presenter

It is important for planners to ensure that future urban growth can be supported by clean and reliable water supplies. Understanding how new development will impact water supplies in the future can support scenario planning efforts by municipalities and regional organizations. There are a wide range of methodological approaches to estimate future water consumption at a variety of scales (House-Peters 2011). The modeling approaches vary but the applicability of all of them all comes down to data availability. Sometimes the necessary data does not exist. For example, we know that individual attitudes and preferences influence water consumption but in the absence of widespread surveys that variable cannot be used to calculate future estimates (Randolph and Troy 2008). In other instances, data required to estimate water consumption is not shared outside of a single agency. Public utility records that contain property location and type are some of the most useful data to link urban development and built environmental characteristics to water consumption, but the data are often not made available by the public utilities (Ruddell 2018). There is a need for either more data sharing or a simplified approach to estimate how urban development affects water consumption. This study represents the latter approach and develops a simple but accurate method for estimating water consumption in a large metropolitan area.

The Phoenix Metropolitan Area (PMA) is one of the fastest-growing urbanized areas in the U.S. as well as one of the hottest. Regional water providers responsible for managing the water supply want to better understand how urban development will impact water consumption in the region. The problem is they don't have the data they need. There is no single regional or state agency responsible for understanding how both water is consumed and how land is developed. Instead, land use and water resource management is fragmented between multiple jurisdictions. The PMA contains over ten municipal governments that provide water to their residents as well as plan and permit urban development. The customer data is not shared between the organizations, nor is it made publicly available to researchers or planning agencies.

This study presents an approach to accurately estimate water consumption using only data that is publicly available. Land use data was collected from the Maricopa Association of Governments and the Maricopa County Tax Assessor. Using GIS, the total acreage of each land use, i.e. single family, multifamily, agriculture, industry was calculated. Water consumption data was obtained from state mandated annual reports as well as published water resource management plans. Combining the land and water data allows calculation of average water consumption per acre by land use. For example, a single-family residential property in Phoenix uses on average 1.2 acre feet per acre each year. This measure is called a "water duty" and when the water duties were applied to current land use in the region the estimate was only 0.004% different than the five-year average of actual water consumption. The estimate was almost exactly what is consumed in the region. The water duties were then applied to a future development scenario where all vacant land was developed in the PMA and agricultural lands were converted to residential. Interestingly, the conversion from agriculture to residential reduces water consumption and overall water consumption would only increase slightly despite a much larger population in the region. These formulas and water consumption rates were implemented in an Excel based scenario planning tool that is now being used by a regional water provider to estimate water consumption under different scenarios of urban development.

EVALUATION OF URBAN STREET TREES FOR A MORE RESILIENT CITY

Abstract ID: 1108.0.0.1139.2024
Individual Paper Presentation

Fang Fang [University of Illinois at Urbana-Champaign] fangf@illinois.edu, presenter
Andrew Greenlee [University of Illinois Urbana Champaign] agreen4@illinois.edu
Shiva Sheikhfarshi [University of Illinois at Urbana-Champaign] shivas4@illinois.edu

Urban greenspace is part of the important component to support a healthy and sustainable urban environment. During the past decades, there has been a growing body of literature explored the quantity, quality, benefits, and costs associated with urban greenspace and street trees, and broader impact toward environmental justice and urban socioeconomic disparities.

In this talk, we systematically evaluate the quantity and quality of 196825 urban street trees in District of Columbia, using street view images, remote sensing and GIS datasets. To begin with, we used remote sensing images to map the tree species and tree health using machine learning algorithms. We found that high-resolution and multi temporal remote sensing images have the potential to distinguish both tree species and tree health status at individual tree level. At the same time, we explored influences from various aspects such as socioeconomic, environmental and landscape structures toward the health status of street trees at census tract level. We further identified the association and causality for street trees under poor health conditions due to several socioeconomic and environmental factors. We found that the health status of the street trees is directly impacted by environmental and landscape pattern factors. There is also an indirect impact from socioeconomic factor toward quality of street trees. We also used street view images to identify the streetscape patterns and further provide strategies and insights for urban street tree management for cities to not only address environmental inequity for climate adaptation plans, but also promote a more resilient urban greenery system.

EXAMINATION OF FACTORS THAT AFFECT LOCAL CLIMATE ACTION PLANNING IN JAPAN

Abstract ID: 1108.0.0.1050.2024
Individual Paper Presentation

Hiroyuki Iseki [University of Maryland, College Park] hiseki@umd.edu, presenter

Global warming and climate change continue to threaten people's lives, communities, and the natural environment around the globe. The Paris Agreement of the United Nations Framework Convention on Climate Change requires industrialized countries to report their annual greenhouse gas (GHG) inventory, which covers emissions and reduction of direct GHGs. The Government of Japan has set an interim goal to reduce its CO2 emissions by 46 percent by 2030, compared to the 2013 levels, on the way to eventually meeting the goal of net zero by 2050. In 2019, the CO2 emissions from the transportation category accounted for 199 million t-CO2 or 16.4% of the total GHG emissions in Japan; road transportation accounted for 89.2%.

Local governments possess critical roles in identifying the need for adaptation and mitigation and developing measures that can be effectively implemented in the areas, including land use, transportation, and infrastructure (Amundsen et al., 2018). However, the literature on transportation-related climate action plans in the US indicates the lack of rigor in developing climate action plans, the problem with silos among the relevant planning areas, and the resulting lack of effectiveness in achieving the stated goals of GHG emissions reduction, including the case with SB375 in California (Deakin, 2019b; Sciara, 2020). As the Government of Japan delegated, in the Global Warming Law (GWL), its authority to implement relevant laws to prefecture governors and city/town/village mayors, local governments are responsible for developing, implementing, and monitoring their climate action plans. While the local action plan only for government-related activities ("administrative business" version) has been mandatory for all local governments since 2008, the one for non-government-related activities ("area measures" version) is required only for the governments of prefectures, "designated cities," and "medium-size cities" with the population of 200,000 or more. At the same time, there has been an increasing number of local governments of all sizes declaring net-zero CO2 emissions by 2050.

This study follows the previous study that examined the effectiveness and challenges in implementing climate change policy in local climate action planning and implementation in Japan, focusing on the transportation and land use planning fields (Iseki, 2024). It addresses questions, including (1) what factors are related to the earlier production of climate action plans by local governments, (2) what factors influence the GHG emissions reduction goals and the set years of achieving the goals, and (3) what factors are related to the relative importance of alternative fuel vehicles in the climate action plan.

The study analyzes the database built based on three primary datasets. The first dataset contains the data from "the survey on the implementation status of the law concerning the promotion of global warming countermeasures at the local governments in 2021" published by the Ministry of Environment. The second dataset contains information on the local governments that have declared net zero carbon dioxide emissions by 2050, published by the Ministry of Environment between 2019 and 2024. The last dataset contains the responses of the two original surveys collected from a total of 116 local governments during the seven months of 2021. The first survey was sent to and responded by the planners of a unit that prepares local climate action plans, while the

second survey was sent to and responded by the planners of one of the transportation-related units, which is considered most relevant to climate action planning by each local government.

This study contributes to the literature on climate action planning, with a focus on its connection with the transportation sector and the critical roles of local governments. It seeks to increase the understanding of factors that lead to successful climate action planning.

EXAMINING THE ROLE OF COMMUNITY STAKEHOLDERS IN CLIMATE PLANNING

Abstract ID: 1108.0.0.693.2024
Individual Paper Presentation

Emma French [University of California Los Angeles] emmafrench@ucla.edu, presenter

Climate change represents a wicked problem facing the world. Due to their proximity to climate impacts and understanding of context-specific vulnerabilities, local governments are increasingly viewed as critical change agents in addressing both the impacts and the causes of climate change. Global injustices related to climate risk and responsibility are mirrored at the local level, where marginalized urban residents that have contributed least to the problem are most at risk from its consequences. As awareness of the complexities of climate change and the potential for responses to have unintended negative consequences has grown, local governments are experimenting with participatory and collaborative approaches to climate governance.

Community-led climate planning and policy making approaches are promoted as a way of addressing persistent injustices in local climate governance processes and outcomes by shifting both resources and decision-making power to those most impacted by climate change.

In theory, these efforts align with mainstream participatory planning practices, as well as the demands of environmental and climate justice advocates who call for more meaningful engagement with frontline communities. However, given the plethora of research highlighting the gap between participatory ideals and practice, this recent rise in state-sponsored, community-led climate planning raises questions about the potential for these efforts to reproduce, rather than challenge, unjust processes and outcomes.

Building on theories of participatory planning and environmental and climate justice, this study investigates an ongoing experiment in state-funded, neighborhood-scale, community-led climate planning in California. I ask: How are impacted community stakeholders involved in and influencing local climate planning processes and likely outcomes in historically marginalized communities? This question is addressed through a two-part analysis of the TCC Program, a prominent government-funded, neighborhood-scale climate planning program in California. Launched in 2016 by the State Legislature, TCC funds the design and implementation of climate mitigation and adaptation projects among the State's priority populations, communities characterized by their disproportionate environmental and economic marginalization. Using qualitative document analysis and critical discourse analysis, I analyze the relationship between divergent understandings of community, strategies of involvement, and planning decisions through a critical environmental justice (EJ) lens.

I find that community based organizations representing some of the state's priority populations played a key role in imagining and realizing the TCC program. At the same time, however, the scale and scope of the projects being funded make it difficult for historically marginalized communities to lead in their design and implementation on the ground. The comprehensive nature of the projects being funded, which is considered essential by environmental and climate justice advocates, makes community control more challenging, if not inaccessible, ultimately curtailing the visions of climate justice being put forward by frontline communities.

EXPLORING ENVIRONMENTAL AND SOCIAL EQUITY IN PERI-URBAN PARKS

Abstract ID: 1108.0.0.14.2024
Individual Paper Presentation

ChengHe Guan [New York University Shanghai] cg157@nyu.edu, presenter

Peri-urban parks play a crucial role in enhancing urban living conditions and promoting contact with nature. However, assessing peri-urban park environmental and social equity requires understanding actual park user activities, which has been lacking in previous research. To bridge the gap, this study utilizes mobile phone big data from over 40,000 visitors to peri-urban parks in Tokyo. We applied Local Moran's I, Lorenz Curve, Gini coefficient, and K-means clustering methods to scrutinize accessibility and social inequities among residents of Tokyo's 23 special wards and within distinct visitor groups. The findings reveal significant insights: Firstly, mobile-based indicators expose disparities, underscoring the relevance of human activities in assessing peri-urban park accessibility, variations in these indicators highlight the need for a multi-dimensional approach. Secondly, Gini coefficient analysis of mobile-based and two-step floating catchment area indicators suggest that extending the service radius beyond 10km enhances accessibility equity. Furthermore, social inequities are more distinctly illustrated through mobile-derived visitor groups compared to age-demographic groups. These findings offer valuable insights for decision-makers in park planning policy, enabling the development of strategies that address accessibility and social inequalities while establishing effective classifications for peri-urban park visitor groups.

EXPLORING LIVELIHOOD IMPACTS OF SETTLEMENT RELOCATION: A CASE OF XICHUAN

Abstract ID: 1108.0.0.476.2024
Individual Paper Presentation

Hang Li [Tongji University] lh961681560@gmail.com, presenter

The formulation and implementation of policies to harmonize resource use and human development has become a major task globally, especially in ecologically-dependent areas where productive human life is overly constrained by natural resources. Household livelihoods (HL) provide a well-established framework for the analysis of policy effectiveness, defining the activities, assets, and access that determine an individual's or household's livelihood (Ellis, F, 1998). In China, Poverty Alleviation Relocation (PAR) is a policy tool for resolving localized human-land conflicts through the means of rural settlement relocation, and is particularly relevant for poor people living in areas where resources cannot support sustainable livelihoods. However, no clear conclusions have been drawn about the sustainability of people's livelihoods after settlement relocation (Zhou et al., 2018), especially in

ecologically-dependent rural areas that lack diversified livelihoods (Liao and Brown, 2018). This study aims to empirically answer the following questions: how do shifts in the spatial environment in which households are located affect their livelihood structures under conditions of homogenous production? What specific role do spatial relevance elements play in the influence process?

This study focuses on six mountainous villages in Xichuan Township, China and their households that have completed relocation under the PAR policy. The main methods of data collection are the use of participatory tools and techniques, household surveys, supplemented by GIS analysis. The relocation network was constructed by integrating information on the attribute changes of geo-referenced and spatially related elements before and after relocation. For the 56 household samples, livelihood capital was selected as a measurement indicator, and a five-dimensional indicator system describing changes in livelihood structure was constructed for human capital, natural capital, social capital, financial capital, and physical capital. In terms of spatial correlation element improvement of relocation network, transportation, infrastructure, and agricultural production improvement can be achieved through relocation and support livelihood optimization (Liu et al., 2020; Perz et al., 2012). This study quantifies this in a GIS system. Finally, panel data were used to test the correlation between changes in livelihood capital and spatial correlation elements in relocation networks.

The results show that PAR has differential effects on the five types of livelihood capital. For household financial capital and physical capital, the improvement is more obvious, and the average optimization index reaches 0.73 and 0.68, respectively. while natural capital and social capital are not effectively optimized with the change of the living environment, which shows the negative impact of PAR on the accessibility of natural resources and the social network in rural areas. The results of regression analysis showed that the improvement of public service accessibility and the shortening of the radius of non-farm employment had a positive effect on the improvement of household human livelihood capital. However, the improvement of the surrounding agricultural production environment does not enhance households' natural livelihood capital. Meanwhile, households that relocate to live in more populated areas do not effectively acquire more social capital. This paper concludes that for rural livelihoods to remain sustainable and balanced in the process of policy implementation, the organization of relocation networks must be properly selected and optimally laid out in combination with specific spatially linked elements.

These empirical results depict the impacts of spatial adjustment and resource management policies on specific households in the implementation process, which can provide a basis for the practice of PAR in special areas. At the same time, the experiences and shortcomings can provide lessons for other countries around the globe in addressing the challenges of harmonizing resource use and human development.

EXPLORING THE ROLE OF NATURE-BASED SOLUTIONS IN URBAN RESILIENCE

Abstract ID: 1108.0.0.364.2024
Individual Paper Presentation

Willian Lima [Florida Atlantic University] wsiqueiralima@live.com, presenter
Melina Matos [Florida Atlantic University] matosm@fau.edu

Climate change presents significant challenges to urban areas, including rising temperatures, extreme weather events, and urban heat islands. Addressing these challenges requires the development of effective strategies to enhance urban resilience, mitigate the impacts of climate change, and adapt to evolving conditions. In this context, Nature-Based Solutions (NBS) have gained recognition as a promising approach to tackle the complex climate-related issues facing urban landscapes. However, there is a lack of comprehensive understanding of how NBS are being implemented in cities and their potential to enhance resilience and address climate change.

Nature-based solutions (NBS) are centered on protecting, sustainable management, and restoring both natural and modified ecosystems, aiming to benefit biodiversity and human well-being. They are designed to promote healthy ecosystems and support adaptation to climate change, reduce the risk of natural disasters, enhance food and water security, mitigate biodiversity loss, and protect human health. Despite the growing interest in NBS, their application in urban settings to address climate change and bolster resilience remains ambiguous. Existing literature primarily focuses on actions in natural areas on the outskirts of cities, which have been altered by human activities, with the assumption that interventions in these areas will positively impact urban environments. However, this assumption necessitates further research to fully comprehend the potential, limitations, and implementation of NBS within urban contexts.

This research aims to investigate the role of NBS in urban landscapes as a means of simultaneously addressing the challenges of climate change, with a specific focus on resilience, climate mitigation, and climate adaptation. Employing a mixed-methods approach, the study integrates quantitative data analysis, qualitative interviews, content analysis of plans, and spatial analysis of plan policies. The policy analysis phase involves creating a comprehensive list of policies categorized as Nature-Based Solutions and conducting an in-depth analysis to understand their specific characteristics and potential impacts.

Preliminary results from an initial sample of 230 cities recognized for their leadership in sustainable development indicate that investments in adapting cities to climate change often favor traditional gray infrastructure over NBS. This preference is possibly due to the well-established science of conventional city-building, with clear investment

costs and improvement indicators. However, there is a need for a comprehensive assessment of how cities incorporate NBS into their climate adaptation and mitigation strategies.

This study provides valuable insights for urban planners, policymakers, and researchers in the field of sustainable development and climate resilience. By evaluating the implementation status of NBS policies in selected cities and examining their experiences, successes, failures, challenges, and lessons learned, the research aims to contribute to a better understanding of the potential and limitations of NBS in enhancing urban resilience and addressing climate change.

EXTREME WEATHER, CHARGING RATE AND MODERATING EFFECT OF STATION SHELTERS

Abstract ID: 1108.0.0.1201.2024
Individual Paper Presentation

Mushu Zhao [The University of Hong Kong] zhaomsh3@connect.hku.hk, presenter
Weifeng Li [The University of Hong Kong] wfli@hku.hk
Dawei Wang [Department of Urban Planning and Design, The University of Hong Kong] wangdwei@connect.hku.hk

As green and efficient means of transportation, new-energy vehicles are increasingly favored. The rapid growth of these vehicles requires greater attention to the construction and operation of charging infrastructure. However, the development of charging infrastructure faces multiple challenges. There is a mismatch between high-cost construction, low utilization, expanding market size, and increasing charging demand. Therefore, it is significant to understand the factors influencing the utilization of public charging stations. Furthermore, recent record-breaking heatwaves and extreme precipitation in many cities have strained water and power supplies, impacted food security, livelihoods, travel behavior, and public health. These extreme weather events also pose challenges for urban infrastructure operation. However, existing charging station studies and planning seldom consider this aspect. Thus, there is an urgent need to consider the impact of extreme weather and adopt moderating strategies when promoting the construction and management of public charging stations.

This study evaluates the utilization of public charging stations under extreme weather conditions using weather data and charging record big data, focusing on Shenzhen, a pioneering city in promoting vehicle electrification and renowned for its high density of public charging stations. Extreme precipitation has a more significant negative impact on fast charging station utilization. Additionally, we explore the moderating effect of station design, with a particular emphasis on the role of shelter. We find a correlation between parking cost, built environment, socio-economic context, and the installation of station shelters. The moderating effect of shelters is found to be more significant for fast charging stations, and the impact differs between weekdays and weekends. Our research provides a systematic and empirical exploration from a station perspective, offering evidence for the planning, operation, and management of charging infrastructure in the context of climate change. It further promotes the development of the new-energy market.

FACTORS IN THE ADOPTION OF LARGE SCALE SOLAR PROJECTS IN THE UNITED STATES

Abstract ID: 1108.0.0.1235.2024
Individual Paper Presentation

Nikhil Kaza [University of North Carolina at Chapel Hill] nkaza@unc.edu, presenter
Heerae Lee [University of North Carolina] heerae@unc.edu
Noah Kittner [University of North Carolina at Chapel Hill] kittner@email.unc.edu

Over the past decade, thousands of megawatts of capacity have been added to the grid, through utility-scale solar projects. Yet the best estimates suggest a 4-6 year time horizon for planning and permitting these Large-Scale Solar (LSS) projects, with significant delays in the permitting and lengthy interconnection queues. While there has been a significant interest in identifying the patterns and causes of rooftop solar adoption by households (Graziano and Gillingham 2015; Wolske, Gillingham, and Schultz 2020), there has been not much work done in identifying the correlates of successful utility scale solar adoption in different areas. Even though utility scale solar is spatially clustered much of the work has been concentrated on identifying barriers and delays in specific projects(Susskind

et al. 2022). The one national study we can find (Ding et al. 2023) uses cross-sectional data and suffers from category errors in their policy level variables.

In this study, we present the results form longitudinal analysis of large scale solar projects. We use the data from Energy Information Administration's form EIA-860 to locate generator level information of existing and planned generators with 1 MW or greater nameplate capacity. We take advantage of the recent efforts by Lawrence Berkeley National Laboratory and United States Geological Survey which validated the locations and extents of the generators (Fujita et al. 2023). Using this primary dataset, we explore the following questions. We will explore the following questions by constructing appropriate statistical models: (1) What are the spatial and temporal patterns of adoption (clustering, dispersion etc.) in the Southeast? Does the metropolitan context matter? (2) What trends in demographic and economic characteristics of a jurisdiction are important to explain the adoption over time? What are the differences between communities that are currently designated as Justice40 and those that are not? (3) What are the impacts of trends in agricultural practises and outcomes (loss of farmland, productivity), changes in forest land uses and urban development pressures on adoption? (4) How do regional and infrastructural features, such as proximity to existing urban centres and transmission infrastructure impact the adoption? (5) Does jurisdictional and ownership fragmentation/consolidation affect the adoption rates? (6) Exploring spatial and temporal autocorrelation. Does prior experience with LSS, increase or decrease the likelihood of adoption of new LSS? Does the presence of LSS in neighbouring jurisdictions increase or decrease the likelihood of adoption?

To answer these questions, we assemble data from large number of sources including UGSG landcover, American Community Survey, County Business Patterns, USDA's National Agricultural Statistics. By analysing spatial and temporal trends, we aim to explore potential causal links between the rise of photovoltaic infrastructure and changes in land use. We use a generalised spatial dynamic panel data (GSDPD) to estimate the effects of various correlates on LSS (Jin et al. 2020). While we don't aim to present a causal model, this is paper sets the stage for a more in depth qualitative exploration of jurisdictional practises that help or hinder the energy transition.

FLOOD VULNERABILITY ANALYSIS OF INDIVIDUAL SEMI-BASEMENT HOMES IN SEOUL

Abstract ID: 1108.0.0.642.2024
Individual Paper Presentation

Sora Han [University of North Carolina at Chapel Hill] sora1@unc.edu, presenter
Jae Kwon Lim [Dankook University] limjk3796@dankook.ac.kr

The increasing intensity of rainfall due to global warming is increasing the vulnerability of people living in semi-basement houses to urban flooding. To address this issue, The Seoul Metropolitan Government has announced a policy to assist in relocating underground residents to the ground floor. However, to effectively mitigate the flood risk of semi-basement houses and facilitate the relocation process, adopting a proactive approach that reflects various urban spatial factors is important. Therefore, this study aims to evaluate the flood risk of individual semi-basement houses in Seoul by analyzing the physical environment, population, and socio-economic factors. This study will also suggest flood risk mitigation measures based on a detailed index analysis. The analysis of the Flood Vulnerability Index (FVI) of all semi-basement houses in Seoul shows that the flood-vulnerable semi-basement houses are significantly concentrated in Dobong-gu and Eunpyeong-gu. Moreover, the analysis of the flood-prone areas in Dobong-gu and Eunpyeong-gu using the detailed indicators shows that Dobong-gu has a relatively high Exposure Index (EI) and Physical Vulnerability Index (PVI) value. In contrast, Eunpyeong-gu has a relatively low Social Resilience Index (SRI). Therefore, Dobong-gu should prioritize reducing physical vulnerability and flooding exposure, while Eunpyeong-gu should focus on improving social resilience. This study contributes by analyzing flood vulnerability at the level of individual semi-basement houses, reflecting their urban spatial characteristics. Furthermore, this study provides basic data that can help local governments develop flood risk reduction policies based on the evaluation characteristics of semi-basement housing.

FORMING RISKS OR RESILIENCE: RECOVERY PLANNING IN BHIMESWOR CITY IN NEPAL

Abstract ID: 1108.0.0.545.2024
Individual Paper Presentation

Jiwnath Ghimire [Iowa State University] jghimire@iastate.edu, presenter

Human vulnerabilities to disasters are formed over time by geographic, social, economic, and policy changes and disparities (Cutter et al., 2003; Wisner et al., 2004). Disaster recovery offers opportunities to overcome these vulnerabilities and build resilient communities. However, communities rarely plan for recovery (Hokanson & Schwab, 2014), even though recovery is a locally driven process (Johnson & Hayashi, 2012). A 7.8 magnitude earthquake shook more than 15 densely populated districts of Nepal on April 25, 2015, followed by a major aftershock of 7.3 magnitude with its epicenter in Dolakha District. More than 9,000 people were killed, and over seven billion USD worth of property and infrastructure damage occurred (Yamada et al., 2016). Bhimeswor Municipality, the largest city of Dolakha District, faced extensive damage to residential buildings, official facilities, and road networks due to its proximity to the earthquake epicenters. After nine years of the event, the municipality recovered, but many questions on vulnerability and resilience remained unanswered. This study strives to untangle the landscapes of disaster recovery efforts and changing faces of social and economic vulnerabilities in the aftermath of the 2015 Nepal Earthquake with the case study of Bhimeswor Municipality of Dolakha district.

Most earthquake-damaged private houses, government buildings, community facilities, and infrastructures were restored by 2023. Volunteerism, social capital, and informality played significant roles in the tangent of formal institutions. But earthquake recovery was not the same for all. Some communities achieved higher resilience, and others became more vulnerable. To understand multiple fronts of resilience and vulnerabilities in disaster recovery planning, this study uses 400 household surveys among earthquake-affected families, 13 in-depth interviews with community leaders and recovery planners, and a desk review of publications from national and international sources. Using binary logistic regression models on survey data, coding of interview transcripts, and triangulation of survey and interview findings with desk review results, this study concludes that social capital and informality played crucial roles in the earthquake response. However, when the recovery started, bonding relationships functioned well among poor ethnic minorities compared to economically well-off classes. The insufficiency of funds and incompatible building designs with livelihoods were significant challenges, resulting in displacements, migrations, and economic vulnerabilities among minorities. The study recommends empowering local government and informal institutions in communities as the best planning strategy to build resilience against future geologic and climatic disasters in Nepal and beyond.

GARDENING IN THE MACHINE: ECOLOGICAL PRAXES FOR RESHAPING NEIGHBORHOODS

Abstract ID: 1108.0.0.98.2024
Individual Paper Presentation

Michael Zang [Florida State University] mcz18b@fsu.edu, presenter

Crises of the Anthropocene place exponential demand on cities. In planning, we speak of improving sustainability, resilience, and adaptation with increasingly integrated and interdisciplinary strategies. More commonly, this discourse emphasizes material-technological solutions, but seldom acknowledges the role of transforming culture, practice, and other intangibles such as emotional connections to nature (Kahn and Hasbach 2012). Echoing early bioregional planners, this research focuses on integrating and building a socioecological ethos through praxes at the grassroot level to transform neighborhoods and improve cities socially and ecologically (Thackara 2019). Neighborhood praxes provide long-term, hands-on engagement that reshape norms, behaviors, routines, and practices and, from a systems lens, can be greater than the sum of their parts (Kennedy 2011).

Through this presentation, I explore the Urban Ecology Center's (UEC) use of applied, community-based ecological praxes to catalyze individual and neighborhood changes. For the last 30 years, the UEC in Milwaukee, WI has been organizing a range of environmental programs and activities from land stewardship and community science to outdoor recreation, workshops, nature-based public events, and more – all oriented around community building and connection. This pragmatic work also generates real-world outcomes such as restored greenspaces. While creating local networks and stewarding resources, such praxes promote a common identity that integrates social and ecological awareness and action. Thus, I answer, 'How and to what extent does the UEC's praxes inspire a socioecological ethos in residents and communities? And to what extent do these praxes influence local cultures and conventions towards greater sustainability and resilience?

To study this phenomenon, I spent 5 months conducting participatory research at the UEC, attending weekly programs and events, observing, listening, and conversing with practitioners and volunteers. By living and working in proximity to the UEC's locations, I became part of several intersecting communities and gathered critical insights about the individual and neighborhood impacts of this work. To document my data, I took rigorous fieldnotes, conducted 36 semi-structured interviews, photo-documented events, and analyzed physical and digital content.

The results of this research suggest that, in some ways, these praxes do drive individuals and communities towards more synthesized social and ecological sensibilities and practices. Beyond tangible outcomes, many practitioners adopt and spread sustainable, resilient, and adaptive ways of thinking about and existing in urban spaces, some of which challenge and defy traditional urban norms and conventions. Additionally, in viewing urban neighborhoods as part of the broader environment, this work can improve practitioners' sense of socioecological justice and equity. I make the case that such praxes, as a form of grassroot planning, can transform urban neighborhoods in a

meaningful and empowering way by developing new imaginaries, practices, and cultures based on an infused social and ecological paradigm.

In terms of planning scholarship and practice, this research highlights the effective role of using community-based ecological praxes to transform cities alongside other strategies. My work supports similar findings which demonstrate how local environmental work dramatically alters participants' environmental awareness, knowledge, and actions (Krasny and Tidball 2012). By conducting this work right within neighborhoods and focusing on community, the UEC builds intimate relationships between people and places, so they envision their own lives and communities as interdependent parts of a socioecological system. Furthermore, this research supports the need for more practical, project-based education - across different disciplines and institutions - with real-world outcomes that engage with local environments and neighborhoods using a socioecological perspective (Madiraju and Brown 2014). Although limited in scope, such efforts provide a pathway to reimagine and reshape neighborhood cultures and foster new ways to inhabit cities with greater social and ecological awareness and intention.

GREENING THE GAP: EXAMINING URBAN GREENERY EQUITY IN SHRINKING CITIES

Abstract ID: 1108.0.0.105.2024
Individual Paper Presentation

Mingze Chen [UBC] mingzec@student.ubc.ca, presenter
Xuanyu Zhou [Zhejiang University] 3210100324@zju.edu.cn

Urban green spaces (UGS) play an essential role in improving residents' health and achieving equitable urban development, particularly in cities experiencing shrinkage (Nesbitt et al., 2019). Currently, numerous cities worldwide are experiencing urban shrinkage, characterized by depopulation and economic decline (Martinez-Fernandez et al., 2016). This trend often results in the unequal distribution of UGS, leading to challenges in Urban Green Equity (UGE) (Hoffimann et al., 2017). However, many studies rely on cross-sectional data and overlook the insights gained from longitudinal data in tracking temporal changes (J. Chen et al., 2023). Furthermore, UGE quantification typically focuses on the quantity rather than the quality of UGSs, like whether the park is easily accessible and whether the green space is adequately visited (S. Chen et al., 2020). Addressing these gaps, this study selected 10 cities from each of four countries (Japan, China, the United States, and Australia), all experiencing varying degrees of urban shrinkage. These countries cover the developing and developed world, and what these

cities have in common is that they have gone through a process of urbanization and contraction as the city's mainstay industry declines. The research begins in the American city of Pittsburgh. We employed machine learning methods to analyze a decade's satellite imagery, assessing changes in UGS's type, area, and morphology in these shrinking cities. In addition, we use census block fine-grained access data to observe whether green spaces in the city are visited, which is used to assess the quality of green spaces. Our approach redefines the UGE index, incorporating the Gini coefficient weighted by proximity to residential areas. Moreover, we developed a random forest model to evaluate the significance of different quality aspects of UGS in shrinking urban environments. This model utilizes satellite imagery to predict UGE outcomes in these cities. This study offers a novel perspective and tool for enhancing UGE in cities undergoing shrinkage by extending beyond the conventional focus on UGS quantity and integrating quality factors. Our findings underscore the importance of considering both the quality and quantity of UGS in urban planning, particularly in the context of urban shrinkage.

GREENNESS PROTECTS FEMALES MORE AGAINST LUNG CANCER WITH PARTICULATE MATTER

Abstract ID: 1108.0.0.337.2024
Individual Paper Presentation

Keyu Luo [The University of Hong Kong] bessyluo@connect.hku.hk, presenter

New cases of lung cancer occurred globally rank first among all caner type, and east Asia was reported a highest risk of lung cancer mortality. Lung cancer is more prevalent in male, but the incidence gap between female and male has narrowed since 2000. The lung cancer may overtake breast cancer as the leading cause of cancer death in female. Degradation of air quality has been confirmed to have severe side effects on human health. More research is needed on the environment-health nexus.

With lung cancer incidence as health outcomes, we hypothesis that particulate matters (PM1, PM2.5 and PM10) have a negative impact on the lung health in the context of Chinese cities, but this impact is moderated by greenness and the protective effect are stronger on female than on male. In this large longitudinal county-level study, we verified our hypothesis I and II by multiple linear models and generalized linear regression with relative risk (RR), and examined the hypothesis III with addictive interaction. The particulate matters with a aerodynamic diameters ≤ 1, 2.5 and 10 μm (PM1, PM2.5, and PM10) and vegetation index (NDVI) are set as proxies for independent and moderating variable respectively. This large-scale longitudinal study, which sampled from 344 Chinese county-level cities, investigated the associations between air pollutants and lung cancer incidence, as well as the modifying effect of greenness on those associations.

The study included environmental and socioeconomic variables in the models and confirmed the first hypothesis that PM1, PM2.5 and PM10 were associated with elevated lung cancer incidence. Similar results were reported in our generalized model, finding elevated relative risks of lung cancer with each IQR increment in particulate matter. The detrimental association between particulate matter and lung cancer incidence remained robust in region-adjusted models. Re-running analyses with an alternative index of lung cancer mortality rate as a proxy for health response yielded consistent results.

The present study examined the moderating effect of greenness on the association between particulate matter and lung cancer at a county level. We found protective independent associations of greenness proxies, including NDVI, enhanced vegetation index (EVI) and green area ratio (GAR), with lung cancer incidence. Our study observed that counties with a higher presence of greenery exhibited a decrease in both lung cancer morbidity and mortality rates among males and females, in comparison to counties with lower greenery levels, indicating a potential protective effect of greenery against the adverse impacts of particulate matter on lung cancer.

The joint associational analysis of exposure to air pollutants and NDVI greenness showed elevated RRs of lung cancer incidence (male: 33% for PM1, 40% for PM2.5, 30% for PM10; female: 43% for PM1, 51% for PM2.5, 42% for PM10) in high air pollution and low NDVI greenness (double-impacted group) relative to those exposed to low air pollution and high greenness (confirming the second hypothesis). Synergistic effects of particulate matter and greenness were evident for PM1, PM2.5, and PM10. By identifying a stronger interaction between greenness and air pollution in female lung cancer, the study emphasized the potential protective role of greenness in mitigating the larger side impact of particulate matter on females compared to males (confirming the third hypothesis). Similar dose–response associations between particulate matter and EVI and GAR on lung cancer incidence were also observed. These moderation effects remain consistent across different division methods, greenery proxies, region, and smoking rate.

This study implys the importance of ecological planning and urban greenery in the development of female health cities. The incorporation of green spaces and vegetation in urban environments can promote better respiratory health for female residents.

GREENNESS, LOCATION, AND MENTAL HEALTH DISPARITY IN SHANGHAI

Abstract ID: 1108.0.0.628.2024
Individual Paper Presentation

Xibin Jiang [Hong Kong University of Science and Technology] jxbshu@gmail.com, presenter

One in eight people suffers from mental disorder problems worldwide, and such a percentage may be higher in low-middle-income countries. A large body of research, though focusing on various mental health symptoms and in different social contexts, indicates that residential greenness, such as trees, forests, and grassland, is closely associated with people's mental health. However, some mixed and even reversal conclusions are provided referring to the greenness-mental health relationship and a growing number of research puts effort into the heterogeneous effect of greenness on human beings. This study investigates such a heterogeneous effect by proposing that people may be influenced more by greenness where the green space is insufficient than where green resources are sufficient. In our research, we believe urban and suburban areas in the city can be good settings to assess such heterogeneous influence of greenness.

7690 individuals from 4712 families from the Shanghai Urban Neighborhood Survey are included in our analysis. The greenness is measured using the Normalized Difference Vegetation Index (NDVI) from the satellite image of the European Space Agency based on 250,500, 750, and 1000 buffers of the location where people live. The Multiple regression models are adopted to analyze the association between greenness and individuals' mental health.

Our research finds that residential greenness is negatively associated with people's mental health with a statistic significance. However, people who live in urban areas significantly benefit from the surrounding greens, and their depression is curbed by the increase in surrounding greenness. People who live in suburban areas still face more mental problems when the surrounding greenness increases. This study further explores the mechanism and finds that people living in the urban area are more willing to use community facilities as the residential greenness increases, while those facilities in the suburban area are both not enough and less frequented. In addition, people in the urban area are more satisfied with their neighborhoods and households as the greenness grows. For those in the suburban area, more greenness around their households means they live farther from the urban center and earn less, which may negatively influence on their mental health. Our findings provide policy implications for urban planners that green space plays different roles in the urban and suburban context in terms of mental health treatment.

HERE, THERE & EVERYWHERE: RESIDENTIAL MOVEMENT FOLLOWING A NATURAL DISASTER

Abstract ID: 1108.0.0.779.2024
Individual Paper Presentation

Anthony Priest [Rice University] aap11@rice.edu, presenter

Recent reviews on the social dynamics of climate change emphasize the need for spatially and temporally granular data on environmental hazards, residential mobility (i.e., moving from one home to another), and their connection to place-based inequalities (Klinenberg et al., 2020). These studies highlight the importance of such data in understanding how racial residential segregation shapes communities' experiences of environmental hazards and subsequent residential mobility (Arcaya et al., 2020). Building on this need, this study utilizes micro-level, longitudinal data to examine community-level residential displacement following Hurricane Harvey's impact on Harris County, Texas – the core county of the Houston metropolitan area – in 2017. Specifically, it investigates (1) whether the extent of flood impact experienced led to different patterns of residential displacement within block groups, and (2) whether these patterns are influenced by racial place-based inequalities.

To answer these questions, this study employs consumer reference data (Steward 2021) from Data Axle to analyze the annually recorded, address-level residential movements of 832,212 Harris County residents, aggregated to the block-group level (N=2,143) between 2014 and 2019. By aggregating address-level data, this study builds on prior research by accounting for residential mobility, whether down the street or across the county, that may be lost when using larger spatial measures (Logan et a., 2016). Additionally, by using annually recorded data, this study accounts for households' residential histories and the potential for the effects of the storm to be sustained across time. To gauge the impact of Hurricane Harvey, this study utilizes 3x3 meter resolution, modeled flooding data from the Federal Emergency Management Agency (FEMA) to assess both the average depth and area of flooding at the block-group level. High-resolution data provides a clear picture of where and to what extent flooding occurred. In addition to demographic data from the 5-year, 2016 American Community Survey, by leveraging these technological and methodological advances in residential mobility and flooding data, this study helps to develop a deeper understanding of the social impacts of flooding unavailable with more commonly used approaches (Hoffmann et al., 2021).

By employing Coarsened Exact Matching and fixed-effects regressions, the study identifies heightened rates of residential movement following Hurricane Harvey. However, these results are strongly influenced by racial-ethnic inequalities and the combined effects of average flood depth and area. Only majority non-White block-groups experiencing extreme flood impact exhibited increased residential mobility. Notably, these effects persist for up to three years after the storm – emphasizing the longevity of natural disasters' impacts. These findings demonstrate the value of spatially and temporally granular data in understanding the impact of environmental hazards and the longevity of those impacts on residential displacement, particularly when considering the mediating role of both environmental impact and racial place-based inequalities. As such, this study carries three important implications for disaster managers and urban planners seeking to promote environmental justice in the wake of major, natural disasters. First, future research should avoid race-blind analyses to prevent erroneous conclusions about the influence of natural disasters on residential movement. Second, these findings point to the existence of a threshold beyond which households can no longer maintain their current residential location. Finally, focusing solely on the initial push of Hurricane Harvey would provide an incomplete picture. Therefore, disaster managers and urban planners must recognize how residential displacement accumulates within communities following a disaster. By engaging with these three insights, disaster managers and urban planners will be more equipped to promote environmental and urban equality in the face of an increasingly uncertain global climate.

HOUSEHOLD CARBON FOOTPRINT IN HIGH-LATITUDE CITIES: A CASE OF EDMONTON

Abstract ID: 1108.0.0.41.2024
Individual Paper Presentation

Nilusha Welegedara [University of Alberta] yalingas@ualberta.ca, presenter
Sandeep Agrawal [University of Alberta] sagrawal@ualberta.ca

Cities are one of the leading sources of greenhouse gas (GHG) emissions since 50 - 60 % of global GHG emissions originate from cities linked to energy use (UN-Habitat, 2023). Urban household energy consumption has a significant impact on city-level emissions (Long et al., 2021). Therefore, it is essential to take necessary actions to reduce GHG emissions from household energy consumption to reduce cities’ carbon footprint. This is particularly

important in high-latitude cities, where per capita energy use is higher compared to mid and low-latitude cities. High-latitude cities face extreme weather conditions requiring heating in winter and cooling in summer and largely rely on fossil fuel-based electricity generation (Fercovic & Gulati, 2016; Welegedara et al., 2021).

In our study, we explored household energy-related GHG (HEGHG) emissions across the neighbourhoods in a high-latitude city. We sought to answer three major questions: 1) What is the primary source of HEGHG emissions in a high-latitude city such as Edmonton, Canada, and does this source hold across all the residential neighbourhoods? (2) How do different socio-economic characteristics affect HEGHG emissions in these cities? and 3) What are the possible ways to reduce HEGHG emissions in high-latitude cities? We analyzed data from 265 residential neighbourhoods in the city of Edmonton, which sits at the 53rd parallel, by categorizing them as mature and newly developed based on their age. Mature neighbourhoods (n = 196) were developed prior to 2000 and located around the city's core. On the other hand, newly developed neighbourhoods (n = 69) have been developed in the last two decades and are located at the city's fringe. We used dwelling energy consumption data (n=17, 400) and dwelling area data (n = 334,379) provided by the Natural Resource Canada, a federal agency and the city of Edmonton to calculate GHG emissions from dwellings. This data was complemented by vehicle kilometre travelled data aggregated at the neighbourhood level collected by the city of Edmonton.

We found significant variations in HEGHG emissions across neighbourhoods in the city, particularly within mature neighbourhoods. The average annual per capita GHG emissions from dwellings were 45 % higher than those from personal transportation in the neighbourhoods we studied. This highlights the need for greater emphasis on reducing GHG emissions from dwellings in high-latitude cities. Interestingly, our analysis showed that even though new building standards and techniques have reduced energy use intensities in newly built houses in new neighbourhoods, the increased size of these dwelling units has not resulted in the corresponding reduction in per capita emissions.

Our results also indicate that per capita GHG emissions are highly correlated with neighbourhood median income level, percentage of renters, and residents' affordability. Direct per capita emissions from dwellings and personal transportation increase with increasing neighbourhood income levels in both the mature (r = 0.8) and newly developed neighbourhoods (r = 0.4). This is mainly linked to the residents in affluent neighbourhoods having larger houses and using more personal vehicles for transportation. Per capita GHG emissions decrease with an increased percentage of renters in the neighbourhood, particularly in the mature neighbourhoods (r = -0.5), potentially due to renters' proximity to workplaces and public transportation and their tendency to live in small dwellings to reduce expenses. A significant negative relationship (r = -0.3) showed between the percentage of households spending 30% or more of their income on housing, i.e. those for whom housing is becoming unaffordable and HEGHG emissions. These findings can facilitate the implementation of mitigation measures and appropriate policy development focused on areas where they will have the most impact in reducing carbon footprint.

HOW DO 'HOT WEATHER' AFFECT THE PERCEPTION OF URBAN DWELLERS?

Abstract ID: 1108.0.0.1180.2024
Individual Paper Presentation

Meizi You [New York University Shanghai] my2683@nyu.edu, presenter
ChengHe Guan [New York University Shanghai] cg157@nyu.edu

Understanding how climate change might affect people's perceptions and prompt action to mitigate its threats and promote resilience is crucial. While past research has utilized social media tweets to establish the relationship between resident perceptions and temperature, there are four limitations: the lack of direct technical support for capturing residents' heat perception, oversimplification of emotional states, regional research restrictions and lack of comparison, and a scarcity of exploration into temperature adaptability. To address these limitations, this study trained a model called hot weather-Bidirectional Encoder Representations from Transformers (BERT) based on 300 million English-language tweets, covering 240 regions in 40 countries worldwide. The model captures the linguistic diversity of residents discussing hot weather on social media, solving the technical problem of establishing residents' heat perception on a large scale. By integrating various NLP emotion models, our study innovatively identified seven emotional responses associated with hot weather, including joy, sadness, fear, neutrality, surprise, anger, and disgust.

Subsequently, we compiled temperature data from the past twenty years (including maximum, minimum, and average temperatures) and calculated the 90th, 95th, and 99th percentile thresholds as benchmarks. We compared these data with the corresponding daily temperatures for 2022. Finally, we applied various machine learning techniques to establish the correlation between temperature and emotional responses.

Results show that the assumption in past research that higher temperatures are positively correlated with the frequency of heat tweets is not entirely correct. Firstly, we observed an interesting phenomenon: 32 cities experienced counter-seasonal heat expression, where residents' frequency of heat expression in winter approached or even exceeded that in summer, as seen in Sydney, Australia. Secondly, the assumed seasonally significant variability was more pronounced in Cfb climate types than in Cfa climate types, indicating unusual hot weather suffered by cities like London and Berlin, a weather anomaly worth attention.

Furthermore, using the surprise score to reflect a city's heat preparedness, we found significant differences and heterogeneity in residents' perceptions of historical temperatures and those of the current year. For example, in New York, when the historical maximum temperature's 99th percentile was in the range of 94 to 96 Fahrenheit, the maximum temperature for 2022 was between 82 to 84 Fahrenheit, and the surprise score decreased by 0.25. However, when both were around 92 Fahrenheit, the surprise score increased instead. Sydney appeared relatively tolerant of the highest temperatures in 2022, only expressing surprise when the historical maximum temperature exceeded the current year's by 20 Fahrenheit degrees. London was particularly unique, with a weak dependency

between the two, possibly indicating that past historical thresholds had little impact on the perception brought about by the current year's maximum temperatures. This aligns with the previously mentioned abnormal climate change case in Cfb climate types.

In conclusion, we also confirmed that heat perception could predict climate change in a region to some extent. This study provides significant contributions to understanding residents' heat perception and paves the way for applying these insights to climate adaptability planning.

HOW DO MULTI-DIMENSIONAL FACTORS OF GREEN ROOFS AFFECT URBAN HEAT ISLAND?

Abstract ID: 1108.0.0.483.2024
Individual Paper Presentation

Yulu Huang [UCL] ucbq171@ucl.ac.uk, presenter
Weixuan Wei [Tongji University] weiweixuan@tongji.edu.cn
Qiwei Song [The Chinese University of Hong Kong] qiwei.song@link.cuhk.edu.hk
Waishan Qiu [The University of Hong Kong] waishanq@hku.hk
Nannan Dong [Tongji University] dongnannan@tongji.edu.cn

Rapid urbanization and high-density development have encroached on the natural landscape, exacerbating the urban island heat (UHI) effects – higher temperatures in built areas than in non-urban areas, which can adversely affect the health and comfort of city dwellers and increase energy use and carbon emissions (Dong et al., 2020). Green roofs, which convert concrete rooftops to vegetation-covered roofs, are found to be effective in mitigating UHI effects.

Many existing studies have examined multi-dimensional factors of green roofs (e.g., green roof area and the Normalized Difference Vegetation Index (NDVI) as two-dimensional (2D) factors and building height as a three-dimensional (3D) factor) to better understand their relationship with UHI effects, thus helping to develop appropriate policies related to urban green roofs (Hu et al., 2020). However, few have considered the 3D structure of roof vegetation into 3D factors and examined its effects. In fact, Bai et al. (2019) recently proposed an efficient and scalable method to calculate the 3D green index of green space by retrieving vegetation heights from high-

resolution remote sensing images, providing a realistic representation of the 3D landscape of green space. In this regard, there are new opportunities to investigate how the 3D green volume (3DGV) of green roofs can affect UHI effects. On the other hand, while comprehensive climate models, such as the Weather Research and Forecasting Model, are adopted in prior studies, their complexity and data requirements limit their use by most urban planners. Some researchers also employed linear regression to evaluate the effects of green roofs, but their impacts can vary over their full range and have a threshold (Lin et al., 2021). Moreover, such biases caused by non-linearity can be solved by implementing machine learning (ML) models, such as XGBoost. Yet, such non-linear effects of green roofs using ML methods are relatively under-addressed.

To address these gaps, this study, using the central districts of Shanghai as a case study, aims to assess the multi-dimensional features of green roofs (2D and 3D) and their non-linear relationship with UHI effects, utilizing remote sensing images and ML methods. First, the land surface temperature (LST) for each green roof was extracted from Landsat 8 to represent the urban heat environment. Following the methods from Bai et al. (2019), the 3DGV of each green roof measured from GF-1 images, along with the total area of diverse vegetation types (e.g., lawn and brush and tree) were integrated to reflect 3D vegetation structure. Additionally, the underlying influential spatial factors, such as NDVI, building height, and spatial features of nearby green space, were further controlled and analyzed. Finally, besides OLS model, several non-parametric ML methods (e.g., random forest and XGBoost) were adopted to assess the non-linear effects of green roofs on LST.

The preliminary results indicated that ML models outperform OLS model in explaining the relationship between green roofs and UHI effects, highlighting the necessity of considering the non-linear effects of green roofs. It would enrich and enhance our understanding of the effective range of various factors of green roofs affecting UHI effects. More importantly, we anticipate that this research would provide insights for urban planners and policymakers on how to spatially configure the vegetation structure of green roofs and arrange green roofs to improve the urban thermal environment.

HOW HOUSING VULNERABILITY SHAPES CLIMATE ACTION IN CITIES

Abstract ID: 1108.0.0.273.2024
Individual Paper Presentation

James Connolly [University of British Columbia] james.connolly@ubc.ca, presenter
Keisha Maloney [University of British Columbia] keisham@student.ubc.ca

To what extent does experience with housing vulnerability shape the relationship between peoples' perception of climate risk and their support for climate action in cities? This research question is derived from recent empirical studies suggesting that both climate change and climate interventions may undermine long-term residential security and place-based livelihoods (Keenan et al. 2018, Anguelovski et al. 2019), raising the specter of what Gould and Lewis (2021) describe as a sustainability class emerging as the new urban elites. This argument demonstrates the importance for planners of extending the framework for developing and evaluating urban climate and resilience interventions toward one that fully internalizes housing vulnerability and displacement as a central component. Without such a framework, the politics of implementation are likely to hinder the long-term viability of climate planning strategies (Connolly 2018).

This paper presents results from a two-stage analysis of the relationship between housing precarity, perception of climate risk, and preference for climate action. The first stage of the analysis is built on a systematic review of existing scholarly literature on the link between housing and climate vulnerabilities. Following current PRISMA methodological guidelines, the qualitative systematic review proceeds through identification, screening, and inclusion phases in order to outline current evidence from around the world of how urban residents process climate risks in relation to their degree of housing vulnerability, and how this processing shapes preferences for climate action. The second stage of the analysis presents results from a survey of nearly 1,500 renters in the Vancouver metropolitan area, which has recently been targeted for extensive climate planning interventions. Building from Canadian national studies of climate risk perception, the survey of renters introduces a novel measure of experience with housing precarity as a possible mediating factor that reshapes the expected relationship between knowledge of climate risk and preference for climate action.

The literature review finds that, despite being more acutely aware of and exposed to climate risk, precariously housed individuals prioritize residential stabilization over climate action in order to maintain their connection with place-based livelihoods. The literature also reports on conditions that lead climate planning regimes to overlook this circumstance. The survey data analysis finds that, even though respondents experiencing housing precarity perceive a high likelihood of climate risk and call for climate action (especially urban greening), they prioritize housing precarity over climate. The recommendations for planning implied by these results refine recent work seeking to shape a new mode of practice for climate urbanism (Connolly et al. 2023). This refinement begins from an acknowledgement that interactions within urban riskscapes like those observed here reorder the geography of risk.

IDENTIFYING OBSTACLES TO EQUITABLE FLOOD MITIGATION FUNDING

Abstract ID: 1108.0.0.1051.2024
Individual Paper Presentation

Miyuki Hino [University of North Carolina at Chapel Hill] mhino@unc.edu, presenter
Antonia Sebastian [University of North Carolina at Chapel Hill] asebastian@unc.edu
Helena Garcia [University of North Carolina at Chapel Hill] hmgarcia@unc.edu
Julian Plough [University of North Carolina at Chapel Hill] plough@unc.edu

With climate change increasing the frequency and severity of flooding, there is a growing need for investments in resilience. In the US, FEMA's Hazard Mitigation Assistance (HMA) portfolio is a key source of funding for flood risk mitigation projects such as household elevations, property buyouts, and drainage infrastructure improvements. FEMA's HMA funding has steadily increased in recent years. Past research has documented concerns about the equity of the funding distributed through HMA, finding that urban and wealthier communities are more likely to receive assistance than marginalized communities (Elliott et al., 2020; Mach et al., 2019). However, the underlying reasons for this inequity – and the interventions that can enable more equitable funding allocation – remain unclear.

A primary limitation of past research on this topic is an inability to see into the funding pipeline for the HMA programs. The funding allocation process is complicated: after federal funding is made available through a presidential disaster declaration, local governments and interested residents must work together to assemble documentation, assess eligibility, and compile property-level applications. Local governments submit applications to the state, which passes applications onto FEMA, at which point funding decisions are made, then money is distributed back down to local governments. There are multiple points in the pipeline where inequities can be introduced. For example, it may be that local governments lack the capacity to assemble and submit applications, and marginalized households within those communities are unable to access the funding as a result (Curran-Groome et al., 2022). Alternatively, the cost-benefit analysis may render some properties uncompetitive, perhaps because their property values are lower, making the benefits smaller. Because past work has examined only on where funding has ultimately ended up, it has been impossible to identify where in the pipeline the issues emerge.

Here, we synthesize multiple novel datasets to construct the full mitigation funding pipeline and identify the specific barriers that may prevent marginalized households from accessing federal funds. First, we identify flood-affected parcels using a new database of flood footprints for over 50 past flood events within the state of North

Carolina. These parcels comprise our pool of potential beneficiaries of flood mitigation funds. Second, we compile data on applications for flood mitigation projects that were submitted to the state from local governments. These data were collected and cleaned through a collaboration with the state and enable unique understanding of the funding process. We use the applications to examine which communities have flooded but never applied (potentially due to local capacity constraints). We can also assess which parcels within a community apply – for example, whether it is the neighborhood with high property values that submits applications but not the flood-prone mobile home parks. Third, we examine completed mitigation projects (i.e., applications that were selected for funding and implemented). By comparing those who apply to those who receive funding, we can assess the role of cost-benefit analysis and other state and federal selection criteria in shaping the distribution of funds.

This analysis provides new insight into the processes that shape the distributional equity (or lack thereof) for flood risk mitigation funds in the United States. The results speak to the reforms needed to increase access to federal funding and ensure that resources are being delivered to those who need it most. Given rapidly growing funding dedicated to climate resilience in the US, enabling equitable access to such resources is urgently needed.

IMPACTS OF LAND COVER CHANGE ON WILDLIFE CORRIDORS AND PLANNING RESPONSES

Abstract ID: 1108.0.0.345.2024
Individual Paper Presentation

Xin Fu [Northwest A&F University, China] fuxinuc@outlook.com, presenter
Weifeng Wang [Northwest A&F University, China] wwf0562@163.com

Wildlife habitats have been severely affected by human activities, and more than two-thirds of species are constrained in their movement between habitats by damaged corridors (Daskalova et al., 2020; Wolff et al., 2023). Wild forest musk deer (Moschus berezovskii) has been listed as an endangered animal in China, and their distribution area in Qinling Mountains decreased by nearly 40% due to urbanization in past 50 years(Wu et al., 2022). It is urgent to protect them in advance addressing connectivity between habitats. We propose a scenario-based integrated framework to identify wildlife habitats and corridors combining with a land cover/use change forecasting model. And Baoji Area, Shaanxi, at Northern Piedmont of Qinling Mountains is selected as the study area. Four alternative land cover/use change scenarios were developed to represent future development strategies and policies. The future land cover/use is forecasted by CA-Markov model, and habitat corridors are identified by

Circuit theory. The connectivity and patency indices are applied to assess the quality of habitat corridors. The preliminary results showed the ecological conservation provided sound habitat protection with the lowest fragmentation among scenarios. Whereas the implementation of Territorial Spatial Master Plan (2035) could improve corridors' quality. Farmland reclaim and urban sprawl would intensify the difficulty of migration with existing paths for wild forest musk deer. To maintain pinch points and reduce barriers, we proposed an optimized land cover/use scheme for spatial layouts of core habitats and primary corridors and provided specific suggestions for corridor protection in the future. This study reveals impacts and relations of land cover/use changes related to urban and social development on the core habitats and corridors of wild forest musk deer. It provides a scientific foundation and guidance in delineating "Three Zones for Land Use" in Territorial Spatial Planning for strengthening wildlife habitat connectivity.

INTEGRATING STORMWATER MANAGEMENT AND PLACEMAKING STRATEGIES

Abstract ID: 1108.0.0.433.2024
Individual Paper Presentation

Guobin Pan [University of Minnesota Twin Cities] pan00294@umn.edu, presenter
Sungduck Lee [University of Minnesota Twin Cities] sungduck@umn.edu

Urbanization has detrimental impacts on increased impervious surface along major water bodies which resulted in deteriorated ecosystem services and natural infrastructure. For the last couple of decades, while waterfront post-industrial sites have gained attention for restoring green infrastructure with environmental benefits, urban design researchers acknowledged potential social benefits of waterfront redevelopment for placemaking.

This study aims to explore how water-sensitive urban design (WSUD) strategies can be embraced into placemaking principles to positively impact on storm water mitigation performance at a site scale. WSUD has recently recognized as one of the most cost-effective tools in stormwater management and flood mitigation. While much of the literature has explored the implementation of WSUD strategies to obtain environmental benefits in general,

there is little empirical and illustrative evidence of these benefits in an effort to mitigate stormwater runoff in post-industrial redevelopment at a site scale.

Thus, this project seeks to address this research gap by applying descriptive and urban hydrology modeling analysis using post-industrial areas along the Mystic River in Boston, MA. The Mystic River is located in inner Boston Harbor and has a long history of industrial use. Especially areas near lower waterway have higher percentage of impervious surface which requires greater attention to improving stormwater runoff mitigation.

This project includes two phases with the following two research questions: 1) How might we develop a framework that embraces various dimensions of community planning principles into WSUD strategies for waterfront post-industrial site? For this research question, we review a series of community planning principles that emphasizes mixed-use, compact, and pedestrian-friendly urban design; and imply WSUD stormwater mitigation strategies such as permeable paving, green roof and façade, detention pond, and swales into appropriate placemaking design tactics.

2) How might we assess stormwater management strategies that help understand the potential environmental and social benefits of waterfront post-industrial redevelopment? For this research question, a spatial descriptive analysis is conducted using GIS software to identify suitable study sites with over-scaled impervious surfaces. In addition, a series of hydrology modeling analysis is conducted to estimate annual stormwater retention volumes in order to evaluate the effectiveness of the proposed framework applied into the selected sites along the Mystic River. This phase also focuses on case study review that references social benefits of WSUD when it is implemented with placemaking strategies.

This study expects to reveal the feasibility of WSUD and placemaking strategies in mitigating stormwater runoff at a site scale. In spite of the possible environmental and social benefits of post-industrial redevelopment, it is important to acknowledge that post-industrial areas with high percentage of imperviousness is incumbrance for sustainable development. This project contributes to our understanding on integrating stormwater management and community planning strategies by building a framework for sustainable redevelopment of post-industrial sites. The framework can help apply appropriate community planning strategies for stormwater management and understand how to leverage physical design to improve environmental and social sustainability in post-industrial sites.

Despite the fact that small businesses make up almost 99% of the U.S. economy, little research has been focused on recovery experiences of businesses and the challenges they face. This is problematic for community recovery at large which depends on successful businesses recovery. Relocation, as an aspect of recovery, is particularly understudied which is an important oversight as more and more communities face risk of displacement due to natural hazards.

Numerous internal and external factors influence a business's recovery and relocation decisions after a disaster. While post-disaster business recovery studies have existed since the 1990s, earlier works have tended to frame recovery as a matter of internal capacity affecting their recovery, namely factors such as a business sector, size, financial status, or business owner or manager's entrepreneurial skills. Where external factors were considered, these were conceptualized in economic terms as indirect effects of disruptions in supply, distributions, labor access and consumer demand. However, this purely economic framing of business recovery has come under question recently in view of research that shows that businesses can be social as well as economic actors in the community. Recent studies have examined business recovery as occurring in an ecosystem of actors and events that influence their own decisions—such as governmental actions, nonprofit actions, household recovery and infrastructure restoration. Recent studies have also shown that business recovery shares characteristics with recovery of other "social" actors like households such as, for example, attachment to place and use of social capital. This implies a need for more holistic research on the dynamic interdependencies between business relocation decisions and decisions occurring in other community systems and spaces, including actions of households, other businesses, utilities, governments, and nonprofits.

The study poses one research question: What stakeholder interdependencies exist in the recovery experiences of local businesses affected by disasters? The study was conducted in two communities of Puerto Rico: Comerío and Loíza that were severely impacted in Hurricanes Irma and Maria during 2017. Data collection involved a purposive survey of 150 businesses in both communities conducted in June 2022 by a team of bilingual students from the University of Utah. The survey was conducted in Spanish and the questionnaire covered topics such as the operational status of business, disaster impact, housing status of business owners, relocation/reconstruction or business closure decisions, formal participation in the R3 program, recovery financing, and interaction with peers and other stakeholders. The survey data was translated into English, processed and then analyzed. Survey analysis

involved performing a binary regression analysis to test the relationship between intent to relocate and variables related to business profile, hazard risk perception, damage received, aid assistance from government and nonprofit sources, infrastructure restoration, and relocation actions of residents and other businesses. The study finds that relocation actions of residents and financial ties to place can positively affect decisions to stay in place while loss of utilities, loss of sales and availability of governmental aid can negatively affect these decisions.

The findings of this study highlight the importance of broader community-level events and actions to local business relocation decisions. The study findings also add to emerging literature on the social role of small businesses in community functioning after disasters. Finally, the study contributes to better community recovery policymaking by advocating for improved coordination between economic policies and policies surrounding housing and household recovery.

INTRODUCING PLANNING-READY AND ADVOCACY-READY DATA URBAN HEAT MITIGATION

Abstract ID: 1108.0.0.1025.2024
Individual Paper Presentation

Mehdi Heris [CUNY] mp5160@hunter.cuny.edu, presenter
Haijing Liu [The University of Texas at Austin] hjliu@utexas.edu
Travis Flohr [Pennsylvania State University] tlf159@psu.edu

This abstract introduces "planning-ready data" and "advocacy-ready data" as pivotal concepts in climate justice and urban planning, with a focus on urban heat mitigation. These concepts address the critical gap between complex scientific research on urban climate risks (i.e. heat, flooding, and air quality) and their corresponding strategies in urban planning and policy-making (Heris et al., 2019). Due to the sophisticated nature of climate-related risks and inequalities, we need distilled knowledge and guidelines curated for the planning process and regulatory tools (Van Oijstaeijen et al., 2020).

To overcome this challenge, our approach advocates for research tailored to the policy-making process, divided into two streams: planning-ready data for local government planners and advocacy-ready data for coalitions and

advocacy groups. While both concepts may share some knowledge, they are designed to meet distinct needs. Planning-ready data offers tools that can generate knowledge that is compatible with regulatory tools such as zoning, building codes, and design guidelines (Godschalk, 2004). Advocacy-ready data equips advocacy groups with processed, actionable information appropriate to support public campaigns pursuing policy change concerning urban heat mitigation efforts.

Using urban heat as a case study, we developed a data portal that provides planning-ready and advocacy-ready data for New York City. This portal demonstrates how spatially explicit strategies for mitigating urban heat and the underlying science can be distilled into tools that serve both local governments and advocacy groups. Our tools address tree planting, green infrastructure, and cool roof programs. For local governments, this entails actionable scenarios and cost-benefit calculators that inform how changes in zoning, landscaping regulations, and enforcement efforts can improve heat resilience efforts. For advocacy groups, it involves creating compelling storytelling tools that create reports for the urban heat status of neighborhoods.

This dual approach not only makes scientific data accessible and actionable for key stakeholders in urban planning and climate justice but also underscores the necessity of crafting research outputs to align with the operational realities of policymakers and advocates. By providing planning-ready and advocacy-ready data, this project exemplifies how we can translate urban heat mitigation strategies into practical, impactful tools that empower local governments and advocacy groups.

LAND-USE CONTROL IN COASTAL CITY CAUSE SPRAWL: RISK OF FLOOD OR PROPERTY?

Abstract ID: 1108.0.0.491.2024
Individual Paper Presentation

Segyo Seo [Department of Urban Planning and Engineering, Pusan National University] plan_ssg@pusan.ac.kr, presenter
Juchul Jung [Department of Urban Planning and Engineering, Pusan National University] jcjung@pusan.ac.kr

[Problems]

People have a desires to own coastal landscapes. The purpose of zoning is for land to be used in a way that enables all people to access coastal spaces and be safe from the impacts of climate change. According to prior studies, coasts are structurally vulnerable to flooding, and it is important to secure disaster-preventive area by zoning.

However, in many coastal cities in South Korea, zoning is used to privatize coastal landscapes, and preserve personal property, which puts people at risk. As development progresses, residential buildings aggressively

encroach on the coast. Every year, the government invests considerable amount of money in disaster prevention to protect residents' property. But what if zoning had been carried out correctly from the beginning?

Most previous research has focused on the choices and risk perceptions of people who decided to reside on the coast despite the risks. However, if land-use regulations had not been relaxed, demand would have been controlled. This study focuses on the predevelopment phase, analyzing how zoning has changed and impacted risk exposure in contrast to value of property.

[Research Methodology]

The study area of this paper covers highly developed coastal areas in Busan, South Korea. Busan is the second-largest city in South Korea and the most popular with coastal tourism. Additionally, high-rise building development is actively taking place adjacent to the Busan coast. In this study, we traced the zoning changes along the coast, which has been rapidly developing since the mid-2000s.

We used spatial analysis to compare risk to the population exposed to floods before the relaxation of land use regulation in 1998-2021. In addition, we used DID(Difference in difference) analysis to evaluate the demand for housing in flood-prone areas before and after huge floods to examine whether exposure to flood increases citizens' housing demand.

[Findings]

The analysis revealed that land use regulations on the coast of Busan have been consistently relaxed since 1998. Reclaimed land was designated as commercial zones with the highest density without buffer space, and the residential areas with low density have been relaxed to high density. Development and housing demand have subsequently been concentrated on the coast.

The dramatically increased prices of high-rise buildings have generated profits for property owners and developers. In addition, The population living in flood-prone areas has increased by more than 150% since 1998. The DID analysis revealed that, during Typhoon Chaba(2016), significant damage occurred due to flooding. Residents realized that they were at risk of flood, but there was no change in demand.

[Conclusion and Discussion]

Three implications can be derived from the results of this study. First, people's desire to own coastal landscapes and tourism resources outweighs their perception of risk, leading them to choose to live in flood-prone areas. Second, the relaxation of zoning not only puts many people at risk but also encourages private use of public resources. Third, the coast satisfies both aesthetic preferences and economic interests. It is evident that if land use regulations are relaxed, people's demands will become concentrated at coast. The city government should regulate the choice to live in hazardous areas and the privatization of public resources by zoning.

This study has limitations in that it focuses solely on Busan. The high-rise buildings along Busan's coast have served as inspiration for many other cities, leading to coastal overdevelopment in various urban areas.

Ironically, people tend to criticize the officials rather than the planners. Perhaps this is because zoning has been detrimental to the city over an extended period.

Local comprehensive plans have emerged as crucial instruments within the United States' policy frameworks for addressing flood hazards and implementing mitigation and adaptation strategies. While previous research has predominantly focused on the effectiveness of these plans in mitigating coastal flood risks, there remains a dearth of studies examining their efficacy in rural contexts. This study aims to bridge this gap by scrutinizing 64 comprehensive plans from communities across Nebraska, assessing their performance in managing floodplains. Specifically, the research investigates the extent to which Nebraska's communities, particularly rural ones, have prepared for flood risk reduction and whether they have taken more proactive measures in the wake of the historic 2019 flood disaster. The evaluation criteria encompass three vital aspects: awareness, goals and objectives, and action. The findings reveal deficiencies across all three categories, with awareness being relatively well-addressed while goals and objectives exhibit the lowest coverage. Although hazard location delineation demonstrates some proficiency, the identification of vulnerable communities remains inadequate. Moreover, the absence of goals aimed at reducing damage to structures within high-risk zones and deficiencies in educational outreach strategies underscore areas for improvement in plan implementation. Following the 2019 floods, rural communities have demonstrated proactive efforts to improve flood plain management and planning; however, they still exhibit significantly less capacity in the regard compared to larger communities, indicating a considerable journey ahead. The study advocates for the integration of critical components of floodplain management into comprehensive plans to enhance awareness and preparedness, thereby bolstering the resilience of Nebraska's rural communities against flood risks. The research findings contribute to resilience planning theories, particularly for resource-limited and disadvantaged rural communities in the United States.

MANDATING WATER QUALITY COMPLIANCE AND PLANNING FOR EQUITY

Abstract ID: 1108.0.0.292.2024
Individual Paper Presentation

Sarah Heck [Temple University] sarah.heck@temple.edu, presenter
Chaeri Kim [Simon Fraser University] chaerik@sfu.ca

Equity is increasingly important as urban greening initiatives gain popularity. Green stormwater infrastructure (GSI) is receiving particularly heightened attention due to federal encouragement and enforcement (Hopkins et al., 2018). Communities are adopting GSI, such as rain gardens and bioswales, to manage stormwater and comply with the Clean Water Act. GSI is attractive because it simultaneously saves costs and provides co-benefits such as air quality improvement, urban heat island alleviation, and neighborhood beautification, largely attributable to the increase of vegetation in urban areas. Both scholars and practitioners argue that GSI can improve the inequitable distribution of urban green amenities and access to decision-making processes by prioritizing investment in historically underserved communities and fostering inclusive planning processes (GILE, 2021; Mandarano & Meenar, 2017). Despite the well-intended efforts, studies have found that such GSI projects contribute to reinforcing inequalities, such as disinvestment in infrastructure or green gentrification (Heck, 2021; Walker, 2021). Do equity considerations in GSI planning facilitate equitable outcomes? This research explores this question through a comparative analysis of three local governments: Cleveland, OH; Philadelphia, PA; and St. Louis, MO. These post-industrial cities have legal obligations to implement GSI and began planning around the early 2010s (2010, 2011, and 2012, respectively), completing a majority of the mandates. This study first investigates what equity elements are incorporated into GSI planning documents (e.g., consent decrees, GSI plans, annual reports) and analyzes their characteristics and implications, building upon the equity literature. To capture nuances not addressed in the documents, this study conducts interviews with actors in the public sector, including regulators

(e.g., federal and state government) and practitioners (e.g., stormwater managers in the local governments and collaborating organizations). Through comparative analysis, this study examines the regulatory frameworks, policy initiatives, and equity approaches in the three cities' mandated GSI projects to identify synergies, best practices, and challenges to implementing water quality and equity goals. Ultimately this research demonstrates the need for cross-collaboration among utilities, city departments, stakeholders and communities to achieve equity and water quality goals.

MAPPING SOCIAL AND NATURAL CAPITAL IN URBAN GREENING FOR RESILIENCE

Abstract ID: 1108.0.0.1075.2024
Individual Paper Presentation

Shruti Syal [Virginia Commonwealth University] syals@vcu.edu, presenter

BACKGROUND

In Richmond, VA, urban greening (including green infrastructure, GI) is critical to address multiple shocks affecting city resilience: heat stress, flooding, river pollution, food insecurity, etcetera. Urban greening/GIs are multifunctional, offering many ecosystem services: from sub-site plant species or microhabitat considerations to site-scale landscaping, to landscape scale planning to integrate ecological flows. This makes it possible to link a neighbourhood project pursuing food security via community gardens to one building on Richmond's Biophilic Cities promise by enhancing pollinator diversity, or a tree canopy cover project to mitigate UHI to another tackling urban flooding, and so on. However, given the hundreds of stakeholders planning, designing, implementing, and managing urban greening/GIs for targeted uses, projects get siloed. How can we study the relationships between

the many state, civic, and private actors involved in urban greening, to better support integrated urban greening/GI planning in cities?

FRAMEWORKS

Systems research and urban resilience scholarship provides a theoretical framework to integrate the study of urban greening/GIs and their social networks: as natural and social capital crucial to resilience (1,2) and tied together inextricably (3). Given the emphasis on “interactions”, “connections”, or “links” in research operationalizing social and natural capital (4), we map Richmond’s capital as a Network Map. Network Analysis provides a way to integrate natural and social capital in a self-explanatory format (nodes → links → network) that can be empirically analysed (5), making this is our empirical framework, applied once the map is complete. While the network map will integrate three datasets—(i) geospatial network of urban greening/GIs at sub-site, site, and landscape scales, (ii) documented human-environment interactions therein, and (iii) the network of government and civic actors associated with them—the presentation focuses on the (preliminary) social network map generated by the presenting (primary) author.

METHODOLOGY

The research thus far has involved >500 hours of content analysis and >100 hours of network mapping. Starting with an initial list of 50 actors (government, civic, private), we have now identified >500 actors and >900 urban greening/GI projects within Richmond city (system boundary). For each actor, we identified relevant projects, and for each project: (i) the actor’s role(s) therein, (ii) project personnel to interview, (iii) partner organization(s), and to the extent we could ascertain, (iv) the nature of the relationship(s) between them (funding, data sharing, advocacy, etcetera). We developed the code to convert this spreadsheet data into a network map on the website KUMU, an open-access platform that conveys this complex information in a visually engaging and interactive way, allows easy data updates, and has a few built-in SNA metrics.

PRELIMINARY FINDINGS

While we identified >500 actors and >900 projects, we have only mapped 164 actors as of March 2024. We identified the most prolific actors based on number of projects, and (preliminary) network map analysis reveals several of these actors to also have the highest Degree, Closeness, Betweenness, and Eigenvector Centrality, and Reach. We also found several dozen dyadic and triadic relationships in the network, mostly projects by community/ neighborhood groups. Lastly, while content analysis was fruitful in gathering data about actors and their projects, the nature of their interactions with their (often, many!) “partners” is largely vague. To map social capital, we need to interview hundreds of actors, which we will start once we have mapped all actors and ranked them on the basis of their centrality and reach metrics.

SIGNIFICANCE

Planning is a multi-stakeholder effort, and network analysis is a great conceptual and empirical tool to do so. But given the growing importance of making Planning transparent and engaging, we also find the tool we use, KUMU, to be critical for outreach.

MEASURING THE IMPACT OF THE URBAN MICROCLIMATE ON HOUSING PRICE: AUSTIN, TX

Abstract ID: 1108.0.0.103.2024
Individual Paper Presentation

SeWoong Kim [Syracuse University] sewoongkim98@gmail.com, presenter
Robert D. Brown [Texas A&M University] rbrown@arch.tamu.edu

There is a growing need for research to understand the economic impact of changes in the urban thermal environment, which has deteriorated over time due to climate change. To understand the impact, this study aimed to determine whether it is possible to analyze the effect of residents' outdoor thermal comfort in low-rise residential complexes on housing prices in a region with a hot and humid climate. This study evaluates the effectiveness of using housing prices and a thermal environment evaluation to understand the impact on residential complexes due to changes in the urban thermal environment. The purpose of this study was to examine the role of residential environment factors, including street trees and yard area, in the thermal comfort evaluation process of external residential spaces. In addition, based on the prices in the past 10 years of individual houses in residential complexes in the research target area, this study analyzed the effect of the outdoor thermal comfort level affecting the price difference between houses as the evaluation standard for the residential environment. The study also focused on the importance of the residential thermal environment, the types of important architectural/landscape design factors affecting the thermal comfort of the outdoor residential environment, and the limitations of evaluation methods to estimate the residential thermal environment.

The primary research question set to achieve the goals of this study is: "Is it possible to analyze the effect of thermal comfort on house prices to understand the economic impact of changes in urban thermal environments?" The following three sub-research questions were also explored: 1) How important is the outdoor residential thermal environment on housing prices in low-rise residential neighborhoods in cities? 2) Among the factors that constitute the outdoor living environment, how can researchers confirm that outdoor thermal comfort level influences housing prices? and 3) What analysis method should be used to supplement the spatial autocorrelation

approach in evaluating the relationship between the components of the residential environment and housing market prices?

Using a hedonic pricing model, this study analyzed the effect of structural characteristics, locational characteristics, and environmental characteristics constituting the residential environment on housing prices. A semi-log hedonic pricing model was utilized as a suitable functional form for this study. In addition, to avoid errors caused by spatial autocorrelation, we developed a spatial autoregressive (SAR) model and spatial error model (SEM). The results confirmed that the outdoor thermal comfort level corresponding to environmental characteristics in the classic hedonic pricing model is an essential factor affecting the market price of houses. In addition, three environmental characteristic variables (i.e., tree canopy coverage ratio, outdoor thermal comfort level, aspect ratio) showed high significance in terms of the influence on housing prices. This result explains that the factors including both the structure of the house and the outdoor residential and thermal environment influence housing price formation.

In this study, the post-evaluation model of residential complexes focused on determining housing prices provides an opportunity to suggest a method to better understand the correlation between residential thermal environment analysis and housing market prices. The results can also be used in the final design by considering the influence and distribution of each urban/landscape design element on the outdoor thermal environment in the residential complex development stage.

MITIGATION BEHAVIORS OF HOMEOWNERS & RENTERS IN WILDLAND URBAN INTERFACE

Abstract ID: 1108.0.0.680.2024
Individual Paper Presentation

Jochen Schubert [University of California Irvine] j.schubert@uci.edu

Brett Sanders [University of California Irvine] bsanders@uci.edu

Residential development within the wildland urban interface (WUI) has greatly expanded in the United States since the 1990's, placing people and structures in greater proximity to flammable vegetation (Carlson et al., 2022). Such land use practices coupled with the increased frequency and intensity of wildfires due to climate change have amplified wildfire hazards within arid and semi-arid regions such as Southern California. However, our understanding of the wildfire mitigation behaviors of residents that mitigate and shape risks within WUI areas remains limited. Emerging research suggests that prior wildfire experience, risk perception, self-efficacy, and place attachment influence homeowner intention to adopt protective measures, but few studies have examined mitigation behavior of renters (Collins, 2008). In addition, existing studies typically do not distinguish between different types of household wildfire mitigation actions, such as purchasing fire insurance, making protective structural changes, maintaining defensible space, and adopting firewise landscaping (Brenkert-Smith et al., 2012; Ghasemi et al., 2020; Schulte & Miller, 2010). Differentiating between these mitigation behaviors is especially important given these actions can differ substantially in terms of the financial cost of implementation, knowledge required for adoption, perceived self-efficacy of residents to adopt them, and the perceived effectiveness of each action in mitigating wildfire impacts, factors that could differ for homeowners and renters. Studies of wildfire mitigation actions are also typically limited to household- and property-level behaviors and do not account for factors associated with taking community-level actions such as organizing with neighbors to create mitigation plans or participating in government emergency meetings or awareness campaigns.

To expand our understanding of these dimensions of household and community wildfire mitigation actions, in 2023 the current study surveyed over 500 residents living in WUI areas within Southern California near recent burn scars in the Santa Ana and San Bernardino Mountain ranges. Drawing on the Protection Motivation Theory (PMT) framework, we construct a conceptual model to evaluate the factors driving the wildfire mitigation behaviors of surveyed households living in WUI areas. In addition, we examine how factors such as place attachment, home ownership, knowledge, skills or assistance, and residential geographical location influence household and community mitigation behavior. Using a structural equation model (SEM), we examine the factors influencing households' adoption or intention to adopt five risk-mitigation actions: fire insurance, major structural changes to the property, minor maintenance of the property, exterior measures, and community actions.

Consistent with previous research, we find that response efficacy (perceived effectiveness of the action) and self-efficacy (perceived ability of the household to undertake the action) have a significant positive impact on the mitigation behavior across all action types. Residents with stronger place attachment were associated with adoption of or intention to adopt household structural and defensible space mitigations or to engage in community-level mitigation activities; households surrounded by more undeveloped land were associated with purchasing or intention to purchase fire insurance. Being a homeowner was also associated with purchasing or intention to purchase fire insurance and to conduct minor structural maintenance or exterior mitigations, perhaps because renters lack the authority or resources to undertake these types of mitigations. Regardless of ownership status, residents who indicated they lacked the required knowledge to implement mitigation actions were associated with lower levels of mitigative behavior. Our findings emphasize the importance of education and outreach programs to address gaps in knowledge, skills, and assistance for WUI households to undertake wildfire mitigation actions. Additionally, our findings underscore that policy initiatives are needed to support renters in effectively implementing wildfire mitigation actions.

MOVING OUT OF HARM'S WAY: AN ANALYSIS OF LAND USE IMPACTS OF FLOOD BUYOUTS

Abstract ID: 1108.0.0.477.2024
Individual Paper Presentation

Sungyop Kim [University of Missouri - Kansas City] kims@umkc.edu, presenter
Julia Crowley [University of Missouri-Kansas City] jcc45g@umkc.edu

Floods are destructive to human society and have caused harm to communities. Implementing structural mitigation measures involving the construction of physical structures to prevent flooding has been a traditional approach to reducing the risk of flood occurrences and damages. However, the catastrophic damage from the Midwest Floods in 1993 has shifted the federal policy towards more non-structural measures (Godschalk et al., 1999), and flood buyouts, or moving people out of floodplains by voluntarily acquiring properties and making the sites open space, have become a critical flood policy option (Mach et al., 2019). There have been studies on the implications of flood buyouts, including municipal finance (BenDor et al., 2020) and social justice (Siders, 2019). However, tracking floodplain development is challenging (Hino et al., 2024). Thus, the change and impacts in land use at the buyout sites and surrounding areas have been underexplored.

This research examines the land use impacts of flood buyouts in the City and County of St. Louis areas in Missouri by answering the following two research questions: How have land uses changed at flood buyout sites and surrounding areas? How are demographic and socioeconomic factors and the characteristics of buyout sites and surrounding areas associated with the land use outcomes? This research utilizes the geocoded flood buyout database provided by the Missouri State Emergency Management Agency and the study area's census block group level information from 1990 to 2020. There are 903 flood buyout sites in the study area. The land use type information of the buyout sites and surrounding areas is developed using GIS. This study employs a spatial autoregressive logit model to address potential model misspecification. This study will contribute to a better understanding of land use outcomes of flood buyouts and future planning implications of flood buyouts in the era of climate change.

MUTUAL AID, COMMUNITY CARE, AND PLANNING IN THE CLIMATE CRISIS

Abstract ID: 1108.0.0.700.2024
Individual Paper Presentation

Holly Caggiano [University of British Columbia] holly.caggiano@ubc.ca, presenter
Alana Rader [California State University Northridge] alana.rader@csun.edu
Clara Riggio [Northeastern University] clararose817@gmail.com
Sara Constantino [Northeastern University] sara.constantino@gmail.com

Environmental hazards disproportionately impact racialized, marginalized, and underserved groups, creating feedbacks that reinforce systemic oppression through vulnerability. Dominant modes of aid provisioning (like charity and government aid) following hazards do not typically account for this feedback, providing only enough aid for a community to, at most, return to a pre-hazard status quo. As we face increasingly dire compounding environmental and social crises, more research in community planning can thus ask: how do informal networks of support, like mutual aid, respond in times of crisis, and what roles do they play in planning for socio-ecological systems? Further, what roles could or should they play in uncertain futures? When and how might planners make room for informal, unofficial, radical, or anarchist efforts?

During the COVID-19 pandemic and in response to subsequent extreme weather events throughout the US, communities across the US saw a resurgence of mutual aid networks, informally organized to meet basic needs like healthcare, housing, food, and social support through direct action. In the absence of sufficient public response, existing community organizations, self-help groups and new mutual aid networks responded from “the bottom up” within a fractured social landscape to meet the immediate needs of their communities. Mutual aid networks and other voluntary community organizations not only provide alleviation from the material impacts of crises but may also act in a bridging capacity, creating horizontal linkages among individuals that increase social capital and community solidarity. While scholars have highlighted the importance of social capital and infrastructures to successful local climate adaptation efforts and community resilience, little research in planning has specifically examined the functions of mutual aid and other informal organizing efforts.

To highlight the gaps and opportunities in diverse approaches to providing aid, this paper proposes an ethic-process-outcome framework to characterize modes of aid provisioning following environmental hazards. Through a collaborative case study of the work of Mutual Aid Disaster Relief (MADR), “a grassroots network whose mission is to provide disaster relief based on the principles of solidarity, mutual aid, and autonomous direct action”, this paper explores how mutual aid centers particular ethics, processes, and outcomes that both differentiate it from other types of aid provisioning and prioritizes long term scaffolding for collective action aimed to address compounding socio-economic pressures and vulnerability to environmental hazards. We provide illustrative examples from MADR’s participatory, solidarity-based work in impacted communities of the Gulf Coast, Puerto Rico, Panama City, and beyond to theorize, in MADR’s words, “disaster relief work as justice work”.

We argue that future hazard planning efforts should transparently assess their respective aid provisioning strategies in terms of ethic, process, and outcome to better provide the multi-scalar and material nature of aid required by the diverse communities impacted by environmental hazards of the current era. Further, we raise questions about the coexistence of mutual aid and formal planning efforts, highlighting potential for both tension and conflict and synchronicity and support.

NAVIGATING LOCAL RESISTANCE: PLANNING FOR RENEWABLES IN RURAL MICHIGAN

Abstract ID: 1108.0.0.846.2024
Individual Paper Presentation

Lanika Sanders [University of Michigan] lanikacsanders@gmail.com, presenter

With the passage of Public Acts 233 and 234 in November 2023, Michigan joined the growing list of U.S. states streamlining permitting processes for renewable energy projects. This legislation grants the Michigan Public Service Commission authority to restrict local control over renewable energy siting decisions, eliciting outrage across rural Michigan. Local governments and residents are especially vocal about agricultural impacts, as the unshaded, flat,

accessible land characteristic of farmland is particularly suitable for renewables. The Michigan Townships Association, the Michigan Farm Bureau, and other advocacy groups echo these concerns, arguing that inviting in 'Big Wind' and 'Big Solar' threatens livelihoods and alters rural landscapes in ways residents neither recognize nor endorse.

Though some scholars also warn that the global expansion of renewables will necessitate substantial claims on rural land (McCarthy, 2015), scholarship has yet to fully explore how planning for renewables might impact rural livelihoods. Planners wield substantial power over renewables development through land use decisions (Poggi et al., 2018), but planning literature still focuses largely on how the discipline can accelerate renewables development without considering community buy-in. As the National Academies of Science (2023) argues, planning for renewables without local support can significantly slow progress towards reducing emissions, regardless of the reasons and validity behind local pushback. As the capacity to generate renewable electricity rapidly expands, planners must help advance this transition without compromising rural welfare and engendering pushback that ultimately impedes emissions reductions.

Reflecting similar trends nationwide, this study considers Michigan as a case example to investigate how planners can more effectively and equitably support renewables development amid tensions between skeptical local communities and a state government pushing renewables expansion. Through an analysis of local ordinances and zoning codes, media sources, and semi-structured interviews with local government stakeholders, I examine how local governments are responding to pushback and preparing for the November 2024 implementation of these policies. Per this legislation, in communities with Compatible Renewable Energy Ordinances (CREOs, which cannot be more restrictive than the state policy), developers must have projects reviewed locally and be denied before applying to the state regulatory body to override the local decision. I thus focus on three townships with different regulatory approaches to renewables development – one with no CREO, one with a restrictive CREO, and one with a permissive CREO (as determined in relation to the state's policy and corroborated by the University of Michigan-compiled Michigan Zoning Database) – and consider if and how various actors aim to alter local regulations in response to the policies' passage. I also explore specific policies that would increase buy-in from local governments.

Results suggest that local officials acknowledge how renewables can increase tax revenue and create jobs, but most are unwilling to cooperate with efforts to accelerate this development without meaningful representation and control over siting processes. I argue that local siting parameters should not be defined through top-down, singular approaches, but should instead allow planners to delineate locally specific guidance for their townships. During a time when the Michigan Public Service Commission is seeking public comment on the 2023 legislation, this research informs specific and plausible policy paths toward equitable energy transitions, and offers lessons for other states managing local versus state-level renewable energy tensions.

OPTIONAL ASSISTANCE PROGRAMS AS A PATHWAY TO CLIMATE PLANNING IN NEW YOR

Abstract ID: 1108.0.0.1119.2024
Individual Paper Presentation

Donovan Finn [Stony Brook University] donovan.finn@stonybrook.edu, presenter

What drives communities to address climate change adaptation in local plans? While state mandates have not proven to conclusively result in better planning outcomes, connecting climate related planning to discretionary funding, providing technical assistance, and generally creating a supportive atmosphere for planning has been highlighted as important antecedents of effective climate planning (Shi et al. 2015).

New York State has a long history of planning and plan-making, from 1929's Regional Plan of New York and Its Environs to the State Housing and Regional Planning Commission in the 1920's and the Office for Regional Development (ORD) in the 1960's. More recently, planning has been prioritized at the state level through efforts like the Regional Economic Development Councils, the Cleaner Greener Communities program, and the post-Sandy New York Rising Community Reconstruction Program. But despite a rich history and "culture of planning" (Bolan 1969), New York State lacks a planning mandate for its 1,600 counties, towns, cities, and villages, and local plans vary widely in coverage, scope, and content. As a number of recent events have illustrated, many communities in the state are increasingly vulnerable to natural hazards (e.g. Superstorm Sandy, Hurricanes Lee and Irene, etc.) and plans are a critical tool for addressing challenges of climate change adaptation and community resilience.

In 1982, the state of New York created the Local Waterfront Revitalization Program (LWRP) as the Office of Planning and Development's chief mechanism for assisting coastal, riverine and Great Lake waterfront communities with waterfront-related planning for development and redevelopment. To date 95 LWRP plans have been adopted, unlocking more than $300 million in state Environmental Protection Funding in 95 communities statewide. In addition to encouraging economic development, addressing ecological issues, facilitating better public access to the waterfront, a key goal of the LWRP is to "avoid and reduce the negative impacts of climate change."

This project asks two related questions: 1) What climate change planning strategies are present in LWRPs and how have these strategies evolved over time in more recent LWRPs? And 2) Does the presence of a LWRP relate positively to the presence of climate change adaptation strategies in other local planning documents in the same community?

We first analyze the 95 existing LWRPs, using widely accepted plan evaluation methodology (e.g. Berke and Godschalk 2009, Lyles and Stevens 2014, Woodruff and Stults 2016) to identify adaptation strategies. We then analyze the other existing planning documents (e.g. comprehensive/master plans, adaptation plans, resilience plans) in these 95 communities, cataloging the presence of additional adaptation content. Finally, we analyze

existing planning documents from a random sample of 95 additional waterfront communities using the same methodology. We then compare adaptation planning efforts in LWRP communities to that of non-LWRP communities to assess the degree to which presence of LWRPs facilitates more climate-change focused general planning even absent a mandate to do so. Results provide planners with a snapshot of adaptation efforts being undertaken by a variety of localities in a planning-friendly state and a better understanding of the role of optional antecedent planning efforts in facilitating additional but optional efforts to address climate change challenges.

PARK FEATURES INFLUENCING VISIT DURATIONS: A LONGITUDINAL SURVEY IN AUSTIN

Abstract ID: 1108.0.0.121.2024
Individual Paper Presentation

Ruqing Zhao [Department of Geoscience and Natural Resource Management, Faculty of Science, University of Copenhagen] kzt283@alumni.ku.dk, presenter
Yang Song [Texas A&M University] yangsong@tamu.edu
Shuying Guo [Wageningen University and Research] shuying.guo@wur.nl
Zipeng Guo [Texas A&M University] guo7501@tamu.edu

Appropriate duration of exposure in parks can bring lots of benefits which encompasses ameliorating the life quality along with the well-being of city dwellers (Kim & Jin, 2018). To encourage people to be involved more in parks, and stimulate their vigor, it is essential to explore and improve the relevant factors that influence both park attractiveness and human behaviors of visiting. However, many previous studies have been conducted to investigate the components affecting park visit flow, which is quite one-sided in representing park visit behavior (Lyu & Zhang, 2019), few of them referred to the visit duration.

In this regard, this study delves into the relationship between various park characteristics and visit duration in different park categories, with a focus on five typical types comprising district parks, neighborhood parks, pocket parks, nature preserves and school parks in Austin, Texas. It is emphasized how to allocate the park features influencing visit duration dominantly in each typology of park.

We apply longitudinal smartphone data, monitoring long-term behaviors in all the parks in this study for a period of four years, which provides abundant information about visitors' behaviors and experiences (Ye & Andris, 2021), so that place perceptions, landscape facility quality and effectiveness within urban parks can be better comprehended (Han et al., 2018). A fixed effects regression model is employed and analyzed respectively according to the park categories. Each model considers park attributes, socioeconomic factors, and time-related variables which aims at reducing unobserved deviation.

Our analysis finally embraced a total number of 119 parks, with 4 district parks, 6 nature preserves, 72 neighborhood parks, 20 pocket parks and 17 school parks as our focus panel dataset for this study. In general, the impact of each characteristic on visit duration varied widely in different types of parks. To be more specific, a feature exerting positive in one type of park may exhibit negative in another. Otherwise, while in some parks, a feature shown to significantly affect the visit duration pattern, it is inconspicuous in others. Among them, an intriguing detection is that when the relationship is statistically significant, the existence of benches and nature including planting beds and high coverage of canopy were always documented a strong positive correlation with park visit duration in most parks, while an inverse trend was observed with the presence of water. Therefore, based on the outcome as evidence, the targeted amenities can be expected to be more rationally equipped in different types of parks.

This can not only contribute to reasonable arrangement of resources but also refine the construction of parks to facilitate people to prolong their stays in parks which is demonstrated to be salubrious for their health consisting of raising a sense of serenity and belonging, as well as relieving stress (Kim & Kaplan, 2004). In brief, this study can provide a reference for urban planners and landscape architects to design parks more considerably to encourage people to extend their stay periods in parks and thus improve public health.

PLACE-BASED COMMUNITY ENGAGEMENT TO ADDRESS NEAR-ROADWAY POLLUTION

Abstract ID: 1108.0.0.481.2024

Individual Paper Presentation

Douglas Houston [University of California, Irvine] houston@uci.edu, presenter
Gregg Macey [University of California, Irvine] gmacey@uci.edu
Jeannine Pearce [University of California Irvine] jeannimp@uci.edu
Catherine Garoupa [Central Valley Air Quality Coalition] catherine@calcleanair.org

Racial and economic disparities in exposure to near-roadway air pollution remain stubbornly persistent due to structural inequalities embedded in the built environment (Antonczak et al., 2023). Such disparities, which are associated with a broad range of negative health effects – including increased mortality, heart disease, asthma, reduced lung function, and adverse birth outcomes – are the result of historically uneven land use development, racial segregation, discriminatory lending and zoning practices, and the exclusion of historically marginalized populations from decision-making (Houston et al., 2004). Federal and state agencies have begun to compile technical guidance on strategies to reduce near-roadway exposures, including changing land use and the built environment, reconfiguring the site design of near-roadway sites, and converting vehicle fleets to cleaner technologies. Unfortunately, we know little about the implementation of these strategies in practice, particularly for historically underserved or "disadvantaged" communities.

Specifically, there is a substantial knowledge gap regarding how state-sanctioned, place-based programs to address environmental impacts can fulfill dimensions of environmental justice such as participation, distributive fairness, and recognition. We address this gap by reviewing how residents and community leaders in California's San Joaquin Valley engaged in the Community Steering Committees (CSCs) of the Community Air Protection Program to develop targeted mitigation strategies in some of the state's most heavily polluted census tracts. This program is administered by the California Air Resources Board (CARB) under California Assembly Bill 617 (AB 617), which directs regional air districts to form and facilitate a CSC that engages local residents and industry representatives to develop enhanced air monitoring capabilities and identify targeted strategies to reduce localized air pollution (London et al., 2022). We focus on four strategies adopted by CSCs for three AB 617 communities to address near-roadway impacts – transforming roadways and land use, re-routing trucks from sensitive receptors, installing protective vegetative barriers, and blocking freeway and warehouse expansion – and utilize a mixed method approach based on a variety of sources. We interviewed over twenty-five resident and industry CSC representatives; analyzed proposed and adopted CSC plans, monthly meeting agendas, agency presentations, strategy updates, and meeting recordings; and reviewed related city land use plans and processes, and infrastructure project environmental review documents, public comments, and interagency communications.

Although we found that the state-led, place-based AB 617 CSCs in three San Joaquin Valley communities were characterized by substantial participation, the impact of resident engagement was often muted due to epistemic injustices embedded in CSC decision-making processes (Ottinger, 2024). AB 617 processes were initially hailed by state and regional agencies as a model for equitable, community-driven planning. Yet CSC members were often relegated to consultative roles in the design and implementation of near-roadway mitigation strategies in ways that limited their ability to contribute judgment or insights into the process, the resources available to empirically express their embodied experiences, and their recognition as knowers within CSCs and broader decision-making processes. Instead, fragments of local knowledge were left ill-defined, deflected, obfuscated, or dismissed within a state-led process which was heavily driven by agency priorities and timelines, and which deployed scientific justifications and interagency policy knowledge to deprioritize or eliminate consideration of community concerns, often in favor of industry priorities and incentives (Harrison and Contreras, 2023). Despite these limitations, our case study details several areas in which resident engagement influenced implementation strategies, secured substantial state pollution mitigation funding, and provided threshold levels of multi-sectoral and multi-

governmental awareness that community groups are now leveraging beyond existing state-sanctioned CSCs to advance a broad-based environmental and health justice agenda within the San Joaquin Valley.

In many parts of the world, climate change is exacerbating already-worrying trends of many natural hazards, including frequency, magnitude, and, in the case of some hazards, duration. The result is not only increasingly detrimental impacts, but also increasing exposure to more than one type of hazard (Liu et al., 2016). Worse still, these multiple hazards can occur in close proximity—in both spatial and temporal terms. While hazard effects can be independent of each other, in many cases interactions and compounded consequences – potentially even exhibiting a one-plus-one-greater-than-two pattern – can result (Liu et al., 2016). For instance, in the case of Mount Pinatubo, rainfall from a typhoon combined with ash from the volcanic eruption to generate lahars that caused a further flooding disaster and structural failures (Gill & Malamud, 2014). Recognizing such potentialities, scholars and many authorities have been increasingly calling for research that goes beyond single hazard events to take into account multiple relevant hazards.

It has been increasingly recognized among planning and disaster scholars that plan integration – the extent to which the ecosystem of planning documents is consistent for a particular goal (Berke et al., 2019; Yu et al., 2023; Woodruff & Meerow, 2022) – can play a substantial role in strengthening community resilience to natural hazards and its absence can weaken it. Given the severe impacts of multi-hazards and the potential of plan integration to relieve them, it is critical that planners take hazard resilience into account. Yet, despite the growing scholarly attention to multi-hazard approaches and plan integration, no process has emerged regarding how to evaluate plan integration in the context of multiple hazards. This study addressed this gap by extending the Plan Integration for Resilience Scorecard™ method to encompass multi-hazards. We demonstrate the novel PIRS™ for multi-hazards approach in Beaumont, Texas, by simultaneously evaluating the community's network of plans for three hazards: flooding, wildfire, and extreme heat.

Results show that the areas highly exposed to multiple hazards mainly cluster along the Neches River. Encouragingly, the disaster- and infrastructure-oriented plans, such as Beaumont's Emergency Management Plan, are well-integrated for vulnerability reduction in most cases, thus strengthening the community's resilience toward multi-hazards. However, the development-oriented plans, such as Beaumont's Development Strategies Plan, contain a considerable number of policies that exacerbate hazard vulnerability which, taken together, can overwhelm the more limited resilience-boosting policies and weaken the community's multi-hazards resilience.

This research offers a novel PIRS™ for multi-hazards approach, providing planning practitioners with a continuous evaluation tool. It also allows them to track their performance regarding multi-hazards plan integration and identify integration-promoting and vulnerability-increasing policies within their plan networks. These can, in turn, support practitioners in refining their plan networks to more effectively strengthen community multi-hazards resilience.

PLAN QUALITY EVALUATION FOR DISASTER'S RESILIENCE OF LOCAL GOVERNMENT

Abstract ID: 1108.0.0.486.2024

Individual Paper Presentation

Bokyeong Jeong [Pusan National University] mybean1@naver.com, presenter
Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

Climate change is increasing the frequency and intensity of disasters, highlighting the importance of plans as a non-structural measure to increase community resilience to disasters. Plans have the capacity to move the community towards its aspirations based on the local context and determine the capacity of the local government to implement budgets, policies and promote disaster management in accordance with the plan (Berke et al. 2006; Hopkins and Knaap 2018). In the Republic of Korea, wind and water disasters cause fatalities and severe property damage every year. As a planning basis for responding to these disasters, the Republic of Korea requires the preparation of a Safety Management Plan (SMP) and a Comprehensive Natural Disaster Mitigation Plan (CP). In addition, various plans and systems related to rivers and disaster prevention are being enacted and incorporated into urban planning. However, despite these legal and institutional efforts, the vulnerability of cities has not improved and damage caused by wind and water disasters is recurring. The objective of this study is to evaluate the SMPs and CPs of 16 local governments in the Republic of Korea and determine the level of plan implementation based on the allocated budgets. The study first assesses whether each local government has included the necessary components for disaster response in their plans. Then, it compares the evaluation results of SMPs and CPs to explore whether the two plans complement each other to form an integrated planning system. However, plans usually concentrate on the formulation process and components, which restricts the ability to evaluate the plan's implementation, i.e., the plan's ability to move in the intended direction (Brody 2003; Lyles et al. 2023). To analyse the plan's implementation, text mining was conducted on the data related to disaster safety budgets prepared under the SMP and CP to examine the actual use of disaster management budgets by local governments. The analysis revealed that while both the SMP and CP offer detailed disaster preparedness and response manuals, the SMP lacks a thorough analysis of current disaster situations and fails to describe the connections between organizations, plans, and policies for disaster response. This may result in fragmented implementation during a disaster. The CP provides a detailed analysis of the current situation and vulnerability to disasters. It lays the groundwork for implementation by describing the operational framework and funding. The SMP and the CP are complementary and require close coordination. However, the documents do not specifically address this coordination, resulting in a fragmented and uncoordinated planning system. Furthermore, an analysis of the budgets established under the SMP and CP revealed that the actual budgets were used for administrative operations, in contrast to the plans which mainly proposed structural measures. Therefore, there is a need to review the system where plans are implemented through budget execution. The Republic of Korea suffers significant human and material damage from wind and water disasters annually. To respond to these disasters, the country has established several legal and institutional frameworks, including the SMP and CP, which are statutory plans. Additionally, there are various plans to improve urban systems, which are closely related to wind and water disasters. However, having multiple plans is not the only way to achieve disaster preparedness. In fact, an overabundance of plans can create congestion and hinder the actual implementation of plans. Therefore, to ensure resilience in responding to disasters, an integrated and coherent planning system should be aimed for, rather than multiple plans. This system should be actionable and based on it.

PLANNING FOR ENERGY TRANSITION IN SOUTH AFRICA

Abstract ID: 1108.0.0.721.2024
Individual Paper Presentation

Thanyani Madzivhandila [University of Limpopo] tmadzivhandila@gmail.com, presenter

Planning for Energy Transition in South Africa: Challenges and Policy Implications for Two Coal Mining Communities in Mpumalanga and Limpopo Provinces

To respond to the climate change crisis and to starve off its devastating impact, the Intergovernmental Panel on Climate Change (IPCC) estimates that by 2030 the anthropogenic gas emissions would need to significantly decrease to limit global warming (Bosca and Gillespie, 2018; Cha, 2020). To meet this target, fossil fuel extraction and use must be substantially reduced. On the Paris agreement, for example, in 2015, 184 countries acknowledge the urgency of shifting towards a low-carbon economy and committed to keeping the global temperature rise well below 2 degrees Celsius and to pursue efforts to limit the temperature increase even further to 1.5 degrees Celsius (UNFCCC, 2019). This process, of course requires commitment towards specific actions and intervention in the field of politics and legislation, environment, economy, and society at large. The Paris Agreement, however, acknowledges that dealing with climate change will require an understanding that there are local and regional dimension of communities that are built upon the extraction and use of fossil fuel resources and that these should be taken into consideration (Mey, Briggs, Dominish, Rutovitz, Nagrath and Setton, 2019). In other words, the Paris accord recognizes that whilst energy transitioning is positive in many respects, it calls into question the degree to which a rapid low-carbon transition may adversely affect certain economic sectors, communities, and regions (Mey et al., 2019; Blazquez, Fuentes and Manzano, 2020; Cha, 2020). This research adopts a qualitative approach to gather data in Middelburg and Lephalale Mining communities in South Africa. The research used focus group discussions and interviews to collect data from community members and key informant from the mines and municipalities. The results indicates that communities are not consulted on issue relating to energy transition, thus they do not comprehend the inevitable transition the country is anticipating. There was a feel from the community members that the transition will impact not only on their job security but will disrupt their entire livelihood network in the community as most of their livelihood activities are aligned to the operation of the mines. The paper concludes by recommending concrete measures that will not only allow for community participation in energy transition, but which can also transform the entire socio-economic environment of these mining communities.

PLANNING FOR MULTI-BENEFIT INFRASTRUCTURE & EQUITABLE COMMUNITY ENGAGEMENT

Abstract ID: 1108.0.0.503.2024
Individual Paper Presentation

Santina Contreras [University of Southern California] santinac@usc.edu, presenter

A growing body of scholarship has identified the importance of addressing co-benefits across planning spaces. Specifically, co-benefits are frequently presented as providing "a win-win strategy to address two or more goals within a single policy measure" (Mayrhofer & Gupta, 2016). However, despite this acknowledgment, there continue to be gaps in our understanding of how to best incorporate and evaluate co-benefits surrounding planning and policy infrastructure activities, particularly in regard to addressing the multi-faceted dimensions associated with meeting climate and resilience goals (Jones & Doberstein, 2022). Questions of co-benefits are further complicated when considering how to best incorporate equitable community engagement practices within work in these multi-dimensional spaces.

The case study of Los Angeles County presents a useful case for exploring the consideration of multi-benefit and community engagement in climate-resilience infrastructure planning. In 2016 and 2018 Los Angeles County voters passed four funding measures that collectively focused on the investment of over $1.2 billion annually in sustainable and resilient infrastructure projects in the Los Angeles region. Many of the advocacy organizations supporting those measures recognized the benefits of leveraging funding to achieve integrated community multi-benefits around water quality, parks, transportation, and housing, particularly in front-line communities. Several nonprofit organizations committed to integrated planning worked to encourage the LA County Board of Supervisors to develop policies prioritizing multi-benefit projects in the County's programs. That effort was active from 2019 through 2022 and served as a catalyst for the formation of the Infrastructure Justice for LA Coalition (formerly the WHAM Coalition). This coalition is comprised of nine organizations and has served as an external body providing an NGO perspective on these issues since late 2021.

To contribute to the discourse on multi-benefit infrastructure planning, this study draws on findings from a qualitative assessment of plans, policies, and stakeholder data to present lessons learned from the assessment of infrastructure planning efforts in Los Angeles County. Specifically, this study centers on addressing (1) how climate

resilience-focused infrastructure projects in Los Angeles County are addressing multi-benefit interests across water quality, parks, transportation, and housing; and (2) how community engagement interests are incorporated within these multi-dimensional spaces. Study findings highlight the current gaps and opportunities associated with the integration of multi-benefit considerations in planning approaches and work to present how planning efforts can better address equitable community engagement practices in cross-discipline infrastructure planning activities.

PLANNING FOR RISK REDUCTION: HOLLOW STATE AND EQUITABLE HAZARD MITIGATION

Abstract ID: 1108.0.0.634.2024
Individual Paper Presentation

Yiwen Wu [University of Kansas] yiwen@ku.edu, presenter
Ward Lyles [Kansas University] wardlyles@ku.edu

As climate change impacts continue to exacerbate myriad types of climatic disasters, planning for hazard risk reduction becomes increasingly critical. Environmental planners play a pivotal role in combating climate-related risks that impact residents. However, localities encounter challenges such as planner shortages and funding constraints in their efforts to enhance hazard resilience both socially and structurally. This phenomenon of shrinking governance capacity is not only in planning but in local governance in general (Terry, 2005). Outsourcing local hazard mitigation planning to private agencies has become prevalent, yet there is a dearth of studies exploring the impacts of outsourced planning on planning outcomes. This study addresses this gap by examining the impact of outsourcing on planning outcomes through the lens of hazard mitigation planning.

The trade-offs associated with consulting planners are apparent; while they may lack direct access to community groups, local partners, and residents, they excel in efficiently drafting plans to meet federal mandates like the Disaster Mitigation Act (DMA). This norm in hazard mitigation planning leads to the widespread hiring of consultants (Loh and Norton, 2015), potentially undermining communities' capacity to address climate impacts locally. What is financially beneficial for a county – which also meets the legal requirements like DMA – may not be enough for the county's mitigation outcome (Lyles et al., 2023).

Different types of planning agencies have distinct incentives and goals. Public entities like county or city planning departments encounter more bureaucratic hurdles than private consulting firms. Nonprofit planning agencies often rely heavily on government funding and can be influenced by local politics (Linovski, 2021). However, private architecture or strategic planning firms with market-oriented goals may prioritize clients' requests over public interests (Sturzaker & Hickman, 2023). This study delves into how various types of planners shape local planning outcomes. Specifically, we ask to what extent various types of planners affect the plan quality and funding acquisition for local government. Additionally, what are some of the varied understandings of equitable mitigation among different types of planners and across levels of government?

Our methodology includes systematic content analysis to capture planning consultants' involvement in planning processes and plan quality around public engagement, plan integration, and land use and structural protection policies. Additionally, we leverage interviews with mitigation officers across governments. Expanding on an NSF-supported project examining local mitigation outcomes in the Southeastern coastal regions, we include 155 counties in a total of six states in both the Southeastern and Midwestern regions of the US. We conduct hierarchical linear models to predict counties' plan quality and federal funding acquired for hazard mitigation.

Preliminary findings indicate that consulting planners positively impact mitigation plan quality in certain policy areas, and increase the likelihood of federal funding acquisition, yet reveal varying perspectives on equitable mitigation. These findings have significant policy implications for short-staffed local governments collaborating with planning consultants, offering insights into equity-oriented climate change adaptation involving private planners.

PLANS TO ACTION: DO CLIMATE ACTION PLANS MATTER FOR CLIMATE INVESTMENTS?

Abstract ID: 1108.0.0.225.2024
Individual Paper Presentation

Haoyu Yue [University of Washington] yohaoyu@uw.edu, presenter
Wei Zhai [University of Texas at San Antonio] wei.zhai@utsa.edu

Climate-related public investments are pivotal in reducing greenhouse gas emissions, exposure, and vulnerability to climate change. In California, the California Climate Investments (CCI) supports a range of state-led programs to

reduce greenhouse gas emissions and deliver other social and environmental benefits. Local governments and public agencies need to apply for those grants through statewide programs. The engagements of local governments and public agencies are associated with the climate commitments and roadmaps within local climate action plans (CAP). Although not mandatory statewide, around half of cities and counties in California have completed a climate action plan. However, previous studies suggest that there are limited causal impacts of climate action plans on action outcomes, even sometimes with regressive outcomes (Millard-Ball 2013, Swanson 2023, Tang 2010). Therefore, a more detailed investigation into the range of strategies and policies under climate action planning and their variance across different locales is needed.

This research intends to examine the effectiveness of climate action plans by assessing the impact of municipal and county climate action plans on the received investment from California Climate Investments. We analyze 237 city climate action plans for municipal incorporations and county climate action plans for unincorporated regions. Using large language models (LLMs), we evaluate their comprehensiveness in climate pledges, addressing mitigation, resilience, adaptation, social equity, implementation, and climate finance. Meanwhile, we construct a block-group level index to represent the spatial distribution of California Climate Investments based on the California Climate Investment Implemented Project Dataset between 2015 and 2022. In the end, we conduct hierarchical regression models to examine the relationship between climate investments and climate action plans as well as other key determinants of climate investment, such as natural hazard risk and pollution exposure.

Our preliminary results show whether adopting a climate action plan is not statistically significantly associated with the allocation of climate investments, though some key components, such as the carbon-neutral target and local fiscal policy, do influence the funding distribution. Also, communities characterized by more democratic, higher pollution levels and high white-only populations tend to have better chances of receiving higher climate investments. These results can provide empirical knowledge of the relationship between climate action plans and investment and suggest the need for more targeted and substantive commitment and actions in local climate action plans.

PRACTICAL PERSPECTIVES ON RESILIENCE DEFINITIONS

Abstract ID: 1108.0.0.747.2024
Individual Paper Presentation

Melina Matos [Florida Atlantic University] matosm@fau.edu, presenter
Malini Roy [University of Arizona] maliniroy@arizona.edu

Sara Meerow [Arizona State University] sara.meerow@asu.edu
Bryce Hannibal [U.S. Census Bureau] bryce.hannibal@gmail.com

Urban resilience has become a central concept in various fields, including disaster management, urban planning, and environmental science. According to Munoz-Erickson et al. (2021), the urban resilience literature organizes the definitions into 5 categories or traits: (1) System property, outcome, and process; (2) Shocks and stresses; (3) Pathways of change; (4) Relationship to sustainability, equity, and anticipation; and (5) Social, Ecological, and technological resilience. While many studies discuss how academics define resilience, little attention has been given to how resilience is conceptualized across different urban contexts and among the actors that build resilience 'on the ground' (Munoz-Erickson et al., 2021).

Academic literature and policy discourse suggest that certain governance arrangements, or networks, are more likely to enhance resilience, leading major urban resilience initiatives to aim for reforms in city governance accordingly (Beilin & Wilkinson, 2015; Fastiggi et al., 2021). The literature on urban resilience governance emphasizes that breaking down organizational silos and fostering collaboration between diverse actors can improve knowledge exchange across different policy sectors and expertise, provide a platform to deliberate on synergies and conflicts in goals, and redress power imbalances among actors. Yet, studies rarely explore drivers of collaboration- more specifically, if whether resilience collaboration networks share similar understanding in resilience definitions, and if they do, which traits are shared by collaborators and which traits are under-represented?

This paper addresses this gap by analyzing collaborative governance networks for flood resilience in four coastal U.S. cities that are at the forefront of resilience planning: Boston, MA; Baltimore, MD; Fort Lauderdale, FL; and Seattle, WA. The paper addresses the following research questions: (1) How do definitions of resilience differ across cities? (2) How do definitions of resilience differ across organization types? (3) To what degree do key actors collaborating on flood resilience planning networks share traits of resilience definitions?

To investigate the collaborative governance networks on flood resilience, we first used name-generator questions through stakeholder surveys and employed social network analysis (SNA). We identified key actors using centrality measures, and categorized actors by types of organization (Hannibal et al., 2023; Prell et al., 2009). Second, our survey asked "The concept of resilience can mean different things to different people. In a few words, what comes to your mind when you think of cities (or your city in particular) as being resilient to climate change?" Two coders independently coded open-ended responses using a deductive coding approach, allowing us to classify the responses into the five key traits of resilience definition based on Munoz-Erickson et al., 2021.

The results of our study highlight that, generally across the four cities, framing of resilience tend to converge around definitions that emphasize (1) System property, outcome, and process; (2) Shocks and stresses; and (3) Pathways of change. However, perspectives related to sustainability, equity, and social-ecological-technological systems (SETS) are rarely associated with resilience.

Notably, there are significant differences across type of organizations in the way resilience is conceptualized. We unpack these differences and discuss their implications for resilience research and practice moving forward.

RE-EVALUATING THE LAND USE IMPACTS OF UTILITY-SCALE SOLAR IN VIRGINIA

Abstract ID: 1108.0.0.136.2024
Individual Paper Presentation

Damian Pitt [Virginia Commonwealth University] dpitt@vcu.edu, presenter
Jennifer Ciminelli [Virginia Commonwealth University] s2jmcimi@vcu.edu
Aaron Berryhill [Virginia Department of Energy] aaron.berryhill@energy.virginia.gov

Like many states, Virginia is experiencing a rapid increase in utility-scale solar energy capacity. While utility-scale solar provides many benefits related to climate change mitigation, pollution reduction, and tax revenue for the impacted localities, it also raises concerns. These include the possible loss of farmland, forest land, and sensitive ecosystems (Hernandez, et al., 2014; Kaza and Curtis, 2014), as well as environmental justice concerns from concentrating these facilities in low-income and/or minority communities (Mulvaney, 2019). Research into the impacts of existing solar facilities can help planners and policymakers mitigate those impacts, through siting agreements and other local regulations, and guide the future location of utility-scale solar through zoning codes, comprehensive plans, and other policy tools. (Dias, et al., 2019; Poggi, Firmino, and Amado, 2018).

This paper will be an update to research previously presented at the ACSP Annual Conference in 2021. Our earlier work examined the land use impacts of the 38 utility-scale solar facilities (5 MW or greater) that had been installed in Virginia as of January, 2021. In the ensuing three years, Virginia's utility-scale solar industry has exploded, with 86 facilities currently operational and hundreds more in development. We also have access to new data sets that will help us better understand the impacts of this utility-scale solar development on prime agricultural lands. Our key research questions are as follows:

• What is the total acreage of land dedicated to utility-scale solar development in Virginia thus far, and the average acreage per megawatt (MW) of installed utility-scale solar generation capacity?

• Does utility-scale solar development occur disproportionately in counties that are lower-income and/or have high minority populations, compared to the statewide average?

• What types of land uses are most often converted to utility-scale solar development (agricultural, forested, open lands, etc.), and do these patterns vary significantly by region?

• To what extent is utility-scale solar impacting "prime" agricultural or "high conservation value" forest lands, versus farm or forest land with lower agricultural or conservation values?

• Based on current trends, what are the potential future impacts on agricultural and forest land if utility-scale solar grows, as expected, per Virginia's clean energy and climate mitigation goals?

To answer these questions, we have built a new Geographic Information Systems (GIS) database of all utility-scale solar facilities currently operating in Virginia. Maintaining this data set requires meticulous cross-referencing of information from aerial photos, site maps (e.g., from county-level special use permit applications), and other sources to georeference the actual impacted site areas for each new utility-scale solar project. This includes the solar panel footprints as well as additional land converted around the panel area, but not any undisturbed land on the applicable parcels. After georeferencing the individual project sites, we overlay those project footprints with the Virginia Land Cover Dataset to identify the previous land uses at those locations. Our initial findings, presented at ACSP in 2021, showed that over 80% of the impacted acreage has been former forest (58%) and cropland (25%), and that 61% of the impacted cropland was of Very High agricultural value. We also found that the largest utility-scale solar facilities were disproportionately located in Census tracts with a high percentage of African-American residents. These numbers will be updated and expanded upon for ACSP 2024.

This research will inform policy recommendations to support further growth of utility-scale solar, while mitigating negative land use impacts. It will also identify best practices for tracking the impacts of utility-scale solar in a given state or locality. Finally, it will contribute to the evolving research on the impacts of utility-scale solar on forest and agricultural use, as well as related environmental justice concerns.

RECOMMENDATIONS FOR LEADING AN URBAN TREE PLANTING INITIATIVE

Abstract ID: 1108.0.0.269.2024

Individual Paper Presentation

Theodore Eisenman [University of Massachusetts Amherst] teisenman@umass.edu, presenter
Lara A. Roman [U.S. Forest Service] lroman@fs.fed.us
Johan Östberg [Nature Based Solutions Institute] johan@tradkontoret.se
Lindsay K. Campbell [U.S. Forest Service] lcampbell.fs@gmail.com
Erika Svendsen [U.S. Forest Service] erikasvendsen@gmail.com

Large-scale tree urban planting initiatives (TPIs) have emerged as a prominent strategy to harness the benefits of vegetation in cities and town. More than 60 municipalities worldwide have committed to planting over 11 million trees through the Trees in Cities Challenge, and urban TPIs have become commonplace across the United States (Young, 2011; Eisenman et al., 2021). This has received an additional boost with $1.5 billion in federal funding allocated toward urban tree planting and management in the 2022 Inflation Reduction Act. The scale of this urban greening activity is arguably unprecedented and has the potential to provide a range of environmental and human health and wellbeing benefits. But if not strategically and inclusively planned, TPIs can also generate problems and may not deliver desired or equitable benefits (Roman et al., 2021).

Tree plantings are often celebrated in media-friendly 'golden shovel' events, and success is often framed in terms of the number of trees planted or canopy cover achieved. By extension, the vast majority of economic and human resources that are mobilized for TPIs are typically allocated for tree purchasing and planting (Eisenman et al. 2021). As a result, there is little investment in pre-planting community engagement and post-planting stewardship and monitoring; this has significant implications for environmental justice and long-term sustainability. For example, residents in marginalized neighborhoods may resist TPIs when these communities are not included in the planning process that establishes planting goals and management strategies. Urban tree planting is also costly, ranging from $500 to $3,500 per tree, while 30% of urban tree plantings typically die within five years (Hilbert et al. 2019).

Importantly, TPIs are a type of green infrastructure practice that is directly or indirectly under the purview of urban planners (e.g., Schwab, 2009). Based on a paper that has been accepted for publication in the Journal of the American Planning Association, this presentation will outline concrete actions that urban planners and community leaders can take to promote more sustainable and equitable urban greening across three phases of a TPI: 1) the pre-planting phase that includes goal setting, community engagement, and planning; 2) the installation phase when trees are sourced and planted; and 3) the post-planting phase when maintenance and monitoring is critical. In each of these phases, there are five important cross-cutting themes: 1) ensuring adequate funding for all project phases; 2) cultivating place-based landscape design; 3) engaging and investing in communities; 4) following arboricultural best practices; and 5) evaluating performance and adapting over time.

Recommendations are grounded in scientific literature, including studies from the coauthors who have over nine decades of combined experience with transdisciplinary research partnerships in urban forestry, arboriculture, stewardship science, management and governance of urban trees, and landscape planning and design. The role of planners is especially noteworthy and will be foregrounded in the presentation. This includes community engagement with a range of interdisciplinary stakeholders, especially in the pre-planting phase when planting objectives and landscape design strategies are developed. It also includes the influential role that planners can play in institutionalizing adequate distribution of funds and resources across the pre-planting, installation, and post-planting phases of a TPI.

REGIONAL CARBON EMISSION EFFICIENCY ANALYSIS AND FACTOR DECOMPOSITION

Abstract ID: 1108.0.0.504.2024
Individual Paper Presentation

Giwoong Park [Pusan National University] gwpark@pusan.ac.kr, presenter
Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

Differences in socioeconomic levels, technology and innovation capacities between regions create unequal relationships that create structures of exploitation. Existing disparities are likely to deepen through cumulative and path-dependent processes and lead to new disparities during the carbon neutrality transition. Regions with a carbon-intensive, low-value-added industrial structure are heavily impacted by regulation. Innovation is necessary for regions to break out of negative lock-in (Martin and Sunley, 2006). Innovation does not happen by chance, but reflects a region's existing capabilities (Martin, 2010). Regions that have grown up with high-carbon industries will seek to maintain the systems already in place (Seto et al., 2016). Creating new pathways out of this carbon lock-in requires not only investment in innovation, but also a base for innovation (Zhang and Du, 2023). So, can regional innovation capabilities bridge the carbon neutrality disparities, and do existing capabilities matter for innovation? The objective of this study is to measure the carbon emission efficiency of different regions and decompose the factors contributing to efficiency disparity among them. According to the IEA, out of the top 20 carbon-emitting countries, South Korea ranks sixth in per capita emissions. In addition, more than half of the country's population is concentrated in the Seoul capital region, which covers only about 12% of the country. It is difficult for even the most economically advantaged regions to achieve carbon neutrality. However, it is necessary to close the gap by reducing carbon emissions at least as much as the economically advantaged regions. We want to measure carbon emission efficiency as an indicator of this. To measure regional efficiency, we use Stochastic Frontier Analysis. To analyze the disparities between regions, we use the Tobit Blinder-Oaxaca Decomposition. In addition to the control variables, we use patents and R&D expenditures as innovation capability variables. To analyze the causes of the carbon emission efficiency gap, we separate the top and bottom 30% of the efficiency score into two groups. The

Tobit Blinder-Oaxaca Decomposition shows that a penalty exists in the bottom 30% of efficiency regions. Of the total efficiency variance, 10.5% is explained and 89.5% is unexplained. The energy industry share and patents are significant in the explainable part. This gap can be explained by the high share of energy industry and low innovation capacity in regions with low efficiency. On the other hand, GRDP per capita and patents are significant in the unexplained part. This means that low-efficiency regions have a disparity even if they have the same GRDP per capita as high-efficiency regions. However, innovation capability appears to be able to reduce the unexplained gap. Among the innovation capability variables, R&D expenditures were not significant, which could be interpreted as being invested in production activities rather than carbon reduction (Wang et al., 2023). This study suggests that the innovation base needs to be strengthened to reduce carbon and improve efficiency. Regions with a high number of patents already have a good innovation base, but R&D is an input to innovation and is more likely to develop into outputs such as patents only if the innovation base is supported. As human capital and knowledge-based industries are concentrated in the Seoul capital region and metropolitan cities, the situation in other regions will continue to deteriorate. In addition, all regions should transition to renewable energy, not just those with fossil fuel-fired power plants. The study found that the share of energy industry is a possible explainable driver of the gap between regions. While major countries around the world are moving to phase out coal, South Korea has been delayed in enacting legislation.

REGIONAL VARIATIONS IN GREENHOUSE GAS EMISSIONS FROM A SPATIAL PERSPECTIVE

Abstract ID: 1108.0.0.949.2024
Individual Paper Presentation

Jaemin Song [Seoul National University] jaemins@snu.ac.kr, presenter

The global urbanization brings about both challenges and opportunities in the realm of climate change mitigation. While urban concentration of populations and jobs can enhance resource efficiency, particularly in energy consumption, this concentration also brings about challenges in greenhouse gas (GHG) mitigation such as increased congestion, extended commuting distances, and the urban heat island effect. This dichotomy is further complicated

by the growing interconnectivity between cities, transcending administrative borders, and thus rendering localized climate change strategies at the city level less effective. At a broader scale, regional integrated spatial planning emerges as a crucial strategy. It holds potential for optimizing deployment of renewable energy, a reduction in transportation energy demand, and refining resource utilization in the industrial sector. Nevertheless, there is a notable gap in empirical research exploring which specific spatial forms effectively reduce GHG emissions at regional and national scales.

On a broader scale, research focusing on the regional and national impacts of urbanization on GHG emissions has predominantly used urbanization rates as a proxy. Such studies reveal a correlation between escalating urbanization and increased GHG emissions. However, the impact of spatial forms at these larger scales has been less explored (Haberl et al., 2023; Lim et al., 2019). With the intensification of inter-city movement of people and goods, prompted by advancements in mobility, it becomes imperative to examine spatial characteristics beyond the city level.

In this context, this study seeks to empirically assess the impact of spatial distribution patterns of populations and workers on GHG emissions at a regional level, with a case study of South Korea. Specifically, this study aims to address three research questions: (1)

How have the sectoral and total greenhouse gas emissions changed over the past 30 years by region? (2) what are the main drivers of regional GHG emissions variations by sector and how much regional spatial form contribute to the variations? To tackle these questions, this study conducts an empirical analysis of the influence of spatial characteristic changes in six Korean regions from 1990 to 2019 on GHG emissions, using a STIRPAT model (Stochastic Impacts by Regression on Population, Affluence and Technology), which is the most widely used in research for identifying greenhouse gas emission drivers.

The analysis revealed that characteristics of total and sectoral emissions differ significantly by region. Except for the Seoul metropolitan area, which predominantly comprises service industries, the industrial sector accounts for the largest share of GHG emissions in all other regions. In Seoul, the building sector is the primary source of both direct and indirect emissions. Emissions from the transport sector are slightly lower than those from the building sector in every region. Furthermore, the annual growth rate of GHG emissions has decelerated across all regions over time.

The STIRPAT model identified population as the primary drivers of greenhouse gas emissions. Following closely, energy efficiency was identified as the subsequent critical variable, notably influencing emissions in the industrial and transportation sectors. Meanwhile, the density of a region, reflecting its spatial form, exhibited an elasticity ranging between -0.3 and -0.5. Notably, the impact of density was more pronounced in the industrial and building sectors than in transportation. These observations underscore the significant role of a region's spatial attributes not just in transportation but across various sectors affecting greenhouse gas emissions. In order to achieve carbon neutrality, this highlights the critical need for consistent monitoring and adaptable spatial strategies to address the ongoing expansion of urban areas with declining densities, despite a declining population.

REGULATING TO PROTECT TREES WHILE AVOIDING REGULATORY TAKINGS CLAIMS

Abstract ID: 1108.0.0.675.2024
Individual Paper Presentation

Richard Norton [University of Michigan] rknorton@umich.edu, presenter

Trees and forests are vital components of terrestrial ecosystems; provide multiple climate adaptation benefits to property owners and society, such as shade and stormwater control; and help to mitigate climate change by sequestering carbon (Schwab, 2009; Safford et al., 2013). Given climate change, the imperative to regulate the removal of trees, and to require mitigation when they must be removed, is only growing. Indeed, local ordinances that regulate the removal and conservation of trees are now commonplace, and there are now numerous guidebooks available to assist localities looking to plan for and adopt or improve such ordinances (e.g., Swiecki and Bernhardt, 2001; Schwab, 2009; Safford et al., 2013; Bardon et al., 2019).

That growing attention to tree protection will surely prompt increased pushback in turn from private property owners who are constrained by regulation. It is not enough merely to justify to those property owners—or to courts—why tree conservation is important; regulations adopted to do so must pass legal muster too. Most contemporary tree conservation guides address the authorities required to adopt such ordinances and the legal protections that apply to them generally. Some identify specifically the potential for a private property owner to assert that a regulation that compels the preservation of trees on site—or payment of fees into a tree replanting fund—amount to the regulatory taking of private property (e.g., Duerksen, et al., 1997; Nichols, 2007). These cautions are abstract, however, without providing much insight into how courts might respond to such claims or how ordinances might be crafted to withstand such constitutional attack accordingly.

Several cases involving a local tree preservation ordinance in Canton Township, Michigan recently worked their way through the courts. In both cases, one federal and one state, the township lost regulatory takings claims, which had the effect of voiding the township's tree mitigation requirements. In a prior paper, we analyzed why the township lost those cases and offered preliminary guidance for localities wanting to protect trees (i.e., especially trees on private property), based on historical and legal analysis of the underlying issues, content analysis of court filings and decisions, and evaluation of the township's prior planning efforts. The legal challenge left by the Canton Township experience is the need to demonstrate clearly to both property owners and the courts that the costs of any demands made by government to mitigate for the removal of trees—either by replanting or paying into a tree replanting fund—would be roughly proportional to the harms (or loss of benefits) caused by removal of the trees.

For this paper, we collaborated with Canton Township planners and: updated our literature reviews of contemporary tree protection studies and guidance documents; reviewed a sampling of current tree protection ordinances widely regarded as leading models for good practice, assessing especially measures used to justify and impose mitigation requirements for tree removal; evaluated systematically an array of on-line tools now available for assessing tree benefits (e.g., iTree), focusing especially on their administrative feasibility and usefulness for demonstrating rough proportionality between harms caused and mitigation required; conducted spatial analyses of Canton Township and evaluated potential outcomes from selected approaches to amending its tree protection ordinance; and developed more generalized guidance materials. Our goal was to provide guidance to help

communities plan for, develop, justify, and administer tree protection regulations that are both effective and legally defensible, especially with regard to regulatory takings claims. This paper summarizes the background issues, setting, study methods, key findings, and recommendations drawn from that work.

REPURPOSING LAND GRANT POLICY FOR JUST REPOSSESSION VIA BIOREMEDIATION

Abstract ID: 1108.0.0.1158.2024
Individual Paper Presentation

Chayce Kenny [Rutgers University] chaycekenny@gmail.com, presenter

Through centuries of forced and coerced land dispossession, racialized zoning and development policy, and environmentally unjust and exploitative practices, minority and impoverished populations in United States cities have been stripped of ownership over land and agency over urban environments and ecosystem access. The intersections of economic disenfranchisement and property theft and environmental injustice are complicated and inextricable. This paper seeks to address one area of potential redress for this problem through a novel approach to land repossession vis a vis bioremediation and brownfield redevelopment technologies.

This project starts with an intellectual and political history of the idea of land-grant, land-seizure, homesteading, and the historical notion of certain populations having more of a right to own and determine the fate of land and environment. This history both sets up the logic that will be repurposed for contemporary environmental justice and also helps to establish what has led to the current state of environmental dispossession that will be addressed in the paper.

Following this history, current data regarding landownership, environmental degradation, brownfield distribution and environmental impacts of such will be analyzed, with particular attention paid to the disproportionately negative outcomes facing minoritized and disadvantaged communities.

Having established the strength of the link between historic policies of unjust land seizure/granting, urban environmental agency, and socio-economic and health outcomes, this paper will move to propose a potential avenue for redistribution and redressing by both taking advantage of modern bioremediation technologies and repurposing the logic of land-grant policies.

This section of the paper begins by providing an overview of the current state of bioremediation technologies, including benefits and drawbacks, as well as analysing some of the continued systemic concerns of justice impacting their utilization (economically disinvested/disadvantaged communities being unable to afford or access technologies, concerns over gentrification or pricing out of neighborhood, and profitability and ease of developers using other technologies for redeveloping brownfields).

Following this, this paper repurposes logics of land-grant to propose that the government aides in land repossession and ownership granting to communities which have been historically impacted by unjust development, environmental degradation, and land seizures, on the condition that these communities engage with bioremediation techniques.

The hope with this project is that it can simultaneously redress historic injustice while protecting against contemporary concerns regarding gentrification or inequitable distribution of the benefits of brownfield redevelopment. This paper will also acknowledge and discuss potential difficulties and troubles with this proposed plan of action, recognizing constraints and imperfection of such. All in all though, the hope of this work is to push the state of the field forward, and push the multiple fields of scientific bioremediation and planning justice together.

RESOLVING CONFLICTS IN PLANNING GREEN PATHS TO RESILIENT FUTURES

Abstract ID: 1108.0.0.465.2024

Individual Paper Presentation

Nidhi Subramanyam [University of Toronto] nidhi.subramanyam@utoronto.ca, presenter
Eileen Murray [University of Toronto] eileen.murray@mail.utoronto.ca

Stormwater runoff over roads, streets, and pavements is a major contributor to urban flooding. It also has implications for environmental health and water quality. Green streets or the incorporation of decentralized green stormwater infrastructure solutions in the public right-of-way has emerged as a popular urban solution to reduce stormwater runoffs and reduce urban flooding in dense urban environments where green infrastructure competes with other land uses for space (McPhillips & Matsler, 2018). Like other green infrastructure (GI), green streets also promise to deliver co-benefits such as urban heat island reduction, groundwater recharge, aesthetic enhancements, expansions in access to green spaces, improved pedestrian activity, and greater community engagement in urban environmental governance (Newell et al., 2013). In practice, realizing multiple co-benefits at once has proven difficult. Research has documented tradeoffs between different benefits, which in turn have introduced conflicts between planners, practitioners, and diverse communities involved in GI planning, with implications for realizing distributive and procedure environmental justice through green streets (Diep et al., 2022; Finewood et al., 2019).

The politics of GI planning is an analytical approach that examines the decision-making processes through which tensions between practitioners, communities, (and their desired benefits) get articulated and resolved, i.e., how communities express their diverse desires for urban natures, as well as how the prioritization of GI benefits occurs, decisions around where GI gets sited get made, and who benefits from the outcomes of these decisions (Ernstson, 2013; Finewood et al., 2019; Meerow, 2020, p.2). Whereas scholarship has largely applied this framework to investigate conflicts between expert planners and lay communities, our paper focuses on conflicts that emerge between various agencies involved in managing the urban right-of-way and in environmental governance with regard to their practices for green street siting and maintenance. We examine how these conflicts are resolved in practice and how context-specific environmental justice considerations inform the politics of GI planning to illuminate the practical challenges involved in achieving equity through the development of green streets.

Methodologically, we draw on a detailed review of GI and green streets policies from thirteen major US and Canadian cities, in-depth interviews with twenty-one GI planners and practitioners conducted in 2023-24, and geospatial analysis of green streets distribution for cities with available data. Our findings concur with existing literature in showing that hydrological and stormwater management goals take precedence in green streets' siting compared to other considerations (Finewood et al., 2019; Hoover et al., 2021; Meerow, 2020) but also reveal that many GI planners also seek to piggyback on capital improvements to city streets to strategically expand their portfolio of GI assets. Whereas GI planners seek to expand the provision of green streets in ways that advance distributive environmental justice through their routine and opportunistic approaches, the priorities of other agencies involved in governing the public right-of-way (ROW), the unavailability of land, conflicts with other utilities, and limited budgets constrain them, showing the persistent legacies of 'municipal undergreening' practices (Rivera and Hendricks, 2022). In cities where GI planning agencies have access to a dedicated capital budget and decision-making autonomy, it is easier to achieve co-benefits related to community engagement, equitable distribution of GI assets and investments in their long-term maintenance. In conclusion, the paper underscores that although the ROW is publicly owned, implying fewer conflicts over land ownership and use, realizing equity through green streets planning continues to be political and fraught because of the diverse goals and agendas of the various public agencies involved in controlling the public realm.

RESOURCE AND POWER IN FORUM PARTICIPATION IN GOVERNANCE OF WATER COMMONS

Abstract ID: 1108.0.0.517.2024
Individual Paper Presentation

Kahad Adamu [University at Buffalo] kahadada@buffalo.edu, presenter

Effective problem-solving necessitates collaboration among entities from different levels and sectors, as no single entity possesses the necessary authority, resources, and expertise to independently translate policy intentions into action. Collaborative forums serve as crucial platforms for engagement and coordination. However, actors often face the challenge of choosing from multiple forums in which to participate. This study takes the Cuyahoga River Basin as a case study, a region that has seen the emergence of numerous regional collaborative forums aimed at addressing water pollution and other problems, particularly in designated Areas of Concern (AOCs). This study adopts an interdisciplinary approach, drawing from the Ecology of Games Framework (EGF) (Long, 1958; Lubell, 2013), social capital theory (Larsen et al., 2004; Putnam, 1994), resource dependency theory (Pfeffer & Salancik, 2015), and power theory (Morrison et al., 2017; Morrison et al., 2019). It also leverages the Exponential Random Graph Model (ERGM) in its analysis. This comprehensive approach allows me to assess how social capital (bridging and bonding), actors' perceptions of forum power (design, pragmatic, and framing), and the forum's capacity to provide access to human, financial, and technical resources influence actors' choice and participation in forums. It shows that forums serve diverse purposes and exhibit varying compositions, with actors' participation being influenced by the forum's ability to assist in accessing different forms of resource capacity and exerting power in policy design and resource mobilization. These findings underscore the importance of considering power dynamics and resource availability in fostering effective participation and coordination to address environmental issues, offering practical insights for environmental planners and practitioners.

Individual Paper Presentation

Zhuoxu Qi [Southeast University] qizhuoxu@seu.edu.cn, presenter

In recent years, urbanization has accelerated, and abnormal changes in climate have increasingly threatened and affected cities with disasters. Intense rainstorms have caused urban flooding in highly urbanized areas, resulting in property damage and threats to life. Therefore, the development of flood-resilient infrastructure systems is crucial. However, achieving this goal may be challenging in high-density urban areas due to constraints on land resources. Current studies on flood resilience are limited to assessing infrastructure systems and do not consider dynamic, resilient scenarios based on Blue-Green solutions. This study proposes a framework based on local human wisdom that can withstand, absorb and recover from floods in a timely manner to improve flood resilience in the urban design process. In this study, we analyze the hydrological characteristics of Zhengzhou City and constructs a rainfall and flood security pattern using GIS and hydrological models. Corresponding Blue-Green solutions are determined for different terrain situations based on the above conditions. These solutions include the Trench Ring + Dry Pond mode, Connected Ponds + Sponging Infrastructure mode, and Blue-Green Network + Elevated Groups Mode. Finally, a rainfall and flood mitigation program is established at the macro scale, and its effectiveness is evaluated based on the Storm Water Management Model (SWMM). The results indicate that the Blue-Green program produced 40,000 cubic meters of stormwater storage, resulting in significant economic benefits for the community. The savings are more than three times that of the traditional solutions. Furthermore, from a spatial perspective, the Blue-Green looped network solution improves flood resilience and reconnects previously fragmented lakeshore spaces, while increasing the water storage capacity of abandoned land. This approach can enhance the flood resilience of inland cities, particularly in response to heavy rainfall and riverine flooding.

RISING SEAS: RISK PERCEPTION AND POLICYMAKING IN HAWAII

Abstract ID: 1108.0.0.852.2024
Individual Paper Presentation

Sandeep Kandikuppa [East-West Center] kandikus@eastwestcenter.org, presenter
Colin Moore [University of Hawaii at Manoa (UHERO)] cdmoore@hawaii.edu
Ketty Loeb [University of Hawaii at Manoa, Institute for Sustainability and Resilience] kloeb@hawaii.edu

According to NOAA's 2022 Sea Level Rise Technical Report, around 2 feet of sea level rise (SLR) along the U.S. coastline is increasingly likely between 2020 and 2100, and failure to curb future emissions could cause an additional 1.5 - 5 feet of rise (for a total of 3.5 - 7 feet by the end of this century). This will dramatically affect coastal communities and ecosystems across the U.S. According to the Fifth National Climate Assessment, US. Coastal communities—home to 123 million people (40% of the total US population)—are exposed to sea level rise, with millions of people at risk of being displaced from their homes by the end of the century. The State of Hawaii presents a "most likely" case study for the rapid advancement of sea level rise (SLR) policy because of its high vulnerability as a remote island state, deep blue politics, high public awareness of climate change, a strong Public Trust Law, and because of historical and cultural ties to living near water. In 2023 a research team from University of Hawaii conducted an online survey of State Legislators and County Council Members in Hawaii, which revealed that 94% of respondents were concerned or very concerned about SLR, and 100% believe it will have serious impacts on Hawaii's residents in the next 50 years. Of these, 34% think impacts will be catastrophic. Despite this high level of concern, however, only 17% of State Legislators (and no County Council Members) placed SLR policy at the top of their priority list, and only 15—mostly minor—bills have been passed in Hawaii over the past decade. How can we account for this disconnect between risk perception and the passage of meaningful, concrete policies and planning actions?

This paper will provide findings of a new survey related to SLR risk perception and policy preferences in Hawaii, to be completed in the summer of 2024, which targets staff in key agencies tasked with planning for sea level rise adaptation. The semi-structured online survey is deployed among Hawaii State agencies and all four county agencies using the SurveyMonkey platform. Agency staff play a significant role in researching, writing, and implementing prospective bills, which significantly impacts the viability of proposed legislation. Therefore,

understanding how agency staff evaluate the risks and policy options is of critical importance to the advancement or stalling out of SLR policy.

Survey results will be analyzed in comparison with the 2023 survey of elected officials to provide a multi-level analysis (Legislature, County, and Agency) of drivers behind local level climate change adaptation policy. The study will provide insight into risk perceptions, strategy preferences and challenges facing state and county policymakers and planners as they consider how best to respond to sea level rise. This research will contribute to planning scholarship on coastal management; how risk perceptions and policy preferences impact adaptation response; and multi-level governance of environmental management. The study will also be of interest to practitioners seeking to better understand the drivers of complex, multi-agency environmental planning.

RISK PERCEPTION IN DISASTER PLANNING PRACTICE IN THE GLOBAL SOUTH

Abstract ID: 1108.0.0.715.2024
Individual Paper Presentation

Tapan Dhar [University of Oregon] dhar@uoregon.edu, presenter
Gonzalo Lizarralde [Université de Montréal] gonzalo.lizarralde@umontreal.co
Lisa Bornstein [McGill University] lisa.bornstein@mcgill.ca

Risk perception, a judgment of how risk is perceived individually and communicated scientifi- cally, helps clarify local knowledge, know-how, and experience. However, community disaster preparedness and DRR planning have often overlooked community risk perception. This study investigates how risk perception at the community level influences and facilitates local DRR initiatives. It explores southwest Bangladesh as a case study, an area highly vulnerable to climatic impacts such as tropical storms, floods, and rising sea-level. This study analyses media and local narratives, in-depth interviews, and field observations. We find that community risk perception (a) tends to be ignored in local adaptation planning and (b) is shaped by four influential factors relating to local residents: their varied interests; socio-economic opportunities; attachment to place and community; and risk-tolerance capacity. The study advances theory in revealing a dynamic relationship among perception of risk, adaptive behaviour, and tolerance of risk. Prac- tically, it helps local authorities in southwest Bangladesh and similar locales enhance DRR

practices by considering community experiences and perceptions of risk. Though oft challenged by the contemporary socio-political dynamics of the Global South, transferring knowledge of risk perception to inform decision-making is critical to strategic planning in the face of disasters.

RUBBLE TO RESILIENCE-EXPLORING SATISFACTION LEVEL IN POST-DISASTER RECOVERY

Abstract ID: 1108.0.0.959.2024
Individual Paper Presentation

Apil KC [University of Michigan, Ann Arbor] apil@umich.edu, presenter

Post-disaster reconstruction is a complex process that must contend with the urgent need to act alongside the often-slow process of involving multiple stakeholders and addressing social, cultural, economic, and psychological dimensions that affected populations face (Tierney & Oliver-Smith, 2012). Despite the annual post-disaster reconstruction of hundreds of thousands of houses by governmental and non-governmental agencies, limited attention is paid to the satisfaction levels of individuals after the reconstruction and its correlation with the broader policies guiding the reconstruction process. Hence, a notable gap remains in understanding how specific components of the wider recovery approach—process and policies—influence the satisfaction levels of those directly affected by disasters. Most research on evaluating the recovery process attributes its findings to the overarching recovery approaches, a broad assertion that is overly simplistic.

Jha & Duyne Barenstein (2010) categorize these reconstruction approaches into three main types: owner-driven, where homeowners take the lead in reconstruction with government compliance and support; NGO-driven, where non-governmental agencies offer community support; and agency-driven, where governments or NGOs hire contractors for centralized or large-scale construction projects. Similarly, following the catastrophic Gorkha earthquake of 2015 in Nepal, which rendered more than five million people homeless, the Government of Nepal pursued owner-driven housing reconstruction, backed by international development partners, while also incorporating NGO and agency-driven approaches.

The implicit assumptions within these approaches regarding the embedded properties of participation, flexibility, and community input, alongside the involvement of homeowners and its empowering and dignified nature(Jha & Duyne Barenstein, 2010; Lam, 2023), exhibit significant variations in a real-world implementation. The study unbundles the critical factors associated with recovery approaches that foster or hinder satisfaction, emphasizing their broader implications for social justice and equitable recovery outcomes.

While previous studies have acknowledged the satisfaction level of individuals as an essential outcome of recovery efforts, more nuanced exploration is needed into the intricate factors within recovery approaches that significantly influence residents' satisfaction levels (Hudson et al., 2021; Taheri Tafti & Tomlinson, 2016). To explore the procedural differences among these approaches and their effects on individuals post-reconstruction, I analyze cases from Nepal with similar socio-economic contexts. By selecting three settlements in Nepal, each representing distinct reconstruction approaches as case studies, this study presents the associated intricacies of the reconstruction process as participation, technical support, and repercussion effect, as well as their enduring impacts on residents. Employing qualitative methodology, I interviewed ten individuals from each settlement, representing marginalized groups and diverse inhabitants. Additionally, comprehensive insights into the reconstruction process were obtained through interviews with local leaders, engineers, and reconstruction officials. Additionally, the study investigates the process and outcomes of various post-disaster housing reconstruction approaches in Nepal, utilizing the theoretical framework of justice, particularly distributive and procedural justice, to understand the correlation between residents' satisfaction levels and different reconstruction approaches.

The research suggests that marginalized individuals supported by NGO-driven approaches reported higher satisfaction levels than those in owner-driven approaches, where they felt overlooked. Engineers and officials in owner-driven reconstruction funded by the government faced heavy workloads, limiting their ability to provide adequate technical support, while NGOs had greater human resources for support and were more considerate of service provision. Larger NGOs tended to employ a bottom-up approach, while smaller local NGOs often adopted a top-down approach and engaged agencies to complete tasks. The study offers cases of individuals with higher social and economic status who had a greater influence on village reconstruction policy meetings. Furthermore, the study reveals that community cohesion weakened as the reconstruction progressed in all cases.

SCALING UP MANAGED RETREAT STRATEGIES AND SCENARIOS IN KAUAʻI, HAWAIʻI

Abstract ID: 1108.0.0.801.2024
Individual Paper Presentation

Kammie Tavares [Institute for Sustainability and Resilience, Univeristy of Hawaiʻi, Mānoa] kdat@hawaii.edu, presenter
Makena Coffman [University of Hawaiʻi at Mānoa] makenaka@hawaii.edu

Isabella Roberson [University of Hawaiʻi, Mānoa] irobe@hawaii.edu

In the face of rising sea levels, sandy beach habitats are vulnerable to coastal erosion and inundation, amplifying negative impacts on coastal communities. Shoreline maintenance through beach nourishment and protection have historically been the response to coastal erosion (Griggs and Reguero, 2021). However, for many coastal communities, these mitigation options are too socially and financially costly in the long-term. Retreat, the relocation of coastal development (i.e. buildings, dwellings, infrastructure) away from the shoreline, has been proposed as a response that can avoid maladaptive outcomes (Haasnoot et al., 2021). Research by Setter et al. (2023) used sea level rise models to identify the impacted structures over time and assess the public and private costs associated with three retreat approaches and compared them to potential beach gain over time. The retreat approaches, which are distinguished by the relationship to the time of damage occurring to the coastal structures from coastal hazards, are: all-at-once (well-before damage occurs), threshold-based (just before damage occurs), and reactive (after damage occurs). They found that a threshold-based approach offered the lowest cost for the greatest potential beach area gained. However, the study was limited to a single community (Paumalū, Oʻahu) and only explored a limited range of scenarios. This study expands on the Setter et al. (2023) method by 1) increasing the scale to all residential sandy shorelines on the island of Kauaʻi and 2) adding more scenarios by using other sea level rise modeling products. Previously there were six scenarios that differed in the hazard that triggered retreat (coastal erosion or wave flooding), potential land and building value assessments, and clean up costs. New scenarios that were added include ones driven by passive flooding, and by sea level rise exposure area (SLRXA), which is the combination of coastal erosion, wave flooding and passive flooding models. While this research is still ongoing, preliminary findings suggest that the cost of retreat is magnitudes larger for infrastructure than it is for retreating residential structures. The hazard that drives the costs also depends on the area being considered. Of the four hazard triggers, the most buildings affected were by SLRXA, wave flooding, coastal erosion, and passive flooding respectively. Another notable difference was between scenarios of full building value versus no building value. These findings highlight the importance of continued research on costs and collaborative community planning because each community will be affected differently. Policies and plans of retreat should reflect this need for flexibility and private-public collaborations. By examining the financial and ecological implications of each approach and their scenarios, we aim to inform more managed and sustainable retreat policies that balance short-term costs with long-term benefits. Ultimately, our findings contribute to a better understanding of sea level rise response strategies and support coastal management policies in the face of climate change not only for the coastal and ecological resilience of Kauaʻi's community but also for other coastal communities worldwide.

SPATIAL DYNAMICS OF SURFACE RUNOFF AND RELATIONSHIP WITH LANDSCAPE PATTERN

Abstract ID: 1108.0.0.1154.2024
Individual Paper Presentation

Tong Cheng [NYU Shanghai] tc3532@nyu.edu, presenter
Chenghe Guan [NYU Shanghai] chenghe.guan@nyu.edu

Accelerated urbanization induces substantial alterations in landscape configurations, exerting profound influences on the direction and volume of surface runoff. Recent progress have focused on the effects of changes in the built environment on surface runoff, while less attention has been paid to the nonlinear relationship between natural or unnatural land use and runoff, which is helpful for establishing the synergistic evolution relationship between the landscape and the hydrological cycle, providing an effective way for future urban planning to protect the urban hydrological system, and putting forward a sustainable urban and region planning policy. We used six landscape indicators to explore the relationship between surface runoff volume and the extension, fragmentation, irregularity, and concentration patterns of different land use types in the Yangtze River Delta region, examining these relationships at both the three river basin and city levels.

The findings reveal a substantial escalation in surface runoff volume during the months of June, July, and August, with the highest mean runoff volume observed across the three basins. The Yangtze River Basin exhibits a significant concentration of elevated surface runoff in proximity to the Yangtze River and Taihu Lake. The Southeastern River Basin experiences peak runoff volumes in areas adjacent to the Yangtze Basin from May to July, and along the East China Sea coastline from August to September. Conversely, the southern boundary of the Southeastern Basin, encompassing regions such as Lishui and Wenzhou, witnesses minimal surface runoff during the rainy season.

Urbanization encroaches upon original croplands, while simultaneously driving the conversion of grasslands, shrublands, and water bodies into croplands to meet the increased food demand from population growth, leading to cropland fragmentation and irregularity. In the Yangtze River Basin, approximately 1% of cropland has been transformed into forests, a higher rate than observed in the Huaihe River Basin, suggesting urbanization facilitates cropland-to-forest conversion through policy interventions, potentially exacerbating cropland fragmentation and irregularity. Contrastingly, the Southeastern River Basin exhibited a net cropland outflow to forests, with land use policies contributing to a 146% increase in overall forest cover without escalating cropland fragmentation. The stable fluctuations of forest landscape indicators indicated a dispersed increase in forests. However, substantial

grassland transformation into croplands, forests, and impervious surfaces induced grassland fragmentation in the Yangtze River Delta region.

Significant correlations between forest landscape indicators and surface runoff volume varied by month, with more cities showing correlation in June, July, and August. Larger and less fragmented, regular and connected forest and cropland areas reduce surface runoff volume. The degree of forest extension contributes more than 20% to surface runoff volume compared to other indicators. The larger extension, less fragmentation, more regularity and connectivity of the water area are not conducive to lower surface runoff volume output, especially in the cities in the Yangtze River Basin and in the areas surrounding Luoma Lake, Hongze Lake, and Gaoyou Lake. While the regularity of its shape contributes more than 20%.

To reduce surface runoff and land appropriation in urbanization, preserve natural irregularities and fragmented water bodies. An alternative way to reduce surface runoff volume is to incorporate cropland into the forest to increase plant connectivity and create a larger, less fragmented, and regular-shaped plant tree area. This study concludes that incorporating natural landscape features and strategically planning landscape distribution patterns hold significant practical implications for mitigating surface runoff volumes.

TEMPORAL AND SPATIAL PATTERNS IN GREEN COVERAGE IN US METROPOLITAN AREAS

Abstract ID: 1108.0.0.1199.2024
Individual Paper Presentation

Hanxue Wei [NYU Grossman School of Medicine] hanxue.wei19@gmail.com, presenter

As urban areas continue to grow, understanding the dynamics of urban green coverage becomes increasingly crucial for climate change, public health, and quality of life. This study provides a comprehensive investigation into the neighborhood-level temporal dynamics and spatial patterns of urban green coverage in 10 major U.S.

metropolitan areas spanning nearly two decades, offering insights with a higher level of granularity than what larger-scale analysis typically offers.

Employing a time-series K-means approach based on the National Land Cover Database (NLCD) data (2001-2019, with intervals of 2-3 years), the temporal green coverage changes at the neighborhood level are clustered into three types. The spatial patterns of these clusters are subsequently examined in relation to urban containment policies. Furthermore, associated socio-economic and built-environment factors, derived from the American Community Survey (ACS) and the Environmental Protection Agency, are analyzed and compared between these distinct groups.

The investigation reveals three main insights: Firstly, while neighborhood-level green coverage has been on a decline since 2001, the rate of this decline has significantly slowed after 2006. Secondly, the clusters with substantial green coverage loss are predominantly found in transition zones between urban and rural lands, highlighting an ongoing correlation between urban sprawl and green coverage loss over the past 19 years. Lastly, the pronounced green loss clusters are associated with higher socio-economic status and shorter commuting times, suggesting that urban sprawl, accompanied by green coverage loss, may exacerbate social equity challenges. This study provides a granular temporal and spatial analysis of green coverage within the U.S. urban context, shedding light on the complex interplay of green coverage, urban sprawl, and socio-economic factors, and providing implications for future environmental planning and urban policymaking.

THE GIANT IN THE NICHE: PLANNING MEGAPROJECTS AS URBAN EXPERIMENTATION

Abstract ID: 1108.0.0.982.2024
Individual Paper Presentation

Yunjing Li [Lee Kuan Yew Centre for Innovative Cities/Singapore University of Technology and Design]
yunjing_li@sutd.edu.sg, presenter

Xin Li [City University of Hong Kong] xinli87@cityu.edu.hk

The legitimacy of planning is inherently and increasingly challenged by the dilemma between predictability and flexibility in an urban world defined by uncertainty and complex. Calls for more effective and appropriate planning methods prevail both within and beyond the traditional planning field to address the most pressing problem of sustainability and climate change. Two theses have received particular scholarly and political attention. One is the concept of urban experimentation, which stands for a collaborative style of learning and knowledge production towards the goal of innovation and urban transformation (Bulkeley & Castán Broto, 2013). The other one is a renewed interest in large-scale development projects as a platform to deliver green and climate-resilient infrastructures. These "green megaprojects" gain momentum globally with the growth of green new deals led by different national governments (Rizzo, 2020). Together, these two highly-expected mechanisms for solving contemporary urban problems reiterate planning's fundamental paradox between predictability and flexibility, which is articulated in the rhetoric of mega vis-à-vis niche, the principle of delivery vis-à-vis openness, and the conceptualization of uncertainty and risk as something to avoid vis-à-vis "constructive drivers of urban development processes" (Karvonen et al. 2014, p. 113).

This paper bridges these dualisms and interrogates the relationship between traditional planning and the emerging paradigm of urban experimentation through the lens of megaprojects. Focused on a low-carbon city project in Shenzhen, China, it illustrates how an experiment-framed megaproject is advanced through continuously adjusting the boundaries between control and flexibility. Inspired by Savini et al.'s (2015) analytical concept of "dilemma," we examine the negotiation between the open and closed notions of space and time, the general and particular norms of regulation, and the quantitative and qualitative conceptions of income and risk. It is found that the megaproject encompasses a real-time process where tentative negotiation results are trialed or replicated in different parts and stages of the same project through strategic demarcation and phasing. Rather than a single large-scale project, the megaproject constitutes an experiment of experimentation where the effectiveness and adaptability of particular solutions to the planning paradox between control and flexibility are tested and learned.

These findings were based on a review of project-related planning and consultation documents, government reports, and media coverage, as well as in-depth interviews with 39 local government officials, developers, NGOs, planning and architecture consultants, and existing residents and businesses. They contributes to the emerging literature on "planning by experiment" (Scholl & de Kraker, 2021) by demonstrating the mutual constitution of megaprojects and urban experimentation in the area of urban climate governance, indicating planners' strategic role in experiments as definers of scale and scope physically, temporally and politically.

THE IMPACTS OF VACANT LOTS ON EXTREME HEAT AND SOCIAL EQUITY

Abstract ID: 1108.0.0.119.2024
Individual Paper Presentation

Saeideh Sobhaninia [Arizona State University] saeideh.sobhaninia@gmail.com, presenter
Patricia Solis [Arizona State University] patricia.solis@asu.edu
Ebenezer Nana Kwaku Boateng [Arizona State University] eboaten4@asu.edu

Vacant lots in urban landscapes are thought to impart negative socio-economic and environmental impacts on surrounding communities. In addition, their land cover types generally increase the temperature in the local microclimate, rarely are accompanied by shade, and correlate to poor air quality. Vacant lots are disproportionately found in parts of the city where marginalized or underrepresented residents live (Smith et al., 2017; Pearsall, 2017).

Yet these sites represent a potential landscape of solutions to interrelated threats of extreme heat and social inequity. Given that outdoor heat-related deaths disproportionately occur among people experiencing homelessness and indoor heat-related deaths among people with inadequately cool shelters such as mobile homes, affordable housing with affordable energy for cooling technologies is a critical solution set to move the needle among the most vulnerable and exposed to extreme heat (Solís et al., 2023; Phillips et al., 2021).

Thus, the strategic conversion of vacant lots across a city into heat-smart land uses presents a systems-level opportunity to both remove a negative impact and add positive resilient capacity to a city. We call this Heat-Strategic Vacant Parcel Conversion (HSVPC). Thus, if strategically developed in the future, vacant lands can provide a unique opportunity to convert to different land cover that ultimately could cool urban areas and surface temperatures in neighborhoods. However, a number of questions arise. How many discrete vacant parcels must be converted to which kinds of uses to reach the scale of being able to significantly alter both local and city-wide metrics on temperature and air quality?

This paper thus begins the process of designing a dynamic HSVPC model to address these questions. At present, we have the opportunity to work with the city of Mesa, Arizona, where there are 12,260 vacant lots. Our long-term research aim is to determine how these parcels could be developed more strategically into other land covers, as argued above, so that a city-wide HSVPC design could impact extreme heat and social equity positively. The first step to reach this aim is to test the starting assumptions for the selected city case. This paper tests the hypotheses that the thousands of vacant parcels in the city of Mesa indeed exhibit the negative impacts assumed in terms of social equity and extreme heat in a two-part test. The method of testing social resilience to heat is a comparison of all lots to the US Census' newly released Community Resilience Estimates for Heat. Each parcel is assigned a 0 or 1 to indicate if it is vacant (1) or not. Moran's I autocorrelation and Hot Spot Analysis are then used to compare to the corresponding CRE-Heat score. The method of understanding the extreme heat exposure that vacant lots exhibit in Mesa uses the Body Heat Storage metrics, respectively. Then, we used the Geographic Weighted Regression to test whether and how these variables are linked. We finally map these results in order to understand the spatial

patterns with the distribution of vacant lots at the parcel level in the city of Mesa, labeling a subset of the 12,260 parcels for prioritization on the basis of the original baseline vulnerability and exposure. The results of this first phase of the study sets a foundation for highlighting the importance of vacant parcels and their impacts on extreme heat and social equity. In addition, since our HSVPC model is performed at the parcel level, it will form the basis for future steps in our research to design scenarios to support policymakers to more strategically plan for impacting extreme heat, social equity, social vulnerability, and housing affordability using the most appropriate vacant parcels for conversion.

THE LEGACY EFFECT OF REDLINING ON DISASTER RISK AND COMMUNITY RESILIENCE

Abstract ID: 1108.0.0.186.2024
Individual Paper Presentation

Kijin Seong [The University of Texas at Austin] kijin.seong@austin.utexas.edu, presenter
Akhil Mandalapu [The University of Texas at Austin] akhilm@utexas.edu
Junfeng Jiao [The University of Texas at Austin] jjiao@austin.utexas.edu

In recent years, the establishment of the National Risk Index (NRI) by FEMA marked a significant advancement in our understanding of community risks related to natural hazards. This innovative tool aims to encapsulate a multi-hazard view of risk, integrating the likelihood of natural hazards with social and community risk factors to offer a holistic perspective on disaster vulnerability. Meanwhile, the historical practice of redlining, initiated in the 1930s by the Home Owners' Loan Corporation (HOLC), has been recognized for its long-lasting impacts on urban segregation, socio-economic disparities, and environmental inequities (Shaker et al., 2023). Despite the prohibition of redlining in 1968, its legacies—manifesting in increased temperatures (Hoffman et al., 2020; Wilson, 2020; Li et al., 2022; Conzelmann et al., 2023), diminished green spaces (Nardone et al. 2021), elevated gun violence (Benns et al. 2020), and reduced healthy food access (Shaker et al., 2023) —continue to influence the resilience and vulnerability of communities today.

This study identifies critical gaps in the existing literature, notably the insufficiency of research linking the historical implications of redlining to present-day disaster risk and resilience, and the effectiveness of current risk assessment tools like the NRI in capturing the nuanced socio-economic legacies of redlined neighborhoods. Additionally, it

addresses the need for actionable strategies that urban planners and policymakers may utilize to alleviate the long-standing disparities caused by historical injustices.

We explore three research questions: (1) How do disaster risk, community resilience, social vulnerability, and estimated annual loss vary across neighborhoods with different historical redlining classifications?, (2) How do historical redlining practices impact community resilience and vulnerability to disasters, controlling urban dynamics, including gentrification and urban redevelopment?, and (3) What strategies can urban planners and policymakers implement to enhance disaster resilience and promote environmental equity in historically disadvantaged communities?

This study utilizes ANOVA and Kruskal-Wallis tests to compare mean values across neighborhoods categorized by the level of redlining and spatial regression models to evaluate the impact of redlining on resilience and disaster risk metrics, drawing on the HOLC data, FEMA's National Risk Index, and the American Community Survey (ACS) 2018-2022 5-year estimates to understand the interplay between redlining, sociodemographic factors, urban dynamics, and disaster resilience in communities.

Preliminary findings suggest that neighborhoods historically subjected to redlining display greater social vulnerability and markedly lower resilience and estimated annual loss, culminating in paradoxically lower disaster risk scores when compared to neighborhoods less affected by redlining. These disparities can be traced back to a legacy of segregation and sustained disinvestment. However, it is important to consider that the observed lower disaster risk scores, likely caused by depreciated building values, may not accurately reflect the actual level of disaster risk. This potential underestimation stems directly from a history of neglect and sustained disinvestment, highlighting the pressing need for targeted urban planning and policy measures to address these deep-rooted inequalities.

This study contributes significantly to the fields of urban planning, disaster management, and environmental equity by underlining the importance of recognizing and addressing the socio-economic legacies of discriminatory practices. By leveraging tools like the National Risk Index and advocating for the incorporation of smart technologies into planning practices to achieve equitable outcomes, this research provides valuable insights for urban planners, policymakers, and researchers on strategically allocating and prioritizing efforts to strengthen community resilience and advance environmental equity.

THE PLANNING IMPLICATIONS OF COASTAL WETLAND MIGRATION UNDER SEA LEVEL RISE

Abstract ID: 1108.0.0.469.2024
Individual Paper Presentation

Celina Balderas Guzman [University of Washington] celinabg@uw.edu, presenter

Coastal wetlands are at risk of catastrophic losses under sea level rise. Humans depend on coastal wetlands for a range of critical ecosystem services that are increasingly important under climate change: shoreline protection, carbon sequestration, and habitat for endangered species, among other functions. Ecological modeling has shown that allowing wetlands to migrate to higher elevations as seas rise is key to preserving this critical ecosystem under long-term coastal change. In fact, they emphasize the importance of removing obstacles to wetland migration, such as levees. In certain areas of the United States, wetlands are already migrating.

Wetland migration under sea level rise presents a significant environmental planning challenge. Wetland migration is already infringing on private property, such as homes and farmlands. In doing so, migrating wetlands can damage property, reduce property values, limit adaptation options, incur legal liabilities, and raise human and environmental health concerns. These impacts could disproportionately harm disadvantaged communities, who are also less likely to armor their shorelines and thereby block wetland migration. Localized modeling studies show that wetland migration could have extensive encroachment into certain developed areas, especially under high rates of sea level rise.

Given the potential for conflicts with private property, planners need more information about the population living in areas that could be wetlands in the future. Currently, there are no estimates of the number of people that could be affected by wetland migration at either local or national scales nor a synthesis of the potential impacts. Based on geospatial analysis, this research quantifies the number and demographic characteristics of people living in potential wetland migration corridors across the coastal United States. With an emphasis on social vulnerability, this research identifies hotspots where disadvantaged communities could be affected by wetland migration. In addition, this research synthesizes the emerging potential impacts of wetland migration on humans based on a literature review. Understanding the impacts on humans is an emerging topic as research on wetland migration has mostly been dominated by the ecological sciences. Yet there is increasing awareness of the need to examine and plan for its societal impacts.

Wetland migration is a long-term phenomenon that will intersect with a range of planning policies, including coastal management, conservation, hazard mitigation, floodplain management, climate adaptation, zoning, and land use plans. The complex impacts of wetland migration necessitate innovation in adaptation policy. For example, conservation of wetland migration corridors could be combined with managed retreat to maximize social-ecological benefits. Protecting future wetland migration corridors through conservation measures, such as easements and land acquisitions, faces challenges in funding and landowner perceptions. Moreover, planners must ensure that policy to conserve future wetlands does not predominately target disadvantaged coastal populations and mitigates potential harm. Fundamental data and knowledge on the potential impacts on humans will help in the development of more equitable, cross-sectoral, and holistic policy that successfully balances wetland conservation goals with human adaptation needs.

TREE EQUITY AND HOUSING PREMIUM: MEASURING TREE VALUES IN SAN ANTONIO, TX

Abstract ID: 1108.0.0.599.2024
Individual Paper Presentation

Ryun Jung Lee [The University of Texas at San Antonio] ryunjung.lee@utsa.edu, presenter
Thomas Thomson [The University of Texas at San Antonio] thomas.thomson@utsa.edu

Urban trees are known to bring social, environmental, and economic benefits to communities. To gauge the tree benefits on housing premiums, studies looked at the property as well as greater ranges of tree canopy coverage utilizing a series of rings around each property through hedonic modeling on single-family home sale transactions (Kovacs et al., 2022; Saphores & Li, 2012). Despite the benefits, trees are also known to be less found in low-income and socially vulnerable communities (Riley & Gardiner, 2020) and potentially have adverse health effects in these communities due to poorly maintained trees (Lee et al., 2023). While property trees could have higher premiums in affluent neighborhoods (Seo, 2020), both property and neighborhood-level tree values across different socioeconomic neighborhoods are not extensively examined.

This study aims to fill the knowledge gap on potentially unequal tree benefits on housing premiums in socially vulnerable communities. From the perspective of tree equity and environmental justice, it would be critical to understand who benefits from trees and why. Using San Antonio, Texas, as a case study, we employ the 1m resolution tree canopy data from the 2017 LiDAR, from which we derive the percentage of tree canopy on each property and at the block group level. Traditional hedonic variables such as lot size, square footage, garage spaces, bathroom, etc. are also included. From the buyers’ observation, they gain a visual estimate of the tree canopy for the property and for the neighborhood in which the property is located. Given this imprecise purchaser estimate of

tree canopy, we partition the tree canopy by property and neighborhood into the lowest 25%, the middle 50%, and the highest 25%. Interacting these, we create nine indicator variables to measure the combination of property and neighborhood tree canopy. We then employ a semi-log hedonic pricing model to analyze about 96,000 existing home sales to estimate the value of tree canopy. In addition, we posit the value of tree canopy may depend on the overall area income conjecturing that lower income areas may be more concerned with the housing space while higher valued areas may place increasing value on what may be seen as the amenity of tree canopy.

The results indicate that both property and neighborhood tree canopy generally add value to home sale prices. For the lowest-income area, however, increasing the property tree canopy in a low-canopy neighborhood shows no statistically reliable gain in value. Although property tree canopy does not contribute to value, neither does it reduce value. In the moderate and high canopy neighborhoods, we observe some value gain, but increasing the property canopy in these neighborhoods shows no additional gain in value. The tree value we are examining is directly related to social well-being as urban trees are an essential component of urban living. Socially vulnerable communities already suffer from low levels of tree canopy creating concerns for their well-being. This study provides new evidence that trees might not increase home prices in these communities. For future directions, it is important to identify the root cause of devalued trees in socially vulnerable communities and suggest alternatives to bring tree benefits to promote tree equity.

UNDERSTANDING CE INSTRUMENTS IN RAPIDLY GROWING EXURBAN AREAS OVER TIME

Abstract ID: 1108.0.0.587.2024
Individual Paper Presentation

Caitlin Dyckman [Clemson University] cdyckma@clemson.edu, presenter
Anna Treado Overby [U.S.D.A. Forest Service] anna.overby@usda.gov
David L. White [Clemson University] whitedl@clemson.edu

Stella Watson Self [University of South Carolina] scwatson@mailbox.sc.edu

Notwithstanding the significant flexibility and variability in US and global land conservation mechanisms, on private lands, the conservation easement (CE) has become the predominant tool since the 1970s. They are increasingly integral with President Biden's "30 by 30" initiative to combat climate change through land conservation. CEs' permanence, combined with their ubiquity and relative obscurity, generate questions about and growing recognition of their impact on the landscape.

Despite extensive spatial analyses, there is very little research on the CE documents. Only four studies to date focus on their substantive nature. Rissman et al. (2007) and Kiesecker et al. (2007) studied 119 CEs in eight states, all held by The Nature Conservancy, an international land trust. They found that "almost all easements have explicitly identified biological targets, an indication that they were established with clear conservation purposes" (Kiesecker et al., 129). CEs have several purposes, the most common were ecological and "intended to reduce habitat loss and fragmentation" (Rissman et al., 716). Wallace et al. (2008) conducted a study of private land conservation more generally in one county in CO, and studied 178 CEs. Their primary reasons/public benefits were open space, scenic and aesthetic value, and wildlife value. Owley & Rissman (2016) examined 269 CEs in six states, systematically choosing the CEs from multiple regions (and by size). They identified 17 purposes, finding that "the number and specificity of purposes increased over time" but did not display dominant purposes and instead, CEs included conflicting ones (Owley & Rissman, 81). The most frequently occurring purposes were relatively natural habitat, wildlife habitat, open space, preventing inconsistent uses, scenic enjoyment, and wetlands or riparian areas. Reeves et al. (2020) studied working forest CEs and baseline documentation in GA and found themes of protecting natural habitats and preserving the conservation value of the land.

Among other research objectives, we built on this work by amassing a database of information on CE location and characteristics in rapidly urbanizing areas of the US. We chose counties in states with urbanization pressures, 25 or more CEs by county, exurban character and Level 1 ecoregion exemplification of the largest and most representative ecoregions in the contiguous US. These counties include Sonoma and Sacramento, CA; Boulder and Mesa, CO; Douglas and Washington, MN; Lebanon and York, PA; Charleston and Greenville, SC; and Albemarle and Loudoun, VA. We collected 2823 CEs placed between 1997 and 2008/2009 and used intercoder reliability checks to develop our coding instrument through an iterative process for the CE purposes. Two research team members conducted semi-structured interviews with almost half of the land trusts in the study counties. We first cycle coded these results using descriptive coding.

These data allowed us to establish a baseline understanding of the CE instruments, specifically examining the following questions, through two lines of inquiry: (1) the instrument patterns and internal relationships of their content, and (2) the relationship of those patterns with the CE holders. For the first inquiry line, we statistically assessed the level of variation in the CE purposes and identified the most common reasons and their geographic dispersion. We evaluated the volume of variation and commonality in CE purpose(s), conservation intent, public access, etc. that exist despite disparate geographies. We also examined whether the CE reasons internally supported or defeated each other, considering climate change pressures. For the second inquiry line, we revealed the relationships between the CE holder characteristics, their preservation criteria and the variability in the CE reason patterns. These results build a greater understanding of a critical tool for conserving land with future biome shifts, potentially reinforcing or impeding similar local government efforts.

URBAN DIURNAL HEAT VARIABILITY AND ITS NONLINEAR RELATION WITH URBAN FORM

Abstract ID: 1108.0.0.540.2024
Individual Paper Presentation

Miyoung Yun [Chung-ang University] mmloveu@cau.ac.kr, presenter
Yujin Park [Chung-Ang University] yujinp@cau.ac.kr

As the importance of effectively managing the Urban Heat Island effect and heatwaves grows to enhance quality of life and environmental sustainability in urban areas, numerous studies have explored the relationship between Land Surface Temperature (LST) and urban built-environment form. However, these studies have mainly focused on midday LST, such as noon, overlooking diurnal thermal fluctuations and potential disparities among neighborhoods (Park et al., 2021). This study delves into the diurnal variation of summertime LST, examining how this variability relates to urban planning and environmental elements. Utilizing recently released thermal infrared satellite imagery named NASA ECOSTRESS, which observes LST globally at various times of the day, we investigated diurnal LST changes with a high resolution of 70m. Launched in 2018, ECOSTRESS operates in a non-sun-synchronous orbit, capturing diurnal cycles of surface temperature changes (Chang et al., 2022; Han et al., 2023).

Focusing on Seoul, South Korea, as a case study, this study collected ECOSTRESS data to construct time-series LST data at 70m resolution, covering observations from morning (7:21 am) to evening (5:26 pm) between 2019 and 2022. Based on this data, we quantified diurnal LST variability and visualized its spatial distribution. Subsequently, explanatory variables, including land cover, building form, vegetation density, proximity to natural areas, and point-of-interest (POI) density, were developed to explain diurnal LST variability. Unlike atmospheric temperatures, LST is highly sensitive to physical urban environment forms and may exhibit nonlinear relationships with environmental factors due to heat convection and inertia. Therefore, two different analyses were conducted: first, Seoul was

classified into distinct Local Climate Zones (LCZ) as proposed by Steward & Oke (2012) to examine the characteristics and disparities of diurnal LST variability among them. Second, a Generalized Additive Model (GAM) was used to estimate the nonlinear impacts of explanatory variables on diurnal LST as the dependent variable.

The analysis revealed significant nonlinear effects of all explanatory variables on daytime LST variability. An increase in building footprint ratio exponentially increased daytime LST variability, while increases in both floor area ratio and building height also raised LST variability, though their impacts diminished rapidly as their values increased. NDVI (vegetation density) exhibited a threshold effect, with values above 0.1 contributing to reduced LST variability. Proximity to water bodies and forests turn out to be the most important variables in mitigating LST variability, showing nonlinear effect curves. This study is one of the first to investigate the diurnal pattern of LST variations and its nonlinear association with built-environmental forms, offering insights into potential land use regulations for enhancing thermal comfort for urban residents.

URBAN GREEN SPACE AND PATHWAYS TO ADULT ASTHMA

Abstract ID: 1108.0.0.838.2024
Individual Paper Presentation

Peng Chen [Ohio State University] chen.10996@osu.edu, presenter
Bernadette Hanlon [The Ohio State University] hanlon.42@osu.edu

Urban green spaces (UGSs) play a crucial role in shaping the environmental and public health landscape of cities. This study utilizes a variety of data to investigate the complex interplay between neighborhood-level UGSs, air pollution, land surface temperature, and adult asthma emergency department visits in the Los Angeles metropolitan area. The data we examine include information on asthma, toxic releases, and PM2.5 from the CalEnviroScreen Database, land surface temperature from Landsat imagery, and high-resolution land cover data from EnviroAtlas. Using these data to determine links between UGS and asthma, we examine the interactions these

phenomena have not only with each other (Mueller et al., 2022), but also with air pollution and urban land surface temperature, both of which are known to also interact with each other especially as urban areas become hotter.

Previous studies note the role that UGS plays in helping to reduce urban heat (Grilo et al., 2020). Other studies note the ways that UGS helps reduce air pollution and asthma (e.g., Eisenman et al., 2019), although there is some debate around the direction of effects (Madaniyazi & Xerxes, 2021). In addition, UGS negatively impacts air pollution via its mediating effects on urban heat (Yang et al., 2023). This study builds on these studies by considering health effects and thus examining the various complex pathways UGS effects take in reducing incidences of adult asthma. As we identify in this study, there are both direct and indirect effects of UGS, and these effects vary depending on the racial and ethnic makeup of neighborhoods (e.g., Wolch, Byrne & Newell, 2014)

Using Structural Equation Modeling, we find that neighborhood level UGS directly impacts emergency room visits for adult asthma in both positive and negative ways. Grass cover at the census tract level has a positive relationship with adult asthma while tree cover has a negative relationship. UGS also indirectly impacts emergency room visits for adult asthma through varied pathway. One of the most substantial indirect impacts of land cover on asthma occurs through UGS's effects on land surface temperature. The asthma-reducing impact of UGS is enhanced by the fact that UGS also help to reduce land surface temperature. Significant disparities are noticed between majority White compared to majority People of Color (POC) tracts. More specifically, grasses are positively related to asthma and land surface temperature in POC tracts but not in White tracts. Trees have larger overall impacts on asthma in POC tracts, primarily due to their effects on toxic releases.

The study emphasizes the importance of considering the socio-ecological context across different ethnic communities when developing targeted strategies for UGS planning and asthma mitigation. The findings suggest that planners should prioritize tree cover among UGSs types in addressing public health concerns like asthma, particularly in POC communities. This is likely due to the combination of direct and indirect impacts, with those indirect impacts inclusive of the ways in which tree coverage helps reduce land surface temperature and air pollution. The findings can guide policymakers and urban planners in developing effective strategies to promote environmental justice and public health through the strategic use of urban green spaces.

URBAN MORPHOLOGY AFFECTS CARDIOVASCULAR DISEASE VIA HEAT AND AIR POLLUTION

Abstract ID: 1108.0.0.861.2024
Individual Paper Presentation

Junsik Kim [The University of Utah] profjunsik@gmail.com, presenter
Reid Ewing [University of Utah] ewing@arch.utah.edu
Alessandro Rigolon [The University of Utah] alessandro.rigolon@utah.edu
Andy Hong [University of Utah] a.hong@utah.edu

Introduction. Cardiovascular disease (CVD) is the leading cause of death in the U.S. and is affected by extreme heat and air pollution. Specifically, high temperatures increase heat-related illness (e.g., heart disease) and death. Also, air pollution contributes to increased illnesses such as asthma and cardiovascular disease. The relationship between urban morphology and climate characteristics, such as thermal environment and air pollution, has been studied extensively, focusing on the buildings' arrangement, density, height, volume, complexity, and number. However, studies have mostly analyzed the relationship between urban morphology and health by looking at walkability and physical activity promotion. Yet the indirect effect of 2D/3D building morphology on CVD via extreme heat and air pollution has not been thoroughly studied.

Research questions. We analyzed the direct and indirect effects of 2D/3D urban morphology on CVD morbidity via extreme heat and air pollution in Los Angeles County.

Methods. We conducted a Bayesian network model focusing on the census tracts in Los Angeles County's urbanized areas. We used data from 2015 to 2017 and considered the complex relationship and chain reaction between CVD morbidity, climate conditions, environmental characteristics, and socioeconomic factors. To model CVD morbidity, we used spatially modeled age-adjusted emergency department (ED) visits per 10,000 data from the State of California. For the 2D/3D building morphology, we calculated 11 variables considering previous morphology studies: mean building area/height/perimeter, building area/height/perimeter range, building area/perimeter/volume/number density, and Sky View Factor (SVF). For climate conditions, we calculated the median daytime Land Surface Temperature (LST) in summer from Landsat 8 and the median 550nm Aerosol Optical Depth (AOD) from MODIS using Google Earth Engine. For the environmental and socioeconomic characteristics, we considered land use, toxic releases from facilities, tree canopy ratio, traffic volume, geographical characteristics (elevation and distance to ocean), aging (65+), race and ethnicity, and various socioeconomic vulnerabilities.

Results. We found extreme heat (LST in the daytime summer) and air pollution (AOD) can directly increase CVD morbidity. Notably, even though increased building surface area can increase extreme heat, compact development with lower SVF in urban canyons can decrease CVD morbidity directly and indirectly by reducing extreme heat in LA County's urbanized area. Also, building morphology complexity and irregularity can reduce air pollution. In addition, the tree canopy cover can reduce temperature significantly, as well as indirectly reduce CVD morbidity. Surprisingly, the area with lower SVF showed higher tree canopy cover. Also, this result showed that socioeconomic characteristics and race and ethnicity are highly related to the selection of building morphology. In addition, we found clear environmental and climate conditions and CVD morbidity gaps by race and ethnicity, especially between White and Latinx. Through further analysis, we found that the worse environmental conditions (e.g., lower tree canopy cover) and built environment conditions (e.g., higher SVF, lower building height range) faced by

the Latinx population (compared to white populations) are linked with inequities in worse climate conditions (higher extreme heat and air pollution) and CVD morbidity.

Implications. This study provides essential information to stakeholders, policymakers, and planners in terms of the legitimacy and importance of smart growth, building morphology complexity and irregularity, and green infrastructure to mitigate climate risk (extreme heat and air pollution) and CVD morbidity. Also, this study shows that a significant gap in the built environment and environmental conditions by socioeconomic vulnerability and race and ethnicity can lead to climate and health inequity. Therefore, our findings suggest that planners should consider not only green infrastructure but also building morphology in the redevelopment initiatives to mitigate climate health risks and inequity, especially for underserved communities.

URBAN SPATIAL STRUCTURE AND AIR QUALITY IN THE UNITED STATES

Abstract ID: 1108.0.0.539.2024
Individual Paper Presentation

Steve Hankey [Virginia Polytechnic Institute and State University] hankey@vt.edu, presenter
Sajjad Abdollahpour [Virginia Polytechnic Institute and State University] sabdullahpur@vt.edu

Previous studies on the relationship between urban form and air quality: (1) report mixed results among specific aspects of urban form (e.g., urban expansion, form, or shape) and (2) use primarily cross-sectional approaches with a single year of data. This study takes advantage of a multi-decade, longitudinal approach to investigate the impact of urban spatial structure on population-weighted concentrations of PM2.5 and NO2. Based on fixed-effect regression models for 481 urban areas (UAs) in the United States spanning from 1990 to 2015, we found significant associations between various aspects of urban spatial structure and air quality after controlling for meteorological and socio-economic factors. Our results show that population density, compact urban form, circularity, and green space are associated with lower concentrations. Conversely, higher rates of urban expansion, industrial area, and polycentricity are associated with higher concentrations. For large cities (total population: 180,262,404), we found

that increasing key factors from each category (i.e., greenness, population density, compactness, circularity) by a modest 10% results in 10,387 (12,376) fewer deaths for PM2.5 (NO_2). We recommend that policymakers adopt comprehensive strategies to increase population density, compactness, and green spaces while slowing urban expansion to reduce the health burden of air quality in US cities.

URBAN TEXTURE AND HEAT RESILIENCE – MITIGATING EXTREME HEAT IN SEOUL

Abstract ID: 1108.0.0.323.2024
Individual Paper Presentation

Steven Jige Quan [Seoul National University] stevenchuan6656@gmail.com, presenter

As climate change intensifies, cities like Seoul face more frequent summer heatwaves, leading to significant surging energy and water demands and public health challenges. How to achieve better heat resilience becomes a major concern in urban planning and management. Numerous studies have delved into urban form factors and their relationship with urban heat island (UHI) effects. However, a gap exists in examining how UHI effects intensify during heatwaves, a crucial component when considering urban resilience. While some researchers have started exploring the relationship between urban form and heat resilience, their efforts often fall short due to a narrow interpretation of heat resilience or the coarse temporal scope of results, which is often attributed to limited satellite imagery data. This study aims to fill the research gaps by examining the relationship between urban form factors and heat resilience in Seoul in summer 2023, using data from 1,058 official weather stations. The study defines heat resilience by measuring UHI variances between heatwave and typical summer days and the recovery time post extreme heat events. Urban form factors are calculated using GIS, such as building density, tree canopy, impervious surface, and proximity to parks and rivers within a 500 m station radius. To draw meaningful and reliable conclusions, the study employs and compares spatial regression and spatially explicit gradient boosting decision trees models for the two heat resilience indicators. All the models are thoroughly interpreted, examining coefficients and feature significance to understand the impacts of urban form factors. Through partial dependence plots, this study further discusses linear and non-linear relationships between urban form and heat resilience. The findings promise to deepen our understanding of urban form's role in improving heat resilience during peak

summer heatwaves. They will also inform policymaking, steering Seoul and cities alike towards effective strategies to combat urban extreme heat.

URBAN TREE INVENTORIES, STAKEHOLDER MOBILIZATION, AND PLANNING PROCESSES

Abstract ID: 1108.0.0.785.2024
Individual Paper Presentation

Andrea Restrepo-Mieth [Rutgers University] andrea.rm@rutgers.edu, presenter

The link between spatial patterns and ecology is one that has kept environmental planners busy as they have sought to balance environmental, social, and economic conflicts (Campbell, 2016). Planners see land, air, and water as critical resources to be protected and managed through spatial planning processes. Similarly, conservation and the protection of biodiversity are seen by planners as actions to be integrated into broader work on spatial patterns (O'Neill et al., 2023). The potential for mutually beneficial engagements between conservation science and planning is highlighted in recent literature: Ecologists, particularly those working in or near urban areas, are increasingly called to prioritize cities, urban residents, community development, and human interests (Turo & Gardiner, 2020). These calls respond to increased awareness of the positive contribution that cities can have when it comes to regional biodiversity. Despite these positive developments, the historical animosity between conservation and development (Redford et al., 2008) has led many conservation organizations to undertake activities without actively engaging with communities or environmental planners. Failure to engage often leads to tense relations between conservation organizations and citizens on one hand, and disjointed actions between these organizations and urban planners.

This manuscript examines efforts by the researcher starting in May 2023 to bring together members of conservation organizations, local and provincial planners, and a group of community scientists to carry out an urban tree inventory. The research sought to pair community scientists and planners with members of conservation organizations to inventory the number, species, size, and health of trees growing in the municipality of Puerto Baquerizo Moreno, Galápagos, Ecuador. The findings can be used by planners and conservationists for risk management and conservation planning purposes, while the collection process creates spaces for conservation organizations to interact with urban planners and community members. This research seeks to understand if activities that bring together community members and conservation organizations, such as a tree inventory, help to improve relations among these actors and if these interactions translate into greater participation by conservation

organizations in broader urban environmental planning. Interviews prior to and after the census allowed me to analyze perceptions of conservationists by planners and community members and vice versa, and to assess the interest of these organizations in becoming more engaged in the planning process. Findings shed light on the diversity of difficulties that emerge when attempting to bring these actors together and the potential of perceived win-win activities, such as tree inventories, to help overcome these challenges.

The active participation of the community is crucial in strengthening resilience and identifying its needs. Although there is an ever-growing literature on planning for post-disaster recovery and resilience, studies that are designed with the active participation of community members to understand their perceived needs and solutions are still lacking. This is an important gap because disaster recovery is a multifaceted and time-sensitive process that evolves through multiple trajectories. While research has examined some of these aspects individually (such as through survey studies on housing reconstruction or business recovery), few studies conceptualize recovery through the nuanced perspective of disaster-affected communities themselves. Importantly, these studies underemphasize the role of community agency and capacity in the process of recovery. As a consequence of this, research and policy practices that follow from this research may overlook aspects of recovery important to the community itself or fail

to capitalize on recovery efforts of the community itself. PhotoVoice, as an emerging participatory action research methodology, holds the power to generate nuanced knowledge of disaster recovery through a self-empowerment perspective, thus leading to more community-informed recovery actions on ground.

This study utilizes data from a PhotoVoice project conducted in two communities in Puerto Rico, Comerio and Loiza that were significantly impacted by the 2017 hurricanes and subsequent disasters, such as Hurricanes Maria and Irma. The PhotoVoice project was funded by the National Science Foundation (NSF). It utilized an innovative community-based participatory research (CBPR) approach, which involved training of 24 community members through ten sessions on visual techniques and research ethics, capturing photographs in their respective communities, having group discussions on them, and showcasing these photos through community exhibits. There were 56 photographs (28 from each community) selected for the exhibits. These photos portrayed community residents' perceptions and experiences regarding disasters. The research team analyzed the photos, their captions, and narratives which listed community members' recommendations under the four stages of disaster management established by FEMA: Mitigation, Preparedness, Response, and Recovery. In addition, the team conducted an analysis of stakeholders targeted by community members to implement their recommendations specifically: (i) Citizens/Individuals, ii) NGOs/Community Organizations, iii) Government, iv) Businesses, v) Collaborative initiative. The community residents proposed 167 alternatives (84 from Loiza and 83 from Comerio) for the current situation addressing their needs or suggestions for enhancing the resilience of their communities. Most of these alternatives targeted the government, followed by citizens/individuals.

The initial findings from the study revealed that the alternatives proposed by the residents of Comerio and Loiza predominantly focused on mitigation, followed by recovery. The results highlight the communities' emphasis on reducing the impact of disasters and preventing them where feasible. The findings from this study have significant academic and policy implications. This study highlights the effectiveness of utilizing participatory methods such as photovoice to gather and incorporate community viewpoints into research. Finally, the results of this study will provide valuable perspectives for planners and policymakers to effectively allocate resources and prioritize initiatives that are better aligned with communities' perspectives.

WATERSIDE WELLNESS: RDD ANALYSIS OF COVID-19 OPENING-UP ON MENTAL HEALTH

Abstract ID: 1108.0.0.274.2024
Individual Paper Presentation

Longfeng Wu [Peking University] longfengwu@outlook.com, presenter

During the Covid-19 pandemic, it was observed that increased exposure to water-bodies had a positive impact on residents' mental health levels, particularly in densely populated urban areas implementing lockdown measures. However, limited research has explored the effects during the transition from strict lockdown measures to reopening in urban settings and the buffering role of water-bodies within this context. In this study, a Regression Discontinuity Design (RDD) was employed, utilizing a unique dataset (N=2545) from two major Chinese cities, Beijing and Shanghai, to investigate how the conclusion of the "zero-Covid" policy influenced residents' mental health and, crucially, how exposure to water-bodies mitigated any adverse effects on mental health. Additionally, subgroup analyses were conducted to compare how the effects of ending the "zero-Covid" policy on residents' mental health varied based on exposures/accesses to various water-bodies. The findings confirm that the conclusion of the "zero-Covid" policy significantly promotes residents' mental health, as measured by CES-D scores ($p<0.05$). Residents living within 400-800 meters from water-bodies, as opposed to those in closer proximity (within 400 meters), experience mental health benefits. Visual exposure to water-bodies through residential windows significantly enhances mental health (CES-D scores) compared to residences with limited visual exposure. Moreover, compared to those without exposure to high-quality water-bodies, individuals with exposure to high-quality water-bodies significantly elevate their self-assessed happiness during this period. These findings underscore the crucial role of urban water-bodies in buffering the psychological impacts of major policy changes during the Covid-19 pandemic, highlighting their significance in urban planning and public health strategies.

WHERE DID THE MODEL FAIL? EXPLORE THE MODEL IN LOS ANGELES COUNTY

Abstract ID: 1108.0.0.403.2024
Individual Paper Presentation

Yefu Chen [University of Texas Austin] chenyf56@utexas.edu, presenter
Junfeng Jiao [The University of Texas at Austin] jjiao@austin.utexas.edu

Previous studies have proven that exposure to air pollution can have various short-term and long-term effects on individuals' health, such as respiratory and cardiovascular problems; however, due to the limitations in data collecting techniques, it was hard for previous studies to quantify the exposure. Among the air pollutants, particulate matter (PM) 2.5 and 10, made up of tiny particles and liquid droplets suspended in the air, have raised concerns among researchers and practitioners. Although there are demands of studying the factors on PM concentration, previous studies had to depend on the regional air pollution sensors, which may not precisely represent the actual PM exposure to the individuals.

Recently, low-cost air pollution sensors have become increasingly popular and have been used in research and practical projects due to their affordability and ease of use. To date, studies have utilized data from low-cost air sensors to explore the impact of the built environment and public transit on PM concentrations and predict the concentrations in places without sensors, while few explored the disparities in the model performance.

In response to the demand for street-level air pollution studies and research gaps, this study explores the impacts of the built environment and public transit services on average PM 2.5 concentrations through interpretable machine-learning approaches based on the data from Purple Air. There are two research questions: What are the roles of the built environment and public transit on PM 2.5 and 10 concentrations? Where does the best-fit mode perform the worst? Choosing Los Angeles County as the study area, in the analysis, we first developed a data collection. The dependent variables are the average PM 2.5 concentration in the morning, afternoon, evening, and night. The independent variables are land use variables and transportation variables. The control variables include meteorology factors, such as temperature, wind speed, and wind direction. Based on the final data collection, we tested five machine-learning approaches and identified the best-fit model based on the root-mean-square deviation (RMSE). Then, we utilized an interpretable framework to visualize the model results. Last but not least, we calculated the gap between the actual value and the predicted value of each observation (i.e., sensors) and identified those where the gap is significant. Through exploring the sociodemographic and economic situations of the census block groups where the sensors with significant gaps are, we concluded the disparities in model performance.

In the results, first, the X-gradient boosting decision tree model performed best. Based on this model, we developed four sub-models to explore the impacts of land use and public transit services on PM2.5 concentrations at different times. In addition, we found that the temporal disparities in important predictors affecting PM2.5 concentration are significant. For instance, the findings indicate that the distance to the closest public transit stops, the traffic flow of the nearest street, and the distance to the closest commercial land use can significantly be correlated with high PM2.5 concentrations, and the impacts of traffic flow and public transit reach peak in the afternoon and evening. Also, distance to the closest land use turns out to be an important predictor in the morning and evening, while it is insignificant in other periods. Third, we noted that most of the sensors with significant gaps gathered in the neighborhood with low-income (below the regional average) populations.

These findings could have three implications for the researchers and practitioners. First, the interpretable machine learning framework should be worth using in future studies due to its accuracy. Second, the temporal disparities

are significant, so related improvements, such as increasing humidity near the transit stations during the peak hour, should be on the list of actions. Third, the performance in low-income neighborhoods could be tricky, and there should be more sensors equipped in these neighborhoods to collect extra data.

WILL THE HEAT WAVE DETERMINE WHERE YOU LIVE?

Abstract ID: 1108.0.0.452.2024
Individual Paper Presentation

Youhyun Kim [Pusan National University] youhuen907@pusan.ac.kr, presenter
Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

The ongoing climate change and climate crisis not only has negative impacts on the environment, such as ecosystem destruction, but also poses threats to sustainable human life, such as economic activities. In addition, reports of excess mortality due to high temperatures have raised the need for research on socioeconomically vulnerable populations (Basu & Samet, 2002; Barreca, 2012, Ying et al., 2017). Previous studies have identified three main vulnerable populations to climate change: infants, the elderly, and outdoor workers (Patz et al., 2000; Diaz et al., 2002).

Therefore, the research questions and purpose of this study are as follows. Does heat waves exacerbate residential segregation as an influencing factor? The purpose of this study is to predict and identify residential segregation by vulnerable groups in Korea in the future , and the study consists of three steps. First, we estimate the population by future heat wave vulnerability. Second, based on the estimated population of vulnerable groups, we predict and identify the residential distribution of vulnerable groups. Third, we derive the spatial separation index of the future heat wave vulnerable population.

The research materials and methods used in this study are described below. The population of vulnerable groups in future heat waves is estimated using SHAP, an explainable artificial intelligence algorithm. SHAP is a type of

explainable artificial intelligence algorithm developed to overcome the black box phenomenon of machine learning. The spatial segregation of the future heat wave vulnerable population is identified by applying the dissimilarity index, theil index, and interaction index to identify the characteristics of equality, exposure, concentration, and clustering based on Massey and Danton's (1988) discussion of residential segregation.

As a result of the study, the number of elderly people in Korea in 2050 is predicted to increase by 40% compared to 2024. We found that the exposure to heat is 20% higher and the proportion of green spaces that can mitigate heat is 30% lower in areas where the elderly live than in other areas, confirming the existence of spatial segregation in heat-prone areas. In contrast to the results for the elderly population, the residence of infants and the working-age population was not associated with heat-prone areas.

This finding of residential segregation in response to heat waves may help explain how vulnerable populations are systematically excluded from accessing urban living benefits and services due to climate change. The findings also suggest that Korea should take measures to mitigate heat waves for the elderly population in the future, and that strategies for the elderly population can help build sustainable and socially inclusive cities.

ADAPTATION DILEMMA: TO MIGRATE OR ADAPT IN-SITU WHEN BOTH ARE MALADAPTIVE?

Abstract ID: 1110.0.0.237.2024
Research-in-Motion (RiM)

Prakriti Shukla [University of Michigan] prakriti@umich.edu, presenting author

Motivation: The world's deltas are facing a planning dilemma — whether to adapt on-site or migrate out. But in the Indian Sundarban, both options are maladaptive. This is because funder-driven theories of climate adaptation have increased vulnerabilities they aimed to reduce. This is maladaptation, an "[adaptative] action result[ing] in an undesirable and unintended outcome(s)" (Magnan, 2016, p.649). Adaptive actions can become maladaptive during exceptional situations, over time, and across space and social groups. With climate change, exceptional situations like epidemics and floods are becoming common, and with that, the multifold precarity of the Sundarbans archipelago — rising sea levels, salinizing drinking water and soil, recurrent cyclones, and subsequent loss in farming — increase the risk of maladaptation. For the 7.5 million people in Indian and Bangladeshi Sundarbans and 500 million in the world's deltas, it is urgent to understand how adaptive actions become maladaptive, especially in the Global South context.

Problem Statement: When suitable adaptation actions are inaccessible, people rely on their social networks to find and adopt an alternative. Thus, studying the social network of Sundarban's vulnerable people is vital to examine maladaptation on site and in migration. This network includes friends, family, grassroots organizations, government agencies, forest officials, and health workers. Adaptation literature disproportionately focuses on positive relations in social networks to explain adaptation (Offer, 2021). These relations are built on trust, endorsement, and reciprocal exchanges of resources, risk, and information (Adger, 2003). However, there is a dearth of theorization on negative relations built on distrust, opposition, and unilaterally beneficial exchanges resulting in strained or severed relations. Thus, I ask: How do negative relations and their negative outcomes in a network shape maladaptation in the Global South context? How do these relations and outcomes differ in in-situ maladaptation versus maladaptive migration?

Methodology: To address lack of theorization, I am using the grounded theory approach to iteratively identify patterns of negative relations and maladaptation. I am using participant observation and semi-structured interviews to collect data. The interview will involve completing sociograms, a diagram, used to visually mark the relationship between the research participant and various actors in their network. The interview and sociogram together will help us understand how the interviewees learned about various adaptation strategies, gained access to them, and how unavailability and inaccessibility to different strategies may lead to adopting strategies that are maladaptive in the long run.

Findings: The research aims to explore four outcomes: negative and positive outcomes of positive relations and negative relations. From my preliminary research, patterns of negative relationship between fisherfolks and forest officers in Sundarban emerge. The officers exercise undue control over boat licenses required to enter mangrove forests for fishing. The negative outcome of such a relationship is that years of mistrust and power disparity could prevent a collaborative effort for mangrove conservation and improving livelihood security. Similarly, an example of positive outcomes of a positive relationship is finding alternative livelihoods. Since jobs are a scarce resource, finding an alternative livelihood for migrants depends on the willingness of friends and relatives to share this valuable information (Louise, 2023). A negative outcome of a positive relationship is that migrant workers often get

tipped about and accept low-paying jobs in precarious sectors where their friends and relatives work (Louise, 2023?).
Relevance to Planning Scholarship and Practice: By examining how negative relations shape maladaptation in-situ and ex-situ in the Global South context, this research brings a multidisciplinary lens to study migration, adaptation, and network analysis, thereby theoretically advancing these fields. The research will also contribute to understanding maladaptation at the intersection of gender, caste, and indigenous identities. Additionally, the research findings will inform policy decisions about in-situ adaptation and planned relocations, helping the Indian Sundarban and other deltas plan better.

ADVANCING THE NATURE ECONOMY LENS

Abstract ID: 1110.0.0.1167.2024
Research-in-Motion (RiM)

Catherine Ashcraft [University of New Hampshire] catherine.ashcraft@unh.edu, presenting author
Shannon Rogers [University of New Hampshire] shannon.rogers@unh.edu

In this research we are further developing a “nature economy” lens to understand the many connections among the various aspects of nature and the ways that local economies function, with a focus on improving access to nature and fostering social justice and climate resilience. Access to the natural environment is critical for the economic, social and ecological resilience of communities. For example, nature contributes to community and economic development through spaces for outdoor recreation, outdoor seating and dining, by providing cleaner air and shade to mitigate high heat events, by absorbing and storing water to attenuate flooding and drought, by creating jobs, attracting workers and increasing youth retention (Rogers et al., In press). However, natural spaces are not always accessible or inclusive, particularly for vulnerable communities in underserved communities. Investments in the natural environment do not necessarily expand benefits for communities and local economies but, instead, can be accompanied by gentrification and exacerbation of conflicts over natural resource use and growth management, especially when professionals and municipal staff working in economic development and environmental conservation work separately. Transportation, infrastructure, cost, and lack of knowledge are examples of barriers to accessing nature that can be a problem even when people live near healthy, natural spaces

(Crytzer, 2023).

This research builds on qualitative, case study-based engaged scholarship by the Nature Economy Collaborative, a partnership based at the University of New Hampshire involving state and local collaborators, which explores the economic benefits of natural assets and efforts to sustainably leverage natural resources for positive economic impact. Existing case studies have focused on how the City of Rochester, New Hampshire is integrating nature access into community recreation and economic development, economic valuation studies to understand residents' willing to pay to mitigate PFAS contamination, and how outdoor recreation career pathway programs can best serve youth and workforce development (Rogers et al., In press). In this next research direction, we integrate existing frameworks for analyzing natural resource and environmental conservation (e.g., the IAD framework (Schlager and Villamayor-Tomas, 2023), community and economic development (French, 2022), and just climate adaptation (Malloy & Ashcraft, 2020). Through qualitative and narrative case studies in New Hampshire we aim to better develop the nature economy as a research framework and set of community action tools for shaping policy and planning.

AN ENVIRONMENTALLY JUST GOVERNANCE OF INFORMAL SETTLEMENTS IN BRAZIL

Abstract ID: 1110.0.0.726.2024
Research-in-Motion (RiM)

Luisa Duarte Milani [university of toronto] l.duartemilani@mail.utoronto.ca, presenting author

In São Paulo, Brazil, many of its nearly 12 million people live in informal settlements (i.e. slums) located in areas at risk of floods or landslides. Living in slums in environmentally risky sites doubly victimizes these residents; they are victims of environmental risks and are threatened with forced displacement by policies seeking to improve their safety and protect the environment. This creates a well-publicized conflict between two essential human rights; the right to housing and a clean environment (Maricato, 2003). Although research about the conflict between housing and the environment in the Global South has shown the state as a key actor in producing and reproducing

injustices, mainly through informality (Roy, 2016), planners need to consider other actors. Planners can move away from understanding the state as a coherent actor by using the concept of governance – referring to the networks between separate state and non-state actors (Haid & Hilbrandt, 2019). This way, also understand the specific policy and governance mechanisms that create and maintain environmental injustices.

This research focuses on São Paulo as a quintessential example of a Global South city where informal housing conflicts with the environment. It aims to identify the multiple actors involved in creating and maintaining this conflict and identify possible solutions by exploring the history of informal occupation and urban policies in the city. Environmental Justice (EJ) theories pose that minorities and marginalized groups across the world are disproportionately impacted by environmental issues, and suggest that these injustices are historically (re)produced through policies and governance practices involving state and non-state actors (Corburn, 2017). Insurgent citizenship theories refer to the practices through which informal dwellers contest their exclusion from the city (Holston, 2009). By bringing together these frameworks and the concept of governance, this research moves away from narrow explanations claiming that informal settlements are located in areas of environmental risk only because of neglect from governments. This way, this research asks: How does governance introduce conflicts between the right to housing and a clean environment in cities with a high concentration of informal settlements? How can planning reconcile the tradeoffs between citizens' right to housing and the maintenance of healthy urban environments?

To understand how trade-offs between informal settlements and environmental protection were historically resolved, content analysis is used to analyze urban policies since the 1960s – when informal settlements became common in São Paulo – and news articles discussing the informal occupation and environmental risks in the city. Semi-structured interviews with actors involved in environmental protection and those involved in informal settlement governance, such as city staff, public prosecutors, NGO staff, and social movement leaders, help the understanding of how approaches to environmental protection engage with and address the issue of the right to housing, the practical challenges involved, and the outcomes of recent efforts. Visits to informal settlements and conversations with residents also help to understand their experiences of injustices and how these are being addressed through new planning interventions. Taken together, the policy reviews, interviews, and field visits will help assess how environmental injustices have been addressed over time (or not) and how approaches to environmental protection and the right to housing have evolved, even in contradictory ways.

Emerging approaches to environmental protection and climate adaptation often ignore informal citizens' relationships to their housing and environment in the city, reproducing previous inequalities. The approach taken here encourages a more nuanced understanding of how environmental injustices are (re)produced, contributing to advancing EJ research. In a practical sense, understanding how the different actors and specific policies interact to reproduce spatial injustices will help identify target areas for future policy and points to improve in current policies.

CLIMATE CHANGE RESILIENT DEVELOPMENT: HOW TO INTEGRATE NATURAL FEATURES

Abstract ID: 1110.0.0.155.2024
Research-in-Motion (RiM)

Adam Skoyles [University of Waterloo] askoyles@uwaterloo.ca, presenting author
Michael Drescher [University of Waterloo] mdresche@uwaterloo.ca

For municipalities to balance their plans of developing sustainably with the need for housing, they are increasingly encouraging increased density and intensification to reduce urban sprawl and mitigate greenhouse gas (GHG) emissions. As a result, many city governments are concerned with balancing natural features, like trees and wetlands, with the demand for built up infrastructure, like housing. Maintaining and restoring these natural features in urban areas is critical to not only prevent the loss of valuable carbon stocks, but also to improve urban sustainability by helping cities adapt to a changing climate (McGovern & Pasher, 2016). However, a general inflexibility in governance combined with the relative invisibility of the benefits that natural features provide often results in creating incentives to convert these ecosystems into built infrastructure (Kabisch et al., 2016). Due to the widespread reliance on private industry for development, the choices of private land developers will play a significant role in shaping the structure of new residential developments (Göçmen, 2014). Creating incentives for developers to include more natural features in their site plans could have a significant impact on helping cities reach their goals of mitigating and adapting to climate change (Kabisch et al., 2016). Some developers have already expressed a desire to be able to assess the carbon storage potential of natural features so they can get appropriate credit for mitigating GHG emissions in the growing carbon market (Girardin et al., 2021). It is therefore critical to understand how emerging tools which assess the climate change benefits of natural features can be effectively designed and implemented to make them appealing to key stakeholders and facilitate their integration in the residential development planning process.

Through qualitative coding of interviews with municipal planners and private land developers across Ontario, Canada, our research demonstrates how these stakeholders foresee themselves using these types of tools and what they perceive the essential characteristics of these tools to be. Furthermore, the interviews informed the perceived barriers to using tools that quantify the role of natural features in combatting climate change in residential development, and what is perceived to help circumvent those barriers. This study informs researchers and practitioners how they can develop and implement tools to assess the benefits of natural features and how that information is likely to be incorporated into decision making during the planning process. By helping inform the development of acceptable tools or policies that incentivize private developers to incorporate natural features into residential development, this research can help communities reach their goals of mitigating climate change and adapting to its consequences.

CLUSTERING PARKS BASED ON THE MANAGEMENT PRACTICE: A CASE STUDY OF SEOUL

Abstract ID: 1110.0.0.712.2024
Research-in-Motion (RiM)

Jong hyun Lee [Seoul National University] hyun223920@snu.ac.kr, presenting author
Heeyeun Yoon [Seoul National University] hyyoon@snu.ac.kr

Urban parks are essential for sustaining healthy and lively environment for citizens. While it is imperative to procure parks in good quality and quantity, it is equally important to maintain those spaces. Neglecting park maintenance can lead to poor vegetation growth and safety hazards. For example, failure of tree branches and trunks can pose dangers to pedestrians, even resulting in fatalities (Cavalari et al., 2024). This neglect may decrease park visitation over time.

Managing parks is the responsibility of the district office, and the level of maintenance varies depending on the allocated budget. Therefore, evaluating the current state of park management, typically conducted through field surveys, is crucial. However, due to budget and time constraints, experts cannot directly assess all trees and find which parks should be managed. Thus, developing remote sensing techniques to identify parks requiring management is crucial.

Parks are complex environments that feature a range of amenities, species of trees, and other unique characteristics. Effective evaluation of the management status of these spaces requires adaptive strategies that consider the specific features of each element. Therefore, clustering parks based on feature characteristics can significantly boost efficiency. Numerous studies have undertaken the task of clustering parks by analyzing both internal and external factors, commonly, including park size, area of green space, proximity to urban centers, and available amenities (Brown et al., 2018; Nor & Abdullah, 2019).

Unlike such static factors, plants including trees and ground covers constantly change over time and seasons. Some species, such as eucalyptus and platanus, grow faster than others (Xu et al., 2024). However, studies clustering parks based on the temporal changes of trees have not been frequently conducted. Clustering parks with similar arboreal change patterns could significantly improve the management efficiency of trees within these spaces. For instance, maintenance practices like pruning and replanting play a vital role in preserving the visual appeal and safety of urban parks. Therefore, it's essential to cluster parks with a particular emphasis on tree management practices and determine the timing of the latest maintenance activities for each park.

For such purpose, Normalized Difference Vegetation Index (NDVI), extracted from satellite images is a widely used indicator of vegetation vigor. Although it has been studied for identifying tree species and monitoring vegetation over large areas, its potential for park management has not been explored (Hwang et al., 2022; Xu et al., 2024). NDVI within parks demonstrates annual cyclic patterns and long-term trends over time corresponding to tree growth. Thus, analyzing NDVI time series enables us to understand seasonal changes, yearly periodicity, and average NDVI over 10 years or more.

Against this backdrop, this study aims to cluster parks for the purpose of park management. By utilizing Landsat satellite imagery, we conduct time-series clustering of NDVI trajectory, considering seasonal changes and trends, for park clustering. We can then identify the dominant tree species of parks (deciduous versus evergreen) and the average tree density, both of which are crucial factors affecting management practices and the level of care needed. Additionally, detecting turning points in NDVI trends may signal tree management activities, such as pruning, which result in a temporary decline in NDVI. The study site is Seoul, which contains the highest number of neighborhood parks in South Korea. We utilize the neighborhood parks established before 2014 and conduct time-series clustering from 2014 to 2023.

The findings from this investigation will assist in systematically clustering parks to enhance the efficiency of tree management and identify parks that require intervention due to extended neglect. Ultimately, this contributes to the creation of safer, more enjoyable park spaces that fulfill their intended roles for the community.

COMMUNITY DECISION MAKING IN AN EXTREME CHESAPEAKE BAY COASTAL ENVIRONMENT

Abstract ID: 1110.0.0.1174.2024
Research-in-Motion (RiM)

Lincoln Lewis [University of Virginia] sxz8wg@virginia.edu, presenting author

This Research in Motion (RiM) presentation considers how the Town of Tangier, Virginia as a small island community in the Chesapeake Bay manages change when facing extreme environmental pressures. As the last

inhabited island in Virginia's portion of the bay, the residents of the isolated community still maintain the original Cornish English dialect of the 17th century settlers. The island's historic working landscape of watermen, or sole proprietors catching fish, mollusks, and crabs, are economically dependent on the surrounding natural environment and the bounty of the bay (Lewis and Packwood 2023). However, the island faces climate change's increased impacts of sea level rise and storm intensity which are leading to greater wave action and coastal erosion. According to the U.S. Army Corps of Engineers, between 1850 and 2015 the island has lost more than 66 percent of its land area (Schulte, Dridge, and Hudgins 2015). Tangier once had more than 1,200 residents, however its population is plummeting and now is less than 300. Considering how the town is facing such extreme impacts of climate change, the state-mandated Comprehensive Plan was only last updated two decades ago due to limited local capacity and resources. Currently, planning knowledge is nascent about how local governments with limited capacity and resources engage their constituents and make regulatory planning decisions when confronting extreme environmental impacts, including accelerated climate change. A better understanding in planning scholarship is needed of how local jurisdictions make coastal planning decisions. This is important due to nearly forty percent of the United States' population living in coastal counties according to the United States 2020 Decennial Census (excluding Alaska). Because of this, the RiM project is working to fill the knowledge gap by recognizing the long environmental history of the island, participating in local comprehensive plan making, and considering necessary systems change for the island's survival or managed retreat. The presentation will focus on the project's research methods and researcher positionality due to Tangier's context. For the plan making methods, Participatory Action Research (Kemmis and McTaggart 2005) is being used to assist the town to update its Comprehensive Plan. And local government coding methods by Milz (2018) are revealing the town's decision-making processes regarding key planning strategies, including climate adaptation, community engagement, land use, emergency preparedness, and resiliency. Considering the project context, the researcher's positionality is especially important due to bringing necessary expertise to the jurisdiction and facilitating the plan making process. The RiM presentation will consider the values and ethics needing to be weighed by the planner (Brooks 2002) in comparison to the residents' rejecting the term climate change yet acknowledging the significant erosion happening and other contributing environmental factors. These important considerations factor into resident views, and eventually local government decisions, of whether to adapt or retreat. Findings of the research most relevant to planning scholarship inform community engagement approaches and planners' roles for environmental justice and systems change in low-capacity coastal contexts.

COMPARING PARTICIPATORY COMMUNITY RELOCATION IN POST-HAIYAN REBUILDING

Abstract ID: 1110.0.0.310.2024
Research-in-Motion (RiM)

Kanako Iuchi [Tohoku University- IRIDeS] iuchi@tohoku.ac.jp, presenting author

In post-disaster settings, participation is considered critical to foster better information flows, novel ideas, and a sense of ownership (Hamideh, 2020). Studies find the same with relocating communities after sudden- and on-set disasters; however, research examining how participation works in governance on community relocation – a complex network of stakeholders engaging themselves into the goals of the governmental relocation program through knowledge production (Rogers and Wilmsen, 2020) – is limited, thereby highlighting the importance of examining actual cases on the ground (Ngulube et al., 2024). Because there is as-yet limited understanding about governance, institutional mechanisms and planning procedures to relocate communities successfully by involving members of the community (Bronen, 2015), exploring and cross-comparing post-disaster relocation projects that aim for a participatory process will make an important scholarly and practical contribution to the field of post-disaster planning.

This paper tracks the 10-year process of residents' participation and involvement at three NGO-led relocation sites in Tacloban City of the Philippines after Typhoon Haiyan in 2013. Out of 30 relocation projects that have evolved in the city over the years, NGOs have led seven of them, and the three sites included in this study are particularly renowned for aiming at inclusive processes. The number of relocating households was also significantly large for the selected sites, varying from 400 to 880 (Tacloban City, 2024). This research, through site observation, aims to capture 1) variations of governance for participatory relocation, 2) timelines resulting from different governance, and 3) residents' satisfaction of living in the new sites by measuring recovery levels. Ultimately, the research intends to understand how different participatory processes create distinctive timelines and foster unique outcomes. Other important factors impacting the residents' satisfaction level will also be documented.

The research is part of a study that has been tracking community relocation longitudinally since 2014. For this paper, the central analysis uses interview data collected during 10 days of fieldwork in 2024. It included interviews with community leaders who have overseen site developments as well as residents who participated in relocation. Four group interviews took place with community representatives – one each for three sites and one for former community chairpersons – and a total of 42 interviews with residents in the three relocation sites. Questions covered overall site development processes, relocation paths, participation in relocation, and residents' satisfaction levels post-relocation. Information and understanding gained from relocation projects over the past ten years supplement in-depth site descriptions and interview interpretations.

Initial findings suggest that the ways in which participation is defined vary, ranging from participation in construction work and construction management at relocation sites to simply attending various community development trainings. Each site had a different timeline for resident participation, speed of site development, and level of resident engagement due to different leadership and site specifications. Residents with direct involvement

and longer hours of engagement in site development fostered a greater sense of ownership, while residents with lower levels of involvement and shorter hours of mobilization resulted in residents with lower levels of expectations. However, the level of engagement during site development did not ensure the level of resident satisfaction post-relocation; rather, satisfaction level depended on whether the dynamics of the stakeholders' making decisions about resettlement sites – in other words, the governance – were sustained. This was evident from one of the sites that was considered successful with high community participation prior to relocation; it turned out to be the least satisfactory site, discouraging residents from proactively participating in community activities in the long term. The finding suggests that inconsistencies in governance leave residents feeling unsatisfied at the end of relocation despite the amount of time invested in site development.

CULTURAL STEWARDSHIP FOR RESILIENCE IN AN ERA OF RAPID ENVIRONMENTAL CHANGE

Abstract ID: 1110.0.0.669.2024
Research-in-Motion (RiM)

Renia Ehrenfeucht [University of New Mexico] rehrenfeucht@unm.edu, presenting author
Marla Nelson [University of New Orleans] mnelson@uno.edu
Laura Solitare [Texas Southern University] laura.solitare@tsu.edu
Siyu Yu [Texas A&M University] syu@arch.tamu.edu
Traci Birch [Louisiana State University] tbirch@lsu.edu

Cultural stewards and culture bearers actively work to preserve and adapt cultural practices and lifeways along with tangible heritage and landscapes in the face of climate and other community change (Rushfield, 2021). Residents recognize multiple and intersecting forces alongside climate impacts that have shaped their communities through time, and these histories determine adaptation action and resiliency (Knapp et al, 2020: Nelson et al 2020). In the United States, resources are being deployed to facilitate energy transition, make communities more resilient to extreme weather, slow climate-related change, as well as to reflect changing demographics. Although these

initiatives emphasize the need to pursue equity (i.e. Justice40 Initiative), and documents often mention the need to respect and preserve cultural diversity (i.e. Department of Interior's Climate Action Plan), much climate planning fails to address culture and cultural practices (Rumbach et al, 2020). Meanwhile, formal cultural planning often fails to align with residents' lifeways and priorities despite the ways these practices can enhance well-being and resilience (Birch, Nelson and Ehrenfeucht, 2024). In some circumstances, policy and programs create barriers for community cultural stewards who are facilitating change in ways that reflects their values and histories (Nelson et al, 2020).

This project addresses two questions. How are community-based cultural stewards adapting and preserving community cultures at the confluence of environmental and economic change? How do community-based cultural stewards interact with formal institutions in these processes (such as governmental agencies, planning processes, plans, and policy)? The presentation draws on 20 semi structured interviews with cultural resource stewards in New Mexico, Texas and Louisiana alongside an analysis of co-stewardship and power sharing for cultural resources in planning documents. Our preliminary findings suggest that cultural stewards engage in a range of actions to preserve and adapt meaningful tangible and intangible heritage while plans include little or vague commitment to co-stewardship even when cultural resource management is a priority. Fundamental assumptions about property and land tenure, and policies and programs that fail to recognize local knowledge, informal land and water-based ties, livelihoods and cultural practices, create barriers for cultural stewards who cannot access resources needed to assist in resilient transitions.

This study contributes to both planning theory and practice. Because cultures are nuanced and specific, extending far beyond the few tangible resources and landscapes formally protected by governmental agencies, this project uses a grounded theory approach to envision local cultural management and adaptation as communities face rapid change that includes migration and place-based environmental and cultural shifts. This is occurring at a moment when agencies at different scales—from local governments to the federal Departments of the Interior and Agriculture—are developing pathways for co-stewardship for both culturally respectful and pragmatic reasons. This project explores grassroots cultural adaptation in conjunction with analysis of planning and policy documents to better align what cultural stewards need to meet their and public objectives and highlight innovation and potential in collaborative policy and program development.

DISAGGREGATED LANDSCAPE REVEALS HETEROGENEOUS LEGACIES OF REDLINING IN HEAT

Abstract ID: April 8th 2024, 7:31 pm

Research-in-Motion (RiM)

Meen Chel Jung [Yonsei University] jungmc@yonsei.ac.kr, presenting author

Uneven urban temperature highlights the role of landscape attributes for better climate equity. Heterogeneity in urban landscapes can significantly affect land surface temperature variation. Therefore, social drivers that contribute to landscape heterogeneity should be considered when analyzing disparities in urban heat exposure. In this study, historical redlining is considered a major social driver that still influences the contemporary landscape of US cities. However, although redlining contributes to the overall heterogeneity of the landscape within a city, it does not sufficiently account for surface variation within the Home Owners' Loan Corporation (HOLC) redlining grade. To capture historical HOLC impacts and contemporary landscape features, I additionally use two raster land cover datasets at different resolutions: Landsat-based National Land Cover Database (NLCD) 2019 and Sentinel-based WorldCover 2020. By using these datasets and HOLC grades, I explore the influence of landscape heterogeneity on tree canopy cooling to highlight the significance of considering disaggregated landscape information in developing more equitable heat mitigation strategies.

This research assumes that the influence of redlining policies persists in shaping contemporary urban landscapes but that redlining alone cannot sufficiently account for the observed variations within these landscapes. Based on the assumption, I set three research hypotheses: (1) Disaggregated landscape heterogeneity reveals a more systematically structured pattern in land surface temperature, (2) Disaggregated landscape heterogeneity produces a statistically better model estimating canopy cooling effects, and (3) Disaggregated landscape heterogeneity unveils variance in canopy cooling effects. I select three major Northeast region US cities for this study: Boston, Massachusetts; New York, New York; and Philadelphia, Pennsylvania. The analytical units are grid cells (30 m × 30 m) from Landsat-based data, and only grid cells classified as one of four developed land cover classes in NLCD 2019 and intersected with the HOLC-graded neighborhoods are used in this study. I first create three HOLC-based groups to reflect historical redlining information and contemporary urban landscape features captured at different resolutions, each associated with temperature levels: HOLC group consisting of four classes, Landsat–HOLC group of 16 classes, and Sentinel–HOLC group of 20 classes. Then, I use boxplots to explore the distribution of land surface temperature based on HOLC-based groups. Finally, I develop three mixed-effects models for each city using HOLC-based groups as a group factor.

The boxplots show that all three cities demonstrate a consistent pattern of rising land surface temperatures as the HOLC grade changes from "A" to "D," but the hidden patterns are revealed by breaking down HOLC grades according to degrees of development. In the statistical models, mixed-effects models that consider more detailed landscape information are statistically better. In addition, these models show heterogeneous canopy cooling magnitudes. Overall, the findings of this study support three research hypotheses and indicate the benefits of disaggregating the impacts of redlining in understanding unequal heat exposure. Urban planners and city governments should consider the more comprehensive micro-level landscape features for better climate equity.

DO REMOTE WORKERS LESSEN THEIR CARBON FOOTPRINT WHEN THEY MOVE?

Abstract ID: 1110.0.0.187.2024
Research-in-Motion (RiM)

Andre Comandon [University of Southern California] comandon@usc.edu, presenting author
Bonnie Wang [University of Southern California] wangbonn@usc.edu
Seva Rodnyansky [Occidental College] srodnyansky@oxy.edu
Marlon Boarnet [University of Southern California] boarnet@usc.edu

Remote work has an ambiguous relationship to household greenhouse gas emissions and can undermine cities' sustainability targets. The reduction in car-related emissions from commuting less often can be offset by other types of driving and more intensive home energy use (Wu et al., 2024). Remote work has also decoupled residential and work locations, allowing many to move farther from their place of work and to commute much longer distances when they do commute (Akan et al., 2024). Both phenomena – increased home-based energy use and living farther from urban centers – reinforced trends toward greater long-distance commuting and exurban growth that work against achieving more efficient cities and meeting greenhouse gas emissions reduction targets set under the 2015 Paris Agreement (Goldstein, 2020).

This project uses a nationally representative survey to examine how neighborhood, housing, and transportation changes are associated with household-level emissions among people who moved and work under different regimes (full-time remote to full-time in-person). Existing research on migration linked to remote working has found clear aggregate patterns that show people moving from city centers to suburbs and exurbs (usually of the same metropolitan area) (Ramani & Bloom, 2021), and we know that the people able to work remotely are far more likely to be higher wage workers with college degrees (Dingel & Neiman, 2020). However, it is unclear how much people have changed their lifestyles entirely. Moving is expensive. Transit-dependent people and renters generally have the lowest carbon footprint and are unlikely to be the main drivers of migration. Through this research, we can more closely compare people's living arrangements before and after switching to remote work and better understand who is driving emissions changes.

The survey includes over 2200 respondents. IPSOS, a market research firm, administered the survey using their proprietary KnowledgePanel, a pre-selected panel of respondents that is weighted to be nationally representative. Respondents were selected to ensure proportional representation of people along two dimensions: moved or not and worked remotely or not. This selection criterion was implemented to study the joint effect of moving and working remotely. We examine changes in housing, location, and car use to ascertain if people who can work remotely significantly alter their carbon footprint. Each respondent reported their ZIP Code of residence in March 2020 and at the time of the survey in September 2023, where they worked, the size of their home, and the kind of car they drove most often. We link the survey data to the EPA Fuel Economy database to estimate transportation-related emissions and the database Goldstein et al. (2020) created to estimate residential emissions based on the ZIP Code of residence and housing type. We expand on the survey results using the American Community Survey Public Use Microdata Series to generalize the patterns we observe and provide a better sense of the magnitude of the changes in emissions linked to remote work.

This research assesses the conditions under which emissions are reduced and the extent to which, in the aggregate, the trends in remote work are working in favor or against cities' efforts to cut their emissions. We provide a novel approach that leverages individual-level data tailored to study people's decisions under a fundamentally different relationship to work locations. Results will shed light on how cities can incentivize the benefits of a remote workforce and mitigate the downsides.

ENVIRONMENTAL JUSTICE IN THE LENS OF PUBLIC SCHOOLS

Abstract ID: 1110.0.0.1171.2024
Research-in-Motion (RiM)

Ning Ai [University of Illinois Chicago] ain@uic.edu, presenting author

Public schools have long been a central issue for planners and policy makers, drawing attention to their educational and social benefits for children, families, and communities (Downes & Zabel, 2002; Neal & Watling Neal, 2012). Extensive research on environmental health and justice has scrutinized public schools' siting, building conditions,

maintenance, funding, and surrounding environment (Cohen, 2010; Sampson, 2012). While most research has been devoted to studying the environmental hazards affecting schools—such as their proximity to freeways, presence on contaminated lands, and the condition of their air conditioning systems—the environmental footprint of public schools themselves tends to be overlooked. This includes their role in exacerbating traffic congestion, air and noise pollution, resource consumption, and carbon emissions. This oversight of the dual role of public schools bears significant consequences for community-level environmental planning.

Aiming to shed light on this understudied area, this research delves into the environmental justice (EJ) implications of public schools, exploring both the advantages and challenges they present. Through a comprehensive review of interdisciplinary literature and empirical analysis (e.g., through surveys and housing prices), the study uncovers community preferences regarding school siting, reflecting a nuanced understanding of their dual impact. It also examines innovative approaches that enhance the positive contributions of schools to their communities while mitigating adverse effects.

Numerically, the study further seeks to underscore how examining public schools can enhance our understanding of EJ in nearby communities and elevate overall awareness. The lack of community-level environmental data often poses a significant barrier to thorough EJ assessments. Meanwhile, public schools, which often collect environmental data as a regulatory requirement, offer a valuable resource for higher quality, more regular data than what may be typically available at the community level. We demonstrate this potential in an empirical investigation of Chicago neighborhoods, highlighting the disparity in lead pollution data availability and the mandatory testing in schools as stipulated by Illinois SB 0550 (2017). By linking school-level data with local community characteristics and other environmental indicators, the research expands upon existing EJ studies in Chicago neighborhoods and discusses the value and potential applicability of extending this approach in EJ analysis.

Ultimately, the study not only examines health and student performance impacts but also aims to articulate the important role of public schools in fostering community development, enhancing a sense of belonging, and improving the overall quality of life. It presents public schools as sources of both positive and negative outcomes, discussing planning implications, potential strategies, and overlooked opportunities for harmonizing the educational landscape with environmental justice objectives.

Digital technologies are increasingly used in cities worldwide to monitor, plan, and manage urban trees and forests for improved environmental and community well-being (Nitosklawski et al. 2019). For example, urban forest assessment and valuation tools quantify the ecological structure (e.g., tree canopy), function (e.g., air pollution removal), and economic value (i.e., dollars saved) of urban forests. Designed to aid land managers and the public in estimating urban forest ecosystem services, i-Tree is perhaps the most well-known and widely applied set of assessment and valuation tools. Yet surprisingly few studies evaluate i-Tree model estimates of ecosystem functions (Lin et al. 2019) despite use of these data for prioritizing tree planting locations and targeting future potential investments (Kroeger et al. 2018).

Our research asks: How do modeled estimates of fine particulate matter (PM2.5) deposition derived from i-Tree, a widely used coarse-scale urban forest model, compare to field measurements of PM2.5 at the census block group scale? To answer this question, we measured PM2.5 deposition to 240 trees total in Salt Lake City, Utah, Eugene, Oregon, and Cleveland, Ohio, in May and August 2024. Social vulnerability index and road density data were used to stratify the urban landscapes. Using urban forest inventory and other tree location data, 80 trees were selected randomly for sampling in each city. Abundant and frequent tree species in U.S. urban forests were chosen given their representativeness of the urban canopy layer. In the field, leaves were clipped from 3-5 m above ground in each cardinal direction, composited, and then transported to the lab where particulate matter was determined using a leaf washing method followed by gravimetric analysis. Leaves were washed with ultrapure water to remove particulate matter and air-dried to press and analyze for leaf area. Rinse water was filtered sequentially through two filters—first through a 2.7-µm filter and then through a 0.2-µm filter—to isolate the PM2.5 fraction (here defined as 0.2-2.7 µm). Pre-weighed filters were conditioned and weighed on a microbalance. We also modeled PM2.5 deposition using i-Tree Landscape, which derives PM2.5 from i-Tree Eco (Nowak et al. 2014). In this Research-in-Motion talk, we compare our modeled and measured estimates of PM2.5 deposition to urban trees (similar to Pace et al. 2021) for each city and for all cities combined at census block group and city scales.

New applications within existing urban forest assessment and valuation tools, such as i-Tree, seek to address inequities in access to urban trees and their benefits. While these technological developments are encouraging, most digital tools model urban tree benefits at coarse spatial scales (e.g., city) that are mismatched with the localized scales (e.g., city block) at which racial and ethnic disparities in air pollution occur. In other words, urban forest assessment and valuation tools and the planting prioritizations generated by these tools may not adequately address equity concerns due to the scale mismatch between the tools and human lived experiences. Our comparison of i-Tree and PM2.5 deposition will inform how spatial scale and approach influence benefits

estimations. Future research will investigate the downstream impacts of such differences on planting prioritizations and distributional outcomes, providing a guide for i-Tree model improvements.

FILLING FOR THE FUTURE: GOVERNANCE OF SEDIMENT IN SAN FRANCISCO BAY

Abstract ID: 1110.0.0.1193.2024
Research-in-Motion (RiM)

Courtney Humphries [Boston College] courtney@strangestsea.com, presenting author

San Francisco Bay is the largest estuary on the United States West Coast and contains 59,000 acres of tidal wetlands around which 7.7 million people live across 7,000 square miles of land. The Bay's coastal dynamics have been greatly altered by urban development, with an estimated 90 percent of tidal wetlands destroyed or seriously degraded. Numerous stakeholders involved in a complex governance structure are working toward a goal of restoring the Bay's natural ecosystems, efforts made more urgent and complicated with projected future sea level rise.

Habitat restoration was traditionally oriented toward the past, with a goal of recreating historic ecologies, but increasingly has been viewed as 'futuristic' restoration that aims to make habitats resilient in the face of a changing climate (Choi, 2007). In urban coastal environments like San Francisco Bay, restoration projects are increasingly called upon to function as natural habitats while also serving as "nature based solutions" for climate change adaptation and as a substitute for traditional 'gray' infrastructure, providing services such as flood protection, wave dissipation, and water filtration.

In practice, orienting restoration toward a dynamic future requires changes in resource use and governance. Coastal managers in the Bay Area envision a need to use large amounts of sediment to maintain coastal ecosystems with sea level rise. They anticipate a "long-term mass imbalance of regional sediment" (Dusterhoff et al., 2021; p.

112) that requires identifying new sediment sources and mobilizing increasing amounts of dredged sediment, waste sediment, and debris for use in creating and maintaining elevation of coastal wetlands. This suggests a view of the urban coastline that involves continuous cycles of replenishment and rebuilding, creating new urban industrial-natural ecologies in which securing an increasing local sediment supply and metabolism is critical management and policy focus for cities facing sea level rise.

Given past histories of filling wetlands to create land for urban development, current federal, state, and local regulations strictly limit the placement of sediment as fill along shoreline. In keeping with an interventionist and reparative vision of restoration, groups promoting Bay restoration have identified environmental regulations as one of the key obstacles to a resilient future (Goodrich et al., 2023), and increasingly characterize permitting processes as obstructive 'green tape.' to alter policies to streamline permitting, allow 'beneficial' uses of fill, loosen standards for sediment quality, and allow projects that use 'nontraditional resources' such as construction debris in climate adaptation projects. These changes have been the subject of debate among planning and coastal management institutions (Pinto et al., 2018).

This research examines the governance and discursive implications of this shift in sediment management, focusing on decision-making processes and regulations around the use of fill for nature-based solutions in San Francisco Bay. It draws on field site observations, document analysis, and interviews with coastal stakeholders. I focus on recent proposed and implemented regulatory changes, as well as decision-making processes around specific projects requiring fill, particularly 'horizontal levees,' a type of constructed wetland used for water quality improvement and flood protection. I discuss the implications of this empirical study for broader conceptions of ecological restoration, which has been critiqued by social sciences as an example of neoliberal 'accumulation by restoration' but also may function as a 'world-making practice' and a generative political and social tool for creating new social-environmental futures (Usher, 2023).

FOSTERING GREEN BUILDING: THE CASE OF THE TORONTO GREEN STANDARD

Abstract ID: 1110.0.0.395.2024
Research-in-Motion (RiM)

Christopher De Sousa [Toronto Metropolitan University] chris.desousa@ryerson.ca, presenting author

While the state of our natural environment has been a concern for over a century, growing signs of the disastrous impact of human activity on climate, natural resources, biodiversity, and other ecological systems have intensified public-sector efforts to promote more sustainable development. Globally, the United Nations 2030 Agenda for Sustainable Development, adopted by world leaders in 2015, set goals and targets to protect the planet from degradation so that it can support the needs of the present and future generations. A UN Goal of particular interest to urban planners and policymakers is Goal 11, which calls for making cities and human settlements inclusive, safe, resilient and sustainable (United Nations 2015, 2021). While most of my past research has focused on where human settlements are built (i.e., brownfields), I have been increasingly interested in exploring what is being built and how we can get developers to build more sustainably. Indeed, buildings and the building construction sector are responsible for over one-third of total global final energy consumption and energy-related CO2 emissions, in addition to their extensive use of land and natural resources and production of waste (UN Environment Program, 2021, p 29). Moreover, the demand for buildings continues to grow worldwide, with the floor area of the global building sector projected to double by 2060.
One vital tool that has emerged internationally to enable investments in developing sustainable and more efficient green buildings has been mandatory and voluntary green building (GB) and building energy performance measures, codes, and rating systems. Toronto was an early adopter, launching the Toronto Green Standard (TGS) in 2009. The TGS is a two-tier set of environmental performance measures comprised of five performance measure categories: (1) Air Quality; (2) Building Energy, Emissions and Resilience; (3) Water Quality and Efficiency; (4) Ecology and Biodiversity; and (5) Waste and The Circular Economy. Tier 1 of the TGS is mandatory for all new development applications in Toronto, while Tier 2 is a higher voluntary performance level incentivized through refunding fees charged to development. A more stringent TGS Version 2 came into effect in 2014, Version 3 in May 2018, and Version 4 in May 2022.

This presentation is based on research that:
• Examines the history and evolution of the TGS to understand better its alignment with public GB policy and municipal building code policy and research;
• Tracks the scale, character, and location of building development incorporating the TGS since the program's inception and investigates the green performance measures being adopted and rejected; and
• Lays the foundation for future research on the TGS, specifically, and public GB policy, codes, and programs generally, with particular attention to the experience of private developers and consumers, as well as policy, funding, and other measures to enhance their engagement.

Information for this project was gathered via the review of government documents, interviews with policymakers, staff, and others involved in developing and implementing the TGS, and the compilation and analysis of data on building projects involving the TGS submitted as part of the development Site Plan Application for planning approval from 2013 to 2022. As of the writing of this abstract, the dataset with information from over 1000 development projects that have incorporated the TGS is being analyzed. The results of this study will provide important information to scholars, policymakers, developers, and other stakeholders about the scale, character,

and location of buildings incorporating the TGS and the kinds of green features being adopted and rejected by developers.

FROM ECOSYSTEM SERVICES TO NATURE-BASED SOLUTIONS: A COMPARATIVE ANALYSIS

Abstract ID: 1110.0.0.795.2024
Research-in-Motion (RiM)

Faroq Lotfi [University of Cincinnati] lotfifq@mail.uc.edu, presenting author
Danilo Palazzo [School of Planning, College of DAAP, University of Cincinnati] palazzdo@ucmail.uc.edu

Literature shows a notable rise in the number of green concepts that address the escalating environmental and societal challenges. Ecosystem services, green infrastructure, and nature-based solutions are among the more popular concepts adopted to tackle the issues. While sparking a significant wave of interest across various disciplines, the coining of new concepts has occasioned skepticism. This paper aims to dissect and clarify these concepts by referring to bibliographic data and authoritative definitions provided by respected entities like the United Nations, the European Commission, and the International Union for Conservation of Nature.
The central motive behind this research is to see if the concept of nature-based solutions improves the previous concepts of ecosystem services and green infrastructure or it is merely a rebranding. That is to ask, do these concepts offer unique perspectives to our collective understanding of environmental stewardship? Or are they repackaging the previous concepts? By delving into the boundaries and the notions included in the definitions provided and tracking the records on the Scopus database, this study undertakes a comparative analysis designed to shed light on the distinctions and overlaps between these strategies to capture a clear picture of their roles and significance.
Ecosystem services pertain to the wide array of indirect or direct services humans derive from the ecosystems. The concept highlights the strength of linkages between the categories of ecosystem services and components of human well-being, in addition to the degree to which they can be mediated to ensure sustainability. Succeeding ecosystem services, green infrastructure was systematically defined by the European Commission (2013) as a network of natural and semi-natural areas strategically planned to deliver a wide range of ecosystem services. A

few years later, the same institution promoted nature-based solutions to leverage the benefits of functioning ecosystems.
Together with a juxtaposition of the conceptual frameworks and how they are utilized in a selection of case studies, a quantitative bibliometric and citation network analysis will be employed to understand each concept's perspectives. The results can tell us how informed the latter concepts are by the previous ones. It can help determine if the recent concepts complement the former ones or are merely sporadic attempts that do not significantly add to the contributions of the past strategies. The implications of this study extend well beyond the realms of academic discourse, offering valuable insights for urban planners, policymakers, educators, and practitioners. By demystifying these concepts and providing a nuanced description of their meaning, the paper enlightens the decisions about environmental strategies adopted or communicated in urban planning or policy making. The perspective this paper aims to enlighten informs us about the path taken so far, which is the lodestar that directs tomorrow's decisions.

HOW MAY MUNICIPAL GREENING DETERIORATE URBAN CLIMATE JUSTICE?

Abstract ID: 1110.0.0.1110.2024
Research-in-Motion (RiM)

Meen Wook Jung [The Ohio State University] jung.763@osu.edu, presenting author

Rapid urbanization has increased built environments, which deteriorated urban thermal inequality. A high proportion of built environments generate the unequal distribution of high temperatures (i.e., urban heat islands), increasing marginalized populations' heat risk (Hsu et al., 2021). From a planning perspective, unequal distribution of heat risk will undermine municipal efforts toward sustainable and just urban environments. Introducing urban green space (UGS) (e.g., parks, greenways, street tree canopies, and green roofs) has been considered a significant strategy for reducing elevated temperatures in marginalized neighborhoods in municipalities' climate action plans. However, recent literature on green gentrification pointed out that socially marginalized residents can be displaced to other neighborhoods due to newly developed UGS (Anguelovski et al., 2018). The presence of well-maintained

and abundant UGS makes marginalized neighborhoods attractive and desirable places from the perspective of real estate speculation, which in turn may result in the displacement of long-time residents who have no means to adjust to the increased financial pressures (Anguelovski et al., 2018; Pearsall & Eller, 2020). It is anticipated that those who enjoy the cooling effects of UGS would be middle- or high-class gentrifiers (i.e., newcomers), not existing marginalized residents. Although previous studies have examined whether UGS development leads to gentrification in marginalized neighborhoods, less focus has been made on extending the issue to climate injustice.
In this study, I explore how municipal greening efforts may deteriorate urban climate justice through the green gentrification case of Atlanta, Georgia. Conducting the Difference-in-Difference regression as a preliminary analysis, I first examine whether constructing the Historic Fourth Ward Park caused gentrification in its nearby areas. The regression results reveal a statistically significant disparity in a gentrification metric in the areas. Next, I compare the temporal dynamics of thermal environments between pre-development and post-opening years via ENVI-met simulation. I set the grid cell size of simulation models and add spatial components, such as land surface cover, buildings, and vegetation. Meteorological full forcing is also applied in the simulation process to make more realistic simulation environments. The simulation results show that mean air temperatures are reduced by up to 2.17℃ during the day and up to 1.87℃ at night due to park construction. The stormwater drainage pond serves as a cold spot, constantly contributing to reducing air temperatures in nearby areas. Lastly, I compare demographic and socio-economic characteristics to understand who had the benefit of the park's cooling effects. Compared to the pre-development year, the proportion of African Americans considerably decreases in the post-opening year. In contrast, the proportion of White and high-income households shows the opposite trend.
These findings imply that municipalities' greening efforts to mitigate thermal inequality in marginalized neighborhoods may lead to paradoxical consequences. Overall, this study indicates that when municipalities introduce UGS in marginalized neighborhoods to mitigate thermal inequality, they should even consider the potentially negative impact it may have on existing residents. In doing so, municipalities will move toward thermal equity.

INEQUITIES IN THE CAPACITY OF STORMWATER CONVEYANCE SYSTEMS

Abstract ID: 1110.0.0.1231.2024

Research-in-Motion (RiM)

Jessica Lee [Texas A&M University] jjlee8605@tamu.edu, presenting author
Shannon Van Zandt [Texas A&M] svanzandt@arch.tamu.edu

The capacity of stormwater infrastructure plays an important role in reducing the damage from urban flooding. In this sense, studies have examined whether the capacity of stormwater infrastructure is equitably distributed across neighborhoods in a city (Baker, et al., 2019; Hendricks, 2017; Mandarano, et al., 2017; Park, et al., 2023; Porse, 2018). However, such studies cannot consider the capacity of different types of infrastructure by examining a single infrastructure type in each analysis.

The purpose of this study is to investigate how the capacity of stormwater conveyance systems, including storm sewers and roadside open ditches, is equitably distributed in diverse neighborhoods. The study addresses the following research questions: Are race/ethnicity characteristics, income, and appraisal value of neighborhoods significantly associated with the density of stormwater conveyance systems? Are housing and neighborhood characteristics, including housing age and vacancy, associated with the density of stormwater conveyance systems? The study area is the city of Houston, Texas, a strong case for examining the equitable capacity of stormwater conveyance systems, since Houston is one of the most flood-prone and racially and economically diverse cities in the U.S.. This study conducts multilevel regressions of the street segment level and the census block group level with the spatially merged secondary datasets in the Geographic Information System (GIS).

Our preliminary results are consistent with the findings of environmental justice and social vulnerability literature. First, Black or Hispanic neighborhoods with lower appraisal values tend to have a lower density of conveyance systems than White neighborhoods having higher values. Second, neighborhoods having older housing are inclined to have a lower density of conveyance systems. The findings of this study provide implications for developing land use plans and capital improvement plans to reduce the impacts of flooding and make them more equitable. This study also adds insight into environmental justice and hazard vulnerability research to understand inequities in flood damages.

MAPPING URBAN FLOOD RISK USING REMOTE SENSING & CROWD-SOURCED DATA

Abstract ID: 1110.0.0.441.2024
Research-in-Motion (RiM)

Mengjue Zhu [Georgia Institute of Technology] mzhu356@gatech.edu, presenting author

This study proposes a novel approach to map flood risk in Pinellas County, Florida. It uses neural network modeling with inputs from topographic, land cover, demographic, precipitation data, and geographic coordinates to capture the spatial relationships among data points. The ground truth is established using 'flooded' and 'un-flooded' pixels processed from remote sensing imagery. By integrating real-time precipitation data, the model will provide timely flood risk predictions for any given geographic point in the county.

The significance of this research lies in its utilization of both remote sensing data and other crowd-sourced data to address the challenges of flood mapping in densely built-up areas. Various algorithms are being tested and evaluated, with validation against crowd-sourced data such as social media flood posts. For instance, during Hurricane Idalia, time-series Sentinel-1 images were used to experiment with the Normalized Difference Flood Index (NDFI), Ratio Image (RI), and Difference Image Index (DII) for flood extent processing. Comparisons with social media flooding posts revealed that RI-processed flood extent aligned most closely with community reports for this event. Considering the differences in image availabilities and noises for different hurricane events, this experiment-validate approach will be continuously applied for other historical hurricanes like Hurricane Irma, and the index thresholds will be refined iteratively based on validation data. Validated flood extents from various events will enrich the dataset for neural network training.

Furthermore, the neural network incorporates the Bayesian Framework. It predicts a whole distribution of the posterior-predictives for each data point using Monte Carlo Dropout. Compared to the situation where only a single deterministic prediction is available at each point, the availability of a whole distribution of prediction will empower us as urban planners with more information to evaluate model performance with the awareness of inaccuracies inherent in remote sensing data processing. This will also empower us with more freedom in deciding the thresholds to map the final flood extent from the probabilities of flooding.

The implications of this work extend to planning practice by providing a data-driven tool for real-time flood risk assessment. Local authorities can utilize these predictions to prioritize response efforts and allocate resources effectively, even in the absence of direct flood reports. Ultimately, this research contributes to enhancing community resilience to flooding and underscores the importance of leveraging emerging technologies in urban planning and disaster management.

NATURE-BASED SOLUTIONS AND SPATIAL PATTERNS OF RISK: A SCALAR MISMATCH?

Abstract ID: 1110.0.0.432.2024
Research-in-Motion (RiM)

Ana Polgar [University of British Columbia] apolgar@mail.ubc.ca, presenting author

The intensification of environmental challenges due to rapid urbanization and climate change has led to widespread use within planning of urban Nature-Based Solutions (NBS) as potential mitigators, often without accounting for the unequal distribution of environmental risks and social vulnerability between neighbourhoods. As a result, the planning and implementation of NBS faces criticisms for overlooking on-the-ground impacts. Particularly, this criticism focuses on the possible intensification of nuanced processes that generate underlying socio-spatial inequalities and continually leave the least-resourced populations at greater risk (Tozer et al., 2020). While it is generally acknowledged that local context determines which benefits of NBS are most relevant and accessible for residents in and around a given site, implementation remains challenging because interconnected social, ecological and infrastructure systems are governed in urban areas by diverse local government agencies with overlapping administrative boundaries and varied mandates. As a result of this complex spatial governance system, the scale of issues that NBS seek to address is often out of line with the actual environmental risks perceived by local populations. This scalar mismatch between NBS governance and local resident risk perception may mean that the NBS fails to address the real challenges faced by vulnerable populations and can exacerbate existing socio-spatial inequalities or may have negative externalities just outside the city's jurisdiction (Anguelovski & Corbera, 2023). While scalar mismatch of urban NBS has begun to be explored in the Global North, the Global South is underrepresented in existing research on interactions between NBS and social dimensions of rapidly urbanizing cities, resulting in limited understanding of the distributional dimensions of urban NBS and potential impacts on socio-spatial inequalities.

Through an exploration of multiple case studies from cities in the Global South, this research assesses (mis)alignments in geographical, social, and ecological dynamics in NBS governance. I develop a conceptual framework leveraging the literature across several disciplines on scalar mismatch (Cummings et al., 2006) to propose a way for practitioners to recognize and rectify spatial, temporal, and functional mismatches within NBS governance. This framework also operationalizes the notion of riskscapes (Müller-Mahn, 2013) to elucidate how various actors and social groups perceive risk across landscapes within the context of NBS. I employ these concepts as a lens to comprehend the spatial dynamics of vulnerability and enhance NBS design to effectively address diverse forms and expressions of risk reduction.

I test the proposed conceptual frame through results from an ongoing text analysis of planning documents and maps across numerous Global South urban NBS case studies that identifies and assesses risk distributions and ecosystem flows in socio-ecological systems, justice considerations, and the complexities of multilevel and heterogeneous governance configurations (Lawhon et al., 2018). Preliminary findings from this comparative case study analysis reveal that scalar mismatches in NBS governance, stemming from power imbalances and institutional constraints, contribute to uneven distribution of benefits, limited political support, and the

marginalization of vulnerable populations. To address these governance challenges, proposed improvements include the implementation of scale-crossing brokers to facilitate collaboration between different scales of governance and bridging organizations to foster collaboration between various types of formal and informal institutions within "hybrid" governance configurations, thereby enhancing coherence and effectiveness in urban planning processes.
This research provides two main contributions. First, it advances knowledge on urban greening, climate intervention, and theories of the geography of scale by proposing a multi-scaled approach for planners to navigate conflicts within NBS governance, bridging gaps between different socio-ecological scales that other approaches may overlook. Second, by addressing the complexities of urban socio-ecological systems and advocating for inclusive and equitable NBS strategies, this study contributes to the discourse on sustainable urban development and resilience building in the face of climate change. Addressing scalar mismatch within NBS governance can lead to more effective and equitable outcomes, harmonizing the involvement of different actors in planning and execution, thereby enhancing the capacity to address socio-environmental risks comprehensively across various scales and stakeholders in urban governance.

SPATIAL DISPARITIES IN COOLING CENTER FOR VULNERABLE GROUPS IN SEOUL

Abstract ID: 1110.0.0.926.2024
Research-in-Motion (RiM)

Jisu Kim [University of Seoul] rlawltn3582@uos.ac.kr, presenting author
Mingyu Kang [University of Seoul] mgkang23@uos.ac.kr

As primary strategies for adapting to heatwaves in South Korea, cooling centers play a significant role in preventing harm to vulnerable populations who have difficulty accessing air conditioning facilities. The Ministry of the Interior and Safety recommends that the operation of these centers should prioritize accessibility for populations vulnerable to heatwaves, tailored to local characteristics. Despite these recommendations, Seoul has been criticized for its provider-centric approach, which emphasizes securing a high number of cooling. This has led to not only administrative and financial inefficiencies but also a lack of consideration for the residential situations of the

actual users, who are susceptible to heatwaves. Therefore, this study aims to explore effective strategies for operating cooling centers in consideration the residential situations of heatwave-vulnerable populations.

Research on heatwave adaptation has primarily focused on the spatial dynamics between high-temperature zones and the vulnerable. The focus of research on the spatial fairness of heatwave mitigation efforts has mainly been on green infrastructure. However, there remains a significant gap in research regarding the accessibility of cooling centers and the needs of heatwave-vulnerable populations. To address this gap, the study aims to conduct an empirical analysis of the relationship between cooling center accessibility and the living areas of vulnerable groups at the neighborhood level within Seoul's districts (dong, a neighborhood-level administrative unit within a district in Seoul). It also seeks to investigate how the policy demand for cooling centers varies across these neighborhoods to provide insights into policy adaptations tailored to specific local needs.

To achieve this, Geographically Weighted Regression (GWR) analysis is employed in the study. The analysis commences by selecting cooling centers that meet specific criteria, such as being air-conditioned and having adequate capacity. Subsequently, the kernel density is estimated using the location data of these centers and is used as the dependent variable. Various vulnerable groups, including the elderly, individuals living alone, the disabled, and foreigners, are considered as independent variables, along with meteorological conditions such as the number of heatwave days and tropical nights. Unlike Ordinary Least Squares (OLS), GWR analysis enables the estimation of the impact of independent variables on a regional basis, thereby reflecting regional differences in the model. This facilitates the specific identification of factors influencing access to cooling centers in each neighborhood (dong) of Seoul. Such analysis will play a pivotal role in identifying policy needs based on local characteristics.

Given that Seoul's heatwave countermeasures are implemented at the 'gu' level, which comprises several 'dongs', this study facilitates a more efficient allocation of limited resources and budgets by the responsible local government agencies. This will enable the development of customized heatwave adaptation policies that align with the distinctive characteristics of each area. Moreover, by enhancing cooling center services to meet the needs of heatwave-vulnerable populations and safeguard their health, this study is expected to offer valuable insights into improving the effectiveness of heatwave response policies.

SPATIOTEMPORAL CHANGES IN THE ACCESSIBILITY OF TORONTO'S GREEN SPACE

Abstract ID: 1110.0.0.791.2024
Research-in-Motion (RiM)

Manahel Khan [Toronto Metropolitan University] m31khan@torontomu.ca, presenting author

This study investigates the relationship between urban green space (UGS) and walkability within the framework of the City of Toronto's Neighbourhood Improvement Area (NIA) designations. Research finds that urban environments often present a binary between being green or walkable, but the coexistence of both attributes in cities is rare—a conclusion supported by various studies both in Canada and on an international scale (Doiron et al., 2020; Shuvo et al., 2021). Despite the recognized importance of access to urban greenery for environmental justice and quality of life, the relationship between green spaces and walkability, especially within the context of temporal access changes in Toronto, has yet to be examined.

The research sets out to evaluate the effectiveness of the Toronto Strong Neighbourhoods Strategy 2020 (TSNS) in its efforts to enhance the distribution and accessibility of UGS. This research aims to assess the effectiveness of the Toronto Strong Neighbourhoods Strategy 2020 (TSNS) on the distribution and accessibility of UGS. The TSNS, which identified 31 NIAs based on a series of indicators, sought to improve living conditions in neighbourhoods, including green spaces and walkability. However, updates to the TSNS were delayed due to the redirection of funds during the COVID-19 pandemic, leaving the TSNS informed by data that are now nearly a decade old, although the City of Toronto continues to use the NIA designations.

Utilizing a mixed-methods approach integrates publicly accessible data from the City of Toronto and applies multivariate clustering techniques inspired by Doiron et al. (2020) and Shuvo et al. (2021), who have previously assessed greenness and walkability in cities globally. This process differentiates areas that are simultaneously green and walkable ("sweet spots") from those that are not ("sour spots"). Such a distinction serves as the foundation for a nuanced regression analysis conducted in two parts: Model 1 explores the influence of land use and policy, including NIA designations, on UGS accessibility, while Model 2 incorporates sociodemographic factors to assess their potential differential impact on these dynamics.

Preliminary analysis up to the year 2022 reveals a patchwork of progress and decline in the accessibility of neighbourhood green spaces since the inception of the TSNS in 2014. These findings indicate that the strategy's impact has been inconsistent, with some areas witnessing improvements in environmental access, whereas others have experienced significant declines. This variance underscores the complexity of urban environmental planning and highlights a range of influencing factors that extend beyond policy measures alone. The regression analysis particularly illuminates the significant role of land use patterns and sociodemographic characteristics, with Model 2 emphasizing the critical impact of economic, linguistic, and demographic factors on the equitable distribution and accessibility of UGS.

By focusing on the implications of NIA designations and the broader socioeconomic and structural context within which they operate, this research contributes valuable insights into the discourse on urban sustainability, policy efficacy, and implementation. It underscores the necessity for integrated planning approaches that account for the

complex interplay between land use, socioeconomic equity, and demographic diversity, especially as the City of Toronto considers revising the TSNS and updating its indicators.

For urban planners and policymakers, the study's findings serve as a pivotal call to action, urging a reevaluation of current strategies to more effectively address the complexities of urban realities. It advocates for the adoption of comprehensive, context-sensitive policymaking that emphasizes adaptive approaches capable of navigating the intricacies of urban development and striving for environmental equity. Ultimately, this research offers a detailed examination of the impact of NIA designations on UGS accessibility, highlighting the critical importance of socioeconomic and demographic factors in urban environmental transformations. It argues for evidence-based, targeted interventions and contributes to both academic discourse and practical policymaking, aiming for more equitable, healthy, and sustainable urban communities.

STATISTICAL ANALYSIS OF SHORELINE STABILITY ON THE BARRIER ISLANDS, USA

Abstract ID: 1110.0.0.386.2024
Research-in-Motion (RiM)

SaMin Han [Mississippi State University] sh2851@msstate.edu, presenting author
Walter Hogue [Goodwyn Mills Cawood] walter.hogue@gmcnetwork.com

Barrier islands play a pivotal role in coastal dynamics, primarily due to their distinctive geographical positioning and inherent natural features. These islands not only afford critical protection to adjacent coastal communities but also foster ecological diversity and support offshore ecosystems. The preservation and stabilization of barrier islands have become priorities at both state and national levels, particularly in light of the increased frequency and intensity of hurricanes that exert significant pressure on these islands, contributing to chronic erosion. This phenomenon underscores the vulnerability of these islands to substantial land reduction and erosion, especially within high hurricane activity zones such as the Gulf.

This study delves into the impacts of longshore current flux and human developmental activities on the erosional and accretional changes observed in three barrier islands located in the Gulf of Mexico. These islands are in close proximity to one another and share similar environmental conditions, with the exception of human intervention. Our study examines the relationship between human development and the dune system by conducting a comparative analysis between Dauphin Island, Alabama, and its less developed counterparts, Petit Bois Island and Horn Island, Mississippi. Given the similarities in location, climate, weather events, and ecological regions shared by these islands, human development on Dauphin Island stands out as a unique variable.

Employing the Digital Shoreline Analysis System (DSAS), our research design encompasses a comprehensive comparative analysis that focuses on natural dune formations and ecological preservation. We analyze historical shoreline morphology through regression models over a thirty-year period from 1984 to 2015, utilizing USGS shapefiles derived from aerial imagery and lidar data. This analysis enables us to observe the natural morphological changes of the islands, including patterns of erosion and accretion. Through statistical analysis, including Ordinary Least Squares (OLS) time-series regression, we evaluate the validity of our initial findings, visualize emerging trends, and predict future shoreline changes. This process involves isolating transect datasets from each island's leeward and windward shores, generating OLS models, and visualizing the results through scatterplots and trendline tables. Our findings reveal distinct levels of shoreline stability across the islands, influenced by fluctuation patterns, erosion and accretion ratios, and directional shoreline changes. Unlike its counterparts, Dauphin Island exhibits a unique pattern of windward erosion and nearly exclusive leeward accretion, underscoring the issue of chronic erosion and significant sediment over-wash towards its western bay. In contrast, Horn and Petit Bois Islands display a more balanced dynamic of erosion and accretion, suggesting the presence of a more effective natural stability system that minimizes sediment over-wash.

This research addresses a gap in the literature by utilizing the DSAS to measure and analyze shoreline changes, thereby providing insights into the complex interplay between natural processes and human influences on barrier islands. Our findings highlight the crucial relationship between the health of vegetative dunes and shoreline stability, suggesting that the health of dune systems is a correlating factor in maintaining shoreline integrity. The significance of this study lies in its contribution to the understanding of coastal processes and the implications of human activity on barrier island ecosystems, offering a foundation for informed conservation and developmental strategies.

THE MULTI-SCALAR LANDSCAPE IMPACTS OF LAND USE REGULATION

Abstract ID: 1110.0.0.670.2024
Research-in-Motion (RiM)

Steven Richter [East Carolina University] richters22@ecu.edu, presenting author
Courtney Baker [East Carolina University] bakerco22@ecu.edu
Roshan Saud [East Carolina University] saudr23@students.ecu.edu

Urban land use has a myriad of direct and indirect impacts on environmental conditions. Direct impacts include concerns such as water quality, heat island, biodiversity, and more. Indirect impacts are typically conceptualized through travel behavior associated with said land use. These include the generation of vehicular emissions and the consumption of natural lands beyond the urban edge (EPA 2013). However, the conceptualization of direct and indirect pathways is underdeveloped. There are more indirect pathways beyond land use and travel behavior.
For example, restricted housing supply and gentrification have led to the suburbanization of poverty (Kneebone and Garr 2010). But this is not just a demographic and spatial phenomenon, there are also landscape implications. The infill development that drives such relocation often intensifies the existing landscape (Muller and Mitova 2023), while the developed landscape in the growing working-class suburbs often lacks ecosystem services and has lower environmental quality, in general. Thus, the direct environmental implications of infill development are not the only environmental outcome, there is also the indirect intense suburbanization that accompanies the displacement of poor residents to peripheral jurisdictions with less stringent land use regulations.
Past research has described how urbanization processes differ across an urban-to-rural gradient (Richter and Bixler 2022), but this needs to be expanded on to understand how different locations within an urban region, through multi-scalar processes, affect and are affected by one another. Multi-level models (MLM) are a useful tool for distinguishing relationships across different scales (Woltman et al 2012). This work leverages applies MLM to three distinct scales - the metropolitan region, local jurisdictions, and neighborhoods - to better understand and articulate the complex indirect pathways linking land use and the environment. Modeling leverages a variety of data sources: land use data comes from the National Longitudinal Land-Use Survey (NLLUS)(municipal) and National Zoning Atlas (NZA)(neighborhood); environmental data comes from the National Land Cover Database, a 30-meter grid that includes developed land, impervious cover, and tree canopy; socio-demographic data comes from the US Census and American Community Survey.
This work contributes to a growing body of literature that conceptualizes cities not as predictable economic engines but as complex, social-ecological entities. In particular, the use of MLM to target multi-scalar patterns provides a new perspective on regional interactions. In addition, this project provides useful insight to policy makers that need to avoid unintended consequences of land-use regulations (e.g. the displacement of vulnerable populations to distant and environmentally underserved suburbs). And the novel combination of the NLLUS and NZA provides an innovative approach to the analysis of land use regulations.

The demographic landscape is shifting dramatically. Globally, the population aged 65 and over is projected to nearly double by 2050, reaching 2 billion. This trend, coupled with the diverse needs of people with disabilities, presents a growing challenge in ensuring equitable mobility and accessibility for all community members. Navigating existing transportation systems can be difficult for older adults. Physical and cognitive difficulties that may occur with aging can make using public transportation or even driving a car difficult or dangerous. Even within their homes, mobility limitations can be an obstacle if modifications for aging in place have not been made. Similarly, people with disabilities often face significant barriers, from inaccessible bus stops and train stations to a lack of wheelchair-accessible vehicles. Homes lacking disability support features add another layer of difficulty. These challenges can limit people's travel opportunities and lead to social isolation, reduced access to healthcare and employment opportunities, and a diminished sense of independence.

This roundtable discussion brings together a group of planning scholars who conduct research and create knowledge that can support the shaping of the future of our cities. As cities and communities evolve to accommodate an aging population and changing disability demographics, accessibility becomes crucial for continued independence, social connection, and economic participation for these groups. Through facilitated discussions, we will delve into key challenges faced by older adults and people with disabilities. We will explore existing research on accessibility solutions, and identify opportunities for further research and collaboration among scholars who work in disability and aging in relation to the built environment. By fostering knowledge exchange and collaboration, this roundtable discussion seeks to bridge the gap between research on disability and aging. Ultimately, it aims to pave the way for more inclusive and equitable accessibility solutions that allow everyone, regardless of age or ability, to fully participate in the social and economic life of our cities.

What does it mean when an editor instructs you to make sure that a piece of writing works for the general audience of a planning journal? Who is implied, in that general audience and who's left out? How have, or should understandings of that general audience changed and what does that mean for how we communicate in planning journals and across other forms of planning communication?

This roundtable brings together planning researchers, educators and creative communicators to think through these questions together, inviting the audience into a discussion about communicating planning research in light of the complex politics of the day.

The aim of this conversation is to trouble the normative ideal of who that general audience is. To say out loud that what has been imagined is a white, upper class, able-bodied man. But then, more importantly, to share examples of other audiences. Other ways of speaking and listening. And the generative possibilities for teaching, research and practice that emerge when we all get to say stuff the way we would with friends and family. When the likes and uhms, the intersectionalities and subalterns, the sin fronteras and debwe, the vibes and feels all get to sit together on–or off–the page.

ACCESSIBILITY ANALYSIS OF COOLING CENTERS IN THE MOUNTAINOUS AREA

Abstract ID: 1108.0.0.297.2024
Individual Paper Presentation

Hoon Hyuk Choi [Pusan National University] wairport380w@pusan.ac.kr, presenter
Byeong Cheol Lee [Pusan National University] lee2bch99@pusan.ac.kr
Jung Eun Kang [Pusan National University] jekang@pusan.ac.kr

The heat wave has garnered less public attention due to its relatively minor physical damage compared to other natural disasters. However, with the recent exacerbation of climate change, the escalating human casualties have led to an increasing risk in urban areas(Klinenberg, 2015). One important finding of epidemiologic investigations of extreme heat-related morbidity and mortality is that poor and minority populations, located in urban neighborhoods, are disproportionately affected(Luber & McGeehin). Among the vulnerable groups, the elderly are particularly susceptible to extreme heat. Owing to their diminished physical capacity and slower recovery, as well as a higher likelihood of cardiovascular or chronic diseases, they face a surging risk of heat-related illnesses during periods of extreme heat(Epstein & Yanovich, 2019). The local governments are developing or implementing response measures to mitigate the adverse effects of extreme heat, among them cooling centers are the representative measure.

Although cooling center is the most representative extreme heat policy for extreme heat, research on whether it is effectively designated and operated, as well as its current status and accessibility, is lacking.

Accordingly, the study analyzes the service area in Busan Metropolitan City, situated in the mountainous terrain of South Korea. The study collected contour data, road centerline data, and locations of cooling centers via open API. Subsequently, the research calculated the service area considering slope using ArcGIS Pro 3.0. Comparing to previous research, the study adjusted walking speeds to 1.3367m/s for general adults and 0.9416m/s for the elderly by applying the method proposed by Satoh et al. (2006) due to considering the slope and the walking speed

of elderly more meticulously. Additionally, reflecting extreme heat as a natural disaster, the study sets appropriate approach time to the cooling centers at 7.5 minutes, based on evacuation times in South Korea ranging from 5 to 10 minutes. Afterwards, the study conducted an analysis of Spatial Autocorrelation between the service area ratios of cooling center and the natural logarithm of vulnerability variables.

According to the result, a total of 1440 cooling centers are operational during nighttime hours, with 891 of these equipped with air conditioner. The service area of cooling centers based on the walking speed of adults/elderly individuals is 60.19 km2/42.56 km2, respectively. Also, the service area ratio of cooling centers in the downtown is high, while the outskirts is low. According to the spatial autocorrelation analysis, the placement of cooling centers appears to be well-established for traditional vulnerable groups however, it is questionable to consider that cooling centers have been adequately positioned to address the needs of the elderly population. In conclusion, it appears challenging to provide effective cooling centers for heat-vulnerable populations in Busan Metropolitan City, as only about 62% of the designated cooling centers are equipped with air conditioning and theoretically capable of nighttime operation. Therefore, it is necessary to implement nighttime heatwave measures in vulnerable communities by providing incentives or financial support for nighttime operation of public facilities.

While the spatial placement of cooling centers considered socio-economic vulnerable groups, doubts linger regarding whether sufficient consideration was given to the elderly population. In future designations of cooling centers, it is imperative not to simply designate more centers in areas with low service area ratios, but rather to comprehensively consider factors such as age, economic status, terrain slope, etc., to designate additional cooling centers.

ACCESSIBLE SCHOOL TRANSPORTATION FOR DISABLED STUDENTS

Abstract ID: 1108.0.0.341.2024
Individual Paper Presentation

Elyse Comeau [University of Toronto] elyse.comeau@mail.utoronto.ca, presenter
Ronald Buliung [Department of Geography, Geomatics and Environment, University of Toronto] ron.buliung@utoronto.ca

Tim Ross [Bloorview Research Institute, Holland Bloorview Kids Rehabilitation Hospital; Department of Geography & Planning, University of Toronto] tross@hollandbloorview.ca

School transportation is integral to children's education access (Buliung et al., 2021; Ross & Buliung, 2019). Accessible student transport services are organized and implemented in ways that are intended to support disabled students' education access; however, they can at times contribute to their exclusion from education. Barriers within accessible student transportation services have been cited globally as a key obstacle to disabled students' inclusive education. Examples of such barriers include, but are not limited to bus driver shortages, inadequate bus driver training, arrangements causing disabled students to miss classroom time, and even disabled students being forgotten on school buses or dropped off at the wrong locations. By failing to provide reliable and legally mandated accessible student transportation services, school boards may be failing to satisfy disabled children's right to equal access to education, as enshrined within the United Nations Convention on the Rights of the Child, Canadian Human Rights Commission, and provincial/territorial education legislation; in turn, they are at times denying some disabled children equal and equitable access to education.

Given these issues, we conducted a qualitative study that engages the following questions: 1) How do families living with childhood disability experience school travel in the Greater Toronto and Hamilton Area?; And, (2) How do student transport processes and operations materialize norms of able-bodiedness and able-mindedness?

Specifically focusing on their everyday school travel experiences, semi-structured interviews were conducted with 13 disabled children and 13 parents. Interview transcripts were analyzed and thematically coded in NVivo, using Braun and Clarke's (2021) reflexive thematic analysis approach. This thematic analysis was guided by our use of a critical disability studies (CDS) perspective. The CDS lens lends itself to questioning how bodies that do not fit the regulatory norms are subject to oppression when navigating physical environments and institutional processes that are designed with little attention to their needs. Further, our analysis engaged the concept of 'ableism' (i.e., a set of beliefs, practices, and processes that favour certain abilities over others; Goodley, 2014) to question how ableist norms and values may be allowing the perpetuation of inequitable student transportation arrangements and experiences.

Findings indicate that families living with childhood disability undertake different types of additional access work (e.g., administrative, advocacy, emotional, and physical), and often rely on a constellation of care involving various actors and organizations to fulfil daily school transport needs (e.g., education support staff, health care professionals, private and public organizations, family members, and friends). These findings lead us to question the 'normative' logic underpinning school transport operations which places inequitable and time-consuming work on families living with childhood disability. Informed by the challenges experienced by families as well as their ideas, we identify several recommendations for improving the design and implementation of school transport for students with disabilities.

This study contributes to the limited discourse on childhood disability and school travel (and, by extension, education access) in the transport planning literature by explicitly discussing the role of disability theory in the study's design and analysis. This is particularly helpful for scholars and practitioners who are unfamiliar with critical disability studies. Two key study contributions for planning scholarship and practice are: (1) providing in-depth, user-informed direction from families for improving accessible school transport services; and, (2) supporting the active questioning of normalized ableism in both transport and urban planning research, policy, and practice. We

encourage planning scholars, practitioners, and policymakers to meaningfully engage with families living with childhood disability regarding the organization and implementation of accessible school transportation.

ASSESSING PARK ACCESS EQUITY PRE AND POST URBAN REDEVELOPMENT

Abstract ID: 1108.0.0.531.2024
Individual Paper Presentation

Hae Song Jo [University of Seoul] jhs0380@uos.ac.kr, presenter
Chung Ho Kim [University of Seoul] chkim0428@uos.ac.kr

[Background] Parks are crucial public and community spaces in neighborhoods, offering diverse benefits to residents. Because of these advantages, discussions on park accessibility and their equity are becoming active. However, most of these studies focus on the state of equity at a single point in time, and while many countries and cities are working to create equitable parks, evaluation of these efforts is still lacking. Therefore, it is time to discuss not only equity in park accessibility but also equity in accessibility changes at the regional scale.

To provide equitable park services, the Seoul Metropolitan Government is aiming for a balanced park supply by analyzing the supply status of parks as “local living service facilities” and establishing a community plan accordingly. Under these policy stances, parks are supplied by several urban projects. In the case of redevelopment projects for residential areas in South Korea, the existing residential areas are completely removed and high-density apartment complexes and infrastructure such as roads and parks are provided. Recently, however, apartment complexes have been in the form of gated communities due to safety and privacy issues, making it difficult for residents to pass freely. Also, because only a part of the project area can be developed as an apartment complex, low-rise houses are still mixed nearby.

[Research Questions] This study aims to analyze the changes in park accessibility and equity in a neighborhood that has changed due to a large-scale apartment complex and park created by an urban redevelopment project. Our study seeks to answer the following questions: 1) Has the urban redevelopment project improved the park accessibility of the residents in the community zone?, 2) Has the change in park accessibility varied by districts?, 3) Has the urban redevelopment project increased equity in park accessibility?

[Data and Methods] To answer these questions, first, the study area was Ahyeon Community Zone, and data were collected based on 2002, 2016 and 2023 so that it could be compared before and after urban the redevelopment projects and community plan. For park accessibility analysis, data on pedestrian networks, parks, park entrances, and buildings were collected. Next, park accessibility was calculated using the distance to the nearest park and the Gravity index using the UNA toolbox. Through this, we tried to measure the proximity to the park and the diversity of the available parks. Finally, We quantified the equity in park accessibility for all buildings in the Community Zone with the Gini coefficient and compared it before and after the project and by zone.

[Findings] As a result, it was found that the distance to the nearest park increased even though additional parks were supplied as a redevelopment project. In addition, the total area of the accessible parks increased, but the rate of change differed greatly depending on the area. In addition, there was a significant difference in park accessibility and accessibility change rate by area. However, as a result of comparison before and after the introduction of the Community Plan, after the introduction of plan, a park was located at the boundary of the apartment complex and in contact with the surrounding area, improving equity in park accessibility.

[Implications] Our results suggest the importance of selecting the park location and opening the complex considering the equity in park accessibility of the entire neighborhood after the urban redevelopment projects. Specifically, neighborhood-level living area plans can play a role, and planners can assign the complex in consideration of accessibility to existing parks at the planning stage.

ASSESSING THE IMPACT OF SILVER ZONES ON ELDERLY WALKABILITY: A SCM APPROACH

Abstract ID: 1108.0.0.487.2024
Individual Paper Presentation

Heewan Kim [Seoul National University] heewan0608@snu.ac.kr, presenter
Jungmin Yi [Seoul National University] yijungmin@snu.ac.kr
In Kwon Park [Seoul National University] parkik@snu.ac.kr

Silver Zones, pedestrian safety areas specifically designed for the elderly, have attracted attention due to concerns over their effectiveness and spatial mismatch with areas prone to elderly pedestrian accidents. This paper expands the discourse beyond accident occurrence, advocating for an examination of Silver Zone policies' broader impact on overall elderly walkability. With an increasing emphasis on active aging and creating walkable urban environments for the elderly, understanding the implications of Silver Zones on walkability gains significance, particularly at the neighborhood level where elderly mobility is essential.

Situated in the context of South Korea's high rates of elderly pedestrian fatalities, this study examines the effects of Silver Zone implementation on pedestrian safety and vitality. Additionally, by assessing overall walkability, the research aims to provide policy insights to enhance their urban experience and vitality for the elederly. This mutifaceted approach contributes to a comprehensive understanding of Silver Zones' role in shaping urban environments for active aging, providing valuable implications for policy interventions to improve walkability and urban livability for the elderly population.

This study uses the Synthetic Control Method (SCM) to empirically analyze the impact of the Silver Zone policy on walkability, specifically in the traditional marketplace. The SCM, a methodology for assessing policy effects in specific targets or areas with a limited number of subjects, creates a synthetic control group for effect comparison. Since the Jangwi marketplace, the only traditional marketplace designated as a Silver Zone, lacks a control group, this research uses SCM to synthesize a control group by assigning weights to small-scale, neighborhood-oriented, alley-type marketplaces. The analysis focuses on changes in pedestrian accidents and foot traffic before and after the Silver Zone policy implementation in April 2021, drawing comparisons between the Jangwi traditional marketplace and the synthetic control group. Spanning from 2019 to 2023, the data used in the analysis comprise pedestrian accidents, involving the elderly, from Seoul Metro, and commercial district and street-level foot traffic data provided by the Seoul Credit Guarantee Foundation. This comprehensive dataset allows an in-depth examination of the Silver Zone policy's effectiveness in enhancing walkability.

These findings highlight the importance for urban planners and policymakers to consider pedestrian safety measures in broader urban development strategies, especially in areas with significant elderly populations.

BEING MIDDLE-AGED AND SINGLE WOMEN IN THE CITY

Abstract ID: 1108.0.0.90.2024
Individual Paper Presentation

Naka Matsumoto [Meiji University] nakam227@gmail.com, presenter

Over the past several decades, the number of single-person households in city centers of large metropolitan areas across the globe has increased significantly (Klinenberg, 2012). Tokyo, the largest city in Japan and one of the most populous cities in the world, is no exception (Ronald & Hirayama, 2009). In Japan, the rise in women joining the workforce alongside heightened economic uncertainty (given that men are becoming less capable of supporting an entire family as sole breadwinners) are the primary factors contributing to both men and women remaining single. For many, especially women, marriage is no longer economically essential and can even be considered a burden or a risk (Retherford et al., 2001). Consequently, a substantial portion of Tokyo's population is comprised of middle-aged singles born in the late 1950s to 1980s. Without immediate family support, these individuals are aging alone, potentially placing a strain on the social welfare system in the future. Additionally, singles are often considered temporary residents with weaker ties to their neighbors and less engaged in neighborhood activities (Rohe & Stewart, 1996). These characteristics of middle-aged singles may hurt neighborhood well-being, especially during times when cooperation is needed, such as natural disasters or unforeseen threats like COVID-19.

However, contrary to single elderlies, middle-aged singles have generally been overlooked in the fields of urban policy and planning. Through a survey (N=2,547) and interviews with singles (N=22) in central Tokyo, this paper explores the social relationships single women maintain within and outside their neighborhoods and the meaning of neighborhood community and activities for them.

The results indicate that social relationships for singles are influenced by one's gender and age cohort. While single women aged 50–64 maintained relatively active social relationships within and outside the neighborhood and felt less fearful of their futures, younger women between 35 and 49 tended to withdraw from neighborhood activities and worried more about their finances, housing, and future isolation. Uncertainty about the future related to social change (including job loss), the threat of natural disasters, and negative social perceptions associated with being single, middle-aged women disincentivized from participating in neighborhood activities and expanding their social networks within their neighborhoods. One apparent reason was that most of the existing neighborhood associations in Japan are traditionally family-based, and the singles felt excluded from such organizations.

At the same time, while holding back from participating in those organizations, younger single women exhibited some interest in neighborhood activities as opposed to men, who often avoided them, and remained open to the idea of staying in the neighborhood as long-term residents. There was also a higher ratio of homeownership among single women compared to men despite women having lower wages (Yamaguchi, 2019). However, although the middle-aged single women were interested in being more active in their neighborhoods, they preferred casual and ad-hoc neighborhood relationships over joining closely-tied and family-based organizations.

Based on the results, this paper advocates for local governments and neighborhood organizations to take a more inclusive approach towards singles, especially younger women, involving them in neighborhood activities through more unconventional means, such as through personal and social interest-based groups. It also highlights the importance of eliminating economic gender gaps and shifting social norms regarding family status as crucial steps in encouraging their involvement in the well-being of the neighborhood.

BLACK HERITAGE IN THE NATIONAL REGISTER: THE WILLIAMS YWCA IN PORTLAND, OR

Abstract ID: 1108.0.0.1029.2024
Individual Paper Presentation

John Arroyo [University of California San Diego] arroyojc@alum.mit.edu, presenter
Eleonora Redaelli [University of Oregon] redaelli@uoregon.edu
Alexandra May Carson [University of Oregon] amay4@uoregon.edu

In this paper, we analyze the landmarking process of the National Register of Historic Places—a federal program established in 1966—that lists national, state, and local properties considered worth preserving. Using an analytical framework that combines multilevel governance theory (MLG) (Vogel 2007) and Black geography (Summers 2019; Watkins 2013), we focus on the nomination process of the Williams Avenue YWCA in Portland, Oregon, asking: How is its historic significance for Black communities framed? What connects the different levels of government and other actors in the process?

To answer these questions we analyze two key primary documents for the National Register nomination process: the Multiple Property Document (MPD) African American Resources in Portland Oregon, from 1851 to 1973 (Galbraith et al. 2020) and the Registration Form Williams Avenue YWCA (Davis and Ewers 2019). MPDs and Registration Forms are key sources of information and have been underutilized in the academic context, relegating them to a mere bureaucratic function despite the wealth of information they collected about the representation of the ethnic and racial diversity of American history and its influence on the National Register (Hanson et al. 2022).

Built in 1926, the Williams Avenue YWCA offered a place for socialization, recreation, and activism for the African American community, at a time when public spaces were segregated. Today, it is one of the few buildings of the African American community still standing in Oregon's largest remaining Black community.

We start our analysis with how the preservation discourse has shaped perceptions of historical value so that we can better grasp the emergence of attention on Black heritage. Then we outline the key aspects of the National Register process, highlighting its criteria for evaluation of the historic significance, its benefits, the evolution of its framework, and the actors involved over the years. We continue by introducing the City of Portland and illustrating our sources and analytical framework. The analysis articulates the historic significance of the Williams, representing both Black women's history and civil rights and the connections among different actors that flourished during the nomination process. Our conclusions highlight how the broadening of the historic significance and the cooperation

among different levels of government and civil society are instrumental to a racially diverse approach to historic preservation. In particular, cities and their actors play a crucial role in protecting local history, emphasizing the importance of this study and how the overall complexity of the American preservation system contributes to an improved understanding within urban planning scholarship and its contribution to the multifaceted history of places.

The nomination of the YWCA gives voices to African American traditions in Portland that have been not only undocumented but also physically destroyed due to redevelopment because their value was not recognized. Our analysis brings to light how over time the National Register has created a more inclusive listing protecting local realities, enhancing the pluralistic fabric of places, and recognizing the role of underserved communities in the national sphere.

BRIDGING THE ACCESSIBILITY DIVIDE IN BUILT ENVIRONMENTS

Abstract ID: 1108.0.0.1121.2024
Individual Paper Presentation

Maryam Hosseini [Massachusetts Institute of Technology] maryamh@mit.edu, presenter
Andres Sevtsuk [Massachusetts Institute of Technology] asevtsuk@mit.edu
Abdulaziz Abdulrahman Alhassan [Massachusetts Institute of Technology] alhassan@mit.edu
Chu Li [University of Washington] chuchuli@cs.washington.edu
Jon E. Froehlich [University of Washington] jonfcs@washington.edu

The notion of accessibility has been defined by two distinct audiences in urban studies–ones using it to describe universal access via detailed routes among mobility-challenged populations, the others referring to a more general potential for spatial interaction with destinations and opportunities. Examining both definitions and their practical applications, we propose a unified accessibility framework that combines the concept of spatial accessibility from

transportation and planning literature with considerations of universal design and barrier impedance. Using spatial networks as a common baseline for mobility and interaction, we demonstrate how a detailed documentation of physical accessibility impediments, combined with their impact levels on different population types, can be used to achieve a continuous spectrum of accessibility measures that describe the ability to reach and interact with the same bundle spatial destinations for differently abled population types.

Our analysis diverges from conventional accessibility assessments by considering the interplay between pedestrian infrastructures and the individual needs of three distinct pedestrian groups: fully-abled individuals, mobility aid users (such as those with canes or walkers), and wheelchair users. This differentiation allows us to examine how urban environments cater to or, conversely, inhibit access.

We implement the framework in downtown Seattle, WA, where we combine a crowdsourced dataset of geo-tagged accessibility impediments with a detailed sidewalk network dataset and address-level destinations to measure pedestrian access across different physical ability levels to the same destination bundles. We focus our analysis on four broad categories of destinations– public transit stations, schools, parks, and amenities, with the latter category further subdivided into health, personal service, retail, and food amenities–and use a detailed spatial network representation to examine access to these essential destination types among the three different user groups. Our methodology juxtaposes traditional accessibility metrics with barrier-inclusive observations, thereby unveiling significant discrepancies and underscoring critical planning oversight: sidewalks and pedestrian pathways, while physically present, do not inherently guarantee accessibility for all.

The implications of this research extend across the urban planning spectrum, challenging conventional spatial accessibility applications and advocating for a more inclusive approach to urban accessibility. The unified accessibility framework we present aims to not only quantify accessibility but to also contextualize it, offering a metric that is reflective of the diverse pedestrian experiences within urban spaces. For practitioners, the findings provide a framework capturing spatial accessibility through the lens of universal ability. Academically, our work enriches the discourse on both spatial accessibility and barrier-free routes, offering directions for future research. Educationally, it highlights the imperative to imbue planning curricula with a deep understanding of accessibility's multifaceted nature, preparing future planners to champion inclusivity.

BUILDING INCLUSIVE HOUSING INFRASTRUCTURE FOR INTERNATIONAL STUDENTS

Abstract ID: 1108.0.0.1089.2024
Individual Paper Presentation

Zhixi Zhuang [Toronto Metropolitan University] zczhuang@torontomu.ca, presenter

International students are culturally and economically important to Canadian society, contributing to the country's economic prosperity, knowledge networks, and global competitiveness. In 2019, Canada ranked third globally in attracting international students, with 642,000 students contributing annually $22 billion to the country's economy and supporting over 170,000 jobs (El-Assal, 2020). They are also considered as ideal immigrants as they obtain Canadian education, high human capital, and good language skills. However, the admission of over one million international students to the country in 2023, a record high, has heightened public concerns and sparked policy debates about the housing affordability crisis across the country. Many are scapegoating international students, blaming them for driving up housing costs and exacerbating the already limited housing supply.

There is no clear evidence establishing a causal relationship between international students and Canada's housing affordability crisis, which is a complex issue influenced by multiple factors and actors. Instead, many international students have unfortunately become extremely "vulnerable to housing discrimination, rent gouging, rights abuses and sexual harassment," making them susceptible to further exploration (Das Gupta & Su, 2023, para. 1). Additionally, sub-standard, illegal, and overcrowded housing not only threatens the safety of students, but also intensifies public anxiety within local communities and potentially creates tensions with municipalities, which are responsible for creating a safe and supportive environment. Emerging research calls for 'housing justice' for international students and the protection of their housing rights (Pottie-Sherman et al., 2023).

It has become imperative to capture these stories of struggle and to adopt a comprehensive, holistic approach that addresses the needs of international students, encompassing daily necessities, social adjustment, career trajectory, health and wellbeing, and academic life (Calder et al., 2016; Zhuang, 2023). Among these considerations, housing emerges as a pivotal factor profoundly influencing the students' overall wellbeing, academic performance, and their capacity to adapt and integrate into the Canadian society. Building upon the concept of housing as a fundamental human right, this study aims to delve deeper into the housing experiences of international students, examining the involvement of HEIs and community stakeholders in developing inclusive housing infrastructures. It seeks to address the following questions: What are the key challenges international students face regarding housing affordability, availability, accessibility, and associated services, programs, and amenities? How can HEIs and community stakeholders contribute to supporting international students, fostering a sense of belonging, and enhancing community cohesion?

This study emerged from a timely studio project that employed evidence-based methods, including literature reviews, policy analysis, case studies, and semi-structured interviews with key informants. Five stakeholders, representing the for-profit and not-for-profit housing development sectors, student housing providers, and HEI administrative staff, offered their insights into the current challenges and barriers in developing inclusive housing infrastructure and services for international students. Additionally, 24 international students from 14 countries, enrolled across 10 public and private HEIs in Southern Ontario were interviewed to share their housing experiences, encompassing both the positive aspects that support academic performance and wellbeing, as well as barriers and their adverse impacts, such as exploitation by landlords, lack of legal support, limited housing aid, and substandard housing conditions. Interviewed students also expressed a strong desire to build a sense of belonging and a sense of home through their housing experiences in Canada.

The findings offer short-term and longer-term recommendations, including but not limited to increased community and institutional support, intergenerational shared housing, legal and planning policy changes, and incentivizing student housing developments. Specifically, it highlights the need to engage international students and amplify their voices in the ongoing discussion about their housing needs and experiences, to better inform future policies and programs.

COMMUNICATION BY DOING: INFORMAL URBANISM AS "FIRST UTTERANCE"

Abstract ID: 1108.0.0.1018.2024
Individual Paper Presentation

Ryan Devlin [Temple University] rtdevlin@temple.edu, presenter

Community participation has become a nearly universal value in planning practice and education. For planners committed to participatory processes, one of the challenges is finding methods and practices that truly rise up the rungs of Arnstein's Ladder to the realm of partnership, delegated power, or citizen control (Arnstein 1969). In this presentation, I argue that two aspects of classic models of participation tend to hinder deeply participatory processes and then, through an example from recent fieldwork, propose a potential remedy.

The classical model relies on two elements that can pose challenges to deeply participatory planning. First, most participatory planning processes are still examples of "invited" spaces of citizenship (Miraftab 2009), where residents are asked to join a process, usually in a designated location, to think abstractly about neighborhood questions. Second, these participatory processes, while they often rely on collaborative methods to co-produce ideas, nevertheless are usually initiated and directed by professional planners. This presentation argues that, while these methods are useful and appropriate in some contexts, they tend to fall short in others. In particular, "invited"

spaces of citizenship are less useful in communities with large, low income, vulnerable immigrant communities, particularly those with large undocumented populations. In these areas, planners must search for "invented spaces of citizenship" (Miraftab 2009) to engage with communities on their own terms about questions of the use and form of urban space.

To this end, I propose the concept of "communication by doing" as a means of engendering a more inclusive, deeper participatory planning. Drawing on the infrastructural turn in urban studies (Simone 2004) and work on informal city-making in the global South, I argue that planners in the North should turn their attention to the informal practices that immigrant groups use remake the city in a way that responses to everyday needs. Like Tactical Urbanism, (Lydon and Garcia 2015) this process seeks to validate citizen-initiated actions, but adds a focus on inequality, and the needs being expressed through informal action (Devlin 2018). It views informal practices not as unproblematic actions to be romanticized or accepted as-is, but rather as valid "first utterances" in a conversation over urban space, as proposals for use made through practice that can be negotiated and revised through ongoing participatory processes.

As an example, I use the case of Corona Plaza in Corona, Queens, New York City. Corona Plaza, a city-managed public plaza became the site of an vendor market that grew informally during the COVID-19 pandemic to nearly 100 vendors, mostly immigrants from Latin America, selling a variety of food and merchandise. For years, city officials worked to negotiate with vendors, accepting their place in the plaza as valid, even though it was technically not permitted. While this negotiation ended abruptly in August 2023 thanks to a mayoral crackdown on "disorder" in the plaza, it has since continued. Using interviews with vendors and vendor advocates, but also with city officials and planners working on the issue, this presentation seeks to understand the mechanisms – both formal and informal, that allowed for this sort of deep participatory process that validated the vendors' occupation of the plaza as a form of communication by doing. In drawing lessons from this example of practice, this presentation seeks to inform theories of participation, urban informality, and the role of planners in processes of bottom-up city-making.

COMPARING RESIDENT- AND PEDESTRIAN-BASED URBAN GREENERY EXPOSURE

Abstract ID: 1108.0.0.244.2024
Individual Paper Presentation

Dongwei Liu [City University of Hong Kong] dongweliu3-c@my.cityu.edu.hk, presenter

Urban greenery offers diverse and vital benefits to city dwellers. Yet, inequity persistently prevails in individuals' exposure to urban greenery and few cities have managed to prevent it. Realizing such benefits requires various types of contact between humans and vegetation. However, past studies often assess individuals' exposure to urban greenery solely based on their resident or workplace locations, potentially overlooking their diverse mobility patterns, which may result in inaccuracy estimation of actual exposure to urban greenery.

This study introduces a methodology that incorporates street-view imagery to quantify citywide pedestrian volume of different age groups and evaluate pedestrian-based exposure to green spaces. A comparison between this novel method and the conventional residents-based measurement was conducted. We employed both top-down (NDVI) and eye-level (GVI) to measure urban greenery. The combination of these methodologies yields four distinct measures of green exposure: resident-based NDVI exposure, resident-based GVI exposure, pedestrian-based NDVI exposure, and pedestrian-based GVI exposure. We found significant spatial heterogeneity of greenery exposure in terms of value ranges, Gini index, and spatial distribution. Furthermore, a notable contrast between greenery exposure for residents and pedestrians was identified. Additionally, there exists a significant socioeconomic inequity in all forms of green exposure, particularly evident in the considerably higher green exposure among high-income TPU residents compared to their lower-income counterparts. These findings suggest that a more fine-grained and multi-dimensional metric is needed for evaluating environmental justice in terms of green exposure. The study also identifies a positive association between all forms of green exposure and median household income, uncovering inequity in green exposure.

Connectivity between Urban Rail Transit Stations and Pediatric Outpatients
Abstract ID: 1108.0.0.254.2024
Individual Paper Presentation

Boya Hu [TONGJI UNIVERSITY] 2330088@tongji.edu.cn, presenter
Kan Liu [TONGJI UNIVERSITY] liukan@tongji.edu.cn

Rail transit constitutes a crucial conduit for children accessing hospital care under familial escort. This investigation targets ten tertiary-level institutions in Shanghai, comprising pediatric specialty centers, comprehensive hospitals with pediatric units, and maternal and child health facilities. Methodologically, the study involved mapping the nearest subway stations to the pediatric outpatient sections of these hospitals, delineating concentric circles with radii of 300 and 150 meters to formulate time-path diagrams. Furthermore, an 800-meter square perimeter was established around the subway stations and hospitals to generate spatial information tables for the interlinking streets. The research meticulously analyzed the spatial functionalities proximal to the pediatric outpatient facilities accessible from the rail transit stations, identifying patterns within the connective street spaces. Conclusively, by integrating relevant higher-level medical policies, this study explores the pediatric subway healthcare environment within Shanghai and other urban locales, scrutinizing the specific application of rail transit in the developmental paradigm of urban pediatric hospital infrastructure.

Demographic Shifts: Strategic Planning for Education Access
Abstract ID: 1108.0.0.914.2024
Individual Paper Presentation

Sinmyeong Hyeon [University of Illinois, Urbana-Champaign] shyeon2@illinois.edu, presenter

This study examines the impacts of demographic shifts, notably population decline and aging, on the spatial accessibility to education. Education is an essential mechanism for enhancing social mobility, and existing inequities are closely intertwined with the unevenness of educational resources(Xu et al., 2018). Population structure changes are intricately linked to the erosion of tax bases, exerting pressure on local government finances and necessitating adaptations in urban planning and infrastructure demands(Wisniewski et al., 2021). The dual trend of declining and

aging populations is reshaping how educational resources are distributed. Outcomes from tax base erosion include a reduction in school resources, prompting school closures and mergers (Egelund and Laustsen, 2006). The distribution of high-quality educational resources and their spatial accessibility represent critical concerns for day to day government operations and for advancing spatial equity. Therefore, to effectively address these changes, it is imperative to analyze the impact of demographic shifts on urban spatial structures and develop strategic and flexible planning strategies based on these analyses.

Despite the critical role of demographic changes in influencing the accessibility of social infrastructure, the broader implications of an aging population and declining numbers have not been thoroughly considered in policymaking and practical applications toward spatial justice. This research proposes a two-phase methodology that combines an evaluation of the quality of schools paired with spatial accessibility to schools. The initial phase involves using K-means clustering to evaluate the quality of schools in Chicago, Illinois, based on essential indicators such as dropout rates, age/grade distortion rates, and students per class. Subsequently, the research employs a refined version of the gravity model, specifically the Three-step Floating Catchment Area (3SFCA) method, to assess the spatial accessibility of these K-12 schools. This approach not only provides insights into how demographic trends impact the availability of 'good quality' educational services but also facilitates the identification of spatial disparities that arise from these demographic shifts (Pizzol et al., 2021).

This study connects spatial changes, particularly physical accessibility to education to demographic transformations, in this case population shrinkage. Such analysis empowers urban planners and policymakers to adapt school districts and educational service distribution to such demographic shifts, ensuring equitable access to high-quality education across all communities. Furthermore, this research offers critical insights into addressing urban shrinkage beyond mere convenience, highlighting the importance of equality and justice in urban planning and societal structures, and contributing to the development of strategies that foster inclusive and equitable urban environments.

ETHICS AND PRACTICE OF MOBILIZING COMMUNITY NARRATIVES OF URBAN CHANGE

Abstract ID: 1108.0.0.813.2024
Individual Paper Presentation

Helen Pineo [University of Washington] hspineo@uw.edu, presenter
Magdalena Haakenstad [University of Washington] mhaaken@uw.edu
Sergio Montero [University of Toronto] s.montero@utoronto.ca

Research funders are increasingly emphasizing the importance of community knowledge of the social determinants of health, opening new possibilities for supporting health equity through urban planning. Moving away from previous paradigms that emphasized technical and top-down solutions, there is now greater attention to the root causes of health disparities (Corburn et al., 2023). Structural racism, gender and wealth disparities, and colonial legacies are thus currently more prominent in urban health conceptualizations. However, this paradigm shift faces significant challenges and limitations related to knowledge and power. Funders, researchers, governments, and other actors will need to adopt new modes of practice and ways of knowing, which can be undermined by traditional power dynamics and interests (Anguelovski et al., 2020).

Understanding how systemic changes for urban sustainability and equity are achieved is the focus of Change Stories, an international research partnership of academics and community-based organizations (CBOs) that aims to spark dialog and learning through storytelling. The project is funded by a U.S. philanthropy that seeks to promote global learning for U.S. solutions. The three case study cities were selected as examples of substantial multi-sectoral urban change, most recently focusing on physical and social infrastructure for women caregivers in Bogotá, food security in Belo Horizonte and housing rights in Belfast. In this paper, we reflect on a two-year process of co-production leading to an actionable research framework that strives to better understand the role of storytelling in equitable and sustainable urban change and policy mobilization.

The Change Stories research approach was developed iteratively, with an initial grant supporting participatory and social research to define overarching research questions, case study locations and routes to impact in the U.S., as required by the funder (Pineo et al., In Press). A second stage of study conceptualization began once all academic and CBO partners were funded, culminating in a four-day knowledge exchange session with 37 participants, including advisory group members, in Bogotá in March 2024. The meeting's purpose was to build trusted relationships, identify shared goals, engage with decolonial research approaches and find ways to centralize underrepresented community voices in urban change narratives, building on other research (Castán Broto et al., 2022).

Our extended project conceptualization resulted in more radical project ambitions and a greater diversity of methodologies to avoid epistemic injustice (Ortiz, 2022), summarized through the following three outcomes. First, we discussed the colonial and epistemic injustices that tend to dominate the production and circulation of stories of urban planning change. We agreed on the necessity of centralizing residents' voices about urban change, acknowledging that their narratives may conflict with each other and dominant narratives within a city. Such conflict puts responsibility on the partnership to accurately portray diverse understandings of urban change, despite academic and policy community's desire for a simplified story. Second, we agreed that integrating storytelling and other arts-based methods with active participation from our local community members could produce more nuanced stories from the study cities that are more visible, both to global audiences and to the people who live these urban changes. Lastly, we found that experiential learning, specifically visiting infrastructure for caregivers in Bogotá, sparked valuable learning for the visiting CBOs. With simultaneous translation, community partners were inspired by their peers' strategies and the event provided valuable space for reflection.

At a time where funders are increasingly looking for community-based research, our approach highlights the methodological and practical (significant time and financial resources) requirements of developing multi-country research studies that can avoid epistemic injustice. Through Change Stories, we highlight new modes of practices in planning research to facilitate learning from other cities and avoid epistemic injustice.

EXPLORATION OF THIRD PLACES BY OLDER ADULTS: GENDER AND AGE DISPARITIES

Abstract ID: 1108.0.0.205.2024
Individual Paper Presentation

Hyeongju Seo [Seoul National University] jsgshj@snu.ac.kr, presenter
In Kwon Park [Seoul National University] parkik@snu.ac.kr

In South Korea, rapid economic growth, coupled with advancements in living conditions and medical technology, has led to an increase in life expectancy and a decline in birth rates, resulting in an unprecedentedly rapid aging population. Concurrently, enhancement in physical health and activity levels among older adults have underscored the need for third places, i.e., spaces where they can spend time unencumbered, particularly post-retirement. However, there is a dearth of empirical research that delves into the exploration and attachment processes of urban older adults to these third places. Existing studies often overlooked the nuanced characteristics of older adults segmented by gender and age group.

This study aims to analyze the characteristics of third places that older adults voluntarily frequent and use on a regular or routine basis. It delves into their processes of place exploration, interaction, and attachment processes, thereby understanding their urban spatial utilization and demands. A combination of in-depth interviews and participant observations were conducted with a sample of 40 older adults residing in the Seoul metropolitan area and 10 stakeholders, adhering to the principle of theoretical saturation for analysis.

The findings from this grounded theory analysis suggest that "the availability of spare time" and "the pursuit of health in old age" have emerged as direct causal conditions for the exploration of older adults' third places. A supporting policy in South Korea that provides free subway rides for older adults enables them to explore various places within the metropolitan area without constraints. The primary conditions older adults seek in third places are spaces where they can "spend time," "engage in physical exercise," "have flexibility in dates and times of usage," and "bear a low economic burden." Older adults aged 75 and above demonstrate a preference for places where "social activities are possible," "minimal interaction with younger generations" is encountered, and "gender-separated usage is possible." In contrast, older adults aged 65-74 place increased importance on "places for learning" and the "pleasantness, aesthetics, safety, and participation of spaces," while their preference for separation from younger generations and gender separation appears to decrease. This discrepancy is interpreted as a reflection of sharp age-related differences within the contextual backdrop of rapid societal, economic, and ethical-cultural consciousness shifts experienced in South Korean society.

Male older adults, characterized by a preference for "commuting-style mobility," "discomfort with deep social relationships," and a "preference for outdoor spaces" tend to explore various places alone for the purpose of spending time, thereby enjoying multiple third places. In addition, male older adults who had left their hometown in the past tend to regard Jongno 3-ga, an old downtown area in Seoul as a second hometown, evoking a sense of nostalgic attachment. Conversely, female older adults characterized by "spatiotemporal constraints due to household chores" and a desire for "intimate relationships with frequent interaction" tend to seek places of relational hometown such as home or community centers. They generally move with clear purposes within the vicinity of their residence, enjoying one or two third places. They often change their visited third places due to recurring conflicts.

Attachment to places formed during the exploration process of third places results in increased vitality and life satisfaction among older adults. Conversely, when places are consumed without attachment, leading to a view of third places as spaces replaceable at any time within the urban area, it did not lead to increased vitality and satisfaction in life. Collectively, the study identifies the key factors leading to third place attachment and offers insightful policy implications.

EXPLORING PERCEIVED (IN)ACCESSIBILITY OF PEOPLE WITH VISUAL IMPAIRMENTS

Abstract ID: 1108.0.0.585.2024
Individual Paper Presentation

Sagar Verma [Indian Institute of Management Ahmedabad] phd22sagarv@iima.ac.in, presenter
Sandip Chakrabarti [Indian Institute of Management Ahmedabad] sandipc@iima.ac.in

The transportation system plays a key role in facilitating access to opportunities for people to engage in spatially dispersed activities. Ensuring equal participation across all groups, without barriers, is necessary to make the transportation system inclusive and equitable (Pot et al., 2021). However, persons with visual impairments (PVIs) face considerable accessibility-related challenges while traveling independently due to their reduced ability to identify and experience visual elements of travel (Qiao et al., 2023). It has been argued that, to a large extent, this reduced ability stems from perceived travel challenges rather than visual impairment. Literature also suggests that the ability to participate in spatially dispersed opportunities through various transportation modes depends not only on their availability but also on how the surrounding environment is designed and perceived (Low et al., 2020; Pot et al., 2021). This perceived accessibility is argued to be a real basis for decision-making while traveling. To design inclusive transportation systems, policymakers must understand how such perceptions are shaped. Although prior literature on perceived accessibility has sought to explain mechanisms and developed evaluation measures, the consideration of visual impairment is missing (Lättman et al., 2016). Furthermore, studies that have attempted to understand the travel-related challenges of PVIs have not explored the perceived accessibility of PVIs in their surroundings (Mogaji & Nguyen, 2021). In this study, we aim to explore how PVIs perceive their opportunities to engage in spatially dispersed activities through various transportation modes. We also analyze factors that affect the perceived accessibility of PVIs.

We adopt a qualitative research approach involving semi-structured interviews with PVIs in India. This enables us to delve deep into PVIs' travel experiences within the existing transportation system and explore perceptions of accessibility. Using snowball sampling, we recruited 30 PVIs with varying visual challenges (specifically, totally visually impaired by birth, totally visually impaired due to illness/accidents, and partially visually impaired) from various Indian cities. Each interview lasted between 60-90 minutes. We asked participants open-ended questions about their daily activity-travel behaviors and associated problems within the city. We also captured their perceived accessibility based on previous literature, in addition to sociodemographic characteristics. Interviews in regional languages were audio recorded with consent and transcribed in English before thematically analyzing them in an iterative process with ATLAS.ti software. This helped categorize and organize interview data into meaningful and emergent first-, second-, and third-order conceptual categories. Throughout the research process, we tried to ensure the trustworthiness criteria of qualitative research, i.e., credibility, confirmability, dependability, and transferability.

Our study reveals three significant factors influencing the perceived accessibility of PVIs. First, infrastructural support and maintenance play a crucial role, aiding in the identification and interpretation of the surroundings, like station announcements, tactile pathways, seamless movement between platforms and bus/trains/metros, pedestrian space management, design elements of transportation modes, etc. Second, the advent of emerging assistive technologies, such as artificial intelligence-based chatbots and apps, offer promising solutions for interpreting and describing surroundings. These technologies, along with IT support at stations/roads and ride-

hailing apps, help to make travel decisions, especially at unknown locations. Third, people-level support and behaviors exhibited by train/bus/airport/ride-hailing staff and the public significantly impact accessibility perceptions. Instances of misbehavior and associated safety concerns can detrimentally affect the accessibility experience. These factors collectively shape perceptions of accessibility across different transportation modes. Our study presents a framework for targeted and strategic improvements in transportation systems, particularly aiming at improving the accessibility of persons with visual impairments in developing countries. Theoretically, our research underscores the limitations of existing measures of perceived accessibility in the literature and offers improvements.

EXPLORING URBAN EMOTIONAL MAPS UNDER THE PERSPECTIVE OF GENDER DIFFERENCES

Abstract ID: 1108.0.0.532.2024
Individual Paper Presentation

Xiliu He [Southeast University] hexiliu_seu@outlook.com, presenter
Siyuan Hao [Southeast University] 220220040@seu.edu.cn
Shijie Sun [Southeast University] sun_shijie@seu.edu.cn

The urban built environment produces a profound effect on public emotions. Current research on emotional geography has revealed the non-linear relationship and synergistic effect between public emotions and built environment, and has explored public emotions under gender differences in waterfront areas. However, only a few studies have been conducted on the relationship between the built environment and public emotions of various land uses under the gender difference perspective. With the development of the Internet, social media has become a window for the public to perceive the city and express their emotions, providing a large source of data for public emotions research. As the central city of China's Yangtze River Delta region, which has a permanent population of more than 9 million and a complex built environment, Nanjing is a typical representative for conducting this study. This study puts forward new research approaches and perspectives based on more than 56,000 geolocated social media data posted in Nanjing over one quarter. The main content is: (1) classify social media data based on geolocation into six land use types: green space, residential, transportation, public service, commercial and office,

and industrial; (2) use deep learning methods to analyze the emotional intensity and polarity, and construct emotional maps of various land uses; (3) compare the public emotional characteristics of different genders; (4) use a text-subtraction statistical analysis method based on the Jieba and Wordcloud modules to explore the perceptual elements behind public emotions; (5) compare the differences in the perceptual elements of different genders, and propose spatial optimization suggestions to improve urban emotional states. Our empirical study constructs a model of public emotions of different genders in different land uses at the urban scale, and provides feasible technical approaches and planning guidance. This will contribute to helping urban governments to identify the different characteristics of the public emotional perception of different genders in different land uses, and to reveal the perceptual elements that generate the differences. This study supports the development of built environment optimization measures and policies to promote a more positive urban emotional environment.

GENDER DYNAMICS IN PLANNING: THE IMPACT OF FEMALE LEADERSHIP ON PLAN-MAKING

Abstract ID: 1108.0.0.28.2024
Individual Paper Presentation

lu liao [Renmin University of China] luliao@ruc.edu.cn, presenter
Jinghui Lu [Renmin University of China] 18813013977@163.com
Helin Ding [Renmin University of China] dinghl1030@ruc.edu.cn

Throughout planning history, females have played significant roles in various city movement and reshaped modern urban planning theory and practice. However, few empirical studies have examined the role of females and how their leadership influences plan-making. In this research, we construct an innovative dataset of comprehensive plans of 168 California cities based on gender information of 2785 planners, 2019 California Planning Survey, 2017 Census of Governments, and 2020 US Census. Our research examines the role of females and their leadership in shaping plan-making. We connecting feminist theory with leadership theory, and representative bureaucracy theory, to explain how the involvement of women and their leadership in three major institutions of planning – city council, planning commission, planning advisory committee, would shape local plan-making. Our models control for local contexts including population size, local government fiscal revenue per capita, and local government fiscal,

managerial and civic capacities. The descriptive statistics show that female leadership in city council is comparatively rare than that of planning commission and planning advisory committee. The regression analysis indicate that the involvement of women results in more progressive plans – that plans have greater focus on climate adaptation, aging and health, and affordable housing. Overall, our research advances scholarly understanding of the role of females and leadership in urban planning theory and practice.

GEOGRAPHIES OF MISSING DATA ABOUT FEMINICIDE

Abstract ID: 1108.0.0.434.2024
Individual Paper Presentation

Amelia Dogan [University of Washington] dogan@uw.edu, presenter
Catherine D'Ignazio [Massachusetts Institute of Technology] dignazio@mit.edu
Isadora Cruxên [Queen Mary University of London] i.cruxen@qmul.ac.uk
Angeles Martinez Cuba [World Bank] martinezc.angeles@gmail.com
Helena Suárez Val [Feminicidio Uruguay] ladelentes@gmail.com
Natasha Ansari [Massachusetts Institute of Technology] nansari@mit.edu

Feminicide is the gender-related killing of cisgender and transgender women and girls. It reflects patriarchal and racialized systems of oppression and reveals how territories and socio-economic landscapes configure everyday gender-related violence. In recent decades, many grassroots data production initiatives have emerged with the aim of monitoring this extreme but invisibilized phenomenon. We bridge scholarship in feminist and information geographies and planning with data feminism to examine the ways in which space, broadly defined, shapes the counterdata production strategies of feminicide data activists.

Drawing on a qualitative study of 33 monitoring efforts led by civil society organizations across 15 countries, primarily in Latin America, we provide a conceptual framework for examining the spatial dimensions of data activism. We show how there are striking transnational patterns related to where feminicide goes unrecorded, resulting in geographies of missing data. Activists' experiences of data monitoring revealed that some feminicide cases tended to be more legible or “mappable” than others, especially when these “others” intersected with forms

of socio-spatial segregation and inequality. Uneven state planning capacity and infrastructure availability, for example, made it more difficult to identify information about cases in remote or vulnerable communities.

In response to missing data challenges, activists deploy multiple spatialized strategies to make these geographies visible, to situate and contextualize each case of feminicide, to reclaim databases as spaces for memory and witnessing, and to build transnational networks of solidarity. We show that activists navigate and creatively confront geographies of missing data on feminicide through four evolving counterdata strategies: reach, emplace, reclaim, and cruzar (crossing). By reach we refer to counterdata strategies that seek to amplify activists' ability to identify cases and access information from different parts of the territories they cover. The emplace metaphor relates to how activists collect, produce and visualize geographic data in order to situate feminicides in place and in context. Reclaiming refers to spatial strategies that aim to memorialize and contextualize feminicide as a structural phenomenon. Cruzar or crossing highlights how activists' counterdata strategies often involve building connections across territories, practices, and experiences. Our use of cruzar / crossing borrows from the idea of cruzar datos / crossing data put forth in a recent call for Latin American and North-based activists and scholars to collectively reflect on "engaging with data across the borderlands of disciplines, practices, migrations, and languages'' (Alvarado Garcia et al., 2022).

In this sense, we argue that data activism about feminicide constitutes a space of resistance and resignification of everyday forms of gender-related violence. More broadly, our work demonstrates the importance of counterdata strategies employed by civil society organizations in revealing planning inequalities and improving planning practice. The strategies we present are relevant to planners working in partnership with civil society groups and activists to understand and address data gaps or address data gaps or missing data about many issues related to minoritized groups, including structural violence, environmental harms, and housing insecurity.

HEALTHCARE EQUITY AMONG RURAL RESIDENTS IN METROPOLITAN AREAS: A CASE STUDY

Abstract ID: 1108.0.0.458.2024

Individual Paper Presentation

Lu Liu [Tongji University] liulu1205@tongji.edu.cn, presenter

Spatial inequality poses a significant global challenge (UN, 2021), extending across critical domains such as housing, transportation, public health, and safety, affecting urban centers, suburban areas, and surrounding rural areas. Peri-urban and rural communities face additional hurdles, underscoring disparities in the allocation of public resources. Despite ongoing debates over a standardized understanding of spatial equity across economic, social, and cultural variations, there is consensus that it has become pivotal in urban planning.

In terms of healthcare equity, early studies conducted by Shannon et al. (1982) were among the first to investigate healthcare accessibility for indigenous populations in urbanized areas. Later, Luo et al. (2003) introduced the 2SFCA method, considering supply and demand scales, to explore healthcare accessibility with GIS, which has become a cornerstone approach in relative studies. Nevertheless, McGrail et al. (2009) exposed shortcomings in the 2SFCA method when quantifying accessibility in rural areas. Technologies such as Information and Communication Technology (ICT) and online-to-offline (O2O) platforms have reshaped public resource distribution dynamics. Scholars are exploring new approaches, such as the I2SFCA method (Zhang et al. , 2023), which translates online service accessibility into offline parameters for calculation. However, its improvements over the traditional 2SFCA method remain limited.

Healthcare equity among urban-rural residents in China has become a foundational element as the Chinese government has been striving to achieve the goal of equalizing basic public services for many years. In this study, we conduct a case study on healthcare accessibility in the southern Jiangsu region, aiming to reveal the spatial accessibility patterns of healthcare services among rural residents in this region and the resulting spatial inequality and injustice with integrated online and offline methods. This involves:

1) Developing a methodological framework for measuring accessibility: A spatial service network consisting of online booking systems and offline service delivery systems is used to assess the accessibility of healthcare facilities such as pharmacies. Parameters for online services, including supply scale, demand scale, and distance impedance, are recalibrated within algorithms based on real-time factors such as the number of choices, delivery times, and delivery costs.

2) Depicting the spatial pattern of medical accessibility in metropolitan regions: Facility Point of Interest (POI) data is utilized to conduct kernel density analysis, examining spatial clustering patterns of healthcare services. Origin-Destination (OD) path analysis is employed to calculate spatial distance or time cost from demand points to the nearest service supply points. Then, a new algorithm is proposed with necessary data collected by online service platforms to calculate online accessibility. Eventually, the integrated online-offline method provides a refined depiction of the medical accessibility pattern.

3) Evaluating the inequality of medical accessibility patterns and injustice for rural disadvantaged cohorts: Utilizing the Lorenz curve and Gini coefficient, this study assesses disparities with socio-demographic factors to investigate healthcare disparities among rural communities. Additionally, a comparison is made between the traditional 2SFCA method and the integrated online-offline approach, shedding light on the impact of the trend towards online service integration on healthcare equity.

As the research is ongoing, some primary findings have been identified: 1) The integrated online-offline healthcare accessibility pattern aligns with the "central place" theory in multi-centric setups. 2) Online services significantly improve access in suburban areas but have minimal impact on rural areas. 3) Urban areas benefit more from online services, exacerbating healthcare accessibility inequality between urban and rural areas.

HOUSING AS A MEDICAL DEVICE: ACCESSIBLE HOUSING FOR ENVIRONMENTAL ILLNESS

Abstract ID: 1108.0.0.922.2024
Individual Paper Presentation

Justin Stern [Yale-NUS College] justindstern@gmail.com, presenter

This paper focuses on the intersection of urban planning and environmental illness (EI). EI refers to medical conditions in which exposure to everyday pollutants and toxins, ranging from pesticides to synthetic fragrance and low levels of radiation from power lines and wireless devices, trigger adverse and potentially disabling health reactions, such as difficulty breathing, brain fog, chest pain, seizures and anaphylaxis (Steinemann, 2016). Three of the most common types of EI are known as Electromagnetic Hypersensitivity Syndrome (EHS), Multiple Chemical Sensitivity (MCS), and Toxicant Induced Loss of Tolerance (TILT). About six percent of the general population report having a doctor-diagnosed EI and EI is one of the most frequently cited complications of post-acute sequelae of SARS-CoV-2 infection, or long COVID (Kreutzer et al., 1999). In 2016, EI was recognized as a disability by the United States Department of Justice Civil Rights Division under the Americans with Disabilities Act.

People diagnosed with EI experience a range of accessibility barriers to housing and public facilities such as community centers, healthcare facilities and public transit. Housing represents one of the most acute accessibility barriers for people with EI (McCormick et al. 2023). At present, there is no ‘cure’ for EI. The most commonly prescribed ‘treatment’ for disabling conditions of EI is avoidance of triggering environmental exposures (Ziem, 1992). Avoidance represents a considerable challenge considering the sheer range and volume of chemical exposures in virtually all aspects of modern life (Nadeau and Lippel, 2014). Healthy housing, or housing which does not trigger an individual’s EI symptoms, can be extraordinarily difficult to identify (Peek and Lyon, 2015), leading one EI advocacy organization to refer to housing as a ‘medical device’ in and of itself, one that is critical to general health maintenance (Environmental Health Association of Quebec). The case of a 51-year-old woman in Ontario, Canada, who died after an unsuccessful two-year search for healthy housing, is but one example of the critical need for EI-accessible housing (Favaro, 2022).

This paper builds on current scholarship on EI to better understand the unique architectural and planning-related needs of people with EI, with particular attention to access to healthy housing. The paper is motivated by three central research questions: What are the distinct housing needs of people with EI? What are best practices in the provision of housing for people with EI, including construction strategy and materials selection? And which purpose-built EI housing development projects might serve as a global model for EI-accessible housing?

To answer these questions, the paper draws on two months of field research conducted at four different residential communities for the environmentally hypersensitive: the HUD-sponsored Ecology House in San Francisco, California; a chemical-free apartment complex in Zurich, Switzerland; a faith-based housing development near Ottawa, Canada; and the rural EI community of Snowflake, Arizona. The paper adopts a mixed-methods approach, which includes spatial analysis, observational analysis, and semi-structured interviews with architects, building managers, construction firms, public health leaders, and individuals with EI.

Through this analysis, I draw attention to the different strategies that are being taken in Canada, Europe and the United States to provide accessible and affordable multifamily housing for people with EI. I argue that there is a critical need for new approaches to healthy housing for this population. The paper concludes with a more generalizable discussion of how planning practice can better meet the needs of people with EI.

HOW PERCEPTIONS AND ATTITUDES TOWARDS RAIN GARDENS DIFFER BETWEEN GENDERS

Abstract ID: 1108.0.0.1032.2024
Individual Paper Presentation

Huicong Han [Ohio State University] han.2048@buckeyemail.osu.edu, presenter

Rain gardens have been recognized as essential elements of urban green infrastructure, offering multiple benefits. However, the rain garden design typically commences from a gender-neutral viewpoint, inadvertently overlooking

the variances in gender-specific necessities, particularly women's enhanced environmental sensitivity (Rosa et al., 2020).

Understanding the divergent perspectives across genders on rain gardens is crucial for promotion environmental justice. Literature has identified some gender-based disparities in landscape perceptions, such as safety concerns and social demands. Specifically, some research indicates that women visit parks less frequently, especially large parks with dispersed management and extensive natural views. Additionally, women exhibit a stronger demand for urban green spaces and prioritize their recreational, health, and social benefits more than men (Ma et al., 2023). However, despite rain gardens being promoted as urban green spaces, there is a lack of investigation into gender differences in perceptions and attitudes towards rain gardens.

Therefore, this study poses following questions: 1) Whether and how variant genders perceive rain gardens differently regarding experiences, ownership, and ecosystem services? 2) Are there any disparities in attitudes towards rain garden, including tradeoffs between cost and benefits, and willing to pay across genders? If so, how? 3) Are those findings remaining constant between the two countries?

This study uses questionnaire survey to answer these questions. This survey covers six topics, ranging from rain garden experience, ownership and maintenance, ecosystem services, tradeoffs, economics, to demographics. We employed AI to removal of any identifying national indicators in images, such as vehicles. Respondents were asked to select and provide comments on their preferences as well as reasons for various types of rain gardens and offer insights into their decision-making processes. We use presentative samples of residents in Columbus, Ohio, USA and multiple Swedish municipalities, echoing sociodemographic context of these cities. Questionaries are distributed by Qualtrics. This survey gathered 600 responses, evenly split between the two countries.

This study counts the frequency of each option selected and utilizes descriptive statistics to identify variations across genders and examine consistency across different social contexts. Nonparametric analyses, specifically the Mann-Whitney U test and Kruskal-Wallis H test, are employed to assess the significance of differences across genders. Logistic regression is subsequently used to identify the variables contributing to the variability in perceptions and attitudes towards rain gardens among different genders. Gender as well as interaction variables between gender and other socioeconomic factors are included as independent variables, while controlling for socioeconomic variables such as age, race, education level, income, occupation type, and housing conditions.

This research identifies gender disparities in perceptions and attitudes toward rain gardens. Women prefer well-organized designs, while men prefer wilder gardens with more biodiversity. Despite higher motivation for participation, women express lower satisfaction with planning outcomes and communication during rain garden planning and construction. These findings underscore the importance for planners and policymakers to address gender-specific sensitivities and expectations, aiming for more equitable participation and benefits from urban green spaces.

IDENTIFYING BANQUET HALLS AS IMPORTANT SPACES FOR ETHNO-CULTURAL PRACTICES

Abstract ID: 1108.0.0.300.2024
Individual Paper Presentation

Sneha Mandhan [University of Toronto] sneha.mandhan@mail.utoronto.ca, presenter

The Greater Toronto Area is home to people with diverse ethno-cultural backgrounds, many of whom are increasingly bypassing dense downtowns to live in the suburban areas and municipalities in the region. Despite the growing ethno-cultural diversity in the area, local municipal planning efforts do not comprehensively accommodate the ethno-cultural practices and spatial needs of these communities (Viswanathan, 2009; Zhuang, 2021a). This has resulted in ethnic entrepreneurs taking on the responsibility of creating spaces such as places of worship and event spaces, many of which are located in areas zoned for industrial uses (Basu & Fiedler, 2017; Zhuang, 2021b). These spaces serve as critical community infrastructure but are not often formally recognized or supported by local municipalities.

Using the example of privately-owned event spaces serving South Asian communities in the municipalities of Toronto, Brampton, and Mississauga, this paper interrogates cultural planning efforts in these cities to ask: Are privately-owned event spaces currently understood and recognized as being culturally important spaces per planning definitions and regulations? Do these event spaces qualify for any municipal support or protection? What are some of the ways in which these spaces can be integrated into or accommodated by local cultural planning efforts?

This paper uses an analysis of policy documents and interviews with owners and operators of event spaces, and municipal staff working in cultural planning or cultural services to answer the questions posed. Initial findings indicate that most municipal cultural planning efforts focus on cultural production from an economic lens, and fall short of accommodating spaces for the practice of ethnic cultures. Cultural planning efforts currently also do not adequately support the emerging Do-It-Yourself event community, which rely on spaces like banquet halls for their work. This paper contributes to the emerging body of literature on the ethno-cultural use of space and multicultural planning practice.

IMPACT OF NEW METRO LINES ON THE ACTIVITY SPACE OF THE ELDERLY

Abstract ID: 1108.0.0.590.2024
Individual Paper Presentation

Keyu Lin [Tongji University] 2230100@tongji.edu.cn, presenter
Mi Diao [College of Architecture and Urban Planning, Tongji University] diaomi@tongji.edu.cn

The rapid aging of population has emerged as a pressing concern in many countries. With declining physical health with age, the elderly face increasing difficulties in traveling and shrinking activity space, which could have severe negative effects on the well-beings of the elderly and raise significant equity concerns. Metro, as a driver-free transit mode, offers promising potential to improve the mobility of the elderly and expand their activity spaces. Despite its policy significance, there remains a notable gap in research investigating the causal relationship between a new rail transit line and the activity space of the elderly. Existing studies predominately rely on cross-sectional travel surveys, facing the limitations of small sample size and difficulties in establishing causal inference.

To fill this gap, we develop a mobile-phone-data based approach to assess the causal impact of the metro on the activity space of the elderly, using the opening of Shanghai Metro Line 15 in January 2021 as a natural experiment. The mobile phone data used in this study are from a major operator in China, which contain the trajectories of hundreds of thousands of anonymous users in every November from 2017 to 2022. We classify the users into four age groups, representing the youth (19-24), the adults (25-59), the younger elderly (60-69), and the older elderly (70+). With the mobile phone data, we construct a panel dataset to track the evolution of activity space of users at 250-m grid cell level for different age groups over time. The activity space is characterized by metrics including the number of activity spots visited, the area of standard distance circle, and the maximum travel distance.

We calibrate a set of difference-in-differences models to assess the impact of Metro Line 15 on the activity space for individual age groups. We classify grid cells within 500-m of the new metro stations as the treatment group and those within 500-1000-m as the control group and compare the activity space attributes of the treatment and control groups before and after the opening of Metro Line 15. The results show that the opening of the new line has led to an increase in the number of activity spots visited and the size of activity spaces for all age groups, with the elderly enjoying greater benefit in activity space than the adult group. On average, the opening of Line 15 has increased the number of activity spots visited by 8.5 % and the area of standard distance circle by 29.7%, respectively.

As a robustness check, we perform an event study to show that the parallel trends assumption required by a DID analysis is satisfactory. We further use the difference-in-difference-in-difference model (DDD) to explore the heterogeneity of the new metro line effect over space. We find that (1) the elderly living in areas without any metro stations before the opening of Line 15 gain more activity space increase than those living around an intersection station of Line 15 and another pre-existing metro line; and (2) the elderly living outside the suburban areas gain more activity space increase relative to those living in the urban core, which implies that: (1) a new line

in an area that previously lacked a rail network can provide a greater enhancement to the mobility of the elderly in the station areas; and (2) the opening of the new line can help the elderly living outside the suburban areas to gain access to the rich amenities in the urban core.

Our findings provide empirical evidence demonstrating the significant role of metro in enhancing the elderly mobility, which can assist policymakers in planning for age-friendly cities.

IMPROVING EQUITY ANALYSIS IN REGIONAL TRANSPORTATION PLANS

Abstract ID: 1108.0.0.139.2024
Individual Paper Presentation

Maxwell Cabello [University of California, Irvine] mbcabell@uci.edu, presenter
Nicholas Marantz [University of California, Irvine] nmarantz@uci.edu
Michael Hyland [University of California, Irvine] hylandm@uci.edu

Metropolitan planning organizations (MPOs) in the United States develop long-range Regional transportation plans (RTPs), which are required in order for municipalities to receive federal funds for transportation projects. Title VI of the federal Civil Rights Act of 1964 requires MPOs to submit an equity analysis to demonstrate that their RTPs do not discriminate against protected groups. This paper aims to address two research questions: (1) what is the current (range of) practice(s) associated with equity analysis at large MPOs in the US and (2) how can planning agencies improve their equity analyses conditional on their current travel forecasting model capabilities? To identify the range of practices, we perform a content analysis to assess how MPOs define equity goals, identify populations of concern, integrate their equity analysis into their RTP documents, use community input, and whether they meet or exceed legal standards. Additionally, we evaluate how MPOs use travel forecasting models in their equity analyses and the quality of their models; we also describe practical steps for MPOs to improve their equity analyses along this dimension. We find significant variability in how MPOs define fairness in their equity goals, define populations of concern, use community input, and use travel forecasting models in their equity analyses. For example, several MPOs conduct in-depth equity analyses using advanced travel forecasting models, synthetic populations of households, and various classifications of populations of concern. In contrast, other MPOs only display the locations of RTP projects on a map with geographies labeled as disadvantaged or non-

disadvantaged. We also find that MPOs with more restrictive state requirements than federal guidelines produce higher quality equity analyses—an important finding considering the Biden Administration's review of Executive Order 12898, a potential avenue to alter guidelines to improve MPO equity analyses. Despite differences in resources and approaches, we are able to identify ways in which MPOs, regardless of current practices, can advance their equity analyses towards the state-of-the-art equity analysis framework going forward.

Inclusion and Emergency Response: Identity, Location, Politics, and Trust

Abstract ID: 1108.0.0.833.2024
Individual Paper Presentation

Kathy Quick [University of Minnesota] ksquick@umn.edu, presenter
Rebekah Cedar [University of Minnesota] cedar046@umn.edu
Alicia Ruminsky [University of Minnesota] rumin003@umn.edu

The erosion of willingness to call the police in emergencies reflects the public's view of the appropriate role of policing and consent to be policed (McLean et al., 2023). The fact that Black, indigenous, and people of color, younger people, and urban residents are increasingly wary about calling 911 speaks to the connections between place, identity, and safety (Quick, 2022). This is a planning problem of place-associated aspects of inclusion and exclusion (Zapata and Bates, 2015; Jackson et al., 2023), relating to Whiteness as an "encompassing and veiled" quality of access to the advantages of government policies and protection (Goetz et al., 2020, p. 145).

Issues of access to and trust in emergency response have been particularly acute in Minnesota, the location of this study, following the 2020 murder of George Floyd by Minneapolis police officers and ensuing protests. Fearful of biased or violent police responses, some communities now advise against calling 911 and are self-organizing other resources for safety and support in emergencies. Police departments across the Twin Cities metropolitan area have faced significant staff recruitment and retention challenges. Meanwhile, the growing need for emergency services to respond to mental health and addiction crises places new demands on police officers as well as other first responders. Altogether, these patterns increase the risk that those needing help in emergencies may not be willing

and able to access needed support. In addition, the lack of trust in public safety professionals and the heightened anxiety of people interacting with first responders during emergencies may elevate responders' burnout, risks, and trauma (Jacob, Rossler, and Scheer, 2024).

This paper explores what Minnesotans expect from first responders, including 911 dispatchers, police officers, firefighters, and emergency medical technicians (EMTs). We examine public expectations descriptively (i.e., respondents' assessment of the quality of these aspects of emergency response) and normatively (i.e., what values they believe should be prioritized in improving emergency response). Through an anonymous survey, we collected data from 907 consenting adult residents of Minnesota in late summer 2023. Respondents were asked ten short, close-ended questions about their recent use of 911, whether they do or do not feel safe around different first responders (police officers, firefighters, and EMTs), the reasons they might feel more or less likely to call 911 for help, their confidence in different kinds of responses to mental health emergencies (including social workers), and which values they believe should be prioritized in the implementation of and investment in the emergency response system as a whole.

Through descriptive statistics, data visualization, and statistical tests, we explored whether there are patterns of difference in attitudes between urban and rural residents (classified by zip code) or by gender, race and ethnicity, age, income, and political affiliation. Our analysis demonstrates that a substantial majority of respondents have a positive perception of 911 dispatchers, though less so in the context of mental health emergencies. Respondents' feelings of safety are weakest around police officers (compared with other firefighters and EMTs), with statistically significant differences by age (with those aged 18-34 feeling least confident), race (with less than half of BIPOC respondents feeling safe), and income. Political affiliation was also statistically significant, with Republican respondents not only markedly more confident of their safety around police but also being the only group with a majority disagreeing that social workers should respond to mental health emergencies. Before ACSP, we will be performing additional analysis of differences by rural, suburban, and urban places of residence. We will conclude the paper with recommendations for improving the quality of residents' interactions with 911 dispatchers and first responders.

INCLUSIVE VOICES: NAVIGATING COMMUNITY DEVELOPMENT THROUGH DISABILITY LENS

Abstract ID: 1108.0.0.1125.2024
Individual Paper Presentation

Leonor Vanik [National Coalition for Latinxs with Disasbilities] leonor.vanik@me.com, presenter
John Betancur [University of Illinois at Chicago] betancur@uic.edu

The revitalization of lower-income communities often sparks conflict among community development organizations, planners, preservationists, and residents. In Chicago's Pilsen neighborhood, a demolition application emerged quietly during COVID setting in motion a landmark ordinance to preserve approximately 975 buildings and triggering distrust in the community development process, particularly surrounding a contested parcel - the 18th and Peoria Project. Amidst the COVID-19 pandemic, stakeholders, including the Alderman, residents, and activists, contested this ordinance and won; only to find themselves fighting for another transparent and inclusive process to create affordable housing against a backdrop of gentrifying forces at multi-scale levels. As there are many voices in the community development process, this paper examines whose voices speak on behalf of whom, specifically, "How are the myriad of disability community voices being included in inclusive participation of gentrifying communities and how are accessible engagement processes rolled out by City of Chicago and contracted developers?"

Conducted within a larger 35-year longitudinal study of Chicago's Pilsen community, we employ a historical genealogy and grounded critical visualization's mixed-method by the authors who have carefully followed the politics of gentrification in the neighborhood. Drawing on a variety of sources, including published and unpublished materials from archives, secondary data, research publications, photo-voice, interviews, and participant observations, this portion of the research purports on the ethnographic lens as both a disability researcher and impacted resident. The power dynamics between the city's strategies and residents' struggles against gentrification and for community participation are documented and analyzed through the lens of a handful of Pilsen disability activists.

This paper demonstrates the challenges that planners face with engaging the disability community - through a superficial understanding of accessible and inclusive disability communities. Disability continues to be seen as a health descriptor of the person with a disability and not part of the racial and ethnic intersections of multiple social identities that continue to evolve with each generation and cultural privilege. This paper starts the conversation on the need for developing cultural competency disability planning discourse through the introduction of a "Tribrid" model of disability community participation through the intersection of political and capitalistic forces of under/overdevelopment alongside the social production of disability space(s) that is situated in LatDisCrit theories and Disability Justice tenets. This paper also adds to the literature on gentrification and community participation by adding disability voices and their involvement, long missing in the urban development academic literature.

INSIGHTS ON THE APPLICATION OF ACCESSIBILITY INDEX TO PHARMACY SERVICES

Abstract ID: 1108.0.0.1207.2024
Individual Paper Presentation

Sumei Zhang [University of Louisville] sumei.zhang@louisville.edu, presenter
Lihui Bai [University of Louisville] lihui.bai@louisville.edu
Demetra Antimisiaris [University of Louisville] demetra.antimisiaris@louisville.edu

Pharmacy plays a crucial role in the U.S. health care system and often goes beyond the traditional prescription services, as it can also provide vaccination, immunization, diagnostic, preventive and urgent care among others. Inspired by the urgent need for combating the COVID-19 pandemic, authorities are increasingly considering pharmacies as strategic community partners for promoting public health and handling health-related emergencies.

Although community pharmacies are large in number and distributed across broad geographical areas, there is evidence suggesting that their risk-adjusted accessibility to all U.S. residents are not equitable, when risk factors such as age, income, transportation, and health conditions are considered (Chen and Suen, 2023; Guadamuz et al., 2021; Pednekar and Peterson, 2018; Qato et al., 2014). In fact, researchers argue that disparities in accessing community pharmacies are worsening over time and could be an overlooked contributor to disparities in the public health outcomes. Therefore, there is a pressing need for research and development in accessibility to community pharmacy, and pharmacy deserts have emerged as a promising study.

This research uses Jefferson County, Kentucky as a case study to explore an enhanced Pharmacy Accessibility Index (PAI) by integrating additional socio-economic factors relevant to potential pharmacy users. Many existing measures of pharmacy accessibility heavily rely on distance metrics and demographic data at the neighborhood level (Guadamuz et al., 2021; Pednekar and Peterson, 2018). By employing these standardized accessibility measures, we identified non-pharmacy deserts in areas lacking quality pharmacy services in Jefferson County. Our enhanced PAI incorporates several key components: the spatial distribution of pharmacy services and potential users, the quality of pharmacy establishments assessed through Google reviews, and the actual usage of pharmacies based on smartphone location data from Placer.ai. This multifaceted approach allows for a more comprehensive assessment of pharmacy accessibility, considering not only geographic proximity but also service quality and user behavior.

MULTIGENERATIONAL SHARING IN URBAN PLAY SPACES: A CASE STUDY OF WUHAN

Abstract ID: 1108.0.0.654.2024
Individual Paper Presentation

Yumeng Zhang [Huazhong University of Science and Technology] zhangyumeng0606@gmail.com, presenter
Qing Qin [Huazhong University of Science and Technology] iamqinqing@outlook.com

The accelerated pace of urbanization has precipitated a decline in the availability and dispersion of public play spaces within urban environments, posing significant challenges to child development and the overall well-being of city dwellers. In the context of China's "multiple-child policy" and an increasingly aging population, the transformation of family structures has underscored the urgency of child care and companionship, paralleled by the growing prominence of in-home elderly care. The rise in intergenerational caregiving and community interactions has underscored the importance of multigenerational space sharing as a vital urban strategy to address these evolving societal problems and thus redefine the role and boundaries of urban play spaces. The concept of play spaces has transcended their singular recreational purpose to become multifunctional hubs that facilitate educational development and social interaction within community life., making the construction of play environments that meet the shared needs of multigenerational families increasingly vital.

Despite this evolution, research and practical projects often disproportionately cater to the needs of children, neglecting the potential for elderly and broader family member interactions. This oversight limits the potential for urban play spaces to be fully inclusive and comprehensive in their design. Wuhan, a major city in Central China, has made significant progress in urban planning and child-friendly city construction in recent years. Nevertheless, crafting urban play spaces that both cater to children's play needs and encourage interactions among the elderly and various age demographics persists as an unresolved issue.

Leveraging advanced international and domestic insights into play space design and multigenerational inclusion, this study selects Wuhan as a focal point. The research involves categorizing the city's play spaces by functionality, scale, and child-friendliness. Field observations were conducted across 30 targeted sites, enhanced by in-depth

interviews with residents of diverse ages and detailed quantitative analysis, incorporating thirteen indicators across four major dimensions—sociability, growth potential, autonomy, and natural appeal. Aims to explore the dynamics of shared play experiences across generations, the investigation pioneers the introduction of "play imagery," mapping out the dynamic interplay between behavioral patterns in play and the evolving characteristics of physical spaces over time.

The study's findings reveal a notable inverse relationship between physical play activity levels and the accessibility of urban play spaces, suggesting that the most engaging play areas are not always the most accessible. Additionally, the investigation into the time patterns of multigenerational play within a single day indicates variability. It underscores the diverse needs and preferences of different age groups but also suggests that thoughtfully designed shared spaces could serve as a solution to the limitations posed by urban spatial constraints. Participants reported a noticeable increase in physical engagement when spaces were shared across generations, as well as enhanced emotional well-being, contributing to a healthier, more integrated social environment.

Overall, this research delineates the diverse play requirements and preferences of urban populations and contributes scientific evidence for urban play space innovation, advocating for inclusive and comprehensive "people-centric" urban planning to serve the needs of an intergenerational society.

PLANNING FOR AGING: ARE WE MAKING PROGRESS?

Abstract ID: 1108.0.0.419.2024
Individual Paper Presentation

Xue Zhang [Cornell University] xz435@cornell.edu, presenter
Mildred Warner [Cornell University] mew15@cornell.edu

Aging is a global trend that creates an opportunity to rethink economic structure, urban form and approaches to social wellbeing. In this paper, we provide a demographic overview describing current and projected demographic trends by global region using UN and World Bank data (Guillemot, Zhang & Warner, 2024). Then we review the implications of such a change for planners.

Planners have been addressing the implications for cities (Forsyth and Lyu, 2024; Warner and Zhang 2022), but women are still invisible in many comprehensive, economic development and transportation plans (Zhang, Warner, Xu, Wang, 2024). While demography may be destiny, societies can choose the destiny they want. Aging can help us rethink economy, urban form, and societal response.

We present data from three national surveys, conducted from 2013 to 2023 to show how US communities are responding in their planning, zoning, land use and services. We find only slight improvement in the attention to aging in comprehensive, economic development and transportation plans, little movement at all in zoning and land use, and little improvement in service delivery to address the needs of an aging society.

What delays this planning response? It is more than inertia; it is the inability to conceptualize the significant paradigmatic changes required to address the needs of an aging society. These paradigmatic changes include the need to: rethink economic development and recognize its foundation in the care economy, reframe transportation from a commuting to a mobilities paradigm, and shift from separated to integrated land use. But progress has been slow. The American Planning Association (2014) has proposed a comprehensive framework for age-friendly cities that addresses services, built environment, economic and social organization. Concerns over social inclusion and inter-generational equity are centered in these approaches. Aging has the potential to widen our lens as planners to the needs of women, children and others, but greater attention to the social organization aspects is needed if we are to make progress.

PLANNING HIERARCHY OF COMMUNITY FACILITY AND RESIDENTS' TERRITORY COGNITION

Abstract ID: 1108.0.0.263.2024
Individual Paper Presentation

Guiheng SI [School of Architecture, Tsinghua University] sgh19@mails.tsinghua.edu.cn, presenter
Mingyi HE [School of Architecture, Tsinghua University] hemy17@foxmail.com
Weimin ZHUANG [School of Architecture, Tsinghua University] zhuangwm@tsinghua.edu.cn

Background and question: The overemphasis on community territory segregation is one potential cause of social segregation. With the global focus on social inclusion, community planners have been trying to optimize the

distribution of facilities at different planning hierarchies to shape the community's activity circle and promote participation for different groups of residents. Although facility planning affects residents' cognition of territory, previous studies have indicated that residents' cognition is not the same as the planning structure. The question of what elements in which planning hierarchy have more significant impacts on residents' territory cognition is one important research gap and deserves further study for better urban inclusion. This study hopes to explore how facility planning at different hierarchies affects residents' territory cognition.

Methodology: The empirical research was conducted in a mixed residential area (new town) in Singapore. Based on the cognitive map method, the study asked respondents to draw their perceived community boundaries on a map and collected their willingness to share the community during the on-site survey. Then the study calculated the distribution of different types of transportation and functionality facilities within the 200m, 500m, and 1000m range of each respondent's residential location referring to the different hierarchies of new town planning, including the precinct level, neighborhood unit level, and 15-minute walking circle scale, using GIS data. The study built multilevel regression models of territory cognition scopes and planning features under different hierarchies to examine their relationships.

Research findings: The study confirms a positive correlation between territory cognition scope and the sense of exclusivity, suggesting that a compact territorial scope rather than an expansive one is conducive to inclusion. The study also finds that the factors affecting residents' territory cognition vary at different hierarchies. At the 200m level, the distribution of functional facilities has no significant effect, but the fewer the vehicular arterial road space, the more compact the territory cognition; at the 500m level, sufficient facilities for service functions significantly reduce the scope of perceived territory and promote sharing; at the 1000m level, pedestrian roads have a greater impact, with the more sideways having a more compact territory cognition.

Research implication: At the theoretical level, the research provides new perspectives on community inclusion based on territory cognition, suggesting that territoriality is crucial to interpreting inclusivity. At the policymaking and design practice level, the study suggests different emphases at different planning hierarchies to efficiently promote inclusion. For service facilities, a radius of 500m can be considered the appropriate scale to maximize their role; for road layout, attention should be paid to creating a car-free environment at the 200m scale and optimizing the pedestrian environment at the 1000m level.

POWER TO THE PEOPLE: HOW ACCESSIBLE ARE ELECTRIC VEHICLE CHARGING STATIONS?

Abstract ID: 1108.0.0.844.2024
Individual Paper Presentation

Chang Xu [Michigan State University] xuchang1@msu.edu, presenter
Noah Durst [Michigan State University] durstnoa@msu.edu

Electric vehicles have gained significant popularity as the world transitions towards a more sustainable future. Yet, the full potential of this shift is hindered by the accessibility of electric vehicle charging infrastructure, both physically and socially (Wu & Yang, 2020). This study, focusing on the Detroit and Grand Rapids metropolitan areas, embarks on an exploration of the multifaceted nature of accessibility to electric vehicle charging stations (EVCS), probing the efficacy of various metrics employed in prior research, disparities in access based on different social characteristics, and the influence of geographic location. The study first employs Principal Component Analysis to dissect and compare four metrics previously used in scholarly papers to measure EVCS accessibility: distance-based metrics (Falchetta & Noussan, 2021), time-based metrics (Falchetta & Noussan, 2021), concentration-based metrics (Khan et al., 2022), and hybrid metrics (Li et al., 2022). The results indicate a strong similarity between distance-based and time-based metrics, suggesting these two metrics can be substituted for each other. The findings also show that there is no significant variability in considering the road network or measuring straight-line distance for distance-based accessibility. The study then conducts descriptive analysis and multivariate regression, uncovering potential disparities in accessibility from home and work based on demographic groups such as race, income, and education, and highlights the contrast in EVCS accessibility between urban and rural settings to understand how location affects electric mobility opportunities. This study seeks to address key questions regarding the effectiveness of different accessibility metrics, the extent of access disparities among specific populations, and the variance in accessibility from urban to rural areas. It enables policymakers and investors to identify gaps and opportunities in the existing infrastructure, promoting an environment of social equity.

PRIORITIZING UNHEARD VOICES IN EXTREME HEAT RESILIENCY PLANNING.

Abstract ID: 1108.0.0.814.2024

Individual Paper Presentation

Sajani Kandel [University of Minnesota] kande048@umn.edu, presenter

Increasing extreme heat conditions resulting from climate change have threatened cities worldwide. Previous decades have seen a dramatic increase in extreme heat events attributed to climate change, resulting in increases in heat morbidity and mortality. These trends have initiated considerable new research into the study of heat waves and urban heat island effects (UHI). Despite this, the dangers posed by extreme heat have mainly remained unseen, and awareness of the impacts on most marginalized communities is largely unknown. This study adopts a transdisciplinary, mixed methods approach, integrating theories of community-engaged research, participatory action research, advocacy planning, and decision sciences. This study documents the lived experience of low-income seniors in Boston, a socially and racially marginalized group. Findings highlighted chronic heat issues among residents related to diverse challenges such as a crumbling-built environment, weakened social infrastructure and community response, and lack of space for elderly residents to voice their concerns. This reinforced the often-stated observation that heat is not a singular issue but a cascading, dynamic, and complex multilayered problem related to race, socioeconomic conditions, age, health, and physical and social infrastructure. The dynamic and heterogeneous nature of extreme heat impacts low-income seniors of color due to the crumbling-built environment, financial insecurity, lack of social networks, and physical immobility drive heat vulnerability. Secondly, lack of investment in community-level response and support systems largely absent in the city's environmental justice communities often deprive elderly residents of essential services and resources needed to combat extreme weather events. Finally, the findings highlighted the need for inclusive and equitable planning processes and democratic spaces to create pathways that include the voices of our most underrepresented communities in efforts to co-create community-centric, equitable, and just resiliency interventions.

Queering Home – 2SLGBTQI+ Older Adults' Housing

Abstract ID: 1108.0.0.601.2024

Individual Paper Presentation

Victor Perez-Amado [Toronto Metropolitan University] victor.perezamado@torontomu.ca, presenter

Access to safe, affordable housing and care is a pressing concern for all older adults (aged 65+) in Canada (City of Toronto, 2021). Those who identify as 2SLGBTQI+ (Indigenous Two-Spirit, lesbian, gay, bisexual, transgender, queer or questioning, intersex, and other sexual orientations and gender identities), face additional concerns about the potential for discrimination, homophobia, or transphobia from neighbours, staff, or fellow residents as they transition from independent to congregate living settings (Baynes, 2022). Inclusive housing and related services are required to support 2SLGBTQI+ older adults' self-determination and identity (Gahagan, 2020). Some inclusive housing models have begun to emerge in the US and elsewhere that offer various levels of independent and communal elder housing, but there is limited research on inclusive housing feasibility and planning within the Canadian context (Baynes, 2022).

2SLGBTQI+ groups have typically been concentrated in large urban centres and neighbourhoods across the country. Once considered social sanctuaries, these inner "gaybourhoods" typically do not allow for aging-in-place due to a lack of older adults' housing and services (Bitterman & Hess, 2021). As the first generation of openly 2SLGBTQI+ individuals in Canada age (Bitterman & Hess, 2021), there is an increasing demand to develop affordable housing models and policies that meet their needs not only in typical "gay enclaves" but in cities at large. It is also essential to understand the necessities of different 2SLGBTQI+ older adults to avoid generalizations between groups, especially for individuals that identify as transgender, queer, and account for intersectional issues affecting racialized and migrant 2SLGBTQI+ older adults.

This paper investigates the spatial manifestation of age-inclusivity and aging-in-place in Toronto while expanding the definition of inclusivity to encompass 2SLGBTQI+ identities. Theoretically, this paper frames how heteronormative ideals of relationships, family roles, and co-habitation have influenced the development of housing opportunities for older adults, which marginalizes those that do not conform to heteronormative societal standards (Savage, B., & Barringer, 2021). Building on previous research on affordable housing for older adults in Toronto and the extensive expertise of our research partners, this paper contributes to theories on aging-in-place for 2SLGBTQI+ older adults and informs equitable and inclusive design in architecture and urban planning. Specifically, the paper explores 2SLGBTQI+ social configurations, and 2SLGBTQI+ housing studies, using a three-phase mixed method research approach. The research involves multiple modes of quantitative data collection methods, including demographic studies, case studies, and a policy evaluation.

This paper helps 1) advance the age-friendly and aging-in-place housing design discourse; 2) foreground inclusion, equity and diversity in housing for 2SLGBTQI+ as they age; and 3) provide not-for-profit organizations and municipalities with empirical data about existing housing while offering architecture, urban design and planning recommendations to engage in the development of housing guidelines that will enable 2SLGBTQI+ older adults to be safe, supported, and included.

Urban environments frequently witness incidents of sexual violence against women, posing a significant threat to public safety and societal sustainability. Crime Prevention Strategies through Environmental Design (CPTED) to create gender-inclusive cities has been a focus of urban planning. However, due to the lack of data on violence against women and its relations to street-level environment in some large geographical urban areas, the influence of the built environment on such crimes remains largely unaddressed. Furthermore, the spatial-temporal relationship between the macro and micro characteristics of the built environment and sexual violence is still largely unknown.

This research employs Street View Images (SVI), Computer Vision (CV), and Machine Learning (ML) to measure the eye-level street features of Mumbai streets. It addresses the deficiency of street environment data, and provides more environmental variables not previously considered, thereby enhancing the model predictive capabilities for crime rates. In order to more accurately capture the correlations between environmental variables and crime events, this paper divided the macro built environment variables with functional differentiation into four parts: crime defense sites, crime attraction sites, crime generation sites, and crime neutral sites. Then, the data on sexual violence against women are classified into four time periods. Four Geographically Weighted Regression (GWR) models were constructed to capture the geospatial non-stationary of criminal behavior across different periods, and temporal variations in correlations were captured by comparing coefficients across different periods. Meanwhile, this study takes socioeconomic variables as the baseline model, constructs regression models based on micro street view variables, macro built environment variables, and both of them, respectively, to compare the

performance of the models, and analyzes the spatiotemporal changes in the explanatory ability of the explanatory variables in the two groups.

The study reveals that both macro and micro-built environment variables play complementary roles in explaining sexual violence. Specifically, the complexity of street facades, general stores, and fire stations can provide territoriality and surveillance, thereby reducing the incidence of gender-based violence. Maternity homes, casinos, cyber-cafes, and public toilets have been identified as potential hotspots for gender-based violence. In addition, the temporal differences in the same urban variables cannot be ignored. The effects of some variables (e.g., schools, trees, worship) on violence against women varied over time and space, with differences observed between day and night and between southern downtown and northern suburbs. The results of these studies yield several planning and management recommendations.

The results of this study can help planners address the problem of violence against women by improving the built environment and implementing effective management strategies. The consideration of time factors will also help planners optimize resource allocation with maximum efficiency. At the same time, this study demonstrates the potential of leveraging multi-source data and artificial intelligence tools to analyze the correlations between macro- and micro-scale built environment and gender-based violence, providing a practical and scalable method to study women's safety issues in other regions.

The ABCs of DEI in ACDs: Fostering Belonging in Arts and Cultural Districts

Abstract ID: 1108.0.0.420.2024
Individual Paper Presentation

Jonathan Jae-an Crisman [University of Arizona] crisman@arizona.edu, presenter
Stephanie Ryberg-Webster [Cleveland State University] s.ryberg@csuohio.edu
Amanda Ashley [Boise State University] amandaashley@boisestate.edu
Carolyn Loh [Wayne State University] cgloh@wayne.edu

Arts and cultural districts (ACDs) grew as an economic development strategy in the 1990s and proliferated in the 2000s, often in reaction to state, regional, and local programs and incentives (Stern & Seifert, 2010). More recently, the increased emphasis on placemaking as an economic development strategy, including within ACDs, has sharpened critiques from scholars and activists. They argue that place-based arts and cultural economic development or creative placemaking may emphasize aesthetics and promote gentrification rather than focusing on belonging and ensuring inclusiveness (Barry & Agyeman, 2020). In response, some arts policymakers, planning scholars, and advocates are increasingly focusing on how to support diversity, equity, inclusion, and belonging in arts infrastructure and arts interventions (Ashley et al., 2022; Crisman, 2020; Redaelli, 2018). We draw from an original national survey of ACDs in the U.S. using regression analysis to better understand ACDs' prioritization and outcomes of DEI efforts. We unpack the relationship between ACDs DEI efforts and several ACD characteristics including district and organizational type, political environment, and human and financial capacity to understand the degree to which these characteristics enable or inhibit DEI efforts. These insights can provide planners engaged with arts and cultural policy, ACDs, and efforts to integrate the arts into planning practice a better understanding of how to ensure their work contributes toward equity, diversity, inclusion, and belonging rather than gentrification or disbelonging.

The Persistence of Spatial Mismatch in Metropolitan America

Abstract ID: 1108.0.0.586.2024
Individual Paper Presentation

Yunlei Qi [Sun Yat-sen University] qiyunlei@mail.sysu.edu.cn, presenter
Greg Lindsey [University of Minnesota, Hubert H. Humphrey School of Public Affairs] linds301@umn.edu

Problem: Kain's (1968) spatial mismatch hypothesis (SMH) first described the lack of access to job opportunities experienced by Blacks in declining inner cities due to housing segregation and limited accessibility. Over subsequent decades, various legislative and policy interventions in housing and transportation have targeted on the alleviation of spatial mismatch problem faced by Black workers. These interventions may have been effective, but scholars have not reached consensus on the severity of spatial mismatch still facing Black workers. Meanwhile, scholars' attention to other low-income worker groups prompts us to consider if the spatial mismatch for Black workers is more a consequence of structural racism and restricted suburban housing access than the limited commuting options, exacerbated by low wages. These questions establish the need to comprehensively assess the scope and magnitude of spatial mismatch experienced by Black workers and other marginalized individuals in the U.S., including low-income workers.

Research strategy and findings: We provide new evidence on the severity of spatial mismatch experienced by Blacks and low-wage workers in metropolitan America in 2019 for automobile- and transit-based commutes at two time thresholds (i.e., 30 and 60 minutes) using two measures, job accessibility and accessibility-based dissimilarity indices (ADIs). We test the hypotheses: Black workers experienced greater spatial mismatch than white workers; and low-wage workers experienced greater spatial mismatch than middle-/high-wage workers. We find ADIs provide more theoretically valid measures of spatial mismatch because they account for workers' housing locations; whereas job accessibility tends to underestimate the severity of spatial mismatch for Black workers. We find Black/white disparities universal for auto-dependent Blacks across metropolitan areas, but Black transit-commuters do not face disadvantaged statuses in 43 of 100 metros. Disparities experienced by low-wage workers relative to middle-/high-wage workers are not as severe as those of Blacks relative to whites.

Takeaway for practice: These findings comprise evidence that the legislative and policy efforts during the past few decades have not resolved the spatial mismatch problem for Blacks. More effective policies to address structural racism and break patterns of historic housing segregation are still necessary, including housing policies like a rent or purchase subsidy and transit policies like more rapid connections between the low-wage jobs and low-income, minority neighborhoods to better serve the urban poor, and extended transit schedules for night workers. Other solutions such as creating more entry-level jobs near the rapid transit lines with supportive policies and proposing zoning plans to better connect jobs and housing spatially could also be considered to alleviate the spatial mismatch.

The Pursuit of Procedural and Distributive Justice in Hurricane Recovery
Abstract ID: 1108.0.0.78.2024
Individual Paper Presentation

Luis Santiago [Boston University] lesantia@bu.edu, presenter

Hurricane Maria, a category 4 tropical cyclone, hit Puerto Rico on September 20, 2017, causing damages estimated at $112.5 billion, the fourth costliest in US soil (NOAA, 2024). Nearly eight years after the event, some of the lessons from ongoing recovery efforts have matured and crystallized in the minds of participating community organizers, local government officials, and members from academia residing in two of the municipalities assessed as most physically and socially vulnerable in the context of the Puerto Rican archipelago.

Santiago et al. (2022) explored nature-based solution relief funding distribution in coastal regions after Hurricane Maria, documenting intended distribution patterns that did not match the population's social vulnerability profiles. This study explores the pursuit of procedural and distributive justice in hurricane recovery efforts. The central question is: how do procedural and distributive justice challenges affect the ability of local governments and community organizations to collaborate effectively in long term recovery efforts? Justice is explored as a multi-dimensional phenomenon, considering distributional and procedural dimensions. While distributional justice explores the extent to which environmental harms and economic benefits are equally distributed (Cutler, 1994), procedural justice focuses on the ability to influence existing government processes, requiring community engagement in the planning process. It ensures meaningful participation of communities in decisions that affect them to counteract past oppression (Van den Berg and Keenan, 2019). If necessary feedbacks and meaningful engagement are not in place, adaptation processes after extreme weather events are challenged to gain social and political traction due to a weakened state of procedural justice (Van den Berg and Keenan, 2019).

Two facilitated conversations were conducted in 2021 and 2022 to document challenges to achieving procedural and distributive justice through recovery efforts. Data was analyzed using Corbin and Strauss (2014) coding categories to identify and differentiate emerging challenges in collaboration to achieve distributional and procedural justice after Hurricane Maria.

Our working hypothesis is that local government, while more effective in short-term recovery efforts, faces procedural challenges that limit its capacity to collaborate in relief efforts with community organizers and members, particularly in addressing structural inequality issues in the medium and long term. Preliminary findings show that local NGO's and municipal governments played a significant role in short-term recovery efforts, but procedural justice issues impeded broader scale long term recovery efforts. This study contributes to planning scholarship and practice by emphasizing the importance of addressing procedural and distributive justice collaborative challenges in recovery efforts to achieve more equitable long-term outcomes.

Towards Inclusive Autonomous Vehicles Society for Underserved Populations

Abstract ID: 1108.0.0.301.2024
Individual Paper Presentation

Tongbin "Teresa" Qu [University of Texas at Arlington] tongbin.qu@uta.edu, presenter
Lijuan Tang [The University of Texas at Arlington] lijuan.tang@uta.edu
Patrick Dunstone [Michigan State University] patrick.dunstone@gmail.com

New inventions in transportation have consistently disrupted mobility patterns while presenting improvements and challenges each time. Trains, cars, and other innovations have changed how humans live, and cities are planned and organized (Taylor 1951). With each successive wave of technological revolution, mobility for various population groups has changed. Autonomous vehicles are poised to do the same thing again, perhaps more than any other burgeoning innovation today (National Highway Traffic Safety Administration 2017). The rapid evolution of autonomous vehicles (AVs) promises a transformative impact on transportation. As AVs inch closer to mainstream adoption, understanding the perceptions of different user groups becomes paramount.

Studies were conducted to examine the perceptions of AV from population groups. Dicianno et al. (2021) revealed diverse attitudes and concerns among different populations towards AVs. For instance, older adults perceived higher levels of safety, while individuals with visual impairments expressed optimism about AVs but also had significant safety concerns. On the other hand, Ho et al. (2023) undertook a bibliometric research study, analyzing a vast array of scientific articles to discern emerging trends in public acceptance of AV technology. Their study identified key themes such as attitude, trust, technology, and impact, which are pivotal in understanding the user experience of AVs. These studies underscore the multifaceted nature of public acceptance and the importance of considering both the general population and underserved populations in the development and deployment of AVs.

While these previous studies primarily touched upon aspects of safety and technology, the nuances of cost and willingness to pay were less studied. In addition, most studies were cross sectional in nature and conducted at one point in time. To date, very few studies have examined the longitudinal evolvement of AV perceptions over time, especially coving all socio-economic groups and underserved populations in a society. This study aimed to delve deep into the comparative and evolved perceptions of the various groups, focusing on multiple AV perceptions on safety, technology, cost, and economic opportunity with emphasis on underserved populations. The significance of this study lies in its comprehensive investigation of perceptions on AVs. By identifying population groups with low acceptance and affordability but limited mobility choices, interventions can be targeted to mitigate mobility

disparities among the underserved population groups, promote inclusive society with the revolutionary AV technology.

Two Michigan statewide surveys of 2017 and 2022 were used to understand the factors and evolvements of AV perceptions from socio-economic groups. Preliminary results revealed significant disparities between AV perceptions and mobility needs. Those socio-economic groups which have more mobility choices, for example, younger, male, high education, high income socio-economic groups, were more acceptive to AVs, feeling safer, and willing to pay more. In addition, the results showed an overall statewide declining trend on familiarity and comfortableness of AV technology for the 5-year period. However, contrary to the statewide trend, those socio-economic groups which were more acceptive to AVs showed growing receptivity of AVs. The findings offer some reasonable warnings about the mobility disparities exacerbated by the AV technology that those who have more mobility needs will not likely be provided by the AV technology alone.

Towards Inclusive Urban Parks

Abstract ID: 1108.0.0.1031.2024

Individual Paper Presentation

Jingwen Wang [Tongji University] jingwwen@tongji.edu.cn, presenter

Towards Inclusive Urban Parks: A Case Study of Shanghai People's Park and Recommendations for Design Diversity

China's urban parks have their roots in ancient royal and aristocratic gardens, initially catering to the elite and their guests, with limited access for the general public. However, as history unfolded and Western influences permeated society alongside rising living standards, Chinese urban parks underwent a continuous evolution. Gradually transitioning from mere green spaces, they developed into comprehensive public areas, offering an array of facilities and services, thus becoming more inclusive and accessible. Today, urban parks have become integral components of cities, providing diverse benefits and opportunities for citizens. Among their primary functions is the fulfillment of physiological and psychological needs across various demographic groups. Systematic observation, analysis, and research of park usage play a pivotal role in bridging the gap between user demands and the planning, design, and management of urban parks.

This paper focuses on Shanghai People's Park, the largest and most comprehensive urban park in downtown Shanghai. It conducts systematic observation and evaluation of its design, management, and user engagement, delving into community participation mechanisms in its planning and management processes. Furthermore, it analyzes the cooperation and interaction between park managers and citizens, while also discussing how the park fosters equitable enjoyment and community cohesion among urban residents. The research methodology involves meticulous on-site observations, recording user activity patterns at various times and days, encompassing user demographics, types of activities, and utilization of park amenities. Subsequently, qualitative and quantitative analyses are employed to graphically represent these observations, providing a visual depiction of park usage trends. Finally, the observation results are synthesized and analyzed to discern the primary park users, their behaviors and activities, and the efficacy of park design and amenities in catering to diverse societal needs.

The findings gleaned from this research offer invaluable insights into the factors driving diversified park usage and those contributing to territorial segregation in park design. They shed light on whether contemporary parks embody inclusivity, fairness, and diversity. In contexts of constrained public funds, evaluating existing parks becomes essential not only for their future design but also for their renovation and enhancement, ensuring their continued relevance as public spaces within cities. The research underscores the importance of certain design elements that exhibit greater utility and applicability across a spectrum of users. To foster more equitable urban parks and accommodate diverse user groups, designers and planners should incorporate features such as enclosed or open green spaces for leisurely walks, picnics, designated children's play areas, interactive fountain squares, recreational facilities, and spaces tailored for senior activities. It's crucial to note that the aim is not to provide a standardized, homogenous ideal meeting space for everyone. Instead, the paper advocates for considering spatial and amenity types that effectively cater to the needs of different user groups. Ultimately, the paper proposes additional recommendations for designing urban parks with diversity in mind, aiming to enhance inclusivity and community engagement within these vital urban spaces.

TRANSIT-INDUCED GENTRIFICATION IN PLACE: 25-YEAR OF RESTRUCTURING IN TOKYO

Abstract ID: 1108.0.0.145.2024

Individual Paper Presentation

Yudi Liu [Waseda University] yudiliu@aoni.waseda.jp, presenter

Transit-induced gentrification is a rising and still debated theme in critically understanding transportation infrastructure's influence on neighborhood change. The theme emerged following the global boom of transit infrastructure construction and transit-adjacent land development, often labeled as Transit-Oriented Development (TOD). However, scholarly works so far have primarily focused on newly built transit infrastructure, leaving existing infrastructure's long-term influence on transit-induced gentrification a research gap. A plain but notable fact here is that all the infrastructure and development age over time, while early urbanized cities with historical transit have regretfully not received equivalent attention as their growing counterparts.

Emerging transit metropolises worldwide will confront challenges from existing instead of newly built transit infrastructure sooner or later. This research contributes to understanding such neighborhood changes in Tokyo, a relevant global case for observing the changes, with its century-long history of transit-development synthesis and constantly changing built-up environment causing transient housing tenures. A mixture of the above two dynamics is that Tokyo's existing station areas have become hotspots of land redevelopment, framing the common practice known as station front redevelopment (ekimae saikaihatsu) and inducing an incremental decrease in residential and commercial affordability with no or minor changes in transit infrastructure. The paper identifies the changes as an alternative form of gentrification: transit-induced gentrification in place.

This ongoing study is mobilizing an explanatory sequential mixed-method research design, quantitatively analyzing the block-scale (chōchō moku) population and employment datasets of the greater Tokyo from 1995, right after the collapse of the Japanese bubble economy, to 2020 in the national census. Longitudinal spatial data for land price, railway infrastructure, and various facilities support the analysis. Then it qualitatively looks into policies and project documents to engage the result in recent debates on transit-induced gentrification. The quantitative analysis preliminarily confirms that Tokyo is physically intensifying and spatially polarizing, while proximity to station front redevelopment projects raises the neighborhoods' socio-economic conditions. The qualitative interpretation discusses that the process is endorsed by various statutory pro-development policies, leading to a private sector-led practice redeveloping myriad and piecemeal land parcels with or without updating transit infrastructure.

Transit-induced gentrification in place is peculiar from the threefold roles of transit as mobility, infrastructure, and capital in the station front redevelopment projects. Tokyo's path dependence on rail transit mobility guarantees the agglomeration of people and resources around stations, but beyond that, it is indispensable to note that transit entities are social and political. They tie to actors from public policymakers and private investors, carrying out infrastructure and property projects to earn profits from Land Value Capture (LVC), and, in Tokyo's case, the capital provision for property development is more prominent than the less active infrastructure construction. Recently, transit entities-related redevelopment projects have shaped unprecedentedly luxurious urban spaces serving local and, remarkably, transnational consumers. The past 25-year change in Tokyo preliminarily demonstrates that transit-induced gentrification should go beyond the mindset of new transit infrastructure changing old communities. Tokyo reveals a "post-TOD" challenge that emerging transit metropolises across the world will confront when their transit (entities) become(s) popular among most demographic groups, embedded in the urban political economy, and desirous of leveraging neighborhood changes for profit.

TWO GENDERS IN ONE RESTROOM: A CASE STUDY OF WOMEN'S RESTROOM IN SHENZHEN

Abstract ID: 1108.0.0.708.2024
Individual Paper Presentation

Qianni Pan [Columbia University, Barnard College] qp2141@barnard.edu, presenter

The persistent prevalence of son preference has led to sex-selective abortions and skewed sex ratios at birth in China. For instance, the full implementation of the third-child policy resulted in a male-predominated baby boom: in 2020, the average gender ratio was 132.93 (female newborns: 100). In response to the rising needs for childcare, in 2023, a design featuring male-style standing urinals in a women's restroom emerged as a "resolution" accommodating the new demographic of children. In this case, how did a restroom define a desired gender and reveal motherhood oppression? This paper answers the question by focusing on one woman's restroom with installations of male-style standing urinals, located at a children's indoor playground in Shenzhen, China.

Through interviews, ethnography, and engaging with survey data, I argue that the presence of male-style urinals perpetuates systemic oppression, particularly towards motherhood. The design reinforces traditional gender roles by assuming mothers as the primary caregivers accompanying children to such spaces(both the playground and the restrooms). Specifically, this space establishes a 'vacuum' wherein the absence of the father is tacitly assumed by transferring the duty of childcare, bringing children to the restrooms, as familial responsibilities to mothers. From the perspective of the children's playground, the unique design of the women's restroom provides convenience and toilet facilities for mothers with male children, yet simultaneously reveals a broader oppression manifested as women involuntarily and collectively relinquish the public space for men.

UNDERSTANDING THE RISKS OF NATIONAL POLICYMAKING FOR MARGINALIZED GROUPS.

Abstract ID: 1108.0.0.853.2024
Individual Paper Presentation

David Weinreich [University of Bergen] david.weinreich@uib.no, presenter

Integrated transport governance structures at higher levels of government holds the promise of reducing fragmentation along governance boundaries, minimizing service gaps for marginalized groups, integrating services across operators, and increasing ridership due to ease of transfers (Miller et al., 2005).

While these important benefits to transit governance integration have been defined in the literature, the drawbacks have not. This paper explores the risks of higher-level governance integration by examining an “extreme case” (Yin, 2009). While much of the literature has examined European and North American cases of transport governance, we look here at a case in Israel, chosen for its highly centralized decision making process combined with a history of ethnically-based decision making.

Israel’s minimal local autonomy allows integrated national decisions over things like regulation of bus services (Israeli Government Decision 3988, 2011), leading to extensive national coordination of even the most local services. At the same time, this paper demonstrates how Israel’s centralized national governance also exists without strong checks and balances, and without a written constitution protecting equal rights to government services across ethnic groups. This leads to a capricious governing environment, where decisions over mundane but essential services like access to public transport are subject to the policies negotiated by each governing coalition and its respective constituency.

This paper demonstrates how nationally integrated service distribution policies has benefits for service coordination, but risks leaving politically marginalized groups without equal service and subject to the whims of national politics. In Israel this is especially true for its Arab population, a large portion of the 21% of all Israeli citizens classified as non-Jewish in 2018 (Central Bureau of Statistics, 2018). [Note that the occupied territories are governed separately under military rule, and are outside the scope of this paper]. This paper uses interviews with local and national policy makers at the city level and the national Ministry of Transport, as well as the many consultants that develop transport plans for the government to understand the process that has limited transport accessibility to Arab Cities.

Israel has a history of neglecting to provide robust public transport to (ethnically) non-Jewish cities within the Green Line (UN-recognized) areas (Yiftachel, 1999), a problem recognized by the Israeli government with its approval of Resolution 922 of 2015, with the intention of increasing spending on non-Jewish services including transport by 2022 (Israel Government Resolution No. 922, 2015).

This paper focuses on Nazareth and Ulmm al-Fahm, two of the largest Arab Cities in Israel. It examines state documents on transport services provided, and interviews policy makers in the national and local governments in order to understand the reasons for providing services to Arab Cities, as well as reasons not to. This paper makes findings regarding how long-term infrastructure disinvestment has led to ineligibility for many transport services, compounded by political marginalization. Interviews with local policy makers in non-Arab cities indicate it is difficult for any local government to have an influence over the services they receive from the central government, leading to a disconnect between service and local needs, but the impact of this process is most stark in the Arab community.

UNVEILING THE CLOSET-CITY: URBAN BINARY CONSTRUCTS IN BELO HORIZONTE

Abstract ID: 1108.0.0.154.2024
Individual Paper Presentation

Daniela Faria [University of Massachusetts Boston] d.faria001@umb.edu, presenter

Belo Horizonte, the meticulously planned capital of Minas Gerais, Brazil, embodies a paradox at the intersection of urban design and social reality. Conceived at the turn of the 20th century with modernist, positivist, and sanitary aspirations, the city was intended as a beacon of order, cleanliness, and societal hierarchy. However, its streets tell a different story—a vibrant mosaic of diverse voices, including those of marginalized groups and non-normative identities, challenging the very principles upon which the city was built.

This paper navigates the intricate dance between Belo Horizonte's planned orderliness and the messy, multifaceted reality of its inhabitants' lives. Through a critical lens, it examines the deliberate inclusion or exclusion of societal groups within the city's urban fabric, shedding light on the implicit biases and power dynamics embedded in its

plan. Drawing parallels between physical closets and metaphorical ones, it explores how normative social constructs dictate visibility and invisibility, perpetuating marginalization and erasure.

By dissecting the binary nature of Belo Horizonte's urban structure, where clarity and darkness, inclusion and exclusion coexist in uneasy tension, this paper endeavors to challenge the status quo of urban planning. It advocates for a paradigm shift towards inclusivity and diversity, recognizing the richness inherent in the city's diverse tapestry of identities and experiences. This exploration poses a fundamental question: Can urban planning evolve beyond its historical constraints to embrace queerness and create spaces that authentically reflect and accommodate the needs of all inhabitants?

In grappling with this question, this paper not only interrogates the specificities of Belo Horizonte but also serves as a broader call to action for urban planners worldwide. It invites a reimagining of urban landscapes as dynamic, inclusive spaces that celebrate differences and foster belonging, transcending the limitations of binary thinking to embrace the full spectrum of human experience.

WORLDVIEW MOSAIC APPROACH TO URBAN DEVELOPMENTS WITH DIVIDED PUBLICS

Abstract ID: 1108.0.0.1248.2024
Individual Paper Presentation

Maged Senbel [University of British Columbia] maged.senbel@ubc.ca, presenter

This paper addresses the emerging challenge of planning with a divided public and rapid urban change. Numerous cities around the world have committed to ambitious climate actions and are mobilizing their plans and policies to facilitate decarbonization. Other cities have prioritized addressing housing affordability crises by supporting and fast-tracking non-market and rental housing. The City of Vancouver is attempting both by committing to the greenest city initiative, and partnering with the Provincial Government to build thousands of new housing units. It is doing so while also upholding its commitment to the United Nations Declaration on the Rights of Indigenous Peoples. From one perspective these efforts in Vancouver are laudable, and a beacon of progressive planning. From another perspective these efforts are misguided, draconian and threaten to erode the very character of Vancouver’s precious neighbourhoods. Resistance to change has been strong, organized and litigious.

This paper introduces the worldview mosaic as a theorized approach to planning with a divided public. It combines science with art; reason with emotion; and precision with abstraction. If thoughtfully constructed, a mosaic can

harmonize disparate objects into a spectacular composition. It is powerful and beautiful, and can be reproduced in endless combinations of patterns with different meanings, each with its own rationality and beauty. The metaphor is chosen to undergird the importance of appreciating the unique rationality and beauty of different perspectives and worldviews, while recognizing that some perspectives are deliberately destructive and anti-social and resistant to harmonization with the whole. The mosaic metaphor also suggests that there is much greater diversity within seeming homogeneity, and much greater commonality within seeming difference, in the individuals and communities that make up our society.

In theorising the worldview mosaic this paper builds on Lederach's Moral Imagination (2005), ethnocentrism and intercultural communication, therapeutic planning, trauma informed practice, and inclusive public engagement. It allows for multiplicity and complexity in framing individual and community perspectives, while underscoring the fundamental power of othering in creating social order or disorder. Voicing and elevating the lived experience of the people affected by urban development, along a broad temporal frame, is at the core of the worldview mosaic approach, particularly as it relates to decolonization.

Using four highly publicised development projects in Vancouver, this paper applies the worldview mosaic approach to ask the question: how can public dialogue leverage contested urban development projects to bridge across polarization and division? Each of the projects experienced strong opposition against resilient support. Using a combination of grey literature, news and social media, public meeting archives and legal judgments, the author builds a series of narratives for several different actors in the various projects. Applying the mosaic approach the author finds that local discourse is more nuanced than the facile depiction of NIMBY against YIMBY. The discourse also borrows liberally from global discourses that pit right against left, and liberal against conservative, but it does so selectively and strategically. For example, to make an argument more persuasive conservative values are disguised in liberal language.

Ultimately the mosaic approach reveals that discourse is primarily self-referential, on both sides, with little attempt to engage deeply with the other, or with the other's worldviews and lived experience.

Managing expectations and reactions to the inevitability of a singular outcome, when there is a multiplicity of desired outcomes, is an emerging challenge for planners working with diverse and divided publics. While planning has always been political, urban development projects are increasingly becoming arenas that reflect the societal trends of politicization, fracture and polarization. The worldview mosaic approach offers conceptual and practical tools to help planners with this growing challenge.

A GIS-BASED ACCESSIBILITY AND EQUITY ANALYSIS OF URBAN PARK DISTRIBUTION

Abstract ID: 1110.0.0.938.2024
Research-in-Motion (RiM)

Tahsin Tabassum [University of Oklahoma] tahsin.tabassum-1@ou.edu, presenting author
Ladan Mozaffarian [University of Oklahoma] ladan.mozaffarian@ou.edu

Accessibility is a multifaceted concept essential for evaluating the spatial relationship between origins and destinations, encompassing factors like distance and speed (Nicholls, 2001). In recent decades, accessibility, particularly concerning the quality and distribution of urban parks, has become integral to urban green space development. Scholars discuss that when the distribution of parks aligns with the population density, accessibility to urban parks is enhanced (Tsou et al., 2005). Optimizing accessibility is pivotal for determining park locations, ensuring ease of access for the maximum number of people. Parks are deemed suitable and convenient when they adequately serve densely populated areas. It is imperative for urban green spaces to be sizable enough to accommodate the local population and be easily reachable within walking distance, as emphasized in previous studies (La Rosa, 2014; Wright Wendel et al., 2012).

Dallas, a rapidly expanding city in Texas, has experienced significant population growth, with the metropolitan area witnessing a 25% increase in population from 2010 to 2022 (See: https://texas.reaproject.org/). As urban sprawl continues unabated, concerns about sustainability have heightened, particularly regarding the preservation of urban green spaces amidst rapid development. The rapid urbanization trend poses challenges for city planners and decision-makers, necessitating sustainable strategies to guide new projects while safeguarding the city's green spaces from various threats. Despite numerous studies on urban growth, research specifically addressing urban green spaces remains scarce.

To address this gap, this study aims to assess the distribution and accessibility of urban parks in Dallas, TX through conducting socio-spatial analysis. We conducted comprehensive mapping of Dallas's 195 parks across various categories, including pocket/mini parks, civic plaza parks, linear parks, neighborhood parks, community parks, special purpose parks, metropolitan parks, and dog parks. To achieve this, we employed diverse data sources and mapping tools, including Google Earth Pro, City of Dallas GIS Services, land use data, and Census Bureau Data. Initially, our analysis focused on examining the geographical distribution of urban parks within the city. Subsequently, we utilized the network analyst tool in ArcGIS Pro to delineate the service regions of these parks. The

study further employs the Lorenz curves strategy to delve into the equity scenario regarding park accessibility in Dallas. This method allows for a detailed analysis of the distribution of park resources across different segments of the population (Delbosc & Currie, 2011), providing valuable insights into potential disparities and informing equitable planning strategies.

The study reveals that urban parks in Dallas are predominantly concentrated in the city center, with special-use parks catering to both locals and visitors. However, this clustering leads to an uneven distribution of parks, posing accessibility challenges for many citizens. Specifically, there is an evident scarcity of neighborhoods and pocket parks in the southern part of the city, impacting a significant portion of the population. This shortage underscores the need for a more equitable distribution of parks throughout Dallas to effectively serve all residents.

By employing the Lorenz curve method, the study will further analyze the equity scenario regarding park accessibility in Dallas, shedding light on potential disparities. These findings are crucial for improving the accessibility and spatial sufficiency of parks in the city. City planners can utilize this information to better understand the current adequacy of parks and identify locations for future urban park development. Ultimately, the study's insights can inform more equitable and effective urban park planning and design strategies in various geographical location in the United States.

MINDFUL STREETS: PLANNING FOR NEURODIVERSITY

Abstract ID: 1110.0.0.455.2024
Research-in-Motion (RiM)

Samantha Leger [University of Waterloo] sjleger@uwaterloo.ca, presenting author
Jennifer Dean [University of Waterloo] jennifer.dean@uwaterloo.ca

Planning for equitable and inclusive built environments is critical in contemporary planning practice and theory. We are now aware of, and actively attempting to unsettle, systemic ableism, racism, sexism, and genderism produced and upheld by historically unjust planning practices. Part of this effort is deploying more progressive approaches to planning for disability, wherein we design with respect and consideration to the full spectrum of (dis)abilities and different abilities (Ross et al., 2023). Such thinking led to the introduction of planning for neurodiversity (Kenna,

2023).

Planning for neurodiversity acknowledges, respects, and uplifts neurodiverse people within urban planning processes and practices. Neurodiversity is a comprehensive term that encapsulates diagnoses of autism spectrum disorder (ASD) and attention deficit and hyperactivity disorder (ADHD), as well as other learning disabilities. In recent years, social and medical understandings of neurodiversity have changed drastically leading to the destigmatizing of neurodiverse identities and a rise in diagnoses, especially among adults and women.

Despite this prevalence, there has been very little attention given to neurodiversity, even in planning efforts that strive to be inclusive. For example, the efforts of transportation planners to accommodate 'all ages and abilities' in transport infrastructure, seldom consider neurodiversity and different mental capabilities (Elliot, McLeod, Bopp, 2022). Yet, the limited body of research that examines neurodiversity and the built environment, suggests that experiences in transportation (regardless of mode) have the potential to impede and limit accessibility for neurodiverse-identifying people (Kenna, 2023; Toronyi, 2021). This study fills a gap in understanding the relationship between neurodiversity and transportation accessibility more broadly and provides recommendations for how to better accommodate neurodiverse experiences in how we plan our streets and mobility networks. This session will introduce exploratory research about transportation behaviours among neurodiverse populations as well as the potential avenues to integrate neuro-inclusivity into transportation planning processes and practices. An important facet of planning for inclusion is centring the voices of those with (dis)abilities or different abilities in the work (Ross et al., 2023), and this study adopts this approach through the use of walk-along interviews conducted with Ontarian residents who identify as neurodiverse and actively travel around their communities. This method allowed participants to share their embodied experiences of walking along different street typologies and reflect on their infrastructure preferences and perceived comfort and safety.

In addition to the interviews, a knowledge mobilization activity was conducted with professional planners to co-develop practical design guidelines for neuro-inclusive streetscapes and transportation systems. The recommended guidelines address common barriers to accessibility, comfort, and perceived safety on the street, and provide a way forward for neuro-inclusive planning in transportation policies and practices.

Preliminary findings from this work suggest that planning for neuro-inclusivity is both a process and a product that requires urban planners to reframe their positionality, common sense, and preconceptions to reimagine planning processes that can be truly inclusive and progressive to accommodate 'all ages and abilities'. Designing for neurodiversity in transportation planning is needed to make streets and transportation networks more accessible and comfortable. Such thinking aligns this work with the ongoing struggle for mobility justice (Sheller, 2018) and provides a novel lens into how we can envision neuro-inclusive and mobility-just futures.

PUBLIC-PRIVATE COOPERATION TO METRO-BASED ACCESSIBILITY AND EQUITY

Abstract ID: 1110.0.0.555.2024
Research-in-Motion (RiM)

Yuling Yang [The University of Hong Kong] yuling93@connect.hku.hk, presenting author
Jiangping Zhou [The University of Hong Kong] zhoujp@hku.hk

Public transit can connect people to many destinations within a reasonable travel time at reasonable costs, thus safeguarding people's decent level of motorized accessibility to (essential) opportunities and ensuring related equity. In practice, such accessibility and equity depend on not only the government's endeavors but also on those of the private sector. However, the existing scholarship has rarely considered the role of the private sector in the (initial) supply and continued stabilization of accessibility. In this manuscript, we use empirical data from Hong Kong to illustrate how the public and private sectors can work hand in hand to improve and sustain metro-based accessibility and related equity. We theorize three typical urban forms concerning the metro-based accessibility supply: adaptive cities, adaptive transit, and mutual adaption. Based on empirical data such as census data and geo-spatial data, we quantify the recent metro-based accessibility and related equity in Hong Kong. Specifically, we compared how accessibility varies across different time intervals in different geographical areas and income groups. Based on the understanding of recent metro-based accessibility and related equity, we use the above theorization and case study method to examine the roles of the public and private sectors in producing/ensuring metro-based accessibility and related equity at both the metro line and station levels. We find that achieving/ensuring/sustaining the metro-based accessibility and related equity requires cooperation between the public and private sectors, regardless of the urban forms. Our cases/findings illustrate how public-private cooperation can come about and evolve.

TYPOLOGIES OF COMMUNITY ENGAGEMENT IN ZONING REFORM: LESSONS FROM OREGON

Abstract ID: 1110.0.0.774.2024
Research-in-Motion (RiM)

Jose Melendez [University of Oregon] jmelende@uoregon.edu, presenting author
Rebecca Lewis [University of Oregon] rlewis9@uoregon.edu

Oregon is at the forefront of the middle housing policy debate as the first state to push middle housing zoning changes at the state level, requiring cities over 10K in population to allow duplexes on lots zoned for single homes, and larger cities over 25k to allow triplexes and quadplexes in addition to duplexes (ORS 197.758). In requiring that cities update ordinances to allow middle housing, the state provided a model code that could be implemented. For cities that did not want to implement the model code, cities could choose to adopt their own ordinances consistent with minimum standards in the Oregon Administrative Rules. In either case, cities chose the type and level of community involvement in adopting state-mandated ordinances. HB2001 was supported by a broad coalition of interests including the development sector, environmental groups, housing nonprofits, and social justice organizations.

Research on adoption and implementation of middle housing reform is sparse to date. There has been tremendous attention paid to zoning reform by think-tanks and special issues of academic journals like the Journal of the American Planning Association which published several articles debating the merits of middle housing zoning reform (e.g., Wegmann, 2020; Manville, Monkkonen, & Lens, 2020). However, there has been limited research examining the implementation of Oregon's zooning reform policy and limited research on how the community is engaged in adopting zoning reform at a local level. This study fills an important gap in knowledge of community engagement and zoning reform.

We examined the public engagement efforts of the 11 largest cities in Oregon to consider what role equity played in designing public engagement methods, and whether or how engagement with underrepresented community groups informed the code adopted at the local level. We focus on equity, as it relates to either how cities structured public engagement processes that amplified historically under-represented voices and/or on outcomes of the zoning changes that prioritized reducing restrictive regulations. Advocates of affordable housing and organizations that voice under-represented community interests typically recommend eliminating regulations given how research suggests that eliminating zoning restrictions can increase the production of a wider range of housing options and lower the price of such units (Calandrillo, & Dunn 2024).

To run our study, we conducted extensive web research to document public engagement processes. We also conducted interviews with key city and local stakeholders. Finally, we coded the public engagement efforts against ideals of democratic practices, using Smith's framework (2009) for innovative designs for public engagement.

Our findings highlight key strategies different cities undertook to engage underrepresented groups. These strategies varied in size and scope, from a more top-down approach in Bend, to a more bottom-up approach in Eugene that included a lottery selected panel. Surprisingly, our findings suggest that the method of engagement did not determine the level of restrictiveness of the zoning code. This might suggest the double-bind embodied between a pluralist versus advocate approach to planning (Davidoff, 1965). Overall, we found that most cities, even when they went out of their ways to engage in the public, performed poorly when evaluated using Smith's framework, failing to advance democratic ideals. We will highlight the exceptions and end with key lessons for

moving beyond common engagement efforts that have taken root in planning practice even when they fail to design beyond outreach efforts that prioritize collecting input and communication.

Track 6 – Housing

Track 6 Pre-Organized Session Summaries and Abstracts for the Sessions

BALANCING STATE AND LOCAL POWER FOR HOUSING PRODUCTION AND AFFORDABILITY
Abstract ID: 1112.0.0.140.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.250.2024, 1108.0.0.185.2024, 1108.0.0.377.2024

Minjee Kim [Florida State University] m.kim@fsu.edu, organizer

The high cost of housing and limited production of new housing have prompted state legislatures throughout the country to consider policy solutions that can tackle housing affordability. One such policy option has been state preemption of local control. This session brings together five papers that grapple with the challenges and effects of such state preemption. Presenters will discuss concrete cases of state preemption of local zoning and land use, the administration of housing choice voucher program, and the implementation of comprehensive plan mandates. Contemporary developments in the states of California, Florida, Indiana, Iowa, and Texas will be discussed and analyzed. Presenters will share the processes, politics, implementation, and effects of state preemption, with particular focus on how such preemptions have affected housing affordability. This session contributes to the growing literature on zoning reform for housing affordability and sheds a renewed light on the longstanding power struggle between state and local governments by considering the variations in the political and socioeconomic contexts within and across the states.

Learning Objective(s):

- Explain contemporary examples of how state legislatures have stepped in to limit local control over zoning and land use and administration of housing programs and policies
- Understand the opportunities, efficacies, and pitfalls of using state preemption for addressing housing affordability
- Compare state preemption approaches across different states and explain how the outcomes of policy interventions may differ due to the variations in political and socioeconomic contexts

STATE ZONING OVERRIDE AND THE COST OF HOUSING: FLORIDA'S LIVE LOCAL ACT
Abstract ID: 1108.0.0.250.2024
Pre-Organized Paper Presentation

Minjee Kim [Florida State University] m.kim@fsu.edu, presenter

Restrictive land use regulations, particularly those requiring discretionary approvals or zoning changes to build apartments, have been one of the primary and most powerful tools to keep out low-income households of color from affluent suburbs (Davidoff & Davidoff, 1970; Whittemore, 2021). More recently, scholars have shed light on how such discretionary land use approvals are likely to increase the cost of housing production (Manville et al., 2023; Kim, 2020). One strategy to tackle these issues, gaining popularity in recent years, is the state preemption over local zoning ordinances (Ifranca, 2019).

In March 2023, the Florida legislature passed a landmark legislation referred to as the Live Local Act (LLA), signed into law by the governor on March 29. It was an omnibus housing bill that included funding and tax incentives for affordable and missing middle housing. Moreover, LLA created new laws that override local zoning ordinances to promote the construction of income-restricted, affordable housing projects.

The original 2023 LLA overrides local zoning on three aspects: use, density, and height. On the use front, LLA allows affordable housing projects to be built on any land zoned for commercial, industrial, or mixed-use if at least 40% of the units are reserved for households earning up to 120% AMI for at least 30 years. On the density front, LLA allows affordable housing projects to be built up to the highest residential density allowed within the locality. On the height front, LLA allows affordable housing projects to be built up to the highest allowed height for commercial or residential development within one mile or at least three stories. The 2024 amendment to the LLA further eliminated minimum parking requirements in transit-oriented development areas and clarified that LLA projects can be built up to 150% of the maximum allowable Floor Area Ratio (FAR) within the jurisdiction.

Developers of Low-Income Housing Tax Credit (LIHTC) projects, referred to as “tax credit developers” in the real estate industry, are the natural and intended beneficiaries of LLA. LIHTC projects automatically meet the income threshold and thus can potentially be built on any land zoned for commercial, industrial, or mixed-use and ignore the density and height limits. This paper examines how LLA has affected the tax credit developers and their projects. I answer this question by analyzing 154 LIHTC applications for the 9% tax credit program in 2023, 24 of which were ultimately selected, and compare those with LIHTC applications and recipients in 2022, prior to LLA. I also present lessons learned from interviewing tax credit developers.

LLA was intended to ease the construction of LIHTC projects. However, beyond this obvious and direct effect, I find that LLA has had a serendipitous positive effect on non-LLA, LIHTC projects. These projects reported seeing lower land acquisition costs due to the increased competition in the land market. Landowners that used to command monopoly prices due to the scarcity of land suitable for LIHTC projects were losing ground. I corroborate this serendipitous effect by analyzing the land acquisition costs of 2022 and 2023 LIHTC applications, developer interviews, and case studies. The findings from this study contribute to the growing literature on the efficacies of zoning reform for housing production and affordability. The study also sheds light on the longstanding literature on the economics of land values and regulatory stringency.

STATE PREEMPTION FOR AFFORDABLE HOUSING: FLORIDA'S "LIVE LOCAL ACT"

Abstract ID: 1108.0.0.185.2024
Pre-Organized Paper Presentation

Elizabeth Strom [University of South Florida] estrom@usf.edu, presenter
Jared Austin [University of South Florida] jaredaustin@usf.edu

Central theme: The dearth of affordable housing has become a pressing issue in many US metro areas. While there are many factors shaping housing markets, in the past decade we've seen increasing focus on land use and zoning codes as barriers to the expansion of the housing stock. This paper studies the local implementation and impact of Florida's 2023 "Live Local Act" which among other things has preempted some local commercial and industrial zoning to encourage more housing production. It includes case studies of three counties and two cities in the Tampa Bay region, with the goal of determining 1. Whether local officials are enthusiastic, neutral, or resistant to this new policy approach, and 2. Whether this policy has resulted in new housing starts (and if so, where and for which income levels).

Methods: This research is primarily qualitative case study research. We use several data sources to capture the local government response to the Live Local Act. First, we will be following housing projects that invoke the Live Local Act to build housing in areas zoned industrial or commercial. Secondly, we are downloading, transcribing and analyzing City Council and County Commission meeting minutes where the implementation of Live Local is discussed. Finally, we are interviewing planners, elected officials, housing officials and affordable housing builders in our study area to get further insight into their response to the Live Local Act.

Findings and Relevance: Our findings will provide insight into the responses of local housing and planning actors when confronted with a state preemption aimed at encouraging housing development. Our research will allow us to identify local government characteristics that inform different responses to the Live Local Act preemption. Because such policies are relatively new everywhere and just a year old in Florida, these findings will be novel. Moreover, Florida differs from several other states and cities overriding local zoning to encourage housing in that the Florida preemption only involves commercial and industrial land. This provides an interesting contrast to preemptions or local zoning changes that seek to change challenge single family zoning.

As more states and communities consider ways to alter zoning to promote housing development, this research is quite salient to planning scholars and practitioners. It addresses the political and practical implications of zoning changes as tools of affordable housing policy, and contributes to the literature on state-local government relations.

SOURCES OF POWER OVER SOURCE OF INCOME DISCRIMINATION

Abstract ID: 1108.0.0.377.2024
Pre-Organized Paper Presentation

Justin Steil [Massachusetts institute of Technology] steil@mit.edu, presenter

Tensions between cities and states over home rule and the powers of cities to innovate are long standing, as are political differences between city councils and state legislatures (Frug, 2001). The increasing political polarization over the past decade has been accompanied by a long-standing but growing geographic sorting based on political affiliation, both across states and between cities and rural areas (Rodden, 2019). State preemption of housing laws, cutting in multiple directions, has grown rapidly over the past decade, such as state laws preempting local single-family zoning provisions (e.g. California, Oregon, Maine, and Montana) and state laws preempting local tenant protections (e.g. Texas, Florida, etc.). As Congress has shifted funding from public housing to Housing Choice Vouchers, the Housing Choice Voucher program has become an increasingly crucial lifeline for more than 2 million low-income households across the country. Although Congress allocates funding for the Housing Choice Voucher program, the federal Fair Housing Act does not prohibit discrimination against voucher holders, commonly known as source of income discrimination. The number of states and localities enacting laws protecting voucher holders from discrimination has grown rapidly over the past decade (PRRAC Appendix B). At the same time, in response to local laws prohibiting discrimination on the basis of source of income, four states have passed laws preempting source of income protections: Indiana (2015), Texas (2015), Iowa (2021), and Florida (2023), with other related laws under consideration in additional states. This paper analyzes the political dynamics leading up to the passage of these four laws and the similarities and differences in their design, relating them to literature on the political dimensions of state preemption (e.g. Fowler and Witt 2019; Goodman and Hatch 2023) and on the collective action dimensions of progressive and conservative efforts to affect local and state legislation. It also reviews developments in preemption legal doctrine and implications for housing policy and home rule more broadly (Briffault et al. 2017).

EVERYDAY STRUGGLES OF TENANTS ACROSS GEOGRAPHIES

Abstract ID: 1112.0.0.129.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.342.2024, 1108.0.0.224.2024, 1108.0.0.344.2024, 1108.0.0.324.2024

Andrea Urbina Julio [Cornell University] aru8@cornell.edu, organizer

As housing affordability, availability, and quality become growing concerns in cities and regions, struggles experienced by tenants are also growing. Accounts of evictions, rent increases, and everyday struggles with landlords are spanning across geographies – from urban to rural, in Canada and Chile. While tenant struggles have persisted through time, pressures related to financialization, digitization/platformization, and globalization of rental housing have brought about new terrains of dispute and resistance.

Housing struggles have been studied - among others - by looking at everyday experiences focusing on low-income families navigating the housing market, tenants being subjected to displacement, social movements demanding housing access in the global south, or theoretical and right-based approaches to conceptualizing housing. Taking account of tenants' perspectives on housing struggles gives space to understanding the daily interactions and struggles tenants are confronted with. In light of this, we invite contributions from scholars in all geographies working on telling the stories of tenants confronted with everyday or systemic struggles around housing. In this Paper Panel, we welcome papers with a tenant-focused perspective, whether qualitative or quantitative, empirical or theoretical, historical or contemporary. Possible research topics include but are not limited to:

Evictions, renovictions, and demovictions;
Rent increases;
Landlord-tenant relations;
Roommates and co-living;
Surveillance and property technology;
Tenant resistance and organizing and counter methods;
Differentiated tenant experiences based on landlord type or tenant type;

Comparative studies on tenant struggles;
Historical perspectives of tenant struggles.

Learning Objective(s):

- Have a global perspective of the current tenants' struggles
- Expand the theoretical and right-based approaches to conceptualizing housing

EQUITY ACHIEVED? RENTERS' COMPLIANCE IN SEOUL'S REDEVELOPMENT SITES

Abstract ID: 1108.0.0.342.2024
Pre-Organized Paper Presentation

Euna Kim [Cornell University] ek683@cornell.edu, presenter

Urban residential redevelopment is one of the oldest housing programs in Korea. While the program has gone through minor changes, the structural framework has remained unchanged since its first introduction in the early 1980s. In essence, redevelopment projects remove entire areas of old low-rise houses, which are homes to many low-income households, and replace them with high-rise apartment complexes. The program has played a dominant role in housing production for 40 years and continues to boast its presence in shaping Korean cities. In the early days, due to forced eviction and displacement, the program mobilized social movements that fought for the rights of evictees, who were mostly tenants in the area. Due to these efforts, tenant compensation and public housing for evictees were introduced in the 1990s, greatly placating evictees' movements against residential redevelopment (Kim, 2010). Since then, conflicts between residential evictees and developers have greatly subsided. Seemingly, equity issues have been "resolved." Yet, there has been little examination into understanding the nature of such abatement, and the question of whether equity issues have been resolved remains unanswered. Some scholars have hinted at the notion that the lack of public resistance should be understood in relation to Korea's history under a developmental state but provide little empirical support (Shin & Kim, 2016). Hence, discussions regarding redevelopment in Korea have proceeded without a deep understanding of residents' experiences of eviction, displacement, and redevelopment. This study addresses this gap of knowledge by taking on a qualitative approach in which the experiences of to-be evicted residents in two redevelopment sites in Seoul are examined. Based on 33 semi-structured in-depth interviews accompanied by site visits and document analysis, I argue that the working of a "culture of redevelopment" renders opposition meaningless and irrelevant. Interviews reveal that renters remain excluded during the entire process, receive little or no information about compensation, and due to the stringent eligibility conditions, only very few renters receive full compensation. Despite weak tenant compensations and the destruction of affordable housing, tenants do not express strong opposition toward being evicted and displaced. Rather, they remain indifferent or submissive to their circumstances, while viewing redevelopment as a positive and necessary change. I argue that such an attitude is rooted in a culture of redevelopment that constructs social values closely tied to property rights. The notion of rights to the city is understood in relation to property rights which shape renters with no property rights irrelevant, a phenomenon similar to the working of a "cultural hegemony of property" in Hong Kong (Ley & Teo, 2014). This shared norm makes it extremely difficult for a complete restructuring of the program and poses distinct challenges for changes to be brought about via equity planning and insurgent planning. I explore alternative approaches that may be more plausible and can have meaningful impacts in shaping the current redevelopment program more equitable. The

paper concludes with possible modifications within this context to produce more equitable outcomes and processes, and calls for planning scholars to place more attention on cultural dimensions to pursue contextualized and equitable alternatives (Abram, 2011).

ALTERNATIVE VISIONS OF HOUSING POLICY IN A NATIONAL TENANT CAMPAIGN

Abstract ID: 1108.0.0.224.2024
Pre-Organized Paper Presentation

Chenab Navalkha [Massachusetts Institute of Technology] chenab@mit.edu, presenter

Recent tenant mobilizations shed light on the contradictions and instabilities brought on by the transformations in housing provision, including neoliberal policies and financialization. This paper examines tenant organizers' efforts to politicize housing and pursue policies to protect tenants against the impacts of these in the United States.

Scholarship on the housing question has long debated the role of housing in the capitalist political economy, and the extent to which inequality is resolvable at the site of housing. These debates trace the transformation of shelter, as housing, into a commodity governed by the logic of the market, and argue that this process renders land and housing into technical objects and policy a domain of technocratic knowledge (Li, 2014). This way of seeing shapes both how the "housing crisis" is understood and what is seen as possible and viable solutions. Where housing is understood as a resource allocated through the market, the housing crisis is understood in terms of production, and attempts to address housing problems are relegated to the sphere of experts and removed from public purview (Pattillo, 2013). Scholarship on current and past tenant movements analyze how these movements' politicization of housing counter hegemonic conceptions of housing as a commodity to be allocated through market-oriented policy. Tenant movements' visions of housing justice entail discursive and epistemological interventions that assert the social meaning of housing, reinterpret dominant notions of the "housing crisis" and displacement, and build alternative infrastructures of knowledge production (Camp, 2012; Lancione, 2020; Lima, 2021). These alternative knowledges not only disrupt what is taken for granted in market-based housing allocation but also inhere alternative ways of being and shaping society.

In this paper, I report findings from ethnographic fieldwork of an ongoing national tenant campaign in the United States fighting for federal policy that encodes tenant protections. I investigate how this campaign complicates ideas of housing policy expertise through its focus on tenant experiences as lived expertise and the translation of tenant

priorities into concrete policy positions. How do tenants engaged in this campaign define and describe their experiences of the "housing crisis"? How do causes and solutions that tenants identify of crisis differ from or align with dominant policy framings? To what extent do institutionalized participatory processes accommodate tenants' political claim-making? My analysis draws on 14 months of participant observation at weekly virtual meetings of tenant leaders working both in their local communities and coordinating with the national campaign, as well as a weeklong in-person convening of tenants in Washington, D.C. It also incorporates analysis of media coverage, public hearings, and public comments solicited by federal agencies.

Through local base-building, direct action, and narrative strategies, this seeks to politicize rental housing and tenancy in the United States. Tenants working with this campaign work together to translate their experiences and struggles with safe and affordable housing into both policy goals and narrative change. The campaign's emphasis on tenant expertise and leadership brings to the fore the disjuncture between housing as shelter and home and housing as a commodity that has accelerated with the expansion and consolidation of corporate ownership of rental properties, and pursues the inclusion of tenants in the policy-making process. This project's findings shed light on how tenants and community organizers identify avenues for claim-making across the local and national scales in today's financialized housing landscape, and how they navigate constraints therein. This paper has implications for how planners might re-examine pathways for participation in policymaking across scales and calls for greater attention to the work of claim-making and knowledge production undertaken by local organizers working toward housing justice in the United States.

INVISIBLE LANDLORDS:TENANTS COPING WITH CORPORATE LANDLORDS IN CHILE.

Abstract ID: 1108.0.0.344.2024
Pre-Organized Paper Presentation

Andrea Urbina Julio [Cornell University] aru8@cornell.edu, presenter

The tenure patterns of the Latin-American population tend to move towards the rental market, changing the traditional relationship between finance and housing through homeownership. These tenure changes have been tied to transformations of city centers, leading to the emergence of dense high-rise housing developments via

models of verticalization, creating new vertical enclaves (Harris, 2015), attracting young families and Latin American migrants. Institutional financial actors, such as investment funds, insurance companies, and family firms, are increasing their investment portfolios by owning and managing residential buildings, transforming them into financial capital assets. In Chile, corporate landlords oversee over 130 buildings, which make up 3% of the city's housing market. This number is expected to grow by 65% in the coming years as they expand a high-rise, multifamily model in downtown areas of the city.

At the same time, Chile has become an economically attractive destination for migrants. The last Chilean National Socioeconomic Characterization Survey (CASEN) 2022 estimated the presence of 1.628.223 migrants, representing 8.2% of the population, mostly coming from Venezuela, Colombia, Peru, and Haiti. 65% of the total migrant population lives in Santiago (CASEN, 2022), where the labor force is concentrated (Rodríguez-Vignoli, 2022). Most migrants in Santiago access housing through rental arrangements in the formal and informal markets. In the US and Europe, Institutional investors purchased thousands of homes after the subprime crisis, raising multiple concerns about property conditions, poor management, increasingly high rents (Semuels, 2019), and higher eviction rates than other multifamily properties (Seymour, 2022). However, given the recent incorporation of corporate landlords in the Latin American housing market, not much research looking at tenants' perspectives have been conducted in buildings managed by institutional investors. Thus, using a qualitative approach that includes 63 interviews with tenants (Chilean and migrants), participatory observation and site visits in 10 buildings, this paper looks at how corporate landlords transform the daily experiences of renters in Santiago. To answer this question, the research analysis focused on the application process of tenants, building experience, and landlord-tenant relationships. This paper argues that although tenants' experience varies depending on the building and the tenant's socioeconomic background, many renters feel a cost burden, perceiving high costs and extra fees from living in these buildings. At the same time, there is a lack of accountability and communication from management. Furthermore, Chilean tenants differ from migrant tenants in that the latter group often has no choice but to remain in these buildings due to their migratory status, rental requirements, or financial capacities. This paper contributes to planning theory and practice to rethink regulatory mechanisms on rental housing and how to counteract the impacts of institutional investors.

'SMALL' LANDLORDS AND OWN-USE EVICTIONS: PREVENTING TENANT DISPLACEMENT

Abstract ID: 1108.0.0.324.2024

Pre-Organized Paper Presentation

Cloé St-Hilaire [University of Waterloo - School of Planning] csthilaire@uwaterloo.ca, presenter
Danielle Kerrigan [Simon Fraser University - Department of Geography] danielle_kerrigan@sfu.ca
David Wachsmuth [McGill University - School of Urban Planning] david.wachsmuth@mcgill.ca

No longer can we call the housing situation in Canada a 'crisis.' Escalating housing costs and decreasing availability have been a fact of Canadian life for over a decade. Policy discussions and reporting on topics related to housing are pervasive and housing organizers are demanding better protections to ensure tenants' right to remain. Two key areas of concern are the growing cost of rent and the rise in evictions. Over the past year, there has been an emerging media scrutiny of 'own-use' evictions (or repossessions), an eviction subtype. Wachsmuth and colleagues (2023) found that own-use evictions were the most common type of evictions amongst their interviewees, and also the least likely type to be contested formally through housing courts. Own-use evictions also tend to be very difficult for tenants to resist because the onus to prove abuse rests on the tenant. Despite the unlikeliness of tenants to challenge eviction cases in housing courts, the number of cases of landlords evicting tenants to repossess rental units for their personal use have been increasing substantially in multiple Canadian provinces. As an example, in the province of Ontario alone, 6634 own-use evictions were filed in 2022, representing a 28% increase over 2021 and a 447% increase compared to 2012. In other provinces, with few rent controls, notably New Brunswick, the number of own-use evictions has been marginal and steady.

And yet, even among a wave of scholarly literature on evictions, 'own-use', evictions remain under-researched, with research tending to focus on corporate landlords (Leung et al., 2021; Seymour & Akers, 2021), which are typically unable to use the own-use clause to instigate an eviction attempt. This paper aims to fill this research gap by answering the following key questions: What have been the trends regarding own-use evictions in Canada? Why are they growing at different rates based on the jurisdiction? How can housing policy and planning prevent unlawful displacements associated with own-use evictions? We employ a mixed method approach combining 88 semi-structured interviews from 2022-2023 and twelve years (2010-2022) of 'own use' eviction data from housing courts in British Columbia, Ontario, Quebec and New Brunswick. We show that in Canada's three most populous provinces, each with relatively robust rental protections, own-use evictions have risen rapidly. In contrast, we document how in New Brunswick, own-use evictions remain marginal. As rental housing availability is low and costs are high across the country, we hypothesize that in provinces with relatively strong evictions protections, landlords are resorting to using 'own-use' clauses as a loophole to evict tenants and raise rents, whereas in jursidctions without strong protections, landlords can non-renew leases, or raise rents according to the market.

We also argue that formal data on evictions represents a great underrepresentation of the current state of own use evictions by showing how most of our interviewees having been evicted between 2017 and 2022 had not contested their repossession in housing court. Interviewees who did not resist stated a sense of hopelessness in the outcomes of housing courts regarding own-use evictions and a lack of adequate legal protections from own-use evictions. Even in cases of multiple evictions (where entire buildings were evicted in near succession), tenants reported own-use clauses being used systematically, with multiple family members allegedly moving in multiple units. In light of other stricter tenant laws being "back on the agenda of policymakers in light of rent inflation in many global cities" (Kholodilin & Kohl, 2021: 1), we argue that planners should take own-use evictions seriously as they represent regulatory evasion of existing and potential rent control legislation. We conclude by offering relevant pathways for planners, policy makers, and tenants to help mitigate the negative outcomes of own-use evictions on tenants by presenting case studies from Vancouver, Canada and Berlin, Germany.

MARKET AND NEIGHBORHOOD IMPACTS OF INVESTOR-OWNED SINGLE FAMILY RENTALS

Abstract ID: 1112.0.0.782.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.839.2024, 1108.0.0.803.2024

Edward Goetz [University of Minnesota] egoetz@umn.edu, organizer

The growth of investor ownership in the single family rental markets across U.S. cities is having significant impacts on those markets, on tenants, and on the communities in which the properties are located. These four papers provide recent research findings from four different metropolitan areas on the impact of ownership and changing landlord strategies on rents, rental markets, and neighborhood outcomes.

Learning Objective(s):

- How do investor single-family rental acquisition strategies vary across housing market types?
- How do landlord strategies relate to rent-setting vary by portfolio size and geographic location?
- How does investor ownership of single family rentals affect the self-sorting of tenants across neighborhoods?

INVESTOR ACQUISITION OF RESIDENTIAL PROPERTIES IN NEW JERSEY

Abstract ID: 1108.0.0.839.2024
Pre-Organized Paper Presentation

Eric Seymour [Rutgers] eric.seymour@rutgers.edu, presenter
Will Payne [Rutgers] will.b.payne@rutgers.edu
Lauren Nolan [Rutgers University] lauren.e.nolan@rutgers.edu

Kathe Newman [Rutgers University] knewman@rutgers.edu

Concern is mounting about investor ownership of residential properties. Investors, from small proprietors to private equity firms, account for an increasing share of home purchases since the foreclosure crisis and through the pandemic. Many investors hold properties as rentals, and research indicates recent buyers, particularly large corporate landlords, are associated with negative outcomes for tenants, including excessive fees, poor maintenance, and faster eviction (Raymond et al., 2018). Further, there is concern that investors are crowding out affordable home purchase opportunities (An, 2023). While research on investor-buyers has focused on large landlords and either on single-family homes or rent-stabilized apartments in major cities, there has been little study of the housing that lies between, like the 2-4 unit rental properties that populate the rental landscape in many communities and the type of investors seeking them out (Decker, 2023).

This paper investigates the geography, timing, scale, and business models of investor acquisition of small residential properties in New Jersey since 2010. We focus on seven geographically dispersed municipalities reflecting the wide range of housing market conditions present in the state: Asbury Park, Millville, Montclair, New Brunswick, Passaic, Phillipsburg, and West New York. We draw on historical real estate transaction and tax roll data to identify investor activity and the types of investors present in these different communities. This research draws primarily on the NJ MOD IV HIstorical Database (HDB), a historical database of tax parcel data maintained by Rutgers in partnership with the state of New Jersey. We use these data to examine changes in the degree of investor ownership of 1-4 unit residential properties at the parcel-block level over time and their association with housing market and demographic characteristics. We also link these trends with recent histories of high-risk mortgage lending and foreclosure, which we hypothesize have destabilized historically Black neighborhoods and facilitated investor acquisition. We draw on interviews with community based organizations and other stakeholders along with contextual housing market and demographic data from the Census to explain these patterns.

Our research suggests the presence of at least three types of market-based investor strategies. There are (1) investors purchasing properties in areas with strong demand who are converting or upgrading rentals to serve higher-income households; (2) those buying in relatively lower-cost areas where renters have few options and are ineligible for vouchers, allowing them to capture relatively high rents for lower-quality homes; and (3) those specializing in the conjunction of lower-priced properties and the presence of racially or otherwise segregated markets and cater to voucher holders possessing few alternatives.

This research has implications for understanding a broad range of issues involving investor acquisition of residential properties, including those affecting historically Black neighborhoods and communities and places experiencing high levels of recent immigration. Increased investor activity can remove housing units from affordable submarkets contributing to increased competition for limited supply and rising prices. These trends also contribute to the challenges of finding affordable starter homes in New Jersey and beyond, preventing working-class households from building wealth and widening the racial wealth gap. This research also has implications for understanding the changing geography of residential investment over time as investors search for the next location to generate profits as locations in and near New York City become increasingly expensive.

RENT CONTAGION: A SOCIOLOGICAL ACCOUNT OF RISING RENTAL COSTS

Abstract ID: 1108.0.0.803.2024
Pre-Organized Paper Presentation

Andrew Messamore [University of Washington] andrew.messamore@gmail.com, presenter

This article considers landlords' decisions to raise rent as a case of social contagion. Employing a ten-year study of rental ownership and housing market dynamics in Austin, Texas, the author finds that rental pricing tends to be linked through shared ownership and shocked by nearby new multifamily construction. In the case of shared ownership, rental prices at properties owned by the same owner tend to rise and fall in tandem. In the case of multifamily construction, rents at lower priced properties tend to rise near new market-rate construction where rents tend to be higher. Finally, the author shows that landlords exposed to market-rate construction tend to raise rents at all their lower-priced properties in the year after exposure regardless of where properties are located. Paradoxically, these findings suggest new multifamily construction can create short-run rent contagion in low-income housing which spreads through co-owned properties, even when construction prevents overall rent from rising exponentially. These results advance a relational and actor-centered account of housing systems which views landlords' behavior as not only shaped by their characteristics or context, but also by organizational and relational mechanisms that can facilitate processes of diffusion.

RESEARCH ON RESIDENTIAL MOBILITY: NEW HORIZONS AND CHALLENGES

Abstract ID: 1112.0.0.343.2024
Pre-Organized Session Summary
Session Includes: 1108.0.0.400.2024, 1108.0.0.407.2024, 1108.0.0.438.2024, 1108.0.0.355.2024

Wenfei Xu [Cornell University] wenfeixu@cornell.edu, organizer

Residential mobility, as “a process that changes lives and neighborhoods” (Coulton, Theodos, and Turner, 2012), is deeply implicated in a wide range of phenomena of policy interest, such as gentrification and residential displacement, neighborhood effects and individual outcomes, and housing instability. Consequently, improvements and innovations to capturing and operationalizing household-level residential mobility can have far-reaching impacts on many fields, including demography, planning, housing, and public health. The recent availability of big data, novel consumer trace data, and newly unlocked large administrative data has pushed the frontiers of research on residential mobility. Previously having relied on proxy or traditional survey data, researchers now have access to address (and other) data for significant shares of the population. However, while these datasets provide unprecedented coverage and granularity for the study of residential mobility, some uncertainties remain regarding their accuracy, bias, and, ultimately, usability. Our session explores the topic of residential mobility using novel data and/or methodological approaches.

Learning Objective(s):

- How has the measurement of residential mobility benefitted from new data in recent years?
- What are the impacts of MIH, HOPE VI, and naturally occurring affordable housing impacted residential mobility?
- What are some of the new challenges brought on by new methods and data on residential mobility?

MOVING UP OR MOVING OUT? INCLUSIONARY ZONING AND MOBILITY OUTCOMES IN NYC
Abstract ID: 1108.0.0.400.2024
Pre-Organized Paper Presentation

Yining Lei [University of Pennsylvania] yiningl@design.upenn.edu, presenter
Lance Freeman [University of Pennslyvania] lancefre@design.upenn.edu
Wenfei Xu [Cornell University] wenfeixu@cornell.edu
Yeonhwa Lee [University of Pennsylvania] yeonhwa@design.upenn.edu

As urban America experiences rising housing costs and the withdrawal of the federal government from direct housing subsidies, inclusionary zoning (IZ) has emerged as a popular tool for local governments to increase the supply of affordable housing. IZ typically requires or encourages developers to set aside a certain percentage of housing units in market-rate residential properties for low-income households (Office of Policy Development and Research, 2013). Offsets such as expedited approval processes, reduced development fees, or density bonuses are provided to allow the development to remain profitable while cross-subsidizing the affordable housing component (Mukhija et al., 2016). New York City’s Mandatory Inclusionary Housing (MIH) program requires rezonings that significantly increase density to include an affordable housing component. As of early 2020, the city designated eight large MIH zones ranging from roughly 1.7 million square feet to nearly 10 million square feet, representing a few city blocks to large sections of a neighborhood.

In addition to producing affordable housing, another goal of IZ is to reverse the widespread trend of exclusionary zoning in the late 20th century, which features zoning practices championed by NIMBYs to keep affordable housing out of their neighborhoods. In this view, IZ functions as a desegregation tool, building mixed-income communities and improving the upward mobility of low-income households.

Despite the putative power of IZ to encourage residential mobility, opposition has surfaced from an unexpected source, questioning whether IZ will make neighborhoods affordable for low-income households to move to or stay

in at all. Affordable housing advocates have likened the market-rate development component of IZ to a Trojan horse that spurs gentrification (Roberts, 2015; Stein, 2014). The act of IZ designation itself might also serve as a signal to landlords and would-be tenants that the neighborhood will soon be an up-and-coming neighborhood and bring higher housing costs along with it.

The literature thus far has discussed the efficacy of IZ to produce affordable housing, and concerns over whether IZ stifles future residential development (Kontokosta, 2015; Mukhija et al., 2016). The fate of residents remains an important yet understudied outcome of IZ. In this study, we examine the early effects of New York City's MIH program on residential mobility patterns and ask: Who moved to MIH neighborhoods? Is there a difference in the origination neighborhoods they moved out of, before and after the destination neighborhoods became MIH? Mirroring the questions we ask about in-movers, we ask the following questions regarding out-movers: Who moved from MIH neighborhoods? Is there any difference in the destination neighborhoods they moved to, before and after their origination neighborhoods were rezoned for MIH?

To answer these questions, we use data from Infutor Data Solutions. Infutor combines information from multiple sources such as telephone data, deed and property information, and subscription services, into a national database that details individual-level residential address histories. We use Infutor data from three years before MIH designation to 2020, to identify the census tracts of in-movers and out-movers, and the characteristics of tracts to/from which they moved. By employing an Adjusted Interrupted Time Series approach with controls for time trends, we compare neighborhoods exposed to the designation of MIH with those not exposed, both before and after the designation of MIH, to determine whether MIH contributes to changes in residential mobility patterns. Our findings would inform debates on whether IZ meets its goal to promote upward residential mobility by incentivizing households to relocate from lower-income neighborhoods, or whether IZ contributes to gentrification by hindering the entry of low-income households while displacing current residents.

The HOPE VI program funded the demolition of nearly 100,000 public housing units across the country between 1993 and 2010. Initial evaluation studies documenting where the displaced residents moved suggest that the outcomes varied by their destination and mode of relocation, with those who moved into private market units living in better housing and neighborhoods with improved employment, social, and environmental conditions (Popkin, Levy, Buron 2009). However, these studies were limited to select sites within cities and were typically only able to track about 2/3 of the displaced residents. Moreover, with redevelopments incomplete at the time of study, return rates to newly developed HOPE VI sites were still low.

In this longitudinal descriptive study that spans 1990 to 2020, we analyze the long-term destinations and residential trajectories of households displaced by the HOPE VI program in four cities–Chicago, New York, Philadelphia, and Atlanta. Using a novel residential mobility dataset and address data on public housing developments, we identify those who lived in demolished public housing developments and their subsequent addresses and examine their patterns of residential mobility and neighborhood attainment. In particular, we assess how their neighborhood conditions differ based on whether they lease or own private market units, transfer to other public housing developments or relocate to newly constructed HOPE VI mixed-income communities—analyzing not only the initial post-displacement move but subsequent moves thereafter.

We leverage hierarchical linear and logistic regression models to estimate the likelihood of households moving to neighborhoods of higher, lower, or similar opportunity relative to their origin neighborhoods of severely distressed public housing. We hypothesize that: i) the majority of residents who moved as a consequence of HOPE VI moved into private market housing; and ii) while attaining higher-opportunity neighborhoods than their counterparts who moved to other traditional public housing units, residents who moved to private market housing subsequently moved more frequently. We also anticipate these patterns will vary by city, based on market-rate housing affordability and the proportion of developments demolished by HOPE VI.

LEVERAGING CREDIT DATA TO MEASURE RESIDENTIAL MOBILITY OUTCOMES

Abstract ID: 1108.0.0.438.2024
Pre-Organized Paper Presentation

Alex Ramiller [University of California, Berkeley] alexramiller@berkeley.edu, presenter

As housing costs have risen over the past decade, lower- and middle-income households in major metropolitan areas across the United States have faced an increasingly difficult trade-off: devoting an ever-growing share of their income to pay for expensive housing in centrally-located urban neighborhoods, or moving to neighborhoods that are more affordable but further away from employment opportunities (Blumenberg & Wander, 2023). This dynamic is associated with broader regional socioeconomic stratification, contributing to both the gentrification of central city neighborhoods and to the suburbanization of poverty (Hochstenbach & Musterd, 2018). The impacts of these residential moves have not been fully explored due to a lack of robust granular data on residential mobility outcomes, but the growing availability of proprietary and administrative microdata opens up new avenues for the analysis of residential mobility and neighborhood change (e.g. Greenlee, 2019).

This project leverages a novel panel dataset – consisting of administrative data for 100% of individuals with a recent credit history in the state of California – to examine a heretofore underexplored mechanism shaping residential mobility outcomes: household credit and debt. Specifically, I ask: how do intraregional residential moves impact household consumption of housing, auto loan, and credit card debt? Household debts – which have been steadily rising over the past decade – are influenced in part by residential location, as neighborhood housing costs and access to transportation can greatly impact the extent to which households rely on mortgage loans, auto loans, and credit card debt (Walks, 2013). Consequently, identifying the relationship between residential moves and household debt consumption can reveal an important and novel dimension of residential mobility outcomes at the household level.

Leveraging the comprehensive and longitudinal nature of the credit panel dataset, this project employs a two-stage modeling framework that is increasingly employed in research on neighborhood effects (van Ham et al., 2018). First, I use a conditional logit model to analyze the relationship between individual household characteristics and residential location, establishing the household characteristics that are most strongly associated with moves between urban, suburban, and exurban contexts. Second, I incorporate the results of this model into a second-stage analysis that measures the impact of neighborhood destination on household debt consumption outcomes, controlling for neighborhood selection effects. This modeling framework is used to test the hypothesis that households moving to lower-cost suburban and exurban neighborhoods will utilize higher levels of auto loan debt to facilitate access into those more affordable but auto-dependent neighborhoods, while households moving into comparatively higher-cost urban and suburban neighborhoods will utilize higher levels of mortgage loan debt and credit card debt.

This research contributes to the existing research on residential mobility in several key respects. First, this analysis highlights the benefits and challenges of using a large credit panel dataset for residential mobility research. Second, the use of comprehensive data on residential moves elucidates both the household determinants and aggregate patterns of intra-regional moves. Finally, this project raises attention to a novel residential mobility outcome by considering the impact of neighborhood destination on household debt consumption.

USING RESIDENTIAL MOBILITY DATA TO ANALYZE NOAH DISPLACEMENT

Abstract ID: 1108.0.0.355.2024
Pre-Organized Paper Presentation

Carolina Reid [UC Berkeley] c_reid@berkeley.edu, presenter
Taesoo Song [University of California, Berkeley] taesoo.song@berkeley.edu

Concerns over gentrification and displacement remain at the forefront of urban planning research and practice, and research has highlighted the complexities of both the phenomena and the challenges of measuring these dynamics empirically (Zuk et al. 2015; Hirsh et al. 2020). While research has captured neighborhood changes over time—particularly as it relates to a loss of lower-income, Black and other structurally marginalized populations—the actual measurement of urban and economic processes that lead to residential displacement is underexplored (although, see Raymond et al. 2021).

In this paper, we examine a specific mechanism thought to spur gentrification and displacement: the purchase of naturally occurring affordable housing (NOAH) by investors, the subsequent investments that are made in the property, and the eviction (formal or informal) of existing tenants as a result of that process. Using parcel-level assessor data for California matched to household-level consumer reference data, we answer the following research questions: What types of NOAH properties do investors target for flipping, and in what kinds of neighborhoods? What are the impacts of NOAH sales on property investment and valuation? And what characteristics of the NOAH sale—such as investor type, neighborhood, or increase in valuation—increase the likelihood that renters are displaced from their units?

We find that the sale of NOAH properties is an under-explored dimension of neighborhood change: in major metropolitan areas in California, over 60 percent of NOAH properties change ownership within a 10-year period. The pace of these sales has accelerated, especially with the COVID pandemic, and are associated with a significant increase in both property valuation, mortgage debt, and taxes – with attendant implications for the building's rents.

Preliminary results suggest higher residential turnover at these properties compared to those that don't change hands, particularly in neighborhoods that are experiencing significant investor activity.

This research has direct relevance for scholarship trying to better understand the causes of displacement, as well as for local efforts by community land trusts and other nonprofits to acquire and preserve NOAH. It also offers insights into the strengths and weaknesses of using consumer reference data to track residential mobility.

TACKLING HOUSING AFFORDABILITY: RESPONSES FROM PUBLIC AND PRIVATE SECTORS

Abstract ID: 1112.0.0.111.2024

Pre-Organized Session Summary

Session Includes: 1108.0.0.115.2024, 1108.0.0.617.2024, 1108.0.0.429.2024

Hyojung Lee [Seoul National University] hyojung.lee@snu.ac.kr, organizer

The United States is in a housing crisis. In 2022, a record-high 22 million renter households, or half of all renters, and another 20 million owner households were spending more than 30% of their income on housing. While exclusionary zoning and discriminatory housing practices remain a pervasive barrier to homeownership, especially among people of color, sharply increased mortgage interest rates in recent years put the dream of homeownership out of reach. To address this defining issue of our time, efforts to improve housing affordability and accessibility have been gaining momentum at all levels of policymaking. Four papers in this session will present up-to-date research on the impacts of various housing programs (i.e., shared equity, PRO Housing, upzoning, LIHTC) implemented by different levels of public and private organizations across the country. The findings will deepen our understanding of the housing policies designed to make our communities more affordable and accessible.

Learning Objective(s):

- Understand the severity of the current housing crisis and the reasons why public efforts are needed

- Explain what types of efforts have been made by diverse public and non-profit agencies to address housing affordability and accessibility issues
- Identify factors and conditions associated with housing policies that have successfully improved housing affordability and accessibility

PURSUING HEALTHY HOMEOWNERSHIP

Abstract ID: 1108.0.0.115.2024
Pre-Organized Paper Presentation

Arthur Acolin [University of Washington] acolin@uw.edu, presenter
Geoffrey Gusoff [University of California, Los Angeles] ggusoff@mednet.ucla.edu
Alex Ramiller [University of California, Berkeley] alexramiller@berkeley.edu
Vince Wang [University of Washington] vrwang@uw.edu
Frederick Zimmerman [University of California, Los Angeles] fredzimmerman@ucla.edu

Background: Shared equity homeownership – a model in which low- and moderate-income households purchase homes at affordable prices on the condition that the houses remain affordable upon resale – has been shown to produce several health-enhancing housing outcomes. These include permanent affordability, housing stability, and modest wealth-building. However, studies suggest low- and moderate-income households often sacrifice neighborhood quality when becoming homeowners, which may undermine the health benefits of homeownership. To more fully understand the health impacts of the shared equity homeownership model, it is important to evaluate participants' neighborhood health trajectories – how their neighborhood health environments change when they move into homeownership – and how these compare to the trajectories of households entering traditional homeownership and those continuing to rent.

Methods: We conducted difference-in-differences analyses comparing changes in neighborhood health characteristics (walkability, food access, socio-economic vulnerability, and life expectancy) for US households moving into shared equity homeownership between 1997 and 2017 compared to households moving into traditional homeownership and those continuing to rent. Shared equity homeowner data was obtained through the Grounded Solutions Network HomeKeeper National Data Hub and households from the Panel Study of Income Dynamics served as matched controls for the analysis. All data on neighborhood characteristics were obtained from publicly available, census-tract level datasets.

Results: Compared to traditional homeowners, shared equity homeowners experienced neighborhood changes with relatively better walkability (difference-in-differences 0.92, $p<0.01$), better food access (difference-in-differences 0.13, $p<0.001$), worse socio-economic vulnerability (difference-in-differences 0.05, $p<0.05$), and similar life expectancy. Compared to households moving to rental units, shared equity homeowners experienced similar neighborhood changes in terms of walkability, food access, and socio-economic vulnerability, but experienced a relative decrease in neighborhood life expectancy (difference-in-differences -0.78, $p<0.01$).

Conclusions: Shared equity homeowners have neighborhood health trajectories similar to households that continue to rent. Importantly, shared equity homeowners avoid the sacrifices in neighborhood walkability and food access that are associated with moving into traditional homeownership, but they experience increased neighborhood socio-economic vulnerability. While understanding the net impact of these factors on household

health requires further study, these results can inform the siting and design of shared equity homeownership units to maximize the health benefits of the model.

CARROTS WITHOUT STICKS: ANALYZING PROPOSALS TO REMOVE OBSTACLES TO HOUSING

Abstract ID: 1108.0.0.617.2024
Pre-Organized Paper Presentation

Daniel Kuhlmann [University of Arizona] dok@arizona.edu, presenter
Atticus Jaramillo [University of Arizona] atticus@arizona.edu
Daniel McKenna-Foster [Municipality of Anchorage] daniel.mckenna.foster@gmail.com

How can the federal government increase local housing production? Debates on this question tend to focus on one of two strategies—voluntary carrots to incentivize cities to remove barriers to housing or penalizing sticks for those that continue to obstruct. In this paper, we examine how cities respond to one such voluntary, incentive-based federal grant program. By analyzing grant proposals, we document how cities frame their barriers to new housing production and what they propose using federal grant funding to overcome them.

We analyze approximately 100 municipal proposals developed in response to HUD's Proactively Removing Obstacles to Housing funding opportunity. This program offers grants to state, county, and local governments to address existing barriers to housing production. In their proposals, applicants must document their current obstacles and propose solutions using the grant funds to overcome them. Analyzing these proposals shows how cities respond to a voluntary, incentive-based grant program targeting barriers to new housing production.

Our analysis suggests that applicants focus on non-regulatory barriers to housing, such as insufficient subsidies for affordable housing development, outdated permitting systems, and high development costs. Few applicants mention land use or other development regulations as barriers to new housing production. While our analysis is

limited to a single grant program, it reveals some limitations of voluntary, incentive-based programs to tackle meaningful barriers to housing production.

SPILLOVER EFFECTS OF UPZONING IN NEW YORK CITY

Abstract ID: 1108.0.0.429.2024
Pre-Organized Paper Presentation

Hyojung Lee [Seoul National University] hyojung.lee@snu.ac.kr, presenter
Minjee Kim [Florida State University] m.kim@fsu.edu

As housing affordability crisis continues and housing options remain limited for low- to middle-income families, there have been growing calls for zoning reform to increase housing supply and lower housing costs. In the United States, such zoning reforms have also garnered support as a strategy to further fair housing and expand access to high-opportunity neighborhoods, especially for people of color. One example of such a zoning reform is upzoning, a policy intervention that amends existing zoning ordinances to increase the allowable densities. A number of cities (e.g., Minneapolis, Seattle) and states (e.g., California, Oregon) have adopted or have been considering upzoning to address both housing affordability and equity.

However, critics of upzoning have continued to question whether increasing the supply of market-rate housing can improve housing affordability, and empirical research has yet to offer a definitive answer (Been et al., 2019). On the one hand, new housing construction can result in the supply of low-income housing through filtering process, in which homes built for richer families trickle down to relatively lower-income families as the properties deteriorate (Rosenthal, 2014). On the other hand, recent studies indicate that the rate of downward filtering substantially varies across housing markets and that even upward filtering may occur in tight markets (Liu et al., 2022). Besides, recent studies on the upzoning effects provide mixed evidence in terms of housing production and costs within upzoned areas, while none of them have yet examined its external effects on surrounding neighborhoods (Freemark, 2023).

To address these research gaps, we investigate how upzoning initiatives affect property values and housing production on nearby parcels, and how such spillover effects vary across housing submarkets. We analyze 53 upzoning initiatives implemented in New York City (NYC) under the Bloomberg administration (2002–2013). During the period, more than 120 rezoning initiatives were approved in various parts of the city, enabling us to examine the long-term effects of upzoning (ranging from 10 to 20 years) and compare across diverse housing submarkets.

We will further analyze whether and how pre-upzoning local market conditions (e.g., land use characteristics, racial composition, socioeconomic status, housing demand) are associated with the spillover effects of upzoning.

We constructed a database of properties in NYC and their sales transaction records and identified parcels within and near the 53 upzoning initiatives. Similar to the methodological approach employed by Diamond and McQuade (2019), we examine whether changes in housing prices and construction of new units vary by the physical distance from the upzoned site. We do this by creating multiple ring zones around the upzoning initiatives and comparing the changes in housing prices and new construction across the different zones. In addition to the aggregate results, this paper explores spatial heterogeneity in the spillover effects across housing submarkets. The findings of this paper will deepen our understanding of the broader effects of upzoning beyond the parcels directly upzoned and thus contribute to our understanding of the efficacy of zoning reforms for housing supply and affordability.

Track 6 Roundtables

BEYOND NIMBY & YIMBY: FINDING FRESH PERSPECTIVE ON THE AFFORDABILITY CRISIS

Abstract ID: 1109.0.0.655.2024

Roundtable Submission

Max Buchholz [UC Berkeley] mbuchholz@berkeley.edu, organizer
Gregory F Randolph [Georgia Institute of Technology] gregory.randolph@design.gatech.edu
Minjee Kim [Florida State University] m.kim@fsu.edu
Julia Harten [The University of British Columbia, School of Community and Regional Planning] julia.harten@ubc.ca
Carolina Reid [UC Berkeley] c_reid@berkeley.edu

While housing affordability has long been a concern for planning scholars and practitioners, it is increasingly recognized as one of the key policy challenges of our time—especially, though not uniquely, in North American cities. Improving housing affordability is now a major priority for local, state/provincial, and national governments. Yet housing scholarship—for all its productivity—has yet to reach any consensus regarding the causes of declining affordability and their relative importance across different contexts. Some scholars focus on supply constraints and emphasize the importance of deregulation and upzoning to boost housing production, while others point to the financialization of housing and the growing influence of corporate landlords seeking to maximize returns on an increasingly important asset class. New geographies of housing demand, rising scarcity of developable land in dynamic areas, and increasing labor market inequality are likely causal factors as well, though they have received less treatment in the literature. Affordability is also a fundamental concern for racial justice; White flight and disinvestment in majority Black and Brown urban cores throughout much of the 20th century, followed by subsequent urban "revitalization" and coupled with weak labor market opportunities, has subjected marginalized communities to a particularly acute affordability crisis. In this context, it has become increasingly difficult for planning practitioners and policymakers to navigate the complex evidence on housing affordability – let alone design solutions capable of addressing one driver of declining affordability without inadvertently reinforcing another.

Against this backdrop, this roundtable will engage a diverse group of housing scholars who use different disciplinary frameworks and methods to understand our contemporary affordability crisis. By juxtaposing different perspectives, we aim to chip away at the thorny question underlying a key contemporary housing debate: What are the root causes of declining housing affordability, and to what extent are current policy and planning approaches capable of addressing those structural issues?

In an effort to support academic housing research, the Department of Housing and Urban Development (HUD) has begun providing funding to establish housing centers of excellence. These opportunities have, to date, targeted minority-serving institutions—Historically Black Colleges and Universities (HBCUs) in the first two funding rounds and Hispanic-serving institutions (HSIs) in the third. In this roundtable discussion, we convene planning academics participating in these centers to discuss their experiences developing proposals and establishing centers. We will discuss the strategies for successful proposals, challenges in establishing new research centers, avenues for cross-center collaborations, and opportunities this funding provides to advance academic scholarship on housing issues.

THE STATE OF HOMELESSNESS RESEARCH: VIEWS FROM ACADEMIC RESEARCH CENTERS
Abstract ID: 1109.0.0.856.2024
Roundtable Submission

Josh Newton [University of California, San Diego] jdnewton@ucsd.edu, organizer
Mirle Rabinowitz Bussell [Homelessness Hub, University of California, San Diego] mbussell@ucsd.edu
Ryan Finnigan [Terner Center, University of California, Berkeley] rfinnigan@berkeley.edu
Marisa Zapata [Portland State University] mazapata@pdx.edu
Gregg Colburn [Homelessness Research Initiative, University of Washington] colburn3@uw.edu

Homelessness is one of the largest health, economic, political, and humanitarian challenges of US cities. The Department of Housing and Urban Development Point-in-Time count estimates 653,104 people have experienced homelessness in the United States with 35.2% of this population living on the West Coast in California, Oregon, and Washington (PD&R, 2023). However, the National Law Center on Homelessness & Poverty claims the actual number is in the range of 1.4 to 5.6 million due to a severe undercount caused by inconsistent methodologies, neglect of unsheltered and other uncounted subgroups, and infrequency in counts of homeless people (NLCHP, 2017). Despite the growing prevalence of homelessness, research on the topic in urban studies and planning is multifarious and typically subsumed in broader housing research. Yet, interdisciplinary homelessness research centers are emerging with the support of urban planning departments and faculty throughout the US, especially on

the West Coast. These centers are producing cutting edge research with innovative methodologies, by determining best uses of available data, and in partnership with multiple stakeholders including those who have or are experiencing homelessness.

This panel will delve into the research and findings of multiple academic research centers throughout the US West Coast that focus on homelessness. Dr. Mirle Rabinowitz Bussell (Faculty Director) will discuss the Homelessness Hub at University of California, San Diego and its commitment to applied and community-partnered research, as well as the development of a comprehensive geospatial database on homelessness. Ryan Finnigan (Associate Research Director) will discuss his work at the Terner Center for Housing Innovation at University of California, Berkeley, which has become a leader in housing and homelessness research and policy in California. Marisa Zapata (Center Director) will discuss the Homelessness Research & Action Collaborative at Portland State University and its solutions-oriented research to reduce homelessness and associated negative impacts, particularly for communities of color. Finally, Gregg Colburn (Co-Chair and author of the recent book, Homelessness is a Housing Problem) will discuss the Homelessness Research Initiative at the University of Washington and its focus on drivers and consequences of homelessness and housing access and associated findings for policymakers and nonprofits.

The panel brings together center researchers to create awareness of the state of homelessness research in urban studies and planning. It thus asks the following questions: What is each center's research focus and what methodologies are emerging from their projects? In an environment where individuals' stories are left out of policy conversations (Smith et al., 2021), how are centers engaging people with lived experience of homelessness? Being that groups already marginalized by race/ethnicity, gender, sexuality, disability, age, and vulnerability to climate change are most at risk of falling into homelessness (PD&R, 2023), how are centers dealing with intersectional identities of people experiencing homelessness? What stakeholders are centers targeting with dissemination and how is their research informing local, state, and federal policy? Finally, considering how homelessness research and policy are usually shaped by what is "allowable or sayable (or fundable)" (Farrugia & Gerrard, 2015, p. 277), how are centers pushing the boundaries of what is acceptable in homelessness research and policy?

Homelessness research in urban studies and planning is more needed than ever, making this an ideal time to examine the state of the field. Much current research examines pathways into and out of homelessness—particularly evaluation of programs that help with the latter—but the topic requires multidimensionality and stories to truly understand homelessness beyond episodes of being unhoused and receiving assistance (Somerville, 2013). This panel brings together researchers at the field's forefront to share their approaches, learn from each other, and provide insights into the future of homelessness research.

"PREVENTING EVICTION: STATE AND FEDERAL INTERVENTIONS DURING THE PANDEMIC"

Abstract ID: 1108.0.0.1001.2024
Individual Paper Presentation

Kasey Zapatka [UC Berkeley] kaseyzapatka@berkeley.edu, presenter
Tim Thomas [UC Berkeley] timthomas@berkeley.edu

During the COVID-19 pandemic, households who lost income streams quickly became unable to pay their rent and faced eviction. Local, state, federal agencies responded by creating a bevy of housing precarity interventions aimed at stemming eviction and keeping people in their homes. Two of the most notable interventions included eviction moratoria designed to temporarily halt eviction and the US Treasury Department's Emergency Rental Assistance Program (ERA) that distributed $46 billion to help renters cover their rental debt.

As the dust has begun to settle, much is still unknown about the success of these interventions. This paper seeks to fill this gap by addressing four broad research questions: (1) How did state tenant protections and moratoria impact eviction filing rates during the COVID-19 pandemic? Not only is there significant variation in eviction moratoria, but there is also important variation in state tenant protections (e.g., length of eviction filing notice and grace periods). (2) How did the receipt of ERA funds and program design impact housing stability during the study period? ERA funds were distributed to programs in different amounts and to varying degrees of success. In this analysis, we are particularly interested in how program effectiveness impacted county-level filing rates during the study period. (3) Despite these housing stability interventions, some households remained at higher risk than others. Following previous research on high eviction demographics, we seek to understand how counties with high concentrations of these communities fared during the study period. (4) Finally, to what extent did housing market conditions continue to impact housing stability? It's likely that housing stability was even more precarious in counties that had already had tight housing markets and high rents.

We combine several data sources to answer these questions. First, using eviction filing data provided by the Legal Services Corporation and the Eviction Research Network, we calculate an eviction prevention ratio (EPR)—the

observed eviction filing coun over the expected county-level eviction filing count had there not been a pandemic—from March 2020 (the start of the pandemic) to August 2022 (when the U.S. returned to historical average eviction filing rates). Second, we use the US Treasury Department's ERA payments data aggregated to the respective counties within the same time-period. We then join these data with state-level data on tenant protections and eviction moratoria, as well as US Census county-level data on hundreds of socio-demographic and housing market characteristics. Our resulting data has information on approximately 1,200 counties across 32 states during the study period. Using a Bayesian machine learning framework, we identify important predictors associated with suppressed eviction filing rates and then evaluate how each variable, particularly ERA and policies, impacted eviction prevention.

Preliminary findings suggest that the duration of state-level moratoria (days) and various state-level tenant protections played outsized roles in keeping eviction rates low during the pandemic. However, by the time that ERA money arrived to counties, we find that filing rates had already begun to rise as eviction moratoria were ending. Moreover, given that eviction is concentrated in the most disadvantaged communities and tight housing markets, we find that counties with higher levels of Black-White segregation, higher unemployment rates, and higher median rents experienced higher eviction rates than would be expected. Together these findings provide strong evidence for the importance of state and federal legislative interventions designed to prevent eviction filings and slow down the eviction process. Despite eviction moratoria and strong tenant protections, we find there that eviction filings remained concentrated in highly segregated, poor, and low-income neighborhoods.

A CRISIS OF QUALITY: IDENTIFYING VARIEGATED HOUSING CRISES IN THE US

Abstract ID: 1108.0.0.1172.2024
Individual Paper Presentation

Emma Walters [University of Illinois at Urbana-Champaign] emmalw4@illinois.edu, presenter

When housing researchers consider the modern 'housing crisis', they often consider one or two instances in US and global history: the housing bubble of 2008 or the ongoing housing shortage and affordability crisis. Most commonly, especially today, the US housing crisis is commonly defined through the experiences of tight market cities. This results in a housing crisis centered on housing shortages and increased housing costs. Leading research centers, affordable housing organizations, and scholars highlight increasing barriers to affordable housing due to skyrocketing housing costs and its relationship to supply (Been et al, 2019; Joint Center for Housing, 2023). Scholars in the field also focus on land regulation challenges, NIMBYism, and the tools necessary to increase access to affordable housing in these higher barrier markets (Glaeser et al, 2006; Walter et al, 2016). The continued centering of tight housing markets in both scholarship and policy lends itself to growth-oriented biases in measurement systems and the proliferation of some response strategies over others. This centering of large (usually coastal) cities in planning and policy scholarship, or "metrocentrism", leads to inherent "hierarchies of attention and value" (Bunnell and Maringati, 2010, p. 417). These hierarchies explain how scholars and policy makers frame our modern-day housing crises through the lens of a select few cities that are perceived as the best expression of urbanism while other cities are seen as "devoid of [. . .] theoretical significance" (Bunnell and Maringati, 2010, p. 417). In the case of the United States housing crisis, the field's theoretical and practical groundings are based on the experiences of the households and markets of large, growing cities while small and midsized cities (often stagnant or declining) are made invisible. The inherent othering of places outside of large metro areas results in an inadequate construction of space and place – cities are reduced to the experiences and framings of our larger metro areas. This reduction inherently results in mismatched policy and planning strategies throughout the country.

The goal of this research is to make visible the heterogeneity of housing markets and their crises in the United States through statistical and spatial analysis while highlighting the need for varied and flexible policy responses. Seeking to expand the scholarship on housing crises, I present a statistical analysis of the United States housing markets using principal component analysis and hierarchical clustering to bring into focus the multiscalar heterogeneity of housing markets in the US. Ultimately, statistical and spatial analysis make visible a housing crisis not often addressed or focused on by state and federal policy. It highlights the vast number of communities and neighborhoods that may have abundant affordable housing stock, but ultimately struggle with housing quality and difficulty accessing equity to address quality concerns. This crisis is due to older housing stock, high vacancy rates, and high poverty rates and it requires different policies and funding mechanisms for stabilization. Varied and flexible federal policy responses are needed to address the diverse crises that have manifested throughout the country.

A MOSTLY PUBLIC CONSENSUS ON HOUSING? RESULTS ON A SURVEY FROM CALIFORNIA

Abstract ID: 1108.0.0.879.2024
Individual Paper Presentation

Kevin Fang [Sonoma State University] fangk@sonoma.edu, presenter

High and increasing housing costs are a source of stress for households in many cities across the world. Housing issues have been particularly oft discussed in California, where 81 percent of low-income residents, 48 percent of middle-income, and 54 percent of renters are overburdened by housing costs. In many venues, such as among policymakers, in media, and in academic literature, there has been much debate about the causes and potential solutions to housing unaffordability.

Leaving aside the question of what perspectives best describe or would best address housing unaffordability, what does the public-at large think about housing issues? What perspectives have broad support? Are there perspectives that are less popular, but said loudly? As the cliché goes, is social media real life? Previous research has shown disconnects between the perspectives of the public at-large and participants of public meetings, highlighting challenges in making planning decisions that accurately reflect public sentiment.

This study explores the results of a survey of 962 Californians on housing-related topics fielded from May to June 2023. Survey response were solicited from the CalSpeaks California statewide survey panel, administered since 2016 by the Institute of Social Research at Sacramento State University. Administration of the survey was mostly online via Qualtrics, but a paper option was available for respondents. The survey was available in Spanish in addition to English. An incentive of $5 was offered to respondents for the completion of the survey.

In popular discourse, debates over housing are often described as support versus opposition to more housing construction or specific policy interventions. That said, there is much more than binary thought in the debate, particularly in the why of opposition. Along these lines, this survey attempted to unpack underlying perspectives related to housing that might lead individuals to oppose certain policy changes, but for different reasons. Among the survey themes explored were:

1) Do people think housing-related issues such as rent increases, overcrowding, and jobs-housing imbalance are even a problem? Related to this, do people think governments should prioritize low housing prices (to benefit renters and first-time homebuyers) or prioritize high housing prices (to prioritize existing homeowner equity)

2) If people thinking housing issues are a problem, do they think it is a societal problem (that should thus be addressed with public policy), or rather an individual problem?

3) Does the public at-large find infill housing problematic?

For seven different potential problems related to high housing prices, between 74-94% of respondents reported they thought they were moderate or major problems. Respondents also indicated they thought housing was a societal issue, disagreeing 58-19 with a statement that housing was an individual problem.

In terms of new construction, only 36% of respondents thought new homes altering the physical look, feel, or character of an area was a moderate/serious problem. Additionally, respondents disagreed 48-20 with a statement that infill housing degrades quality of life in those areas.

Looking at crosstabs, results were generally consistent across multiple categories such as gender, housing tenure, age, income, education, race ethnicity, and political lean. That is not to say there were no differences between categories, but they tended to be in the magnitude of agreement rather than the holding of opposing positions. For example, a supermarjority of both progressives (95-5) and conservatives (74-26) thought that government should prioritize low rents/first-time buyer costs than existing owner returns.

Overall the results of the survey may suggest to planners and policymakers that there are broadly popular housing takes in their communities. They may hear contrary positions, but they may be less popular than comments in other venues (e.g public meetings) may indicate.

A MULTISTAKEHOLDER ASSESSMENT OF ILLINOIS HOUSING CODE ENFORCEMENT OUTCOMES

Abstract ID: 1108.0.0.475.2024
Individual Paper Presentation

Andrew Greenlee [University of Illinois Urbana Champaign] agreen4@illinois.edu, presenter
Sharon Legenza [Housing Action Illinois] sharon@housingactionil.org
Emma Walters [University of Illinois at Urbana-Champaign] emmalw4@illinois.edu

Housing code enforcement reflects a form of "law in action" (Ross, 1995) that brings the state's regulatory power inside the home. Like other forms of policing, code enforcement officers apply standards in ways that are principled, but subjective. Bartram (2022) describes these discretionary actions as "stabs at justice" occurring outside of criminal law enforcement. The proliferation of crime free and nuisance housing ordinances in states like Illinois, increasingly align criminal law enforcement with housing code enforcement, calling upon code enforcement officers to force the removal or displacement of renters based upon encounters with criminal law enforcement.

In this paper, we draw from a novel spatial analysis of code enforcement administrative data and more than 30 hours of documentary interviews to analyze and interpret where code enforcement actions accumulate in 7 Illinois

cities, focusing on how distinct burdens are placed on certain neighborhoods, property owners, and tenants. We describe the primary findings regarding code enforcement action and displacement potential, and also focus on the application of participatory multistakeholder research methods in this project to fostering local community conversations about code enforcement action and resulting outcomes including displacement.

Findings from this work underscore how highly spatialized burdens further compound other forms of regulatory authority to increase the potential for the displacement of tenants and the disenfranchisement of small landlords. Based upon these findings we suggest ways in which local community conversations can form the building blocks not only for solidarity but also for structural reform of code enforcement ecosystems.

A QUALITATIVE REVIEW OF SUPPORTIVE SERVICE IN HOUSING FIRST PSH PROGRAM

Abstract ID: 1108.0.0.1251.2024
Individual Paper Presentation

Azza Kamal [University of Colorado Boulder] azza.kamal@colorado.edu, presenter

Stable housing is defined as residence in an independent apartment, room in a congregate living facility, or house; residence in a family members home with intended stays of 6-months or more; or transitional housing programs with a minimum 6-month stay. Measures of housing stability in the literature include percentage of time stably housed, Number of days stably housed, and percentage of group/individuals stably housed at given intervals. These measures are a component of success rate of several Housing First Program, the US Program that serves different needs and types of people experiencing homelessness [PEH]. Literature shows that the most calculated outcome for PSH trials are measures of housing stability. This paper focuses on Permanent Supportive Housing [PSH] as one of Housing First Programs. PSH is housing typology with access to services including long-term leasing or rental assistance as well as health and physical services. Services are provided to assist households with at least one adult or a child with a disability in achieving housing stability. This paper focuses on exploring different parameters associated with the location, type, and frequency of service access. It examines the issues contributed to a long-lasting impact on individuals housing stability by questioning the efficiency and other external factors that might be associated with current housing affordability gaps and landlord's agreement in two cities: San Antonio, Texas and Boulder, Colorado.

Access to mental health service for PSH clients is critical and attempts to address many of the mental and physical health problems of homeless individuals fail when clients are denied access to safe, affordable, sanitary, and

reliable housing. Consumer choice in the two primary types of PSH, scattered site, or congregate/project housing, in addition to the prioritization process of housing placement process impact client's retention.

To understand the extent of challenges of client retention as a measure of housing stability, a review of literature was conducted to identify research indicators that will be further examined. The indicators include housing instability, health and wellbeing, substance abuse, Community integration, and child and family outcomes. qualitative approach to understand the issues associated with the efficiency and ease of system exit to independent and self-sufficient life. While quantitative data from the Homeless Management Information System (HMIS) analysis provide an idea of the frequency that clients sought housing-related service or legal counsel, it did not suffice as an overall source to understand the root of these conflicts.

Thus, the author conducted a 90-minute focus group with service providers and social service managers was conducted to enrich quantitative study with first-person experience from front-line (FL) providers. Eight providers from five agencies in the district participated. The focus group findings revealed that manager and supervisor/director (M/S) participants stress the need for outreach and education aimed at property owners and managers to increase awareness of the difficulties faced by this marginalized population. They stress the lack of landlords that are sensitive to the needs and are willing to work with clients. While scattered-site (non-project-style) housing is central to the original conception of housing first models, many providers and researchers have cited problems with isolation and lack of sympathetic community. Participants in this focus group also suggested that formerly homeless people in scattered-site housing may rely on pre-existing social networks from the homeless community to decrease feelings of isolation or stigmatization. Additionally, they identified a source of conflict between landlords and clients, which typically occurs when clients reconnect with old friends or acquaintances to ease the stress of new surroundings and unfamiliar routines. The research suggests a broader educational outreach to landlords and providers to bridge the gap of multi-homelessness episodes and ensure long-term housing stability.

ADAPTIVE REUSE: LESSONS FROM THE DEREGULATORY APPROACH TAKEN IN ENGLAND

Abstract ID: 1108.0.0.148.2024
Individual Paper Presentation

Ben Clifford [University College London - Bartlett School of Planning] ben.clifford@ucl.ac.uk, presenter
Helen Pineo [University of Washington] hspineo@uw.edu

Given changing use patterns of commercial space post-Covid, particularly offices, and housing crises occurring in many places internationally, there is growing interest in adaptive reuse of commercial buildings for residential purposes, including in multiple North American cities. Sustainability considerations regarding embodied carbon within buildings and the potential to revitalize downtowns with mixed-use development also make such changes of use increasingly appealing. Alongside this, a supply-side understanding dominates responses to the housing crisis is many national contexts, leading proponents to call for ever further deregulation of urban planning and related governance as the means to resolve the crisis, in a neoliberal imaginary.

In England, in 2013 central government changed planning regulations so that developers could convert office buildings and, from 2015, retail and light industrial spaces, into housing without needing the traditional case-by-case planning permission from the local authority: a process called “permitted development” (PD). Existing research has demonstrated how deregulation has led to numerous quality issues, including in relation to the size of the dwellings, natural light, access to outdoor space and the location of housing in relation to neighbouring land uses and accessibility (see Ferm et al, 2021).

Health and wellbeing are two measurable outcomes of housing quality that have multiple societal impacts, such as healthcare costs and productivity. Given the multi-scalar relationship between housing, health and wellbeing and societal inequities, there is a key role for urban planning in partnership with public health to ensure housing availability and quality (Pineo, 2022; Bird et al, 2018). Given the increasing amounts of time some people are spending within their homes post-pandemic, the housing and health relationship is important, particularly in socio-economically deprived neighbourhoods where residents may be more vulnerable to housing exposures than the general population.

There are a range of potential causal pathways linking health and wellbeing outcomes with a decline in housing quality and wider neighbourhood conditions found in some converted non-residential buildings in England, but a lack of empirical research (Marsh et al., 2020). We therefore undertook an exploratory study in a sample of PD properties in London. Working with housing charity Groundswell, we conducted an online survey and interviews with occupants of PD housing. We used the Warwick-Edinburgh Mental Wellbeing Scales (WEMWBS) wellbeing outcome measure and undertook a questionnaire survey with 218 responses and 41 in-person interviews (Pineo et al., 2024).

Our exploratory study found that deregulated non-residential conversions to housing pose potential health and wellbeing risks in the areas of space, overheating, amenities and perceived safety. Residents also highlighted problems with windows and outdoor space. Having sufficient space for socialising, eating together as a household and studying was strongly associated with higher mental wellbeing. A lack of cooling options in the homes was associated with significantly higher risks of probable clinical depression, after controlling for household income. Individual agency and co-occurrence of housing-related challenges (for example insecure tenure) may play a role in modifying potential wellbeing impacts. We are have recently expanded this study to a national sample.

Despite the differences between English and North American office buildings and urban form, there remain transferable lessons from our study to inform office to housing conversions in other settings. In this paper, we present the results of our exploratory work and preliminary findings of our national study. We then consider the implications for the relationship between planning regulations and public health, and the importance of design quality in broader debates about urban governance and housing. We argue this is particularly important when adaptive reuse is proposed for existing buildings, which may not have been originally designed for residential uses, with implications for policy-makers and planning practitioners.

AIRBNB AND HOME SHARING ORDINANCE IMPACTS ON RENTS IN LOS ANGELES COUNTY

Abstract ID: 1108.0.0.227.2024
Individual Paper Presentation

Craig Olwert [California Statue University, Northridge] craig.olwert@csun.edu, presenter
Chih-Hao Wang [California State University, Fresno] cwang@mail.fresnostate.edu
Elizabeth Galbraith [California State University, Northridge] elizabeth.galbraith.61@my.csun.edu

Short-term rentals revolutionized the accommodation industry by allowing people to rent part or all of their housing units as a more affordable option to a hotel room. Airbnb users appreciate the authentic experience of being embedded in residential areas and interacting with the owners. Airbnb owners appreciate the extra income from an unused bedroom or from their temporarily unoccupied housing unit. The extra income can increase the owner's ability to pay the rent or mortgage for the unit.

However, as more short-term rentals are offered, the increased income of owners can increase rents and housing prices. Property owners start evaluating properties from the perspective of the higher revenues from hosting short-term rentals versus having long-term leases (Deboosere et al., 2019). With many Airbnb customers preferring full-unit rentals, owners converted many housing units into full-time short-term rental units (Lee, 2016). The full-unit short-term rental units then reduce the housing availability for residents and increase rents and housing prices (Horne & Merante, 2016).

Units offered as Airbnbs tend to concentrate in certain types of neighborhoods. Generally, they are in tourist-oriented areas near the center of town that are either high-income or gentrifying low-income (Deboosere et al., 2019; Gutiérrez et al., 2017; Lee, 2016). Rent increases are higher in neighborhoods that are more attractive Airbnb locations. This can lead to displacement of long-term rental residents, and can speed up the gentrification process.

To protect long-term residents and the impact of short-term rentals, cities have created Home Sharing Ordinances which vary from complete bans on short-term rentals to limiting short-term rentals to the owner's primary residence to creating a fee structure for operating a short-term rental.

Studies on short-term rentals and their impact on rents have been increasing. And while some studies have evaluated the impact of homes sharing ordinances, fewer have evaluated the effect on rents once the ordinances are in place. Koster et al. (2021) did find that the ordinances did reduce rents in Los Angeles.

We collected data on Airbnb units for 2017 and 2021 for Los Angeles County from Inside Airbnb and combined it with US Census data at a census tract level for the same years. Using ArcGIS Pro, distances to important locations were also assessed including downtown Los Angeles, Hollywood, and the Pacific Ocean. For the 88 cities in Los Angeles County, the presence and type of Home Sharing Ordinance and year of implementation was also determined. Initial results indicate that a decrease in Airbnb units decreases the increase in rents after controlling for income, change in income, change in housing units and distances to important locations. Home Sharing Ordinances generally reduce Airbnb availability and help slow rent increases in the market.

ALIGNING TRANSPORTATION AND HOUSING: ADVANCING ETOD UNDER THE NEW IIJA

Abstract ID: 1108.0.0.698.2024
Individual Paper Presentation

Ned Murray [Florida International University] murrayn@fiu.edu, presenter
Alex Almanzar [Florida International University] aalmanza@fiu.edu
Rachel Bach [Florida International University] rachel@holisticcommunities.net

The 2021 Infrastructure Investment and Jobs Act (IIJA) was the largest single investment in transportation and public works in decades. Despite the IIJA's potential to upgrade the nation's transportation infrastructure and its provisions to encourage localities to adopt transit-oriented development (TOD), there was no allocation of funds to address the nation's affordable housing shortage. While TOD can help create more affordable options near high quality transportation services, research has found that despite the best efforts of local governments and their transportation departments, TOD projects generally do not include affordable housing for low-income residents and often unintentionally burden existing residents and small businesses in the area. The benefits that come along

with TODs – new businesses, restaurants, retail, public amenities, and neighborhood services – also attract new residents to the area. With increasing demand, rents and property values increase, and existing neighborhood residents are often priced out.

Significantly, the IIJA includes a new process by which Metropolitan Planning Organizations (MPOs) engage in a "Housing Coordination Plan" with local stakeholders. The IIJA also continues the competitive Transit Oriented Development (TOD) planning program that provides funding for efforts associated with an eligible transit project for which the project sponsor will seek funding through the Federal Transit Administration's (FTA) Capital Investment Grants Program. The focus is to grow TOD around transit stations to create compact, mixed-use communities with easy access to jobs and services.

This paper investigates how the IIJA's new process by which MPOs engage in a "Housing Coordination Plan" with local stakeholders has resulted in the formulation of planning strategies and policies that align planned transportation investments with expanding the affordable housing supply near transportation hubs and increasing the share of households with affordable access to transportation networks. The IIJA offers an unprecedented opportunity for communities to align transportation, land use, and affordable housing and, in doing so, address inequality and improve sustainability. The research focuses on the inextricable link between housing affordability and accessible transportation incorporated into the Equitable Transit Oriented Development (eTOD) framework in assessing the extent to which MPO Housing Coordination Plans have adequately aligned planned transportation investments with housing affordability. The eTOD planning framework provides for the creation of sustainable communities for existing and future residents of all income levels and where transit is truly accessible, and displacement is avoided. Significantly, the eTOD concept prioritizes equity at every step of the planning process to enable inclusive communities around transit hubs. This paper draws on pre-IIJA and current eTOD project case studies to determine how localities have addressed the challenges and created the opportunities for developing inclusive and sustainable communities. These experiences should help inform the formulation of Housing Coordination Plans under the IIJA.

This research provides cutting-edge analysis of IIJA's Housing Coordination Plans and more broadly the critical elements of an inclusive stakeholder process and eTOD plan. This should benefit educators, MPOs, local governments, housing advocates, and CBOs.

ANALYZING ADU & TINY HOME REGULATIONS IN US CITY & SUBURBAN JURISDICTIONS

Abstract ID: 1108.0.0.178.2024
Individual Paper Presentation

Katrin Anacker [George Mason University, Schar Scho] kanacker@gmu.edu, presenter

Over the past few years, some U.S. jurisdictions have facilitated small, affordable housing solutions by changing their zoning. These housing solutions have relatively small footprints, resulting in lower construction, rehabilitation, or renovation costs and, thus, lower property values or rents, which makes them affordable for many lower- and moderate-income households.

As Pfeiffer (2019, n.p.) states, "[d]espite the rising prominence of ADUs, little is known about the types of communities that build them […]." While there are some U.S. jurisdictions that have permitted Accessory Dwelling Units (ADUs) and tiny homes, there are few systematic, national analyses about U.S. jurisdictions that have permitted versus not permitted these solutions. There are even fewer analyses that compare principal cities and suburbs. The goal of this study is to analyze variations in demographic, socioeconomic, and housing characteristics between principal city and suburban jurisdictions that offer permits versus do not offer them for ADUs and tiny homes.

The geography of this study is the U.S. The unit of observation is the jurisdiction. I utilize two datasets to analyze the variation between jurisdictions that regulate ADUs and tiny homes. First, I use the National Longitudinal Land Use Survey (NLLUS), conducted by the Urban Institute in collaboration with Rolf Pendall in 2019 (Pendall et al., 2022; Urban Institute, n.d.). The NLLUS 2019 Land Use Dataset includes data on jurisdictions with populations over 10,000 within the top 50 Core Based Statistical Areas (CBSAs) and a sample of land use planning empowered jurisdictions with populations under 10,000 in select CBSAs (Pendall et al., 2022; Urban Institute, n.d.). The NLLUS 2019 data set contains the following two variables of interest:

- ADUs permitted or ADUs permitted by discretionary use permit by right or with ministerial use versus not permitted [NLLUS 2019 question 18] and
- Tiny homes permitted versus not permitted [NLLUS 2019 question 16].

Second, I use the American Community Survey (ACS) 2015-2019 (5-year averages), conducted by the U.S. Bureau of the Census annually since 2005 (U.S. Bureau of the Census, n.d.). ACS questions focus on demographic, socioeconomic, and housing characteristics.

My methods are descriptive statistics and Welch's independent samples t-tests. I utilized nine demographic, one socioeconomic, and 11 housing variables in my analysis (21 variables total).

Preliminary results indicate that principal city jurisdictions that permit ADUs have a high proportion of Asians, principal city jurisdictions that permit tiny homes have a high proportion of Blacks/African Americans, suburban jurisdictions that permit ADUs have a high proportion of Whites, and suburban jurisdictions that permit tiny homes have a high proportion of Hispanics/Latinos, possibly indicating that these groups have the power to effect regulatory change.

Principal city and suburban jurisdictions that allow ADUs and tiny homes have very high housing unit values, possibly indicating that jurisdictions that are permitting these housing solutions try to address housing affordability issues.

This research may provide guidance for federal, state, and local governments that would like to understand demographic, socioeconomic, and housing characteristics in connection with reforming regulations for ADUs and tiny homes. Permitting these solutions may partially solve the U.S. national housing affordability crisis (Anacker, 2019).

ANALYZING EVICTION FILINGS AND ABOVE GUIDELINE RENT INCREASES IN ONTARIO

Abstract ID: 1108.0.0.373.2024
Individual Paper Presentation

Julie Mah [University of Toronto Scarborough] julie.mah@utoronto.ca, presenter
Steven Pham [University of Toronto] steven.pham@mail.utoronto.ca

While there are other structural drivers of evictions, an important one is the role of legislation in shaping the rental housing landscape, which can create the conditions for evictions to occur (Merritt & Farnworth, 2020). However, rent control legislation can help with eviction prevention by maintaining affordability through limiting the amount rents can be increased each year, although this effectiveness is undermined if loopholes exist (Hartman & Robinson, 2003). Landlords in Ontario, Canada, can only raise rents annually in rent-controlled buildings by a provincially-set 'guideline' amount. However, landlords can bypass these rent control limits by applying for 'above guideline increases' (AGIs) to pay for eligible capital costs, extraordinary property tax increases, or operating costs related to security. AGIs, thus, enable landlords to increase rents above what would legally be permitted in a rent-controlled building, which can lead to evictions as tenants become increasingly unable to afford the higher rents. Despite growing awareness of the affordability problem associated with AGIs and potential displacement (Zigman & August, 2021), the impacts of AGIs have yet to be rigorously examined.

Evictions research has grown significantly in recent years and has yielded important insights into how and where evictions occur (e.g., Goodspeed et al, 2021), and how different policy landscapes exert strong influence on the spatial distribution and occurrence of evictions (Merritt & Farnworth, 2020). Crucially, research has also spotlighted serious racial and gender disparities in the eviction process (Merritt & Farnworth, 2020), as numerous studies illustrate that racialized neighbourhoods tend to experience disproportionately higher rates of eviction (e.g.,

Howell & Teresa, 2022). However, the geographic focus of this growing body of work has primarily been the United States. Little research, until recently, has been conducted in the Canadian context. This research seeks to address this gap.

This paper is part of a larger research project to better understand the impacts of AGIs on rental affordability and tenant displacement in Ontario. Our main focus in this paper is to examine the spatial and temporal dimensions of AGI applications and eviction filings (2010-2021) across the province to provide a broad comparative overview of the incidence and prevalence of AGIs in different housing markets and geographic contexts (e.g., small city vs. mid-sized city; urban vs. rural). To do this, we use a dataset (n=4889) of AGI applications obtained from Ontario's Landlord and Tenant Board (LTB). One application can cover a few buildings, so each building has been separated out for geocoding purposes. Each building in the database has been mapped and we calculated location quotients (LQs) at the census tract level to identify and compare spatial concentrations over time.

This paper also explores the relationship between AGIs and the incidence of eviction filings. To explore potential connections between affordability and displacement, we linked the AGI buildings in the dataset to a second database that contains over 765,000 eviction filings (2010-2021). This database has been cleaned, geocoded and cross-validated to ensure that eviction filing addresses have been accurately attached to the correct census geographies.

ANYPLACE ARCHITECTURE? EVALUATING PODIUM AND WRAP APARTMENTS

Abstract ID: 1108.0.0.1080.2024

Individual Paper Presentation

Liz Falletta [USC Price School of Public Policy] falletta@usc.edu, presenter

The proliferation of two distinct, yet related, apartment types across the United States over the past decade has been praised for providing much needed housing, but also criticized as monotonous, placeless, and formulaic (Kode, 2023; Lefkowitz, 2021; Nishimura, 2022). "Podium" buildings, which stack apartments over a concrete base, and "wrap" buildings, which wrap units around a concrete core, can be found on urban infill to exurban greenfield

sites in cities of all sizes across the U.S. Both are working to alleviate the housing crisis in high-growth cities like Nashville, Raleigh, and Austin, which finally built enough housing to moderate rents, down 7% in 2023. Public conversations about these buildings, however, discount the important role podiums and wraps are playing in housing production and question the future of cities with a concentration of these building types. In these venues, podium and wrap apartments are "blandmarks," which are "everywhere, but look like they could be anywhere" (Nishimura, 2022).

Why do so many new podium and wrap apartments built across the U.S. look somewhat different yet still all the same (Kode, 2023)? Anecdotal explanations from those in the industry are myriad. Developers cite rising land, material and labor costs, but also say that location, massing and architectural style is driven by restrictive local planning and zoning codes (Lefkowitz, 2021). Architects identify inherently risk averse developer clients and bare bones budgets that require the use of low quality materials, but also the International Building Code, used by most U.S. jurisdictions, which enables the hybrid podium and wrap structural type (Lefkowitz, 2021; Nishimura, 2022). And planners recognize that even this comparatively cheap mode of construction is costly, discouraging experimentation that might require discretionary approval and encouraging fully built out sites that maximize density (Lefkowitz, 2021). All note the anodyne effects of the high returns required by institutional capital and the consequences of consolidation in the building industry, meaning most housing is constructed by national, not local, actors (Lefkowitz, 2021). In other words, housing homogeneity comes down to codes, costs, clients and capital (Lefkowitz, 2021).

But, which codes, costs, clients and capital are the most homogenizing, and in what contexts? How are these "5 C's" working dampen regional character and place identity? To better understand the role of the 5 C's in standardizing housing practice, this paper presents a comparative case study of three clusters of podium and wrap buildings in the East Austin, Mueller and South Lamar neighborhoods in Austin, TX. It will use the 5 C's as a framework to evaluate and categorize outcomes. Data collected on each case will include drawings, renderings and photos to evaluate project design, planning and zoning code parameters, design guidelines, applications for discretionary approval, and design review requirements to assess planning context, and ownership information, land and construction costs as well as rental and cap rates to appraise the real estate development and investment environment. The study will use these materials to ask:

1. How similar or different are these buildings from an architectural perspective? Do they exhibit the degree of sameness across multiple locations as alleged by their critics?

2. What are the urban planning, real estate development and political forces shaping these specific physical outcomes? Are they those cited by industry players or are other forces at work? Of the forces involved, which work to create the most similarity, which might be used to create difference?

By answering these questions the study hopes to provide data that could ground a deeper conversation about this kind of "anywhere architecture," and ask whether the current proliferation of podium apartments is really any different than housing shortages in the past, which were also addressed with repetition and sameness.

ASSESSING FAIR HOUSING PROGRESS: LIHTC AND OPPORTUNITY NEIGHBORHOODS

Abstract ID: 1108.0.0.158.2024
Individual Paper Presentation

Sowmya Balachandran [University of Massachusetts Boston] sowmya.balachandran@umb.edu, presenter
Nathan Hutson [University of North Texas] nathan.hutson@unt.edu
Madeline Sovie [University of Massachusetts Boston] madeline.sovie001@umb.edu

The efficacy of the Low-Income Housing Tax Credit (LIHTC) program in advancing fair housing remains a contentious issue. Research indicates that LIHTC neighborhoods only marginally outperform those created through other housing subsidies like voucher programs, particularly in aspects such as poverty exposure, crime rates, school quality, and employment access (Ellen et al., 2018; Lens & Reina, 2016; McClure & Johnson, 2015). However, the past decade has seen a concerted effort within state-crafted Qualified Allocation Plans (QAPs) to elevate LIHTC projects into areas offering greater opportunities. This shift, largely attributed to fair housing litigation's influence (Fischer, 2018; PRRAC, 2023), prompts an in-depth examination of QAPs' alignment with fair housing principles.

Our study aims to discern how the Texas Department of Housing and Community Affairs v. Inclusive Communities Project, Inc. (2012) litigation has impacted QAP modifications to foster fair housing. We problematize the oversimplified definition of "opportunity" as poverty reduction and the enhancement of affluent conditions, as it fails to address the complex realities of accessing substantial opportunity structures—such as institutional intermediation and educational and employment resources—essential for achieving economic mobility (Balachandran, 2023; Reid, 2019).

Our methodological approach involves a longitudinal analysis of Texas' QAPs spanning 21 years (2002-2022), divided into four distinct phases – pre-litigation (2002-2007), litigation (2008-2011), remedial action (2012-2016), and post-remedial action (2017-2022). We complement our document analysis with qualitative data from in-depth interviews with a diverse pool of developers and fair housing organizations. Further, building upon Ellen and Horn's (2018) methodology, we evaluate the relationships between quantified fair housing criteria and the probability of tax-credit housing in better neighborhoods across the study period using LIHTC project-level data from the Department of Housing and Urban Development (HUD). This mixed-methods approach provides nuanced contextual insights into the policy's practical implementation.

Our findings reveal a significant, albeit unintended, policy shift: a five-percentage point decrease in criteria strength aimed at promoting access to neighborhoods with high economic mobility potential and dismantling barriers for

underserved groups during and post-litigation. Additionally, we observe a dilution of criteria incentivizing location in low-poverty neighborhoods and deeper income targeting. Poverty thresholds at the tract level changed from “10% or lower” to “20% or higher,” with a similar reduction in median income criteria. The maximum points for affirmative marketing were reduced from 22 to 16, requiring a lower set-aside. Despite these shifts intending to simplify project approval processes and potentially increase affordable housing development, developers report mounting challenges stemming from intensified but potentially misaligned deconcentrating poverty criteria. This misalignment has led to a scarcity of viable low-poverty locations willing to accommodate tax credit housing, indicating an unintended consequence of the policy's evolution. Finally, while tax credit units are increasingly located in lower-poverty neighborhoods, there is considerable variation in access to better schools, jobs, transportation, and local factors vital for upward economic mobility.

This study's innovative, state-focused temporal analysis illuminates the complex interplay between social-political changes, market behaviors, and policy responses. It underscores the necessity of continuous monitoring and recalibrating QAPs to effectively align with fair housing objectives. For planning education, the study emphasizes the importance of adaptive policy design and offers a case study on how legal actions can drive, but also complicate, policy evolution. In scholarship, it contributes a critical perspective on policy effectiveness, highlighting the dynamic relationship between regulatory intention and lived reality. It challenges the field to reconsider how policies are crafted, implemented, and evaluated over time.

ASSESSING THE DRIVERS AND FEATURES OF SOCIAL RENT ADOPTION IN BRAZIL

Abstract ID: 1108.0.0.1145.2024

Individual Paper Presentation

Ana Costa [University of Washington] anacosta@uw.edu, presenter

While the homeownership rate has surpassed 70% in Brazil, rent burden has become the main cause of the housing deficit, affecting about three million households in 2019. These numbers illustrate the complexity of the housing issue in Brazilian cities, which is based on interlacing spectrums between homeownership and rent, as well as formal and informal housing. Recent efforts from organizations such as the Inter-American Development Bank and the United Nations to mobilize interest in social rent, coupled with the fact that some of the country's largest municipalities have adopted this policy model indicates the possibility of continued growth. Whether diffusion happens or not, much can be learned from the current trend. In fact, processes of diffusion that do not lead to policy adoption may be as important as processes of diffusion that do lead to adoption, as they demonstrate the challenges in adding a new policy to the agenda. In this study, the following questions will be investigated: What are the domestic conditions, external pressures, and individual behaviors that drive the adoption of social rent in Brazil? What factors explain the policy design similarities and distinctions between local social rent policies? From September to December 2023, I conducted fieldwork in four Brazilian municipalities that either have adopted or are in the process of adopting social rent: São Paulo, Belo Horizonte, Recife, and Campo Grande. During this period, I conducted approximately 55 semi-structured interviews with elected officials, civil servants, researchers, consultants, investors, program beneficiaries, and housing movement leaders. Codes and themes will be identified within and across the four case studies. Furthermore, documents such as reports, meeting minutes, conference presentations, news articles, and press releases have been collected from publicly available sources and interview subjects. These materials will be used for additional information and validation purposes. This study aims to enrich the burgeoning literature on renting practices and policies in Brazil and Latin America at large. By providing insights into the characteristics and expansion of rental policies, it can inform the development of affordable housing strategies focused on rental solutions in locations where such initiatives have been scarce. Moreover, it invites practitioners to reflect on locally adaptable mechanisms that could ensure the sustainability of such initiatives over time.

BEST PRACTICES FOR HOMELESS SERVICE CENTERS IN SPOKANE, WASHINGTON

Abstract ID: 1108.0.0.144.2024

Individual Paper Presentation

Christabel Agyei [Eastern Washington University] cagyei2@ewu.edu, presenter

Abstract: Homelessness continues to pervade cities in the United States (US) today. According to the US Department of Housing and Urban Development's Annual Homelessness Assessment Reports to Congress in 2022, more than 500,000 Americans are homeless on any given night. The objective of the study is to identify and examine existing best practices for an emergent kind of emergency response shelter facility: the "homeless service center," which is low-barrier and increasingly incorporates wrap-around services like mental health counseling, addiction treatment, and housing service providers. Considerable evidence from surveys and annual Point-In-Time (PIT) data has revealed that most shelter-resistant homeless people avoid shelters due to fear of theft, violence, sexual assault, anxiety, rules that disrupt their communities, abusive or dehumanizing treatment from shelter staff, etc. Yet, very little peer-reviewed scholarship exists on how best to respond to this long-standing phenomenon. The study asks how and in what ways local governments, both within and beyond the US, are responding to this dilemma. In the process, evidence-informed interventions and policies that promote quality, safe, and attractive homeless service centers, yet are also adaptable to contextually specific conditions (e.g., housing market conditions, vacancy rates), are presented.

The research employs a mix of primary and secondary qualitative methods, including content analysis of existing grey literature on homeless service centers and semi-structured interviews and surveys with shelter managers and/or representatives at existing facilities in Spokane, WA; Seattle, WA; Colorado Springs, CO; Houston, TX; Boise, ID; and Vancouver, Canada. Interviews delve into the operational model of the homeless service center facility, focusing on criteria that encompass the capacity of the facility, the security measures in place, health and sanitary conditions, accessibility for individuals with disabilities, and the level of integration or interaction with neighboring communities. The study's findings suggest that trauma-informed frameworks are critical for those who operate such facilities. The findings also suggest myriad implications for policymakers, urban planners, non-profit organizations, and individuals who are interested in improving the efficacy of homeless service centers. This is crucial in urban contexts with limited supplies of affordable and/or subsidized housing stock. However, it is also revealed that congregate shelters are being eliminated in some places (e.g., Seattle). While this may sound initially counter-intuitive, insofar as sufficient temporary and permanent housing units are available into which unhoused people can be placed, homeless service centers do not necessarily need to invest in providing warehouse-like modes of emergency shelter, which is often connected to the reasons for why unhoused people avoid seeking assistance at shelter facilities.

CHILD DEVELOPMENT IN PUBLIC HOUSING: UNRAVELING SOCIAL DISORGANIZATION

Abstract ID: 1108.0.0.1173.2024
Individual Paper Presentation

Nadia Kim [University of Illinois Urbana-Champaign] nadiak2@illinois.edu, presenter

Throughout U.S. history, there have been numerous accounts that attest to the negative and dissatisfactory impacts of public housing projects, which led the U.S. housing policy to divert from project-based to household-based assistance, as well as initiating experimental programs, such as the Moving To Opportunity that tested out the transition of public housing residents into different neighborhoods. Given that most public housing residents live in highly segregated and poverty-concentrated neighborhoods, the notion that public housing signifies disadvantaged areas has been widely accepted and used as a measure of disadvantage. Furthermore, the negative perception of public housing is supported by Shaw and McKay's (1942) and Wilson's (1987) social disorganization theory, which attributes the concentration of financial and residential instability as the cause of institutional resource deprivation in neighborhoods.

However, despite the common belief that views the effect of public housing as negative, whether living in a public housing project brings more disadvantages to distressed families remains empirically ambiguous. This study specifically focuses on young children whose access to opportunities is determined early through participation in quality child care (Dupere et al., 2010). The study examines the impact of public housing on early child development, particularly in terms of access to center-based child care, and aims to answer whether there is a correlation between the prevalence of public housing and child care availability after controlling for state and local characteristics.

The analysis takes place in the Chicago Metropolitan Statistical Area. To account for community and family characteristics, U.S. Census data, the American Community Survey, and A Picture of Subsidized Housing are utilized. Additionally, the addresses of child care centers are geocoded and allocated to census tracts. The mode of analysis involves hierarchical spatial autoregressive models (Dong & Harris, 2014), which assess neighborhood and regional fixed and random effects, as well as the additional neighboring effect of public housing.

This study aims to yield results that provide an all-encompassing evaluation of how public housing influences early childhood development and accessibility to center-based child care. By delving into the lived experiences of children nurtured in these environments, it explores the intricacies of public housing's role in shaping opportunities available to children and their life outcomes. The findings promise to shed light on this critical social issue and make a significant contribution to the ongoing discourse surrounding the role and impact of public housing. The implications of this research could potentially extend far beyond academia, influencing policy-making and shaping the futures of children living in public housing communities.

CORPORATE OWNERSHIP AND SINGLE-FAMILY RENTAL HOUSING IN LUCAS COUNTY, OHIO

Abstract ID: 1108.0.0.1046.2024
Individual Paper Presentation

Daniel J. Hammel [University of Toledo] dan.hammel@utoledo.edu, presenter
Sujata Shetty [University of Toledo] sujata.shetty@utoledo.edu

National trends towards declining homeownership rates and increasing numbers of Americans in rental housing over the past decade have led to a renewed focus on the rental housing market in the United States. Research has found that the location of rental housing is changing; renting is becoming more expensive, even compared to homeownership; and there is increasing consolidation of the ownership of rental housing.

Our previous research on the changing geography and ownership of single-family rental (SFR) housing in Lucas County, Ohio, and the county seat, Toledo, found that SFR housing in Lucas County accounted for over half of all rental housing units and ownership of these units is increasingly concentrated into the hands of a few large owners who operate in multiple housing markets across the country. Many of these properties are being sold multiple times in short time periods. Analysis showed some differences between local and multiple market LLCs that were owners of large numbers of SFRs in the city and county, and a link between SFRs and foreclosures. There was also significant variation among LLCs based on how clustered they are and on the value of the houses that they choose to purchase.

In this paper, we seek to build on this research to examine the practices of these large corporate owners to better understand the reasons and effects of the increasingly rapid changes of ownership of SFR properties. In addition, we begin to explore the role of large property management firms. Such firms are often local and offer management services from collecting rent to paying property taxes. For small scale landlords, a management firm makes it possible to efficiently manage properties as absentee owners. For larger regional or national operators, property management firms can sometimes be used to make limited ownership in a market economically viable. Our initial research in Toledo suggests that while there is concern about larger SFR owners, especially in potentially pricing prospective homeowners out of the low- and moderate-income market, many more tenant complaints focus upon the management firms, most of whom are local. We explore the impact of these firms through interviews with several actors in our housing market including representatives of SFR operators who are active locally, local housing activists, representatives from the city's Housing Court, and local government officials. We will use MAXQDA to analyze this data.

The rise of rental housing and the increase in the precarity of this housing for many of the county's most disadvantaged residents is cause for concern among local fair housing advocates. Gaining a deeper understanding of the strategies that large real estate and property management firms are pursuing in our county can help our policy makers and advocacy community to develop housing policies that are more equitable while also helping individual renters.

CULTIVATING SUSTAINABILITY TRANSITIONS IN AFFORDABLE HOUSING EXPERIMENTS

Abstract ID: 1108.0.0.892.2024
Individual Paper Presentation

Peyvand Forouzandeh [University of British Columbia] peyvand.forouzandeh@gmail.com, presenter

Fostering urban sustainability transition is an urgent global challenge. To navigate through the complex governance of transitions (Rotmans & Loorbach, 2008), one of the most prominent approaches are Sustainability Transition Experimentations (STEs). STEs encompass real-world, multi-stakeholder, learning-oriented, and place-based processes aimed at fostering innovative strategies, ideas, and policies to addressing pressing urban issues (Sengers et al., 2018). In Canada, diverse experimentation approaches and theories have organically emerged in recent years, particularly in response to the ongoing housing affordability crisis.

However, research on the internal and context-specific dynamics of experimentation governance, as well as their impact evaluation, is limited. Academic literature has only started to explore the effectiveness and complexities of governance in STEs (Hughes et al., 2017; Williams, 2019). This gap persists despite expectations of governments to not only adopt new approaches amid uncertainty and austerity conditions, but also to facilitate experiments and learning to discover innovative solutions to address complex and systemic issues across various levels and scales.

This paper investigates strategies for guiding STEs in housing affordability in Vancouver toward transformative results. The interplay between socio-political configurations - including regulations, institutional arrangements, power dynamics, knowledge exchange, policy integration, and cultural narratives – significantly influences the success or failure of STEs and their impacts. For emerging urban experiments to become less of an 'isolated experiment' and transform into 'governance experimentations' (Bulkeley & Castán Broto, 2013), there is a need for

effective approaches to facilitate the uptake, mainstreaming, and embedding of their results to urban planning, policy, and broader governance frameworks.

This paper aims to introduce relevant interdisciplinary literature and evidence-based suggestions for guiding and evaluating Sustainability Transition Experiments (STEs) in Canada, focusing on the Vienna House demonstration case study. This project, a collaboration between Vancouver and the city of Vienna, represents a prominent effort in the sustainability transition of social housing in Canada. This research seeks to address the following questions: How can the governance of urban sustainability experimentations be effectively guided towards transformative results to address complex housing affordability and environmental sustainability challenges? and what are the key enabling factors that contribute to their success or failure in achieving impacts? Data collection involved conducting 15 semi-structured interviews with key stakeholders of the project from December 2021 to June 2023. Additionally, participation and observation of decision-making processes in project meetings and events were undertaken. Furthermore, this study was complemented by analyzing project documents and reviewing relevant policy documents across various levels of governance.

The results of this study underscore the necessity and commendable efforts undertaken to foster experimentations in partnership with multi-level governance actors for housing transition. However, the study also highlights entrenched systemic, innovation, and learning constraints that pose a significant impediment to the transformative potential of this experimentation. It concludes that these constraints have the potential limit the short- to long-term impacts of this experimentation to primarily incremental changes. Furthermore, this research provides a comprehensive framework based on literature review and reflections on the case study. It delineates pivotal governance factors essential for enhancing knowledge capture and dissemination in STEs. Planners, policymakers, evaluators, and facilitators can derive considerable insights from this framework, as it elucidates critical pathways for harnessing experiential learning, refining procedural methodologies, and deploying evaluative strategies conducive to navigation experimentations toward transformative results. The framework includes 9 key themes, each encompassing sub-categories that suggest governance, research, and evaluation strategies for supporting the likelihood of transformative change. Drawing on the findings of this study and evidence of positive dynamics and deficiencies in the experimentation process, the framework proposes a spectrum of actions and strategies across initiation, process, and impacts of collaborative experiments in sustainable social housing.

DO LONGER HOUSING SEARCHES LEAD TO BETTER MATCHES? EVIDENCE FROM VOUCHERS

Abstract ID: 1108.0.0.725.2024
Individual Paper Presentation

Sarah Strochak [New York University] sarah.strochak@nyu.edu, presenter

As rental markets have gotten increasingly tight across the country, households may find it more difficult to find adequate and affordable rental housing that meets their needs. This can be an exceptional challenge for low-income households, who may lack the time and resources to partake in longer and more costly housing searches. One group in particular that may struggle to find housing is participants in the Housing Choice Voucher program, the largest rental assistance program in the US. The program is designed to allow voucher recipients to live in communities of their choice, as tenants rent homes on the private rental market. However, this means that the housing search process becomes a crucial step in the program.

While voucher holders may enjoy a more relaxed budget constraint than unassisted renters, they still face many challenges, including discrimination from landlords, operating within the program's rent guidelines, and time constraints on their housing search. In fact, almost 40% of voucher households are unable to use their vouchers due to the difficulty of this search process, and for households who are successful, searches have increased in length over time. Households that are able to use their vouchers often live in similar neighborhoods to unassisted renters, despite the core programmatic goal of expanding neighborhood choice.

In this paper, I evaluate the effect of search time on housing match quality. I focus on two different sources of variation in search time. The first is variation across households, within a housing authority- holding constant the amount of time that households are given to search by the housing authority that administers the program. To identify a causal effect, I leverage the random timing of voucher issuance in an instrumental variables strategy. The margins of match quality that I look at are housing turnover (the likelihood of moving units or exiting the program in a short time period after entering), and neighborhood outcomes, including the poverty rate of the destination neighborhoods.

The second source of variation in search times comes from different allowable search times that are used across housing authorities. While PHAs must give households at least 60 days to search, there is no upper bound on search times, and PHAs across the country take vastly different approaches in managing initial search terms and extensions. I collect original data on allowable search times and extensions for over 500 PHAs. Using the collected metrics, I classify PHAs based on both their initial search frames, and calculated measures of leniency based on how their observable search times differ from stated policies. I then evaluate the effect of allowable search time and leniency on the same dimensions of match quality.

This paper makes two major contributions. First, I apply frameworks of job search and match quality from labor economics to the rental housing context. Second, I provide evidence on setting optimal policy for search time within the voucher program, an important lever that housing authorities can use to promote success for voucher recipients.

Amelia (pseudonym) is a Latino older woman part of the Texas Housers Caucus whose home was destroyed after Hurricane Harvey in 2017. Under the Texas General Land Office (GLO) Homeowner Assistance Program (HAP), some of Amelia’s neighbors had chosen to raise their houses wary of the floods that accompanied life in this community. When asked why she didn’t opt for a home like her neighbor she replied, “I’m not fond of those beach houses.” Her statement carried a determination as she expressed her dislike for the design of elevated homes at least one foot of freeboard for structures in the 100-year floodplain. Amelia also explained that her area didn't face flooding as bad. She believed that the risk of future flooding was minimal and didn’t warrant the changes that came with raising her new GLO house. Another factor that seemed to be influencing her decision was her mobility issues related to age. Although these homes are built with a long ramp, she found the idea of climbing stairs or going around a long ramp to enter her home inconvenient. This story raises the question of why do individuals choose not to have an elevation for their new construction when it is offered at no extra cost?

By examining the Houston locations where people participating from HAP opt to raise their homes, this study will provide information about the distribution of elevated homes. This data can be used to to assess whether there is a need for elevation for HAP homes and identify patterns and trends shedding light on the physical and sociological factors that influence people's decisions to elevate their homes (e.g., distance to waterway, previous experiences with flooding, flood duration, extent of damage incurred, property damages, perception of longer time for construction for elevated homes, beliefs about flood risks, cultural aesthetic perceptions of home design, perceptions of lower home values due to elevation, perception of old structure being better quality than new construction, community expectations and norms, etc.). Additionally, this study seeks to investigate the decision-making process of individuals who accept to raise their homes or not due to factors such as interest of aging/staying in their homes, expectation of increasing instances of flooding over time, and other personal or community trends. It is crucial to note that this research considers the importance of considering subgroups and social factors such as age, race, nationality, citizenship, language, income, length of time in a particular neighborhood, and ability. By examining how these factors intersect with people's choices to raise their homes this research can uncover personal preferences as well as disparities and inequalities in awareness of elevated housing options.

EMPIRICAL EVIDENCE ON THE IMPORTANCE OF COHORT EFFECTS TO RRPO SATISFACTION

Abstract ID: 1108.0.0.988.2024

Individual Paper Presentation

Jane Rongerude [Iowa State University] jrong@iastate.edu, presenter
Jake Wegmann [University of Texas at Austin] jagw@utexas.edu
Daniel Kuhlmann [University of Arizona] dok@arizona.edu

Elizabeth Muetter [University of Texas, Austin] ejmueller@utexas.edu

According to the old chestnut, the most important elements of real estate are “location, location, location.” But there are reasons to believe that temporal cohort effects condition the experiences of Residential Rental Property Owners (RRPOs), in particular those that are non-institutional in ownership structure (i.e., those sometimes shorthanded as “mom and pop”). Non-institutional RRPOs may not enjoy the ready access to capital, professionalized property management, and other advantages of institutional RRPOs (Apgar et al, 2008). The particular time period when an RRPO enters the business matters to their financial health and by extension satisfaction with their work in at least two ways. First, their cost of debt is conditioned by nationally prevailing interest rates. And second, their properties’ performance is affected by locally prevailing fundamentals at the time of entry into the market, such as the ratio between acquisition prices and rents, within the multifamily rental market. If there are widespread cohort effects resulting in dissastisfaction and in turn prompting the simultaneous exit of many non-institutional RRPOs from a given market, there could be important consequences for their tenants. For instance, researchers have found evidence that low-income tenants under duress can find more lenient treatment from their RRPOs if they are small and nonprofessionalized (Garboden et al, 2018; Balzarini & Boyd, 2020). In this study, we operationalize the satisfaction of non-institutional RRPOs from a cluster of variables from the Iowa State RRPO Survey (ISRRPOS) collected in two waves from 3644 responding non-institutional RRPOs in 9 US cities. Controlling for a number of other relevant factors harvested from the ISRRPOS, we regress temporal cohort effects (via the two pathways listed above) on owner satisfaction. In this way, we evaluate the extent to which cities may face risks of large-scale waves of exits from the multifamily rental business by their populations of non-institutional RRPOs.

ENTRY TO HOMEOWNERSHIP BY AGE COHORT AND RACE IN THE UNITED STATES

Abstract ID: 1108.0.0.899.2024
Individual Paper Presentation

Sihan Mao [University of Southern California] sihanmao@usc.edu, presenter

Entry to homeownership is a significant event in an individual’s life cycle and a milestone on the journey to the middle class. The timing of the first entry bears important socioeconomic implications on childbearing, labor supply, wealth accumulation, and tenure security. However, the 2000, 2010, and 2020 Decennial Census data show

that younger households achieve lower homeownership rates compared to older households born ten years earlier at the same age. The homeownership gap measured by age group and race is more evident among African American households. The article addresses two main questions. First, do younger households postpone their first-time homebuying, and by how many years the homebuying is delayed? Second, how do the cohort changes contribute to the homeownership gap among ethnic and racial groups?

While the census data shows the aggregated homeownership patterns by age group, it does not follow individuals during their life course or provide information on the length of time between splitting off from parents' families and buying their first homes. Therefore, using the Panel Study of Income Dynamics (PSID) data, this article applies the survival analysis approach to investigate the probability of entry to homeownership at different ages by age cohort and race. This article addresses left-censoring by assuming the risk of homeownership starts at age 18 after one moves out of parents' house. The sample includes children or grandchildren of PSID families who later became heads or spouses of households in the survey between 1985 and 2021. Sample observations are grouped into four cohorts based on birth year using 10-year spans. A discrete-time logistic model is employed to estimate the effects of age cohort, race, education attainment, household income, parental assistance, and employment status on the likelihood of entry to homeownership.

The results reveal that younger cohorts are more likely to postpone homebuying to later ages. The cumulative probability of entry to homeownership between age 25 and 44, the critical ages for first-time homebuying, also drops by each cohort. Moreover, the effect of age cohort on entry to homeownership differs by race. African American households have a significantly lower probability of first-time homeownership compared with Hispanic or non-Hispanic white households at the same age, contributing to the well-documented black-white homeownership gap. The finding implies that younger cohorts are more likely to miss the advantageous positions to invest early in housing markets for home equity gains. Housing policies should provide more support for young households to transition into homeownership.

EQUITY IN DISASTER RESPONSE: THE CASE OF EMERGENCY RENTAL ASSISTANCE

Abstract ID: 1108.0.0.671.2024

Individual Paper Presentation

Yi Wang [Portland State University] yiwang@pdx.edu, presenter
Lisa Bates [Portland State University] lkbates@pdx.edu
Minji Cho [Portland State University] minji2@pdx.edu

In response to the COVID-19 pandemic's economic devastation, the federal government launched the Emergency Rental Assistance Program (ERA) to help struggling renters stay housed. While prioritizing historically underserved populations was a key objective, the Oregon Emergency Rental Assistance Program (OERAP) faced significant implementation challenges that hindered its ability to reach those most in need. Using OERAP administrative data, this study examines the extent to which OERAP successfully targeted vulnerable groups from application to fund allocation. The study finds that the program design favored early applicants and resulted in a situation where vulnerable groups' chances of receiving assistance were significantly influenced by the timing of their applications. For instance, extremely low-income households had a lower probability of receiving aid compared to higher-income households within the eligibility range. This lower probability was due to both late applications (indirect effect) and a lack of prioritization in case processing (direct effect). On the contrary, female- / nonbinary-headed households had a higher probability of receiving OERAP compared to male-headed households. This advantage stemmed from both earlier applications and prioritized processing. The findings highlight the mixed outcomes of prioritization efforts in disaster response programs.

EVICTION, SPATIAL INEQUALITY, AND FINANCIALIZATION IN TORONTO

Abstract ID: 1108.0.0.635.2024

Individual Paper Presentation

Martine August [University of Waterloo] martine.august@uwaterloo.ca, presenter
Julie Mah [University of Toronto Scarborough] julie.mah@utoronto.ca

Financialization is driving intensified socio-spatial inequality in cities around the world. The financialization of multi-family rental housing is contributing to these trends, as financial firms (private equity groups, institutions, publicly-listed firms, real estate investment trusts [REITs], and asset managers) increasingly consolidate ownership of apartments. In Canada, financial firms have amassed an estimated 30 percent of rental housing stock, with levels in some cities and neighbourhoods much higher. Researchers have argued that financialization is intensifying crises of affordability and security of tenure, as financial firms are structurally motivated to pursue investor returns in ways that are more aggressive than other types of landlords. While advocates and researchers expect that financialization is associated with an increase in evictions, only a few studies (in the US, focusing on single-family rentals) have demonstrated this link. This paper explores whether financial firms file higher rates of evictions in multi-family housing in Toronto, Canada, and spatially analyzes the connections between eviction and gentrification. Drawing on a unique database of all evictions filed in the 10-year pre-pandemic period of 2010-2019, applying to all Toronto rental housing properties (over 20 units), we find that financial firms file to evict at dramatically higher rates than chain owners, multi- and single-property owners, and non-profit and public firms. We also analyzed all building transactions during this time period, finding decisively that financial firms have a higher rate of filing after purchasing properties. This is most significant when buying from small-scale one-property owners, with a six-fold increase in filings going forward each year after purchase by a financial firm. Spatially, filings are concentrated in low-income communities (often in Toronto's inner suburbs), indicating that lower-income, racialized, and newcomer populations are most affected by the financialization-driven housing insecurity. For planners, these patterns show that ownership matters when it comes to rental housing stability.

EVICTIONS IN A HISPANIC COMMUNITY POST-COVID-19: MARYVALE, PHX CASE STUDY

Abstract ID: 1108.0.0.980.2024
Individual Paper Presentation

Aurora Munoz Casarrubias [Arizona State University] ammunozc@asu.edu, presenter

Millions of renters across the U.S. lose their homes through eviction each year. During the COVID-19 pandemic, the federal government feared that evictions would reach unprecedented levels and contribute to the spread of COVID-19. In response, they distributed billions of dollars in rental assistance to state and local governments and implemented a federal eviction moratorium. Still, house prices skyrocketed nationwide while household income

fell. Researchers have explored different adverse eviction outcomes (1) on a small scale by studying household vulnerabilities and (2) on a larger scale by establishing neighborhood eviction patterns. However, few studies have focused on evictions' impact on neighborhoods and how minority communities attempt to address their challenges, especially during societal disruptions.

This paper addresses this research gap by using a case study approach to explore how high eviction rates shaped cultural, social, and economic dynamics and resident responses in one majority Hispanic community in Phoenix, AZ, over the pandemic: Maryvale. Maryvale is an ideal case study, as it has a supermajority of Hispanic residents (81%), one of the highest eviction rates in the country (32% compared to the 6.2% national average), and a long history of displacement and resilience. I triangulated three forms of data in this research: 1) qualitative meta-analysis of news articles, scholarly articles, and planning and policy reports, 2) direct observation of community events reflecting neighbors' interactions and cultural dynamics that enhance community cohesion, and 3) semi-structured interviews with residents and local institutions, non-profits, and community coalitions in Maryvale. The data obtained from this research offers insight into how evictions changed Maryvale's character and what strategies the community used to build resilience during and after COVID-19. The results are an assessment of Maryvale's eviction resilience and an overview of community resilience tools. Overall, this study contributes to the theory of how evictions affect minority neighborhoods during societal disruptions and how these disruptions also offer an opportunity for planning for community resilience.

EXAMINING THE EFFECT OF DIVERSE PUBLIC HOUSING APPROACHES ON SOCIAL CAPITAL

Abstract ID: 1108.0.0.473.2024
Individual Paper Presentation

Hee-Jung Jun [Sungkyunkwan University] hjun@skku.edu, presenter
Hyun Jeong [Korea Development Institute(KDI)] hjeong@kdi.re.kr

Social capital is a crucial element for achieving positive outcomes in economic, social, and political realms, promoting sustainable communities. However, public housing residents often experience lower levels of social capital, accompanied by social exclusion. This phenomenon could be linked to the inherent structural issues in public housing. In many countries, public housing residents face social isolation and stigma, a situation mirrored in Seoul, Korea. Due to limited residential land, public housing in Korea is typically comprised of high-rise buildings

within large complexes, making them distinct from conventional housing. Also, antisocial activities have been observed in public housing sites along with concentrated poverty. These problems together can negatively affect social capital among public housing residents.

In response to these challenges, Korea has developed various public housing programs. Initially, public housing primarily involved the construction of large complexes. However, over time, the approach evolved to include social mix housing complexes, integrating private and public housing units. Additionally, the government has started purchased public housing, purchasing existing low-rise detached houses for public housing, thereby moving away from the development of new, large-scale complexes. These later iterations of public housing may have a different impact on the social capital of residents, potentially alleviating some of the associated problems.

Despite the significant influence of public housing on residents' quality of life, there is a scarcity of research exploring how different types of public housing affect social capital. Addressing this gap, this study asks a research question, "Does the type of public housing influence different levels of social capital among its residents?"

To investigate the relationship between public housing types and social capital, this study utilizes data from the 2021 Seoul Public Housing Residents Panel Study, conducted by the Seoul Housing and Communities Corporation (SH). The dependent variable is social capital, including trust, network, and norm of reciprocity. The primary independent variable is the type of public housing, which includes independent public housing, public housing within social-mix complexes, and purchased public housing. Control variables comprise housing characteristics, neighborhood environment, and demographic factors. The regression analysis shows that different public housing types are associated with varying levels of social capital.

FAIR LENDING IN CRISIS: FHA LOANS AS A SAFETY NET FOR MINORITY GROUPS?

Abstract ID: 1108.0.0.285.2024
Individual Paper Presentation

Hsuan Lo [Harvard University] jimmylo0827@gmail.com, presenter

Homeownership, often seen as central to the "American Dream," faces significant challenges related to affordability, extending beyond major metropolitan areas to secondary cities across the United States. Data from the 2023 median multiple report by Demographia highlights the pervasive nature of this issue. While cities such as San Jose, Los Angeles, and San Francisco have long been recognized for their high housing costs, even areas like San Diego and Raleigh now confront serious affordability crises.

Credit enhancement mechanisms, notably FHA, VA, and RHS mortgage insurance, play a crucial role in enabling traditionally underserved households to access adequate financing for home purchases. In 2018, 40.6% of Black or African American borrowers utilized FHA loans, a higher proportion than conventional loans, while 37.6% of Hispanic borrowers benefited from FHA loans, compared to only 16.3% of White borrowers. This underscores the significance of FHA loans as a financial resource for minority groups in the housing market. However, White borrowers have historically constituted the majority of FHA lending recipients, with shares ranging from 50-60% over the past two decades, while FHA shares for Black and Hispanic borrowers declined from 30.58% in 2019 to 26.92% in 2022.

While prior research has demonstrated that Black and Hispanic borrowers face higher denial rates with conventional loans, there appears to be a decline in FHA loan approvals for these groups during the COVID-19 pandemic. Consequently, this study seeks to elucidate the challenges encountered by Black and Hispanic FHA loan borrowers amidst COVID-19 (2020-2022) compared to the pre-COVID period (2018-2019). It aims to determine whether Black and Hispanic borrowers are less likely to be approved by FHA compared to White borrowers during the pandemic, and in comparison to their own approval rates in pre-COVID times. Additionally, the study will examine regional disparities to determine whether these differences are more pronounced in tight housing markets.

Utilizing data for Massachusetts from the Home Mortgage Disclosure Act (HMDA) and the American Community Survey (ACS), this research employs stratified regressions to examine the relationship between regions and FHA loan shares among racial groups over time, logistic regressions to compare approval and denial probabilities across races, and a Regression Discontinuity Design (RDD) model to compare FHA shares for Black and Hispanic borrowers during the pandemic with pre-COVID times. The findings can provide insights into fair lending practices within housing finance companies (e.g., Fannie Mae, Freddie Mac, and Ginnie Mae) and raise awareness of regional disparities in housing markets and social equity for local governments.

FEAR AND COMPLIANCE:WOMEN MIGRANTS' EXPERIENCES IN NANJING'S SHARED RENTALS

Abstract ID: 1108.0.0.464.2024
Individual Paper Presentation

Weiyi Cao [Wageningen University] weiyiseu1902@gmail.com, presenter
Jin Xu [Southeast University] zjsxxujin@gmail.com

This study investigates the shared housing experiences of women migrants, focusing on the challenges and constraints they face during the process of finding, securing, and living in a housing unit. By using mixed methods of quantitative analyses, field study, and interviews, this study examines how gender identity, shaped by social norms in China, interacts with the characteristics of the shared housing market, resulting in experiences that unequally disadvantage women tenants.

First, we collected 46,273 shared rental listings, which included the gender information of roommates and detailed unit and complex information from the largest shared rental website in Nanjing, a large metropolis. We identified housing complexes where female tenants outnumber male tenants. We then conducted a field study to further identify physical attributes of female-majority complexes and compare them with male-majority complexes. From the field study, it is evident that complexes preferred by professional migrant women have specific physical attributes.

Secondly, through fifteen in-depth interviews, both in-person and virtual, conducted with women tenants, we employed qualitative content analysis of the interview data to uncover the nuances of these experiences. Findings indicate that, although varying to some degree, women migrants encounter difficulty in locating a unit that is both affordable and can meet their needs for safety and better quality. Moreover, despite their dissatisfaction, they often feel compelled to share accommodations until they are in a position to purchase their own property. The participants attribute their disadvantages to gendered preferences, gender dynamics and inequality, and the lack of regulation within the shared rental housing market. Thus, we show how gendered preferences in the shared housing market are shaped by the interaction between gender identity, social norms, and market features. We advocate for intervention by state and local governments to regulate the shared rental housing market in China more effectively, aiming to address and mitigate the gender-specific challenges identified. This study not only sheds light on the challenges faced by female migrants in urban China but also contributes to the broader discourse on gender, migration, and housing policy.

FISCAL ROOTS FOR DISCRETIONARY REVIEW

Abstract ID: 1108.0.0.1064.2024
Individual Paper Presentation

Nick Allen [Massachusetts Institute of Technology] nballen@mit.edu, presenter

Beginning in the 1970s, U.S. cities have expanded political discretion within formerly rules-based housing development systems (Sagalyn 1997). Why? Planning scholars have mostly scrutinized the rise of "negotiated zoning," in which cities leverage land use variances and permitting to exact public benefits (Kim 2020; Manville et al. 2023). I argue that discretionary review has parallel origins and related functions in local property tax policy. In high-tax communities like Detroit and Chicago, local legislative bodies can selectively subsidize property tax rates on new housing developments (Craft, Drucker, and Weber 2021). These decisions attract public bargaining and development conditions, a process which diverts project subsidies to outside interests. I ask two primary questions: First, do discretionary tax subsidies dominate the development agenda in some housing markets? Second, given strong legal presumptions against tax disuniformity and the economic inefficiency of these diversions, why are discretionary tax procedures adopted and retained?

To find the prevalence of discretionary tax subsidies in weak markets, I exploit ten years of local legislative proceedings for the City of Detroit. Using semi-supervised classification methods, I identify project-level housing development interventions and measure the frequency of legislative action for land use variances, tax subsidies, and other exceptions and exemptions. I code these according to the state and local statutes that provide for legislative review. If the quality of legislative records allow, I will also use HUD annual permitting data to estimate the fraction of new housing units subject to these discretionary reviews.

Second, I use state bill files and legislative records to understand the arguments originally made for local discretionary review of tax subsidies in Michigan. I supplement these records with available personal archives for sponsors of tax subsidy legislation. I expect that city officials sought ways to selectively lower local costs of capital without diminishing tax revenue. As fiscal conditions continued to limit housing investment, these review procedures later took on bargaining functions. Although these records only actors' stated positions, I expect these records to reveal significant contest over the role of local government intervention in development finance.

The primary result of this paper is to document the significance of local discretionary review in domains other than land use regulation. As a secondary result, coding local legislative proceedings may offer a new approach to identifying local policies that visibly limit housing development. As planners evaluate the effect of discretionary zoning decisions in restricting housing production, discretionary tax subsidies warrant similar review.

FOUND MONEY: FAIRCLOTH-TO-RAD AND NEW FEDERALLY ASSISTED HOUSING IN THE US

Abstract ID: 1108.0.0.713.2024
Individual Paper Presentation

Matthew Gebhardt [Portland State University] mfg@pdx.edu, presenter

This paper examines the Faircloth-to-RAD conversion process as an emerging path for public housing authorities to expand the supply of federally assisted, deeply affordable housing. Specifically, it will delve into the origins and structure of the program and discuss the opportunities it opens and limitations it faces. The Faircloth-to-RAD process, its creation, and its implementation are an excellent example of a core aspect of the Congress theme: it illustrates the emergence of innovative, trailblazing programs through an understanding of the complexity of policies and their implementation mechanisms.

Introduced in 2022, Faircloth-to-RAD draws together several existing aspects of federal public and subsidized housing programs and policy. The first is “Faircloth Authority”, dormant public housing unit capacity available to certain public housing authorities. Passed by the US Congress in 1998, the Faircloth Amendment, placed a cap on the maximum number of public housing units that could receive federal capital and operating subsidies. Many public housing authorities, through demolition and redevelopment, are now below this maximum number. The second is the Rental Assistance Demonstration (RAD) program, which allows conversion of public housing subsidies to project-based assistance. Combined these provide a path for public housing authorities to potentially create approximately 235,000 new affordable units through mixed-financing (HUD, 2022; Metcalf, Garcia, and Hacnik, 2023).

Through interviews and review of documents and development plans, this paper explores the structure and mechanics of this new program, discussing both its policy innovation and practical implementation. Initial findings highlight the potential of this program, but also the complexity of execution and continuing limitations imposed by both Faircloth limits and RAD rent levels.

GARAGES AND DRIVEWAYS: AN ADAPTABLE NEIGHBORHOOD INFRASTRUCTURE

Abstract ID: 1108.0.0.26.2024
Individual Paper Presentation

Deirdre Pfeiffer [Arizona State University] deirdre.pfeiffer@asu.edu, presenter
Rababe Saadaoui [Arizona State University] rsaadaou@asu.edu

Residents of America's single-family home neighborhoods have adapted their car-oriented built environments in resourceful and creative ways (Brand 1994; Chase et al. 2008; Mukhija & Loukaitou-Sideris 2014). They have integrated gentle housing density, repurposed streets for arts and socialization, and established community gardens, which may help them lead more socially connected and healthier lives. Garages and driveways are relatively underexamined within literature on single-family home neighborhood adaptation. Garages have sparked moderate attention from pop culture, architects, and housing planners as "programmable" spaces that can jumpstart billion-dollar tech revolutions or contribute to the toolkit of local housing affordability strategies (Erlanger & Govela 2019; Mukhija & Loukaitou-Sideris 2014). Attention to driveways is sparse, with a few noteworthy efforts to explore their function as interstitial quasi-public sites of yard sales and pickup basketball games and sociable spaces during the COVID-19 pandemic (Chase et al. 2008; Mukhija & Loukaitou-Sideris 2014; Pfeiffer et al. 2022).

This research advances this conversation by using a mixed-methods qualitative approach to comprehensively describe residents' adaption of two underexamined single-family home neighborhood spaces: garages and driveways. We ask: 1) How often do residents use single-family home garages and driveways for purposes other than to park cars? What kinds of uses are present? 2) What might drive residents to use garages and driveways in these ways? 3) How might these uses affect residents and neighborhoods? We answered these questions through a thematic analysis of over 6,000 photographs of single-family home garage and driveway adaptations in 13 Phoenix region neighborhoods with diverse demographic, socioeconomic, housing, and ecological conditions and 26 interviews with stakeholders representing neighborhood, planning, and real estate industry perspectives.

Our findings help to theorize these spaces as an adaptive neighborhood infrastructure that may help households and communities thrive. We show that a sizable minority of residents are using these spaces for purposes other than to park cars and articulate a holistic typology of adaptation that includes expression, consumption and production, housing, recreation, social engagement, nature restoration, and surveillance. Choices to adapt are motivated by a culture of consumerism, lifecycle changes, and desires to engage with neighbors. Adaptations enable households to age in place and communities to socially connect but also break land use rules and fuel

neighbors' anxiety about ruined aesthetics, reduced parking capacity, and community decline. Together, these findings reveal that single-family home garages and driveways are an overlooked infrastructure within neighborhoods worthy of integration into frameworks of neighborhood systems.

HERITAGE AND HOUSING ON NANTUCKET: A NATIONAL HISTORIC LANDMARK CASE STUDY

Abstract ID: 1108.0.0.1079.2024
Individual Paper Presentation

Maria Watson [University of Florida] maria.watson@ufl.edu, presenter
Erica Mollon [University of Florida] emollon@ufl.edu
Cleary Larkin [University of Florida] clarkin@ufl.edu
Megan Trudel [Town of Nantucket] megan_trudel@yahoo.com

Nantucket's prized tourist economy was developed as government policy in the mid-twentieth century, during the same period that the entire island was granted National Historic Landmark status and became a nationwide precedent-setter for land conservation. Though the island has long struggled with balancing affordable housing needs of the year-round community with the needs of the seasonal community and economy based in tourism, the needs have reached crisis level with year-round residents providing critical services, such as healthcare, emergency response, and teaching, unable to find affordable rentals, much less ownership.

This paper explores Nantucket's numerous obstacles to "attainable" housing (up to 240% AMI) through a historical assessment of the island's constraints in policy, ethic, advocacy, and land development. The results of an online resident survey will be discussed to illustrate and quantify the actual housing needs. Finally, we present an assessment of current strategies the Town of Nantucket is undertaking and compare with other tourist-destinations in the United States for viability of policy. The paper will conclude with recommendations that consider the priorities of preservation, conservation, affordability and tourism as interconnected and equally important.

HOUSING AFFORDABILITY AND DEMAND FOR SPECULATIVE REAL ESTATE IN MEXICO

Abstract ID: 1108.0.0.1234.2024
Individual Paper Presentation

Dinorah Judith Gonzalez Ochoa [El Colegio de la Frontera Norte] dinorahgo.phd@gmail.com, presenter
Tito Alejandro Alegría Olazabal [El Colegio de la Frontera Norte] talegria@colef.com.mx

Housing affordability and demand for speculative real estate in Mexico.

The rapid rise in housing prices has become a social justice issue at the national and international levels. Between 2019 and 2020 alone, home prices in Mexico increased 27.1%. At the regional level, INFONAVIT (2022) identifies that the effects are more accentuated in tourism markets with significant demographic growth dynamics, such as Baja California Sur, Quintana Roo, Nayarit, Sinaloa, and Baja California. In these states, the increase in the price of housing ranges between 34% and 40% for the same period. Increases in the price of housing have real effects on the well-being and development of the population. Based on the results of the National Income Expenditure Survey (ENIGH), in 2020, Mexican families spent a higher proportion of their income on housing and transportation than in 2018, effectively reducing the percentage of their spending on food, education, and recreation. (INFONAVIT, 2022) (INEGI, 2020).

While housing prices are influenced by a complex interplay of supply and demand market dynamics, a line of research has focused on how the financial acetification of housing is driving housing inflation. However, empirical evidence of the underlying mechanism is scarce for markets in the global south. To breach this gap, this paper focuses on speculative housing demand in Mexico to explain housing price inflation. It analyzes recent increases in buy-to-rent investments in the six most significant metropolitan areas: Mexico City, Monterrey, Guadalajara, León, Toluca, and Tijuana. Furthermore, the research goes in depth with actors in the real estate industry in Tijuana, Mexico, to understand the role of speculative housing demand in that market. The present research seeks to answer the following questions: How is speculative housing demand impacting housing affordability? Who are these investors? And what is driving their interest?

This paper uses a mixed research methodology. Speculative demand is measured by market indicators in Mexico's main metropolitan areas. Meanwhile, through interviews with real estate agents and housing developers, it seeks to delve into the type of investors and the real estate products that have been in demand in the Metropolitan Area

of Tijuana in the last ten years. Finally, data collected from applications for permits to develop housing in this city provide us with an approach to the role of flexible regulations in housing prices.

HOUSING DECAY IN THE CLIMATE CHANGE ERA: A CITY-SENSING APPROACH.

Abstract ID: 1108.0.0.812.2024
Individual Paper Presentation

Esteban Lopez-Ochoa [UTSA] esteban.lopezochoa@utsa.edu, presenter
Wei Zhai [University of Texas at San Antonio] wei.zhai@utsa.edu
Ryun Jung Lee [The University of Texas at San Antonio] ryunjung.lee@utsa.edu
Kristen Brown [UTSA] kristen.brown2@utsa.edu
Farzad Hashemi [The University of Texas at San Antonio] farzad.hashemi@utsa.edu
Angela Lombardi [The University of Texas at San Antonio] angela.lombardi@utsa.edu
Neil Debbage [The University of Texas at San Antonio] neil.debbage@utsa.edu

In the last years, the San Antonio (TX) area has endured some of the hardest winters and summers in their history. In 2021 they witnessed the URI winter storm, and in 2022 and 2023 they endured grueling summers with 58 and 60 days over 100 Fahrenheit degrees (38 Celsius) respectively. This paper describes the current efforts of the Historic Westside, a lower income and predominantly Mexican- and Hispanic-American neighborhood of the city, and their struggle to maintain their stock of affordable housing supply in a rapidly growing city that has recently been highlighted for high demolition rates (Way et al., 2021), and the potential of code enforcement bias (Lopez Ochoa & Zhai, 2024). Using a community-led approach, a housing conditions form was developed to prioritize housing repair needs in the neighborhood. The community leaders and UTSA researchers also collaborated to install PurpleAir sensors in neighborhood homes to record temperature and air quality metrics inside and outside of homes with poor (treated) and good (control) homes. The results will discuss the main efforts, organizing challenges, contested spaces between the neighborhood association and city officials, the metrics collected from the sensors, as well as the learning experiences in using these new community-generated environmental evidence to advocate for more resources to maintain and rehab those structures falling in disrepair. These first set of results are in direct communication with current and past literature in housing decay and its role on urban issues such as decline-induced displacement and gentrification (Seymour & Akers, 2023; Suglia et al., 2014; Weber et al., 2006); the deep need of housing repair assistance, and the effects of climate change and extreme weather events in households with repair needs. In addition, this paper will reflect on the cultural clashes between city officials and code enforcement staff whom have an ideal of home beautification that conflicts with the ideals of the community, since

the community uses inexpensive and repurposed materials to maintain their homes, namely rasquachification (Marcuse, 1985), while the city uses white- and high-income ideals to enforce the building standards code.

HOW DISPLACEMENT HAPPENS: LIVED EXPERIENCES OF TENANTS ACROSS ONTARIO

Abstract ID: 1108.0.0.756.2024
Individual Paper Presentation

Brian Doucet [University of Waterloo, School of Planning] brian.doucet@uwaterloo.ca, presenter

Displacement is one of the biggest challenges facing tenants. While displacement is a complex process commonly associated with gentrification (Marcuse, 1985), there is a growing body of research that demonstrates how it can be found in a range of neighbourhood types, as well as in both urban and rural communities (Jones, 2023; August, 2020). However, displacement is notoriously tricky to empirically measure, with statistical analysis unable to capture either the scale of displacement, or the uneven power relations that underpin it (Elliott-Cooper et al., 2020; Slater, 2009). As a result, there is a need to utilize qualitative approaches that focus on the lived experiences and lived expertise of displaced tenants (Jones, 2023).

This paper discusses the results of a large partnership project between academic researchers and community advocates. The aim is to better understand how displacement happens through deep and meaningful engagement with tenants who self-identified as being displaced. In total, 113 tenants were interviewed across four communities in Ontario, Canada's largest province.

Through interviews with displaced tenants, three types of landlord tactics were identified. The first are informal tactics, where landlords simply tell tenants that they need to leave. In some cases, tenants are offered a payment, known as 'cash for keys.' Many tenants end up leaving through these tactics, particularly if they are not aware of their rights, or if they fear being homeless. The second is semi-formal tactics, where official eviction notices are presented, but landlords do not follow official timelines, or file notices with the Landlord and Tenant Board (LTB).

As with informal tactics, the aim is to get tenants to leave 'voluntarily.' These are somewhat fluid categories; in many instances, landlords progress from informal to semi-formal tactics, which collectively cause trauma and a sense of inevitability for tenants. The third tactic is a formal eviction enforced by the courts.

Informal and semi-formal tactics comprised almost all the displacement experiences in this research. But because they are considered 'voluntary' and do not end up at the LTB, they are not recorded in any statistical database. This poses a challenge for planners who lack important information about the scale of displacement, and what it means to tenants. Therefore, informal, and semi-formal tactics should be seen as directly contributing to involuntary displacement: landlords want to evict long-term tenants to take advantage of a lack of rent control on vacant units while tenants are harassed, intimidated and exhausted.

With so little displacement visible within statistics, it can be 'officially invisible': an issue to monitor rather that an urgent problem to address. Therefore, it is essential to centre the lived experiences of tenants within housing planning and policymaking. While there is still work to be done, several municipalities across Ontario are now doing this, which is leading to the development several important anti-displacement measures, in part informed by this research.

HOW MANY UNITS ARE NEEDED? MEASURING THE HOUSING SHORTAGES IN THE U.S.

Abstract ID: 1108.0.0.1083.2024
Individual Paper Presentation

Seongmoon Cho [University of Southern California] seongmoc@usc.edu, presenter

The lack of housing supply has become a recognized crisis drawing attention from the Federal Government (White House, 2024). The estimated national shortages from the various reports are greatly different, ranging from 1.5 million to 7.3 million depending on the methodology and data (Harvard JCHS, 2024). However, most of the estimated amounts of shortages focus on the national level rather than the regional level. Moreover, there has been no academic discussion on the indicators, and thus no agreement is reached on methodology. This study addresses these gaps by investigating three questions. First, what theoretical framework is needed to explain the current housing shortage crisis? Second, how well does each measure of the shortage correlate with rising house

prices or other affordability measures? Third, what characteristics are associated with housing shortages in a metropolitan area?

To answer these questions, this study reviews and tests the methodologies from the publicly available reports and materials on housing shortages. The reports include the ones from federal to private agencies such as FreddieMac, Fannie Mae, National Association of Realtors, National Association of Home Builders, and National Low-Income Housing Coalition. First, by reviewing the reports and academic literature, we categorize the three operational definitions of housing shortage indicators based on their own implicit assumptions and approach: vacancy rate approach, headship rate approach, and jobs and housing growth relation approach. This categorization allows us to modify and develop the indicators based on theoretical concepts in the academic literature such as price-adjustment mechanism (Gabriel & Nothaft, 2001) and decomposition method for household formation (Myers, Pitkin, & Park, 2002; Myers et al., 2016). Second, to estimate the alternative indicators on housing shortages, we use the Decennial Census, American Community Survey Public Microdata Series, and employment data by Bureau of Economic Analysis for the 100 largest metropolitan areas. We estimate the metro-specific shortages of housing by calculating 1) the difference between natural vacancy and actual vacancy rates, 2) the difference between simulated and actual household formation based on the demographic and socio-economic characteristics, and 3) the comparison of employment and housing growth.

Our findings reveal that housing shortages have grown over time and become severe in the largest metros aggravating housing affordability. Using the levels of household formation by age, race, tenure, and structure type in 2000 as the baselines, national housing shortages increased from 1.4 million in 2006 to 8.1 million in 2019. And it dropped by 3.4 million in 2022. Over 90 percent of housing shortages are concentrated in the 100 largest metros. The average number of units of shortages for 100 metros grew from 38 thousand in 2006 to 91 thousand in 2019. Then, we estimate the correlations between shortage and other affordability indicators across the largest metropolitan areas. Preliminary regression estimates indicate that a 1%-point decrease in housing shortages corresponds to a 0.5%-point reduction in cost-burdened households who pay 30% of income for gross rent. Also, a 1%-point decrease in housing shortages is associated with 0.1%-point increase in residential mobility by renters.

The metro-specific shortage indicator reflects the unmet needs for housing and the would-be homeowners. The increase in internal migration from different metro areas is positively associated with housing shortages, especially owner households. High price-to-income ratio is associated with greater shortages in a region. We argue that a metro-specific housing shortage measure that helps local policymakers to build a shared recognition on the exact housing shortages in the region could help build consensus about housing increases needed for greater affordability.

INSIGHTS FROM A FORMATIVE EVALUATION: A SHORT-TERM HOUSING MOBILITY PROGRAM

Abstract ID: 1108.0.0.762.2024
Individual Paper Presentation

Jason Reece [Ohio State University] reece.35@osu.edu, presenter
Rachel Kleit [Ohio State University] kleit.1@osu.edu
Jee Young Lee [Ohio State University] lee.8000@osu.edu

Housing mobility programs aim to diminish inequalities and encourage fairer access to improved living conditions by expanding housing choices for low-income communities and communities of color (Chetty et al. 2016; DeLuca et al. 2016). However, the scarcity of federal Housing Choice Vouchers (HCVs) limits the capability of such programs to meet the housing needs of our nation (Moore, 2016). Currently, fewer than 1 in 4 eligible individuals have access to an HCV, and voucher programs often have waitlists that extend over several years (Ellen, 2020). HCV holders encounter difficulties in utilizing vouchers in high-resourced areas due to cost constraints and landlord resistance. Additionally, a drawback of traditional housing mobility programs is their dependency on traditional federal housing assistance programs to subsidize participants’ long-term housing. With income eligibility requirements, families with housing vouchers risk losing their voucher if their income exceeds program limits, creating a significant “benefit cliff” for families to increase their incomes.

As an alternative, the City and Regional Planning program at The Ohio State University and community partners in Central Ohio created a program with the aim of increasing the supply of affordable housing while improving life outcomes for children and their families by creating opportunities for residential and financial stability using a short-term rental subsidy model. Columbus is ranked as the second most economically segregated metro area in the US (Florida & Mellander, 2015), and central city and inner ring suburbs are isolated from community resources such as higher paying jobs, grocery stores, accessible green space. The rental market is difficult to successfully navigate for people who have traditionally been marginalized from resources, including rental assistance. Moreover, many individuals who do not meet the eligibility criteria for HCVs still require housing assistance. With escalating housing needs nationwide, innovative solutions are necessary to provide affordable housing in high-opportunity areas. The program, Families Flourish, addresses these issues with a multi-faceted intervention that offers housing support through a privately funded $400 monthly rental subsidy, access to high-quality rental units in high-resourced and safe neighborhoods, and life coaching over a three-year period. The program primarily serves socioeconomically disadvantaged families who qualify as very low income but do not receive an HCV.

This paper presents a formative evaluation addressing the development and progress of the program’s implementation along with immediate program outcomes. Using in-depth qualitative methods, this study comprehensively examines the implementation and adjustments throughout the program’s first four years through

engagement with program coaches, participating landlords, and property managers. The formative evaluation elucidates how the program changes and responses to unexpected challenges were navigated using information from both participants and service providers. Additionally, we collected annual data from surveys and interviews from 10 pilot participants over a five-year period, spanning from 2018 to 2022, covering periods approximately four months after relocation to three months after their program exit. Overall, landlords and coaches reported positive experiences with the program. The evaluation results document substantial impacts on the life outcomes of 10 families, with participants experiencing multifaceted improvements in health, mental health, child development, financial security, employment stability, and income. These positive outcomes led to the expansion of the program.

INVESTIGATING THE TENANT SELECTION PRACTICES OF ADU LANDLORDS

Abstract ID: 1108.0.0.31.2024
Individual Paper Presentation

Jenna Davis [Barnard College, Columbia University] jmd2218@columbia.edu, presenter

Landlords are powerful vectors of residential sorting, opening up or constraining access to stable housing, neighborhood choice, and ultimately, social opportunity (Rosen, Garboden, & Cossyleon 2021). Although landlords play a key role in shaping subsequent housing outcomes, landlord behaviors and management practices have largely gone unobserved until recently. An emerging body of scholarship, however, has started to explore the behaviors of various housing market intermediaries – from housing inspectors, to real estate brokers, to landlords – and the ways in which their behaviors contest or reproduce social and racial inequalities (Decker 2023; Korver-Glenn, Bartram & Besbris 2023). Although previous research has started to explore how landlords shape subsequent housing outcomes, minimal research to date has focused on the behaviors or management practices of landlords renting accessory dwelling units (ADU) specifically, in particular their tenant selection practices when they live on-site. ADUs are independent residential dwellings that are located on the same parcel of land as a single-family home, either as a subsidiary internal, attached, or detached structure.

The lack of research into the tenant selection practices of ADU landlords matters for several reasons. For one, ADUs offer some of the most affordable housing options available on the market (Chapple et al. 2017). As a result, examining the tenant selection practices of landlords in this market has the potential to reveal how landlords control access to housing that is affordable to tenants along the economic margins. For another, the unique spatial arrangements of an ADU, in which a landlord is living in especially close proximity to their tenant, could mean that the tenant selection practices of ADU landlords are qualitatively different from those observed in the broader rental market. Previous research has indicated that small-scale landlords often exercise heightened discretion in the tenant selection process (Decker 2023; Rosen, Garboden, & Cossyleon 2021), raising the question of whether ADU owner-occupiers will act accordingly. Finally, the fact that planners and policymakers have increasingly touted ADUs as a core solution to address rising housing costs raises the need for increased scrutiny into this emerging, but understudied, market.

Seeking to fill part of this gap in the literature, this research explores the tenant selection practices of ADU landlords who live on-site on Long Island, which historically has been home to a high concentration of accessory apartments (Anacker & Niedt 2023). Specifically, this research asks: How do on-site landlords of ADUs select tenants for their units? And how do the unique spatial arrangements of an ADU impact those tenant selection criteria? To answer these research questions, we recruited landlords who advertised their units on various online platforms and conducted in-depth, semi-structured interviews with landlords on Long Island. After conducting conventional content analysis on our interview transcripts, we find that on-site ADU landlords often exercise a high level of subjectivity when selecting their tenants, using “gut checks” and highly discretionary criteria to select their tenants, at times factoring in tenants’ physical appearance, personal comportment, and neighborhood “fit” when selecting tenants. We further find that landlords consider specific criteria that are reflective of the unique spatial arrangements of the ADU and the fact that they live on-site, some of which are discriminatory. Our findings point to the need for further research into landlord practices in general and the need to repeal the “Mrs. Murphy” legislation, which allows owner-occupiers with fewer than four units to be exempt from certain provisions of the Fair Housing Act.

IS SALT LAKE CITY, UT GENTRIFYING? - EVALUATING ALTERNATIVE INDICATORS

Abstract ID: 1108.0.0.447.2024
Individual Paper Presentation

Justyna Kaniewska [University of Utah] u1324755@utah.edu, presenter
Reid Ewing [University of Utah] ewing@arch.utah.edu

Even though so much time and effort has been invested in the study of gentrification, there is still relatively little agreement regarding what this process is and how to measure it (Hawkins, 2022). While some scholars see fast increasing rent levels and property prices as the main indicator of gentrification, others focus their attention on the human component and point to significant shifts in ethnic, racial and income level composition of neighborhoods (Baker, 2019). All seem to agree that gentrification is associated with significant socio-economic changes, but there is not much agreement on how to measure them or how much change constitutes gentrification - where lies the thin line between natural progression and gentrification. Similarly, the crucial question regarding factors driving gentrification remains to be answered. In this case, some scholars stipulate that gentrification may be caused simply by an increase in the number of housing units in a neighborhood, while others argue that the cause may lie in residents' increased demand for amenities (Hwang, 2016).

Although this study does not answer neither of the questions, it attempts to demonstrate how using different indicators of gentrification affects which city neighborhoods appear gentrified. It also shows how setting different thresholds for change affects which and how many neighborhoods are seen as gentrified. Lastly, it examines whether socio-economic characteristics (e.g. the age of housing stock, proportion of elderly population, median income) commonly believed to be associated with gentrification are good predictors of gentrification. All analyses are conducted for Salt Lake City, Utah.

To illustrate how different definitions of gentrification affect the perception of the process I selected four alternative indicators of gentrification – changes in (1) the proportion of Latino population, (2) the proportion of population with higher education, (3) median gross rent, and (4) median income. Changes in indicators are measured between year 2011 and 2019 using ACS 5-year data. The lowest threshold (LOW) for change is equal to the city-wide mean change in that criterion in the same time period, while the highest one (HIGH) is set at a level that results in a number of gentrified tracts that allows to build a meaningful linear regression model. The medium threshold (MEDIUM) is set to generate approximately half of the gentrified tracts. I use multivariate linear regression models to examine which characteristics of the gentrified tracts in 2011 are best predictors of gentrification by year 2019. For independent variables I use a set of factors that have been widely acknowledged to affect or cause gentrification, e.g. median household income, percentage of owner occupied housing units, percentage of Latino population, percentage of structures built before 1939, percentage of single family homes (single unit structures), median gross rent.

Even after considering the many limitations of this simple study, some facts emerge that might affect the way we think about gentrification. First, there is either very little or no correlation between the four indicators of gentrification selected for this study, which are also commonly used as criteria for identifying gentrified areas in general. This means that using any of the four indicators individually will always yield different results – show different sets of tracts as gentrified. Second, applying different gentrification indicators (in this case four of them) results in very different sets of tracts deemed as gentrified. Third, applying all four indicators jointly results in no tracts showing as gentrified. The overly simplified conclusion is that not only there is no one definition and indicator of gentrification, but most importantly that the choice of definition and indicators determines what areas are perceived as gentrified.

LAND BANKING AND SOCIAL CAPITAL: A CASE OF DETROIT, MICHIGAN, USA

Abstract ID: 1108.0.0.1066.2024
Individual Paper Presentation

Jung-Eun Lee [Seoul National University] jelee823@snu.ac.kr, presenter
Yunmi Park [Seoul National University] ym.park@snu.ac.kr
Tae-Hyoung Gim [Seoul National University] taehyoung.gim@snu.ac.kr
Hyungchul Chung [Xi'an Jiatong-Liverpool University] hyungchul.chung@xjtlu.edu.cn

The rise in urban vacancy, especially in depopulating cities, has drawn increasing government attention (Heim Lafrombois & Park, 2021). This is because abandoned structures may be hazardous and undesirable, lowering nearby property values (Newman et al., 2018). Unused property taxes make it difficult for the local government to provide enough public services (Alm et al., 2014). As a result, after the 2008 US subprime mortgage crisis, land banking (LB), first proposed in the late 1960s, has acquired popularity (Sands & Skidmore, 2015). The basic goal of LB is to maintain, repair, demolish, lease, or sell empty homes to put them on the tax rolls (Tappendorf & Denzin, 2010). LB also involves working with local governments and connected organizations to use tax-delinquent properties to provide affordable housing, parks, and green spaces (Center For Community Progress, 2019). Consequently, numerous shrinking US communities have constructed land banks, with several programs supporting them. Center For Community Progress (2023) reported 311 land banks and LB programs in 2023, among cities, states, and municipalities.

Studies on LB have demonstrated their ecological, economic, and social significance. Nevertheless, there is a scarcity of studies about their impact on social capital (SC). Several studies have examined how turning vacant lots into community gardens or public green spaces promotes community involvement and ownership. Still, out of 140 land banks in the US, the most common ways to dispose of vacant lots are either demolition or private ownership (Bollwahn, 2019). According to Rigolon et al. (2021), empowered citizens who seek a social purpose in purchasing and transforming property improve lot conditions through private ownership. Anderson and Minor (2017), on the other hand, emphasized that excessive urban vacancy lowers SC, underscoring the need to revitalize unoccupied structures.

Given these facts, this study attempted to explore the direct and indirect impact of LB programs on the SC using 481 Detroit residents' 2021 survey responses. Detroit, one of the most shrinking cities, has lost 10.5% of its population and seen 28.4% more vacant dwellings over the past decade (Census, 2020). Since 2014, HUD's

Neighborhood Stabilization Program has funded the Detroit Land Bank Authority (DLBA) to grow into its current form and fight urban vacancies. As of 2021, DLBA offers Demolition, Auction, Own It Now (sold as is at $1,000), Rehabbed & Ready (sold as remodeled), Partner Sales (sold to community partners to improve neighborhood quality), Side Lots (sold for $100 to residents who took at DLBA properties), and Neighborhood Lots (sold for $250 to residents within 500 feet) (Detroit Land Bank Authority, 2021).

We used structural equation modeling to look at how neighborhood conditions affect the link between reoccupied and transformed properties and social capital (SC) at both the individual and community levels. Research questions were whether properties that are recently occupied, demolished, or maintained would directly (H1) or indirectly through neighborhood condition improvement (H2) help to promote SC as proponents of LB. Furthermore, Halpern (2005) asserts that one can observe SC at both the micro- and meso-levels. This suggests that SC changes at the individual and community levels may occur simultaneously or have different effects. At the micro-level, SC focuses on individual elements such as social networks, trust, and reciprocity, whereas at the meso-level, it includes aspects of the community such as a sense of community, social cohesion, and collective action. The results of this study could provide valuable insights for the creation and execution of successful LB programs that encourage SC at both the personal and communal levels and contribute to beneficial outcomes for neighborhood rehabilitation.

Living Together, Living Apart: A Big-data Approach to Activity-based Segregation between Residents of Public Rental Housing and Commercial Housing Projects in Beijing, China

Social mix has been claimed by planning and policymakers as an effective way to reduce segregation while enhancing social integration. Thus, housing policy in the last few decades have emphasized mixed-income developments, with the hope to enhance inter-group interaction and integration. Empirical observations of the effectiveness of mixed-income development, however, have had mixed findings. Merely living together does not necessarily mean more inter-group interaction or equalized daily-life experiences. Lower-income public housing dwellers suffer from limited access to transport resources or job opportunities compared to relative affluent residents of market-price housing. Scholars have argued that public housing dwellers may have limited exposure to their affluent neighbours during daily activity-travels despite living in the same locations. Nevertheless, empirical evidence has been limited, especially in the context of urban China where, in the past decade, public rental housing has emerged into the largest program of government-funded of affordable rental housing for lower-income residents.

In this study, we contribute to this literature by investigating disadvantages in daily activity-travel patterns of public housing renters relative to commercial housing dwellers in Beijing, China, using activity information derived on anonymous mobile phone data of November 2021. We obtained the list of 78 public rental housing projects owned by Beijing Municipal Government, and were able to identify the geographical boundaries of 63 PRH projects and for each PRH project, one nearby commercial housing project built around the same time. Upon initial cleaning of the mobile phone data, we identified users living in these public rental housing projects and a matched sample of users living in nearby commercial housing projects. We first contrast distinct activity-travel patterns of two social groups including total number of daily activity locations, total distance of daily travel, and spatial fragmentation of daily activities. We then explore to extent to which residents of these two housing types exhibit paralleled lives with limited potential of inter-group contact and interaction in public spaces.

Our research contributes to the emerging literature on the socio-spatial segregation in daily activity-travel patterns between two social groups with distinct housing access, while offering policy insights for inclusive urban planning and housing policy.

MAKING CHOICE NEIGHBORHOODS WORK FOR OLDER ADULTS LIVING IN PUBLIC HOUSING

Abstract ID: 1108.0.0.59.2024
Individual Paper Presentation

Atticus Jaramillo [University of Arizona] atticus@arizona.edu, presenter
Arlie Adkins [University of Arizona] arlieadkins@arizona.edu

The aging of the U.S. population has stoked interest in how federal rent assistance programs can better serve older adults aged 65 and up, who now account for 30% of the 4.3 million adults receiving rent assistance from the U.S. Department of Housing and Urban Development (Eggers, 2022; Reina & Aiken, 2022). Prior work has suggested that, in particular, public housing redevelopment initiatives may need to be revamped in the coming years, as these initiatives have often failed to equitably serve older adults Dubbin & Yen, 2023; Ruel et al., 2013; Tester et al., 2011). However, the question of how exactly such initiatives should be revamped remains open for discussion, for we still know little about why public housing redevelopment initiatives fail to equitably serve older adults much less how local housing agencies can address this issue going forward.

In this study, we advance the literature by considering how the Choice Neighborhoods Initiative (CNI) – the nation's largest public housing redevelopment initiative – can more equitably serve older adults. We do so by providing a case study of the City of Tucson's experience implementing CNI at a 408-unit public housing community where older adults account for 75% of all residents. Our case study uses a variety of data sources, including survey data from residents (N=269), qualitative data from resident focus groups (N=25), and supplemental interviews with local program administrators (N=6).

While our research is still ongoing, our initial findings indicate that many of the older adults have endured the trauma of long-term housing instability before entering public housing and therefore have especially strong place attachments to their units and especially strong concerns about temporary or permanent relocation. Many senior residents have also spent years developing a network of doctors, food provisioning strategies, and networks of friends/family and are concerned about accessing these resources while temporarily relocated. Interviews with local program administrators have further revealed that, because CNI was mainly developed with families and working age adults in mind, legislatively mandated planning and implementation timelines and requirements afford them little flexibility to address the unique needs of older adults.

In light of our results, we argue that CNI could better serve older adults by: (a) allowing more flexibility in program planning; (b) providing longer planning timelines for CNI sites primarily occupied by older adults; (c) developing alternative tracking requirements and metrics that are more relevant to older adults; and (d) providing more resources and technical guidance to support the equitable relocation of older adults during the redevelopment / rehabilitation process.

MANUFACTURED HOME COMMUNITIES IN NORTH CAROLINA AND ACCESS TO WATER SERVICE

Abstract ID: 1108.0.0.1239.2024
Individual Paper Presentation

Kshitiz Khanal` [University of North Carolina at Chapel Hill] kshitiz@live.unc.edu, presenter
Nikhil Kaza [University of North Carolina at Chapel Hill] nkaza@unc.edu
Miyuki Hino [University of North Carolina at Chapel Hill] mhino@unc.edu
Antonia Sebastian [University of North Carolina at Chapel Hill] sebaanto@email.unc.edu

Mobile/manufactured home communities (MHCs) are highly vulnerable to natural disasters, owing to natural hazards risk (floods, hurricanes, wildfire, heat, etc.), structural integrity, and socio-economic status of the residents (Gregory Pierce, Gabbe, and Annabelle Rosser 2022; Ash 2015; Baker, Hamshaw, and Hamshaw 2014). Mobile home units and parks are significantly negatively correlated with reliability of water service, resulting from service cut-offs, and water quality violations (Pierce and Jimenez 2015). Utility planning in mobile homes require thorough assessment of their utility service access. However, one of the major challenges in analyzing hazard risk and service accessibility is the lack of comprehensive publicly available records of mobile homes. In addition, the information about areas served by water utilities is also incomprehensive and inaccurate. An in-depth characterization of accessibility of water utility service can help in equitable planning for essential services, making MHCs more climate resilient.

We used a computer vision approach to detect individual manufactured housing from satellite imagery and identify manufactured home communities in North Carolina using a combination of spatial clustering and matching parcel records. We created a training dataset of size 4500 for object detection comprised of 2500 double wide manufactured homes, 1000 single wide manufactured homes, and 1500 potential false positives such as subdivision homes, roads, industrial and commercial buildings, etc. We retrained a pretrained YOLOv8 object detection model (considered one of the state-of-the-art architectures for object detection) on the curated training dataset resulting in in-distribution performance of overall 97% recall and 93.3% minimum average precision (mAP50) across the two classes of single wide and double wide manufactured housing. We used high-resolution aerial imagery (15 cm resolution) collected by the state of North Carolina. We identified MHCs from individual detections by matching detection with parcel boundaries as well as spatial clustering using DBSCAN.

Our preliminary analysis in selected counties shows that this approach identifies MHCs that are not publicly available in datasets such as the Homeland Infrastructure Foundation Level Data (HIFLD) dataset of Mobile Home Parks at a much granular level (from a geocoordinate for a MHC to individual bounding boxes for each manufactured housing structure). We have also characterized their distribution in North Carolina and their water utility service accessibility using publicly available information of water utility service boundaries and Safe Drinking Water Act (SDWA) datasets. In addition, we delineated the boundaries of Public Water Systems (PWS) that primarily service MHCs, identified from SDWA dataset by matching neighborhood parcel boundaries akin to a knapsack problem. The effort contributes to an ongoing collective initiative to delineate accurate water utility service area boundaries and adds the boundaries for 300+ PWS in North Carolina for which accurate boundaries are not currently publicly available. We will present the spatial characterization of MHCs in North Carolina as well as their water utility service accessibility. Additionally, we will also present the evaluation of the computer vision technique compared to an alternative approach of identifying Mobile Home Parks from building footprints using Machine Learning classifiers (Durst et al. 2021). This paper thus makes both methodological and domain specific contributions to equitable housing and utility planning literature. The results validate the use of computer vision techniques and increasingly accessible high-resolution imagery in planning research and practice. The records of MHCs in North Carolina created as part of this research (to be made publicly available later) makes utility planning for resilient unsubsidized affordable housing possible at a much granular level.

MIGRANTS' HOUSING STRUGGLES WITHIN RENTAL HOUSING COMMUNITIES IN CHINA

Abstract ID: 1108.0.0.883.2024
Individual Paper Presentation

Liubing Xie [University of California, Berkeley] liubing.xie@gmail.com, presenter

Today, over 370 million internal migrants cross jurisdictions and live in unauthorized rental housing communities. The housing struggles of migrants challenge China's urban governance structure. As the governing strategies of the household registration system have proved inadequate, China has launched an initiative to reconfigure the largely informal rental housing market and develop an affordable rental housing market through state-sanctioned corporate projects. Unauthorized rental housing communities are being converted into affordable rental housing respectively for rural migrant workers and migrant college graduates. At the conjecture of increasing migration and a crisis in China's real estate market, I ask 1) how China's shifting from homeownership to rental policies reconfigure the governance and management of migrant populations? 2) how do the housing struggles of migrant communities contest the state power and call for a redefinition of urban citizenship?

Based on a 10-month ethnography of planning processes and of migrant tenants' everyday lives in Guangzhou and Shenzhen, I suggest that the rental housing initiative marks a reterritorialization of the state strategy to fix and govern the heterogeneous migrant populations. I present the following findings: 1) by reconfiguring the unauthorized rental housing market and reorganizing migrants into different housing communities, local government, planning bureaus and real estate companies render the migrant communities and individuals legible and governable. 2) the affordable rental housing communities are mobilized by the state and non-state governing actors to mold industrious and docile rural migrant laborers as well as high-quality (suzhi) (Anagnost 2004) and globally competitive talents. 3) A significant proportion of migrants fell out of the government's categorization, particularly migrant families. In a protest against a rental housing project in Shenzhen, mobilizing the rhetoric of children's constitutional rights to in situ compulsory education, mothers spearheaded a rare protest for the right to the city in China.

ONLINE HOUSING LISTINGS AND ZONING CHANGE

Abstract ID: 1108.0.0.808.2024
Individual Paper Presentation

Clemens Pilgram [University of Southern California] pilgram@usc.edu, presenter

Over the past decades, online housing listings have become the primary way of marketing homes to buyers. Realtors and sellers write housing listings to appeal to the type of buyer they expect to be most interested in their property. In their free text sections, listings draw attention to features of both the homes themselves, as well as to those of its surrounding areas, such as nearby amenities or infrastructure. Listings have become the object of scholarly research as a form of so called "Big Data", due to their coverage of market segments not recorded

otherwise (Harten et al. 2021), or the ability to reflect features not covered otherwise (Su et al. 2021). Recent studies have demonstrated text in housing listings can be employed for tracking neighborhood dynamics over the course of decades (Nilsson and Delmelle 2022), or changes in consumer preferences for different housing attributes during the Covid-19 pandemic (Lee and Lee 2023).

However, no study to date has employed online housing to evaluate how the marketing of residential properties reflects legal changes in what an owner can do with a lot. By applying Natural Language Processing methods to a monthly panel of free text sections of online housing listings in Los Angeles and Orange counties, California spanning from April 2020 until April 2024, I track references to accessory dwelling units ("ADUs"), as well as to new two state laws that liberalized zoning – SB9 and SB10, both of which entered law during the observation period. I find that within months, housing listings change to reflect the legal possibilities offered by these legal changes. In particular, the share of listings referencing ADUs increases substantially; however, adoption is not even across space, and many references merely refer to the ability to construct an ADU on a given lot, rather than to the presence of an ADU.

As a secondary object of study, I track references to new public transit infrastructure within the same data to demonstrate that references to transit infrastructure are responsive to changes in actual nearby infrastructure.

OUTCOMES AFTER EXITING FEDERALLY ASSISTED HOUSING IN MULTNOMAH COUNTY, OR

Abstract ID: 1108.0.0.1069.2024
Individual Paper Presentation

Seyoung Sung [Oregon Department of Human Services] seyoung.sung@odhs.oregon.gov, presenter

Despite the high demand for housing assistance among low-income families, only a small number are able to receive subsidies after long waits to reach the top of waiting lists due to limited resources. According to McClure's (2018) research, the median duration for households receiving public housing assistance is three years, while those receiving vouchers last 4.8 years. Many families leave federal housing assistance programs for a variety of reasons,

both voluntary and involuntary. Yet, there has been little research on the economic and housing stability of those who leave these programs (Smith et al., 2015; Kang, 2021).

This research examines the characteristics and experiences of families who left Home Forward, Public Housing Authority of Multnomah County, Oregon, from 2009 to 2021 through a racial equity lens. In particular, the study asks the research questions: 1) What happens to employment and income after households left Home Forward programs by exit type? 2) What racial disparities exist in post-exit outcomes for employment and economic security? 3) What are the factors associated with experiencing economic hardships (participating in the social safety net programs) for households who left Home Forward's programs?

The primary focus of this research is to illuminate the disparate outcomes in economic mobility, employment stability, and engagement with self-sufficiency programs, considering race, ethnicity, and exit type. Utilizing a dataset collaboratively collected from the Oregon Employment Department and the Oregon Department of Human Services, this research compares the outcomes for families that have exited Home Forward programs and explores how these outcomes are associated with the type of assistance program exited.

The findings contribute to our understanding of what happens when families leave public housing assistance, with a focus on racial equity. Because re-entering housing assistance after leaving it is complicated, families who leave the program need extra care to prevent sliding into extreme poverty again. This study also provides insight into how to improve housing assistance programs and policies to support families that leave or lose their assistance by providing a safety net for economic mobility and housing stability. Further, the research highlights racially equitable strategies with a more focused approach that can mitigate racial gaps in economic outcomes of households at risk of leaving based on the exit type.

POWER IN THE EVALUATION OF INCLUSIONARY HOUSING PROGRAMS

Abstract ID: 1108.0.0.374.2024

Individual Paper Presentation

Susan Halverson [Portland State University] shalver2@pdx.edu, presenter

Inclusionary housing (IH) programs are an increasingly popular tool for increasing the amount of affordable housing and creating mixed-income communities. IH programs incentivize or require developers of new developments to provide housing below market rate for people with lower incomes, and have created at least 110,000 below-market-rate inclusionary units and about $1.8 billion in fees (Wang & Balachandran, 2021), making IH a significant source of affordable housing. Analyzing the degree of residents' participation in evaluating IH programs sheds light on visible, hidden, and invisible power (VeneKlasen & Miller, 2002) shaping this form of affordable housing.

This study uses mixed methods, including semi-structured key informant interviews, archival research of municipal IH reports, and a systematic literature review, asking ask how municipalities and external researchers evaluate IH programs, and whose perspectives they include. Through interviews with nine IH administrators in municipalities across the country, we found that few municipalities report doing any kind of formal evaluation of their programs. In updates to policymakers or annual reports, the data they collect and use to assess the impact of their programs centers the developers' and municipalities' interests, with residents' interests deprioritized. Even when municipalities collect information on criteria in residents' interest, they use information from developers or their own records, failing to ask those residents directly. Similarly, few researchers consider residents' experiences as part of IH evaluations; only two of twelve academic articles evaluating the outputs or outcomes of specific IH programs considered the program's effects on intended beneficiaries.

Visible power (VeneKlasen & Miller, 2002), which relates to who wins overt conflict, appears in IH evaluations as insufficient attention to residents' interests. To increase resident visible power, we recommend collecting data directly from residents in evaluations of IH. Hidden power (VeneKlasen & Miller, 2002) is the power to set the agenda. In IH evaluations, hidden power emerges in the epistemological assumptions about where power lies and whose knowledge is valid. Additionally, the hidden power of research funders determines the kinds of knowledge researchers create. To increase resident hidden power, we recommend using participatory evaluation designs that privilege the participation of residents, as well as including low-income residents in research grant decision-making. Invisible power (VeneKlasen & Miller, 2002) prevents lower-power groups from recognizing their grievances, thus preventing overt conflict. In IH evaluations, this shows up as the spatial isolation of IH residents, which creates significant barriers to seeing their individual concerns as group concerns. We recommend increasing residents' invisible power by facilitating the creation of municipality-wide IH tenants' unions.

This study demonstrates that residents have little power in evaluating their housing. We hope that planners, in both municipalities and external researcher positions, implement strategies for power-sharing with IH beneficiaries and that, as a result, low-income residents successfully gain the power to shape the housing programs that profoundly impact their communities.

PRE-DISASTER PUBLIC HOUSING RECOVERY PLANNING:'NEAR EXPERIENCE' COMMUNITIES

Abstract ID: 1108.0.0.450.2024
Individual Paper Presentation

Sayma Khajehei [Towson University] skhajehei@towson.edu, presenter
Divya Chandrasekhar [University of Utah] d.chandrasekhar@utah.edu

Post-disaster housing challenges for public and subsidized housing tenants are severe, but cities with near experience of disasters may have limited knowledge about how to help them. A community with 'near experience' refers to one with a high hazard risk but has only experienced low-to-moderate type disasters or indirect damage caused by a nearby affected community. There is still a lack of knowledge about pre-disaster public housing planning, especially in communities with near experience communities. We lack studies examining how and when public housing residents, a highly vulnerable social group, recover after disasters. Considering the high dependency on government assistance for recovery in the aftermath of disasters, this gap is critical.

Salt Lake and Utah Counties, UT, are used as case studies to examine policies designed to provide post-disaster housing to public housing residents. Both counties are situated along the Wasatch Front, which increases their susceptibility to earthquakes due to their proximity to the Wasatch fault. The region experiences significant earthquakes, with magnitudes ranging from 6.5 to 7.5, approximately every 50 years. In March 2020, a moderate earthquake with a magnitude of 5.7 struck Magna, a city in Salt Lake County, causing damage to some structures. Despite the earthquake occurring during the early stages of the COVID-19 pandemic, resulting in minor damages and injuries, it raised concerns about the region's readiness for a major earthquake event.

Applying qualitative approaches, this study investigates the underlying factors and dynamics that contribute to disaster planning, or lack thereof, for rehousing public housing residents in near experience communities. Our study combines semi-structured, open-ended key informant interviews with 22 local emergency management, city planning, and housing officials of both counties and their constituent cities to examine how these plans are being implemented, what motivates them, what challenges they face, and how they coordinate with other entities. Thematic coding is used to examine connections and patterns in the qualitative data and to understand post-disaster rehousing for public housing residents in near experience communities.

Our findings suggest cities are not prepared to house public housing residents after a disaster. The absence of disaster assessments, poor coordination and information-sharing, insufficient funding, and poor leadership hinder their pre-disaster planning efforts. This study is intended to serve as a call to action for pre-disaster planning in relation to public housing recovery in near experience communities. Disaster planning for public housing recovery should be promoted by creating joint plans, engaging diverse communities in planning processes, committing funding for such activities, and reviewing existing protocols.

PUBLIC HOUSING'S RIPPLE EFFECT : MAKING PRIVATE RENT AFFORDABLE IN SEOUL

Abstract ID: 1108.0.0.496.2024
Individual Paper Presentation

Yoona Cho [Seoul National University] iud.yoona0207@snu.ac.kr, presenter
In Kwon Park [Seoul National University] parkik@snu.ac.kr

Public rental housing not only directly increases housing options for low-income individuals, but also helps stabilize prices in nearby housing markets by providing affordable living opportunities. However, existing research focuses primarily on the stigma effect of public rental housing on its neighborhood, as reflected through general housing sales prices. This often overlooks its effect on the monthly rental market. Given that households eligible for public rental housing or those with incomes below the median more frequently opt for monthly rentals and multiplex housing markets, it is crucial to examine its influence on these rental markets, rather than the apartment sales market. This study seeks to fill this research gap by analyzing the relationship between public rental housing supply and the monthly rental prices of multiplex (non-apartment) housing, specifically targeting the primary demand segment of low- to middle-income groups in the rental market in Seoul, South Korea. The study aims to understand whether certain types of public rental housing stocks stabilize non-apartment rental prices. The research questions are:

(1) Does the public rental housing stock significantly influence monthly rental prices of multiplex (non-apartment) housing units in nearby areas?

(2) Which type of public rental housing stock can stabilize multiplex (non-apartment) rental prices?

To answer these questions, this study employs a spatial panel model to account for spatial autocorrelation inherent in housing markets. The empirical analysis is based on the context of Seoul, where there is a high demand for public rental housing and a vibrant transaction market for non-apartment residential rentals. The study timeframe is set from 2018 to 2020, just before rent inflation began, using panel analysis. The research utilizes data from the smallest administrative district level, known as Dong. This includes the annual stock of public rental housing supplied by Seoul Housing and Communities Corporation (SH) and Korea Land & Housing Corporation (LH),

Additionally, it involves the annual average of monthly rental transaction prices of multiplex houses within Seoul's 426 administrative districts. In addition to these data, the study considers regional characteristic variables and macroeconomic variables that may affect housing price fluctuations in the model.

This research will provide insights for policymakers addressing housing affordability issues. Essentially, this paper will contribute to the discussion on how public housing can serve as a mechanism to achieve housing affordability and market stability, particularly for economically marginalized sectors, thereby promoting inclusive urban development.

QUALITY OF LIVING, HOUSING DISPARITY AND SEGREGATION

Abstract ID: 1108.0.0.381.2024
Individual Paper Presentation

Yu Zhang [University of Toronto] yyu.zhang@mail.utoronto.ca, presenter
Robert Nutifafa Arku [University of Toronto] rn.arku@mail.utoronto.ca

This study examines the quality of living (QoL) for disadvantaged population groups described as “equity-deserving”. We achieve this by investigating the causal pathways and feedback loops between sociodemographic characteristics and QoL, as well as uncover patterns of housing inequality and segregation within North American mega regions. Improving the living quality for all residents, especially those from the equity-deserving groups, is a significant concern for urban planners (Myers 1988; Pacione 2003; Brambilla et al. 2013; Mouratidis 2021). Disadvantaged communities often face various socio-economic challenges, including inadequate access to service and activities, substandard housing conditions, limited employment opportunities, and insufficient mobility options (Power 2012; Welch 2013; Hu et al. 2020). These disparities can significantly impact their overall well-being and quality of life.

Foremost, a comprehensive QoL index is developed to systematically measure the quality of housing, accessibility and services across the Greater Toronto and Hamilton Area (GTHA). This is empirically studied using micro-level longitudinal property transaction database and multiple geospatial databases for accessibility assessments. Neighbourhood with greatest need of improvements and areas experiencing living quality inequity are visualized. Next, a Structural Equation Model (SEM) is developed to test the hypothesized bi-directional influential paths: the

presence of disadvantaged groups contributes to the deterioration of the neighbourhoods, which, in turn, further disadvantages the residents.

The case study in the GTHA demonstrates the effectiveness of the model and reveals that areas characterized by a larger proportion of disadvantaged populations tend to exhibit lower QoL, reflecting the pervasive challenges faced by the equity-deserving groups. The results indicate that the disadvantaged communities spend larger portions of their income for shelter cost, leaving less time and money to improve their overall well-being. Targeted interventions and policies should be developed aiming at fostering inclusive and thriving urban environments for all residents, especially improving the quality of living for the equity-deserving groups.

REASSESSING THE DIVERSITY OF ASIAN AMERICAN HOUSING OUTCOMES (2000-2020)

Abstract ID: 1108.0.0.117.2024
Individual Paper Presentation

Taesoo Song [University of California, Berkeley] taesoo.song@berkeley.edu, presenter

This study addresses two questions: (1) How have disparities in homeownership and housing cost burdens among different Asian American ethnic groups changed over time? (2) Do economic endowment, immigration experiences, housing market conditions, and ethnic concentration explain those disparities, and if so, how have their influences changed over time? Despite being the fastest-growing minority group in the United States, Asian Americans' housing experiences remain heavily understudied. The lack of research, compounded by the stereotype that lumps the diverse pan-ethnic group into an imaginary "model minority" monolith, risks neglecting the unique housing needs and obstacles faced by Asian Americans. By focusing on ethnic differences within the group, this study aims to illuminate potential housing inequality among Asian Americans, explain how they are produced, and suggest potential interventions aimed at narrowing them.

Asian Americans are a diverse pan-ethnic group with significant class and ethnic diversity. With approximately two-thirds being first-generation immigrants, their socioeconomic and cultural ties to their countries of origin play a

crucial role in determining initial settlement patterns, neighborhood preferences, income, wealth, and access to housing market information. While previous studies have highlighted substantial differences in housing outcomes among various Asian ethnic groups (Burr and Mutchler, 2012; Painter et al., 2003; Reina and Aiken, 2021), these studies have not sufficiently explored what explains those differences or their changes over time. In particular, the influence of changing housing market conditions remains heavily understudied, despite the disproportionate concentration of Asian Americans in coastal housing markets characterized by increasingly high costs and supply constraints, as well as their increasing entry into non-traditional gateways. Additionally, recent changes in immigration patterns and labor market dynamics could have further exacerbated socioeconomic disparities within the group (Sakamoto et al., 2009; Vo et al., 2023). These oversights present a critical gap in our understanding of housing inequality among Asian Americans and the necessary interventions to mitigate these disparities.

To answer my questions, I analyze three waves of Public Use Microdata Sample (PUMS) data from the 2000 Decennial Census and the 2012-2018 and 2018-2022 American Community Survey (ACS) 5-year data, focusing on recent movers. The dataset is analyzed using a multilevel modeling approach, where households (level 1) are nested in Public Use Microdata Areas (PUMAs, level 2) and Metropolitan Statistical Areas (MSAs, level 3). My analysis focuses on the six largest Asian ethnic groups (Asian Indian, Chinese, Filipino, Korean, Japanese) and non-Hispanic whites.

Descriptive findings indicate a significant improvement in housing outcomes among Asian Americans from 2000 to 2020, albeit with variations across ethnic groups and persistent ethnic disparities. Furthermore, despite improvements, all Asian groups still exhibited lower homeownership rates compared to whites. Additionally, with the exception of Japanese and, more recently, Asian Indians, all Asian groups experienced higher housing cost burdens than whites. The sources of these disparities were further explored using multilevel models, which accounted for unobserved heterogeneity at the PUMA and MSA levels. Preliminary modeling results excluding the housing market variables suggest that in 2000, all Asian groups except Chinese had lower homeownership rates than whites. However, by 2020, the homeownership rates of most Asian groups had surpassed those of whites. Factors such as economic endowment and immigration characteristics linked to greater assimilation into U.S. society were associated with higher homeownership rates, although their effects generally diminished over time with the exception of educational attainment, citizenship status, and English fluency. Similar trends were observed for housing cost burden. These findings suggest that the persistent concentration of Asian Americans in high-cost, supply-constrained housing markets, along with factors related to their U.S. immigration and integration, play a significant role in their housing challenges.

RENTAL HOUSING AS SITES OF 'OTHERING': MIGRANT WOMEN'S EXPERIENCES IN INDIA

Abstract ID: 1108.0.0.220.2024
Individual Paper Presentation

Meghna Mohandas [University of British Columbia] meghna.mohandas@ubc.ca, presenter

In the absence of public rental housing, the private rental market addresses a key housing need of migrant communities in urban India (Naik, 2019). However, for Indigenous migrant women from the Northeast Indian borderlands and Himalayan foothills who live in metropolitan Indian cities, their rental houses are spaces where they experience racial harassment, sexual violence, and intrusive surveillance by landlords. Marginalisation of Indigenous people in metropolitan Indian cities is primarily rooted in racism. Despite being Indian citizens, they are often dislocated from the 'Indian' identity due to their phenotypes. Indigenous women in particular have been racialised, hyper-sexualised, and stereotyped as 'loose' and 'sexually promiscuous' by mainland Indians. Moral anxieties pertaining to their bodies have subjected them to 'othering' in urban India (McDuie-Ra, 2012). While this often translates into racialised and sexualised violence in public spaces and their workplaces, this paper focuses on how marginalisation manifests inside their rental houses.

I have chosen as my study site the metropolitan city of Bengaluru, which is one of the top six destinations for Indigenous migrant women in India. The objective of this paper is to analyse how power dynamics shape rental housing experiences of Indigenous migrant women in Bengaluru, and how they navigate and resist their marginalisation in the private rental housing market. I situate this work within a feminist ethnographic methodological framework. Data collection was conducted through 73 semi-structured interviews in Bengaluru between August and December 2023. This includes 62 interviews with Indigenous migrant women who are studying and/or working in the city. Remaining interviews were conducted with participants' employers, and Indigenous community leaders who are based in Bengaluru. Interviews were analysed through transcription and qualitative coding.

I find that Indigenous migrant women commonly experience intrusion and harassment by landlords in their rental houses. Conditions of tenancy often include restrictions wherein visitors are not allowed, with landlords infringing on their privacy by monitoring activities that occur inside rental houses. Many participants have also experienced sexual harassment perpetuated by their landlords. Primarily, it is the power possessed by landlords through property ownership that allows them to invade the privacy of their tenants and control their living environments (Harris, 2004). Furthermore, landlords typically belong to dominant class and caste groups in Bengaluru. This provides them with additional power to interfere in the private spaces of migrant women without repercussions. Moreover, it is common practice in Bengaluru to take 10 months of rent as security deposit. This skews power dynamics as tenants are financially tied to their landlords.

Notably, there is currently no legislation that protects tenants in the city. In this absence, Indigenous migrant women navigate these circumstances in myriad ways. One participant revealed that she swapped her house with a group of men from her Indigenous community as a way to escape the sexual harassment she experienced from her landlord. Others stated that they took over leases from people from their own communities who were moving to other places. This allowed them to rent houses from landlords who have been established as trustworthy.

This paper makes a key contribution towards urban planning and housing scholarship by establishing how the 'othering' of subaltern migrant communities can infiltrate the privacy of their rental houses (Holston, 2007). I will thus advance the public-private debate in feminist urban studies literature through my intersectional analysis of power dynamics in the private sphere of rental housing between tenants, who are Indigenous migrant women, and their landlords (McDowell, 1983). More broadly, the findings of this paper will provide insights to formulate inclusive tenant protection and rental housing policies in a context where such policies are currently absent.

RESPONSE TO FORM-BASED CODE

Abstract ID: 1108.0.0.443.2024
Individual Paper Presentation

Colin Caso [University of Oklahoma] cccaso710@gmail.com, presenter

This research investigates the impact a form-based code has on community members, stakeholders, developers, residents, and municipality officials, with a direct focus on the City Center area in Norman, Oklahoma. Form-based code is a complex attempt to reform zoning regulation in the United States by responding to the challenges and difficulties found with typical Euclidean Zoning (Evangelopous, 2016). Form-based codes (FBCs) are principles that affect the design of urban areas with written rules about the built environments and location of the urban area (Talen, 2009). FBCs are regulatory codes, not advisory (Talen, 2009). This type of building code and zoning offers an alternative to conventional zoning, allowing a large amount of non-typical functions to take place in areas of FBC zoning (Evangelopous, 2016). Through surveys, focus groups, archival research, and analysis of Strava Metro data, the study goal was draw conclusions on questions about form-based codes as well as to assess residents per residents' perceptions, economic activity, and urban development trends before and after FBC implementation. Using the existing literature and evaluation criteria used for form-based codes, this research explores the potential

benefits and drawbacks of FBCs. Initial findings suggest a mixed response among the literature, with improvements needed about informed aesthetics and the catering of the community. FBCs naturally increase the density of an era; these potential benefits of compact cities may also come alongside lower levels of residential satisfaction and stability (Bramely, 2009). This study contributes to the improved literature and understanding of the nuanced effect FBCs have on diverse urban area settings, providing critical insights for policymakers, planners, and academics interested in the field.

REVEALING THE EXCLUSIONARY LANGUAGE OF SHARED RENTAL ADS THROUGH AI

Abstract ID: 1108.0.0.102.2024
Individual Paper Presentation

Julia Harten [The University of British Columbia, School of Community and Regional Planning] julia.harten@ubc.ca, presenter
Geoff Boeing [University of Southern California] boeing@usc.edu
Madison Lore [University of British Columbia] madison.lore@ubc.ca

Fueled by digitalization, home sharing has grown in popularity and offers an affordable housing strategy to cope with rising unaffordability in cities around the world. Sharing means trading off space and privacy for discounted rents. Recent research suggests that listings for rooms in shared units are cheaper and available in more neighborhoods than traditional whole unit rentals. However, merely counting listings may mislead us about the full impact of shared rental housing on affordability. Home sharing requires matching on not only unit but also personal characteristics. Accordingly, shared rental listings' texts often describe ideal tenants as well as rules, restrictions, and hopes for the sharing arrangement. These language cues act as signals to attract or exclude certain renters. In turn, the "gatekeeping" language in these texts could reveal differential access among subpopulations to shared rentals.

This study leverages recent advances in artificial intelligence and natural language processing to ask: how do listings' texts state who is welcome or unwelcome as prospective tenants in shared housing units? To answer this, we draw on thousands of online rental listings for shared units in Los Angeles, California, one of the US' least affordable housing markets. We first hand-code a sample of listings to identify themes, then use it to train a deep learning BERT model to analyze the texts of both full unit and shared unit listings. We then repeat this process on

only the shared unit listings to identify specific themes regarding personal qualifiers in the proposed sharing arrangement.

Our results reveal that the listings' texts fundamentally differ between full units and shared units: full unit listings devote on average 55% of their text to describing the unit and location, while shared unit listings devote only 40%. The latter instead devote 18% of their text to personal qualities, relationships, and restrictions on the prospective tenant (compared to only 2% for full unit listings). However, sharing relationships vary and can have an either a) transactional orientation focused on costs (17% of shared unit listings), or b) social orientation focused on building a congenial sharing environment (45% of shared unit listings). Transactional listings emphasize qualifiers around income, work, and lifestyle choices such as drug use. In addition to work and lifestyle requirements, social listings emphasize friendliness, respect, and cleanliness as well as preferences for gender, age, sexuality, and hobbies.

Understanding these qualitative housing restrictions—beyond just location, size, and affordability—can help planners intervene in housing crises. Our study shows how advances in artificial intelligence and deep learning can unlock planning research previously constrained by tedious manual processing. In doing so, we contribute a new understanding of housing discrimination in an increasingly unaffordable—and digital—world. As the housing search moves online and constrained markets motivate nontraditional living arrangements, our findings reveal how language effectively excludes certain subpopulations from this submarket. This in turn creates new and reinforces existing housing vulnerabilities. The housing search is a social process and non-family home sharing in particular requires sharing living space with strangers. As existing tenants increasingly serve as gatekeepers in these nontraditional arrangements, the language they use to facilitate matches also allows us to re-theorize home sharing beyond the traditional nuclear family.

REVISITING EXOPOLIS: POST-SUBURBAN GOVERNANCE AND ITS EVOLUTION

Abstract ID: 1108.0.0.13.2024
Individual Paper Presentation

Alejandra Reyes [University of California, Irvine] lreyesru@uci.edu, presenter

For decades, local barriers to low-income housing provision and the unequal distribution of housing growth in California have exacerbated residential segregation and unaffordability. Since 2017, the state legislature has therefore passed over 100 new laws to expand housing production and better distribute such development by codifying federal fair housing rules, among other aims. These laws have increased penalties for non-compliance (e.g., streamlined development processes) while setting the stage for heightened conflict between the state and cities resistant to housing development. This paper centers on the implementation of such reforms in Orange County's 34 cities, whose real estate 'innovations', including HOAs, gated communities and quasi-private governance have been replicated across the United States. The county thus represents both a parody and a paradigm of the amorphous postmodern urbanism that characterizes vast portions of diverse regions in the United States. Conservative politics and efforts to bleach the Los Angeles region non-Hispanic white gave way to the development of an expansive, fragmented and centerless metropolis. Yet, governance and development rationalities have continued to evolve. This paper thus offers an updated and lacking examination of a subregion characterized by endemic segregation and opportunity hoarding (Goetz, 2021; Williams, 2020).

Orange County is brought forward as both an empirically and theoretically significant case and an embodiment of the characteristic segregated diversity of contemporary metropolitan regions in the U.S. While shedding light on how (sub)urban political economies influence the working of regions and higher-level politics, this work underscores the emergent prospects for counterbalancing reactionary local policies and politics and their detrimental implications. Incipient organizing and policies to address housing hardships, for instance, are increasingly aiming to represent societal, rather than chiefly private, interests. While nearly every city has pushed back against housing mandates, strategies and responses vary notably by geography. Affluent coastal, canyon and southern cities have been notably resistant to state housing law. In contrast, lower-middle-income cities closer to Los Angeles County have leveraged some state laws to pass rent control and tenant protections in response to political pressure from residents and local activists. Local governments are facing increasing pressure to address the acute housing needs of increasingly diverse and mobilized constituents along the demands of homeowners who feel as though their suburban quality of life is under attack. This article thus offers lessons on the evolution of state-local relations at a period of reform, as well as on the challenges and prospects for promoting more integrated communities in historically exclusionary geographies.

This research draws from a content analysis and our main data sources are news articles and public meetings, but we triangulate these data with relevant government documents related to housing policy in Orange County (e.g., housing and general plans, local ordinances, press releases). We used California's Department of Housing and Community Development (HCD) web news service, which compiles and issues housing development, land use, homelessness and related news articles twice a week (from January 2020 through February 2024). Quantitatively, 201 news articles make up our predominant data source but we also attended and documented 61 public meetings held to update housing plans in OC cities, a process mandated by the state every eight years.

RIGHTS TO PURCHASE AND AFFORDABLE HOUSING PRESERVATION

Abstract ID: 1108.0.0.615.2024
Individual Paper Presentation

Sophie McManus [University of Maryland, College Park] smcmanus@umd.edu, presenter
Casey Dawkins [University of Maryland, College Park] dawkins1@umd.edu
Kathryn Howell [University of Maryland - College Park] klhowell@umd.edu

Facing rising housing prices and a shortage of new affordable homes, affordable housing preservation strategies are a direct and potentially more immediate approach to maintaining an adequate supply of affordable rental housing (Chapple et al, 2023). In the Washington, DC, metropolitan area, several local governments have enacted unique preservation strategies that leverage laws that grant renters, nonprofits, or local governments the "right to purchase" (RTP) rental properties being offered for sale on the private market (Howell, 2016). DC's Tenant Opportunity to Purchase Act (TOPA), adopted in response to a wave of condominium and luxury apartment conversions during the late 1970s, grants existing tenants the right of first refusal to purchase rental buildings prior the initiation of an offer for sale (Huron, 2018). In Maryland, Montgomery County and Prince George's County grant the right of first refusal (ROFR) to government-sponsored housing organizations. These programs have drawn interest by communities around the nation for their unique combined emphasis on tenant empowerment and affordable housing preservation, but little is known about the effectiveness of right-to-purchase tools as affordable housing preservation tools.

This paper explores the challenges and opportunities presented by tenant right-to-purchase programs for affordable housing preservation. In the paper, we address several questions, including: (1) How many affordable rental units have been preserved through the exercise of rights to purchase? What features of RTP processes expediate affordable housing preservation? (2) In what ways have local governments in the DC region relied on RTP laws to secure affordable rental properties? (3) What barriers (lack of financing, opportunistic behavior by third parties, tenants' interests not aligned with preservation goals, etc.) impede the successful exercise of rights to purchase by tenants, nonprofits, and local governments? (4) What lessons does the DC RTP experience offer for other communities seeking to pass RTP laws?

To address these questions, we draw on insights gained through mixed-methods research conducted between June 2023 through March 2024. Utilizing a unique database of TOPA and ROFR preservation outcomes, building characteristics, historical sales data, and neighborhood change metrics, we examine the correlates of successful preservation outcomes that were initiated by the exercise of a RTP. We also draw upon 15 semi-structured interviews with key stakeholders involved in RTP processes – including local government officials, affordable housing developers, and tenant advocacy organizations – to highlight how rights to purchase have been utilized as a lever for affordable housing preservation. We examine the challenges that tenants, nonprofits, and local governments face while working with RTPs and the lessons learned that could be relevant for other jurisdictions considering the enactment of rights to purchase. Answers to these questions will provide unique insights into the effectiveness of a unique and under-examined affordable housing strategy.

SMART GROWTH IN SUBURBAN COMMUNITIES: A PARADOX OF RENTAL HOUSING GROWTH

Abstract ID: 1108.0.0.37.2024
Individual Paper Presentation

Do Kim [Cal Poly Pomona] dohyungkim@cpp.edu, presenter
Sungyop Kim [University of Missouri - Kansas City] kims@umkc.edu

As a pleasing alternative to urban sprawl, smart growth has gained popularity. Smart growth strategies often associated with infill development involving dense and mixed-use development have been the symbols of sustainable development in inner cities (Kim et al., 2022). Furthermore, there has been also a growing interest in developing or reinventing suburbs to be more sustainable through systemic densification (Vall-Casas et al., 2016). The core strategy of the densification is to increase rental housing units such as apartments as an alternative to low-density single-family housing development (de la Ramirez, 2009).

Rental housing needs in suburban communities have increased as the suburbanization of low-income households and minority populations has occurred (Howell and Timberlake, 2014; Kim and Kim, 2023). The housing industry also acknowledges the potential of apartments for a middle market in suburban communities (Belsky et al., 2004). In the State of California, especially, many suburban municipalities began to pay attention to increasing apartments due to a housing shortage and the Regional Housing Needs Allocation (RHNA) Plan that mandates all local jurisdictions to develop a plan to accommodate the housing needs of residents regardless of income.

This paper explores rental housing development in the suburban areas of the Los Angeles-Long Beach-Anaheim Metro Area in California. Constructing a multilevel linear model, it examines the contributing factors to the rental housing development from 2010 to 2019. In the multilevel model, we included the built environment, housing, and socio-demographic characteristics of census tracts and the location and socio-demographic characteristics of cities at which the census tracts are located as level-1 and level-2 independent variables, respectively. The multilevel model estimates show that rental housing penetrated the suburban cities and neighborhoods where this housing type was not conventionally considered desirable. The model outputs also imply that socio-demographic characteristics rather than built environment are the dominant contributing factors to rental housing growth at both city and neighborhood levels. Unlike the common features of apartment developments in urban areas (e.g., mixed-use, transit-friendly, and so on), rental housing developments in suburbs tend to be segregated from local amenities like retail, job, and public transit. The findings of this paper will help suburban cities identify their sustainable land use decisions and smart growth strategies. The findings will also help planners take appropriate

actions and regulations that promote dense development in the areas where low-density single-family housing dominates.

SPATIALIZING THE FISCAL EFFECTS OF CORPORATE RENTIERSHIP IN MEMPHIS, TN

Abstract ID: 1108.0.0.653.2024
Individual Paper Presentation

Michael McCanless [University of Kentucky] michael.mccanless@uky.edu, presenter
Matt Zook [University of Kentucky] zook@uky.edu

Urban and municipal governments are increasingly navigating a housing landscape defined by corporate rentiership. In Memphis, TN, eviction courts have seen a wave of filings at twice the rate of any local landlord after the private equity firm Cerberus Capital purchased a large portfolio of single-family homes (Frankel & Keating, 2018). Over the past decade economic geographers have documented the conversion of single-family rentals into an institutional asset class (Fields, 2018), as well as how that conversion has driven housing markets toward corporate rentiership (Christophers, 2020). Our research investigates the nexus between corporate rentiership and the local state, with an eye towards the tactics, strategies, and outcomes used by institutional investors to contest their largest yearly expenditure in property tax. Early research has estimated that institutional SFR investors successfully appeal $4.1 billion in U.S. property tax on an annual basis (Austin, 2022). To explore this process in Memphis, TN, we use tax assessment rolls in producing a typology of corporate investors (An et al., 2024) before using this classification to identify how and where investors file property tax appeals. We argue that corporate rentiership introduces new incentives into the spatial politics of property tax, as investors exert market power in ways that may change the logic of housing assetization, such as intentionally managing the decline of a property's value to lower tax burden, or using proprietary software to automate property tax appeals on large single-family portfolios. Ultimately, this research contributes to work on the corporate consolidation of housing by investigating the secondary effects of corporate rentiership on the local state, as the prevalence of corporate investors at the

scale at which they currently operate may disrupt long systems pertaining to tax, technology, and the valuation of residential rental housing.

SPATIALIZING THE PRIVILEGE: HISTORY OF ELITE INFORMAL SETTLEMENTS IN DELHI

Abstract ID: 1108.0.0.644.2024
Individual Paper Presentation

Vivek Mishra [Northeastern University] mishra.v@northeastern.edu, presenter

Analyzing Delhi master plans, land acquisition reforms, land governance policies, newspaper articles, parliamentary debates, and archival documents, my paper traces the history of the emergence of elite informal settlements in Delhi, labeled as "Affluent Unauthorized Colonies" in government records. It poses the following questions: how the centralized planning regime, the political economy of land acquisition and transfer, and the ambiguous nature of the elite-state relationship have led to the emergence of elite informal settlements primarily concentrated on a contiguous land in the southern part of Delhi? In this paper, I make three significant claims: First, since almost all these colonies were built on agricultural land previously acquired by the Delhi Development Authority (DDA), they resulted from the government being unable to build acquired land or compensate farmers on time. As a result, fearing low or no compensation, the farmers sold their land to middle-class and upper-middle-class people. There was an economic rationale for farmers who would lose their land regardless. Secondly, while the DDA started building acquired agricultural land in other parts of Delhi after the independence, the state-led development of the southern part started much later. It allowed for informal land transactions between the farmers and the elites. Also, the proximity of these colonies to the other formal elite settlements in Delhi, namely Greater Kailash, Jor Bagh, Saket, Hauz Khas, Lutyens's Delhi, and central Delhi, resulted in their concentration in the southern part of Delhi. Finally, since many administrative elites such as bureaucrats, ministers, judges, and attorneys lived in these colonies, these colonies only experienced episodic demolitions as opposed to the slums and squatter settlements that were evicted and demolished regularly. In other words, the state's role as a land administrator and individual state representatives as consumers participating in informal land transactions and development created these residential spaces for the rich and powerful.

SPATIOTEMPORAL ANALYSIS OF GENTRIFICATION AND DISPLACEMENT RISKS IN CHICAGO

Abstract ID: 1108.0.0.821.2024
Individual Paper Presentation

Bumsoo Lee [University of Illinois at Urbana Champaign] bumsoo@illinois.edu, presenter
Andrew Greenlee [University of Illinois Urbana Champaign] agreen4@illinois.edu
Yongsung Lee [University of California, Davis] yshlee@ucdavis.edu

Amongst many forms of neighborhood change, gentrification continues to capture global attention. Recent research often attributes contemporary gentrification drivers to the distinct lifestyle and locational preference of young generations and transit-oriented development (TOD) around major public transit systems. Ironically, despite the broad focus on describing the gentrification phenomenon, its drivers, and its impacts, the research on spatial and temporal dimensions of gentrification and displacement risks remain relatively understudied.

In this study using the Chicago metropolitan region as our study area, we investigate how a gap between housing price and socioeconomic status of residents in a neighborhood predicts the risk of gentrification and displacement and identify how these risks develop over time. The primary data for this study comes from the 2000 Census and annual ACS surveys, and Data Axle Consumer Database. Data Axle is a unique proprietary dataset that records longitudinal geographical location and demographic information of 155 million households nationwide and we analyze about 50 million data points for the Chicago area from 2006 to 2019. Unlike the repeated cross-sectional data typically used in gentrification research, these are panel data which offer many advantages for studying the spatial and temporal patterns of relocations of households that are displaced from gentrifying neighborhoods.

We perform a series of data analyses. First, we identify neighborhoods (proxied by census tracts) at risk of gentrification where the percentile rank of median income rose significantly above housing price percentile by 2000, the base year of this study. While many recent studies develop indicators of gentrification risk using a mix of demographic, socioeconomic, and housing price variables presenting both current neighborhood conditions and changes (Chapple et al. 2017; Preis et al. 2021), Bunten et al. (2024) focused instead on the gap between housing price and income percentiles – an important signal which we adopt for this research. We try several thresholds of income/housing price gaps (i.e., 20, 25, 30 percentile gaps) to identify census tracts at risk among low-income

neighborhoods that are within bottom 40 percentiles in Neighborhood Change Index (NCI). We developed a census tract level NCI by running a principal component analysis (PCA) for each year from 2000 to 2019, based on percent Non-Hispanic White, percentage college educated, median household income, and percent households below the poverty line.

Second, we examine how well the income/housing price gaps predict census tract level gentrification in the next 17-year period. We define the bottom 40% tracts, as determined by the 2000 NCI, as potentially gentrifiable. Among the bottom four deciles, census tracts that experienced a substantial socio-economic upgrade—ascending by two deciles or more by 2017—were defined as gentrifying/gentrified. Then, we analyze what percent of the tracts identified as at-risk as of 2000 actually experienced gentrification in subsequent years. We also conduct a tract level survival analysis, using a Cox proportional hazards model, to estimate how many years it takes for the neighborhoods at risk to end up gentrified.

Finally, we investigate how displacement risks of low-income households develop over time since the onset of gentrification identified by the housing price to income percentile ratio. We employ a household level Cox proportional hazards model, using the data for low-income households' moves out of gentrifying neighborhoods that are extracted from Axle Consumer Database. Beyond tracking how displacement risks evolve over time, we can also examine if there are tipping points (thresholds) in neighborhood change (Galster, Quercia, and Cortes 2000). In addition, we can also investigate the role of affordable housing policies in lowering and delaying the risks of displacement.

SPECULATIVE INVESTMENT IN THE WAKE OF DISASTER

Abstract ID: 1108.0.0.1027.2024

Individual Paper Presentation

Nora Schwaller [University of California, San Diego] nschwaller@ucsd.edu, presenter
Atticus Jaramillo [University of Arizona] atticus@arizona.edu

This project looks at the relationship between social change, disaster exposure, and the financialization of the single-family housing market. It draws from three key areas of literature: climatology and environmental science, which demonstrate the increasing risk of severe flooding in the United States due to climate change and development; housing literature, which examines the growing role of investors in the residential housing market; and the recovery machine framework, which reveals that post-disaster investments can worsen existing inequalities.

In this analysis, we ask: what role does speculative investment play in neighborhood change following a disaster event? To explore this, we focus on the case of Hurricane Harvey's impact in Harris County, TX. In August 2017, Hurricane Harvey struck the Gulf Coast, causing significant damage to over 300,000 homes due to flooding. Reporting in the aftermath of the storm identified several real estate investment groups who used the hurricane as an investment opportunity analogous to the 2008 housing crash: per reporting, these groups bought thousands of homes at discounted prices, intending to make minor repairs and sell them quickly as the market recovered. These efforts were identified by Harris County officials managing housing buyout programs as being detrimental to their ongoing mitigation efforts.

To address this question, we compiled various publicly available data sources. This includes longitudinal housing data from the Harris County Appraisal District, which provides detailed information on each housing unit, and flood hindcast models to assess disaster exposure. Additionally, we used ACS 5-year data from 2012-2016 for a pre-disaster baseline. Our completed dataset includes more than one-million single-family homes with annual data from 2016-2022. Using the ownership information, we determined which homes changed ownership in the aftermath of Hurricane Harvey, which were sold to corporations, and the race and ethnicity of the sellers.

We are using a multi-level binary regression to understand who sold their properties in the aftermath of Hurricane Harvey, and, more specifically, who sold their properties to a real estate investor. Our preliminary results indicates that white residents living in Hispanic neighborhoods were more likely to sell their properties to companies compared to white residents in other neighborhoods or other residents within Hispanic neighborhoods. This finding aligns with work by Loughran and Elliott (2019), which studied migration patterns of housing buyout participants and found that white residents within Hispanic neighborhoods were more likely to leave their neighborhood and move to a whiter community.

A forthcoming analysis will additionally explore the relationship between commercial companies purchasing homes, and subsequent neighborhood turnover. This will be discussed in the context of the established relationship between disaster exposure and increasing conditions of inequality, and the ongoing affordable housing crises. It will also consider the implications for mitigation activities that are hindered by the activity of real estate investors. The paper will conclude with recommendations for potential policy solutions.

SUBSIDIZING THE MIDDLE: ADDRESSING MIDDLE-INCOME AFFORDABILITY CHALLENGES

Abstract ID: 1108.0.0.667.2024
Individual Paper Presentation

Alexander Hermann [Joint Center for Housing Studies at Harvard University] alexander_hermann@harvard.edu, presenter
Whitney Airgood-Obrycki [Joint Center for Housing Studies of Harvard University] whitney_airgood-obrycki@harvard.edu
Peyton Whitney [Joint Center for Housing Studies of Harvard University] peyton_whitney@harvard.edu
Nora Cahill [Harvard University] ncahill@hks.harvard.edu

Housing affordability in the US has deteriorated significantly over the last several decades, accelerating rapidly since the start of the pandemic. Indeed, the number of cost burdened renters reached a record high 22.4 million in 2022, an increase of 2 million households since 2019 (JCHS 2024). While affordability has worsened up and down the income scale, cost burdens have increased most for middle-income renters. In response to these growing challenges, state and local governments have passed a growing number of “workforce” and middle-income housing programs and policies, including statewide programs in Michigan, Colorado, and Georgia.

Despite rising popularity, these programs have not gained acceptance from housing advocates. Affordability challenges remain especially acute among lower-income households (NLIHC 2024). Moreover, the concept of workforce housing is highly problematic. At its core, the term is inaccurate, implying that lower-income households do not work. Tying affordability programs to work also further evokes distinctions in US social welfare policy between the deserving and undeserving poor. For example, SNAP and TANF benefits are conditional on meeting minimum work requirements and proposals have been raised to expand work requirements to other programs (Hahn et al. 2017). Workforce housing policies also play off the racialized stigma of affordable housing programs (Tighe 2012).

Despite these criticisms, middle-income housing programs have become more prevalent. Given this reality, planners should consider what these programs are intended to do, what the potential benefits are, who they serve, and the policy tradeoffs that might occur if we prioritize addressing middle-income rental affordability. In this paper, we ask:

- What state and local middle-income housing programs exist to support the housing needs of middle-income renter households? What are the characteristics of these programs and who do they intend to serve?

- What are the affordability challenges of households typically eligible for middle-income housing programs? How do affordability challenges vary geographically?

• What are the characteristics of middle-income renters with cost burdens? How do they differ from lower-income households?

To address these questions, we examine 11 middle-income and workforce housing programs in the US. We find state and local middle-income housing programs have become increasingly prevalent since the pandemic and exist in geographically and politically diverse states. These programs focus on expanding the supply of middle-income housing, though the means, mechanisms, and requirements for developers and localities vary greatly. While most programs encourage private development and ownership of middle-income housing, especially in rural or difficult to develop areas, a few—notably in California and Colorado—expressly encourage or enable public ownership and operation of middle-income housing. Though the exact range varies, nearly every program requires middle-income rental housing to be kept affordable to households based on the area median income, rather than some occupation or employment requirement.

We also empirically analyze, using data from the American Community Survey, the affordability challenges and characteristics of middle-income renters. Operationalizing one common definition of middle income, we find that 32 percent of renters earning 60 to 120 percent of area median income had cost burdens, a rate substantially below their lower-income counterparts. Burdened middle-income households also have fewer economic vulnerabilities with higher levels of education, more potential income earners in the household, and a lower likelihood of being an older adult compared to lower-income renters. These households are also disproportionately white, which raises concerns about reinforcing racial inequities. Taken together, these results suggest that planners and policymakers should design middle-income programs in a way that does not stigmatize lower-income households or reduce spending on lower-income households with the greatest need.

SUPPORTING AFFORDABLE HOUSING THROUGH PREDEVELOPMENT REVOLVING LOAN FUNDS

Abstract ID: 1108.0.0.401.2024

Individual Paper Presentation

SHISHIR MATHUR [San Jose State University] shishir.mathur@sjsu.edu, presenter
Shreya Chokshi [San Jose State University] shreya.chokshi@sjsu.edu
Hilary Nixon [Mineta Transportation Institute, San Jose State University] hilary.nixon@sjsu.edu

Planning Issue

A typical housing development follows three stages: predevelopment, construction, and post-construction. Several public housing finance programs focus on the construction stage, for example, the federal and state tax credit and project-based housing choice voucher programs. The large majority of affordable housing finance literature also focuses on these programs (for example, see Ahrentzen et al., 2022). However, the developers typically have to self-fund predevelopment activities that include site identification, site control, legal fees, financial applications (such as tax credit applications), market feasibility analysis, and building design and permits.

While essential to the development process, predevelopment activities are difficult to finance due to the chance that the project will not come to fruition. The risk increases if the real estate product type is new to the market–for example, an affordable, mixed-use transit-oriented development–or the site needs in-depth due diligence (for example, a brownfield infill site).

Predevelopment revolving loan funds (PDRLFs)—pools of money from which the loans are made to fund predevelopment activities and to which loan repayments flow in—are critical for producing, preserving, and rehabilitating housing because they fill a niche—high-risk funding for predevelopment activities—that is often neglected by traditional lenders and banks (Benjamin, Rubin & Zielenbach, 2016; Jenkens, Carder & Maher, 2004). These funds are especially important for non-profit affordable housing developers who have little real estate experience and/or capital (Navarro & Goodwin, 2002). They are also attractive because they are self-renewing (Mikesell & Wallace, 1996).

While there is a need to support predevelopment activities (especially to fund affordable housing), and PDRLFs are one critical way to provide this support, very little research exists on housing-focused PDRLFs. This paper aims to begin filling this research gap by better understanding their structure, the challenges they face, and how they can be strengthened.

Methodology

This study answers two research questions through a review of extant literature, in-depth case studies of several housing and small-business-focused revolving loan funds, and interviews of real estate developers and housing finance experts. First, what are the key features of housing-focused PDRLFs? Second, what challenges do PDRLFs face, and how can they be strengthened?

Findings

Four main findings emerge. First, state and federal governments should play an important role in funding PDRLFs by providing seed capital and by recapitalizing PDRLFs. Second, often, small, minority, and community- and mission-based developers need predevelopment loans the most. However, they may be unaware of such loan programs and not have the institutional and technical capacity to apply for the loans. Therefore, PDRLFs need to be proactively marketed to such developers. Furthermore, the developers-applicants need to be supported throughout the application process. Third, lenders gain efficiency by making large loans as quickly as possible. However, predevelopment loans are likely not large, and the loan applications may not be able to meet rigid, standardized underwriting criteria. Hence PDRLFs need to be flexible to meet the needs of the target loan recipients. Finally, predevelopment needs to be viewed in the context of the entire housing finance process. Predevelopment is the first of the three stages of the affordable housing finance process, with the other two being construction financing and permanent financing. Hence all three housing finance stages need to work well together.

Relevance and implications for planning scholarship and practice

By examining the use of PDLRFs to fund housing, this paper contributes to the literature on this little-known housing finance tool and, more broadly, housing development and finance. Specifically, as stakeholders across all levels—local to federal—explore ways to fund housing, this research will help them make better-informed decisions.

TEMPORAL DELUSIONS IN NARRATIVES RELATED TO THE HOUSING CRISIS

Abstract ID: 1108.0.0.1114.2024
Individual Paper Presentation

Dowell Myers [University of Southern California] dowell@usc.edu, presenter
Elana Simon [University of Southern California] elanarsi@usc.edu

Portrayal of change over time is among the core elements of any public narrative about urban challenges, yet it may be the least understood component. Planners often overlook how the latent temporal structure of narratives diagnose urban problems and frame an implicit set of solutions. A "temporal delusion" is a narrative that conflates multiple dimensions of time onto one, forming a one-sided interpretation that distorts representations of the social phenomena it seeks to describe. This conflation can be either unintended or a deliberate tactic. Case studies of data-driven narratives about urban problems will demonstrate how planners can deconstruct temporal delusions and build alternate narratives that shed greater light.

Tools for temporal thinking can aid planners in engaging and recasting popular narratives about urban problems. The temporal assumptions of "facts" that fuel popular narratives should not be taken for granted. Each case of a temporal delusion also presents a practical technique for insightful temporal analysis. Planners need analytical and communicative tools to ground analyses of change in the underlying dynamics and better compete for public understanding.

Popular narratives about the "housing crisis" illustrate how temporal delusions contribute to the misdiagnosis of urban problems. One popular narrative concerns the role of high housing prices in the so-called "California Exodus." A second narrative pertains to the declining homeownership rate and the implied abandonment of homeownership. The third pertains to debates over the progress of Millennials in the housing market, which highlight biased claims about generational change.

Our first temporal framework is the time-honored model of stock and flows. Net change in a population group stems from inflows minus outflows. Projecting partial explanations onto figures of "net change" conceals inflow and outflow behaviors that drive change. Using the annual American Community Survey (ACS) from 2006 to 2022, we apply a stock and flows analysis to claims about the "California Exodus." Renters keep arriving at a steady rate, while outflows escalated of households becoming homeowners after leaving the state.

Each case also includes an historic time framing that is based on the economic cycle of housing. Peaks and troughs of the strongly volatile post-2000 economy are period effects that shape housing and population dynamics. Conventional planning analysis simply references decades that begin and end on a decennial census year. Selecting when a story begins and ends can frame a "trend" as unprecedented: Extending the time period back to 2006 shows that the exodus of California homeowners was even greater during the 2006 economic peak than in recent peak years, suggesting a regularity of out-migration during economic peaks with sharp rises in housing prices.

We then turn to the alarmist narrative surrounding the declining homeownership rates, a nationwide occurrence since 2005. Unrecognized is that the current homeownership rate represents accumulation over past years, so it is a structurally lagged indicator. Though the homebuying rate rose year-over-year after 2011, the homeownership rate kept falling, not reflecting rising preferences until 5 years after homebuying turned up. The lagged indicator anchored a pessimistic viral narrative that painted "abandonment of homeownership" as reflecting declining preferences and discouraged institutional response.

In sum, "California Exodus" spotlights steady inflows arriving as renters, while periodic price booms shed homeowners. The second case demonstrates how the homeownership rate functions as a structurally lagged indicator that obscures recent trends and misdirects policy. The final case to be addressed combines the aforementioned delusions with a cohort-based analysis to revisit impacts of the Millennial generation, highlighting how the entrance of much larger cohorts into the housing market are an invisible and powerful demographic force.

THE EFFECT OF SEGREGATION ON HOUSING PREMIUMS FROM 1990 TO 2020

Abstract ID: 1108.0.0.629.2024
Individual Paper Presentation

Jinhyun Bae [Texas A&M University] jinhyun2009@tamu.edu, presenter
Youngre Noh [Texas A&M University] ynoh@arch.tamu.edu
Galen Newman [Texas A&M University] gnewman@tamu.edu

Urban areas often exhibit distinct residential geographic patterns within a given metropolitan area, reflecting specific racial, ethnic, and socio-economic characteristics. These patterns, largely shaped by past planning interventions and historical disparities, underscore the unique nature of each urban area (Grigoryeva & Ruef, 2015). The uneven distribution of population groups within these areas is often a defining feature, mirroring income disparities and the preferences of individuals or specific racial groups in select neighborhoods (Brasington, Hite, & Jauregui, 2015). This uneven distribution exacerbates socioeconomic disparities by concentrating impoverished residents, heightening racial barriers, and limiting opportunities for interracial integration. Consequently, this not only impedes individual well-being but also perpetuates political inequality (Massey & Denton, 2019). Despite extensive research on urban segregation, there has been a notable lack of scholarly attention in massively depopulating, or shrinking, cities within discussions on urban segregation (Freixas & Abbott, 2019). These cities, often grappling with demographic and economic decline, present unique challenges that require deeper exploration related to the subject.

To address this gap, this study examines the dynamic relationships between housing transactions and resident distribution within Cleveland, OH, a shrinking city. The focus is on exploring the influence of racial segregation on housing prices within this context. Property sale data spanning from 1986 to 2021 are collected from the Northeast Ohio Community and Neighborhood Data for Organizing (NEOCANDO). The data from 1986 to 1995 is categorized as 1990, while the period from 1996 to 2005 is identified as 2000. Similarly, the timeframe spanning 2006 to 2015 is denoted as 2010, and the data for the years 2016 to 2021 is specified as 2020.

Housing characteristics are extracted from the dataset and utilized as independent variables. The dataset also incorporates information on the proximity of various amenities and dis-amenities. Socioeconomic and neighborhood data at the block group level of 1990, 2000, 2010, and 2020 are also obtained from US census data. The study classifies income groups based on quartiles and employs local segregation indices based on ethnic groups. These indices include the spatial entropy-based diversity index for the Even-Cluster dimension and the local spatial isolation index for Isolation-Exposure assessment (Oka & Wong, 2014). Segregation indices are calculated by aggregating populations of contiguous block groups and combining them with the reference block group to assess local segregation patterns.

The results reveal that segregation significantly impacts housing transaction prices across different years and neighborhood income levels. Specifically, higher diversity is associated with decreased house transaction prices,

particularly notable when certain minority groups are more isolated. The impact of diversity on house prices fluctuates over time, while isolation shows an increasing trend, diversity reaches its lowest point in 2020. However, contrasting trends emerge among lower-income neighborhoods; in 2020, diversity loses significance, whereas in 2010, higher diversity correlates positively with elevated house prices. These findings offer valuable insights for urban regeneration plans and the identification of areas grappling with spatial inequalities and vacant land issues, contributing to a more comprehensive understanding of the intricate dynamics involved in addressing housing inequality and racial segregation in these specific contexts.

THE EFFECTS OF NEIGHBORHOOD REDEVELOPMENT ON HOUSING MARKETS AND BEYOND

Abstract ID: 1108.0.0.15.2024
Individual Paper Presentation

Lizhong Liu [University of Southern California] lizhongl@usc.edu, presenter

Many advocates considered place-based housing policy a remedy for urban decay (Katz & Nowak, 2017), while skeptics questioned the overall effectiveness of place-based interventions, pointing to significant heterogeneity in the long-term success across programs and locations (Neumark & Simpson, 2015). This paper presents the first national-level study investigating the housing market effect of Housing Opportunities for People Everywhere Programs (HOPE VI), the largest federal investment in public housing revitalization. I compiled a unique dataset on a national sample of HOPE VI Revitalization Programs, drawing from various administrative data and the decennial census. To identify the causal effect of the redevelopment, I proposed a stratified version of the synthetic difference-in-difference method introduced by Arkhangelsky et al. (2021). This novel approach constructs synthetic control units for each treated unit using control candidates from the same county. It relaxes the assumption of parallel trends in the classic event study framework and accounts for unobserved region-specific characteristics. The paper found that the housing values and rents in the redeveloped neighborhoods increased by 9 and 12 percent, respectively. There were significant spatial spillovers of the price effects to nearby neighborhoods. The effect on housing values and rents varied by program scales and initial neighborhood characteristics, as poorer, more racially diverse, and more centrally-located neighborhoods experienced more considerable benefits from the investments. Moreover, the price effect was driven by a 6.5 percent increase in median household income and

significantly higher shares of new and low-density units. The redeveloped neighborhoods also experienced lower poverty rates and higher racial diversity. A back-of-the-envelope analysis revealed that a substantial share of these effects could be explained by the programs' mechanically displacing public housing residents and replacing public housing with market-rate and affordable units.

THE HISPANIC HOMEOWNERSHIP GAP AMONG DIFFERENT HISPANIC ENCLAVES IN THE US

Abstract ID: 1108.0.0.1137.2024
Individual Paper Presentation

David Flores Moctezuma [University of Southern California] rosasflo@usc.edu, presenter

Homeownership in the United States is and has been considered a pathway to wealth accumulation (NAHREP, 2020; Strochak, Young, and McCargo, 2019). Homeownership rates are often used as an economic indicator to represent upward economic mobility. These rates among different ethnoracial groups often reveal substantial homeownership rate disparities among races in the United States. The disparity of homeownership rates between two ethnoracial groups is commonly referred to as a homeownership gap. Homeownership gaps between race groups often indicate financial and demographic disparities between those respective groups (Haurin et al., 2007; Cortes et al., 2007).

Previously, the primary focus of this literature was the white and African-American homeownership gap (Sanchez-Moyano, 2020). Recently, literature regarding homeownership gaps has expanded to include the rising homeownership growth of Hispanics and Asians. Recent interest in the Hispanic homeownership gap can be partially attributed to the population and household growth of Hispanics in the United States. McCue and Herbert (2016), project Hispanic households will increase to approximately 20 million by 2025. Perhaps the most important recent phenomenon is the recent Hispanic migration to communities in the United States that have previously had low concentration of Hispanic households. Hispanic migration in the 1980s was primarily concentrated in gateway cities such as Los Angeles; Chicago; Miami; and New York (Frey, 2018). This trend has now shifted to states or

metropolitan areas such as Atlanta. The current areas reflecting significant Hispanic population growth include locations where prior Hispanic presence was not significant (Frey, 2018; Massey and Capoferro, 2008).

In this study, we will pay close attention to the Hispanic homeownership gap. Specifically, the difference between white and Hispanic homeownership rates. We will pay special attention on investigating how the Hispanic homeownership gap differs among different Hispanic enclaves in the United States. One surprising piece of data is that the Hispanic homeownership gap has been shrinking in California, even though housing prices are far higher in California than in the nation as a whole. Does this indicate that Hispanics are faring better in achieving homeownership in California in comparison to other Hispanics enclaves from other states in the United States?

This paper investigates the logic of using homeownership gap indicators; explores different variations of the Hispanic homeownership gap definition, specifically when analyzing the gap by Hispanic origin; and investigates trends following nonoverlapping 5-year files of the American Community Survey (ACS) between 2007 and 2022 (Myers and Flores Moctezuma, 2020). Specifically, by utilizing “Integrated Public Use Microdata Series” (IPUMS) data that allows a fine-grained comparison analysis of the Hispanic homeownership gap among different Hispanic enclaves in the United States and California. A close examination is needed regarding the achievement of Hispanic homeownership among different states. In recent years, there has been an influx of Hispanic cohorts to states not traditionally considered home to Hispanic populations. By drawing state comparisons, we find that recent trends can help explain not only differences among Hispanic homeowners but also how trends over the past 15 years can lead to the implementation of favorable policies that promote homeownership for all ethnoracial groups.

Accordingly, to draw proper interpretations of the Hispanic homeownership gap, we must examine the geographic similarity or exceptionality by comparing Hispanic enclaves in a specific place with the average status for a broader geographic reference area (e.g., comparison among states) (Myers and Flores Moctezuma, 2020). This finding leads to new consideration of the meaning of homeownership gaps as an indicator of inequality.

THE HOUSING COSTS OF ACTIVE TRANSPORT AND PUBLIC TRANSIT USERS

Abstract ID: 1108.0.0.58.2024

Individual Paper Presentation

Markus Moos [University of Waterloo] mmoos@uwaterloo.ca, presenter
Tara Vinodrai [University of Toronto] tara.vinodrai@utoronto.ca

Planning practice in the global north is increasingly promoting higher density urban development in part to facilitate more sustainable commuting modes such as public transit, cycling, and walking that rely on density of the built form. However, in a context of reduced government involvement in subsidized housing provision, higher density developments have become associated with expensive housing, and elements of gentrification (Moos et al., 2018).

The aim of this study is to document the housing cost of active transport and public transit users as compared to automobile drivers, using Canada's three largest metropolitan areas as a case study: Toronto, Montreal, and Vancouver. We use the most recent 2021 Statistics Canada census data. We ask 'what is actually paid for housing by people with different commute modes' and 'do these differences point to potential for exclusion by ability to pay'.

The literature already has documented the importance, variations and characteristics of density, active transport and public transit on sustainability outcomes (Rice et al., 2020). However, it is imperative for sustainability outcomes from an equity perspective that planning research specifically highlights who has proximate access to active and public transit via the structuring forces of the housing market. This paper contributes to this in a novel way through a statistical analysis of actual housing costs and housing affordability of active transport and transit users.

Our methods include a) direct measurement of the impact of transit infrastructure, bike lanes, or walkability on housing values or rents using multivariate statistical methods; b) documenting gentrification specifically linked to transit and other urban sustainability initiatives, now often referred to as eco-gentrification; and c) examining the changing demographic composition of transit-oriented and other high-density neighbourhoods.

We find that public transit users, cyclists and walkers pay higher housing costs than car commuters, but that these findings are highly variable depending on context. The potential for exclusion from locations suitable for alternative commute modes are associated with age, household structure, ethnicity/race, and social class, and their intersections.

Prior research is not conclusive to what extent active transport and public transit may be capitalized into housing values across all contexts, nor is it clear to what extent housing costs in accessible locations may be prohibitive to lower income households from an affordability perspective (Mathur, 2023; Chernobai & Ma, 2022; Hopkins, 2018). Our study thus fills an important research gap at the intersection of urban sustainability, housing affordability, and commuting research in that it directly estimates and critically analyses higher housing costs for several different commute modes using a consistent data set; and documents the characteristics of the population able to afford these types of costs and of those who are excluded by the workings of the housing market.

THE IMPACTS OF HOUSING TENURE MIX ON THE SOCIAL CAPITAL IN SEOUL

Abstract ID: 1108.0.0.1220.2024
Individual Paper Presentation

Jaewoong Won [Kyung Hee University] jwon@khu.ac.kr, presenter
Sungjin Kim [Kyung Hee University] curlyjin@khu.ac.kr

Introduction: Over the past 30 years, various types of public rental housing have been provided to release housing shortage problems for low-income families and stabilize the housing market in South Korea. Despite the policy achievements in the supply of public rental housing, residents in low-income dwellings were exposed to social exclusion, mostly stemming from the stigma associated with negative stereotypes and the discrimination perpetuated by restricted access to neighborhoods. Such social challenges prompted the need for implementing mixed-tenure housing complexes which include public housing renters and private housing owners as a widely adopted form of social mix in residential development. However, previous findings about the effect of tenure mix housing on residents' social capital have shown to be inconsistent in part due to the limitation of true tenure mixing and the lack of longitudinal study design. We focus on the conflicts between private and public housing residents and examine the effects of tenure mix on social capital of public rental housing residents.

Methods: This study used panel survey data from the years 2017 and 2019, collected from in-home interviews of residents in public rental housing. The surveys started with 3,009 sample households by using two-stage stratified random sampling from the sample frame of 183,215 households located across the 25 administrative units called gu (comparable to borough in New York) in Seoul. After excluding invalid samples, we obtained the complete set of observations with the balanced panel samples of 2,249 for each of 2017 and 2019. Social capital was measured by aggregating six items across three domains: interaction, trust, and norm. Tenure mix was measured as the binary (1 for residing in mixed tenure housing and 0 for not) and the categorical variables, considering the presence of conflict with private housing residents (2 for residing in mixed tenure housing without conflict, 1 for residing in mixed tenure housing with conflict, and 0 for not). Covariates included individual and household characteristics (e.g. gender, marital status, occupational status, education level, and income), experiences of discrimination, and satisfaction with the residential environment. Several panel models (random-effect, fixed-effect, and difference-in-difference models) were used to estimate the effects of tenure mix and conflict with private housing residents on social capital of public rental housing residents.

Findings: Among the individual characteristics of residents, discrimination and residential environment satisfaction were found to be significant. The tenure mix was significant, but the presence of conflict showed a negative impact on social capital. The findings highlight the need for effective housing tenure mix policies to enhance residents' social capital.

THE ROLE OF HOMEOWNERS ASSOCIATIONS IN THE SINGLE-FAMILY RENTAL MARKET

Abstract ID: 1108.0.0.832.2024
Individual Paper Presentation

Matthew Dean [Ohio State University] dean.1042@osu.edu, presenter
Bernadette Hanlon [The Ohio State University] hanlon.42@osu.edu

Single family homes are a significant share of the rental market. Various actors, including large institutional investors (Seymour, Shelton, Sherman, and Akers, 2023) as well as small 'mom and pop' landlords, own and rent out these single-family homes. There are a range of landlords involved in the single-family rental market (Harrison, Immergluck, and Walker, 2024). We begin this study by identifying the varied actors who rent out single-family homes in Franklin County, Ohio, with a particular focus on identifying corporate institutional investors. For this purpose, we examine Franklin County tax assessment data utilizing Open Refine (see An et al., 2024). We then consider the geographic location of single-family rentals (SFRs) and their ownership structure to determine if institutional investor activity in the single-family rental market is influenced by homeowner associations (HOA) and their regulations. Using a discontinuity regression model, we find that institutional investors avoid purchasing homes to rent if these homes are located inside homeowner association boundaries. In fact, according to our model results, SFRs owned by corporate landlords are much more likely to be in neighborhoods similar to those with HOAs but without this private governance structure. Thus far in the literature, there has been little research on the role of HOAs in patterns of SFR locations and those rentals owned by institutional investors.

TOC AFFORDABLE HOUSING INCENTIVE PROGRAM: A NEW "PARADIGM" FOR ETOD?

Abstract ID: 1108.0.0.688.2024
Individual Paper Presentation

Qi Song [University of California, Irvine] songq3@uci.edu, presenter

Many municipalities across California are grappling with a housing shortage, particularly affordable housing, which has led to the state experiencing the highest rate of housing cost increases nationwide. California, on the other hand, is under pressure to meet ambitious greenhouse gas reduction objectives in the foreseeable future. Low-income households, the most transit-dependent population, have suffered disproportionally from housing affordability and climate change crises. Some researchers and policymakers have resorted to transit-oriented development (TOD)—higher-density and mixed-use development near mass transit choices such as rail and bus—as a means of addressing both challenges (Boarnet et al., 2017). The integration of affordable housing and transit investment has been considered a critical approach to facilitating equitable outcomes in TODs (Guthrie & Fan, 2016). Producing and preserving affordable housing may contribute to mitigating the unintended consequences of displacement and gentrification that are frequently associated with TODs. However, researchers have revealed a loss of affordable housing units in transit-served neighborhoods in Los Angeles over time (Chapple & Loukaitou-Sideris, 2019). Furthermore, others highlight the significance of policy evaluation in policymaking to further encourage innovative local policies (Mettler & Sorelle, 2018).

In light of these concerns and gaps, I focus on the Transit-Oriented Communities Affordable Housing Incentive Program (TOC Program) adopted by the City of Los Angeles. Adopted in 2017, the TOC Program allows for additional density in projects located near major transit stations if a developer agrees to incorporate a certain percentage of deed-restricted affordable housing as part of the project. It also provides options for developers to apply for a ministerial review and benefit from an expedited permitting process if they only utilize basic incentives, such as an increased allowable number of units and reduced parking requirements (City of Los Angeles, 2017). I examine the extent to which the TOC Program promotes affordable housing production and advances equitable outcomes near transit. To assess the efficacy of the TOC Program, I employ a mixed-method approach that integrates quantitative data analyses as well as qualitative interviews. Quantitatively, I analyze the spatial distribution of TOC projects and compare the characteristics of communities with and without TOC projects using Student's t-tests. Qualitatively, to reveal the major themes and attitudes towards the program, I conduct in-depth and semi-structured interviews with three types of stakeholders: 1) senior planners from the city who are responsible for administrating the program; 2) private developers who have applied for housing development

under the TOC Program; and 3) community organizations that are located near TOC projects and advocate for equitable development, such as the East LA Community Corporation.

The study indicates that Transit Oriented Communities (TOC) projects are concentrated in communities with a higher proportion of non-White residents, higher poverty rates, increased population density, and a lower proportion of single-family detached homes. This suggests that these projects have the potential to address the needs of transit-dependent residents effectively. Interviews conducted for the study reveal that the TOC program has become the most effective tool for delivering both market-rate and affordable housing in the City of Los Angeles, surpassing density bonuses and zone changes in effectiveness. However, the program faces several challenges that could limit its full potential. For instance, some developers opt to downgrade their qualified TOC tiers and only seek basic incentives to avoid discretionary review processes. Additionally, financial feasibility poses the most significant concern for large-scale affordable housing developers. These findings not only help evaluate the program's efficacy and identify challenges but also offer valuable insights into the integration of affordable housing and transit investment to promote equitable TODs.

TOD AND MOBILE HOME RESIDENCE: A CASE STUDY IN FORT WORTH, TEXAS

Abstract ID: 1108.0.0.218.2024
Individual Paper Presentation

Jenifer Reiner [University of Texas at Arlington] jxr0009@mavs.uta.edu, presenter
Julene Paul [University of Texas at Arlington] julene.paul@uta.edu

Transit-oriented development (TOD) has proliferated in the U.S. as a tool for pursuing sustainable growth (Cervero, 2004). However, scholars and activists have also criticized TOD as a potential driver of displacement of low-income residents, as increased investment leads to rising land values (Rayle, 2015). The empirical evidence on whether TOD actually leads to displacement is mixed (Padeiro et al., 2019). Yet regardless of the empirical associations of

TOD with housing changes, community perceptions of it remain critical for planners and policymakers to assess. Apart from the equity concerns related to displacement, community residents represent the actual market for riders on which agencies hope to draw. Further, the perspectives of unique populations toward TOD and displacement – for example, residents of mobile homes – have not been well explored. As one of the last types of affordable housing, mobile homes have attracted the interest of housing scholars, including as sites where residents are especially vulnerable for displacement (Sullivan, 2018). Few scholars have addressed the intersection of issues related to mobile home residence, TOD, and displacement.

To close this gap in the literature, this paper examines a single disadvantaged mobile home community located in the City of Fort Worth. The city's comprehensive plan has designated the neighborhood a priority development zone for transit-oriented development. In this project, we conduct interviews and focus groups to examine the attitudes of mobile home residents toward TOD and zoning changes in their neighborhoods. The targeted neighborhood, whose land has become increasingly valuable due to the potential for increased development, is home to residents with limited alternative housing options. Some of the benefits of TOD – for example, more transit service, increased walkability, and access to new businesses and more housing stock – may prove attractive to mobile residents. However, current models of TODs may fail to meet the needs of this unique population. Our qualitative data collection helps evaluate whether this is true.

This research contributes to an emerging area of scholarship on housing affordability, transit-oriented development, and community perceptions of transportation planning processes. Transportation agencies have been criticized for their top-down approach in which they make investments and service changes with limited input from the community (Taylor & Morris, 2015). Because transit riders tend to be lower income than the average travelers, agencies may fail to incorporate the needs of the very people they predominantly serve. Understanding how mobile home residents view TODs, development, and displacement can inform equitable practices to increase access amidst sustainable growth policies.

TWO BIRDS WITH ONE STONE? SUBURBAN OFFICE-TO-MULTIFAMILY CONVERSION TRENDS

Abstract ID: 1108.0.0.606.2024
Individual Paper Presentation

Jongwoong Kim [West Chester University] jkim@wcupa.edu, presenter
Dorothy (Dottie) Ives Dewey [West Chester University] divesdewey@wcupa.edu

This paper investigates the emerging trend of office-to-residential conversions in the United States and evaluates their economic and regulatory viability, with a particular focus on suburban locations and zoning considerations. The motivation behind this research arose from the increasing number of vacant office units in both urban and suburban locales (CBRE Research, 2023) in the U.S., and recent discussions within the Biden-Harris Administration regarding the potential use of commercial-to-residential conversion to address housing affordability issues and mitigate commercial vacancy challenges (The White House, 2023). Nevertheless, the conversion process is commonly associated with multiple challenges, including securing zoning and regulatory approvals, adapting existing infrastructure, addressing community resistance, and assessing financial feasibility (Lester & Sage-Computing, 2023). These hurdles are known to persist despite the anticipated benefits, such as alleviating housing shortages, fostering sustainable development (as the conversion is seen as more environmentally sustainable than new construction), potentially reducing commute times and promoting walkability (in case of mixed-use conversions), and revitalizing declining area (Gorey, 2023).

While interest in this topic is evident across local governments, planning agencies, and the real estate sector, existing discourse primarily centers on urban cores in such as New York City, Washington D.C., Philadelphia, Pittsburgh, Cleveland, and San Francisco. This focus overlooks the substantial challenges and opportunities present in suburban locations, particularly suburban office parks, which have also experienced heightened vacancy rates exacerbated by the shift to remote work since the pandemic (LaSalvia, Chen, & Luettke, 2024). To bridge this gap, this study conducts an analysis of nationwide suburban office conversion project data, aiming to examine their physical characteristics, locations, local/regional market dynamics, demographics, and most importantly, affordability implications. The initial assessment indicated that the range of housing units converted caters to limited income brackets. Utilizing Geographic Information Systems (GIS) tools and descriptive statistics, this research seeks to offer valuable insights and practical lessons for suburban municipalities, real estate developers, and local business and civic society groups considering office-to-multifamily conversion as a potential strategy for future (re)development to achieve the goals of addressing housing shortage/affordability and office vacancy in suburban areas.

UNDERSTANDING GENTRIFICATION THROUGH ML – A CASE STUDY OF SALT LAKE CITY

Abstract ID: 1108.0.0.858.2024
Individual Paper Presentation

Justyna Kaniewska [University of Utah] u1324755@utah.edu, presenter
Reid Ewing [University of Utah] ewing@arch.utah.edu

This study uses an innovative technique of machine learning to both explore and predict changes in socioeconomic status at the neighborhood level in Salt Lake County, Utah. Instead of defining and measuring the elusive phenomenon of gentrification by using single indicators this study uses Principal Component Analysis to combine the four most used measures of gentrification into one cohesive measure or index that describes the socioeconomic status of a given area, and when used over time shows changes in such status. While using single measures often leads to contradictory results where different areas are defined as gentrifying depending on which measure is used (Galster and Peacock, 1986), using a PCA derived indicator allows to capture the combined effect of multiple measures.

Machine learning has been adopted in gentrification studies very recently. Reades et al.'s (2019) study is a pioneering example and is the first well documented and published work on predicting gentrification using ML methodology. A handful of studies have been conducted and published since with some treating the process of gentrification at large and others investigating various specific aspects of gentrification, e.g., race and gentrification, exploring commercial gentrification using Instagram data (Reades et al., 2019; Thackway et al., 2023, Yee & Dennett, 2022). The main advantage of using ML over other conventional statistical methods commonly used in social sciences is that ML algorithms can tackle both ‘long’ and ‘wide’ datasets and are not impacted by intercorrelation between variables. In addition, ML based methods are less focused on causality and more on utility of findings (Reades et al., 2019).

A predictive model of socioeconomic changes at the neighborhood (Census tract) level requires two sets of variables – the variables used to build the socioeconomic status score (an indicator of gentrification; a PCA score) and the variables used to predict the score or changes in the score (predictor variables). The scores are calculated for each year and each Census tract in the county using Principal Component Analysis and four variables: median household income, median gross rent, the proportion of Latino population, the proportion of population with higher education. The algorithm modeling changes in the socioeconomic status scores (built using a random forest (RF) method) across the county Census tracts is trained and tested with 2011 and 2015 data, and then used to predict the socioeconomic scores for the year 2019. I used 36 predictor variables to train and tune the model. All

data was sourced from the American Community Survey of the U.S. Census Bureau. The scores calculated for year 2019 with actual data were checked against model predicted values and the Pearson correlation coefficient (r) between the actual and predicted values is 0.8063312. The scores show a progressive polarization of the county with the Latino population being over time pushed into the upper left quadrant of the county while other parts of the county experience continuous increases in rent cost and income levels and growing shares of residents with higher education.

In contrast to qualitative methods and conventional quantitative methods that both describe either past or present gentrification processes, machine learning can be used to also predict plausible future trends. When combined with displacement data, machine learning can become a powerful and highly useful tool in predicting future trends at the neighborhood level. This in turn would enable advance planning of appropriate response actions in anticipation of the changes and perhaps would even allow to limit the negative effects of gentrification and to reduce displacement.

UNDERWRITING THE URBAN: HOW LENDERS INFLUENCE ARCHITECTURE AND URBAN DESIGN

Abstract ID: 1108.0.0.1060.2024
Individual Paper Presentation

Matthew Adair [McGill University, School of Urban Planning] matthew@ideo.city, presenter

In the face of spiraling housing affordability crises in cities across North America, scholars, policymakers, and advocates have all increasingly identified the urban development process as a key site animating the politics of housing production. The funders behind urban development, however, have largely been excluded from direct qualitative research. Harvey (1975) highlights the role of financial intermediaries as essential, writing that the "production of the built environment involves processes of fixed capital formation which are 'mediated' through a structure of governmental and financial institutions" and that these "mediations have both general and highly localized impacts upon the urbanization process" (Harvey, 1975, p. 119). To investigate these localized impacts and address this gap in planning research, I conducted 18 semi-structured interviews with bank lenders, non-bank lenders, brokers, and multifamily developers. Through an urban planning lens, my findings demonstrate how

investors and lenders affect the site planning and development outcomes of market-rate multifamily housing, helping uncover the obscured forces of finance capital.

This research adds detail to housing financialization theory that recognizes how housing is becoming an instrument for global investment. Scholars have demonstrated that the demands of the finance sector directly influence the production of housing (Stevens, 2016) and that financial interests are leaders, not followers, when it comes to real estate development (Weber, 2015). In contrast to the conventional wisdom that builders simply respond to consumer demand, the findings of this research align with the conclusions of other scholars demonstrating how financiers have particular penchants for the built form of the products for which they hold debt or equity positions.

Scholars have also explored how lenders impose constraints on developers (Todes & Robinson, 2020) and how these constraints encourage homogenization of urban architecture (Gaudreau et al., 2020). In more than 20 hours of interviews, lenders share their views on a variety of topics including how the current system of housing finance and production results in a “cookie cutter” aesthetic, in the words of one lender, and buildings with “very little character” in the words of another. Discussions also touched on the dissonance between parking requirements (or lack thereof) of jurisdictions and the virtually universal demand for parking by financiers. Despite the insistence of bankers that parking be included to meet perceived tenant demand, one lender admitted “I've never heard of a bank doing a parking study or anything like that.”

On the developer side, complaints about the control of banks over their projects arose—with one multifamily developer saying banks will “do whatever they can to get as far into your shorts as possible so that they're making decisions even during construction.” In addition to banks, one developer said even equity partners can be “borderline stupid” and might hold political views on topics such as car ownership and biking that influence their opinion of project details.

And while scholars have shown that lenders and investors have influenced housing production in the past, most lenders interviewed generally objected to the idea that they directly impact a developer’s vision. With this in mind, a key finding of this research is the role of “lender liability,” or the concept that if lenders exert substantial influence of a debtor’s business venture, they could be held liable and face legal damages. With this moderating influence, deeper nuance is added to the theoretical understanding of the multi-stakeholder housing production process and the role of financial intermediaries in constructing the built environment.

WHO OWNS MASSACHUSETTS?: A NEW TOOL FOR IDENTIFYING INSTITUTIONAL OWNERSHIP

Abstract ID: 1108.0.0.610.2024
Individual Paper Presentation

Eric Huntley [Massachusetts Institute of Technology] ehuntley@mit.edu, presenter
Asya Aizman [MIT Department of Urban Studies & Planning] aizman@mit.edu
Milan Chuttani [MIT Department of Urban Studies and Planning] milanc@mit.edu

Central Theme

Institutional ownership of residential properties is a matter of urgent public interest, but one that is obfuscated by the difficulty of identifying shared ownership given the common practice of creating a different LLC for each property. This presents multiple problems: 1)) an organizing and regulatory problem, in that tenants attempting to organize (and cities trying to regulate the housing market) are limited by what can be discerned from public records; 2) a housing stability problem, in that institutional owners frequently use automated means of tenant and asking rent management and file evictions at greater rates; and 4) a data science problem, in that identifying the scale of shared ownership requires complex entity resolution approaches that are dependent on access to large, reliable datasets.

We will present a new web tool, Who Owns Massachusetts, (to be launched in late May 2024) that attempts to make discovery and analysis of corporate and institutional ownership possible throughout the Commonwealth. We will introduce the tool's functionality (including the ability to search for landlord and properties as well better understand associated eviction filing practices), novel datasets we are making available in building the tool (including a reprocessed set of statewide property records), and future directions for development and research (including the potential for extending the tool to better understand non-corporate forms of ownership, including individual, family, and real estate trusts).

Approach and Methodology

The tool was the result of a long development process with the Healthy Neighborhood Study at MIT DUSP, and built on the lead author's prior work deduplicating ownership in the context of a prior web tool, TenantPower.org. The tool makes extensive use of natural language processing (NLP) and social network analysis (SNA) methods to process statewide property records in Massachusetts. We collate the Commonwealth's parcels and assessor's tables databases with two additional datasets: a database of over 50,000 eviction filings, collected from the Commonwealth's court website, and the OpenCorporates database. We use social network analysis (specifically, greedy modularity optimization) to resolve property-owning entities on the basis of listed addresses, names, and management structures, yielding a database describing the frequently extensive portfolios of institutional owners in the Commonwealth.

We are making the results of this data available through a public-facing web application, built using MapBox, the Django Python framework, and the Svelte Javascript framework. We will share notes on the design process and demonstrate how we thought through the process of interaction design based on the feedback of Healthy Neighborhood Study partners, including tenants, advocates, and policymakers.

New Findings

The tools and datasets we are making available are novel for several reasons: to our knowledge, this is the first statewide tool for identifying institutional and corporate ownership. It is also the first to make its underlying derived and enriched datasets available to the broader research community. Finally, we are making details ownership information available that exceeds that of existing, similar tools, including information on corporate and legal form (LLC, family trust, non-profit) and eviction outcomes (e.g., detailing arrears, case outcomes and duration, legal representation).

Relevance

As outlined above, the tool is responding to an urgent problem: cities around the world are being treated as investment vehicles, and housing is being treated as an asset class. While this isn't new, exactly, it is intensifying. Particularly since COVID, real estate investment, asking prices, and asking rents have skyrocketed in coastal cities. Addressing this problem will require publicly available tools and datasets that go far beyond opening assessors records to the public to present measures of the scale of institutional ownership and the pressure it places on rental markets throughout the United States.

ZONING AND EXCLUSION: THE MEDIATING EFFECT OF NEIGHBORHOOD MORPHOLOGY

Abstract ID: 1108.0.0.18.2024
Individual Paper Presentation

Noah Durst [Michigan State University] durstnoa@msu.edu, presenter
Esther Sullivan [CU Denver] esther.sullivan@ucdenver.edu

In recent years, local land use regulations have been targeted as a potential policy solution for the nation’s housing crisis. Central in these national, state, and local calls to revise land use regulations is a recognition of the fact zoning has a variety of impacts on the overall supply, variability, and affordability of the U.S. housing stock, which, in turn,

impacts racial and economic segregation in U.S. metropolitan areas (Lens and Monkkonen, 2016; Rothwell and Massey, 2009; Stacy et al., 2023). The growing body of scholarship on density zoning is largely focused on two things: 1) examining the effects of regulatory changes on housing production and associated prices or affordability and 2) examining the relationship between density zoning and the creation or maintenance of income and racial segregation. One major gap in the literature is that despite the fact that density zoning and residential segregation are spatial phenomena, analyses of the link between the two are largely a-spatial. To the extent that there is an empirical link between zoning and residential segregation, and to the extent that it functions through impacts on housing supply, these impacts should be observable in the spatial patterns of development and thus in variation in neighborhood morphology. Some research already points in this direction: Durst, Sullivan, and Jochem (2023) use building footprints in five major metropolitan areas to demonstrate that neighborhood morphology is closely associated with the demographic and socioeconomic characteristics of neighborhoods. In this study, we examine the intermediary links between density zoning and residential segregation by analyzing the association between density zoning and both neighborhood morphology and the income and racial composition of municipalities. Specifically, we answer the following questions: 1) How does density zoning shape the spatial characteristics of development, as measured by neighborhood morphology? 2) Are differences in neighborhood morphology associated with variation in the income and racial composition of municipalities? 3) Does neighborhood morphology mediate the relationship between density zoning and the income and racial composition of municipalities? To answer these questions, we use two-dimensional building footprints to examine the neighborhood morphology across the 50 largest metropolitan areas. Specifically, we measure the size, shape, and placement of building footprints within each census block and use these morphometrics and unsupervised classification to develop a typology of neighborhoods. After describing the physical, socioeconomic, and demographic characteristics of these neighborhoods, we use regression analysis to examine the association between density zoning and neighborhood morphology. We then use mediation analysis to examine whether neighborhood morphology mediates the relationship between density zoning and the income and racial composition of municipalities. Our findings point toward neighborhood morphology, and in particular cookie-cutter suburban-style residential neighborhoods, as a key link in zoning's chain of exclusion.

A COMMUNITY-PARTNERED APPROACH FOR AI PREDICTION OF HOUSING INSTABILITY

Abstract ID: 1110.0.0.656.2024
Research-in-Motion (RiM)

Chester Harvey [National Center for Smart Growth, University of Maryland College Park] cwharvey@umd.edu, presenting author
Nicholas Finio [University of Maryland] nfinio@umd.edu
Kathryn Howell [University of Maryland - College Park] klhowell@umd.edu

Communities along the Purple Line light rail corridor, currently being built in suburban Maryland outside Washington, D.C., are struggling with housing instability, in part due to gentrification spurred by this new transportation infrastructure (Finio, 2023, Peng & Knaap, 2023; Peng et al., 2023). Through our work with the Purple Line Corridor Coalition (PLCC), a multi-sector coalition including state and local governments, organizers, funders, service providers, and affordable housing developers, we have developed a new project to predict housing instability along the corridor so it can be addressed more proactively. The project uses novel data and tools, eventually including AI models, to fill a gap in granular understanding of threats to stability for tenants of individual buildings and units. While data from established sources, such as the National Housing Preservation Database, can help identify certain aspects of instability—namely, affordability restrictions for subsidized properties—they tend not to account for unsubsidized stock or precursors to eviction, such as poor building conditions, environmental threats, and filings. Further, data on units and their owners are often siloed or privatized, resulting in information asymmetries that leave advocates and tenants unaware of displacement risks (Hatch et al., 2023).
To address these shortfalls, our project aims to develop an operational framework using principles of data justice/feminism to predict instability at the level of individual buildings and units. We investigate how new data sources and analytic tools may be used to predict the likelihood of a resident being forced from their home. Better prediction will give residents and community partners foresight to more effectively implement countermeasures that are already at their disposal, such as rental assistance or rights-of-first-refusal to buy properties with affordable units. The operational challenge of predicting instability, however, is underpinned by a conceptual challenge in understanding what constitutes instability beyond overt indicators like eviction. What systemic factors contribute to unstable outcomes over multi-year time horizons? What different forms does instability take? How can instability, or preliminary indicators of it, be observed both qualitatively and quantitatively? How can qualitative indicators be appropriately integrated into scalable tools?

The project is groundbreaking on both organizational and technical fronts. First, it is founded in collaboration with community partners so that the research process is born out of grounded needs. It contends with the role of activism in scholarship and how researchers can work alongside diverse stakeholders who have overlapping agendas that include the policy mandates of public agencies, mission statements of advocacy organizations, and deeply personal motivations of residents. Second, the project uses a mixed-methods approach to improve

quantitative understanding of the complexity of housing instability and inform development data-scientific approaches, including AI models, that may help predict instability on a broad scale.

Our work so far has focused on parallel development of conceptual and technical frameworks to understand and account for instability. In dialogue with community partners, we are building conceptual maps to unpack what housing instability looks like from the everyday perspectives of residents and the more formalized terms of public agencies, courts, and real estate markets. We are also investigating how to collect, build, and connect data from diverse sources to identify instability at a granular level, including individual buildings and units. At the outset, this looks like a web of loosely connected sources which become progressively tightened and solidified with new types of data and multiple ways to connect them. Eventually, we aim to develop an enterprise database and AI tools that can scale predictions of instability beyond our initial focus on the Purple Line corridor.

BUYING WHILE BLACK: BARRIERS TO BLACK HOMEOWNERSHIP

Abstract ID: 1110.0.0.1090.2024
Research-in-Motion (RiM)

Abigail Moriah [Black Planning Project] abigail.moriah@gmail.com, presenting author

Homeownership is the primary means for households to accumulate wealth within our society, yet it remains out of reach for many Black Canadians. Data from the 2016 census clearly indicates that Black households continue to have the lowest probability of home ownership amongst racialized groups and that this gap is growing.
Research examining racial differences or the barriers to home ownership Black households' face remains largely limited in the Canadian context. It has been more than 20 years since research was conducted on racial inequities in the housing market in Canada. Joe Darden and Sameh M. Kamel (2000) investigated these issues in Toronto and although their research concluded that racial discrimination was a factor in homeownership rates between Black and White households, it did not explore or explain why Black homeownership in Canada was low.
However, until 2020, there has been little discussion about the low rates of Black homeownership. When this issue is highlighted, there is limited research that examines the connections between race and home-ownership or little

research into how housing policies or programs influence access to homeownership among Black households.

While there were earlier studies, pointing to the low rates of Black homeownership, they did not explore the stories behind the numbers or engage Black homebuyers to understand their experiences. The Buying While Black research moves beyond the numbers and seeks to uncover these stories to better understand what barriers may result in Black households having the lowest homeownership rates.

By exploring the factors influencing the low home ownership rate among Black Canadians, this study seeks to provide insight into the experiences of Black individuals in the home buying process and, importantly, position us to better address these issues once we understand these challenges.

COMPARING THE IMPACTS OF SPECIALIZED INDUSTRIES ON HOUSING PRICES IN KOREA

Abstract ID: 1110.0.0.457.2024
Research-in-Motion (RiM)

Kang-Hyun Cho [Kangwon National University] kang90250@kangwon.ac.kr, presenting author
Jae-Su Lee [Kangwon National University] jslee25@kangwon.ac.kr

South Korea is facing rapid increases in housing prices and residential instability due to job and industry concentration in the Seoul metropolitan region. The sharp rise in housing prices is one of the major factors that impair residential stability and housing affordability. Many studies have highlighted the regional imbalance of jobs and industries as a key factor in the increase in housing prices in the metropolitan regions. It is therefore crucial to identify factors affecting housing prices including industry and job variables.
This study aims to uncover the factors influencing housing prices in the Seoul metropolitan region and the other metropolitan cities including Busan, Daegu, Gwangju, Daejeon and Ulsan in Korea, focusing on the impact of regional specialized industries. Specialized industries are defined as those within a major industry category with a location quotient exceeding 1.25, and the quotients of specialized industries are recalculated using the number of employees working for the specialized industries in the region(Lee and Lim, 2021). To understand the disparity in the industrial impact between the regions, this research compares differences in the influence of specialized

industries on housing prices between the Seoul metropolitan region and the other metropolitan cities. Additionally, to analyze whether there is a difference in impact based on the type of industry, the study further compares the effects of the location quotients by major industry categories. Based on these findings, the study is expected to demonstrate that the rapid increase in housing prices in the Seoul metropolitan region is largely due to the imbalance of jobs and industries.

In this study, panel data analysis is employed to compare the factors influencing housing prices by region. Housing sale prices are set as the dependent variable, with the location quotients of specialized industries, as well as various indicators related to households, housing, transportation, education, culture, and the regional economy, set as independent variables. The panel data consists of annual data from 2011 to 2023, with the boroughs within the Seoul metropolitan region and the other metropolitan cities. Separate panel data sets are prepared for the Seoul metropolitan region and the other metropolitan cities. A fixed effects model is estimated, and standardized coefficients of explanatory variables are calculated to compare differences between the regions.

The results indicate that in both the Seoul metropolitan region and the other metropolitan cities, housing prices significantly increase as the location quotients of specialized industries rise. Furthermore, the location quotients of specialized industries have a more positive effect in the Seoul metropolitan region than in the other metropolitan cities. When standardized coefficients are compared, the impacts of the location quotients of specialized industries are less significant than the net migration rate, the number of households, housing stock, and per capita regional income. However, they are higher than those of other variables related to transportation, education, culture, and the regional economy. Comparing the impacts of specialized industries in the Seoul metropolitan region, finance and insurance, professional, scientific and technical services, and construction are identified as having a strong positive effects on housing prices, while in the other metropolitan cities, manufacturing, construction, and professional, scientific and technical services are identified as significant. Therefore, housing policies in metropolitan regions should be implemented considering regional industrial strategies, including the development of regional specialized industries.

DETERMINANTS OF DISPLACED HOUSEHOLDS' DESIRE TO RETURN TO PARADISE, CA

Abstract ID: 1110.0.0.1088.2024
Research-in-Motion (RiM)

Ryan Miller [University of California, Davis] rgmiller@ucdavis.edu, presenting author

In 2018, the town of Paradise was largely destroyed by the deadliest and most destructive wildfire in California history. Five years later, less than a third of the former residents of the burned area have returned. This work shares results of a survey of past and present Paradise residents conducted in Spring 2023, with a focus on how former residents' perceptions of why the wildfire happened influence their decisions surrounding rebuilding/relocating, their risk appetite, and their overall quality of life since the wildfire. Our team used household-level credit bureau data to obtain current addresses for over 8,000 households formerly in the fire footprint area, and collected 680 surveys from these households. Stated attitudes about climate-driven hazard risk as well as which entities bore blame for the Camp Fire disaster were strongly predictive of households' stated intent to return to Paradise 'under ideal circumstances' using various logistic regression specifications. Households which blamed environmental policies or logging practices for the fire, as opposed to climate change or local land use decisions, were significantly more likely to consider moving back to Paradise. These survey results suggest that future climate-driven events may disproportionaly affect households that are not currently factoring climate change in to their decision-making regarding residential location choices, even after living through a large wildfire driven at least in part by climate change effects.

DO PROJECT VISION AND PUBLIC POLICIES MATTER FOR COMMUNITY DIVERSITY?

Abstract ID: 1110.0.0.647.2024
Research-in-Motion (RiM)

Makbule Yildirim Ozguven [Florida State University] my20bn@fsu.edu, presenting author
Minjee Kim [Florida State University] m.kim@fsu.edu

Hyojung Lee [Seoul National University] hyojung.lee@snu.ac.kr
Chao Wang [Florida State University] cw22k@fsu.edu

The history of suburbanization in America is co-terminus with discrimination and segregation in the housing market, where homeowners, real estate industry professionals, and local governments worked hand-in-hand to prevent low-income households and racial and ethnic minorities from moving into affluent suburbs (Glotzer, 2020; Troustine, 2018). While the Fair Housing Act of 1968 outlawed explicit discrimination in the housing market, access to the wealthy suburbs was neither guaranteed nor welcomed (Davidoff et al., 1970). The rising popularity of gated communities, exclusionary zoning, and NIMBY-ism in the 1970s was a testament to the strong desire to keep suburban communities exclusive and protected from the infiltration of low-income and minority households.

However, there have also been moments of hope in the history of suburban community development. Existing research documented how visionary developers and the federal government have strived to create integrated communities, albeit with limited success (Forsyth, 2005). More recently, Kim and Lee (2023) reported suggestive evidence that developers of large-scale planned communities have become more open to building demographically and culturally diverse communities after the 1990s. These cases suggest that suburban communities can potentially be developed with diversity and inclusion in mind, which may have implications for the diversity and inclusiveness of suburban communities.

In this Research-in-Motion presentation, we report findings from analyzing 395 large-scale planned communities approved in the state of Florida between 1975 and 2012. The state's land planning agency was the central land use approval agency during this period, reviewing and approving all large-scale projects expected to have a "regional impact." We have established a database of all developments of regional impact that had a significant residential component, arriving at a total of 395 projects scattered throughout the state. We then reviewed and documented key elements of the original project applications including project vision, design, and target demographics. We also identified and digitized the geographic boundaries of the communities, which has allowed us to identify census block groups that correspond with the community boundaries.

Joining the above database with census data, we examine whether the original project vision and public policies are associated with the demographic and socioeconomic diversities of the households living in suburban planned communities. We compare the present-day characteristics of the communities using 2022 ACS data and further divide the communities into subgroups by their development vintage and compare communities at similar stages of buildout. Elements of the original project vision explored in this study include (1) the character of the proposed community as described by the developer, (2) the land use mix, (3) diversity in housing structure and types, and (4) target demographics and income levels. Public policies examined are (1) the 1992 revision of the state land planning agency's policy to include affordable housing needs assessment, (2) the creation of the state housing trust fund, which also took place in 1992, and (3) local inclusionary housing ordinances. This research will shed light on the factors that can strengthen the demographic and socioeconomic diversity of suburban communities, contributing to the longstanding literature and effort on lowering the entry barriers to high-opportunity suburban neighborhoods.

EQUITY IN THE IMPLEMENTATION OF MARKET-BASED PUBLIC HOUSING REFORMS

Abstract ID: 1110.0.0.889.2024
Research-in-Motion (RiM)

Rance Graham-Bailey [University of Pennsylvania] rgbailey@upenn.edu, presenting author

In 2012, Congress authorized the Department of Housing & Urban Development to demonstrate a new way of addressing the backlog of physical capital repairs within the nation's public housing inventory. The Rental Assistance Demonstration (RAD) releases properties from the restrictive covenants of the Section 9 Low-Rent program, transfers them to individual Public Housing Authorities or various forms of public-private partnerships, and turns to the private market to obtain renovation financing. This is facilitated by re-packaging public housing Operating and Capital Fund annual contracts into long-term project-based Section 8 agreements. There is significant debate as to whether this constitutes outright "privatization" or the latest evolution in ways that the state turns to the private sector as a partner in delivering affordable housing that started as early as the 1960s (Vale & Freemark, 2012). Multiple proposals and policies from both parties have laid the groundwork for integrating public housing into the traditional real estate market (Hanlon, 2017).

As of April 2024, HUD's Resource Desk indicates that 15% of the over one million potential properties identified in 2012 have completed the RAD Conversion process, with another 24% in various stages of the conversion process. Researchers have studied the extent to which a "budget-neutral" initiative has consumed nearly one-fifth of Low-Income Housing Tax Credits that would have presumably been used to create and preserve other housing units (Schwartz & McClure, 2021). Researchers have also identified the significant adoption of the program by smaller and medium-sized Public Housing Authorities, the regional patterns of adoption, and the impacts of successful renovations on residents (Hayes et al., 2021).

Existing research has, however, overlooked a crucial aspect of the RAD policy: the question of spatial equity in its application. This is a significant consideration given the voluntary nature of its roll-out. The current research project, utilizing publicly available administrative data sets and multivariate regression analysis, aims to fill this gap and provide a fresh analytical perspective on the program's design and implementation. Are properties with the most significant physical repair needs chosen for participation in the program? How strong is the connection between investment in closed properties and their degree of physical need? Furthermore, does the

implementation of RAD reinforce prior patterns of uneven development? The importance of these questions cannot be overstated.

Planners must grapple with these questions due to the evident disparities in the success of previous market-based reforms to housing redevelopment (Khare, 2018). If the process of commodifying public housing to preserve the underlying physical assets worsens inequities, this line of research must be further pursued. In discussions about expanding the program cap to include the entire national public housing portfolio, caution will also be required.

EXAMINING SEATTLE'S DENSITY BONUS FOR FAITH-BASED AFFORDABLE HOUSING

Abstract ID: 1110.0.0.96.2024
Research-in-Motion (RiM)

Nadia Mian [Rutgers University] nadia.mian@rutgers.edu, presenting author

Religious organizations have had to adapt and evolve as the religious landscape changes in North America. In many cities, dwindling congregation sizes, dilapidated houses of worship and underutilized and expansive religious owned property coupled with the rising cost of housing and property values in large urban areas have led faith organizations to partner with municipalities, developers and non-profit organizations to build affordable housing on faith-owned property (Chaves and Eagle, 2016; Hackworth and Gullickson, 2013; Mian 2008). Policymakers on all levels of government have been exploring different policies, programs and legislation to combat some of the difficulties religious organizations face when doing a development project. To encourage the production of affordable housing, states and municipalities have eased development regulations and adopted development incentive tools. In October 2023, the State of California adopted SB4 which permits religious organizations to by-pass local zoning regulations to build affordable housing on their property. In December 2019, the City of San Diego changed the Land Use Development Code to allow religious organizations to build affordable housing on their

property by removing or reducing parking minimums depending on the location of the house of worship to transit priority areas. Washington D.C., New York City, Atlanta, Seattle, San Francisco and San Antonio have engaged with intermediary housing entities such as Enterprise Community Partners and Local Initiatives Support Corporation (LISC) to offer technical assistance programs for faith organizations pursuing an affordable housing development. Washington State also turned to faith organizations to increase the supply of affordable housing. In 2019, Washington State legislation HB1377 mandated faith organizations receive a density bonus for building 100% affordable housing on their property. Each municipality interpreted the legislation to suit the needs of their community. In 2021, the City of Seattle adopted the legislation after several revisions as Ordinance 126445. The purpose of this paper is to explore the number of faith-based affordable housing developments that are in the process of being built or have been constructed since the ordinance was passed. Ordinances focused on faith-based affordable housing construction are fairly recent and currently no studies have been conducted examining the new regulations.

Studies examining density bonus agreements have concentrated on the number of units produced as part of inclusive housing programs. In some instances, developers contributed funding to an affordable housing fund as opposed to building more units (Mah 2022). Other studies have focused on the locational pattern of units constructed using the density bonus incentive. Ryan and Enderle's (2012) study of California's density bonus agreement found that the policy did not foster socio-economic integration as units were constructed largely Hispanic and Black neighborhoods. Krimmel and Wang's study (2023) examined upzoning in Seattle's Mandatory Housing Affordability (MHA) program through a difference-in-difference analysis that compared upzoned areas with those that were not upzoned and found developers building more units in areas that were not part of the MHA program. Scholars have also examined the role of land value capture in density bonus agreements (Biggar and Friendly, 2023). Through interviews, content analysis examining land use development applications, and archival research, as well as GIS mapping showing where faith-based developments are being built, this research seeks to understand the decision-making process behind choosing to utilize the density bonus tool for faith-based affordable housing developments in Seattle and asks "Is the current density bonus tool a useful one for encouraging the production of affordable housing on faith property?" By examining the reasoning behind utilizing or not utilizing the tool, the efficacy of the density bonus tool can be debated. Understanding the decision-making process behind utilizing the incentive tool can help planners and policymakers craft ordinances that are effective for faith-based organizations who want to build affordable housing.

EXPLORING THE IMPACTS OF DISPROPORTIONATE PROPERTY TAX BURDEN

Abstract ID: 1110.0.0.448.2024
Research-in-Motion (RiM)

Hye-Sung Han [University of Kansas] hshan@ku.edu, presenting author

Local governments in the United States rely heavily on property tax as their primary source of revenue. However, property tax can be a significant annual expense for homeowners, especially for lower-income households. Studies have found that lower-income households spend a higher percentage of their income on property taxes than wealthier households. Property tax assessments can also be regressive, with low-priced properties often being assessed at a higher value than high-priced ones. As a result, homeowners with less valuable properties, particularly low-income households, are disproportionately burdened by the property tax (Berry, 2021). A recent study on Detroit's property tax assessments found that the City over-assessed the lowest-valued homes, disproportionately burdening lower-income homeowners and increasing foreclosure risks (Christine, 2020). Additionally, African American and Hispanic homeowners face higher property tax assessments, leading to a higher tax burden. (Avenancio-Leon & Howard, 2020). Research has also shown that real estate appraisers often undervalue homes owned by African Americans, lowering the price of a property on the market. Therefore, over-assessment of property tax and under-valuation of property owned by African Americans hinders their wealth buidling from home equity (Fields, Perry, & Donoghoe, 2023).

This pattern of property tax regressivity is evident at the neighborhood level. Studies provide empirical evidence on the over-taxation of communities with a high share of minority residents. Scholars argue that tax assessments are significantly higher for properties located in neighborhoods with lower median housing values, lower income and education, and higher proportions of African American residents (Avenancio-Leon & Howard, 2020). Further, property values rise faster during gentrification, leading to rising property taxes. Increased property taxes can burden long-term homeowners, primarily low-income households, and may worsen affordability and create displacement pressure in gentrifying neighborhoods (Institute for Housing Studies at DePaul University, 2023).

To explore these issues empirically, this research uses the newly released Federal Housing Finance Agency (FHFA) 's UAD Appraisal-Level PUF data based on a five percent nationally representative random sample of appraisals for single-family mortgages from 2013 through 2021 and the U.S. Census ACS data for neighborhood characteristics. Firstly, using FHFA's UAD Appraisal-Level PUF data, we investigate whether there is a disparity in property appraisals and, consequently, undervaluation based on the property owner's race. Specifically, after controlling for property characteristics, we examine whether there is a significant difference between the appraised value and sales price of properties based on the property owner's race. Secondly, we examine whether there is a disparity in appraisal based on the property's location. Lastly, we explore whether the disparity in tax burden (led by the disparity in property tax assessment) exacerbates housing affordability issues and potential displacement at the neighborhood level. Using the U.S. Census ACS data, we quantify the impact of the disparity in the tax burden on housing affordability and potential displacement measured by the mobility of residents at the neighborhood level.

EXPLORING THE RELATIONSHIP BETWEEN RENTERS AND GREEN SPACES IN NEW ORLEANS

Abstract ID: 1110.0.0.827.2024
Research-in-Motion (RiM)

John Park [University of Maryland] jpark5@umd.edu, presenting author

This research primarily examines the location of Low-Income Housing Tax Credit (LIHTC) and Naturally Occurring Affordable Housing (NOAH) units and their tenants' access to green space in the New Orleans area. The study aims to assess the current relationship between green space and affordable housing units in neighborhoods within the context of a flood-prone city. Additionally, it seeks to offer several suggestions for how affordable housing in New Orleans should be addressed in relation to water-related disasters in response to sea level rise, given the city's nationwide reputation as prone to flooding.

Many housing units and communities in the New Orleans area are vulnerable to natural disasters such as hurricanes and recurrent flooding events. It is also recognized that numerous affordable housing units are not exceptions and are instead more susceptible to floods, according to local experience. While only a few low-income tenants who qualify for federally assisted housing assistance can take advantage of actual assistance, which includes the LIHTC program, little research has been conducted on the geographic distribution of LIHTC tenants relative to low-income households living in NOAH units with rents below the market rate. We have paid little attention to the relationship between such low-income housing units and green space, such as areas covered by tree canopy and permeable topography, which would help lower temperatures and provide better perviousness beneath the grounds. In this regard, a few overarching research questions answered in this study are: (1) How much do LIHTC tenants relative to NOAH tenants benefit from green space in the New Orleans area? (2) How do flood risks change in relation to multifamily rent levels in the New Orleans area?

HOMELESSNESS AND INSECT-BORNE DISEASES: A STUDY OF RISKS TO THE UNSHELTERED

Abstract ID: 1110.0.0.233.2024
Research-in-Motion (RiM)

Michael Hooper [University of British Columbia] michael.hooper@ubc.ca, presenting author

This paper examines how people experiencing homelessness manage the risks posed by insect-borne diseases. Concerns over these risks have increased with realization that climate change is expanding the range of many insects responsible for such diseases. Reflecting these worries, many cities are taking steps to protect their residents. For example, the City of Cambridge, MA, has posted warning signs in parks calling for vigilance on the part of park users and outlining safety measures. Such measures involve not staying in parks at night and wearing appropriate clothing and insect repellent. Nonetheless, many of these parks are home to a large and growing population of unsheltered people who are particularly vulnerable to the risks posed by insect-borne diseases. This paper asks if unsheltered people are aware of insect-borne disease risks, whether they take steps to protect themselves from such illnesses and, if so, what those steps involve. Furthermore, the research seeks to understand how cities might better protect their unsheltered populations from the growing threat to health and well-being posed by insect-borne diseases.

Virtually all studies of diseases in the population of people experiencing homelessness have focused on people in shelters. Several studies have identified the diseases, infections and chronic conditions common within the sheltered homeless population, including, for example, tuberculosis and scabies (Badiaga et al., 2008). These studies have resulted in proposed and implemented interventions, such as shelter-based health screenings and systematic vaccination programs. Studies have also examined the incidence of bed bugs and body lice infestations in shelters (Leibler et al., 2016; Bugs that bite, 2005). The relative lack of attention to the risks posed by insect-borne diseases to the unsheltered homeless population is surprising and it is into this marked gap that this paper steps.

Importantly, climate change has a direct effect on those who spend time or live outdoors. First, warmer weather has the potential to lead to individuals staying outdoors longer throughout the year, increasing exposure to extant risks (Ramin and Svoboda, 2009). Second, insect-borne diseases are expanding in territorial scope, as the ranges of their insect vectors expand. As one example, it is believed that the introduction of West Nile Virus (WNV) to the United States, and its spread on the continent, was enabled by the increasingly warm, dry summers resulting from climate change (Ramin and Svoboda, 2009). The Centers for Disease Control report that, from 2004 to 2016, the incidence of diseases from mosquito, tick and flea bites tripled in the United States (CDC, 2018). Over this same period, 640,000 illnesses borne by these insects were officially documented, which is likely just a small fraction of all cases. Critically, insect-borne illnesses pose particular risk to those who spend time outdoors, putting unsheltered people at particular risk.

The paper's methods of data collection focus on interviews. Seventy-two unsheltered homeless residents of Cambridge, who sleep out-of-doors, were interviewed. Interviewees were identified through purposive and snowball sampling. An effort was made to sample the most representative sites where the unsheltered homeless spend time. The methods of data analysis will involve coding the answers to the questions posed during interviews. The answers will be coded by assigning answers to non-overlapping categories. Basic statistical tests will be used to find patterns and relationships in the interview data. Finally, the more detailed and exhaustive answers to the interview questions will be used to contextualize these statistical findings and present a nuanced picture of how the unsheltered homeless population in Cambridge experiences and manages insect-borne disease risks. The research in currently in the data analysis stage and initial results will be ready by the time of the ACSP conference.

IMPACTS OF PANDEMIC-DRIVEN SHORT-TERM RENTAL GROWTH ON RURAL HOUSING MARKET

Abstract ID: 1110.0.0.177.2024
Research-in-Motion (RiM)

Seungbee Choi [Gachon University] sbchoi@gachon.ac.kr, presenting author
Junghwan Kim [Virginia Tech] junghwankim@vt.edu

The outbreak of the COVID-19 pandemic brought about an unprecedented disruption to the global tourism landscape, severely impacting hotels and short-term rentals (STRs), such as Airbnb. Initially, this disruption manifested as a pronounced downturn, with travel restrictions and health concerns leading to a steep decline in tourism activity worldwide. However, as the pandemic persisted, a remarkable shift in traveler preferences emerged. There was a move away from densely populated urban centers towards destinations that offered a blend of natural beauty, cultural richness, and opportunities for outdoor recreation (Seraphin and Dosquet, 2020; Vaishar and Šťastná, 2023). This shift led to an unexpected resurgence for rural STRs, which found themselves at an advantage due to their location in less populated areas and their ability to offer experiences closely aligned with emerging preferences (Choi and Won, 2023; Demir et al., 2024).
The trend towards rural retreats underscored the adaptability of the STR market, reflecting its capacity to quickly pivot and cater to the evolving demands of tourists in a post-pandemic world. This adaptability facilitated the

economic rejuvenation of rural areas, which traditionally relied on agriculture and small-scale industries, and positioned STRs as a vital component in the broader narrative of rural development and tourism (Airbnb, 2022). However, the rapid growth of STRs in rural areas, while beneficial from a tourism and economic perspective, brought significant challenges related to housing affordability and availability to the forefront. As more properties were converted into STRs to capitalize on the burgeoning demand, concerns arose about the diminishing availability of housing for long-term residents, particularly those employed in essential sectors within these communities (Amore et al., 2022; Lee, 2016; Simcock, 2023).

The transformation of residential properties into STRs presents a multifaceted challenge. On the one hand, converting underutilized or vacant properties, including secondary homes initially intended for recreational use, into STRs could potentially drive local economic growth without adversely impacting the housing market. Such conversions might breathe new life into dormant properties, contributing to the vibrancy and economic vitality of rural communities. On the other hand, repurposing rental housing stock intended for local residents into STRs in pursuit of higher revenues introduces a significant dilemma. This practice could exacerbate housing shortages, driving up rental prices and making it increasingly difficult for local workers.

Given the complexities surrounding the rural STR market and its implications for local housing markets, this study aims to identify the potential impacts of STRs on rural housing markets by categorizing rural STR properties based on their neighborhoods' socio-spatial characteristics, including spatial accessibility to amenities, land use patterns, which will be measured through geospatial analyses. Employing a comprehensive dataset from AirDNA from 2018 to 2022 for rural Virginia, complemented by various additional datasets, this study seeks to discern patterns that might indicate the prior role of STR properties within the housing market. Furthermore, this research delves into the occupancy rates and revenue streams of STRs during the pandemic, aiming to understand the impacts of these trends.

The implications of this research offer critical insights for a broad spectrum of stakeholders, including policymakers, community planners, and industry participants. By examining the trajectory of STR growth and its ramifications for rural housing markets, the study highlights the pressing need for regulatory frameworks. Such frameworks must balance the economic potential inherent in the STR market with the imperative to preserve and protect housing options for local residents. Moreover, findings from this study can be applied to many other rural neighborhoods beyond Virginia that experience the same housing issues pertaining to STR.
