

ACSP2025

BOOK OF ABSTRACTS

This book includes the abstracts accepted for presentation at the ACSP2025 Annual Conference. This book was completed and posted to www.acsp.org 06/30/2025.

Notes about this Book

This book includes only the abstracts accepted for presentation at the 2025 Annual Conference. This book was completed and posted to www.acsp.org on June 30, 2025.

Abstract ID

When submitted to the abstract management system, each abstract was assigned an abstract submission ID number for administrative search/find purposes. This is the number authors should reference to staff with any questions regarding their abstract, their presentation, or their final paper submission. This number stays with the abstract throughout the process and becomes the ID of the presentation of the research at the conference.

Pre-Organized Session

Organizers of groups of authors intending to submit as a pre-organized session used the abstract submission system to provide an overview or intent of the session, the name of a proposed discussant, and the authors and paper titles of those confirmed to be part of the session. The system assigned an abstract number to the grouping of these abstracts. When scrolling through this book and through each track, you'll find the pre-organized session proposals. Each proposal will indicate which of the abstracts in the track belong to that session. Immediately following the pre-organized session proposal are all of the accepted abstracts within that session.

Indexes Available

Separate indexes for Author Name and Keywords. These indexes can be found at the end of this book. Use CTRL+F to search for Names and Keywords throughout the book.

Order of Abstracts within Each Track

Abstracts are first ordered by the type of abstract, then sorted numerically by abstract ID. All types of abstracts are not necessarily represented in all 15 tracks.

1. Pre-organized Session Summaries – the overview describes the intent of the session and lists the included abstracts
2. Abstracts accepted with the pre-organized sessions
3. Roundtables
4. Workshops
5. Individual paper abstracts
6. Research in Motion (RiM) abstracts

Order of Authors

The abstract management system used by ACSP allows for author role declaration.

- **For papers (individual paper abstracts, and abstracts within pre-organized sessions), Research in Motion** the presenting author is always listed first and indicated. No more than eight authors for one abstract are included.
- **Roundtables and Workshops** will have an organizer (listed first and indicated) and participants. The names listed are confirmed participants of the discussion. Anyone in the audience can also participate in the discussion. There is a maximum of eight names listed for each roundtable.
- **Pre-organized sessions** will have an organizer included with the summary abstract.

Multiple Program Placement Policy

Each abstract submission must be unique. You may not present the same research in multiple formats. If you have more than one appearance in one of the categories in this paragraph, in fairness to everyone, we will ask you to withdraw the additional appearance(s) prior to the scheduling of sessions. Presenters on the final program are limited to one of each of the following:

- Presenting author of one research presentation - whether in a paper session OR Research-in-Motion session (inclusive of pre-organized sessions of either format).
- Participant for one placement on a roundtable.
- Teacher of one Professional Development Workshop.
- One (or two max) placement(s) as a discussant or facilitator of a research presentation session.
- Presenting author of one poster.

Requests for Edits

All abstracts in this book are unedited and published as submitted by the author(s) for peer review. It is the policy of the ACSP that the text within the abstracts will not be edited. This book is edited only for formatting consistency. Abstracts cannot be edited after submission according to the instructions in the original Call for Abstracts, the User Guide for submitting an abstract, and the instructions on the submission site. If authors are listed incorrectly, you may request author updates only for the conference schedule (not the Book of Abstracts) by sending a message to abstracts@acsp.org. Please note that changes to authors on the schedule will not be made after September 23, 2025.

Searching this PDF

This document will be over 1600 pages including the Author Index and Keyword Index. In order to find something quickly, copy and paste the titles below in the search box, or use the indexes to search for abstract ID numbers or authors by last name.

To access the search box, use your keyboard CTRL+F.

- **Search by Abstract ID:** Type the words Abstract ID: with one space followed by the number. If you try to search for just the number, you'll likely find it in many of the bibliographical references provided by authors. Sample search: "Abstract ID: 1800.0.0.100.2025"
- **To scan an entire track,** use the word Track followed by a track number 1-16. Sample: "Track 14". This will bring you to the beginning of the abstracts for that track.
- **To get to the Author Index,** search for "Author Index"
- **To search by keyword,** search for "Keyword Index" and then scroll alphabetically.

Table of Contents

Track 1 – Anti-Racism in Planning	7

Track 1 – Anti-Racism in Planning

Track 1 Pre-Organized Session Summaries and Abstracts for the Sessions

Decolonizing Education through Indigenous Planning

Abstract ID: 1840.0.0.827.2025

Track 1: Anti-Racism in Planning

Pre-Organized Session Summary

Session Includes: 1844.0.0.91.2025, 1844.0.0.237.2025, 1844.0.0.804.2025

James Miller [University of Auckland] james.miller@auckland.ac.nz, organizer

Indigenous planning represents a holistic approach distinct from urban planning, integrating cultural and natural elements across scales. Indigenous planners with Western training act as decolonial agents by unlearning and relearning while supporting Indigenous communities.

Colonial legacies persist in planning education, creating challenges when working with underrepresented groups. Western planning tools often fail to address Indigenous contexts. While some institutions offer courses on power dynamics in planning, these are typically electives emphasizing theory over practice and located outside planning departments.

The panel explores how research can inform decolonial teaching through three questions:

- How can planning be taught through Indigenous frameworks?
- What can be learned from the Land through Indigenous perspectives?
- How can non-Indigenous planners engage with Indigenous planning theories?

Learning Objectives:

- Explore pedagogical approaches in addressing power dynamics, colonialism, and subalternity.
- Engage with decolonial and Indigenous planning frameworks.
- Supporting the development of Indigenous planning education.

Beyond Refusal: Balancing Colonial Thinking in Planning

Abstract ID: 1844.0.0.91.2025

Track 1: Anti-Racism in Planning

Pre-Organized Paper Presentation

Joaquin Lopez-Huertas [University of Utah] joaquin.lopezhuertas@utah.edu, presenting author

The impact of colonial power on Indigenous Peoples in Guatemala, as in other regions, transcends mere overt control of Land, labor, policies, and decision-making. Coloniality insidiously shapes intersubjective relationships and knowledge production, fundamentally altering how Indigenous Peoples perceive and engage with the world around them. Yet, in the face of these oppressive dynamics, Indigenous Peoples not only resist but also assert their agency, cultivate, and revitalize their own schools of thought. This counter-hegemonic stance empowers them to envision and plan for a future distinct from the dominant power structures that seek to marginalize them.

Literature has helped deepen our understanding of how Indigenous Peoples employ refusal as an epistemological approach to challenge the colonial practices of settler states. Refusal addresses the implications of state recognition, cultural appropriation, and the co-optation of Indigenous ways of thinking and acting. In the field of planning, a growing body of literature on refusal reveals the colonial violence inflicted upon cities and regions due to assimilation efforts and hostile planning practices. While refusal highlights the complex positioning of Indigenous peoples between settler states and their own communities, it remains unclear how this concept operates in contexts where Indigenous individuals embody both the roles of colonizer and colonized. This article builds upon existing literature to explore how refusal applies in certain situations when Indigenous peoples plan for their futures. Additionally, it advances the "planning in re-existence" framework, offering a nuanced perspective on how Indigenous individuals apply balance to their lives.

I draw on the example of the Mayan Ixil community in Chajul. In this town, 95% of the population identifies as Maya, including those in governmental authorities and the public education system, which operates under a western colonial framework. Despite facing ongoing challenges related to colonial assimilation, the community develops its own schools of thought to challenge the narratives imposed by settler states. Through critical place inquiry, I outline three levels of training in which Maya Ixil women engage in their community. These are organized mainly through the Asociación Centro de Educación Maya Ixil (ACEFOMI) for young girls, the Universidad Ixil for young adults, and the political school of the Consejo Nacional de Viudas de Guatemala (CONAVIGUA) for adult women. These three stages of learning are instrumental in fostering critical thinking rooted in Maya cosmovision and in preparing future leaders of Chajul with a political agenda. By viewing territory and body-land as a relational system that brings balance to their lives, the educational spaces where Ixil women participate contribute to developing a holistic approach to Indigenous community planning.

Possibilities and Challenges for Decolonial Planning Education and Practice in British Columbia

Abstract ID: 1844.0.0.237.2025

Track 1: Anti-Racism in Planning

Pre-Organized Paper Presentation

Maggie Low [The University of British Columbia] maggie.low@ubc.ca, presenting author

Christopher Lamb [The University of British Columbia] chrisallanlamb@gmail.com

This paper explores the role of planning education in decolonizing the planning professions. We present findings from our research project investigating how planning students in British Columbia, Canada, are educated about Indigenous land-relationship principles, decolonization, and reconciliation in planning curricula and pedagogy.

Despite centuries of colonial policies in Canada, Indigenous Peoples continue to engage in planning activities with(in) and on their lands, enacting and adapting dynamic planning practices in place since time immemorial. Planning scholars, educators, and practitioners are increasingly recognizing the challenges and possibilities that Indigenous resurgence and self-determination present to contemporary Western planning education and practice, and that pedagogical change is key to responsible, decolonial, and reconciliatory regional, urban, and community planning relationships. For example, decolonial education should provide non-Indigenous learners opportunities to unlearn what they think they 'know' about Indigenous peoples, in order to make space for more accurate knowledge about Indigenous peoples and settler colonialism. In response to growing scholarly and official recognition of Indigenous rights, professional planning institutes across Canada have initiated Indigenous Planning and Reconciliation task forces and committed to making Indigenous and decolonial education a requirement for planning school curricula and for membership in professional associations.

Research into the state of decolonization in planning education and practice is vital as planning educators, scholars, practitioners, and Institutes look towards reconciliation and decolonization and consider how to move to atonement, action, and responsible partnership. No study to date has evaluated how planning students are educated about these issues.

In this paper we investigate BC planning schools' approaches to Indigenous and decolonial planning education. We present findings from our research into how planning students in BC are being educated about Indigenous and decolonial Planning. We present insights from key-informant interviews with 20 planning educators connected to the four accredited planning schools in BC, exploring their experiences and views on the challenges and possibilities for Indigenous and decolonial planning education in BC and Canada. Across the interviews, several key themes have emerged: planning educators are a) facing significant interconnected ontological, epistemological, and pedagogical challenges to teaching Indigenous and decolonial Planning; b) finding innovative ways to 'do' the work of decolonizing planning education through curricular design and pedagogy in and outside of classrooms; and c) developing important critiques of planning education and practice and overarching goals for what 'decolonizing' planning might look like. Our research provides important insights into how Planning students in BC are being educated about Indigenous land use principles, Reconciliation, and decolonization, informing and planning practitioners, education programs, and institutes to work in respectful partnership with Indigenous communities and to adopt decolonial principles and practices.

Decolonizing Space & Place Through Relational Pedagogy

Abstract ID: 1844.0.0.804.2025

Track 1: Anti-Racism in Planning

Pre-Organized Paper Presentation

James Miller [University of Auckland] james.miller@auckland.ac.nz, presenting author

This paper explores pedagogical approaches applied in decolonizing planning curriculum to prepare students for effective collaboration between governmental planning agencies and sovereign Indigenous communities. The research examines teaching methods developed within the Tribal and Indigenous Planning specialization at Western Washington University's Urban Planning & Sustainable Development program. The research addresses a critical question: How can planning education meaningfully incorporate Indigenous spatial knowledge while navigating the inherent contradictions of teaching decolonial practices within Western academic institutions?

With Washington State's House Bill 1717 now requiring jurisdictions to work with Tribes in city and regional planning, there is an urgent need to educate planning students and professionals to serve as effective facilitators who prioritize Tribal sovereignty in their professional roles. The pedagogy central to this work is grounded in Land and relations, informed by Indigenous literature from Moananuiākea (Oceania) and Turtle Island (North America). Drawing on theoretical frameworks from scholars such as Tuck and Yang, Goeman, Diaz, Teves, Matunga, Jojola, Fujikane, Refiti, and Connelly, the approach centers Indigenous epistemologies that challenge Western planning paradigms. The research methodology combines reflective practice, curriculum development analysis, and case studies of studio courses conducted in partnership with Tribal communities in Northwest Washington.

Reflections from seven years of pedagogical development across a Canadian and American institution—encompassing experiences as part of an Indigenous cluster hire at a Canadian university and a comparative Indigenous studies hire at WWU—reveal three key insights. First, effective decolonial planning and design education requires modeling ongoing relearning as an Indigenous person trained in Western educational systems, creating authentic learning environments. Second, scaffolded learning experiences that move from analyzing the coloniality of power (Quijano) to engaging with Indigenous placemaking and finally examining just transitions provide a comprehensive framework for students to develop a critical approach necessary for respectful cross-cultural planning. Third, incorporating applied projects with Tribal partners prepares students for the real-world complexities of facilitating planning processes that honor Tribal sovereignty while navigating municipal and state requirements—a challenging process.

The research demonstrates that meaningfully preparing students to bridge between Indigenous and non-Indigenous spaces requires guiding principles centered on respect, reciprocity, and responsibility. Students are taught to honor the process and work as facilitators rather than subject experts. Specific pedagogical interventions, including positionality assignments and decolonial futures projects, indicate the effectiveness of these approaches in developing planners capable of facilitating between urban planning frameworks and Indigenous communities while upholding Tribal sovereignty.

This research contributes to planning scholarship and practice by providing concrete strategies for training planners to implement collaborative processes required for Indigenous placemaking within urban centers and by emerging legislation like House Bill 1717. The findings offer valuable insights for planning educators and professionals seeking to work respectfully and effectively with Indigenous communities while navigating their responsibilities within state, county, and municipal planning contexts.

Track 1 Roundtables

Cross-Racial Solidarity and Urban Planning : A Roundtable Discussion

Abstract ID: 1843.0.0.487.2025

Track 1: Anti-Racism in Planning

Roundtable Submission, Topical Discussions

Biswapriya Sanyal [Department of Urban Studies and Planning (DUSP), MIT] sanyal@mit.edu, organizer

Siddhartha Sen [Morgan State University] siddhartha.sen@morgan.edu

Tonya Nashay Sanders Thach [Morgan State University] tonya.sanders@morgan.edu

Gerard Sandoval [University of Oregon] gsando@uoregon.edu

Shreya Bansal [Department of Urban Studies and Planning, MIT] shreya97@mit.edu

Claire Githinji [Morgan State University] clgit1@morgan.edu

One relatively unexplored area in Planning Education is whether and how two prominent subfields in urban planning—namely: Community Development in North American cities, and International Urban Development in the Global South—can reinforce each other. June Thomas (1996) first lamented this knowledge gap, but did not explore research bridging racial disparity in North American cities and urban colonial legacies in the Global South. Earlier, Sanyal (1989) had advocated a "one-world view" of planning but did not probe how “the local” and “the global” played out in multi-ethnic cities, where flows of international migrants sometimes provoked racial tensions, hindering cross-ethnic solidarity.

To advance solidarity building, the two subfields of planning must identify conceptual as well as historical overlaps between two sets of research, which so far had different intellectual priorities. The proposed round table aims to begin a conversation drawing on a recently initiated collaborative research between Morgan State University, an HBCU with a strong African American student body, and MIT's DUSP, known for its large number of international students. This enquiry seeks to understand existing relationships between African Americans and non-white immigrants and identify possibilities for coalition building.

The joint inquiry began by examining the history of the 1992 riots in Koreatown, Los Angeles, which revealed that North American cities were unprepared for the impacts of international migration, particularly its effect on African American communities. Despite efforts to create social harmony after the riots, they floundered because of a lack of understanding of “differences” between two sets of marginalized groups. These efforts remained superficial, with mutual distrust of the government as the only shared sentiment (Chang, 2002). Thus, what could have provided an opportunity for long-term solidarity building was lost in an immediate urgency to cultivate “social tolerance” and stop the violence.

A second element of the joint inquiry is the role of grassroots and faith-based organizations in advancing racial solidarity. Grassroots Asian American organizations, like Asians4BlackLives and the Committee Against Anti-Asian Violence (CAAAV) challenged structural anti-Blackness in new ways in pursuit of historical truth and racial justice (Kim, 2023). Similarly, the Black Alliance for Just Immigration (BAJI) advocates for racial, social and economic justice for Black immigrant communities. Faith-based organizations, though historically significant in the Civil Rights movement and immigrant advocacy, remain an under examined force in solidarity movements, complicated by their capacity to both unite and divide. Chang (2002) questioned whether churches can effectively encourage social

solidarity building given their inaction after the 1992 riots. Lloyd (2014) emphasized the need to examine how the intersection of race and religion influences contemporary organizing.

Having explored existing literature on cross-racial solidarity, we propose a round table to seek insights from two groups within ACSP, namely POCIG and GEPIG. The purpose is to create a deliberative forum to bring together attendees to identify pathways for ongoing research to build cross-racial solidarity in urban planning. The following set of questions will guide the deliberations:

1. What roles do grassroots solidarity groups and faith-based organizations play in fostering cross-racial solidarity? How do they connect historical injustices with contemporary racial justice movements? Can they unify efforts to address urban issues?
2. What spatial and structural factors shape solidarity between African American and non-white communities? How do struggles over urban issues like land use, displacement, and public space access influence solidarity building?
3. How can practicing planners and academics foster solidarity building among different ethnic groups?

Reparative Planning in the Capital City

Abstract ID: 1843.0.0.531.2025

Track 1: Anti-Racism in Planning

Roundtable Submission, Topical Discussions

Marisa Turesky [Mockingbird Analytics] marisa@mockingbirdanalytics.com, organizer

Rashad Williams [University of Minnesota] raw186@pitt.edu

Alissa Ujie Diamond [State University of New York at Buffalo] ad97@buffalo.edu

Emmanuel Frimpong Boamah [University at Buffalo] efrimpon@buffalo.edu

This roundtable discussion seeks to critically examine the intersection of urban planning, racial capitalism, and reparative justice in the context of today's sociopolitical climate in the United States. As cities confront the impacts of rising fascism, neoliberal agendas that fuel austerity measures, and the unrelenting commodification of space, urban planners and scholars are faced with the reality that rational planning has become a racial capitalist project. The recent era of anti-racist planning brought critical reforms to the field (Jackson et al., 2023; Walker & Derickson, 2023; Walsh, 2018). Yet, with a government that no longer believes in data, urban planning will not survive unless we change its entire structure.

In Williams' (2020) theory on reparative planning, he urges us to "reject paternalistic impulses of entrenched planning traditions which would deny African Americans the right to assert, to the extent possible within planning processes, principles of self-determination and self-development" (8). Instead, we must rethink "the role of African American communities in setting planning goals and enacting planning policies" without dismissing or restricting them "with notions of technical efficiency or incrementalism" (8). The tangible process for how to implement this vision, however, is where Williams leaves off and this roundtable discussion begins.

The aim is not to theorize, but to tangibly mobilize our colleagues to fight for a disciplinary revolution for our communities' liberation. Planning scholars are facing critical questions about the roles we play in perpetuating or dismantling these systems—often at the same time. The panel will explore the blurring of this binary, pushing the boundaries of whether we can lead planning to evolve beyond its historical entanglement with racial capitalism and white supremacy while becoming a transformative force for revolutionary justice. Revolution must move beyond changes in property or production relations, toward a redefinition of planning's values, human relations, political responsibility and power (Boggs et al, 1978). How do we, as planners, develop and clarify an alternative to this ongoing political economy? How do we leverage interstitial politics to chart a new course for planning education and scholarship, one that grapples with the possibilities and contradictions of reparative planning frameworks in the face of fascist politics? This roundtable questions whether reparative planning can be an anchor for a paradigm shift whereby planning shifts from a tool of capitalist oppression to one of radical transformation, even without perfection and without resolving every social problem.

The panelists will explore case studies of grassroots movements for racial and economic justice and municipal reparations projects. Panelists will also ground the discussion in how the legacy of plantation logics have been fundamental to planning's rise as a white supremacist project throughout the rest of the country. Participants will be invited to grapple with reparative possibilities within and against hegemonic planning, sharing insights from their own values, advocacy, and responsibilities.

Urban Climate Justice Planning in the Trump Era

Abstract ID: 1843.0.0.966.2025

Track 1: Anti-Racism in Planning

Roundtable Submission, Topical Discussions

Joan Fitzgerald [Northeastern University] jo.fitzgerald@northeastern.edu, organizer

Linda Shi [Cornell University] lindashi@cornell.edu

Julian Agyeman [Tufts University] julian.agyeman@tufts.edu

Vivek Shandras [Portland State University] vshandras@pdx.edu

For many years, climate equity/justice was not a concern in urban climate action plans—whether focused on mitigation, adaptation, or both. Prompted by public and media attention over the past 10 years to both our climate crisis and our deep structural and historical racial injustices, equity and justice considerations, and even climate justice plans that center these critical issues, are becoming more common. Many authors, such as Bulkeley et al , Shi, L. et al , Meerow et al , Sovacool et al , Westman & Castán Broto and Fitzgerald (2021) have documented this shift.

Combining the climate and environmental justice agendas means that locally elected officials, urban planners, environmental justice organizations, and the private sector must work together to undo harms created by past rounds of policy and planning—what Williams calls reparative planning. Urban planning academics have sought to better understand the struggles, challenges, and opportunities for linking urban planning/planners and bottom-up racial and environmental/climate justice advocacy to create more climate-just cities. While planning in cities is important, what is evident to all is that cities need support from their states and the federal government to achieve many of their equity/justice goals.

For a while that support was forthcoming. Several high-profile deaths of blacks by police culminating in the murder of George Floyd in May 2020 catalyzed a national reckoning on race and brought the Black Lives Matter movement into mainstream consciousness. Then in January 2021 President Biden launched the Justice 40 initiative, which mandated that 40 percent of the benefits from federal investment in areas such as climate change mitigation, clean energy, and sustainable infrastructure go to marginalized communities. In August 2022, the Inflation Reduction Act was passed, which committed to investing about \$370 billion in climate related activities.

We're in a very different country now. Since he was elected, Trump signed an executive order to freeze grant payments already committed under the IRA and then to rescind them. He also revoked the Justice 40 Initiative. Other executive orders eliminate diversity, equity, and inclusion initiatives. This means that the cities wanting to center racial equity and environmental justice in their climate action will be fighting an uphill battle.

In this roundtable, we seek to initiate a discussion on how we can move the climate justice agenda forward in this hostile environment. We explore funding alternatives, maintaining political support, preemption of local action and related concerns and opportunities.

Track 1 Workshops

Is Your Campus Ready? Supporting Faculty During Periods of Targeted Harassment

Abstract ID: 1841.0.0.895.2025

Track 1: Anti-Racism in Planning

Professional Development Workshop Submission

Nina Flores [California State University Long Beach] nina.flores@csulb.edu, organizer

Engaging in anti-racist planning education, research, and practice requires navigating anti-DEI legislation, the effects of Executive Orders, and looming funding threats. In today's fraught climate, it also requires being prepared for an ongoing threat facing faculty: targeted harassment by members of the public related to their teaching, research, or personal identities (AAUP, 2023; Doerfler, et.al., 2021). Urban planning is not immune from these attacks, and colleagues in our field have experienced targeted harassment connected to their work. Targeted harassment is when groups or individuals engage in aggressive and often organized campaigns meant to silence and censor faculty (Ferber, 2018). During periods of harassment, the overwhelming number of emails, online posts and messages, social media comments, phone calls, doxxing (the wide release of personal information such as home address, children's names, and more), stalking, and even threats of rape and death contribute to silencing, self-censorship, and a lack of safety — all of which prohibit faculty and staff from fully engaging in academia, higher education, and with the public. Harassment can also produce open records requests in which members of the public issue formal requests for faculty member emails and more (Polsky, 2019).

As a Fellow with the UC National Center for Free Speech and Civic Engagement I developed a workshop series based on my interviews with faculty members who experienced targeted harassment by the public, including faculty at schools of urban studies and public affairs (Flores, 2021). The interactive workshop proposed here complements an introductory session on the issue initially offered at ACSP Seattle and addresses the vastly different political and educational landscape in which targeted harassment is now occurring. The workshop includes an overview of the issue, draws on research, features first-hand experiences from a planning colleague who navigated severe harassment and agreed to share their story during our time together, and leaves participants with clear ideas about what to include in their safety and support plans. Research shows that there is no one-size-fits-all approach, and we will explore a range of formal and informal ways of supporting colleagues, consider what it means to center the faculty member (versus the institution) during periods of targeted harassment, and discuss strategies for support at department, college, and university campus levels.

Workshop Agenda – 90 minutes:

00:00-00:10 – Welcome and introductions

00:10-00:20 – Overview of targeted harassment (what it is, how it happens)

00:20-00:35 – Key findings from research and first-hand planning scholar experiences

00:35-00:45 – Scenario-Based Small Group Exercise: What if this happened to you?

00:50-00:60 – Individual Activity: Personal Safety and Individual Support Plans

00:60-00:70 – Dialogue: Formal and Informal Support

00:70-00:80 – Dialogue: Support at Department, College, Campus Levels

00:80-00:90 – Committing to Next Steps and Q&A

The goal of this workshop is for participants to learn about the issue, identify best support practices during incidents of targeted harassment, and leave with ideas for their own personal safety and support plans as well as next steps for bringing these strategies to their departments or colleges. Workshop outcomes include:

- Learning about targeted harassment of faculty by members of the public
- Learning about how and why faculty become targets
- Learning about the multiple ways in which targeted harassment affects faculty
- Identify formal and informal sources of support
- Identify support mechanisms on- and off-campus
- Identify support at department, college, and campus levels
- Develop personal safety and individual support plans
- Leave with next steps for bringing strategies to your own campus

What will the audience learn from your workshop: Attendees will learn how to support colleagues who may become targets of harassment by members of the public. We will discuss developing safety and support plans, as well as how to scale support at different levels: individual, department, and campus.

Reminders for attendees: All materials will be provided.

Track 1 Individual Paper Presentations

A 'Decarceral Planning' Spring Break Journey through Upstate New York

Abstract ID: 1844.0.0.1086.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

Courtney Knapp [Pratt Institute Graduate Center for Planning and the Environment] cknapp@pratt.edu, presenting author

Though the term "Abolitionist Planning" emerged in the past decade (UCLA 2020, Kim et al 2025) , the abolitionist political movements against slavery, white supremacy, and carceral modes of spatial and social control in the United States are as old as the country itself (Woods 1998). This paper explores the immersive learning environment of a graduate course focused on Abolitionist and Decarceral Planning, which has been taught at Pratt Institute since 2019. The course introduces students to the historic and contemporary political traditions of abolition democracy, abolition geography, decarceration, and transformative justice, and asks: how have urban and community planning practice (broadly defined) factored into both carceral punishment, and place-based movements for freedom and radical social care? What are the possibilities for a future where abolition democracy is central to planners', policymakers', and designers' work— and what might that reorientation look like in practice?

More specifically, this course explores the following critical questions:

- How have mainstream modes of spatial and social planning reinforced racialized logics of punishment and control?
- How do "insurgent planning" movements, situated outside of, and sometimes in opposition to, government-driven efforts— advance antiracist freedom dreaming, care and social and spatial repair?
- Are there opportunities for planners to support and work in solidarity with, place-based, local, and regional movements toward decarceration, abolition democracy, and transformative racial justice?
- Which land use strategies, housing and economic development strategies, community engagement frameworks, and institutional arrangements advance the practical work of abolition democracy and decarceration in communities, and which inhibit such freedom movements? (Knapp 2020)

This course tackles these questions, and others, unpacking the limitations and possibilities of the 'abolitionist' and 'decarceral' planning frames to advance racial justice in the United States and beyond. During the Spring 2025 semester, the course featured a five day, multimodal trip across New York State, beginning in Brooklyn and ending at the US-Canadian border in Niagara Falls. The trip highlighted the significance of upstate New York to both historical and contemporary abolition democracy movements, spanning from the 18th century to the present day. We visited important spaces of antiracist and anti carceral resistance: historic free Black communities throughout the Hudson Valley, Central, and Western New York, stops along the Underground Railroad, decarceration, harm reduction, and community reentry services, and more. We also witnessed some of the real time carceral and enforcement infrastructure that undergirds the upstate economy— inadvertently finding ourselves in political spaces affected by the Spring 2025 Wildcat corrections officers Strikes, immigration enforcement, and border control.

This paper will draw from personal and student reflections on the course and Spring Break trip to illuminate the lessons for planning educators and practitioners about decarceral planning. Through their participation in the course, students expand their understanding of the profession's role and potential responsibility to consider decarceration, and a reimagined understanding of 'public safety' as community care, as critical planning issues. They apply these frameworks to common planning issues, including housing, economic development, environmental planning, accessibility and mobility planning, placemaking, and preservation, and interpret these frameworks through field trips, in class activities, and creative research/ multimedia storytelling projects.

At the Intersection of Ethno-nationalism and Othering: A Study of Korean-Chinese Ethnic Segregation

Abstract ID: 1844.0.0.341.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

Sujin Yoon [Seoul National University] jadeyoon@snu.ac.kr, presenting author

This study investigates the dynamics of ethno-nationalism and processes of othering through the residential segregation patterns of Korean-Chinese migrants in South Korea. It examines how Chinese nationals of Korean descent experience racialization, marginalization, and spatial segregation within South Korean society. Employing qualitative methodologies, including in-depth interviews, participant observation, and group discussions, the research delves into the everyday processes by which Korean-Chinese migrants navigate their ethnic identity, national belonging, and social integration within the framework of state-led multiculturalism.

Despite strong cultural and linguistic ties to Korea, Korean-Chinese individuals often face discrimination rooted in Sinophobia and negative stereotypes that portray them as foreign or outsider figures. This perception is further exacerbated by geopolitical tensions between South Korea and China, which further intensifies this othering. Although the Korean-Chinese population constitutes a significant portion of long-term foreign residents in South Korea, existing policies emphasize immigration status and residency requirements over social integration. This ethno-nationalist framework significantly shapes Korean-Chinese experiences, often excluding them from full participation in South Korea's social, political, and economic spheres.

Of particular significance is the decline of Daerim-dong, historically the primary ethnic enclave for Korean-Chinese migrants. Through the lens of deterritorialization, we see ethnic community boundaries eroding and spatial and social dynamics transforming. As younger generations increasingly move away from the ethnic enclave, they encounter new forms of reterritorialization—seeking new spaces that offer greater social mobility and integration opportunities. This generational residential segregation reflects changing perceptions of homophily—the preference for associating with similar others—and group discrimination across generations.

Ultimately, this study provides a nuanced analysis of the intersection of ethno-nationalism, othering, and residential segregation in South Korea, revealing how Korean-Chinese migrants negotiate identity, space, and social belonging are negotiated in a society marked by both multiculturalism and exclusionary practices.

Community Land Trust Power Dynamics: Assessing Possibilities in Addressing the Racial Wealth Gap

Abstract ID: 1844.0.0.489.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

Josh Newton [University of California, San Diego] jdnwton@ucsd.edu, presenting author

Austin Harrison [Rhodes College] harrisona@rhodes.edu

Andrew Born [University of Illinois, Chicago] aborn2@uic.edu

Since the New Deal Era, the federal government has incentivized the exchange of housing on the private real estate market through financial regulation and subsidy provision to homebuyers and real estate investors (Immergluck, 2004). As a consequence, federal policy has largely exacerbated the racial wealth gap by reinforcing three inter-related practices in the private housing market: 1) the spatial segregation of racial groups within urban regions; 2) the privileging of White housing submarkets and their consumers; and 3) the expropriation of financial wealth from non-White (especially Black) housing consumers through predatory inclusion in racialized submarkets (Harvey, 1973; Taylor, 2019; Wyly et al, 2006). A growing consensus of scholars recognizes the importance of interrupting these practices and repairing the harm that they have caused (Dantzler & Reynolds, 2020).

In recent years, scholars have recognized community land trusts (CLTs) as a promising alternative to the private real estate market, especially in providing affordable homeownership for racially marginalized housing consumers (DeFilippis et al., 2018; Schneider et al., 2023). However, their capacity for more transformative politics—subverting the broader political economy of racial capitalism and overcoming the hegemony of private property relations—has been undermined by a sole focus on affordable homeownership (DeFilippis et al., 2019). To better understand why CLTs do or do not reach their transformative wealth building potential requires attention to the way changes in local politics undermine community control and how local processes are embedded in complex power structures (Spicer et al., 2024; Dantzler & Reynolds, 2020). While scholarship has paid attention to differences in CLT models through transnational comparison and comparison of individual CLTs of a specific type, little work has delineated and described different CLT approaches and their power implications (Moore & McKee, 2012; Spicer et al., 2024).

To address this gap in the literature, we use John Gaventa's (2006) power cube to perform a comparative power analysis of three CLTs from different urban regions and housing submarkets in the U.S. These cases include Avanzando San Ysidro Community Land Trust in San Diego, California; Community Partners for Affordable Housing in Highland Park, Illinois; and Klondike Community Land Trust in Memphis, Tennessee. We use the power cube to analyze the spaces, levels, and forms that power moves in each local community development system (Nickels, et al. 2024) and create a typology of community control in CLTs.

This study seeks to understand the potential of CLTs—in their own local democratic constructs—to overcome the racial wealth gap, subvert speculative capitalist land markets, and transform societal ideas about property and wealth. Our work pushes academic research to distinguish between levels of community control in CLT design, implementation, and outcomes to understand how CLTs can achieve their transformative wealth building potential. The analysis and resulting typology in this study can also be used as a guide for future CLTs in their pursuit of equity, racial justice, and community empowerment.

Cop City in Wakanda: How Reductive Identity Politics Have Failed Atlanta

Abstract ID: 1844.0.0.146.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

Tyeshia Redden [University of Toronto] tyeshiaredden@gmail.com, presenting author

Known as a “Black Mecca,” the “City in the Forest,” and “Wakanda,” Atlanta, Georgia has been praised for its Black political leadership, dearth of historical significance, and rich cultural production. But in recent years, it has also become a firestorm of civil and human rights discourse regarding the siting and construction of “Cop City,” a \$90 million law enforcement training complex. Protests, sit-ins, and federal domestic terrorism charges have been a part of the unfolding theatre of events pitting city leaders against a myriad of activists and residents. The stakes are high as over 30 other states have plans for their own “cop cities” (some planning multiple facilities) and Atlanta is quickly proving to be a test case for the policing industrial complex both in terms of democratic processes of land use planning and what it reveals about racial urban politics.

Announced in March 2021, Cop City is sited in the Weelaunee Forest, the largest green space in Atlanta across 85 acres of city-owned land. First proposed after more than 50 large-scale protests took place across the U.S. in the wake of George Floyd’s 2020 murder, the facility will be among the largest militarized police facilities in the world and will require clear-cutting of the forest. Cop City will not just be a training site for the Atlanta Police Department, with 40% of its proposed offerings to benefit visiting law enforcement bodies including specialized instruction in repressive tactics to quell protests. Critics of the facility cite concerns regarding the implications to air and water quality, the urban heat effect, and the general safety of residents. The project’s approval process has also been mired in controversy with anti-democratic decision-making and the January 2023 killing of 26-year-old forest defender Manuel “Tortugita” Teran by a task force composed of Atlanta Police, Georgia State Police, and the Georgia Bureau of Investigation.

Through a historical analysis (including a prologue of the end of white mayors and the administrations of Maynard Jackson, Andrew Young, Bill Campbell, and Shirley Franklin), this case study explores recent Black political leadership with a focus on Atlanta Mayors Kasim Reed (2010-2018), Keisha Lance Bottoms (2018-2022), and Andre Dickens (2022-present). Particularly, I am interested in the conflict between identity politics and the “Atlanta Way,” the political strategy that allies white business owners and Black political leaders and is credited with guiding Atlanta’s development process from a southern hub to an international metropolis.

Employing racial capitalism as a theoretical framework, I concur that racial capitalism “produces unique classes, including a Black petite bourgeoisie...” that can simultaneously galvanize Black voters around issues of racial injustice and act as agents of capitalism that reinforce punitive values as a function of their middle class identities (Fortner, 2023, p. 631; Wiggins, 2020). Black political leadership in Atlanta leverages “linked fate,” understanding that the Black electorate’s political preferences are heavily influenced by group-based cues and “...of all the groups, African-Americans stand out—both for the unit with which the [B]lack community votes and for the distinctiveness of the [B]lack vote” (Dawson, 1993; Fortner, 2023; Hajnal & Trounstein, 2014, p. 86). Building on Fortner (2023) and Stone’s (1989) work, I posit Cop City as the physical manifestation of the interracial governing alliance of the “Atlanta Way,” a monument to and faucet of the capitalist police state poised to crush civil unrest in the coming days of protest, rebellion, and riots.

Notes on Abolition in Planning: A Framework for Listening

Abstract ID: 1844.0.0.201.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

AJ Kim [San Diego State University] akim10@sdsu.edu, presenting author

Courtney Knapp [Pratt Institute Graduate Center for Planning and the Environment] cknapp@pratt.edu

Carolina Sarmiento [University of Madison-Wisconsin] carolina.sarmiento@wisc.edu

How can planners support and reinforce abolitionist freedom movements? The case for abolition in planning must confront historic and contemporary white supremacy, colonialism and racial capitalism. Urban planning continues to reify and affirm these genocidal structures and the harm they inflict on BIPOC peoples through practices that uphold systems of policing, and institutionalized “law”. The words of leaders in abolitionist thought, Kaba and Ritchie, can provide a blueprint for practicing planners for whom the incremental is perhaps more doable, but the critical reframe required to move towards abolition in planning is a deeper understanding that the incremental can and must also be transformative, destructive, even.

In her provocative essay, “There is No Room for ‘Planners’ in the Movement for Abolition,” geographer Deshonay Dozier argues that planners’ impulses toward incrementalism inhibit their ability to contribute to abolitionist freedom movements, reminding us that “reformist solutions keep institutions of oppression intact, they do not transform them” (Dozier 2018). Moreover, the planning profession’s entanglements with colonialism, white supremacy, and the state make it, in many ways, antithetical to abolitionist praxis: “abolition is not, nor ever will be, about ‘planners’”. It never has been. Instead, it is about practitioners of freedom dreams that occur outside of planning education and profession. Contributing to these movements and redistributing resources to them is a step in what ‘planners’ can do” (Dozier 2018).

Within Dozier’s critique is a lesson about what planners who care about abolition ought to do: find practical ways to aid grassroots freedom movements, and work to redistribute resources and political power to strengthen and support them. Planners need to be able to see the nuances and dynamics of racialization (Bates et al, 2018), racial buffering (Umemoto, 2000), and racial violence, in order to confront how we ourselves perpetuate and further violence in our own agencies and institutions, in communities, neighborhoods, and cities (Poe, 2022 & White, 2022).

Tracing A Black Feminist Tradition of Grassroots Planning in Urban Peripheries

Abstract ID: 1844.0.0.844.2025

Track 1: Anti-Racism in Planning

Individual Paper Presentation Submission

Hilary Malson [UCLA] hemalson@gmail.com, presenting author

I trace a heretofore unrecognized tradition of grassroots planning: placemaking practices led by Black women, working collectively and guided by an 'otherwise' ontology that diverges from planning's dominant white spatial imaginaries (Bates et al 2018), to build communities where Black people, particularly youth, are cared for. Drawing on my historical and ethnographic research on inland towns in Southern California's urban peripheries, I illuminate a pattern of Black women responding to spatial and social exclusion with a politics of refusal (Carter Jackson 2024). Instead of accepting subordination in suburban areas designed to serve white publics, they collectively organize(d) their communities to build Black towns, desegregate public schools, and dismantle carceral power. I argue that the Black feminist praxis of 'other-mothering,' conceptualized by Patricia Hill Collins (1990) in reference to child welfare being a community's collective responsibility, sustains women's organizing momentum despite obstacles and orients their spatial work towards youth (building parks, creating equitable schools, etc.). In this paper, I draw from Black Studies scholars including Katherine McKittrick (2006) to foreground maroonage, garreting, and plot-making as three spatial strategies of this Black feminist grassroots planning tradition.

This work speaks to urban futures, as Black households increasingly reside in the periphery, rather than the core, of North American metro areas (Lung-Amam 2024). I situate this work within the insurgent planning literature, wherein scholars like James Holston (2019) and Faranak Miraftab (2016) foreground urban peripheries and rural spaces, respectively, as sites of struggle, wherein marginalized people participate in grassroots placemaking and thereby cultivate their political power. I aim to contribute insight into how Black residents shape place in suburban American environments absent of urban social movement hallmarks, such as progressive local governments and non-profits with capacity, and argue that many have done so, and continue to do so, through this overlooked Black feminist grassroots planning tradition. This paper contributes to planning scholarship by building on Fayola Jacobs' important 2018 intervention, in demonstrating how Black feminist thought uniquely and significantly contributes to the grassroots planning literature.

125 Years of Racial Discourse in Urban Studies

Abstract ID: 1842.0.0.746.2025

Track 1: Anti-Racism in Planning

Research-in-Motion Presentation Submission, Research currently in process

Kerry Fang [University of Illinois at Urbana-Champaign] kfang@illinois.edu, presenting author

How has racial discourse evolved in urban studies over the past 125 years? While race has always been an essential element of urban studies (Goetz, Williams, and Damiano, 2020), our understanding of it has come a long way. However, the evolution of racial narrative remains understudied, as research on race is often fragmented across disciplines.

Building on Kwon and Nguyen's (2024) analysis of racial equity and justice in twenty urban planning journals (1980–2019), this study expands the scope to the entire Web of Science database, covering all urban studies literature from 1900 to 2025. Using a series of natural language processing techniques including Word2Vector and large language BERT model, I systematically analyze how the language of race has evolved, mapping its contextual associations with key terms and quantifying shifts in racial discourse across decades.

This study makes three contributions, leveraging the ability of large language models to analyze semantic contexts. First, it traces the contextual shifts in how "race" is discussed, uncovering patterns of emphasis and omission across historical periods. Second, it explicitly quantifies bias and discrimination in urban studies over time and examines how such discourse responds to major social movements, including the civil rights movement, the rise of equity planning, and the aftermath of George Floyd's murder. Third, it identifies disciplinary disparities, showing that natural sciences have been slower to progress in racial discourse than humanities and social sciences.

By mapping these trajectories, this research offers the most comprehensive longitudinal analysis of racial discourse in urban studies to date. In addition, it sheds light on how academic narratives are shaped by broader social transformations.

Race and power in the civic engagement practices of the Choice Neighborhoods Initiative

Abstract ID: 1842.0.0.978.2025

Track 1: Anti-Racism in Planning

Research-in-Motion Presentation Submission, Research currently in process

Madeleine Galvin [University of Pennsylvania] galvinm@upenn.edu, presenting author

DeMarcus Jenkins [University of Pennsylvania] demarcus@upenn.edu

Scholars argue that civic engagement in housing redevelopment initiatives can better address racial injustice when it is informed by historical inequities and guided by resident voices and expertise (Stahl, 2023). However, the potential racial justice benefits of civic engagement are left unrealized when housing redevelopment programs fail to consider the power differentials between stakeholder groups. This paper is a critical policy analysis that uses Critical Race Theory (CRT) to understand how race and power factor into the conceptualization and operationalization of civic engagement in two recent federal housing redevelopment programs.

Launched in 2010, the Choice Neighborhoods Initiative (CNI) is a U.S. Housing and Urban Development (HUD) program to redevelop distressed public housing into mixed-income communities. CNI emerged as the successor to the 1992 Housing Opportunities for People Everywhere VI (HOPE VI) program of public housing redevelopment. However, it expands the previous program to encompass the revitalization of neighborhood assets. HOPE VI has been criticized for its lack of resident empowerment in decision-making processes (Chaskin et al., 2012). As HOPE VI disproportionately demolished public housing projects that housed mostly Black residents (Goetz, 2011), the lack of specific and sustained engagement of public housing residents facing the redevelopment of their communities contributed to exacerbating existing racial and class inequities. To address this, CNI requires continuous residential involvement in the redevelopment process. Yet early research on the impacts of CNI indicate that the program's civic engagement practices frequently fail to significantly incorporate public housing residents' voices and needs, which are often forsaken to prioritize other interest groups (Auerbach et al., 2023; Raciti et al., 2016).

This paper examines how CNI conceptualizes and operationalizes civic engagement. It looks at how civic engagement is understood by program stakeholders through a critical discourse analysis of thirty documents that include HUD planning and implementation Notices of Funding Opportunities, as well as grantee submissions from 2011-2022. Critical discourse analysis situates language as inextricable from social structures. As such, language has an ideological function that (re)creates and normalizes social categories, despite oftentimes functioning in an invisible manner. Since critical discourse analysis does not specifically examine race, we pair it with CRT to interrogate how the language of civic engagement in CNI reflects social understandings about race and power, despite often utilizing race-neutral terms.

We pair this analysis with a systematic review of the literature on civic engagement in the redevelopment process within the context of CNI. This review provides an emerging picture of how civic engagement is being operationalized by program stakeholders. The paper situates this analysis within broader scholarship on civic engagement and mixed-income housing to highlight the continued tension between how civic engagement is conceptualized versus how it is implemented, despite CNI's well-documented commitment to deeper resident engagement compared to previous federal housing redevelopment initiatives. The findings suggest that when civic engagement is conceptualized in race-neutral terms, it fails to encompass the contextually specific ways in which low-income communities of color engage in programs that substantially impact their housing and neighborhoods. The frameworks of CRT and critical discourse analysis indicate the need to continuously question and challenge deep-rooted power differentials embedded in planning discourse that contribute to the reproduction of race and

class-based inequities in the process of neighborhood redevelopment. These findings build upon research calling for the prioritization of community knowledge and leadership in redevelopment initiatives.

Rescue or removal? The Entangled Logics of FEMA, ICE, and Undocumented Exclusion

Abstract ID: 1842.0.0.859.2025

Track 1: Anti-Racism in Planning

Research-in-Motion Presentation Submission, Research currently in process

Carlo Chunga Pizarro [University of California at Irvine] cchungap@uci.edu, presenting author

This presentation examines how U.S. immigration enforcement and disaster management systems have become structurally intertwined, creating compounded risks for undocumented immigrants in times of crisis. Since the post-9/11 reorganization that placed FEMA and ICE under the Department of Homeland Security, the boundary between disaster response and immigration enforcement has blurred. This entanglement has reshaped emergency management into a tool that, in many cases, enforces exclusion rather than support—especially for undocumented communities.

This study traces key federal policy shifts from 2000 to the present. These include the denial of aid to undocumented survivors after Hurricane Katrina, the expansion of deportation programs like Secure Communities under the Obama administration, the reallocation of FEMA funds to ICE detention during the Trump era, and the exclusion of undocumented individuals from federal pandemic relief. These turning points demonstrate how the dual logic of national security and disaster management reinforce each other to marginalize already vulnerable populations.

Rather than treating undocumented immigrants as stakeholders in need of protection, federal disaster policy increasingly positions them as threats to be surveilled, policed, or ignored. This paper argues that immigration status has become a silent filter in federal disaster aid programs, shaping who receives support and who is excluded. It also identifies how sanctuary policies have emerged in some cities and counties as local attempts to resist this convergence—seeking to create safer conditions for immigrant communities during emergencies.

This presentation draws from the first chapter of my dissertation. It contributes to planning scholarship by highlighting the role of bureaucratic institutions in producing racialized vulnerability and calling attention to the urgent need to separate disaster response from immigration enforcement. As climate-related disasters grow more frequent and severe, so too does the necessity of ensuring that all residents—regardless of status—can safely access disaster preparedness and recovery systems. The study lays the groundwork for new frameworks in disaster planning that center on justice, belonging, and the lived experiences of undocumented immigrants.

Transformation in planning? A case study of the Fleet Block in Salt Lake City

Abstract ID: 1842.0.0.776.2025

Track 1: Anti-Racism in Planning

Research-in-Motion Presentation Submission, Research currently in process

Jessica Reimer [University of Utah] jessica.reimer@utah.edu, presenting author

Planning theorists have long posited that planning can be a site of transformation for communities (e.g., Sandercock, 1998). Transformation can mean different things in different contexts, but broadly speaking, transformation in planning can be considered a reflection of what planning practitioners reference as creating communities that are equitable, sustainable, participatory, and just (AICP Code of Ethics and Professional Conduct, n.d.). In the past few decades, and particularly in recent years, planning scholars have introduced several approaches to planning that can help to enable these goals of practice, from therapeutic planning (Erfan, 2017), to planning for healing (Knapp et al., 2022), to anti-racist planning (Jackson et al., 2023), to name a few. While aspirational, it remains unclear if and how planning practitioners are integrating these approaches into their practice and how their use affects resulting outcomes.

To explore the use of these approaches in planning practice, I developed a case study examining an occurrence of what could be described as transformational planning. In Salt Lake City following the Black Lives Matter protests of 2020, several murals of Black individuals killed by police, locally and nationally, were painted on abandoned, city-owned buildings by an anonymous art collective. These murals quickly became a site of remembrance and advocacy against police brutality. However, in 2023, the city announced redevelopment plans for the land on which the buildings resided, which included tearing down the murals and creating a new space that preserved their legacy. In March 2025, the murals came down with little fanfare, and with the consent of the families of the individuals depicted.

In this case study, I used document review, media coverage, and interviews with city planners and stakeholders to understand the history of the site, the significance of the murals, and how the city got to a place with community members to tear down the murals while preserving the legacy of what they represented. Salt Lake City began meeting with families in 2021, knowing that redevelopment plans were slated for the property and that the murals had become an important cultural site for healing. What did this process look like? What actions did planners and other city officials engage in with the families and community members? How does this process reflect transformational planning approaches? I aim to answer these questions to shed light on what transformation-in-practice may look like, understand the use of contemporary transformational planning approaches, and highlight lessons for practitioners.

White Governing: A new framework for understanding left-behindness

Abstract ID: 1842.0.0.910.2025

Track 1: Anti-Racism in Planning

Research-in-Motion Presentation Submission, Research currently in process

Emma Walters [University of Illinois Urbana Champaign] emmalw4@illinois.edu, presenting author

Scholars have started to categorize shrinking or declining places as “left-behind places”, a term that envelops social, health, environmental, political, and governance-based understandings of places along with the traditional economic and political economy analysis of uneven development (Pike et al). Under this construct, left-behind places are no longer just the spatial selections of economic change, but a complex interrelation of multi-scalar social, political, and cultural dimensions which require interdisciplinary analysis and a range of policy and practice responses. Outcomes of decline expand to not only include economic, social, and spatial disadvantage, but emotional and psychological outcomes like disempowerment, discontent, and embitterment (Hannemann et al., 2023; Tierney et al., 2023). While left-behindness is an important framework for the analysis of shrinking or declining places and regions, its current construction lacks a proper racial lens which is critical when describing or theorizing how communities are produced or manufactured in the United States. The centering of race in left-behindness is especially critical, and particularly so in Rust Belt shrinking places and neighborhoods whose trajectories are inextricably linked to racial differences and racism (Dantzler, 2021; Dantzler & Reynolds, 2020; Gibbons, 2016; Hackworth, 2019). In the US the urban process produces and reproduces certain social relations and hierarchies related to capital and which are defined by not just location or space but defined by racial relations (Dantzler, 2021; Gibbons, 2016) and, specifically, the normalization of white advantage (Goetz et al., 2020).

Understanding the role of whiteness, specifically, in the manufacturing of left-behind places becomes essential. In recent years, scholars have pointed to incorporating a critical whiteness lens in research on urban planning and urban transformation to better understand how whiteness, and specifically the flight of white affluence, impacts urban processes (Goetz et al., 2020; Williams, 2024). Although race and racial segregation and inequality are widely acknowledged in urban planning and urban studies fields, they have not sufficiently incorporated a critical whiteness lens to center and theorize the role of white advantage and supremacy in urban transformations and governance. By shifting the focus of scholarship and policy to whiteness, we flip the script. Instead of making the problem of race one that singularly focuses on the concerns of people of color, it makes visible the ways that whiteness as advantage and privilege have become systematized and institutionalized systems of racial injustice and subjugation (Goetz et al., 2020).

In this paper I expand the framework of left-behindness to include racial capitalism, emphasizing critical whiteness, to better understand how racism differentiates the process and outcomes of left-behindness and the relationships between people and property in left-behind places. Informed by Cedric Robinson’s (2000) description of the racialization of capital, Prentiss Dantzler’s (2021) framework for racial capitalism, and the field’s recent call for an analytical emphasis on whiteness (Goetz et al, 2020), I blend left-behindness, governmentality and whiteness to understand the outcomes of neighborhood change through a case study in Decatur, IL. I find that left-behind places are not just the outcome of state centered policy making informed by spatially selective economic change, but also an outcome of entangled and multi-scaled systems of racial subjugation that I call “white governing”. Together, these forces result in continuous cycles of disciplined decline and dispossession that are governed by a myriad of agents and informed by both capital and racial domination.

Track 2 – Community Development

Track 2 Pre-Organized Session Summaries and Abstracts for the Sessions

Planning & Public Schools: Opportunities and Challenges

Abstract ID: 1840.0.0.365.2025

Track 2: Community Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.142.2025, 1844.0.0.156.2025, 1844.0.0.267.2025, 1844.0.0.296.2025, 1844.0.0.150.2025

Jason Reece [Ohio State University] reece.35@osu.edu, organizer

Public school systems are a critical component of infrastructure, and essential for youth and community development. Schools serve as important community assets, supporting not only youth development but also neighborhood well-being and economic growth. Public schools, which rely heavily on property taxes, are directly impacted by economic development and housing policies. This pre-organized session explores the opportunities that arise when city planning and public education systems are aligned, and the challenges that emerge from their misalignment. The session includes an analysis of both the historical legacy of redlining and contemporary economic development policies on school funding. Additionally, it documents the role of planning in repurposing former public-school facilities and examines the potential for collaboration between community development and public education systems.

Learning Objectives:

- Understanding the role of planning in the repurposing of former public school facilities.
- Exploring the potential opportunities of aligning youth development, schools and community development practices.
- Documenting the impact of planning and economic development policies on school funding.

Schools for Sale: Disinvestment, Dispossession, and School Building Reuse in Philadelphia

Abstract ID: 1844.0.0.142.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Ariel Bierbaum [University of Maryland] bierbaum@umd.edu, presenting author

Using Philadelphia as a site, this paper delves into reuse of school buildings closed a decade ago to understand how different forms of reuse or vacancy simultaneously reflect and shape the racialized dynamics of neighborhoods in which they are embedded and larger urban transformations. We show that the slow violence of disinvestment and dispossession wrought on Black communities through school closures does not end when buildings are shuttered.

The paper draws from a larger book project (forthcoming 2026, University of Chicago Press) based on nine years of ethnographic fieldwork across three closed school communities, spatial analysis of the city's conditions over time, and photographic documentation of three sites of vacancy and demolition. These multiple analytical modes provide a layered account of the localized impacts brought by regimes of contemporary urban governance organized by racialized logics of austerity, market-based competition, and retraction of public goods. The paper concludes with a typology for the spectrum of school reuses. Based on a theory of "reparative planning" (Williams, 2020), it offers considerations to ensure that those most harmed by closures—Black communities—are central to processes of imagining new possible futures for these buildings.

The analysis is grounded in interdisciplinary scholarship from urban studies, education, planning, and geography to explain how race, capital, and place interact to influence the trajectory of closed schools and surrounding neighborhoods. It is also grounded in a collective awareness and humility about how the authors' layered identities as White women, mothers, and scholars shape the contours of this inherently partial contribution.

While there are patterns around reuse and vacancy, what happens after closure is highly situated and contextual, shaped by long histories of racialized disinvestment and dispossession that manifest at the neighborhood level. Understanding what happens to these schools post-closure is also understanding processes that hinge on racial capitalism, or how "racial hierarchies serve as a basis for historical valuations of people and places" (Dantzler, 2021, p. 115). These processes are not new or unique to school closure but rather mirror the anti-Blackness of capital that has historically constructed new spaces, new imaginations, and new definitions of consumers, often under the veil of "public interest," to the detriment of Black communities in the United States (Bledsoe & Wright, 2019; Vale, 2013).

What is new is how contemporary decisions about school closure and building disposition implicate public education—a lauded public good—in these destructive processes. School buildings are transformed from public assets into privatized financial assets when they are sold and redeveloped. What happens to closed schools is a refraction of the private real estate market, shaped by racialized capital flows that dispossess and displace Black communities from the places and institutions that they have created over time. As districts turn again to school closures, this analysis highlights the links between place, race, and education amidst broader urban transformations, a necessary understanding for advocates, planners, educators, politicians, and scholars as they reconceptualize the meaning of the public realm.

Unequal Histories, Unequal Schools: Redlining's Legacy in Chicago School Funding

Abstract ID: 1844.0.0.156.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Ji Hyun "Nadia" Kim [University of Illinois Urbana-Champaign] nadiak2@illinois.edu, presenting author

In the 1930s, the Home Owners' Loan Corporation (HOLC) systematically labeled certain urban areas "hazardous" for mortgage lending, a classification that limited credit access and prevented residents from accessing the primary means of property-based wealth accumulation. Despite the formal abolishment of these redlining policies decades ago, several studies suggest these discriminatory practices continue to shape neighborhood well-being and educational outcomes (Aaronson et al., 2021; Fishback et al., 2020; Lukes & Cleveland 2021). Further expanding these findings, this study posits that they have produced self-reinforcing cycles of disinvestment, a phenomenon explained by path dependency (Pierson, 2000), in which historically redlined neighborhoods remain fiscally constrained. Because public education in the United States is predominantly financed through local property taxes, suppressed property values often translate into underfunded schools. Thus, understanding how spatial disparities in school funding linger becomes a critical concern for planners, policymakers, and community stakeholders.

Drawing on Chicago, Illinois as a case, this research employs panel matching methodologies to systematically compare formerly redlined and non-redlined neighborhoods under the HOLC maps. By spatially overlaying digitized redlining boundaries on current data from the Illinois Report Card from the Illinois State Board of Education, the analysis isolates the legacy effects of redlining on property values, tax capacities, and per-pupil spending. Consistent with prior findings on redlining's broader impacts (Rothstein, 2017), early results indicate that neighborhoods previously flagged as "hazardous" continue to grapple with lower property tax revenue and reduced school resources—even when controlling for contemporary demographic factors. These disparities both reflect and reinforce the social and economic distance between redlined and non-redlined communities, demonstrating how an early, pivotal choice can set the stage for persistent structural consequences, a hallmark of path dependency theory (Pierson, 2000).

In linking urban planning scholarship to education finance, this study illuminates how historical housing policies still dictate the fiscal landscapes of local governance. Rather than interpreting these inequities as merely a matter of uneven tax bases, the path dependency framework reveals how one discriminatory policy choice from nearly a century ago can become deeply embedded in institutional and financial structures. As a result, short-term policy fixes, whether modest adjustments to funding formulas or incremental property tax relief, often fail to challenge the deeper structural forces perpetuating inequity. On the other hand, interventions such as statewide redistribution measures, targeted tax relief, or holistic planning reforms may offer more durable solutions but require political will and sustained attention to dismantle the underlying institutional biases. Ultimately, by applying path dependency concepts to the case of redlining, this study contributes a clearer understanding of why legacies of urban segregation and discrimination do not simply fade away but continue to shape the quality of public schooling. In doing so, it provides a roadmap for planners and policymakers who seek to address deeply rooted spatial injustice, pointing toward comprehensive, equity-driven reforms that challenge the structural scaffolding underpinning contemporary school finance systems.

Input and/or Output Legitimacy: Industrial Development Agencies and School Board Representation

Abstract ID: 1844.0.0.267.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Elizabeth Marcello [Hunter College] elizabeth.marcello@hunter.cuny.edu, presenting author

Christine Wen [University of Calgary] christopheles.w@gmail.com

Mildred Warner [Cornell University] mew15@cornell.edu

New York State Industrial Development Agencies (IDAs) are local public authorities tasked with promoting economic development. These controversial entities are governed by unelected, appointed boards that have substantial legal authority to make decisions that impact the ability of local governments to collect taxes that in turn provide basic services. For instance, IDA boards can abate or divert property tax revenues that would otherwise go to fund public schools. IDA boards can do so without the consent of school boards. In 2021, New York State public schools lost at least \$1.8 billion in revenue to tax abatements granted by IDAs (Wen and LeRoy, 2023). Importantly, these abatements are not evenly distributed across student populations; districts with higher percentages of historically disadvantaged races abate more per-pupil (Wen et al., 2025).

For over a decade, budget watchdogs and other advocates have been calling for greater scrutiny of IDA activities, critiquing their practices for encouraging a so-called “race to the bottom,” and pointing out the perverse incentives of IDA governing boards. The calls for IDA reform have been especially vocal since 2021. One piece of legislation, in particular, would require that IDA boards include a school board member. This bill passed in both the Assembly and the Senate in 2024 but was vetoed by Governor Hochul.

Despite energetic calls for changes to the structure and legal authority of IDA boards, there is little concrete evidence that any of the proposed reforms, including the one above, would actually have a substantial impact on IDA activities. Accordingly, this paper asks: How does the presence of school board members on IDA boards affect the abatement of taxes intended to fund public schools?

While there are not similar agencies in other states that legally require school board representation with which to compare, some IDA boards in New York State do have school board representation. This research will document which IDAs have school board representation and examine IDA activities during the period a school board member was on the IDA board. Did projects during that period abate fewer school district taxes?

Planners have long been concerned with the legitimacy of planning institutions and practices, especially as “weakly institutionalized” structures have proliferated (Taylor, 2019, 217). Some scholars focus on the outputs governing processes to judge legitimacy, while others focus on inputs, such as the representativeness or democratic election of representatives (Scharpf, 1999). When applied in a planning context, the question becomes to what extent inputs actually produce outputs that are in line with the norms of democratic planning. This paper probes the relationship between input and output legitimacy of planning institutions by treating IDA board members as “inputs” and the various subsidy deals they broker as “outputs.”

Evaluating the Impact of Business Incentives on School Fiscal Health: A Quasi-Experimental Approach

Abstract ID: 1844.0.0.296.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Christine Wen [University of Calgary] christopheles.w@gmail.com, presenting author

This paper examines the impact of Louisiana's four major economic development tax incentive programs on the fiscal health of its school boards using the staggered difference-in-difference (DID) model on a 10-year panel from 2010 to 2019. Given the prolific use of similar revenue diversion mechanics throughout the U.S. and potential harm/abuse associated with the practice, there needs to be clearer understanding of their distributive effects. Few states publish project-level data with adequate details for the kind of analysis required to achieve this clarity as proposed in this abstract—the main reason that existing research falls short on drawing definitive conclusions.

Operating on the generous assumption that projects would not have occurred in the absence of incentives (and reserving this important probabilistic estimation for future studies), I focus here solely on the causal relationship between subsidized development and educational funding. In any year most of the ~70 parish school boards are subject to active tax exemption agreements that vary in count and magnitude. Each year that follows sees some of the old projects ending and new ones starting. As such, the traditional DID model using binary to indicate treatment vs. control is replaced by a generalized version based on continuous treatment intensity or “dosage” of multiple concurrent treatments (either by project or NAICS group) while retaining other design structures that account for parallel (fiscal) trends and (treatment) timing variations—hence “staggered”. The goal is to isolate the marginal effect of one unit increase in treatment intensity across districts and years.

Pending extensive data processing and model building, here are the basic parameters, preliminary summaries, and anticipated workflows based on the dominant program that accounts for 85% of the ~15,000 projects approved to date. Under this program, exemptions in the 10-year period from 2010 to 2019 totaled \$8.4 billion with a 16% overall increase after adjusting for inflation. Three-quarters of the projects get renewed for five more years after the initial five. The individual school board's portion of foregone revenue can be estimated using its 2019 tax abatement financial disclosures (which—to give an idea—added up to \$270 million in the one year). Treatment intensity is measured as cost to a school district relative to its revenue capacity. The null hypothesis is that tax exemptions do not affect school fiscal health and funding adequacy, with a 2-year lag between predictors and outcomes, controlling for aggregate project performance (new jobs created weighed by wage) as well as school district conditions and trends from public school census surveys.

In addition to board-approved projects, Louisiana also publishes advance notifications of incentive applications currently undergoing review for all four programs (2,150 at the moment). Intermediary results from the above analysis at the project level can be used for forecasting the fiscal impact. The findings can also more broadly inform financially sustainable economic development planning in U.S.

MBK: Post-Pandemic Community Development Strategies to Support Schools and Youth

Abstract ID: 1844.0.0.150.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Jason Reece [Ohio State University] reece.35@osu.edu, presenting author

Misalignment and lack of collaboration between schools and community development efforts can impede youth development. School segregation, tax and funding inequities, disinvestment, and school closures undermine both youth and community development (Bierbaum, 2018; Wen, Marcello & Warner, 2025). Despite these inherent challenges, schools and community development practitioners can support each other to foster youth and neighborhood development (Warner, Reece & Zhang, 2024). The need for greater collaboration between these fields is necessitated by ongoing challenges to youth from the pandemic. While learning loss from the pandemic is a national trend, lower-resourced school districts were more likely to experience greater learning loss and slower remediation among their students. Social isolation also contributed to increased mental health and socialization challenges for youth (Reece, 2024).

Emergent collaborative school and community development efforts have attempted to address the challenges to youth development stemming from the pandemic. This case study documents the design and impact of the My Brothers Keeper Village youth development program in Columbus, OH. The collective impact-based program is led by the City of Columbus's Department of Neighborhoods, in collaboration with dozens of nonprofit and educational organizations. Informed by the Obama Foundation's national "My Brothers Keeper Alliance," the program supports a variety of youth empowerment activities, with the goal of improving high school graduation rates. Specifically, intensive summer programming activities aim to align youth employment opportunities with community service in multiple high-need neighborhoods in the city. Youth service providers offer supportive out-of-school "third places" that youth consider safe and nurturing environments. These activities build the confidence of youth, exposing them to transformative experiences and providing extensive mentoring support. Programming to support youth wellness and emotional well-being is integrated into the effort to improve mental health, emotional regulation, and resilience among youth participants.

The case triangulates interview, focus group, and outcome data developed from a two-year evaluation of the program. The case study analysis explores how programming and resources were directly targeted to supplement learning loss and address youth development barriers that emerged in the aftermath of the pandemic. The case demonstrates the potential of aligning schools and community development initiatives to improve both youth and neighborhood outcomes. The case concludes with a reflection on the potential opportunities and limitations of replicating this model in other community settings.

Weaving Pluriversal Dialogues in Community-Engagement: Fostering Care and Coproduction in Planning

Abstract ID: 1840.0.0.963.2025

Track 2: Community Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.344.2025, 1844.0.0.633.2025, 1844.0.0.540.2025, 1844.0.0.650.2025, 1844.0.0.783.2025

Magdalena Novoa [University of Illinois Urbana Champaign] mnovoa@illinois.edu, organizer

This session draws on community-engaged research focusing on scholars that adopt facilitative rather than expert roles, investing in the coproduction of human experiences, life and caring relationships exceeding conventional planning outcomes. Drawing from feminist, decolonial, abolitionist perspectives, and diverse geographies, this session pushes the traditional boundaries of community-based planning to address the challenges of planning pluriversal futures in complex and contested settings while serving communities' needs. Presenters examine how pressing planning issues necessitate learning from the ground up, centering local context, history, diverse temporalities, ways of knowing and situated approaches to problem-solving. The session aligns with Ortiz's (2023) call that in turbulent times, planning needs to recalibrate its disciplinary framing, grounding our reflections and actions in political significance and solidarity with those mobilizing for radical social change.

Learning Objectives:

- To identify ways in which planning can become a tool to repair existing colonial and oppressive legacies.
- To learn strategies and methods of community-engaged research from a pluriversal perspective
- To identify the dilemmas, limitations, and possibilities of community-engaged planning research.

Co-Producing Socially Just Ecological Infrastructure: Urban Wetland Stewardship in Dhaka

Abstract ID: 1844.0.0.344.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Efadul Huq [Smith College] ehuq@smith.edu, presenting author

Mohammad Azaz [River and Delta Research Center] ezazbd@gmail.com

Bridget Ronning [Hampshire College] bbr22@hampshire.edu

As cities across the global South face intersecting crises of biodiversity collapse, climate precarity, and deepening environmental injustice, ecological infrastructure has emerged as a key terrain for intervention (Pauleit et al., 2021). Yet dominant models of ecological infrastructure are often deployed through technocratic, top-down planning frameworks that erase already existing, place-based relationships between urban nature and marginalized communities. In Dhaka, Bangladesh—where wetland ecosystems are rapidly disappearing due to speculative real estate expansion—such erasures have led to the dispossession of informal settlement dwellers who have long engaged in everyday forms of wetland stewardship. These communities are framed not as environmental stewards but as encroachers, making way for elite imaginaries of ‘green’ urbanism. This paper calls for reimagining ecological infrastructure through a co-productive, justice-centered framework building on the concept of Socially Just Ecological Infrastructure (SJEI) (Huq, 2024). Drawing on critical urban theory, feminist and pluriversal scholarship (Vasudevan & Novoa, 2022), we argue that SJEI must be co-produced with the very communities whose ecological knowledge and labor are routinely rendered invisible. Co-production in this context is not merely a procedural gesture but a deeply political and epistemic practice that recognizes the entanglement of human and more-than-human worlds, while confronting the coloniality embedded in dominant planning paradigms.

Based on an ongoing research-to-action collaboration with a collective of informal wetland stewards in Dhaka who are resisting state eviction and envisioning alternative futures for their neighborhood, this paper identifies three interlinked practices through which SJEI can be co-produced in contested Southern urbanisms: (1) Respectful noticing of informal human-nature entanglements and the care work that sustains them; (2) Centering the voices and epistemologies of informal settlement dwellers in research, storytelling, and advocacy around urban environmental futures; and (3) Catalyzing state actors to recognize, legitimize, and co-create novel ecologies with communities, rather than displacing them in the name of ecological restoration.

We show that co-production itself must be produced—it is fragile, contingent, and often relies on insurgent practices that must be nurtured through sustained relationality, trust-building, and collective refusal of extractive knowledge paradigms. The politics of care and co-production, in this case, emerge not from formal participatory mechanisms, but from situated solidarities built through shared struggle, land-based knowledge, and collective endurability. By developing a nuanced account of urban wetland stewardship in Dhaka, this paper contributes to broader conversations on planning for pluriversal futures.

Stitching Memories as Situated Methods in Planning: Coproducing Knowledge with Chilean Arpilleras

Abstract ID: 1844.0.0.633.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Magdalena Novoa [University of Illinois Urbana Champaign] mnovoa@illinois.edu, presenting author

Over the last decades, planning scholars have increasingly grown aware of the importance of understanding experiential and embodied ways of knowing that extend traditional practices of knowledge production. Scholars and practitioners have experimented with participatory methods to depart from positivist and rational planning approaches and to embrace affective perspectives on place that can emerge through creative practices (Allmendinger & Tewdwr-Jones, 2005). Narratives, stories and storytelling have become critical for participatory creative practices in planning, examining planning's rational tendency and its harmful impact on marginalized communities while helping them to envision universal futures (Ortiz, 2022). Pluriversal planning scholars have utilized storytelling as valuable tools to decolonize planning by dismantling historical colonial power structures that shape how we think about land, people and knowledge production (Vasudevan & Novoa, 2023).

In this context, Arts-Based Participatory Planning (ABPP) has become a powerful tool to unveil and validate planning knowledges often not captured by conventional methodologies from the North. ABPP integrates artistic methods and creative expression to engage communities in decision-making, emphasizing collaboration and inclusivity to make planning accessible and meaningful to diverse audiences. However, while arts-based approaches have proven useful to complement conventional understandings of planning focusing on social connectedness and emotions, they pose several methodological challenges (Carpenter and Horvath, 2022). One critical question is how to overcome the power imbalances inherent within the planning system that often become replicated through ABPP. This paper reflects on the critical project of decolonizing planning methods through ABPP to contest dominant narratives in planning. I draw on a coproduce workshop using the local textile craft of arpillera urbana with women in the coal basin in southern Chile to create counter-narratives of the urban history of their cities from a female perspective and influence preservation policy. Despite women having a crucial role in producing social and political life in the coal region's past, they are rarely considered in scholarship and remain invisible from official preservation and planning narratives. The result of the arpillera workshop, a sixteen-foot-long textile entitled *Memorias de la Mujer Lotina* [Memories of the Lotina Woman], suggests that the arpillera urbana emerged as what I refer to as "situated methods" that challenge the limitations of conventional research and the power imbalances of ABPP. With its focus on experiential knowledge, the arpillera, as a situated method in planning, directs attention to and recognizes a broad range of knowledge that exists beyond the experts and authorities, its traditional scientific methods, and the dominant patriarchal culture. It accommodates what Watson (2006) defines as 'deep difference,' encouraging planning scholars and practitioners to seek alternatives to dominant methodologies for understanding urban issues. *Memorias de una Mujer Lotina* suggests that research grounded on communities' cultural practices produces situated responses to complex urban histories that shape present dynamics. It fosters memory, creativity, and coexistence, promotes diversity, and coproduction in planning. *Memorias de una Mujer Lotina* highlights three main contributions for advancing situated methods in planning research and practice: 1) It helps to identify the silences in urban history that planning and preservation processes have perpetuated 2) Foregrounds care and encourages 'horizontal knowledge coproduction' with languages that are accessible to multiple audiences, 3) fosters political action and legitimizes alternative rationalities in planning based on communities' ways of being and knowing.

Re-Imagining the Whole Pie: People's Budgets and Community Based Research

Abstract ID: 1844.0.0.540.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Carolina Sarmiento [University of Madison-Wisconsin] carolina.sarmiento@wisc.edu, presenting author

Genesis Liriano-Terrero [UW Madison] gliriano@wisc.edu

This paper examines a community-based research project conducted in collaboration with Freedom, Inc. (FI), a Black and Southeast Asian non-profit organization in Madison, Wisconsin, that works with low- to no-income communities of color. FI is at the forefront of the Movement for Black Lives and has led a grassroots initiative to reshape the City of Madison's budget. These efforts align with participatory budgeting processes seen globally, raising important questions about participatory democracy. However, a key distinction between the literature on participatory budgeting and the contemporary movements for people's budgets is that current efforts are not state-driven, nor are they limited to a specific portion of the budget.

This paper examines these contemporary bottom-up efforts to redirect investments under new discourses that challenge dominant narratives surrounding safety and austerity. These efforts are part of national movements advocating for people's budgets, which focus on issues of community control and reinvestment at various scales. By combining community-based research with community-based learning courses, this research brought together students and community organizations to build community power while enhancing research capacity. The community-based research design for this paper incorporated several data collection methods, including online surveys, focus groups, community forums, and in-depth interviews, as well as both qualitative and quantitative analyses.

The paper presents the findings of Madison's People's Budget, situating it within the broader historical movement to challenge the dominant frames around safety and the transformation of how reinvestment in safety should prioritize the needs of those most affected by violence, poverty, racism, and discrimination. It also discusses the potential of community-based research, highlighting the challenges posed to positivist research approaches. The paper further explores how planners can use community-based research as a strategy to engage and invest in underrepresented communities, not only for budgetary decisions but also for broader planning processes. Investment in educating community members about budgets is essential for participatory and people's budgeting and is also often lacking in existing municipal budget processes.

Finally, the paper concludes by reflecting on the implications of this national movement for people's budgets. It provides an opportunity to (re)imagine reinvestment and community control in both the community and the classroom.

Un/learning to Rebuild: Abolitionist Pedagogy and Institutional Transformation for Community Engaged Planning

Abstract ID: 1844.0.0.650.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Atyeh Ashtari [University of Washington-Tacoma] atyeh.ashtari@gmail.com, presenting author

How do we learn from, partner with, and support abolitionist freedom movements and collectives in our pedagogical spaces while transforming our institutions from within? This paper reflects on a year-long experience of co-teaching an urban affairs doctoral core course with a local abolitionist coalition concerned with uplifting people's definition of safety by shifting power and resources from punitive measures and violent policing to community-led solutions in Memphis. Building on the recent studies on abolition in planning, this paper explores how the "framework for listening" by Kim, Knapp, and Sarmiento (2025) works in a community-engaged pedagogical setting.

Our participatory project for this class challenged the idea that more policing automatically leads to safer communities. Instead, we explored alternative approaches that address safety concerns without relying on punishment and incarceration-especially in communities that have historically faced over-policing and criminalization. We examined potential alternatives and transformative practices to improve public safety in Memphis by reducing reliance on traditional policing and investing in community-led solutions. Together, we negotiated our roles and defined the scope and goals of our year-long collaboration. Throughout the course, the abolitionist collective trained students to conduct deep canvassing, which involved in-depth conversations with community members to understand their concerns, priorities, and experiences with policing and public safety. Through deep canvassing and data analysis, we gathered insights into how people in Memphis perceive safety and what changes they believe would be most effective. Moreover, in addition to our final report, we used the result of our extensive literature review and content analysis to create a public-facing library of alternatives to policing tailored to the context and realities of Memphis.

Although this class was not designed specifically as an abolition planning course, partnering with an abolitionist collective fostered a growing consciousness about the colonial and carceral history of planning. This awareness was further reaffirmed by the fact that about 40% of Memphis's city budget is devoted to policing and punitive measures. Drawing on pluriversal planning scholarship (Vasudevan & Novoa 2022), we confronted the colonial and carceral history and present reality of our city through centering the counter-narratives and lived experiences of the marginalized communities most affected by police violence; and learning from the situated knowledges, collective acts of resistance, reimagination and rebuilding on the ground by the actors at the center of these abolitionist movements. Grounding our class in a Black feminist abolitionist perspective from the start, we learned and unlearned with Mariame Kaba and Andrea Ritchie (2022), who laid out an incremental blueprint for abolition in planning to move away from carceral measures and policing and instead invest in community resources to achieve greater safety.

Using this class as a case study, this paper delineates six aspects of a transformative pedagogical experience informed by critical feminist, pluriversal, and abolitionist perspectives: (1) Adopting more facilitative roles as educators; (2) redistributing and extending the resources of academia to the forefronts of abolitionist movements; (3) learning from and mirroring the horizontal structure of abolitionist collectives in pedagogical spaces and structures to encourage collective work and accountability that is essential to liberatory frameworks; (4) centering care and occupying pedagogical spaces as whole human beings with affective relations and lived experiences; (5) blurring the imposed borders between academia and communities by fostering inviting and open classroom

settings; and (6) emphasizing accessible outcomes through acknowledging various forms of knowledge and knowledge co-production.

Community Peer Review: Re-Imagining Foundational Roles of Community in Disaster Research Processes

Abstract ID: 1844.0.0.783.2025

Track 2: Community Development

Pre-Organized Paper Presentation

Danielle Rivera [University of California Berkeley] dzrivera@berkeley.edu, presenting author

Participatory processes often presuppose a specific role for community-based knowledge as subservient to “expert” knowledge, downplaying the importance of community agency. This becomes most apparent through participatory research processes disallowing community members from opposing the core premises of projects. “Damage-centered” research, in these situations, is most egregious, as communities have little recourse to fight narratives of their supposed brokenness (Tuck, 2009). Tuck instead advocates for desire-based approaches which advocate for researchers to more deeply engage theories of change in our processes, asking: “What can research really do to improve this situation?” (Tuck, 2009, p. 423). As disaster scholars, this question figures prominently in our post-disaster research. To reflect and codevelop notions of change, we follow Liboiron, et al’s (2018) community peer review research approach, which asserts a community’s right to identify and define, for themselves, when research is helpful or harmful (2018, p. 2). Liboiron, et al emphasize two core aspects of community peer review: (1) consent to participate that extends well beyond the IRB and (2) the full rights of communities to refuse research/researchers. This, in fact, returns back to the original intention behind participatory research (Fals-Borda & Rahman, 1991; Freire, 1970).

Through analyses of post-flood recovery in the Pájaro Valley region of California between 2022 and 2025, our team developed several forms of “community peer review” (Liboiron et al., 2018), extending its use into planning research and practice. In particular, we merged common insights of coproduction of research questions and data collection, with new reflections on how communities ought to maintain agency on reporting out and back on research findings. As such, the paper covers four “phases” of this research: (1) establishing strong community relationships, (2) community involvement in research question development; (3) community guidance in data collection, and (4) community review of data and “next steps.” We find that with the demands of being in an active flood response and recovery situation, Pájaro Valley community representatives and residents clearly communicated a desire to be involved in some phases more than others—the trust built with the community allowed residents to feel connected to the project without posing excessive burdens on already limited time and resources. From this, the paper concludes with suggestions for formalizing and expanding these approaches for future planning research and practice.

Track 2 Roundtables

Leveraging University Innovation to Advance Community-Identified Sustainable Development Projects

Abstract ID: 1843.0.0.698.2025

Track 2: Community Development

Roundtable Submission, Topical Discussions

Ada Inman [EPIC-N] ada@epicn.org, organizer

Stina Kielsmeier-Cook [University of Minnesota] kiel0054@umn.edu

Gavin Luter [EPIC-N] gavin@epicn.org

Maria Dahmus [University of St. Thomas] medahmus@stthomas.edu

The Educational Partnerships for Innovation in Communities - Network (EPIC-N) is an international network of some 100 university- or community-based programs using the “EPIC Model” of university-community collaboration to advance progress on the UN SDGs. Started by planning faculty at US universities, EPIC-N has grown to include universities in the US, Africa, Asia, and Latin America and the Caribbean. The community-driven EPIC Model matches declared community needs for documentation, design, or research to courses of study at universities, with expert faculty/instructors in those courses giving students course credit for working to meet those needs. More than 2200 specific projects in more than 400 politically and demographically diverse communities—all advancing one or several SDGs—have been completed so far.

In this session, Ada Inman, EPIC-N Program Manager; Gavin Luter, EPIC-N Managing Director; Maria Dahmus, Director of the Office of Sustainability Initiatives and Adjunct Faculty at the University of St. Thomas; and Stina Kielsmeier Cook, Program Coordinator at the University of Minnesota, will introduce the EPIC Model, share best practices, discuss challenges, and provide pathways for researchers to get involved in these projects. The session will focus on the outcomes of EPIC Model projects, specifically highlighting the impacts on communities, faculty, and students. Following this presentation, speakers will interactively showcase the EPIC Model at work through select member programs.

During this session, participants will gain a deeper understanding of the EPIC Model, strategies for adapting the EPIC Model to their own university or community context, and resources for doing so. Desired outcomes include a deeper understanding of the EPIC Model, brainstorming on how to integrate the EPIC Model into universities worldwide, ideas for innovative collaborations between universities and communities, and forming connections with other universities and potential partner orgs to further collaborations. Success of the workshop will be evaluated by the amount of connections made and new ideas for university/community collaborations.

The Changing Landscape of Tribal and Indigenous Housing

Abstract ID: 1843.0.0.760.2025

Track 2: Community Development

Roundtable Submission, Topical Discussions

Meghan Holtan [SUNY University at Buffalo] mtholtan@buffalo.edu, organizer

James Miller [Western Washington University] mille630@wwu.edu

Daniel B. Abramson [University of Washington Department of Urban Design and Planning] abramson@uw.edu

Margo Hill-Ferguson [Eastern Washington University] mhill86@ewu.edu

This panel brings together four planning scholars working at the intersection of housing, climate adaptation and Indigenous self-determination. The panel begins with a framing by planning legal scholar Margo Hill, JD who will share the history that shapes the complex land tenure issues that shape housing on and off reservations. Then the panelists will reflect on the following questions:

- In what ways did housing that was developed over the 20th century increase Tribal communities' vulnerability to climate hazards such as flooding, wildfires, extreme heat, and coastal erosion?
- How have historical and current Western governance structures, policies, and regulatory frameworks shaped historical housing development and conditions on Native Tribal lands?
- How do Indigenous values and knowledge capacities mitigate and adapt to the impacts of climate change?
- What planning processes and methods support Indigenous self-determination related to housing in a changing climate?

The panelists bring applied experience from work with coastal tribes in Washington, Hawai'i, and Alaska. Audience members are encouraged to bring their stories and questions to the discussion.

Track 2 Individual Paper Presentations

A Statewide Spatial Analysis of Community Gardens and Agricultural Sites

Abstract ID: 1844.0.0.182.2025

Track 2: Community Development

Individual Paper Presentation Submission

Vivianna Goh [University of California, Irvine] vmgoh@uci.edu, presenting author

Douglas Houston [University of California, Irvine] houston@uci.edu

Karna Wong [HUD/UCI] karna.wong@uci.edu

Community Gardens and Agricultural Sites (CGAs) can support local food systems, enhance ecological services, and strengthen social connections and mental health, especially for vulnerable communities grappling with the impacts of climate change. Few studies have examined the distribution of CGAs within historically marginalized communities, and limited information is available regarding CGA practices and design. We addressed this gap by conducting a survey and geospatial analysis of CGAs throughout California. This research was funded by California Climate Investments (CCI), which invests the State of California's Cap-and-Trade auction proceeds to reduce greenhouse gas emissions and serve disadvantaged and low-income communities.

From October 2024 to February 2025, we conducted a survey both online via email and in-person via physical flyers. A total of 109 respondents completed the survey and provided a baseline understanding of CGAs including information on the size, location, organizational structure, food production, growing techniques, programming, and community engagement. Our findings were derived from triangulation of survey results, spatial analysis, field observations, and informal interviews. We found that gardens and farms served diverse populations, including disadvantaged communities, Native American Tribes, people with disabilities, rural and urban areas, seniors and youth, schools and universities, and unhoused community members. Similar to research on gardens and social capital, our survey respondents emphasized how CGAs were a space for making friends, transferring intergenerational knowledge, and exchanging different cultures. They also reported benefits described by previous research, such as neighborhood beautification and improved mental health.

A total of 93 surveyed CGA locations were mapped. Seventeen percent were located in tracts designated as a Disadvantaged Community (DAC) by CalEnviroScreen 4.0 and an additional 3% were located in a DAC within tribal land. In addition, 14% of surveyed CGAs were located in areas within a half mile of a DAC-designated tract. Just under two-thirds of CGAs (62%) were located within low-income communities. Furthermore, this research analyzed the distribution of 534 CGAs within selected California counties relative to disadvantaged and low-income communities as defined by the CCI Priority Populations map. Of the 534 CGAs mapped in California, 29% were located in a DAC area and 60% were located in a low-income community.

This research also aligns with scholarly evidence that community gardens often support food security and increase access to fruits and vegetables, which can result in reduced disease-risk. Most respondents reported that their CGA allowed them to improve their diet and save money on food costs. The majority of respondents reduced their number of trips for grocery store shopping. CGAs promoted environmental sustainability in a variety of methods. Most CGAs practiced organic gardening without the use of pesticides. They also supported biodiversity by selecting native plants and creating a habitat for pollinators, such as bees, butterflies, and birds. CGAs also restored the soil and sequestered carbon through regenerative agriculture practices.

Although CGAs provide an abundance of benefits, they could use additional support in several areas. Over half of respondents described protecting plants from pests and disease as challenges for their CGA. Another key finding was that CGAs operated on low budgets, which illustrated the need for funding to sustain these sites. The benefits of CGAs were multifaceted and nuanced. This research's survey and spatial analysis is a first step towards understanding and quantifying the participant's perspectives of how the CGAs affect them personally, their community, and the environment. Our study helps planners and policy makers better understand the impacts of CGAs on health, the environment, and social disparities.

A Study on the Vitality of Historic Urban Areas from an Individual Perception Perspective

Abstract ID: 1844.0.0.885.2025

Track 2: Community Development

Individual Paper Presentation Submission

Xiaoyan Fei [Southeast University, School of Architecture] xiaoyan.fei323@outlook.com, presenting author

Xiaosu Ma [Southeast University, School of Architecture] maxs@seu.edu.cn

In Chinese cities like Nanjing, historic cultural districts are often situated adjacent to high-density residential areas. In recent years, the influence of social media platforms has significantly increased tourist traffic to these districts. While the economic benefits from tourism have contributed to their development, this has also led to over-commercialization, heightening conflicts between tourists and local residents over the use of public space. As a result, residents' quality of life has declined, and the risk of displacement among native populations has grown. Thus, quantitatively characterizing and analyzing these issues is crucial for guiding informed decision-making in urban renewal strategies.

Existing research on public spaces has predominantly examined the relationship between the environmental attributes of physical spaces and urban vitality. In contrast, this study applies the Stimulus-Organism-Response (S-O-R) theory from environmental psychology to develop an integrated research framework. The framework combines stated-preference (SP) questionnaires with a SEM-Logit model, refining the "environment-perception-behavior" chain to offer a more comprehensive approach to understanding public space dynamics. For the empirical analysis, Laomendong, a popular historic district in Nanjing driven by social media, and its adjacent residential areas were selected as the case study. The study involved the collection of audiovisual data from 127 public spaces, representing a range of space types. Meanwhile, 460 SP questionnaires were distributed. Respondents were required to provide their socioeconomic background information and evaluate various scenarios across multiple dimensions. Additionally, they were asked to make binary choices between two scenes. Building on this foundation, the SEM approach was employed to quantify the intangible factors influencing public space activities, including visual, auditory, and cultural atmosphere perceptions. Subsequently, a Logit model was applied to establish the relationship between these influencing factors and public space activity preferences.

The model results reveal distinct differences in public space environmental preferences between tourists and residents. Specifically, tourists prioritize visual experiences and the cultural atmosphere, valuing elements such as architectural authenticity. In contrast, residents demonstrate greater sensitivity to soundscape quality and the overall condition of public spaces. These divergent preferences highlight the need for a more diversified approach to urban renewal strategies. Furthermore, traffic congestion and noise pollution caused by commercial activities in the historic cultural districts have negatively impacted surrounding residents. This issue likely stems from the spillover effects of tourism-driven commercial development and the spatial constraints of public spaces.

Building on relevant case studies, this research underscores that while urban renewal strategies driven by the "Instagrammable" effect can enhance district vitality in the short term, an excessively homogenized development model may lead to population decline and urban hollowing-out in the long term. Consequently, the sustainability of urban vitality faces substantial risks. Moreover, as the surrounding residential areas experience an aging population, residents act as key custodians of historical and cultural heritage. Their displacement could further diminish intangible authenticity, including traditional lifestyles and distinctive cultural practices. In this context, local governments are confronted with the challenge of maintaining the population scale in these areas and optimizing demographic structure. Therefore, addressing multi-objective urban renewal scenarios necessitates the

integration of spatial characteristics, vitality features, potential demographic structure, and demand preferences to develop context-specific renewal strategies.

Addressing Climate Gentrification in a Small-Mid-Sized Multi-Risk City

Abstract ID: 1844.0.0.1107.2025

Track 2: Community Development

Individual Paper Presentation Submission

Galia Shokry [Kean University] gshokry@kean.edu, presenting author

Urban greening and climate resilience initiatives are often implicated as drivers of gentrification due to prioritizing sustainability goals without adequately addressing affordable housing and community stability. Despite efforts by environmental organizations and agencies to promote inclusivity, these initiatives frequently remain tied to urban economic growth agendas, which have been linked to gentrification and the displacement of vulnerable residents to areas of higher climate risk (Anguelovski et al., 2023; Pearsall, 2020; Shokry et al., 2020). While existing scholarship focuses on housing affordability strategies as a primary remedy to green climate gentrification (Matteucci et al., 2024), it largely overlooks the potential role of other social infrastructure—community-based organizations, care facilities, and social services—in mitigating these pressures (Shokry, 2021; Best & Jouzzi, 2022). Furthermore, most studies of climate resilience and gentrification dynamics have concentrated on large cities like New York, Chicago, Los Angeles, and Miami (Quinton et al., 2022), leaving smaller cities within their metro regions critically understudied despite their unique dynamics and challenges.

This study addresses two interrelated research questions. First, to what extent do climate resilience initiatives reshape vulnerability and displacement risk in smaller, minority-majority cities? Second, how do networks of social infrastructure shape community capacity to resist displacement and adapt equitably to climate change? Together, these questions examine both the structural drivers of climate gentrification and the locally grounded mechanisms of resilience that may mitigate its effects. By integrating these threads, the research captures both the macro-level planning dynamics and the micro-level institutional responses that characterize adaptation in under-resourced urban contexts.

We employ a mixed-methods approach that integrates spatial analysis with community-engaged qualitative research in Elizabeth, NJ. GIS mapping of green resilience initiatives, social infrastructure, and gentrification indicators provides spatial insights into how climate investments intersect with neighborhood change. Throughout the spatial analysis we conduct community-engaged research with a broad network of stakeholders—including social service providers, nonprofit organizations, educators, and mutual aid groups—many of whom serve predominantly low-income and immigrant communities of color. This collaborative approach centers the expertise of those embedded in the city's social fabric and prioritizes knowledge exchange and relationship-building throughout the research process.

Preliminary insights suggest that in small- to mid-sized cities like Elizabeth, where formal adaptation planning capacity is often limited, networks of social infrastructure may serve as critical, though often underrecognized, foundations of climate resilience. Community-based organizations have expressed a growing interest in serving not only as service providers but also as more active participants in climate communication, displacement mitigation, and adaptation planning. We hypothesize that this process may catalyze stronger relationships among organizations and support their evolving role in shaping equitable climate adaptation responses.

This study contributes to planning scholarship by expanding the analytical lens on climate gentrification to go beyond housing as a means for preventing displacement, and by highlighting smaller cities as key sites for understanding climate equity. It offers insights for planners and policymakers on embedding justice into climate resilience initiatives. For planning education and practice, it reinforces the importance of inclusive, community-centered methodologies and cross-sector partnerships in advancing just climate resilience.

Aging in place: Community Design Strategies for Aging Rural Minnesota

Abstract ID: 1844.0.0.569.2025

Track 2: Community Development

Individual Paper Presentation Submission

Guobin Pan [University of Minnesota Twin Cities] pan00294@umn.edu, presenting author

Sungduck Lee [University of Minnesota Twin Cities] sungduck@umn.edu

According to the U.S. Census Bureau, the population of individuals aged 65 and over increased by 33% from 2006 to 2016, reaching 49.2 million in the U.S. This number is projected to nearly double to 98 million by 2060. Unlike urban communities with targeted facilities for the aging population (e.g., senior assisted living and nursing homes), most rural communities are dependent on neighboring major cities for these resources. Aging in place is an alternative option that helps the rural aging population remain in their places without relocation. Current practices for aging in place primarily focus on design and policy interventions tailored to individual home modification. However, there is a lack of understanding of how physical and social characteristics of rural neighborhoods challenge aging in place practices at a community level. This research explores environmental and socioeconomic characteristics at a neighborhood level and investigates an inclusive, incremental, and community-driven approach that helps identify localized solutions towards building healthy aging communities.

The main objective of this project is to provide rural community policymakers and rural development agencies with a rigorous, empirical understanding of the relationship between environmental/ socioeconomic characteristics and aging in place practices at a neighborhood level. The neighborhood-level strategies for aging in place – including convenient access to medical facilities, grocery stores, community centers, and independent housing options – play a crucial role that supporting independence and social participation, and significantly contributing to older adults' quality of life.

This project explores localized community design strategies by answering the following two research questions: 1) How might we measure and assess physical dimensions that support aging in place for older adults in rural communities? and 2) How might we build aging communities that cater older adults' social needs in rural communities? The research utilizes factor analysis to examine the dimensional structure of these environmental and socioeconomic variables. Additionally, cluster analysis is employed to create a typology based on the spatial patterns of physical and social indicators. The results reveal distinct classifications that visually showcase an opportunity-based framework and highlight both the existing and potential strengths of aging communities in rural Minnesota.

Assessing Affordability and Equity in Northern California TODs: A Typology-Based Spatial Analysis

Abstract ID: 1844.0.0.124.2025

Track 2: Community Development

Individual Paper Presentation Submission

Stephanie Nemet [San Jose State University] stephanie.nemet@gmail.com, presenting author

Ahoura Zandiatashbar [San Jose State University] ahoura.zandiatashbar@sjsu.edu

Transit-oriented development (TOD) is a globally recognized urban planning strategy integrating public transportation with high-density, mixed-use developments to foster walkable, accessible, and sustainable communities. While TODs offer numerous economic, environmental, and social benefits, a persistent challenge is housing affordability, as these desirable areas often experience rising property values and displacement pressures. Despite growing concerns over housing affordability, there remains a lack of a standardized, transparent methodology for quantifying and categorizing TODs based on their affordability and accessibility, which is crucial for planners, policymakers, and researchers aiming to create more equitable transit-integrated communities.

This study develops a TOD typology based on built environment characteristics, incorporating density, diversity, design, and the broader 5D framework within High-Quality Transit Areas (HQTAs) as well as Principal Component Analysis methodology. By systematically analyzing these variables, the study categorizes transit-served areas into three distinct types: TOD, Transit-Adjacent Development (TAD), and Hybrid Zones. TODs are defined as high-density, walkable neighborhoods seamlessly integrated with transit, reducing car dependency and promoting multimodal accessibility. In contrast, TADs are developments near transit infrastructure but lack strong connectivity, often leading to continued reliance on automobiles. Hybrid zones represent a transitional category that blends characteristics of both TOD and TAD, incorporating some transit-supportive elements while maintaining gaps in multimodal access, density, or land-use diversity.

Beyond categorization, this typology serves as a foundation for spatial investigation of the intersection of transit access, affordability, and equity, particularly concerning vulnerable populations. By analyzing socio-demographic factors such as income, race, educational attainment, vehicle ownership, and affordable housing availability, this study identifies spatial patterns that reveal disparities in access to equitable TOD environments. Methodologically, the study employs spatial multi-criteria analysis (SMCA) and hot spot analysis to assess the distribution of affordability and vulnerability variables across the TOD typology. The findings will contribute to the limited body of literature on affordability within transit-oriented developments, offering insights for future planning strategies that balance transit integration with social equity.

Assessing the Impact of University-Led Neighborhood Revitalization Using Difference-in-Differences

Abstract ID: 1844.0.0.1126.2025

Track 2: Community Development

Individual Paper Presentation Submission

Seungbin Park [The Ohio State University] park.2897@osu.edu, presenting author

University-led neighborhood revitalization initiatives have become an increasingly common strategy for community development, aiming to improve the physical and social environments of urban neighborhoods. However, whether these efforts drive meaningful neighborhood change has remained challenging. While qualitative case studies have examined the impacts of university efforts in neighborhood revitalization, only a dearth of research quantitatively measured their effects on neighborhood change.

In this presentation, I address this gap by employing a difference-in-differences (DID) approach to examine the impacts of university-led revitalization efforts on the demographics, economic conditions, and housing characteristics of focus neighborhoods. The DID method provides a robust framework to assess the outcomes of these initiatives and allows for causal inference under specific conditions. Using data from the American Community Survey, which includes demographic, economic, and economic indicators, I investigate variables that align with the program goals of two case initiatives: the Partners Achieving Community Transformation led by The Ohio State University and the University Northside Partnership led by the University of Minnesota Twin Cities.

The findings show the variations in the extent to which neighborhood characteristics change. There is a notable change in demographic indicators right after the implementation of programs, exemplified by the decline in the proportion of Black populations. On the other hand, changes in economic indicators, such as the unemployment rate or the proportion of populations in poverty, are lagged. Housing indicators show less consistent changes. These mixed results highlight the varied impacts of university-led neighborhood revitalization across different dimensions of neighborhood change.

Reflecting on these changes, I raise a follow-up question: do these changes benefit incumbent residents or imply gentrification? Using origin-destination data of households in the case neighborhoods, this part of the research explores changes in household mobility patterns before and after implementing the case initiative programs. I propose that if more lower-income households migrate out of the neighborhoods and higher-income households come in, this signals gentrification. This approach allows for a more nuanced understanding of university efforts for neighborhood revitalization.

By combining the two quantitative analyses, this research has implications. First, I make a caution about universities' place-based engagement and its unintended consequences—gentrification. Conceptually, scholars call for a mix of place-based and people-centered approaches in community development. However, achieving all the goals in the real world may be a fantasy, at least in the short term. Second, the possible uneven impacts of these neighborhood revitalization initiatives highlight the importance of designing interventions. Universities and other nonprofit organizations in community development need to consider how to mitigate the risk of displacement while fostering social and economic benefits. Understanding the diverse patterns of outcomes of these initiatives can inform best practices for future university-community partnerships.

Beyond Distributional Equity: How Do NGOs Advance the Urban Green Space Justice in Beijing

Abstract ID: 1844.0.0.331.2025

Track 2: Community Development

Individual Paper Presentation Submission

Luquan Liang [Faculty of Architecture, Building and Planning, The University of Melbourne]

luquanl@student.unimelb.edu.au, presenting author

Jennifer Day [Faculty of Architecture, Building and Planning, The University of Melbourne] jday@unimelb.edu.au

Sun Sheng Han [Faculty of Architecture, Building and Planning, The University of Melbourne]

sshan@unimelb.edu.au

This paper describes the tactics open-space activists in China use to advance NGOs' agendas in the hierarchical Chinese planning system. Specifically, it focuses on how they shift ideas of equity away from distributional equity towards procedural equity and equity of values. Urban green spaces (UGS) play a vital role in providing ecosystem services and offering social benefits. Cities are encouraging the public use of UGS as part of their sustainability strategies. While the equitable distribution and accessibility of UGS have been widely studied, less attention has been paid to how justice is embedded in the urban greening processes (Nesbitt, Meitner, Sheppard, & Girling, 2018), including who participates in decision-making and whose values and knowledge are recognized (Pike, Nesbitt, Conway, Day, & Konijnendijk, 2024).

Environmental NGOs are activists in urban greening efforts. Their involvement offers an opportunity to assess how justice is negotiated during the planning, development, and management of UGS. By promoting public awareness, NGOs help broaden inclusion and recognition in UGS governance (Rigolon & Gibson, 2021). In China's authoritarian planning context, while NGOs are increasingly welcomed for their technical expertise and contributions to national environmental goals, they also face close regulatory oversight and limited institutional autonomy (Liang & Han, 2025).

Most existing research on UGS justice adopts a top-down perspective, focusing on state-led policy outcomes and distributive equity (Pellerey & Giezen, 2024; Pike et al., 2024). However, the experiences, strategies, and influence of NGOs remain insufficiently examined. Little is known about how NGOs address justice and how their actions reshape power dynamics and advance UGS justice. To address these gaps, this study investigates how NGOs contribute to UGS justice in Beijing. Specifically, it asks:

- 1) Which dimensions of UGS justice do Chinese NGOs focus on?
- 2) What roles do NGOs play in promoting UGS justice?
- 3) How have NGOs shifted the focus of UGS planning from distribution to inclusion?

This research draws on qualitative case studies of NGO involvement in UGS projects in Beijing. NGOs were selected through purposive and snowball sampling, including both registered NGOs such as Friends of Nature and grassroots NGOs such as Let Birds Fly. These NGOs aim to integrate their values into planning outcomes. Fieldwork was conducted between March and July 2023. Data collection included 26 in-depth interviews with NGO leaders, members, and volunteers, and 16 in-depth interviews with key stakeholders (planners, local officials, park managers, scholars, and citizens). These were complemented by participant observations of NGO-led activities such as environmental education, birdwatching, and policy meetings. Further, content analysis of NGO posts on digital platforms was used to enrich the data.

Findings reveal that NGOs contribute to UGS justice from three aspects. From the distributional aspect, NGOs in Beijing reshape the meaning of UGS justice by downplaying the distributional equity. They argue that the city already has an oversupply of homogeneous parks. From a recognitional perspective, they successfully insert local values into planning by framing parks as habitats rather than purely recreational spaces. Through long-term technical engagement, ecological surveys, and narrative framing, NGOs negotiate with government actors to gain tacit recognition of their expertise, even if their influence is not publicly acknowledged. From a procedural angle, NGOs create informal participatory spaces by building trust with planners and governments, networking with peer organizations, and organizing citizen-involved environmental activities. It opens new channels for bottom-up input. This study contributes to UGS justice scholarship by offering new insights into how NGOs navigate state control to act as justice-oriented intermediaries in UGS governance.

Bridging Theory and Lived Experience: Gentrification and Displacement in Pilsen, Chicago

Abstract ID: 1844.0.0.1150.2025

Track 2: Community Development

Individual Paper Presentation Submission

Chaeun Jun [University of Illinois at Chicago] chaeun.jun@gmail.com, presenting author

While existing literature extensively discusses gentrification and displacement, my fieldwork in Pilsen, Chicago, reveals some differences between existing perspectives and residents' lived experiences. Existing studies primarily examine conflicts between longstanding residents and newcomers (Betancur 2002 and 2011; Hyra 2006 and 2015) or longstanding residents' feelings of loss due to displacement pressure (Chernoff 1980; Atkinson 2015; Valli 2016). However, my interviews with nearly 100 residents considering data saturation show that perspectives on gentrification vary widely. Regardless of their length of residency, residential status, or the degree of gentrification occurring in their neighborhood, residents have various perceptions. Notably, they may also share similar sentiments, meaning that it is not possible to categorize their perceptions based solely on their residency status. These findings highlight the need to bridge the gap between academic discourse and lived realities.

This study is ethnographic field research including informal conversational interviews in Pilsen, a historically Hispanic neighborhood undergoing gentrification for 40 years, to investigate how individuals perceive gentrification and the extent to which academic theories align with their lived experiences. Findings suggest that residents' perspectives on gentrification are more variable than conventional notions of gentrification and displacement pressure. By employing thematic analysis, this study found eight different perceptions: Gentrification Advocates, Pragmatic Residents, Gentrification Skeptics, Unaffected People, Exit-seeking Residents, Community Keepers, Gentrification-aware Newcomers, and Alienated Legacy Residents. Furthermore, displacement pressure is experienced not only by longstanding tenants but also by building owners, homeowners, and even newcomers in distinct ways.

Also, this study attempted to consider the fundamental assumption for data saturation—appropriate measurement. Although Guest, et al. (2006) suggest that data saturation may be achieved within the first 12 interviews and Francis et al. (2010) suggests setting 10 interviews as a primary sample with a stopping criterion of 3, this study reveals that this may not be appropriate for gentrification studies. Within the first 20 interviews, only five different perceptions on gentrification were identified, and the sixth appeared approximately within 50, the seventh within 70, and the eighth at the end of data collection. Also, a new type of displacement pressure among building owners due to developers first mentioned approximately the 70th interviewee, while other types were identified within the first 30 interviews. Also, as gentrification is a sensitive topic, interviewees may not openly provide their perspectives, raising concerns about social desirability bias, which could be addressed by an interviewer's stance. Therefore, the saturation points of studies on sensitive topics should be carefully determined.

This study highlights the need to approach gentrification and displacement pressure with a comprehensive and nuanced understanding of residents' perspectives, as residents may share selective narratives about their neighborhood. This study also emphasizes the importance of interviewers maintaining neutrality on gentrification to encourage interviewees to share their perspectives openly, rather than framing gentrification solely as a tension between longstanding residents and newcomers. Investigators should recognize the complexity and intersectionality of gentrification, as affected neighborhoods may have distinct historical, social, political, and cultural contexts. Adopting this broader perspective can contribute to a more nuanced understanding of the consequences of gentrification and support policymakers in making informed decisions that address the needs of gentrifying communities.

Competing for the Community: Ethnic Suburban Settlements and Gentrification in Urban Chinatowns

Abstract ID: 1844.0.0.128.2025

Track 2: Community Development

Individual Paper Presentation Submission

Laureen Hom [San Jose State University] laureen.hom@sjsu.edu, presenting author

Urban Chinatowns have become contested spaces of gentrification across North America and have had various repercussions for different segments of the Asian American community. Working-class Asian American immigrants rely on Chinatown for affordable housing, jobs within the ethnic network, and culturally appropriate social services, the neighborhood is an important site preserving Asian American culture and history, and, for relatively affluent Asian Americans, a place of economic investment. These various meanings and purposes of Chinatown have implications for community development efforts that are responding to these gentrification pressures.

For this presentation, I will present excerpts from my book, *The Power of Chinatown: Searching for Spatial Justice in Los Angeles* (Hom, 2024), which is an ethnographic case study of community politics and gentrification in Los Angeles Chinatown. Specifically, I will highlight how the growth of ethnic suburban settlements and small cities in San Gabriel Valley, which includes Monterey Park, dubbed the “Beverly Hills for Chinese Americans” in the 1980s, shaped the process of gentrification in the historic urban Chinatown in Los Angeles as the smaller cities in San Gabriel Valley became an aspirational symbol and the new residential and economic center for Chinese and Asian Americans. Given these regional and community trends, Chinatown was thus starting to lose its value for Chinese and Asian Americans as a residential space, which has contributed to tensions about ongoing development in the neighborhood and for whom it should center.

I argue that in response to the growth of the Chinese American presence in San Gabriel Valley, Chinatown community leaders have asserted two conflicting identities of Chinatown. The first as a low-income immigrant neighborhood and the second as a downtown adjacent neighborhood appealing to upwardly mobile young professionals. While the former perspective is asserted to resist gentrification and the latter is to encourage gentrification, they both ultimately highlight how Chinatown is often in competition with San Gabriel Valley as community leaders use both to distinguish Chinatown from the San Gabriel Valley that warrants specific types of resources for the neighborhood. This competition shapes community development efforts and tenant rights activism in Chinatown, as there is increasing pressure to develop more market-rate housing to attract both relatively affluent individuals, regardless if they identify as Asian American, to live, work, and spend in Chinatown as a way to “sustain” Chinatown. In the presentation, I will discuss the implications of this competition as to how Chinatown’s core identity as an ethnic space and center for the community continues to evolve, but is also a contested process that reflects intra-ethnic community differences along class, generational, and immigrant cohort lines.

Contested Culture in the Barrio: Gentrification, Representation, and Activism in Boyle Heights

Abstract ID: 1844.0.0.882.2025

Track 2: Community Development

Individual Paper Presentation Submission

Ashley Hernandez [UNC Chapel Hill] ashleych@unc.edu, presenting author

This paper analyzes how cultural regeneration both drives and resists gentrification in Boyle Heights, a working-class Latinx neighborhood in Los Angeles. Since the early 2000s, local officials and private actors have aimed to rebrand the barrio into a cultural destination by drawing on its established Chicanx and Latinx art scene. Efforts to create an official Arts District along First Street illustrate “marketable ethnicity,” which repackages cultural symbols to legitimize “inclusive” development. Through this process, redevelopment is reframed in a racialized context, emphasizing certain aspects of neighborhood culture to attract outside capital. Yet, culture here is more than a promotional device. It is a critical arena where organizations fight displacement and defend local identity.

Drawing on newspaper articles, interviews, and digital artifacts, this study tracks the evolution of gentrification in Boyle Heights and two contrasting responses that took shape in the 2010s. First, a coalition of progressive nonprofits adopts a reformist path that merges affordable housing production, policy advocacy, and cautious collaboration within formal political structures. For these groups, gentrification is contradictory but potentially manageable. Recognizing the structural inequities of market-led change, they push for community benefits, tenant protections, and equitable development, hoping to keep Boyle Heights’ culture alive, preserve livelihoods, and secure needed resources.

Opposing them is a militant coalition of grassroots and mutual-aid groups who reject all engagement with elites or market-friendly strategies. Characterizing gentrification as an inherently violent project of racial capitalism, they condemn cultural regeneration as complicit in displacing immigrant families. Targeting art galleries and civic art initiatives, they charge that public and philanthropic support for “cultural revitalization” conceals speculation and rent hikes. Through disruptive direct actions, they challenge those seen as fostering commodification, reasserting culture as collective survival rather than a market product.

These diverging tactics underscore tensions in a barrio where culture sparks both pride and speculation. While nonprofit coalitions negotiate to alleviate displacement, radical activists see such engagement as endorsing a system that dismisses poor and undocumented residents. Boyle Heights thus reveals a broader struggle in barrios - How do communities secure resources and visibility without deepening systemic inequalities? Ultimately, this paper argues that cultural politics underlie both gentrification and its resistance, illuminating how redevelopment can promise economic renewal yet fuel sharp conflicts over who truly belongs.

Defiende a Cabo Rojo: Insurgent Planning and Territorial Struggles in Puerto Rico's Southwest

Abstract ID: 1844.0.0.207.2025

Track 2: Community Development

Individual Paper Presentation Submission

Ariam Torres-Cordero [University of Puerto Rico, Rio Piedras] ariam.torres1@upr.edu, presenting author

This research explores the insurgent planning practices and place-based meanings developed by grassroots movements in opposition to Proyecto Esencia, a proposed mega tourism and residential development in an ecologically sensitive coastal zone of Cabo Rojo, Puerto Rico. It documents and analyzes how community members, activists, environmental advocates, and allied academics and professionals have organized to challenge a project that threatens not only coastal ecosystems and public access to natural resources, but also the socio-spatial fabric and territorial autonomy of the region. In doing so, the movement has mobilized both invited spaces—such as public hearings and formal comment periods—and invented spaces—including community assemblies, protest actions, independent research, and creative place-making—to articulate alternative visions of development rooted in environmental justice and community-led planning.

Drawing from transformative planning literature and grounded in traditions of Latin American and Caribbean resistance, the research engages the insurgent planning framework (Huq, 2020; Torres-Cordero, 2024) to examine how the movement, organized as Defiende a Cabo Rojo, asserts counter-hegemonic visions of development, sustainability, and territorial justice. Through ethnographic observation, document analysis, and semi-structured interviews with key participants, the study investigates how Defiende a Cabo Rojo not only resists environmental exploitation and dispossession, but also creates spaces for communal gathering, collective imagination, and long-term, community-engaged planning.

The research situates this grassroots struggle within a broader context of post-disaster neoliberal development in Puerto Rico, where extractive and speculative land-use practices often override participatory planning, environmental regulation, and the rights of local communities. In this setting, Defiende a Cabo Rojo challenges dominant planning paradigms by asserting their own knowledges, territorial attachments, and political claims to a more equitable and sustainable futures for Cabo Rojo.

Preliminary findings suggest that the grassroots movement embodies a historically rooted form of environmental justice activism and community-based organizing in Puerto Rico—one that interweaves legal advocacy, storytelling, ecological stewardship, and collective memory (Torres-Abreu et al., 2023). The paper also highlights the movement's role in exposing gaps in the Environmental Impact Assessment process and the broader failures of territorial governance to protect ecologically and culturally significant landscapes.

By documenting and theorizing the insurgent planning practices and place-based meanings mobilized by Defiende a Cabo Rojo, this research contributes to debates on just development, decolonial planning, and grassroots resistance to spatial dispossession. It also seeks to amplify the voices often sidelined in formal planning processes, offering insights into how communities not only resist displacement and environmental degradation but also actively prefigure alternative futures for the places they call home.

Demystifying Urban Planning with AI: Opportunities and Risks

Abstract ID: 1844.0.0.28.2025

Track 2: Community Development

Individual Paper Presentation Submission

Sungju Jung [Texas A&M University] luke9241@tamu.edu, presenting author

Urban planning documents often use technical and bureaucratic language, creating barriers for those unfamiliar with the field (Forester, 1980). This specialized "planner's speak" may unintentionally discourage public participation, increasing reliance on experts and ultimately reducing civic engagement (Forester, 1980; Li et al., 2020). This issue is particularly evident in South Korea, where readability assessments indicate that planning documents intended for public dissemination are often more complex than Korean bar exam materials. While many cities and urban initiatives, as well as prior research, have focused on enhancing the visualization and accessibility of spatial and quantitative urban data (Hemmersam et al., 2015), the excessive complexity of textual planning documents remains largely overlooked.

This study addresses this gap by customizing an AI model that leverages Seoul's urban planning glossary and relevant legislative data as a knowledge base. Through an iterative process incorporating citizen feedback, the study refines AI prompts to improve the readability of planning documents. Reformatted documents generated by the improved model are then evaluated through experimental studies to assess their impact on citizens' comprehension and engagement with urban planning processes. Additionally, expert interviews and validation processes are conducted to verify the accuracy of AI-generated documents. The study also examines the broader implications, challenges, and risks of leveraging AI for urban planning communication. The findings contribute to the discourse on AI-driven public engagement, offering insights into the potential and limitations of language models in democratizing urban planning knowledge.

Engaging Community by Birth Celebrations: Mitigating Maternal Isolation and Enhancing Social Capital

Abstract ID: 1844.0.0.706.2025

Track 2: Community Development

Individual Paper Presentation Submission

Sayaka Fujii [University of Tsukuba] fujii@sk.tsukuba.ac.jp, presenting author

Natsuho Ishikawa [University of Tsukuba] s2420410@u.tsukuba.ac.jp

Japan's declining birth rate is a pressing social issue, yet the burden of childcare continues to fall heavily on mothers, with limited support during pregnancy and postpartum. According to a report by the World Forum, since 2020, suicide has become the leading cause of death among pregnant and postpartum women in Japan, underscoring the psychological and social difficulties many mothers face. Particularly in suburban areas of the Tokyo metropolitan area, where nuclear families are common, the absence of extended family and weak community ties can lead to increased isolation (Yamazaki, 2022). These conditions highlight the urgent need for localized support networks that ensure mothers do not face early child-rearing alone.

While home-visit programs have proven effective in supplementing traditional family support (Byrne, 2015), there remains a need to rebuild community-based structures that foster organic, localized connections (Sharifipour, 2022). Opportunities for interaction between new parents and various their neighbors are vital for reducing maternal isolation and promoting inclusive, supportive environments for raising children. Given the erosion of traditional community structures, it is imperative to reconstruct social networks among a wide range of stakeholders and to revitalize communities so that they can function effectively as platforms for community-based support.

This study examines the Welcome Baby Project, a Japanese community-based initiative (NPO) that celebrates each child's birth and supports new parents by distributing birth celebration gifts prepared by local stakeholders. The project aims to build community engagement and reduce isolation during early parenting. Through this grassroots model, the project fosters a sense of shared responsibility and belonging among diverse community members. By analyzing the project, the study aims to elucidate its social significance, particularly in terms of mitigating maternal isolation during the early child-rearing period and contributing to the revitalization of community networks.

The study involved an investigation of the project's operations through interviews with organizers and analysis of related records. Additionally, semi-structured interviews with ten project participants explored their motivations, experiences, and perceived outcomes, while four in-depth interviews with recipient mothers examined changes in community connections and anxiety levels during early motherhood.

Findings of this study indicate that the Welcome Baby Project provides meaningful opportunities for mothers to connect with their local communities. Participants of the project, including individuals, local businesses, and major corporations, contribute through various flexible forms of involvement. Companies gain insights applicable to their work with families, while individuals report joy and connection through gift preparing activities. These diverse entry points create inclusive, sustainable networks of support.

The project also contributes to rebuilding social capital by promoting local solidarity and strengthening ties among community members. It addresses maternal well-being not only through material support but also by creating a welcoming, supportive environment rooted in shared community values. Importantly, the project adopts a community-led, collective approach rather than relying solely on institutional or family-based support. This model offers a culturally resonant and potentially more sustainable alternative to top-down interventions. By leveraging

local resources and fostering collaboration, the project offers a culturally grounded and sustainable approach to supporting child-rearing in contemporary Japan.

Examining Community-Led Implementation of Comprehensive Community Initiatives

Abstract ID: 1844.0.0.631.2025

Track 2: Community Development

Individual Paper Presentation Submission

Andrew Born [University of Illinois, Chicago] aborn2@uic.edu, presenting author

Mia Almond [Austin Coming Together] malmond@austincomingtogether.org

The Comprehensive Community Initiative (CCI) is a widely used model for community development in major cities across the United States. The CCI model involves a holistic assessment of the needs and assets of a place, the creation of a comprehensive plan with a diversity of stakeholders, and the development of an implementation structure for the plan (Kubisch et al., 2010). Critics of the CCI have demonstrated that in some cases, the model enables CCI sponsors to dominate the planning and implementation processes, advancing agendas for neighborhood change that benefit powerful outside institutions and further marginalize low-income neighborhood residents (Bonds et al. 2015; Fraser et al. 2003; Rosen et al. 2022). Our study asks what happens when CCIs are implemented without a dominant sponsor? How do neighborhood groups govern CCI implementation? What do they have the capacity to achieve without a sponsor? And ultimately, what groups or institutions shape CCI implementation and its beneficiaries? Our study examines 5 places in Chicago where Local Initiatives Support Corporation (LISC Chicago) partnered with community-based organizations to engage in Quality-of-Life Planning from 2015 to 2018. Quality-of-Life Planning is LISC Chicago's CCI model based on its work in the New Communities Program, a multi-sited CCI sponsored by the MacArthur Foundation in the 2000s. In each of the 5 sites of the study, LISC provided modest planning grants and technical assistance through alternative funding sources to one local lead organization. However, local organizations were largely accountable for implementing their respective Quality-of-Life Plans, providing a rich opportunity to explore the similarities and differences in approaches to CCI implementation within the same city and during similar periods. We interpret each site as a separate but overlapping field of community development, each with its own "loosely coupled system" of organizations within a variety of sectors and levels (i.e. grassroots, frontline, and support) that govern and influence CCI implementation (Chaskin, 2003; Stoutland, 1999). We collected data from each site through in-depth interviews with key stakeholders and the collection of plan and implementation documents. Our comparative analysis yields four important findings about CCI implementation. First, in the absence of a powerful sponsor, the lead local organization assumes an influential role in CCI implementation that resembles the role of a community development intermediary organization. They mobilize and assist grassroots and frontline groups to further CCI implementation. Second, due to their central role, lead local organizations exert substantial influence over CCI governance. In each case, lead local organizations made important determinations about governance structure, implementation priorities, and community engagement methods. Third, the way the lead local organization structures the CCI governance and implementation is largely determined by the tradition of community action that their organization follows. Thus, organizations with a tradition of community organizing approached implementation differently than those based in community development or social planning. Fourth, with a few exceptions, CCI implementation was largely opportunistic. That is, an organization's affiliation with the Quality-of-Life plans was perceived to increase their access to existing funding opportunities available in the philanthropic and public sectors. Thus, the existing resources and funding priorities of larger institutions largely determined what parts of the Quality-of-Life plans were implemented. These findings suggest that if CCIs are not dominated by one major sponsor, they are dominated by a loosely coupled system of local, state, and national support organizations, with one organization in the neighborhood playing a key coordinating role.

Exploring Counter-Hegemonic Space: The Case of El Rescate in Humboldt Park, Chicago

Abstract ID: 1844.0.0.1019.2025

Track 2: Community Development

Individual Paper Presentation Submission

Moriah Richman [Cornell University] mer339@cornell.edu, presenting author

This study examines how community organizations create counter-hegemonic urban spaces that resist neoliberal displacement and marginalization. Focusing on El Rescate, an independent living center operated by the Puerto Rican Cultural Center (PRCC) in Chicago, it explores how El Rescate's socio-spatial practices provide identity-affirming housing and community for homeless LGBTQ+ and/or HIV-positive youth.

Drawing from queer and feminist theories, as well as materialist and critical urban theory, this research asks: How do El Rescate's practices shape the lived experiences and identities of LGBTQ+ and HIV-positive youth in Humboldt Park? In what ways does its physical and social organization challenge dominant urban governance? Using ethnographic methods, the study situates El Rescate within the PRCC's broader efforts to create "parallel institutions" that counter neoliberal urban development. The study highlights how El Rescate, in its socio-spatial organization, materializes self-determination, collective care, and spatial justice, offering insights into alternative models of city-making.

Green Commons in Contested Urban Spaces: Fostering the Potential of Kuzguncuk and Roma Urban Gardens

Abstract ID: 1844.0.0.1157.2025

Track 2: Community Development

Individual Paper Presentation Submission

Cagri Tuzcuoglu [Urban Studies Institute/Georgia State University] ctuzcuoglu1@student.gsu.edu, presenting author

Capitalistic, speculative dynamics prevailing in Urban Spaces are changing the ways our public realms are shaped. Urban public spaces are becoming privatized, compartmentalized, and divided between different interest groups (Webster, 2007; Lee & Webster, 2006). Examples include cafés in public parks, private establishments with leaseholds on publicly owned lands, and gated communities. According to Lee and Webster (2006), this is an “evolutionary step”, and it is happening due to congestion in urban public spaces. Congestion happens when the number of people or groups demanding usage of space increases. They argue that public spaces are deemed to be privatized, and privatization is the most efficient use for them as urban areas densify and increase in population.

On the other hand, there are commoning initiatives by citizens, individuals, and collective organizations, where an urban space, a garden, a residential area, a theater, or other types of platforms and resources are managed collectively. Collectively managed gardens, also known as Urban Green Commons, exist in various configurations from allotment gardens in Stockholm to community gardens in Berlin. We know that they are good for ecosystem services, protecting biodiversity, and promoting social inclusion and urban resilience (Colding & Barthel, 2013; Colding et al., 2013). In organizational terms, we know that a common point they share is the ownership of management rights by the users of the gardens (Colding et al. 2013).

However, there are opposed opinions on their existence on congested urban public spaces. Colding et al. (2013) and Lee and Webster (2006) argues that their feasibility and justification on congested, highly demanded, public lands are rather limited. Whereas Arvanitidis and Papagiannitsis (2020) provide an example of an Urban Green Commons actively existing in an urban open space located in a high-density neighborhood of Athens.

Secondly, as stated above, there is a loss of public land in cities due to increased congestion and demand. Istanbul shares the same fate, with an even striking percentage of land appropriation for redevelopment and privatization of public lands (Durusoy, Cihanger 2016). The current dynamics of development expose Istanbul's green commons to the risk of appropriation and redevelopment by private capital (Durusoy, Cihanger 2016). The limits and extent of the new forms of urban green commons in Istanbul, opposing privatization dynamics, remains an unexplored topic.

This research provides insights on two cases of Urban Green Commons located in central areas of Istanbul, where one had significant government intervention and the other was developed informally. Kuzguncuk Urban Garden was done in collaboration with the Uskudar Municipality, being the renter and formal user of the land, and Kuzguncuk neighborhood residents as significant but informal collaborators. On the other hand, Roma urban garden was a place of contestation between the Beyoglu Municipality and Cihangir neighborhood residents, where there were arguments over its land-use and where the garden initiative has developed through informal connections.

Furthermore, this research argues that commons, especially these two cases, are not only subjected to congestion but are also subjected to contestation between different interest groups, namely the local municipalities, local associations and/or concerned citizens. This raises arguments on the political nature of public green spaces, forgotten in property-rights and urban green commons literature.

How Does Housing Supply Impact Asian American Segregation?

Abstract ID: 1844.0.0.216.2025

Track 2: Community Development

Individual Paper Presentation Submission

Taesoo Song [University of California, Berkeley] taesoo.song@berkeley.edu, presenting author

In recent decades, many American cities have experienced significant growth in their Asian populations, accompanied by increasing racial segregation between Asian and non-Hispanic White populations (Iceland et al., 2014). Prior research has typically framed this trend as a case of self-segregation among Asian Americans or, more recently, as a consequence of White flight—where White populations move out of areas undergoing racial transition due to the growth of Asian populations (Li, 1998; Kye, 2023). However, limited attention has been given to the role of urban planning and housing policies in shaping Asian residential patterns, despite growing evidence of their critical role in influencing racial segregation (Rothstein, 2017). Increasingly, research links racial segregation with restrictive local land use regulations and planning processes that inhibit the construction of new housing and raise housing costs, particularly in predominantly White, middle-class suburbs (Pendall, 2000; Trounstein, 2020). While Asian Americans are disproportionately concentrated in expensive housing markets with limited new development, research on these exclusionary local housing policies often neglects their specific impacts on this group. This gap in the literature raises an important question: How do uneven housing supply patterns across suburbs influence Asian American residential patterns and their racial segregation from other groups?

In this study, I argue that the housing supply dynamics in suburban areas plays a critical yet underexplored role in shaping contemporary Asian American residential and segregation patterns. Analyzing longitudinal census data, I find that Asian segregation is increasingly influenced by suburban dynamics—both the segregation of Asian and other racial groups across different suburban locales and within those suburbs by neighborhoods. Multivariate analysis reveals that Asian population growth is greater in suburbs with greater supplies of single-family and multi-family housing, and that this association is greater for Asians compared to other racial groups. Additionally, greater single-family housing supply is linked to increased Asian-Black segregation, while multi-family housing supply is negatively correlated with Asian-Black and Asian-White segregation within those suburbs. Lastly, metropolitan areas with more uneven patterns of housing supply saw greater Asian-White segregation between different suburbs, and slight decreases in Asian-Black and Asian-Hispanic segregation. These findings suggest that while suburban housing developments offer more opportunities to move into those places for Asian Americans, it may also contribute to their segregation, particularly when new supply is primarily single-family homes and unevenly distributed across the region. They also highlight how housing policies may shape emerging patterns of multi-racial segregation that extend beyond the traditional Black-White racial framework in the literature.

How San Francisco's Laundry Jobs Turned White(r): Historical Contexts and Modern Implications

Abstract ID: 1844.0.0.1069.2025

Track 2: Community Development

Individual Paper Presentation Submission

Dafeng Xu [University of Washington] dx42@cornell.edu, presenting author

Data science has turned urban history from a “data-poor” to a “data-rich” field. Planning historians also adopt quantitative tools (Hillier et al., 2010) that, for examples, help scholars quantify labor market trends that were largely described based on narrative evidence previously. Quantitative results further shed light on the details of community and economic development, which were often ignored in the literature yet shaped American cities’ economic and cultural diversity.

We present an example of quantitatively studying historical community and economic development. We study the changing pattern of San Francisco’s laundry jobs at the turn of the twentieth century. Starting from 1849, the city’s laundry jobs were primarily taken by Chinese immigrants; prior historical research described the decline in Chinese laundry over time (e.g., Friday, 2010), yet it (a) fails to quantify this decline, (b) simplifies it as a result only caused by exclusion laws, and (c) thus cannot present nuanced understandings of how different populations engaged in community and economic development.

Using digitized census records, we find that in 1880, over 80 percent of San Francisco’s laundry workers were ethnic Chinese, the majority of whom resided in Chinatown. By 1900, the proportion of Chinese-ethnic laundry workers declined by nearly 30 percent but remained high. The old job pattern changed much more dramatically in the first decade of the twentieth century: in 1910, only 30 percent of the city’s laundry workers were Chinese-ethnic; the proportion of Chinese-born laundry workers was even lower than the French.

The old explanation of the changing pattern—Chinese exclusion—is valid, but there are several key contributors of this change that were ignored in prior research and can only be learned by quantitatively analyzing business directories, census and living cost records, economic survey data, and newspapers. We use regressions, spatial GIS, and topic modeling to identify these contributors: First, long-term demographic trends, most notably Japanese migration, induced competition even without altering stereotyped association between the Chinese and laundry, and, moreover, between Chinese laundry and poverty. Second, the 1906 earthquake, rather than only exclusionary laws, changed Chinatown’s economy that increasingly favored international trade. Third, some white groups previously lived near Chinatown—most notably the French—broke ethnic segregation and worked in this ethnic neighborhood, taking laundry jobs alongside Chinese workers. Overall, the social and political discourse suggested that various non-Chinese communities actively engaged in initiating the change, while economic development played a secondary role.

These diverse mechanisms suggest much stronger motivations of changing the ethnically concentrated pattern of laundry jobs than what was understood before. But the stronger motivations did not lead to better economic outcomes for non-Chinese workers taking laundry jobs, as estimated based on census and living cost data.

These new findings suggest (a) the observed changing pattern of San Francisco’s laundry jobs was not only due to immigration exclusion but, to a larger extent, actively shaped by community and economic development launched in both Chinese and other ethnic groups; (b) such development, driven by demographic, social, and economic factors, broke residential and occupational segregation of San Francisco’s Chinatown, even if was one of the most segregated ethnic enclave in American history (Eriksson and Ward, 2019) and remained so largely by policy design (Lew-Williams, 2018); (c) while we find populists were indeed thrilled by this changing job pattern, they could not

turn laundry more lucrative and thus benefited new, non-Chinese workers, suggesting negative impacts of populism on community and economic development aligning with planning research in modern contexts (e.g., Spicer and Caper-Futterman, 2020).

How South Korean mothers overcome social exclusion: Focus on place and community

Abstract ID: 1844.0.0.133.2025

Track 2: Community Development

Individual Paper Presentation Submission

Nahyun KIM [Seoul National University] gloria0614@snu.ac.kr, presenting author

In Kwon Park [Seoul National University] parkik@snu.ac.kr

This study analyzes how South Korean mothers overcome social and spatial exclusion. South Korea's low birth rate has drawn global attention, with Seoul recording the country's lowest birth rate. While multiple factors contribute to this phenomenon, this study focuses on the social exclusion women face during pregnancy, childbirth, and child-rearing. The research conducted in-depth interviews with 20 mothers raising children under 36 months in Seoul. Data analysis followed a grounded theory approach, involving transcription, coding, and categorization.

The findings indicate that the social exclusion of participants, which coincides with spatial exclusion, results from a combination of patriarchal social norms, capitalist ideologies, and mobility constraints. Pregnancy, childbirth, and childcare are still perceived as women's responsibilities, making pregnant women seem dispensable in the workplace and leading to mobility restrictions. Social exclusion involves both voluntary and involuntary aspects, creating a complex dynamic that often leads women to accept their circumstances. Voluntary factors include heightened safety concerns and physical changes during pregnancy, while involuntary factors include lifestyle changes after childbirth. Negative perceptions of mothers with children restrict their spatial choices, while physical and lifestyle changes create additional mobility constraints.

Participants counter spatial exclusion through place appropriation, experiencing common transformations in their central spaces that closely relate to social exclusion. While the home remains the primary space throughout, other central spaces evolve from workplace to online communities ("mom cafes") and eventually to cultural centers. Exclusion from the workplace weakens their sense of social identity, transforming their perception from a "place" for self-realization to a "space" for income generation. Online communities emerge to fulfill social needs, functioning as trusted sources of information and platforms for new social relationships. Postpartum care centers and the immediate post-discharge home prove the most isolating spaces. This isolation eases when virtual connections from mom cafes transform into real-life interactions. Mothers create real-world communities in local spaces, with large supermarkets evolving from mere shopping "space" into "places" for social interaction and emotional stability. The concept of home is also being redefined. Increased social visits transform home from private retreats into semi-public places for gatherings, largely due to mobility constraints that complicate outings. Similarly, neighborhoods shift from being "convenient for commuting" to "suitable for child-rearing."

These changes in spatial perception accompany shifts in community dynamics. During pregnancy, participants experience weakened belonging with workplaces and friend groups, leading them to seek online communities with others in similar situations. After childbirth, they move these virtual connections into physical spaces, forming localized parenting communities. The extent of this transformation varies based on workforce reentry intentions. Those planning to return to work view local communities as temporary and avoid deep engagement, while those without definite reemployment plans develop stronger attachments to their new spatially based communities, often considering them their closest social networks.

This study reaffirms the relationship between space and place while demonstrating how individuals establish new relationships with space through place appropriation. This suggests that the place is not fixed but adaptable depending on situational contexts. The study also highlights the significant role of online spaces, which have not

been deeply explored in place discourse. These insights suggest the need for careful examination of childcare-related policies at the local level to ensure practical effectiveness.

Qi Qin [Southeast University] 793394274@qq.com

"Urban villages" are unique spatial units that have emerged during China's rapid urbanization, characterized by high-density housing, informal economies, and complex social networks. These areas exhibit highly dynamic and heterogeneous patterns of human mobility, posing significant challenges for spatial renewal strategies. This study takes an urban village in Nanjing as a case study, integrating location-based service (LBS) data, point-of-interest (POI) information, and building morphology data to construct a multi-agent modeling framework. The framework systematically captures internal and external mobility patterns and simulates population responses under various urban renewal strategies. Typical intervention pathways—including off-site relocation, phased redevelopment, and functional transformation—are incorporated into the model. Agent behavior is designed with decision-making logic and migration willingness, allowing for an in-depth analysis of how different strategies impact population distribution, spatial vitality, and functional structure. The results reveal the coupling mechanisms between human behavior and spatial structure in complex urban environments, providing data-driven insights and simulation-based evidence for human-centered urban village renewal.

Indigenous Pedagogies of Love

Abstract ID: 1844.0.0.889.2025

Track 2: Community Development

Individual Paper Presentation Submission

Elspeth Iralu [University of New Mexico] iralu@unm.edu, presenting author

Indigenous life in India is defined by development. Indigenous peoples in India are categorized as Scheduled Tribes, a constitutional category defined by a presumed backwardness, remoteness, and need for improvement. In Nagaland, an Indigenous region of Northeast India, Indigenous life and community well-being are tracked via development measures and initiatives where development is seen as both a requirement for and vehicle of peace and stability. In this paper, we propose Naga pedagogies of love as Indigenous modes of accounting for relations and narrating community wellbeing. We consider Naga storytelling about rice as an embodied Indigenous pedagogy of love that enacts Indigenous futurity in the here and now.

We draw on scholarship on Indigenous pedagogies that centers community as a source of power and knowledge. Our methodology in this paper privileges Naga pedagogies, enacting Naga practices of conversation, reflection, and question and response, to ask what our stories about rice tell us about Naga notions of growth, scale, and political relation. How might these notions of growth and scale infuse a Naga vision of community development?

In this paper, we show that the embodied experience of human relation to rice not only constructs a Naga pedagogy of love and kinship, but also places limits on colonial notions of development. Naga pedagogies generate a vision of Naga presence rooted in social, cultural, and political relations to people, animals, plants, and other aspects of Naga life. A Naga critique of development, both as a process for economic growth and as an organizing principle for contemporary colonial relations, challenges dominant understandings of Indigenous past, present, and future.

Naga pedagogies stand in contrast to dominant notions of development which center models of continually increasing growth and expansion. Building on theorizations of Indigenous epistemologies, we demonstrate how dominant modes of development and scaling-up are unable to account for Indigenous ways of knowing and being. Instead, we explore forms of reciprocity and sociality that are embedded in Indigenous community and allow us to claim past and future as Indigenous features that are outside the economic domain of expansion.

Through its focus on Naga storytelling as a way of relating genealogies, making relations, and narrating community wellbeing, this paper contributes to scholarship on Indigenous planning and proposes that attention to Indigenous methodologies and pedagogies redefines success in community development. Enacting Indigenous pedagogies of love means shifting the standards, framing, and goals of Indigenous community development.

Investigating Asian Language Access and Immigrant Discourse in Housing Policy Across in Greater D.C.

Abstract ID: 1844.0.0.187.2025

Track 2: Community Development

Individual Paper Presentation Submission

Shaheera Sayed [Virginia Tech] ssayed10@vt.edu, presenting author

Through a review of local housing policy documents, strategic communications, and public meeting minutes in Washington, DC; Fairfax County, VA; and Montgomery County, MD, this study investigates whether these materials address the language needs of Asian immigrant communities—and if so, how—or whether those needs remain overlooked. The presence or absence of effective language access tools can have material consequences, shaping who can navigate housing applications, qualify for aid programs, or participate fully in housing-related decision-making processes. To better understand how these tools shape immigrant experiences of accessing housing, my research asks: How do housing-related policies and institutional practices in the Washington, DC metropolitan region explicitly address “language access,” and what themes or omissions characterize the way local governments frame (i.e., represent or discuss) immigrant communities and their needs? The work focuses on Asian immigrants due to rapid demographic growth in these communities and wide linguistic diversity that remains unaddressed by ‘one-size-fits-all’ minority outreach strategies.

This analysis draws from Bourdieu’s concept of linguistic capital to interrogate how language proficiency operates not merely as a communicative tool but as symbolic power structuring access to housing resources and institutional legitimacy. This lens enables a critical examination of how policies frame English proficiency as an implicit norm, echoing Louie’s observations on how language proficiency functions as both a racialized marker and a measure of cultural legitimacy within institutional fields. By focusing on linguistic capital, the analysis aims to expose how language is central to reproducing inequality, especially within systems claiming equity but operating through standardized, technocratic discourse.

Adopting a hybrid methodology merging Critical Discourse Analysis (CDA) with Large Language Model (LLM)-assisted content analysis, the project draws upon a diverse corpus of 200+ documents spanning 2015–2024. Blending the interpretive depth of CDA with computational power of LLMs such as GPT-4 enables large-scale pattern recognition and thematic clustering across complex textual datasets. In applying LLM-driven analysis, I address ethical considerations of algorithmic biases and data privacy, ensuring human-led CDA remains central to interpretative depth.

Mapping discursive patterns, metaphors, and rhetorical strategies used to describe non-English-speaking groups, the research uncovers explicit and subtle references while revealing instances where Asian immigrant communities are relegated to broader “minority” categories or omitted altogether. CDA provides a critical lens for unpacking institutional priorities, policy narratives, and power imbalances underlying official language and public discourse. Meanwhile, the LLM-driven component facilitates pattern detection and categorizing textual gaps or oversights. Preliminary findings indicate a gradual increase in discussions around cultural nuance and linguistic inclusivity; however, the relative scarcity of direct mentions of Asian languages or experiences signals ongoing tensions in resource allocation and sociopolitical attention. By illustrating how discursive practices either amplify or obscure Asian immigrants’ needs in housing processes, this study underscores the importance of data-driven, critical frameworks in shaping policy decisions. It highlights how resource distribution, programmatic guidelines, and equitable communication strategies could refine support for immigrant populations. Ultimately, it contributes fresh insights into the shifting nexus of immigration, governance, and equity, calling for intentional, data-driven strategies to foster meaningful community engagement.

People, Parks, and Power: A Systems Change Analysis of Durham, NC

Abstract ID: 1844.0.0.466.2025

Track 2: Community Development

Individual Paper Presentation Submission

Danielle Spurlock [University of North Carolina at Chapel Hill] dspurloc@live.unc.edu, presenting author

Orion Washington [Communities in Partnership] geena@cipoed.org

Ayan Felix [Communities in Partnership] ayan@cipoed.org

Scholarship on park inequity includes documented disparities associated with race/ethnicity and socioeconomic status in the provision of parks and green space (Klompaker et al., 2023; Rigolon, 2016), the presence of park amenities (Crawford et al., 2008), and funding (Joassart-Marcelli, 2010; Wolch et al., 2005). Communities in Partnership (CIP), a community-rooted organization in East Durham, North Carolina, began their People, Parks, and Power project with funding from Prevention Institute and Robert Wood Johnson Foundation in 2022. This project sought to build knowledge about the current state of parks in historically Black neighborhoods in Durham and the power structures and narratives that hold inequitable conditions in place.

CIP partnered with two other historically Black neighborhoods, and community residents to gather information using a variety of methods including park observation, interviews, community mapping, and content analysis. The project used a power and systems change analysis informed by Arnstein, Lukes, and Kania, Kramer, and Senge (Arnstein, 1969; Kania et al., 2018; Lukes, 1983). In particular, the model created by Kania, Kramer, and Senge provided a framework to examine the conditions necessary for systems change. The model is arranged as three inter-related and interdependent levels of an inverted triangle. The top level, Structural Change, is the outward manifestations of our inequitable system: policies, practices, and resources flows. We examined meeting minutes, the newly adopted comprehensive plan, the parks and recreation comprehensive plan, and budgets. We found the utilization of multiple community engagement tools with limited evidence that information from community participation was included in local park and recreation policies.

The middle level (Relational Change) includes relationships, connections, and power dynamics. We investigated the government agencies with influence over park and neighborhood conditions as well as non-governmental entities such as parks foundations, environmental protection organizations, city beautification groups, land trusts, non-profit housing and financial institutions, and institutions with significant land holdings. Interviews and community mapping exercises revealed the sheer amount of time and resources necessary to secure any physical improvements or policy change. Stakeholders with more power often used strategies that delay action under the guise of gathering more information or community input. Similar to our findings at the Structural Change level, community expertise is gathered but rarely integrated. When it is included, substantial changes that dilute their initial intent are made without consultation.

The Transformative Change level refers to the mental models and the narratives help hold systems in place. Content analysis of local media and in-depth interviews with long-term community advocates highlight the ways the city's reputation as a "progressive" Southern town support an avoidance strategy. The dominant approach to redressing historical inequities is to 1) repeatedly state that no one working for the city today was in place when many of the detriment policies were initially adopted, and 2) to create policies that focus on treating everyone equally despite current unequal conditions. Both strategies are a part of the avoidance narrative, which absolves agents of local government from the responsibility of examining how current systems perpetuate harm and fail to meet the needs of neighborhoods experiencing the effects of generations of disinvestment.

This analysis continues to inform the organization's efforts to address heavy metal contamination discovered in five parks during the project, a 2024 parks and green space bond, and the rewrite of the City's unified development ordinance, which all have implications for future land use, gentrification, and displacement.

Of the approximately 7,000 documented languages of the world's languages, nearly 50 percent are endangered and at risk of linguistic extinction (Bromham et. al., 2021). The United Nations (UN) proclaimed 2019 as the International Year of Indigenous Languages, acknowledging that most of the linguistic diversity projected to be lost in the coming century comprises Indigenous languages (United Nations, 2021). In 2022, the UN further reaffirmed its commitment to safeguarding Indigenous languages from extinction by designating the period between 2022 and 2032 as the International Decade of Indigenous Languages to mobilize support for preserving, revitalizing, and promoting Indigenous languages (United Nations, 2019). These initiatives within the international community demonstrate the global significance of Indigenous languages and underscore the importance of Indigenous people's distinctive knowledge systems, cultural values, and dedication to land stewardship.

The Cherokee language (ᏍᏏᏉᏏ) is an Indigenous language spoken by the Cherokee people, and there exists a concerted effort to invest in language revitalization among the three Cherokee Tribal governments in the United States. In the municipalities of Tahlequah, Oklahoma and Stilwell, Oklahoma, two towns located on the Cherokee Reservation, observers can witness instances of the Cherokee language transcribed into the built environment via various wayfinding techniques, including public signage and art, in addition to English. The presence of an Indigenous language coexisting with English as part of the linguistic landscape is particularly uncommon in the United States, given the jurisdictional limitations between local and Tribal governments.

This phenomenon warrants an investigation to explore the relationship between planning processes and Indigenous language revitalization, in this case the Cherokee Language, with the understanding that safeguarding Indigenous languages is critical to maintaining Indigenous knowledge systems. This paper is the first of a 2-phase project conducting this investigation. We ask the following questions: (1) What are the underlying processes behind the production of transcribed Cherokee language that exist in the public realm?; (2) How can typological system(s) be developed to catalogue how the Cherokee language is transcribed within the public view?; and (3) What semantic differences exist between the Cherokee transcriptions and English that are indicative of Cherokee knowledges being expressed, if any?

Through a document analysis of municipal records and a photographic survey of transcribed Cherokee wayfinding, our preliminary findings indicate that coordination between municipal and tribal agencies is necessary to navigate complex jurisdictional systems for the installation of permitted wayfinding signs. Furthermore, individuals such as private property owners, business owners, and Cherokee language speakers play a crucial role in determining the location and significance of Cherokee transcriptions in the built environment, respectively. While a substantial portion of the Cherokee wayfinding examples are direct translations of their English counterparts, there exist instances where Cherokee cultural knowledge is essential to comprehend deeper cultural nuances.

Chatbots are emerging as tools that facilitate a novel form of data collection through conversational surveys, encouraging users to engage in dynamic dialogues through open-ended questions, interpretation of free-text responses, and interactive follow-up (Xiao et al., 2020). This approach enhances user-centered information collection and has been applied to community and urban planning projects (Xiao et al., 2020; Dortheimer et al., 2024). However, most existing chatbots are designed for one-to-one interactions, highlighting the need for intelligent agents capable of facilitating group conversations (Wagner et al., 2022), which require the support of multiple agents (Jiang et al., 2023). This need is particularly relevant for negotiating urban solutions in multi-user or community contexts. The main goal of this paper is to develop a multi-user and multi-agent AI system for chatbots, based on a large language model, specifically tailored to community contexts. The system will be used to support community dialogues and enhance collaboration among residents in civic engagement. This work aims to explore the potential of the multi-user and multi-agent AI system to facilitate inclusive, structured, and efficient group dialogues, especially in scenarios where diverse perspectives need to be considered and acted upon in real time.

The system architecture is built using Python, JavaScript, and HTML, with WebSocket technology enabling real-time interactions between multiple users. To ensure secure and scalable data management, all user input and conversation data is stored in a web-based SQL database hosted on Google Cloud Platform. At the core of the system's conversational intelligence is the Gemini-1.5-flash-002 model, which enables the chatbot to act as a proactive and context-aware moderator. The chatbot is designed as a multi-agent system, with different agents assigned to specific topic areas, including 'stakeholder connector', 'problem detector', 'communication navigator' and 'summary notetaker'. Interaction begins with an introduction led by the stakeholder connector agent, where users are encouraged to share information about themselves, and the connector agent collects personal attributes and labels that serve as the basis for subsequent group dynamics. Following the introduction, users engage in collaborative scenarios (e.g., completing the tasks in the game together) based on the predefined urban problems that need to be addressed. Meanwhile, the "problem detector" agent will dynamically identify key issues based on context and user input, followed by the "communication navigator" agent, which will manage potential conflicts between users. After the group discussion, the agent 'summary notetaker' will summarize the discussion messages and generate strategy suggestions for next steps. By leveraging community-specific agents and large language models, this study advances the design and application of multi-agent chatbots for public participatory processes and contributes to the intersection of artificial intelligence, human-computer interaction (HCI), and community engagement. We hope that the multi-user AI chatbot can make it easier for communities to discuss complicated tasks and help to effectively address real-world issues. In addition, we hope that the multi-user AI chatbot will lower the barrier to participation and improve the quality of engagement in community settings in the future.

Reimagining social infrastructure: Integrating libraries into mixed-use developments

Abstract ID: 1844.0.0.992.2025

Track 2: Community Development

Individual Paper Presentation Submission

Laura Delgado [Trinity College] ldelgado@trincoll.edu, presenting author

Public libraries are a unique form of social infrastructure and the only organizations that are both free and open to all. The services they provide are not means-tested benefits that are targeted to only those who qualify. Rather, their services and resources are available to everyone, regardless of age, familial status, income, employment status, place of birth, citizenship status, race, ethnicity, religion, or any other ascriptive characteristics. They are third spaces that offer a place to relax or socialize without having to buy a coffee. Historically, public libraries in the US have been housed in stand-alone structures, thanks in part to Andrew Carnegie's funding of thousands of such public libraries across the country, but this is changing.

From Brooklyn to Chicago to Boston, cities are calling for the redevelopment of public library branches that are part of mixed-use developments. This research asks how cities are changing the development model when it comes to public library branches and how they are reimagining public libraries as forms of inclusive and accessible social infrastructure. Through a review of public library requests for proposals, development plans, and news media across the country, I document the evolving nature of public libraries and to what extent they advance planning goals of creating cities that are more equitable, diverse, and inclusive. I find that the newer mixed-use developments combine public libraries with housing, but the mixed uses also extend beyond this pairing, and the concept of a co-located public library is not new. Similar to the first public library Carnegie built in 1890, which was located in a five-story building along with an art gallery and a twelve-hundred-seat music hall, cities have been finding creative partners for public libraries, from health centers to retail, for decades. This research contributes to larger discussions within the field of urban planning about social infrastructure, inclusive and equitable development, and public services.

Restoring a Record, Reclaiming a Place: Collective Memory as Anti-Displacement Practice

Abstract ID: 1844.0.0.959.2025

Track 2: Community Development

Individual Paper Presentation Submission

Margaret Haltom [Massachusetts Institute of Technology] mhaltom@mit.edu, presenting author

Countering legacies of racialized disinvestment and cultural erasure, how can planners ensure redevelopment reflects — rather than overwrites — the histories of marginalized communities? This research proposes three dimensions of memory-based planning as tools for anti-displacement development. In partnership with a Community Land Trust (CLT) emerging in one of the first neighborhoods designed for Black homeownership in the American South, a planning scholar, resident researchers, community organizers, and affordable housing developers worked together to surface the neighborhood's long-observed history. Our collaborative process addresses displacement as both a physical and cultural phenomenon — one that fractures community identity, memory, and belonging (Fullilove, 2004). We respond to claims that redevelopment without historical recovery risks reinforcing the very patterns of exclusion it aims to redress (Hayden, 1995; Sandercock, 1998), and to calls for more inventive historical methods to counter the omission of Black life from institutional archives (Hartman, 2008).

Together, we incorporated a range of community-engaged historical methods into the CLT's formative organizing and engagement, including oral histories, archiving in resident homes and community centers, memory-based focus groups, participatory mapping, walking tours, co-curated neighborhood exhibits, historic markers, and the restoration of a historic home. Across these practices, three dimensions of memory-based, anti-displacement planning emerge: 1) archival recovery, 2) collective memorialization, and 3) tactical remembrance. Each offers distinct takeaways for restoring a record that honors those who remember the past and affirms their place in the future being built:

- 1) Archival recovery, where resident memories serve as finding aids in municipal archives — revealing new connections to documents previously disconnected from the neighborhood — while also surfacing materials held in homes, schools, and community centers;
- 2) Collective memorialization, where residents engage in shared reflections — through group workshops, participatory mapping, and oral history walking tours — that reveal broader patterns of racialized disinvestment, shifting narratives from individual neglect towards an understanding of structural injustices and the possibility for collective action; and
- 3) Tactical remembrance, where visible, place-based interventions — including historic markers, the restoration of a historic home, and a temporary, nine-exhibit neighborhood museum — physically demonstrate that redevelopment can move forward without erasing the cultural fabric of the past.

This work contributes to broader efforts to position grassroots preservation as a reparative practice (Roberts and Kelly, 2019), inviting planners to engage with memory as a foundation for more just futures. We offer new approaches for incorporating historical recovery into community development, and reflect on their significance for cultural repatriation and anti-displacement in practice.

Rural Community Development Planning in the United States: Cases Illustrating an Integrated Approach

Abstract ID: 1844.0.0.614.2025

Track 2: Community Development

Individual Paper Presentation Submission

Kathryn Frank [University of Florida] kifrank@ufl.edu, presenting author

Michael Hibbard [University of Oregon] mhibbard@uoregon.edu

In their Introduction to the Routledge Companion to Rural Planning, Scott, Gallent, and Gkartzios (2019, p. 1) point to “an urgent need to reinvent rural planning for the 21st century,” yet the challenges facing rural areas have not been much reflected in planning scholarship, practice, or institutions (Hibbard & Frank, 2021). As one aspect of that reinvention, our studies of rural planning history, theory, and practice have led us to recommend that the field pay greater attention to rural communities and to “take a more broad-based view of development, to include not only economic growth but also social, cultural, environmental, and political equity and well-being” (Hibbard & Frank, 2024, p. 272).

Planning widely understands itself to be a derivative field that borrows and synthesizes from other fields. As a result, these fields have been rich sources for assessment, innovation, and expansion. One such cognate field that has relevance for rural planning is community development. As explained by Rios et al. (2024, p. 549), “Parallel to the urban school of community development is a second thread that grew out of self-help activities of late-nineteenth-century rural life. Less familiar to planning, the ‘rural’ school of community development has ties to the U.S. Department of Agriculture, land-grant institutions, and educational associations.”

These insights led us to review the rural community development (CD) literature to draw lessons for rural planning (Frank & Hibbard, 2024). In that study, we compared each field’s substantive knowledge, processes, and institutions. Focusing on lessons for practice in the United States, we found that the planning field is biased towards urban interests, the physical environment, formal processes, comprehensive planning, regulations, and government, all of which hinder planners’ effectiveness in serving rural communities. In contrast, we found rural CD to be well supported and successful through its emphasis of opposite elements – rurality, people, informal communications, project implementation, voluntary actions, and non-governmental partners. We thus offered suggestions for how rural planning could incorporate rural CD approaches, while retaining rural planning’s unique, complementary strengths.

Here we report the findings of empirical studies that follow from our rural CD literature review. We seek to understand the rural planning-community development nexus and interrogate the lessons above through case studies of community initiatives in two deep (remote) rural counties, one in Florida and one in Oregon. The cases cover actions taken by local leaders and practitioners to address significant, common rural concerns, including economic development, natural hazards, and community cohesion, using data collected through interviews, document analyses, and observations. We draw on concrete instances to illustrate the substantive knowledge, processes, and institutions involved in each field as they act separately and together to advance rural community development. The strong traditions and professional cultures in planning may make it difficult to embrace and/or collaborate with distinct and sometimes opposite practices. Thus, we conclude by identifying barriers to, and opportunities for, further integration of aspects of rural CD into rural planning.

Tejando Comunidad: Informal Health Solutions Among the Latinx Immigrant Population

Abstract ID: 1844.0.0.188.2025

Track 2: Community Development

Individual Paper Presentation Submission

Luis Macias [University of Texas at Arlington] luis.macias@mavs.uta.edu, presenting author

Undocumented Latinx immigrants continue to face vulnerabilities in obtaining access to healthcare in the U.S. due to their unrecognized status, preventing them from receiving public benefits. Urban planning has studied these populations housing patterns (Chinchilla et al., 2022) and urban placemaking (Talen, 2012), but little has been explored in relation to their health care access. Current scholarship has only just begun to advocate for equitable measures centering marginalized populations (Williams et al., 2023). Previous planning studies explored mobility transportation obstacles immigrants and marginalized communities endure to get to health care facilities (Edward & Biddle, 2017). But this previous research overlooks the solutions low-income Latinx immigrants use to get access to health care in the U.S.

This study aims to center the Latinx immigrant population and their health-seeking behaviors to inform more effective planning approaches. This study's overarching research questions is: What solutions do Latinx immigrants engage in to receive healthcare access in the United States? Given that Latinos in the U.S. continue to experience unequal access to healthcare information, facilities, and services compared to their non-Latinx white counterparts (Hill et al., 2021). Despite greater barriers and less access to healthcare opportunities, a unique trend, the Hispanic Health Paradox, is observed among Latinx immigrants experiencing better health outcomes than native born Americans (Markides & Coreil, 1974). Specifically, Latinx immigrants exhibit higher life expectancy, lower death rates, and lower infant mortality rates than natural born residents (Fernandez et al., 2023). Centering immigrant populations is necessary to comprehend the proliferation of paradoxical health outcomes. Previous planning research has disregarded informal practices immigrants use to address their health needs. Reliance on informal mechanisms like health fairs, non-prescribed medicine, reliance on family members, or community health events can help rationalize and better explain the Hispanic Health Paradox (Madden, 2015).

To better understand the Hispanic Health Paradox and address literature gaps, this study will survey Latino immigrants participating at a local Dallas-Ft. Worth area health fair to gauge their health-seeking solutions. Our research implements an anonymous cross-sectional structured survey (n=88) targeted at the Latino immigrant community attending the Bi-National Health Fair, organized in part by the Mexican Consulate in Dallas. This survey samples the first of three health fairs the research team plans to survey to gauge the immigrant community in North Texas. The survey seeks to understand how health insurance availability among Latino immigrant health fair participants affects their access to and use of formal or informal medical behaviors. Specifically, their medical information sources, medical facilities used to receive or access care, and reliance on community events to receive healthcare. Health fairs are ideal data collection settings because the community trusts them as healthcare sources, and vulnerable populations rely on them for medical access.

Survey results confirmed the hypothesis that low-income Latinx immigrants address their health needs through informal means, such as reliance on community events. Despite a low sample size, preliminary results show that uninsured immigrants are more likely to rely on community events and community centers to access healthcare needs. These results can have public policy implications to better fund and recognize organizations facilitating health fairs for marginalized community members. Additionally, planners seeking to implement community-oriented development strategies can use health fairs and other community events to more effectively target hard-to-reach populations and improve community outreach.

The Physical-Environment Features That Influence Social Capital: A Systematic Literature Review

Abstract ID: 1844.0.0.765.2025

Track 2: Community Development

Individual Paper Presentation Submission

Kin Long Lei [Hazard Reduction and Recovery Center, Texas A&M University] kl934@tamu.edu, presenting author

Siyu Yu [Texas A&M University] syu@arch.tamu.edu

Michelle Annette Meyer [Texas A&M University/ Hazard Reduction & Recovery Center] mmeyer@arch.tamu.edu

The practices of urban planning and natural hazards management have been intertwined in the US at least since the 1970s, when planning agencies began to incorporate the latter as their goals (Baker & McPhee, 1975). While physical/engineering measures had been the predominant approaches to hazard risk reduction, since the turn of the century, the utility of the social approaches has been increasingly recognized. Among the social means the hazards literature has examined, social capital – the social networks and social norms that promote collective actions (Woolcock, 1998) – receives particular scholarly attention.

Many planning studies have examined social capital, despite not necessarily linking it with hazards. In particular, many have investigated how different physical-environment features influence the stock of social capital. Development density, land-use mix, and New Urbanist designs are among the features that have been visited (e.g., Lund, 2003). In fact, planning literature has accumulated a good volume of empirical evidence about what physical environment can affect social capital. However, there is no study synthesizing this booming volume of evidence, which is a problem.

For practitioners, this problem hinders research translation. Despite the substantial scholarly efforts, there is no holistic framework specifying what aspects of the physical environment planning should work on if it is to further social capital. This adds to the uncertainty in taking action to promote social capital, which can ultimately discourage planning agencies from using the social capital tool at all. Alarming, this uncertainty can be compounded when the existing evidence is conflicting – a common situation. An example is development density: while some studies suggested that a higher density can stimulate social capital, a good number of seminal texts (e.g., Freeman, 2001) suggested otherwise.

For planning scholars, this gap represents a missed opportunity to map out the physical-environment features that are understudied. The opportunity is also missed to highlight where existing evidence is conflicting and requires further investigation.

To address this gap, we conduct a systematic literature review on the existing scholarly literature that links urban planning with social capital. Specifically, we answer three research questions: (1) what planning literature has studied about social capital, (2) what physical-environment features have been empirically tested as significant for social capital, and (3) what the direction and mechanisms of the influences are.

Our review consists of two parts. The first part is a scoping review. We extract from each existing study the issue it examined and then thematically group these issues. This provides a snapshot of what planning literature has studied about social capital.

The second part is a textual narrative synthesis guided by Popay et al. (2006). We select from the scoping review the studies explicitly discussing the relationship between physical environments and social capital. We then (1) identify the studies that empirically test the relationship, (2) extract from them the physical-environment features

that influence social capital, and (3) code the direction of the influence. The mechanisms behind the influences are also coded.

Where the evidence conflicts, we refer back to the samples and designs of the primary studies. Based on this examination and supplemented by relevant theories, we derive the possible reasons as to why the conflicting evidence emerges. We also generate a more detailed specification of when a given physical-environment feature may promote social capital and when it can instead weaken the capital.

The ultimate outcome of the synthesis is a tabulation of physical-environment variables that affect social capital. This can be used directly by practitioners to design policies aiming at social capital, which can ultimately contribute to community hazard resilience.

Lucie Laurian [SUNY- University at Buffalo] lucielau@buffalo.edu, presenting author

Iulian Vamanu [University of Iowa] iulian-vamanu@uiowa.edu

Kara Logsden [University of Iowa] kara-logsden@uiowa.edu

With 9,000 public library systems in the US, libraries are almost omnipresent community assets. Libraries free and open environments and librarians' inclusive and caring ethos make libraries quintessential third spaces. They also serve as de facto community resilience hubs. Our team's recent work in 13 Midwestern states, shows that libraries offer free and universal information access beyond collections, provide safe spaces and resources for learning, civic engagement, formal and informal social gatherings, and programs for all ages. As digital access and literacy have become essential in most aspects of economic life, libraries provide computers and internet services, and librarians help patrons fill in and submit job applications and access government and social services. Libraries also serve as formal and informal cooling/warming centers during extreme weather events, and some function as emergency information hubs during disasters. Most pivoted creatively during the COVID crisis and many maintain new services, e.g., outdoor WIFI hotspots -arguably an indicator of resiliency (Laurian et al. 2024). While libraries seek to promote safe and inclusive environments and sound information to all patrons, they have, in recent years, come under intense scrutiny and political pressures for some of their programs and collections, e.g., with book challenges and book bans, from both state legislatures and local residents.

This paper presents results from a 2024 survey of 805 library directors in all US states and territories, supplemented by interviews. It builds on a project funded by the Institute of Museum and Library Services (gutted by executive order on 3/31/2025) developed by scholars in Urban Planning, Library and Information Science, Social Work, Sociology, and Business. The survey provides a comprehensive picture of libraries' community resilience impacts, defined as library programs and practices that address local social, economic, environmental, and political challenges. We focus particularly on the ways libraries (1) support local civic life and community engagement, (2) help patrons access economic and educational opportunities, (3) serve as informal and formal resilience and disaster-response hubs, (4) innovated during COVID and retooled COVID-triggered innovations into enhanced services, and (5) respond to political book challenges and book bans. We explore potential regional differences across the country, and examine the impact of libraries' resources, funding streams, and state political contexts on their interests in, and ability to, deliver community resilience programs.

Environmental conditions play a crucial role in shaping settlement choices. In recent years, climate change has increasingly influenced human mobility, with both direct effects and indirect consequences. The Urban Heat Island (UHI) effect is a prominent phenomenon associated with urban climate change and has been demonstrated to exert a significant impact on the quality of the living environment, consequently reducing the overall well-being of urban residents. However, large-scale evidence on the impact of UHI on residential mobility remains limited. Therefore, this research addresses a central question: Does UHI influence short-term household mobility in U.S. cities, and how do socio-economic factors like green infrastructure and income interact with this process?

This study focuses on San Antonio, Texas—a rapidly warming, high-mobility city—as a case study to explore how disparities in land surface temperature (LST) intersect with income, green infrastructure, housing prices, and energy burden to influence short-term residential mobility between 2018 and 2023. Building on climate adaptation theory and the literature on environmental inequality, the research frames UHI as both an environmental and socio-spatial driver of intra-urban change.

The research utilizes satellite-derived land surface temperature (LST) data and raster-based tree canopy cover. These environmental variables are integrated with household-level data, including economic indicators (e.g., income, housing appraisal values, electricity burden), mobility status, and other demographic covariates. This enables a fine-grained analysis of how UHI and socio-economic conditions jointly influence short-term residential mobility. A two-stage analytical approach is employed. First, Spearman's rank correlation tests and chi-square analyses are conducted to examine whether higher LST values are disproportionately concentrated in lower-income areas. Second, a binomial logistic regression model is used to assess the relationship between land surface temperature (both its absolute level and interannual change) and household mobility status. The model incorporates a rolling-window framework to capture short-term mobility patterns and control for covariates including housing price fluctuations, income level, energy burden, and other demographic characteristics.

Findings reveal that higher summer LST levels are associated with increased short-term residential mobility, especially among lower-income renters in neighborhoods with minimal green infrastructure and higher energy burden. The findings advance planning scholarship by providing new empirical evidence for how climate stress interacts with housing and infrastructure inequality to influence urban mobility.

This research underscores the need for targeted green investment and energy equity strategies in climate-vulnerable neighborhoods. Cities must incorporate UHI mitigation into housing and infrastructure planning to reduce involuntary displacement and promote climate resilience. Additionally, these findings highlight the importance of integrating environmental justice considerations into urban heat adaptation efforts.

The Shifting Geography of Nonprofit Intermediaries

Abstract ID: 1844.0.0.95.2025

Track 2: Community Development

Individual Paper Presentation Submission

Sowmya Balachandran [University of Massachusetts Boston] sowmya.balachandran@umb.edu, presenting author

Nonprofit organizations have emerged as critical intermediaries supporting low-income and minority homeownership, delivering essential intermediation, referrals, and counseling support. This study examines the post-pandemic spatial reconfiguration of crucial intermediaries—HUD-certified housing agencies, place-based anchor institutions, and faith-based organizations. Using spatial analysis and logistic regression, it assesses how changes in nonprofit networks between 2019 and 2024 influence loan approvals. Kernel Density Estimation (KDE) reveals a spatial redistribution of intermediaries, with declines in urban areas—especially Cook County—and increased suburban institutional density. Analyses of Home Mortgage Disclosure Act (HMDA) data indicate that proximity to housing institutions positively impacts cash-out refinance approvals but has limited influence on home purchase loans, challenging assumptions about the universal benefits of nonprofit networks. Findings suggest that while intermediaries support post-purchase stability, structural barriers impede equitable mortgage access. The study underscores the need for policy interventions that strengthen nonprofit networks, address racial disparities in lending, and enhance intermediary effectiveness in supporting first-time homebuyers. These insights contribute to broader discussions on housing equity.

Understanding Foot Traffic Through POI Diversity and Clustering: A Spatial Data-Driven Approach

Abstract ID: 1844.0.0.604.2025

Track 2: Community Development

Individual Paper Presentation Submission

Dingyi Liu [University of Hawaii at Manoa] dingyi@hawaii.edu, presenting author

Suwan Shen [University of Hawai'i at Mānoa] suwans@hawaii.edu

Wei Zhai [University of Texas at San Antonio] wei.zhai@utsa.edu

Haoming Qin [University of Texas at San Antonio] haoming.qin@utsa.edu

Foot traffic data helps business operators and the government refine retail location strategies and improve the visit experience (Lee, 2024; Chang et al., 2023). A mix of point of interest (POI) clustering enhances economic output. (Qian et al., 2022). Although some studies have linked POI and foot traffic (Islam et al., 2021; Yao, et al., 2024), none have discussed how POI clustering impacts foot traffic. This research investigates the relationship between foot traffic patterns and the types of POI clustering in Honolulu, Hawaii, aiming to identify actionable insights that can enhance urban walkability. The research integrates a comprehensive dataset encompassing POI attributes, including commercial establishments, public services, and recreation areas, coupled with pedestrian traffic data obtained from privacy-preserving visitor analytics over a three-month observation period (April, May, and June 2024). Utilizing geospatial analysis, this study measures POI diversity based on the Simpson Diversity Index and applies multivariate clustering techniques to analyze the spatial distribution of POIs and their relationship with pedestrian activities.

Findings from the study reveal complex relationships between POI diversity, clustering, and foot traffic. Areas characterized by high POI diversity generally experience greater foot traffic, underscoring the positive correlation between high density, high diversity POIs, and pedestrian activities. It also reveals that certain combinations of POI will further promote pedestrian activities. For example, if two grids have similar diversity index, the grid with apparel and accessory stores has higher foot traffic than those that don't have. However, notable exceptions were observed in some high-diversity zones where foot traffic was paradoxically low, indicating that factors other than mixed-use zoning and POI diversity influence walking behaviors, such as the location of POIs relative to residential areas, the quality of pedestrian infrastructure, and the specific types of predominant businesses significantly.

This study further discusses the broader implications of these findings for urban planning and policy-making. For example, high POI diversity near low-density residential areas demonstrates less foot traffic rates, suggesting land use strategies that shorten residential and commercial distances or improve public transit connections between residential and commercial areas would improve foot traffic. The study contributes to the field of urban planning by providing empirical evidence on the characteristics of POI clustering that enhance pedestrian-friendly environments, offering valuable insights for policymakers and planners seeking to foster more walkable cities.

In conclusion, this research underscores the necessity of considering both the diversity and strategic placement of POIs in urban planning to effectively enhance walking behavior. The insights gained from the Honolulu case study point towards broader applications for improving urban livability and sustainability through the promotion of diverse, pedestrian-centric POI clusters. Future research should explore these relationships in different urban contexts to validate the findings and further refine strategies for promoting walkability in cities globally.

Urban Heat Stress and Emergency Medical Incidence: Hourly Insights from Human Energy Budget

Abstract ID: 1844.0.0.1037.2025

Track 2: Community Development

Individual Paper Presentation Submission

Kanghyun Lee [University of Idaho] kanghyun@uidaho.edu, presenting author

Rula Awwad-Rafferty [University of Idaho] rulaa@uidaho.edu

Background: Global climate change and the urban heat island effect are increasingly contributing to environments that negatively impact the health of city residents (Yadav et al., 2023). The design of cities can modify microclimates, potentially alleviating or worsening these heat-related conditions. This study aims to analyze hourly patterns between the human energy budget and heat-related Emergency Medical Service (EMS) incidents to assess how thermal comfort and hourly heat effects influence heat-related human health (Lee & Brown. 2022; Seong et al., 2023). This study focuses on using weather data and EMS records from Cincinnati to assess the health impacts of extreme heat.

Method: This study uses hourly weather data and EMS records from Cincinnati, Ohio, focusing on the hot seasons (June–September) of 2019 and 2020. EMS incident categories included heat exposure, cardiovascular distress, headache, and respiratory symptoms. A total of 10,912 EMS cases were selected that involved heat exposure, cardiovascular distress, headache, or respiratory symptoms. The COMFA (COMfort Formula) model was used to estimate the human energy budget, which represents net heat exchange between the human body and the environment. To analyze time-lagged health responses, a distributed lag non-linear model (DLNM) was applied. Spatial analysis was conducted by geocoding EMS incident locations and overlaying them with land cover (impervious surfaces, vegetation, and tree canopy) and heat vulnerability indices at the census tract level, including demographic variables such as age, income, and housing quality.

Results: The analysis reveals that Higher HEB values were significantly associated with increased EMS calls for cardiovascular and headache symptoms, especially within 0–6 hour time lags. Each 10 W/m² increase in HEB led to a relative risk (RR) of 1.37 (95% CI: 1.22–1.54) for cardiovascular cases and 1.19 (95% CI: 1.08–1.31) for headache cases. Respiratory symptoms showed no significant association. EMS incidents were highly concentrated in census tracts with high impervious surface area and low vegetation coverage. Vulnerable neighborhoods with higher poverty and elderly populations experienced disproportionate rates of EMS incidents, aligning with locations of elevated HEB. Peak EMS activity occurred between 2 p.m. and 6 p.m., indicating strong diurnal patterns in thermal stress.

Discussion: This study contributes to planning scholarship by integrating hourly thermal comfort metrics with real-world health data, providing empirical evidence of how microclimate affects urban health on a fine temporal scale. The findings underscore the importance of designing urban environments that reduce human thermal load, particularly in vulnerable neighborhoods. Strategies such as increasing tree canopy, reflective materials, and shaded spaces can help moderate HEB and reduce heat-related health incidents. Furthermore, the use of hourly HEB patterns offers planners a novel metric for forecasting EMS demand and prioritizing interventions during extreme heat events. This approach provides a transferable framework for integrating climate-adaptive design into public health planning, especially as cities face more frequent and intense heat waves due to climate change.

Track 2 Research in Motion (RiM)

Assessing Authenticity in City Branding: The Case of Memphis, Tennessee

Abstract ID: 1842.0.0.445.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Research currently in process

Afsana Tarannum [University of Memphis] tarannum@memphis.edu, presenting author

Charles Santo [University of Memphis] casanto@memphis.edu

Memphis has a rich cultural heritage -- represented in music, history, and food. Memphis is known as the birthplace of blues and soul music, the home of Graceland, and the site of civil rights history at the Lorraine Motel. Cities construct and project their city image through branding efforts. The main goal of city branding is to present it to the world. Other reasons for city branding are to attract tourists and foreign investors. These enable to improvement of the local economy, market cities internationally, and promote civic identities (Mihalís, 2005). Memphis has been subject to all the rationales that make image an important part of public policy and has attempted to promote its cultural history to appeal to creative class workers and increase consumption-oriented development.

Cities initiating branding efforts to attract tourists, investors, and global recognition create tension between authenticity and commercialization. The tension is rooted between top-down branding strategies, such as iconic landmarks and mega-events, and bottom-up lived experiences of the residents. This study investigates the construction and perception of city image in Memphis, Tennessee and examines the tensions between authenticity and commercialization in city branding. Branding is critical for economic development but risks dilution through commodified tourism strategies. This research addresses three questions: (1) Do Memphis's organizational branding narratives reflect its cultural, historical, and social attributes? (2) To what extent do residents perceive these branded images as authentic representations of the city? (3) How can authenticity be systematically measured in urban branding contexts?

The study will employ a mixed-methods design integrating qualitative and quantitative approaches. It will combine purposive sampling for selecting organizations based on predefined attributes (architecture, history, science, society, culture, economy) and company types (formal/informal, local/international), followed by semi-structured interviews. For residents and tourists, the design will include a randomly sampled dichotomous survey (agree/disagree) using the curated images (based on the semi-structure interview) to assess perceptions of authenticity in Memphis. This dual-method approach will ensure triangulation between organizational branding strategies and public perceptions.

The study will advance scholarship by bridging Lynch's (1960) physical-centric model with Lefebvre's (1990) tripartite framework of conceived, perceived and lived experience (Piazzoni, 2018). This study will contribute to the conversation by exploring how Memphis's branding efforts align with or diverge from its cultural and historical realities. By identifying the factors that determine how residents perceive a city's branding efforts, the study will inform urban planners, policymakers, and marketers about the significance of aligning branding strategies with the city's true identity. The findings may encourage cities to prioritize cultural heritage, history, and the lived experiences of residents while creating branding initiatives. This will lead to authentic branding strategies. The results of the study will also be significant for cities like Memphis, which are seeking to rebrand themselves or

improve their existing branding strategies. In the broader context, the research will contribute to the growing field of urban studies by providing a framework for measuring the authenticity of city branding. This can be applied to other cities seeking to ensure that their branding efforts align with the aspirations of their residents and the realities of their communities.

The study will challenge the idea of city branding. The research advocates reimagining branding efforts to use it as a tool to benefit the residents and the community rather than focusing solely on economic development.

Local Schools and Social Infrastructure: Responding to Crisis in Diverse Neighborhoods

Abstract ID: 1842.0.0.132.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Research currently in process

Naka Matsumoto [Meiji University] nakam227@gmail.com, presenting author

Schools are fundamental institutions within neighborhoods, serving not only their traditional roles in education but also as critical support hubs for immigrant families and low-income populations (Forrester et al., 2020; Vincent, 2006). In diverse urban areas such as Baltimore City's Southeast district, public schools have provided trusted spaces where families can access vital information and services in addition to education. For many immigrant families, schools are essential entry points into the broader community, offering support that extends far beyond the classroom (Bierbaum et al., 2023). Parents frequently turn to schools for assistance in navigating complex issues such as interactions with law enforcement, mental and physical health concerns, and access to social services that are otherwise difficult to obtain.

This study examines the role of public community schools—and their collaboration with nonprofit and faith-based organizations—during two recent crises: the COVID-19 pandemic and the sociopolitical turmoil triggered by a new federal administration's anti-immigrant policies in the United States. While Southeast Baltimore is home to a highly diverse population, crises such as these exacerbate existing challenges, including fear, misinformation, and discrimination, increasing the vulnerability of minority and immigrant communities. Understanding how public schools and other organizations respond in these contexts is critical for ongoing and future events.

Based on qualitative interviews conducted between 2023 and 2025 with school principals, community school coordinators, and representatives from nonprofit and faith-based organizations, this research explores how these institutions addressed the crises. Preliminary findings reveal that although social divisions between long-standing residents, newly arrived immigrants, and younger, more affluent newcomers became more pronounced, partnerships between schools, churches, and nonprofits deepened. These organizations worked collaboratively to implement holistic, coordinated responses that addressed residents' urgent needs. They served as key intermediaries, providing accurate information on public health and legal rights, distributing food and medical supplies, and offering mental health support by providing a safe and trusted space.

This case highlights the evolving role of public schools and NPOs as central pillars of social infrastructure in diverse urban neighborhoods. Their ability to foster trust and act as reliable, culturally responsive sources of support underscores their essential function during times of crisis. However, the findings also suggest that without sustained collaboration among a broad range of organizations—including those beyond their immediate focus—these efforts risk losing their effectiveness. Collaborative, community-based approaches must be established and strengthened during non-crisis periods to promote long-term neighborhood resilience and inclusion.

Residential Energy Use and Its Influence on Temperature-Related Mortality in Vulnerable Populations

Abstract ID: 1842.0.0.84.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Research currently in process

Jong pyo Lee [Seoul National University] jgpyoo@snu.ac.kr, presenting author

Heeyeun Yoon [Seoul National University] hyyoon@snu.ac.kr

The seventh goal of the United Nations Sustainable Development Goals (SDGs) aims to provide universal access to affordable, reliable, and sustainable energy for everyone (UN, 2015). Despite these efforts, energy inequality remains a significant issue in many regions in the world. Like many advanced countries in North America and Europe, South Korea archives nearly 100% electricity accessibility, along with a high penetration rate of city gas and natural gas. However, regional disparities are evident, and energy-vulnerable population groups are exposed to higher risks during extreme weather conditions in both summer and winter (Yang et al., 2024). As climate change intensifies, with prolonged summers and winters, these vulnerable groups face year-round exposure to such risks.

Vulnerable groups tend to have low household incomes and live in poor housing conditions (Zhao et al., 2022). They often cannot afford sufficient energy to maintain a comfortable indoor temperature, which is essential for preserving health (Benevolenza & DeRigne, 2019). While previous studies have addressed the energy consumption in climate change era, most have focused solely on predicting energy supply and consumption. Few have directly examined the impact of energy consumption on temperature-related mortality, highlighting the need for further investigation.

Against this backdrop, this study aims to assess the impact of energy consumption on temperature-related mortality rates among vulnerable population group. The study period is set at 18 years from 2005 to 2022, and spatial scope includes a total of 229 jurisdiction (SIGUNGU in Korean) in South Korea. For energy consumption, we look into both residential electricity usage and gas consumption, while temperature-related mortality among vulnerable groups was categorized into mortality rates due to cold and heat among infants, children, and the elderly.

In this following, we conduct a two-fold analysis, assessing overall and spatial inequality and Generalized Additive Model (GAM). First, we measured the overall inequality in energy consumption and temperature-related mortality using the Gini index, and conducted a Local Indicators of Spatial Association (LISA) analysis to reveal the spatial inequalities. Second, we hypothesized a nonlinear relationship in which increases in energy consumption reduce temperature-related mortality among vulnerable groups up to a specific threshold. After the point, the mortality reduction effect would become less pronounced. By conducting GAM, we examine in detail the impact of energy consumption on temperature-related mortality among vulnerable groups to derive the nonlinear effects and the threshold at which these effects change.

Our study contributes to examine the direct impact of energy consumption on temperature-related mortality among vulnerable groups, thereby shedding light on the complex interplay between energy inequality and adverse health outcomes. Furthermore, in the context of climate change and the intensification of extreme weather conditions, our findings underscore the urgent need for policies that reduce regional energy disparities and protect at-risk population groups from the health impacts of prolonged periods of extreme cold or heat.

The Paradox of Vacancy: Speculation, Planning, and the Transformation of Third Places

Abstract ID: 1842.0.0.138.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Research currently in process

Ash Kopetzky [Cornell University] alk278@cornell.edu, presenting author

This project redefines vacancy of third places such as cafes, restaurants, and art spaces—as more than physical emptiness, positioning it as both a disruption of communal and socio-economic systems and a strategy of financialization. In growing cities like Seattle—particularly in Pioneer Square and the Chinatown-International District—vacancy does not indicate decline but an uneven urban process shaped by speculative investment, policy decisions, and shifting land-use priorities. While community-driven efforts seek to reclaim vacant spaces, these same interventions can paradoxically attract speculative capital, troubling the relationship between vacancy prevention, memory preservation, and displacement. Through mapping business closures, analyzing historical business patterns, and tracing how public and private investment firms shape vacancy, this research interrogates how planning policies sustain commercial and ecological vacancies. Using archival research, policy analysis, and spatial mapping, this study reveals how vacancy operates as both a constraint on community stability and a tool for restructuring urban space. By centering neighborhood histories, planning frameworks, and the material conditions of third places, this research uncovers how vacancy is leveraged, resisted, and negotiated in the face of ongoing urban transformation.

University-Community Engagement for Neighborhood Planning: The case for extended partnerships

Abstract ID: 1842.0.0.821.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Innovative practices, concepts, and ideas for pedagogy

John West [Ball State University] jhwest@bsu.edu, presenting author

In poor, post-industrial cities, neighborhoods often do not have the resources to effectively plan (Mallach 2018, Rohe 2009, Peterman 2000). Building on the work of Reardon (2019), this paper shows that urban planning departments and non-profit partners can fill vital gaps in producing data, creating spaces for dialogue, and finding financial support for neighborhood-led planning efforts. This paper argues for the importance of direct involvement of non-profit mediating organizations in the design and delivery of courses for neighborhood-level planning. In 2022, the Ball State Department of Urban Planning established a multi-year effort to enhance local neighborhood planning through a collaboration with the Muncie Land Bank. Ball State faculty and staff designed and delivered neighborhood planning classes with the goal of growing local capacity for effective community development planning by augmenting opportunities for public participation and knowledge production in a specific neighborhood (Innes & Booher 2004). The courses combined student research, regular community input sessions and building new empirical knowledge about the built environment through surveying and analysis. Because land bank staff was deeply involved in the design and delivery of courses, they were able to build on student analysis and plans to acquire property, to write (and receive) grants, and to build development partnerships. The practical and financial successes of the land bank enabled them to hire additional staff, including former students. As a result of initial success, the department and the land bank have elaborated a model for university-community collaboration that will serve several low-income neighborhoods in Muncie, Indiana. Drawing on more than three years of engaged scholarship, as well as interviews with non-profit and community-based partners, this paper details the mutual benefits of long-term, university-nonprofit-community partnerships as well as the challenges of maintaining these relationships in the context of resource deprived higher education and urban settings.

Who Leaves and Who Stays?: the Role of Socioeconomic Status and Place Attachment in Displacement

Abstract ID: 1842.0.0.1118.2025

Track 2: Community Development

Research-in-Motion Presentation Submission, Research currently in process

Chaeun Jun [University of Illinois at Chicago] chaeun.jun@gmail.com, presenting author

While urban development initiatives are enhancing our cities, displacement that often accompanies such progress has been persistently overlooked. Displaced people and those facing displacement pressure are often underrepresented by governments and media. Understanding of mechanisms of displacement would inform policy makers to promote just development.

To understand the mechanisms, we should investigate a process that precede residents' relocation—that is displacement pressure, which is related to residents' feelings. Residents' response to displacement pressure may differ. However, there are two knowledge gaps. First, there is an inconsistency between quantitative and qualitative studies on whether gentrification induces displacement: qualitative studies often demonstrate such an effect, while quantitative studies do not. Second, there are inconsistent arguments about socioeconomic status (SES) and place attachment. Critical theorists argue that lower SES groups rely more on place attachment or community bonds (Harvey 1995; Betancur 2011) due to the scarcity of exchange values, but urban ecologists and urban precarity scholars contend that higher SES groups have stronger feelings of place attachment as lower-SES people do not have enough resources to construct those feelings as they are struggling with daily survivals (McKenzie 1921; Lancione 2015). Scholars in community psychology assert that SES or social class may play a minimal role in constructing place attachment (Sampson, 1988; Hummon 1992).

To fill these gaps, I address two questions: 1. How do residents of varying SES construct their community sentiments? 2. How do these differing sentiments influence responses to displacement pressure, the decision to move out, in a gentrifying neighborhood?

Pilsen, a historically Latino neighborhood in Chicago that has been gentrifying for decades and becoming socioeconomically diverse, is an ideal place for this research. Residents' various income and educational levels and a gentrification index that I developed, consisting of sociodemographic and housing indicators, demonstrate this. I used data collected from a mixed-method approach. First, I conducted an in-person survey (313 respondents). The questionnaire was designed by integrating the extant literature in different fields: community psychology and epidemiology. Second, I used factor analyses to measure respondents' community sentiments and displacement pressure and conducted regression analyses to evaluate the association between socioeconomic status, feelings of place attachment, displacement pressure, and the decision of moving out. I adjusted for confounding factors using covariate adjustment based on directed acyclic graphs and addressed potential sampling bias by raking. I also considered potential non-linear associations.

There are four key findings. First, among individuals who had lived in the area for more than 15 years, those with higher SES reported lower levels of place attachment. Second, individuals with higher levels of place attachment experienced greater displacement pressure and perceived neighborhood changes due to gentrification more greatly. Third, individuals with higher place attachment were more likely to stay in the neighborhood, while those who experienced displacement pressure or with higher SES were more likely to move out. Fourth, there was an interaction between displacement pressure and feelings of place attachment in their relation to the decision to move out; the effect of displacement pressure on the decision to move out was higher among individuals who have higher place attachment.

Findings contribute to understanding the mechanisms behind displacement pressures and the decision to move. They inform policymakers about the varied responses in gentrifying neighborhoods, shaped by residents' SES, length of residency, and place attachment; their effects may diverge from patterns reported in existing quantitative gentrification studies.

Can Local Governments Repair Harm? Moving Toward Equity and Reparative Planning

Abstract ID: 1840.0.0.130.2025

Track 3: Economic Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.64.2025, 1844.0.0.70.2025

Mildred Warner [Cornell University] mew15@cornell.edu, organizer

The COVID-19 pandemic and its aftermath ushered in a new, more equity focused period, with an infusion of funds from the American Rescue Plan, and calls for reparative planning to address structural inequities. While this policy window may be closing with the Trump Administration, it is important for planners to explore the extent to which equity was embraced by US local governments, and the attitudes, processes and actions that differentiate cities that did more to address equity. In this session we explore the extent to which local governments included equity in their ARPA Plans, and if such plans made a difference in ARPA expenditure choices. We also look at several policy innovations – from universal basic income experiments, to new tax credits for families, to reparations programs. This empirical evidence is used to advance our theoretical understanding of the role of planning, economic development and our understanding of the potential and limits of local action.

Learning Objectives:

- Learn how local governments are creatively using their Am. Rescue Plan funds and how AI tools can be used to assess plans.
- Learn about the policies and practices that promote equity at the local and state levels.
- Learn about the opportunities for a reparative planning approach, both theoretically and practically.

Stuck in Neutral: Did US Local Governments Pursue Equity in their American Rescue Plans?

Xuelian Li [Zhejiang University] lixuelian@zju.edu.cn

Since the Great Recession some urban scholars have argued that cities have become austerity machines cutting services to those in greatest need. Others find cities balance service needs within fiscal constraints in a process of pragmatic municipalism (Warner et al. 2023). Progressive action is also possible, and can be used to broaden local government action and address structural constraints (Doussard and Quinn 2025, Diaz Torres and Warner 2024). But this typically falls short of a more radical reparative planning approach called for by some planning scholars (Williams 2024, Poe 2023). However, the possibility for structural transformation and progressive reform was made possible with the American Rescue Plan of 2021 which provided flexible funds for cities and counties to address structural inequities laid bare by the COVID-19 pandemic.

We assess the Recovery Plans submitted to the US Treasury by large US cities and counties regarding their ARPA investments. Using a framework for equity that includes redistribution, procedural and conceptual dimensions as well as measures to detect masquerading (false positives), we develop a ChatGPT-based equity protocol to assess language, action and processes to see to what extent equity was prioritized in ARPA investment plans. We use our ChatGPT protocol to assess the progressiveness of the ARPA Recovery Plans for all 327 Tier 1 governments (over 250,000 population). We then assess the factors that might differentiate the equity rankings of each plan. These include local government context: capacity, politics, local need, fiscal limitations, partisan voting, and local Black Lives Matter protests (during 2020) as well as socio-demographic characteristics. We find that most plans are neutral. Across all plans, we see pragmatic municipalism responses as local governments cautiously address equity while ensuring ARPA benefits extend more widely to the broader community. This may be strategic now that the Trump Administration is challenging the equity focus of all government activity.

The effectiveness of local plans in translating intentions into actions remains a central concern in urban planning. This challenge becomes particularly pressing as local governments expand their equity roles to advance progressive initiatives. Do plans matter in shaping progressive local actions, particularly in times of crisis? This study focuses on the American Rescue Plan Act (ARPA) during the COVID-19 pandemic, which encouraged local governments to invest in public health and address structural inequalities. We investigate whether the progressiveness of local ARPA plans influences expenditure choices and leads to greater investments in equity-oriented areas.

We employ ChatGPT to comprehensively analyze how 327 Tier 1 US cities and counties (over 250,000 pop) spent their ARPA funds. ARPA encouraged local governments to focus on public health and addressing negative economic impacts, especially in minority and low income neighborhoods. At the same time, ARPA gave local governments flexibility by allowing them to claim up to 68% of funds as “revenue replacement”. We use ChatGPT to analyze 77,811 individual project descriptions of funds recorded under “revenue replacement”. This enables us to recode expenditures back into the broader ARPA categories. We find these expenditures are similar to the expenditures reported in the official ARPA categories, except that proportionally more revenue replacement funds are spent on public sector capacity.

Next, we run regressions on the distribution of ARPA expenditures. Our independent variables include the level of progressiveness in the local government ARPA plans, as well as local socioeconomic needs, government capacity, fiscal stress, and political influences, including Republican control. This allows us to compare equity claims with equity actions while controlling for local constraints. Our regression analysis reveals that local ARPA plans play a critical role in driving equity investments, particularly in public health and economic relief for households, affordable housing, and community services. However, we also find evidence that some local governments strategically used their ARPA funds to enhance public sector capacity while framing their actions within an equity narrative. By examining the relationship between planning and implementation, this study highlights the need for stronger link between equity discourse in local planning and actual investment in local actions.

How Financial Incentives and Zoning Shape the Warehouse and Logistics Landscape

Abstract ID: 1840.0.0.643.2025

Track 3: Economic Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.499.2025, 1844.0.0.438.2025, 1844.0.0.433.2025, 1844.0.0.243.2025, 1844.0.0.417.2025

Noreen McDonald [University of North Carolina at Chapel Hill] noreen@unc.edu, organizer

The past decade has been marked by a boom in large-scale warehousing and distribution facility construction, driven by growth in e-commerce, changing technology, and logistics consolidation, accelerated by the COVID-19 pandemic. This result has been development of ever-larger distribution facilities on the peripheries of metropolitan areas coupled with more proximate fulfillment centers. This session explores the economic development and land use planning processes and practices that are impacting siting of warehouse facilities and ultimately impacts of people and communities. We will present case studies from multiple states, e.g. CA, IL, NC, to depict which communities are encouraging and discouraging these facilities and what mechanisms they are employing.

Learning Objectives:

- Understand the causes of the boom in warehouse and logistics facilities in North America and the likely trajectory of such development
- Understand how financial incentives for municipalities influence zoning and siting for logistics facilities
- Understand how zoning and associated development approval processes are influencing siting for logistics facilities

Economic Development Incentives for Warehouse Construction: Evidence from Amazon's Chicago Expansion

Abstract ID: 1844.0.0.499.2025

Track 3: Economic Development

Pre-Organized Paper Presentation

Lauren Nolan [Rutgers University] lauren.e.nolan@rutgers.edu, presenting author

This paper examines the use of economic development incentives for the construction of warehouse and distribution facilities. The past decade has been marked by a boom in large-scale warehousing and distribution facility construction, driven by growth in e-commerce, changing technology, and logistics consolidation, accelerated by the COVID-19 pandemic. Given the infrastructure strain and environmental impacts of these facilities, many municipalities have sought to limit warehouse construction within their bounds, going so far as to institute construction moratoriums. However, other municipalities in the same regions have instead been eager to attract these facilities, doing so with a variety of tax incentives and economic development subsidies. Incentives remain a controversial economic development strategy, as there is limited evidence that they positively contribute to job growth and influence firm location decisions (Donegan et al., 2019). Furthermore, use of incentives comes with opportunity costs in the form of increased household taxes and reduced public services and may serve to exacerbate inequalities (Bartik, 2020; Lippert & Moore, 2020; Jansa, 2021;). While use of incentives is heavily studied, little work examines incentive use for warehouse construction in the contemporary logistics context. This paper catalogs the use of economic development incentives provided for warehouse facilities operated in the Chicago region by Amazon—the largest warehouse tenant in the U.S., to ask two questions: (1) what types of incentives at which scales are subsidizing warehouse construction, and (2) does incentive use exhibit patterns based on municipal demographic and fiscal characteristics? Data on incentives is assembled from government reports, planning documents, media coverage, and data collected by Good Jobs First's subsidy tracker and is analyzed alongside municipal demographic and fiscal data from annual financial reports.

Three findings emerge. First, incentive use is widespread, with over half of Chicago-area Amazon facilities receiving at least one form of incentive. Second, warehouse incentive programs are administered at the local, state, and federal levels by multiple entities, and are frequently layered. Third, the use and type of incentive exhibited patterns based on local municipal characteristics, reflecting the presence of varied entrepreneurial development regimes (Craft et al., 2020). Fiscally distressed and heavily indebted municipalities were more likely to provide large-dollar incentives through tax increment financing than their fiscally healthy counterparts, raising important questions about the opportunity costs and tradeoffs of these incentive strategies. This underscores the need to consider incentive use in context and in conversation with contemporary debates in freight planning about how to facilitate more efficient and equitable logistics planning outcomes.

Warehouse in the Garden: The Changing Logistics Landscape of the Port of New York-New Jersey

Abstract ID: 1844.0.0.438.2025

Track 3: Economic Development

Pre-Organized Paper Presentation

Liana Katz [Rutgers University] liana.katz@rutgers.edu, presenting author

Over the past three decades, the state of New Jersey has seen a rapid expansion in commercial warehouse construction driven by rising import flows through the Port of New York-New Jersey and a speculative industrial land market. Development is occurring not only along major thoroughfares close to the port but also in suburban and quasi-rural municipalities where earlier modes of production and consumption are becoming obsolete. These include agriculture, manufacturing, sprawling office parks, and enclosed malls. Such development mirrors trends across the United States' port cities, particularly Los Angeles-Long Beach (De Lara 2018). Though New Jersey is home to the second largest port in the United States, it has remained understudied in academic literature. Similarly, those familiar with New Jersey's burgeoning logistics landscape argue that the state's locational centrality to the east coast consumer market explains the recent rise in warehousing. This paper seeks to complicate this narrative of geographic determinism by uncovering the historical and political forces which have made land available for development, particularly for logistics infrastructure. It also considers how communities and the warehouse workforce—primarily immigrant temp laborers—are responding to warehouse expansion.

This paper presents findings from twelve months of ethnographic research with planning and policy practitioners and in communities impacted by the growth of logistics as a development strategy in New Jersey. Using data gleaned from qualitative methods including participant observation, semi-structured interviews, historical document analysis, and auto-ethnography, this paper nuances critical logistics studies' interest in the normative rationalities of global goods distribution (Bonacich and Wilson 2008; Cowen 2014). Rather than aiming to map the macro-scale structure of logistics networks, this paper works through three interlocking thematic lenses—land, labor, and the body—to understand the multi-scalar processes and relationships which animate logistics infrastructures in New Jersey. It argues that land has been rendered available for warehouse development through historical redlining practices, speculative investment, and logistics expansion designed to counter the port's trajectory of decline in the late 20th century. These changes have sparked grassroots protest movements in rural and suburban municipalities which simultaneously raise critical environmental concerns and aim to preserve the exclusionary, white character of their communities. Finally, it considers how warehouses serve as a key place of employment for immigrants whose gender and migration status renders them precarious. These workers are often connected with warehouse jobs through temporary employment agencies which link multinational corporations to immigrant strongholds throughout New Jersey. While we might imagine warehouses to be highly technologically integrated worksites, the most vulnerable workers often must use their bodies as their primary tool.

At a broad level, this paper contends that warehouses are more than a repository for goods within our globe-spanning system of production and consumption. Rather, they are symbolic and material constructions which connect disparate communities and concerns. It further suggests that we must center the human body and relations in our understandings of what constitutes logistics infrastructure today.

The Logistics of Zoning, Zoning for Logistics: Toward Equitable Development for Urban Freight

Abstract ID: 1844.0.0.433.2025

Track 3: Economic Development

Pre-Organized Paper Presentation

Travis Fried [University of Washington] tfried3@uw.edu, presenting author

Warehousing and distribution center (W&D) expansion has raised concerns about disparate, adverse health effects from urban freight. While local governments wield several tools to manage logistics-related development, few may be as consequential to public health disparities as zoning. This study synthesizes the state of recent U.S. zoning actions toward W&D, and evaluates zoning as a tool for protecting public health in areas historically burdened by freight traffic. Specifically, we investigate 92 zoning actions at 67 locations (51 municipalities, 9 counties, and 7 states) and assess the level at which Environmental Justice (EJ) principles inform these actions. We analyze 213 public documents including ordinance texts, council meeting transcripts, zoning codes, plans, and developer/advocacy websites. We find that despite the recent attention toward W&D at the state-level, most local actions are discretionary (n=32). While we offer examples of councils aligning with EJ groups, discretionary processes have important drawbacks. Other jurisdictions revisit long-term plans (n=17), land use definitions (n=13), development standards (n=13), and conditional use permitting (n=12). However, many regulations restrict by-right W&D development with little indication that these changes are intended to benefit marginalized communities historically burdened by freight traffic.

Ultimately, local jurisdictions lack a unified regulatory approach to W&D. However, long-term plans and state environmental policies guide jurisdictions with the most EJ-explicit actions. Ensuring equitable and healthy urban freight development requires clear strategic priorities and environmental safe-guards for vulnerable populations. We discuss how these findings fit into contemporary debates surrounding zoning and urban freight planning.

Planning for warehouse development: A case study of spot rezonings in California

Abstract ID: 1844.0.0.243.2025

Track 3: Economic Development

Pre-Organized Paper Presentation

Laura Schmahmann [University of California, Berkeley] laura.schmahmann@berkeley.edu, presenting author

The rise in online shopping has increased demand for large distribution warehouses for the storage and distribution of retail goods on the urban periphery. In northern California, agricultural land has been rezoned to industrial for the purpose of warehouse development, while in southern California, residential development has been cleared to make way for warehouses. The rezoning of residential land to industrial is uncommon, particularly in California where there is a severe housing shortage and residentially zoned land is typically considered to be the “highest and best use.” The proximity of these warehouses to residential communities is an environmental justice concern given they generate negative externalities such as air pollution and can cause road safety hazards for vulnerable road users (Wang et al., 2022; Yuan, 2021).

The introduction of environmental acts and the environmental assessment process during the 1960s and 1970s coincided with a broader movement in planning – the rational or utilitarian approach to planning – which saw planning as a series of choices or decisions (Davidoff & Reiner, 1962). Despite extensive critiques regarding its subjectivity, the rational approach to planning remains a dominant paradigm in the practice of planning, including comprehensive planning. Spot rezonings are private proposals to rezone a site or precinct, that typically occurs outside the comprehensive planning process. There are three core issues associated with spot rezoning: it can confer wealth transfer to the landowner, it may indicate political capture by landowners and developers, and it can violate the structural integrity of the zoning system (Mandelker, 2016). While spot zoning is discussed within the legal literature, it is rarely discussed within planning literature, which has primarily focused on upzonings.

In this paper, I explore how planners evaluate spot rezoning proposals including the planning practices and value judgements which shape their decisions to expand industrial land. I draw on case studies of five projects across San Joaquin, Riverside and San Bernardino counties in California. Through a review of environmental impact reports (EIRs), planning reports, recordings of city council and planning committee meetings, bill proposals, media articles and semi-structured interviews, I explore the institutions and practices that shape the siting of warehousing, as well as their failures. While EIRs conclude that the warehouse projects will have significant and unavoidable environmental impacts, site rezonings to industrial are nevertheless justified based on a “statement of overriding considerations.” These statements prioritize city or county-wide economic “benefits” such as job creation and revenue generation, reflecting the broader fiscal and economic vulnerabilities of these cities, and the fiscalization of land use (Wassmer, 2002).

In this paper, I argue there is a mismatch between the scale of the project-level environmental assessment and the city-wide economic “benefits” which are used to justify the approval of the rezonings, and, more broadly, a mismatch between local incentives and welfare objectives. This paper provides important insights for planners regarding land use planning and the environmental assessment process. Specifically, this paper recommends that planners avoid spot rezonings and instead should ensure rezonings are part of a comprehensive plan and considered in the context of the broader equity considerations for a local jurisdiction.

Planning the E-Commerce Landscape in North Carolina: Analysis of Spatial Patterns and Development

Abstract ID: 1844.0.0.417.2025

Track 3: Economic Development

Pre-Organized Paper Presentation

Noreen McDonald [University of North Carolina at Chapel Hill] noreen@unc.edu, presenting author

Graham Bishai [University of North Carolina at Chapel Hill] gbishai@unc.edu

Yuwei Fu [University of North Carolina at Chapel Hill] yuweifu@live.unc.edu

Recent years have seen a rapid rise in online shopping and a resulting uptick in logistics facilities across American and global communities. Evidence suggests that the spatial patterns of these facilities have changed as the volume increases require ever larger distribution centers and rapid delivery windows require facilities proximate to population centers.

Less clear is how land use planning and development approval processes are responding to this shifting economic landscape. This study assesses these processes in North Carolina to capture how local governments are responding and presents analyses of the spatial patterns of recent developments. We examine recent spatial patterns of warehouse development in North Carolina, and the urban planning processes, locally, statewide and/or regionally, that are guiding warehouse development in the region.

We employ a mixed-methods approach surveying warehouse development in the state with geospatial analysis and conducting interviews with planners, developers, and other related professionals overseeing warehouse development. We interviewed 15 planners in jurisdictions across several municipalities and coded interview results in Dedoose. Simultaneously, we conducted a spatial analysis of warehouse facilities and their development in North Carolina using the U.S. Historical Business Database from Data Axle – Reference Solutions (formerly ReferenceUSA).

The spatial analysis shows hotspots of warehouse facilities located near population centers in locations with rapid access to the transport network. Since 2015, warehouse facilities in NC have increased and the size of facilities has grown as well. The geographic center of warehouse activity has shifted outward showing evidence of logistics sprawl.

Interviews with planners revealed that most warehouse development in the state has minimal development approval processes because it is sited in light industrial zones where these facilities can be developed by right. Most planners in the state indicated a favorable predisposition to these type of developments comparing them to other more impactful uses that are possible in light industrial zones.

A small number of communities used long-range planning processes to be attractive locations for large-scale distribution centers. The strategies included zoning large areas in attractive locations, eg near interstate on-ramps, light industrial and proactively building onramps and other infrastructure. The communities engaging in these activities tended to be at critical nodes on the highway network, ie where two interstates meet, and close to multiple metropolitan areas.

State policies are also influential on these processes. The state has an incentive program to attract these type of facilities and the NC Department of Transportation requirements affect the development approval process.

Public involvement in warehouse siting decisions is limited. This is because most of the development is by-right and because most communities work to separate residential and light industrial areas because of the likelihood of traffic and noise complaints.

The conclusions that emerge from this work are that a small number of jurisdictions that are well-situated along transport networks are likely to see continued demand for warehouse facilities. Long-range planning for this demand would provide these communities with the ability to anticipate fiscal, employment and resident impacts.

'Safe and Clean' Reexamined: Evolving relationships between BIDs, Policing and Smart Technologies

Abstract ID: 1844.0.0.99.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Lisa Berglund [Morgan State University] lisa.berglund@morgan.edu, presenting author

Laura Wolf-Powers [Hunter College] aw2416@hunter.cuny.edu

Devan Bell [Dalhousie University] dv542804@dal.ca

Literature on business improvement districts (BIDs) has described the ways that the presence of law enforcement officers and communication with law enforcement agencies has been integral to the establishment of BIDs and their priorities (Vitale 2008; Stuart 2016; Herring 2019). These authors point to a dovetailing of 'safe and clean' initiatives that have been centerpieces of BID missions with order maintenance policing practices that have been described as keys to urban development under neoliberalism (Wacquant 2009). In recent years, BIDs have also adopted smart city technologies like pedestrian counters and platforms to collect consumer data, along with other technologies that support the objectives of their membership (Kudla 2022). While public safety is a top priority in the mission of many BIDs (and has been since their inception), there is a scarcity of scholarship identifying how their relationships with law enforcement may have evolved in light of the expansion of smart city and police surveillance technology. We currently lack an understanding of how law enforcement-BID coordination may have shifted in terms of formal and informal arrangements, personnel, data/information sharing, and in their shared initiatives. Furthermore, as law enforcement agencies continue to invest more in expanding a tech-focused police surveillance apparatus, the role of BIDs in this expansion—as stewards of public space that often use consumer facing technologies to track behaviors of users—remains undefined. This research uses New York as a case study and is a content analysis of interviews with BID staff and tech companies, city reports on BID functions, and marketing materials. In this analysis, we answer the following: 1) What does the prevalence of smart city tech look like for BIDs? 2) How have these types of tech been integrated into the ways that BIDs cooperate with law enforcement? And 3) How have BID relations with law enforcement evolved under the smart city ethos?

We found that while police surveillance technologies are ever-present features of neighborhoods, BIDs' engagement with smart technology tended not to focus on public safety as a goal. To carry out safety related mandates, BIDs tended to rely on human know-how and relationship-building more so than technology—a strategy that is more akin to their roots in law enforcement collaboration through boots on the ground security officers and frequent communication. There are, however, new ways that BIDs have integrated their practices into the work of order maintenance policing. We found that the practice of hiring private security and coordinating with law enforcement has evolved into established practices of law enforcement (off-duty and retired) being formally integrated within BIDs' organizational structures (e.g.: as board members, staff and security). There were also instances where law enforcement oriented tech products were integrated into the offerings of companies that market their products to BIDs, creating a (not necessarily sought after) overlap between technologies for policing with economic development. Further, we found that law enforcement often obtain CCTV footage from BID members for investigations, and have held public meetings to encourage the adoption of surveillance technologies like CCTV and doorbell cameras. Importantly, we also found evidence of resistance to law enforcement integration and police surveillance technologies into the workings of BIDs, many of whom were concerned that this type of

cooperation would be a threat to community trust and place the safety of over policed populations in further jeopardy. These findings shed light on the nature of relationships between development and policing that are often overlooked in planning literature, and provide new insights around the role of BIDs in the policing of public space.

A Framework for Equitable Economic Development: Looking In, Leveraging, and Locking

Abstract ID: 1844.0.0.1006.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Haegi Kwon [Lincoln Institute of Land Policy] hkwon@lincolninst.edu, presenting author

What would economic development “look like” if resident well-being and equity were primary goals of economic development, not aspirational after-effects of growth? Growth is typically the prime objective of economic development, at least in part due to fears that without continually creating or at least replenishing stocks of economic development assets, economic stagnation and decline will occur in cities and regions (Hill 2023). To this end, economic development practitioners usually employ “best practices” to attract and retain the “right” people and industries to promote growth. This presentation will instead offer an alternative framework - Looking in, Leveraging, and Locking (3Ls) – based on a synthesis of existing asset-based theories to explore how economic development practice may be more attuned to promoting equitable development in places, particularly those with histories of disinvestment, population loss, and other challenges. These existing models include the community capitals framework (Emery and Flora 2006), Asset-Based Community Development (Kretzmann and McKnight 1993), the community economies framework (Gibson-Graham 2006), and the concept of “scaling deep” from the organizational studies literature (Kim and Kim 2022). Looking in refers to a process whereby stakeholders assess existing formal and informal assets to address economic concerns. Leveraging refers to how stakeholders may collectively draw from existing assets to garner additional resources to achieve shared priorities. Finally, locking refers to ensuring that economic activities benefit residents and helps to generate community stability and wealth building. I will then offer two case studies of organizations in cities that exemplify the 3L model in action (Made in Durham in Durham, North Carolina and Invest Appalachia in Central Appalachia).

A Theoretical Framework for the Co-evolution of Technological Change and Regional Economic Growth

Abstract ID: 1844.0.0.573.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Seongjun Yang [Pusan National University] ysjustice@pusan.ac.kr, presenting author

Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

[Central Theme and Research Question] This study examines the complex co-evolutionary dynamics between technological change and regional economic growth. Drawing on endogenous growth theory and evolutionary economics, technology is shaped internally by economic agents pursuing monopolistic competition (Romer, 1990; Nelson, 1994). From a regional perspective, these agents—firms, industries, and institutions—form regional innovation systems (RIS), where networks facilitate continuous interaction and drive further technological advancement (Cooke, 2001; Fritsch et al., 2019). This interplay creates path dependencies in regional economic evolution, leading some regions to stagnate while others reorganize and thrive, rather than “lock-in” (Martin & Sunley, 2006). A key issue for regional planning is to understand how technological change and regional economic conditions mutually influence each other over time, shaping development trajectories. The primary research question is: How do technological change and regional economic growth co-evolve, and what are the mechanisms that drive this bidirectional relationship? By addressing these questions, the study aims to clarify the processes that are essential for sustainable regional development.

[Approach and Methodology] The study develops a theoretical framework rooted in evolutionary economics, regional innovation systems, and endogenous growth theory. This framework explains that technological change and regional economic growth are interdependent: innovations reshape industries and labor markets, while regional characteristics—human capital, infrastructure, and institutional frameworks—guide technological trajectories (Romer, 1990; Nelson, 1994). The methodology combines a comprehensive literature review with comparative case studies of Silicon Valley and the Rust Belt. The literature review synthesizes existing theories to identify gaps in understanding co-evolutionary dynamics, while the case studies demonstrate how regional conditions and technological progress reinforce each other in empirical terms.

[Meaningful and New Findings] The research introduces a novel theoretical model that captures the feedback loops between technological change and regional economic growth, departing from traditional approaches that consider only one-way relationships. This model emphasizes the endogenous nature of innovation in regional contexts and offers a new perspective on development dynamics. Preliminary findings from the case studies reveal a clear co-evolutionary cycle: government investment in infrastructure attracted technology firms, which promoted innovation and economic growth, which in turn enhanced the region's technological capacity. This positive feedback loop provides empirical support for the framework, demonstrating how regional conditions and technological progress are mutually reinforcing. These findings provide a structured approach to analyzing the interrelationships that drive regional development, adding depth to the existing literature.

[Relevance and Implications] This work has important implications for planning scholarship and practice. On the one hand, for scholars, it advances the theoretical understanding of co-evolution in regional development. On the other hand, for practitioners, the framework provides a tool for designing policies that leverage technological investments for sustainable growth—such as R&D incentives for emerging regions or innovation networks for mature ones. By clarifying these dynamics, the research equips planners with strategies for fostering resilient, technology-driven regional economies.

Agglomeration Economies in Social Innovation Cluster through Network Diversity

Abstract ID: 1844.0.0.802.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Mina Kim [Portland State University] kimmin@pdx.edu, presenting author

Greg Schrock [Portland State University] gschrock@pdx.edu

Amid the global growth of the social economy, supporting social economy organizations (SEOs) is increasingly seen as a tool for both efficient public service delivery and economic development through local entrepreneurship and demand-based market creation (Jessop, 2003). Social innovation clusters have emerged as key in regional development, based on theories of innovation districts and industrial clusters that highlight the benefits of geographic proximity and network diversity (Gerli et al., 2021). However, empirical research remains limited due to scarce data and underdeveloped theory on agglomeration effects in social innovation contexts.

This study quantitatively examines how network diversity within a social innovation cluster affects SEO survival. Drawing on agglomeration economies and entrepreneurship literature (Cai & Etzkowitz, 2020; Jacobs, 1969; Porter, 2000), the study hypothesizes that field diversity (e.g., partnerships across IT, education) and sector diversity (e.g., collaboration with public, private, and civil sectors) enhance survival. However, it expects diminishing returns beyond a certain level (curvilinear effects). Regional diversity (geographically dispersed partnerships) is expected to have limited impact considering social embeddedness. Lastly, it hypothesizes that intermediary organizations moderate these relationships by managing partnerships.

To test these hypotheses, the study applied a quadratic logit regression model to distinguish between linear and curvilinear effects of diversity, with network diversity measured using the Herfindahl-Hirschman Index (HHI). Social network analysis was used to calculate degree and closeness centrality. The moderating variable, *ratio_io*, reflects the proportion of an SEO's partnerships involving intermediary organizations. Control variables include organizational type and profit orientation.

The study uses data that is extracted from a performance document of Seoul Innovation Park, a social innovation cluster created in 2015 by the Seoul Metropolitan Government to support SEOs. Located on a 100,000 square-meter site, the park hosts around 130 SEOs and 11 intermediary organizations. Data include business and partnership information on 113 SEOs from a 2020 survey, with updated survival status verified in 2024 using tax records and websites.

Initial Findings show that accounting for curvilinear effects and intermediary roles improves model fit. Sector diversity positively influences survival, while field diversity has a negative effect. Only field and regional diversity show curvilinear trends. These results challenge the assumption that more diversity is always better. Excessive field diversity appears to dilute focus and strain resources. The moderating role of intermediaries, though often emphasized, showed limited empirical support.

This study contributes to the literature by offering a rare quantitative examination of how network structures within social innovation clusters shape SEO survival. By building on existing scholarship and disaggregating the broad notion of cluster diversity into field, sector, and regional dimensions, the study provides a more precise analytical framework for understanding the role of diversity in cluster dynamics. Practically, the findings stress the value of balanced diversity and targeted support mechanisms over indiscriminate expansion of partnerships.

*This study is part of a comprehensive mixed-methods doctoral dissertation that investigates agglomeration economies in the context of social innovation clusters, with this paper focusing on the quantitative analysis.

Beyond Workforce Development: Toward a New Paradigm of Human and Community Flourishing

Abstract ID: 1844.0.0.682.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Greg Schrock [Portland State University] gschrock@pdx.edu, presenting author

“Workforce development” (WD) emerged in the 1990s as an outgrowth of employment and training programs grounded in Federal anti-poverty efforts of the 1960s. Scholarship on this new WD paradigm emphasized job connectivity, skills development, and career ladders (Giloith 2000; Schrock 2014). The WD paradigm arrived at a moment of growing neoliberalization of social and labor market policies, in particular welfare-to-work programs, but also significant experimentation at the community scale with novel approaches to job-centered economic development targeting historically marginalized populations. For this reason, WD as a field has enjoyed relatively broad political support, even though it has been fragmented both in scholarship and practice.

But is the workforce development paradigm in step with progressive planning visions of economic development that center economic and racial justice, human capabilities and flourishing (Doussard and Schrock 2022)? I argue that WD field’s narrow focus on worker skills and labor force attachment, and growing orientation toward employer needs and prerogatives, marginalizes it relative to broader urban justice movements. For example, minimum wage campaigns have successfully “grown the pie” for low-wage workers overall, rather than simply helping them access bigger slices of the existing pie. At the same time, the COVID-19 pandemic drew attention to the role of social infrastructure – such as housing and childcare – in supporting labor force participation, especially for women. And finally, the continued deepening of workplace technology adoption reminds us of the importance of the ability of workers to utilize their skills.

In this paper I sketch out what a new paradigm “beyond” workforce development might look like. The first element would go “beyond skills” to organizational practices and policy frameworks for building worker power and agency. The second element would go “beyond wages” to a focus on individual and household well-being, which would engage more meaningfully with social reproduction. The final element would go “beyond careers” to a broader orientation toward human and community flourishing, including but not limited to jobs and labor force attachment. I draw on case studies from around North America to help illustrate and elaborate the parameters of this new paradigm. I conclude that a new paradigm for worker power, well-being and flourishing would bring the field more closely into alignment with the planning field’s progressive norms and orientation.

Building Inclusive Entrepreneurial Ecosystems: Addressing Market Failures for MWOBs

Abstract ID: 1844.0.0.20.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Sua Kim [University of California, Riverside] sua.kim@ucr.edu, presenting author

Qingfang Wang [University of California, Riverside] qingfang.wang@ucr.edu

Entrepreneurial ecosystems (EEs) are crucial for business development and economic growth, yet research on EEs for minority- and women-owned businesses (MWOBs) remains limited. Traditional EE frameworks emphasize market forces, networks, and institutional support but often overlook systemic barriers such as discriminatory lending, exclusion from supply chains, and limited financial and social capital. These barriers create persistent market failures, reducing business survival rates and economic mobility for MWOBs. Addressing these challenges requires more than conventional entrepreneurial support; it demands intentionally designed, community-driven ecosystems that align mission-oriented stakeholders and leverage existing networks.

This study examines how locally embedded and regionally connected networks function as EEs to address market failures for MWOBs. Using the Ascend program as a case study, we analyze how universities, nonprofits, financial institutions, and private-sector partners collaborate to support MWOBs across 13 U.S. cities. Built on the M3 framework—focusing on financial access (Money), management skills (Management), and market access (Market)—Ascend provides MWOBs with historically less accessible resources. Through qualitative research, including interviews with Ascend business alumni and key stakeholders, we explore how mission-driven partnerships enhance resource accessibility and address structural inequities within traditional EEs.

Findings suggest that purpose-driven partnerships in underserved communities fill resource gaps, foster equitable economic growth, and transform fragmented networks into cohesive EEs. These partnerships do not emerge organically but are intentionally cultivated through mission alignment, pre-existing networks, and strategic opportunities. Universities and nonprofits build trust and legitimacy, while financial institutions and corporate partners provide capital and market linkages for business scaling. By leveraging existing relationships and designing targeted interventions, these collaborations enhance knowledge-sharing, financial access, and market opportunities for MWOBs.

This research shifts the focus from macro-level regional analyses to institutional actors shaping EEs. It provides empirical evidence on how partnerships among universities, nonprofits, corporations, and government agencies enhance MWOBs' access to markets and capital. It also offers practical insights for policymakers and business support organizations on building trust, tailoring programs, and structuring long-term partnerships. Instead of one-size-fits-all models, we emphasize flexible, place-based strategies that align institutional missions with entrepreneurship initiatives to foster equitable economic growth.

Ultimately, this study highlights how intentionally designed EEs—rooted in partnerships, mission alignment, and regional connectivity—can bridge systemic market failures and enhance economic resilience. Insights from the Ascend program offer a scalable model for promoting economic inclusion and entrepreneurship.

Do AI innovations benefit farther-away places' AI entrepreneurship?

Abstract ID: 1844.0.0.44.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Yijia Wen [Florida State University] yw20bn@fsu.edu, presenting author

Kerry Fang [University of Illinois at Urbana-Champaign] kfang@illinois.edu

A long discussion has focused on the role of distance in knowledge spillover effect. On the one hand, studies argued increasing remote working and technology advancement can weaken the agglomeration effect and benefit places geographically further from innovation hub (Haefner & Sternberg, 2020). On the other hand, researchers demonstrate that the technology shock to physical distance is overestimated (Tranos & Nijkamp, 2013).

It is worth revisiting the distance's role in knowledge spillover because the recent evolving technology might have changed the distance of knowledge spillover. AI employee's workplace is less bounded by geography due to the digital and data-driven nature of the industry. The way of interaction and collaboration can be very different among employees in digital high-tech industry from those in traditional industries.

Entrepreneurship is a critical channel and outcome for commercializing knowledge spillover into tangible economic impacts. While incumbent firms tend to select safe alternatives and may underutilize innovation, entrepreneurs are more willing to take risks to commercialize novel knowledge, create new business, and generate jobs (Henderson & Weiler, 2010). Emerging AI technology serves as a potent enabler of entrepreneurship, fostering new economic opportunities. The research tests whether AI-driven innovation spills over beyond innovation hubs, contributing to AI entrepreneurship in more distant locations.

The paper contributes to knowledge spillover theory of entrepreneurship literature by examining AI fields. Due to data limitation, previous studies use a broad definition of high-tech industry and include manufacturing industries into the high-tech categories (Liu et al., 2021; Qian et al., 2013). These results can underestimate the distance of knowledge spillover in high-tech industry because manufacturing industries are more dependent on physical equipment and can be more location-restricted than digital high-tech industries. Our study overcomes the limit by focusing on AI innovation and entrepreneurship.

We use the following datasets. We identify AI patents using Artificial Intelligence Patent Dataset (AIPD). Meanwhile, we collect patent inventor and patent content information from the United States Patent and Trademark Office (USPTO). Besides, we collect AI firms from CrunchBase, which is an increasingly prevailing database on innovative startups and venture capital. The data includes the startups founding date, a detailed address, and a short description of the firm's basic function. The study period is from 2001 to 2020. We use logit regression to check whether AI-innovation hub cities are more likely to benefit entrepreneurship in different cities.

We have geocoded and cleaned all the patents and AI startup data and completed the regression analysis. Next, we will work on writing the manuscripts and results interpretation. Our regression results indicate that AI firm is more likely to locate in cities that are different from AI innovation hubs than that of two decades ago, which verifies our hypothesis.

Practically, our study offers insights to policymakers to design AI-related innovation districts and refine agglomeration policies of digital high-tech industry to benefit from the knowledge-spillover effects. For entrepreneurs, the study helps them to make better location decision to benefit from nearby knowledge spillover.

The emergence of DeepSeek, an open-source large language model that has shaken the global technological discourse since early 2025, has changed the innovation geography of the Yangtze River Delta area in China, which emphasize the role of Hangzhou rather Shanghai. Hangzhou has initially established a resilient innovation ecosystem through improved talent recruitment policies, ample fiscal investment, and a regional collaborative innovation network. It is thought-provoking that Shanghai, long regarded as the leader in comprehensive strength and innovative endowment within the Yangtze River Delta, is now being rapidly caught up by Hangzhou in the global innovation chain. Data from Crunchbase indicates that between 2019 and 2023, Hangzhou has nurtured six local tech unicorns with a total valuation of \$38.2 billion, which seems to reflect a intuitively subtle difference from innovation in Shanghai. Therefore, this paper aims to explore how to create urban spaces that better facilitate knowledge exchange and local innovation, focusing on two key questions: (1) Why have six emerging "unicorn" tech companies, including DeepSeek, originated in Hangzhou rather than in Shanghai? (2) What are the differences in innovation elements between Hangzhou and Shanghai? Inspired from Richard Florida's (2002) theory of the creative class, this study conducts an exploratory research combining qualitative and quantitative methods. Initially, it employs Terry N. Clark's Scene Theory and related research methods for preliminary studies, comparing selected scene dimensions (locality, authenticity, transgression) between two urban spaces located in Hangzhou's Future Science City and Shanghai's Knowledge and Innovation Community, thus addressing the differences in innovation scenarios between Shanghai and Hangzhou. Based on the preliminary research results, the study subsequently constructs a dynamic panel data model of firm formation and talent migration patterns (2015-2023), analyzing the decisive roles of key "hard infrastructures" (such as café density and incubator space distribution) and "soft ecosystems" (such as scenario authenticity, locality, and cultural facility index) in urban innovation capacity. Empirical findings reveal that Hangzhou's innovation scenarios exhibit greater locality and authenticity compared to Shanghai, with three comparative advantages for Hangzhou: (a) A regulatory environment conducive to technology experimentation, where the approval cycle for start-up licenses is 72% shorter than in Shanghai; (b) Market entry costs in Hangzhou's innovation parks are reduced by 60% through targeted subsidies; (c) Cultural facilities attract international talent, with Hangzhou's cultural facility index (0.73) surpassing that of Shanghai (0.61), particularly excelling in attracting Gen Z tech talent. This study presents three innovative arguments: (1) The "low-cost experimentation/high innovation elasticity" paradigm in Hangzhou stems from path-dependent spatial-institutional co-evolution triggered by strong local network embeddedness; (2) The observed reconstruction of rent gradients challenges traditional Christaller hierarchies, revealing how medium-sized cities can break the monopoly of global urban innovation through spatial arbitrage strategies; (3) "Re-localization of innovation geography" demonstrates that compared to Shanghai's positioning as a "global resource hub," Hangzhou's "low-cost testing ground" provides superior early advantages—this finding constitutes a significant revision of global innovation hierarchy theory. The findings of this study has the potential to enrich the understanding of mechanism of innovation in cities.

High-tech Regions as Innovators of Traditional Technologies

Abstract ID: 1844.0.0.457.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Ruoran Liu [Ball State University] ruoran.liu@bsu.edu, presenting author

Joanna Ganning [Cleveland State University] j.ganning@csuohio.edu

In the knowledge economy, a region's economic development often hinges on the innovation capacity of its specialized industries. In some high-profile cases including Silicon Valley and Boston, high-tech industries such as information technology and bioscience have driven development (e.g., Mayer, 2011). Elsewhere, innovation in cultural and professional service industries has received significant attention. However, studies on innovation and technology-led development have largely excluded relationships with traditional industries (e.g., metal working and textile manufacturing). Instead, the academic focus on traditional industries and their regions centers on employment decline and urban shrinkage (e.g., Ganning & Tighe, 2021).

Previous research shows that innovation in high-tech industries contributes to efficiency and innovation in traditional industries through the improvement of production processes (Hansen & Winther, 2011; Robertson & Patel, 2007), product components (Mulhall, 2015), and innovations in design and service. Whether these developments have led to increased patenting activity in traditional industries, however, remains under-studied, and especially at the metropolitan level, where arguably these relationships matter the most. It is entirely plausible that high-tech development encourages increased patenting in traditional industries through regional labor markets, regional demand conditions, and knowledge spillovers between firms. If this happens, regional economic development policy stands to gain considerable effectiveness by building programming around these relationships.

Utilizing technological classifications and patent data from the US Patent and Trademark Office (USPTO), this study tests whether regions with higher patenting levels in high-tech fields between 1996-2000 also had greater patenting levels in traditional fields between 2010-2014, while accounting for the impact of historical traditional specializations and other confounding variables. Additionally, this study divides patenting in high-tech and traditional fields into specific technological categories, thereby providing a more detailed view of industrial dynamics. Briefly, traditional and high-tech industries here refer to the NBER categorization (which is also used by the USPTO), where traditional industries are identified as those with a long, stable history of patenting that predates and underpins many modern technological innovations.

The analyses suggest that regions that demonstrated higher patenting levels in high-tech fields during 1996-2000 subsequently exhibited greater patenting levels in traditional fields between 2010 and 2014, with variation shown at the industry-level. Further, the analysis indicates that regional innovation, including in traditional fields, is predominantly influenced by path dependency, with the high-tech fields' impact being more complementary.

Individual Paper Presentation Submission

Patrick Cooper-McCann [Wayne State University] cooper@wayne.edu, presenting author

Andrew Guinn [Wayne State University] arguinn@wayne.edu

Researchers have documented the conversion of central-city industrial areas into commercial or residential districts since the 1980s (Zukin 1982). Critics of this trend have expressed concern that industrial conversions push manufacturing firms out of central cities, impeding innovation and reducing access to good-paying, working-class jobs. As a policy response, researchers have advocated the adoption of industrial preservation policies, which are intended to retain manufacturing jobs and bolster the working-class communities that depend on those jobs (Gilothe & Betancur, 1988; Leigh & Hoelzel 2012; Lester, Kaza, & Kirk 2013). However, most research on this subject has focused on cities with strong markets, like New York and San Francisco, without examining weak market contexts. Weak markets differ in key respects from strong markets and therefore merit separate attention (Dewar et al 2017; Galster 2019).

This paper examines industrial land use change in Metro Detroit, a metropolitan area that has struggled economically since the 1970s, especially within its central city, which has struggled to respond effectively to deindustrialization (Thomas 1990). We ask: How has the distribution of industrial land use changed over time and with what effects on adjoining neighborhoods? First, using GIS, we document changes to industrial land use throughout Metro Detroit by comparing zoning maps, land use maps, and aerial imagery from the 1950s to the 2020s. Then we more closely examine two types of cases: 1) industrial districts that existed in the 1950s and later expanded into surrounding neighborhoods and 2) industrial districts that existed in the 1950s and were later converted to non-industrial uses. To understand why industrial land use changed in each instance and with what effects, we analyze data from planning documents, legislation, news media, the Census, zoning maps, land use surveys, site visits, and interviews.

In line with prior research, we find examples of industrial districts that have been converted to residential or commercial use. These cases of conversion have occurred in gentrifying areas, including along Detroit's postindustrial riverfront and in inner-ring suburbs like Ferndale and Birmingham. Yet the dominant trend is one of industrial expansion. In the region's weakest real estate markets, including in much of Detroit as well as some of the region's oldest industrial suburbs, state and local policies have enabled the expansion of industrial districts into adjacent residential and commercial territory as a means of preserving and expanding manufacturing employment in the face of ongoing deindustrialization. Such expansion was initially funded by federal and local programs for urban renewal; as federal funding diminished, industrial conversion continued to be financially feasible because older neighborhoods have experienced extensive property abandonment and devaluation, lowering the cost of land acquisition.

The net effect has been that cities like Detroit and Highland Park are devoting more land use than ever to industry, but with shrinking returns, because tax abatements limit the collection of property tax collection and because modern industrial enterprises employ far fewer workers compared to the past. Industrial encroachment has also had significant negative externalities within affected neighborhoods. Thousands of homes and businesses were demolished to enable industrial expansion, and the residents who remain are subjected to increased truck traffic, air pollution, and noise. Thus, industrial expansion has exacerbated environmental injustice, even as it has also enabled the preservation and growth of job-producing firms.

Individual Paper Presentation Submission

Haifeng Qian [University of Iowa] haifeng-qian@uiowa.edu, presenting author

Phuong Nguyen [University of Iowa] phuong-nguyen@uiowa.edu

Libraries are important community resources. They provide books, access to information, internet and databases, space for study and meetings, career service assistance, and special programs, events, and cultural activities to community members. In this research, we study the relationship between libraries and community economic resilience in the United States, which has not been adequately studied in the literature. The empirical analysis includes two parts. First, we conduct spatial analysis to examine the relationships between the presence of libraries/the level of library resources and a set of economic outcome indicators (median household income, unemployment rate, poverty rate, and self-employment) at the U.S. county level. Positive correlations and spatial spillover effects are expected between libraries and some of these economic indicators. Second, we conduct a Difference-in-Differences (DID) event study to examine the causal impact of libraries on community economic outcomes (which cannot be identified in spatial analysis). More specifically, we study whether the closure of a library leads to declined economic outcomes at the U.S. city level. Through both spatial analysis and causal event analysis, we show the importance of libraries in community economic resilience.

Policy-led uneven growth opportunities and the decline of commercial areas in Seoul

Abstract ID: 1844.0.0.1166.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Namji Jung [Seoul National University] pinkclouds00@snu.ac.kr, presenting author

While many commercial areas in Seoul, such as Seongsu and Yeonnam, have gained global popularity as must-visit destinations, some areas near major universities have experienced a substantial decline in the number of businesses since COVID-19. The shrinkage of commercial areas near major universities in Seoul marks an unprecedented shift, as these areas were once trendsetting hubs for young consumers. Media reports often cite shifting consumption patterns, a sharp decline in visitors due to COVID-19, and high rental costs as key factors for the decline. However, this explanation is limited, given that these areas have prospered over the past three to four decades despite repeated economic shocks and evolving consumer behaviors. This recognition calls for a more systematic investigation into the causes of their decline.

This study examines the cause of decline by focusing on public policies particularly its unintended consequences, using the Sinchon/Idae commercial areas. The Sinchon area is located near Yonsei University and the Idae area is adjacent to Ewha Womans University. Theoretically, this study adopts the concept of opportunity structure proposed by Galster and Killen (1995).

Between 2010 and 2015, different types of commercial areas emerged in Seoul and the city government implemented booster policies to foster their growth. Examples include the relaxation of density regulations for Garosu-gil, pedestrian-friendly street improvements in Seongsu, and the construction of a new subway station and park in Yeonnam. Meanwhile, the city government designated Sinchon as a public transit zone and Idae as a special district for fashion and beauty businesses. These programs appeared to enhance pedestrian-storefront interactions and encourage specialized agglomeration of fashion and beauty businesses. However, in reality, they disrupted key elements of the business ecosystem that had supported the area for three decades—such as curbing the automobile access for supply deliveries and discouraging new opening of other types of businesses such as food & beverage through increasing parking requirements.

Before these government initiatives, commercial areas in Seoul operated under relatively homogeneous institutional conditions. However, the introduction of spatially differentiated policies altered the opportunity structure for each area, disproportionately disadvantaging Sinchon/Idae. This uneven opportunity structure influenced individual store owners' location choices, ultimately leading to a voluntary migration from Sinchon/Idae to adjacent commercial areas with better growth prospects. Through this process, the Sinchon/Idae commercial area gradually but persistently lost its growth momentum.

This study empirically examines this mechanism through a comparative longitudinal case study. It compares Donggyo/Yeonnam area with Sinchon/Idae, specifically the business numbers and vacancy rates from 2010 to 2023 to capture the effects of differing policy programs. The results exhibit that Sinchon/Idae struggled, Donggyo/Yeonnam thrived. Additionally, it analyzes the spatial relocation of businesses between Sinchon/Idae and Donggyo/Yeonnam, demonstrating a one-directional migration from Sinchon/Idae to Donggyo/Yeonnam during the study period. To confirm that business movement was driven by imbalanced opportunity structures rather than market forces alone, this study draws on interviews with business owners.

Ultimately, this study challenges the prevailing view that commercial growth and decline are primarily market-driven. It also underscores the need for a more careful and nuanced approach in designing areas specific policy programs to deduce the chances of inadvertent negative impacts.

Reframing Economic Development: How women/non-men/womxn reshape the field through lived experience

Abstract ID: 1844.0.0.412.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Margaret Cowell [Virginia Tech] mmcowell@vt.edu, presenting author

Planning scholars have increasingly shed light on the many ways in which gender relates to both how public spaces are designed and how they are experienced by users. While the planning field continues to prioritize the creation of just, equitable, diverse, and inclusive cities, the field of economic development has been slower to focus its efforts on inclusivity, especially from an intersectional and gendered perspective (Erickcek 2023; Conroy, 2019). To do just that, this paper expands upon existing literature to further explore the history of women/non-men/womxn in the field of economic development and the myriad ways in which they have shaped and are reshaping the field (Warner and Prentice, 2013). The research starts from the premise that, since its inception, the field of economic development has traditionally reproduced existing power dynamics (MacKinnon, et al 2022). As part of a broader project focused on gender in economic development, this study uses interview data collected in 2024 and 2025 to consider how the increasingly diverse workforce in economic development – both practitioners and academics – is changing the focus and practice of the field itself.

Preliminary findings suggest that the number of womxn practicing and teaching in the field of economic development continues to grow. However, the findings also show that the pace with which womxn's participation has grown differs substantially by race, ethnicity, and geography. It also suggests that womxn practicing and teaching in the field possess multiple identities that shape their experiences within the field, how they approach their work, and how they envision the future of the field as the demographics of the field continue to change.

Observable shifts in workforce composition within the field of economic development beg the question of whether the focus of the work will shift as well. To that end, interviewees were asked to reflect on whether they have observed shifts in how the field operates and in terms of what constitutes the focus of economic development. Most interviewees with 15 years or more experience working in the field were able to point to specific changes they had observed during their career, while interviewees who more recently entered the profession spoke of either second-hand accounts from more senior practitioners or how their understanding of the history of the CED field compared to their lived realities in the profession today. When asked about the focus of their work, many interviewees unsurprisingly noted classic economic development approaches like deal-making, real estate development, and retention strategies. Still, many also mentioned myriad other ways of thinking about and performing economic development, and in so doing they enthusiastically talked about how meaningful this other work can be. The focal changes they observed can best be categorized into three main categories: 1) a shift to more strongly center the need for childcare and caregiving more broadly to be considered as an CED priority; 2) expanding and creating opportunities for marginalized communities to participate in the CED process; and 3) an explicit focus on an economic development practice that creates economic opportunities for marginalized communities to benefit from CED. The paper concludes with a discussion of how gender shapes the work that economic developers do and what it is like to be a womxn working in the field today.

Remote Work as an Opportunity for Empowerment and Economic Autonomy

Abstract ID: 1844.0.0.1102.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Raquel Padilla Garcia [Rutgers University] rep147@scarletmail.rutgers.edu, presenting author

As we shift from a manufacturing-based society to one based on information, finance, and creativity, the need for knowledge workers increases. Since this sector of the workforce relies on their own skills and knowledge as labor power, they are able to perform their work from anywhere provided they have access to telecommunication technologies to report back to their employers or clients.

Though the idea of working remotely has been around for fifty years –it was first theorized by Jack Nilles in 1975– it was not until the recent pandemic that it got more attention and became the object of multiple studies. These analyses are concentrated in three main clusters of interest: 1) Labor economics, 2) Office space reallocation and downtown reactivation, and 3) Business management in the remote work era. These studies pull information from official reports, surveys, and other official statistics and demographic data. However, they have ignored one of the key pieces of remote work, i.e. remote workers themselves. It is this gap in this research field that this work intends to fill.

This study seeks to provide further understanding of remote work from the workers' perspective. Moreover, it intends to shed light on how adopting this type of work alters the daily dynamics of remote workers. To achieve this, the study relies on mixed methods, namely a survey and a series of focus groups. Because of the nature of the study and the anticipated geographic dispersion of participants, the study was carried out completely online using online survey services and video conference software. The methodology for this project was inspired by some of the work done around this topic after the Covid outbreak, notably the Real-Time Population Survey (RPS) developed by Bick and Blandin in 2020. In an effort to expand the study at a global scale, both the survey and the focus groups were available in three languages: English, French, and Spanish, and they were promoted through different networks to encourage international participation.

The survey was active from February 19th to March 22nd, 2024, and 152 responses were collected from participants from 18 different nationalities. Focus groups took place at the end of March 2025, and 11 people participated in these sessions. While the survey enquired about changes in daily routines and potential relocations triggered by the adoption of remote work, focus groups allowed for in-depth conversations to expand understanding of remote work, and either confirm or challenge the assumptions made by the studies relying on secondary data.

The findings of this project show that remote workers have mostly a positive opinion of this work modality, with qualities such as flexibility, comfort, and convenience being highlighted. Nevertheless, some negative aspects of remote work cannot be ignored as is its isolating effect and the monotony it leads to. Perhaps because of this, face-to-face interaction remains highly valued among remote workers since it potentializes relationship building, team collaboration, and overall career advancement. However, remote work is not only about professional development, it is also an opportunity to improve work-life balance, particularly during life stages where additional personal time is needed, such as raising a family or dealing with medical issues. Therefore, we see that remote work can also be a tool for empowerment and a path to economic autonomy. However, more work needs to be done to provide this type of work with adequate regulation to ensure fair conditions; and for this thorough understanding of this phenomenon is needed for which remote workers's input is an essential part.

Sectoral Concentration, Competitive Crowding Out, and Displacement in US Innovation Districts

Abstract ID: 1844.0.0.31.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Yihao Wu [Harvard University] yihao_wu@gsd.harvard.edu, presenting author

In local economic development, Innovation district (ID) has been widely regarded as catalyst for spurring job creation and attracting investment through concentrated clusters of knowledge-intensive industries (Drucker and Kayanan, 2024). Many planners and scholars believe it offers a complementary local development model against traditional industrial clusters such as Silicon Valley—characterized by sprawling suburban corridors (Hamidi and Zandiatashbar, 2019). Instead, innovation districts advocate for compact, mixed-use urban environments that prioritize walkability, public transit, and mixed-use, thereby enhancing quality of life while fostering creativity and entrepreneurship. Yet, beneath the surface of the promising picture, concerns persist that extreme specialization and market demand can crowd out locally oriented businesses and displacing lower-income households (Kayanan et al., 2022), hence making ID less resilient to external shock.

In this paper, we investigate these tensions through a comparative study of 25–30 IDs across the United States and their economic performance before, during, and after COVID-19. Drawing on neighborhood-scale data spanning 2015–2024, we measure both the promise and peril of tech-centric development, illuminating how pandemic-era economic shocks have intensified existing vulnerabilities in housing affordability and service-sector stability. There is few empirical evidence documenting these unintended consequences for ID particularly induced by external shock. Our study seeks to bridge the ongoing debates in agglomeration economy by focusing on two key effects of ID specialization.

First, we quantify concentration risk—the extent to which reliance on a single high-growth industry magnifies an area’s exposure to downturns, labor market shifts, and broader macroeconomic fluctuations. Building on established concentration indices (HHI) and location quotients, we trace the degree to which tech and biotech jobs dominate local employment structures (Boix and Galletto, 2009). By assembling longitudinal data from the American Community Survey, the Bureau of Labor Statistics, and HUD, we observe how these booming sectors shape local labor markets over nearly a decade, including the volatile pandemic period.

Second, we explore competitive crowding out and displacement effect in the service and housing sectors due to concentration. Innovation districts thrive on proximity-driven knowledge spillovers, yet they risk expelling smaller, less profitable businesses—particularly those critical for day-to-day neighborhood life. In doing this, we exploit rich establishment-level records, including Yelp business listings to track closures, and we pair them with foot traffic data that capture the shifting spatial patterns of consumer demand. In parallel, we analyze how intensifying real estate pressures limit the affordability of surrounding neighborhoods for middle- and low-income households.

Once we construct key metrics for measuring concentration and displacement, we use difference-in-differences to identify how pandemic shocks produced divergent trajectories for high-concentration versus more diversified districts. We then incorporate shift-share (Bartik) instruments to account for exogenous national-level sector growth, ensuring that local conditions do not entirely drive measured changes. This allows us to assess whether an externally driven surge in specialized employment truly displaces services or low-wage workers, or whether local policies moderate these forces. By comparing innovation districts with “control” neighborhoods from the same metros, we reduce confounding influences.

Beyond a simple success-or-failure dichotomy, systematically assessing the potent and associated risk is a critical step for guiding innovation district toward equitable, resilient futures. WWe expect our empirical results offers concrete policy for mitigating displacement and preserving critical service ecosystems.

Tamara Kerzhner [University of Toronto] t.kerzhner@utoronto.ca

Women typically serve as the primary caregivers for the children in the household, and many work part- or full-time as well. To balance the demands of home and work, employed individuals with caregiving responsibilities benefit from easy access to jobs and amenities by living in either care amenity-rich neighbourhoods or neighbourhoods with high levels of transit accessibility (or both). However, the Covid-19 pandemic brought new challenges of working from home while often serving as full-time caregiver, with lasting impacts for many.

In this paper, we examine two related questions: How does a care amenity-rich environment and high labour market accessibility impact female labor force participation in different contexts (Bogotá, London, and Toronto)? And how did the Covid-19 pandemic transform labor force participation for women living in different types of neighbourhoods? We hypothesize that the presence of care amenities supports higher levels of labor force participation, particularly for high-wage workers in high-skilled occupations, but accessibility plays a critical role as well, particularly for women in low-wage service occupations. These built environment and accessibility factors then lead to higher post-pandemic labor force participation, but again with outcomes differentiated by occupation of employment.

For the analysis, we deploy census, travel survey, Open Street Map, and cell phone data. We develop a typology of neighbourhoods using cluster analysis, and then identify the key factors differentiating those types via discriminant analysis.

The findings of this research not only have implications for transportation, economic development, and land use policy, but also speak to debates about the "15-minute city" by showing how a dense built environment functions as labor market support – but primarily for high-end, high-wage occupations, due to factors such as housing costs. Policy implications will focus on the type and location of care supports that best facilitate labor market participation.

Systemic Barriers for African American Energy Researchers

Abstract ID: 1844.0.0.49.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Yas Motoyama [Ohio State University] motoyama.1@osu.edu, presenting author

Mel Delpech [Ohio State University] delpech.2@buckeyemail.osu.edu

Bryan Patterson [Johnson C. Smith university] bpatterson@jcsu.edu

Chris Ford [Florida International University] jaford@fiu.edu

The past studies on regional innovation are clear that minorities are underrepresented in the workforce of innovation-related occupations or research work. For instance, only 7.1 percent of doctoral degrees were awarded to African Americans (NSF 2019), and they constitute a similarly small share of 7.4 percent in so-called high-tech industries (EEOC 2014). Even more concerning, only 0.3 percent of Small Business Innovation Research grants administered by the National Institute of Health went to teams with African Americans as the principal investigator (Mervis 2015). This pattern of underrepresentation applies to all kinds of minorities except Asian Americans.

However, the objective of these studies was to quantify underrepresentation, and little has been studied about the structural or systemic barriers of minority researchers, which our project aims to contribute. We operationalized to study this aspect by focusing on African American researchers in the energy field. Based on the theory of regional innovation (Cooke 2001), we selected three case regions of North Carolina, Atlanta, and Miami, as each region has a cluster of so-called Research I universities and Historically Black Colleges and Universities (HBCUs). We first identified productive energy scholars at institutions affiliated to these regions based on the bibliometric method, a study of academic journal articles. Then, we conducted in-depth interviews to understand systemic barriers around them. We employed a stratified sampling method combined with a match-pair analysis between White and African American researchers, totaling 28 interviews.

Our interviews confirmed deep systemic barriers for African American energy researchers at multiple levels of institutions, such as departments, universities, and academic networks. We summarize those systemic barriers in eight points and further discuss policy implications.

The Collective Approach to Entrepreneurial Ecosystem Building: The Richmond Virginia Case

Abstract ID: 1844.0.0.1133.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Elsie Harper-Anderson [Virginia Commonwealth University] elharperande@vcu.edu, presenting author

Entrepreneurial ecosystem building has become a central component of local economic development strategies. However, there is no unified theory on how to best achieve the optimal system. Scholars have discussed the necessary stakeholders and their roles (Bischoff et al., 2018). In practice, many different models have been advanced with varying success. Building a seamless system that is diverse, inclusive, collaborative, and equitable has proven elusive for most cities. Entrepreneurship has the potential to alleviate poverty and revitalize neighborhoods.

Richmond, Virginia, is often identified as the former home of the Confederacy, with lingering racial inequality and poverty, a relic of the city's historical roots of oppression. Richmond was considered a trailblazer in its fight to alleviate poverty because it was the first city in the nation to institutionalize its Office of Community Wealth Building strategy by making it a part of the city's governmental structure.

However, in 2015 the entrepreneurial ecosystem has been described as disjointed with many silos (Harper-Anderson 2018). Since then, many new nonprofit organizations and private sector stakeholders have taken an interest in joining forces to create a new model of ecosystem building. Policymakers have bought into the ecosystem approach (Isenberg, 2010). The private sector also views this approach as critical for the region's economic growth.

The 1717 Collective is made up of seven key organizations and many partners who came together to meet the entrepreneurial needs of Richmond and surrounding areas using a community organizing approach. What makes this initiative different is the actual formation of a collective as well as the hiring of a coordinator tasked with "developing and maintaining deep and positive relationships with a variety of regional stakeholders across the private and public sectors to shape and support the evolution and growth of the region's entrepreneurial and business economy" (LinkedIn job description).

This qualitative case study has three main questions. What is the process followed by the Richmond entrepreneurial community to build the 1717 Collective? What key factors and local conditions enable the organizations involved to overcome the silos that previously characterized the Richmond entrepreneurial ecosystem? What are the key lessons that other cities wishing to build their own collective might learn from the Richmond case?

This study uses two sources of data. The primary data are derived from 25 semi-structured, in-depth one-hour interviews with organizational leaders involved in the Collective. We also interviewed five administrators at organizations outside the Collective to ascertain their views of the new initiative. We coded the interview for key themes.

Preliminary findings suggest that having a navigator in place who was explicitly hired for the collective and who can steer and keep track of progress is a game changer. Further, the formalized collaborative partnerships and unity of vision for the ecosystem were key to developing an operational model that benefited a broader array of entrepreneurs than each organization operating separately would have.

The Effects of Urban Center and their Built Environmental Characteristics on Business Productivity

Abstract ID: 1844.0.0.918.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Ebrahim Azimi [Johns Hopkins University] eazimi2@jh.edu, presenting author

Shima Hamidi [Johns Hopkins University] shamidi2@jhu.edu

SeyedSajjad Abdollahpour [Johns Hopkins University] sabdoll2@jh.edu

Extensive planning and economic literature points to the key role of urban employment centers as vital hubs of economic activity, attracting businesses, creating jobs and generating economic growth and productivity in U.S metropolitan areas (Hamidi et al., 2019). Urban centers are distinct from employment and population hubs as they offer place qualities such as land use mix, job-housing balance and proximity to residential areas. Research shows that these qualities, along with access to public transit and walkability, support innovation generation and economic productivity by facilitating access to a larger pool of talents and customers, providing opportunities for knowledge spill over and resource sharing, providing an active social environment for interaction with other businesses and clients, and promoting physical activity and mental well-being for the business community (Zandiatashbar et al. 2018, Padeiro et al. 2019, Hamidi et al. 2017).

Yet, there is little evidence on the effects of urban centers (and their built environmental characteristics) on business productivity. In addition, the causal effects of centers' form and infrastructures on business outcomes remains a major gap. This study seeks to fill these gaps by addressing the following key questions: (i) What is the spatial distribution of urban employment centers in the US metropolitan areas in 2020 (ii) How to best identify the typology of urban employment centers (based on transit amenities, walkability and land use features?) (iii) Whether and to what extent the typology of urban centers and their built environment amenities such as walkability and mixed-use development influence business productivity (measured as business sales volume) in 2020.

To answer these questions, we employed Local Moran's I to identify the main urban centers and applied Geography Weighted Regression to identify subcenters based on employment and population data from the US Census and Longitudinal Employer-Household Dynamics (LEHD) in 340 MSAs across the US for 2020. This follows and improves the earlier works (Hamidi and Ewing, 2014; Park et al., 2020). To identify the effect of transit and built environment amenities on business sale, we aim to control for confounding factors that impact these relationships in following three steps: First, we apply cluster analysis to classify urban centers based on their transit and built environment infrastructure. We anticipate generating four center types based on availability and quality of transit and built environment. Second, from business analyst micro-data (2020) we select firm samples located in each center type and utilize Propensity Score Matching(PSM) methodology to determine the impact of center types on firm sales volume by matching similar firms located in different center types using the following explanatory variables: number of employees, sectoral classification, square footage area, firm headquarter status, public transit accessibility, and accessibility to firms of similar industrial character within a twenty-minute driving time. Finally, this study compares sales volume for the firms in different station area types and computes the ATE of being in a center with transit and high-quality built environment amenities (Zandiatashbar et al. 2019).

These findings have significant implications for urban planning and policy and its influences on business growth, as it informs decisions related to efficient land use, the role of regional transit and built environment amenities on business and economic outcomes. Understanding these dynamics will guide strategies to identify infrastructure bottleneck for business development and prioritize financing amenities in areas that has strong potential to generate economic outcomes.

The Future of Planning amid Population Decline

Abstract ID: 1844.0.0.149.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Joanna Ganning [Cleveland State University] j.ganning@csuohio.edu, presenting author

Research shows that most Legacy Cities fail to acknowledge population decline in comprehensive plans and that among those that do, plans include few if any associated planning strategies. Consequently, cities have utilized their limited resources to pursue inappropriate and ineffective development strategies, often making long-term outcomes worse. In Legacy Cities, the perception of population decline shapes the planning strategies employed. Perceptions of population decline range from ignoring it to accepting ongoing contraction. These perceptions map onto a spectrum of planning strategies ranging from passive to active. Planning culture acts as the moderating force between perceptions of population decline and planning strategies chosen.

This paper evaluates planning culture and quality in Pittsburgh to assess whether and how the city's first comprehensive plan might acknowledge and respond to population decline. The city's successes in economic restructuring and apparent recognition of decline in early communications about their plan suggest that Pittsburgh could provide an example for Legacy Cities.

The research utilizes interviews with key stakeholders and content analysis of materials related to the citywide plan. Planning culture is evaluated in four categories: shrinkage context, general context, Planning context, and planning toolset. The early stages of Pittsburgh's comprehensive planning process were also evaluated for elements of plan quality, like whether there is a clear vision statement for the project, and whether all relevant stakeholders are included, among other considerations.

The interviewees describe a city that has gentrified some neighborhoods while others suffer neglect. This phenomenon has three effects. First, planning is viewed differently between gentrifying and neglected neighborhoods. Second, it is widely believed that the affordability crisis in higher-amenity areas has driven out minorities, worsening population loss, and that affordable housing must be developed in response. Third, there is no single set of goals or strategies that will work for everyone. This fact confounds stakeholders' ability to imagine how the city will successfully develop a comprehensive citywide plan.

The analysis finds a planning culture characterized by talent and dedication, situated in division and constraint, and marred by a perceived lack of transparency. Aspirations of growth remain politically correct, keeping the city anchored in maintenance strategies, and tending more toward urban competitiveness than livability. Due to resource constraints, City Planning is described as failing to articulate clear goals, recording goals that cannot be implemented, and taking an extremely passive stance on plan implementation.

Sources acknowledged Pittsburgh's history of population loss, and most acknowledge ongoing population loss. However, most sources qualified their acknowledgments of population loss—insisting on the upsides of qualitative changes in demographics (such as age), or city-regional dynamics, or mixing optimism with reality. While some interviewees believe decision-makers act rationally despite publicly espousing growth, others point out that responses remain speculative and unclear. For example, affordable housing development is viewed as the solution to out-migration, but plans to produce it are vague at best. This exemplifies accepting decline privately, speculating about responses publicly, and working to maintain current conditions.

Any Legacy City Planning Department will struggle to be fully resourced, but even more so when it is tasked with effectively planning for a divided city. In Pittsburgh, as elsewhere, the result has been prioritizing growth areas and de-prioritizing areas with less access to traditional channels of power and influence. The paper concludes with recommendations from the Equity Planning framework.

The Impact of Gender Equality on Economic Growth: A Comparison of the EU, US, and E7

Abstract ID: 1844.0.0.571.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Katkanok Suta [Pusan National University] katkanoksuta@pusan.ac.kr, presenting author

Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

This research targets for studying the effect of gender equality on economic growth via a comparison of countries with varying levels of gender equality, specifically the European Union (EU), the United States (US), and also the E7 group of countries. If we fully reduce the gender wage gap and back larger female participation into the labor market, can it fairly lead toward economic growth? Klasen and Lamanna (2009) previously pointed out that gender inequality in education can obstruct economic growth in many regions. Furthermore, this study questions precisely how women's participation in Human Resources in Science and Technology (HRST), contributes to driving the economy.

This study collects data from 2014 to 2023, covering a large range of regions, including the European Union, the United States, and from the E7 group of countries namely China, India, Indonesia, Brazil, Russia, Mexico, and Turkey. The main variable used for measurement of outcomes is GDP per capita. The key independent variables that were studied relate directly to gender equality in most terms of education, labor market participation, and special fields of science, technology, and also advanced research (HRST). Several control variables are also included to prevent further factors from distorting the analysis, such as initial GDP, birth rate, investment rate, and trade openness. The analysis is conducted using panel data statistical methods. These methods are used to clearly and accurately understand the correlation between gender equality and economic growth.

A comparative analysis of countries with varying levels of gender equality reveals that countries placing greater importance on gender equality tend to achieve better economic outcomes, particularly in terms of GDP growth and employment levels. Another key finding is that women's participation in science, technology, and research fields (HRST) greatly contributes to economic potential, especially in innovation-based economies such as the United States or specific regions of Europe. More women involved in these jobs improves work output and greatly helps make financial growth faster and steadier. Meanwhile, most of the E7 countries, despite their having high economic growth rates, still face gender inequality within labor markets and in access to education. These disparities continue to obstruct economic growth along with preventing the full utilization of the population's potential.

The Price of Green: Understanding the Economic Impact of Urban Park Development

Abstract ID: 1844.0.0.23.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Jisoo Sim [Pusan National University] jisooosim@pusan.ac.kr, presenting author

Urban parks are widely recognized as valuable public infrastructure that enhances environmental quality, public health, and urban livability. However, their economic impact on housing markets remains complex, as price effects depend on proximity, development timing, and spatial spillover dynamics. While prior research has demonstrated that parks increase property values, most studies rely on cross-sectional hedonic pricing models, which fail to capture causal price adjustments before and after park development. This study addresses this gap by employing a Difference-in-Differences (DiD) approach to analyze the real estate impact of Gwanggyo Lake Park, South Korea, a large urban park developed in a planned new town setting.

Gwanggyo New Town provides an ideal setting for evaluating park-induced real estate appreciation due to its planned urban structure and the sequential timing of park development. As Gwanggyo Lake Park (2.02 million m²) was completed in November 2013 after most residential developments, this sequencing offers a quasi-experimental framework for comparing housing price dynamics before (2011–2013) and after (2014–2016) the park's completion. Utilizing 7,992 apartment transactions, the study examines price changes for properties within 500 meters and 1000 meters of the park against those beyond 1000 meters, leveraging South Korea's transparent real estate transaction data to minimize selection bias.

The findings reveal spatially differentiated price effects. Properties within 500 meters of the park exhibited a 15.9% price increase before the park's completion, suggesting that anticipated benefits were largely incorporated into pre-development prices. As a result, their post-development appreciation was relatively modest at 3.1%. In contrast, properties within 1000 meters experienced a significant post-development price increase of 18.7%, indicating a strong spatial spillover effect where the park's economic benefits extended beyond immediate adjacency. Additionally, regression analyses confirm that building age (-2.5% per decade), unit size (+4.3% per 10 m²), and total household count (+7.2% for larger complexes) significantly influenced housing prices, underscoring the importance of accounting for structural housing characteristics in park-related valuation studies.

This study makes three key contributions to the literature on urban economics and land value uplift from public investments. First, it differentiates market anticipation effects from realized price gains, providing empirical evidence that housing markets incorporate expected benefits long before public infrastructure is completed. Second, it identifies spatial spillover effects, demonstrating that price appreciation is maximized not in immediate proximity to parks but at intermediate distances, where accessibility is optimized while congestion-related disamenities remain limited. Third, it provides actionable insights for urban planners and policymakers, emphasizing that strategic park placement and complementary infrastructure investments can enhance real estate value appreciation over the long term.

From a policy perspective, these findings suggest that real estate value capture mechanisms, such as land value taxation or development-based financing, could help cities recover part of the economic benefits generated by urban parks. Moreover, cities should consider the optimal timing of park development relative to housing construction, as well as the spatial distribution of park-induced value gains, to maximize economic efficiency.

By demonstrating that urban parks are not just environmental amenities but also strategic economic assets, this study highlights the importance of spatial and temporal considerations in green infrastructure planning. These insights contribute to evidence-based policymaking and provide a framework for optimizing public investments in urban green spaces for both economic and social sustainability.

The Private Equity “Roll-up” of Local Businesses

Abstract ID: 1844.0.0.121.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Suzanne Charles [Cornell University] scharles@cornell.edu, presenting author

Stephan Schmidt [Cornell University] sschmidt@cornell.edu

Manoel Pereira Neto [Cornell University] mp2285@cornell.edu

Financialization is broadly defined as the increasing role of finance at the level of economies, firms, and households (Aalbers, 2019). At the firm level, it entails the prioritization of investors’ and managers’ interests, intersecting with growing scholarly interest in asset manager capitalism (Braun & Christophers, 2024; Christophers, 2023; Gibadullina, 2024). One way in which the financialization of firms occurs is through private equity (PE) investments in small to medium-sized, locally serving businesses. PE firms raise large pools of capital from institutional investors and wealthy individuals, with the promise of high returns. Acting as financial intermediaries, they acquire local businesses—such as lumber yards, plumbing companies, and veterinary clinics—engaging in a “rolling up” strategy, where smaller businesses are consolidated into larger entities. They target underperforming or undervalued businesses, implementing management changes to enhance their value before selling them for maximum returns, with the aim of delivering returns to investors. Some local businesses, characterized by stable cash flows and short-to medium-term profit potential, are particularly attractive to PE investors. The regulatory environment governing PE firms differs from that of publicly held companies, allowing PE firms to manage the business they acquire with greater opacity and a higher tolerance for financial risk, with implications for employees, customers, and communities (Appelbaum & Batt, 2014). While PE firms can generate substantial financial gains for their investors and fund managers, they may negatively affect the acquired businesses’ employees and community access to local goods and services. This exploratory study examines private equity firm transactions between 2014 and 2025 across the United States to assess the nature and magnitude of this phenomenon. We examine the types of businesses targeted by PE firms, map their geographic distribution, and evaluate the broader implications of the financialization of local businesses for community access and urban planning.

Track 3: Economic Development

Individual Paper Presentation Submission

Annie Lee [University of North Texas] annie.lee@unt.edu, presenting author

New firms play a crucial role in the local economy by creating jobs, fostering innovation, and facilitating economic growth. However, the extent of their impact varies significantly across industries and business types. During the pandemic, the number of businesses in low-barrier industries, those requiring lower skill levels and contributing less significantly to local economic growth, increased substantially (Kalenkoski and Pabilonia, 2022). While the growth of low-barrier businesses has been well-documented, the dynamics of high-skilled businesses, which play a substantial role in job creation and are crucial to the local economy (Gittell et al. 2014), remain relatively underexplored in existing research, particularly in the post-pandemic context.

This paper aims to address this gap by analyzing the major career trajectories of entrepreneurs in knowledge-intensive industries during the pre- and post-pandemic periods. Using sequence analysis and Current Population Survey data, this study identifies 7 major career trajectories, including stable high-skilled business ownership, wage-based employment, transitions between high-skilled business and wage employment, transitions between high-skilled and low-skilled business, and precarious business ownership. Notably, the prevalence of both stable high-skilled business ownership and precarious business ownership increased in the post-pandemic period. The demographic composition of those in stable high-skilled self-employment has shifted in post-pandemic periods, with younger individuals and those with higher education now more likely to pursue this path. This trend suggests that competition within highly skilled businesses has intensified, making long-term success increasingly challenging.

Track 3: Economic Development

Individual Paper Presentation Submission

Keuntae Kim [Institute for Transportation Studies, University of California Davis] kimprins@hotmail.com, presenting author

The urban form has been recognized as one of the fundamental determinants of economic performance across metropolitan regions, influencing the viability of new business formation, business expansion, and overall economic resilience (Hamidi & Zandiatashbar, 2019; Cissé, Dubé, & Brunelle, 2020). While a substantial body of literature has explored cross-sectional determinants of firm or business formation, less attention has been paid to the longitudinal dimensions of this relationship—how urban form influences the temporal trajectories of business dynamics (Ahlfeldt, Pietrostefani, Schumann, & Matsumoto, 2018). This study seeks to advance this inquiry by examining the association between urban development patterns—specifically the continuum from compactness to sprawl—and the dynamics of business establishments across 202 metropolitan statistical areas (MSAs) from 2000 to 2019 in the United States, thereby addressing a critical gap in the literature before the COVID-19 pandemic occurred.

This study leverages the time-series business establishment data extracted from the Census Bureau's Business Dynamics Statistics (BDS) database. The BDS provides annual aggregated counts of business establishments categorized by age, employee size, and industrial sector across various spatial scales—from county and MSAs to states. This database allows for the construction of robust measures of new business birth rates, as well as the identification of establishment deaths (exits) and the tracking of business survival over time. To quantify urban development patterns, this study utilizes various urban compactness measures, including the 2010 urban compactness index developed by Ewing and Hamidi—a comprehensive measure encompassing development density, land use mix, centeredness, and street connectivity. This study also supplements this with other relevant time-invariant and time-varying covariates from various Census Bureau datasets, including the American Community Survey (ACS), EPA's Smart Location Database, and County Business Patterns, to control for socioeconomic, demographic, and economic factors that may influence business dynamics.

The methodological approach in this study involves two complementary longitudinal modeling strategies. First, spline linear growth curve models within a multilevel framework assess within- and between-MSA differences in new business formation trajectories, accounting for temporal variations induced by the Great Recession (2007-2009) (Grimm, Ram, & Estabrook, 2016). Segmenting the analysis into pre-, during-, and post-recession phases enables examination of how urban compactness potentially mitigates adverse economic impacts. This study hypothesizes that compact MSAs exhibit enhanced economic resilience, reflected in less pronounced declines in new business formation during recessionary periods.

Second, Generalized Additive Mixed Models (GAMMs) provide a flexible, non-parametric approach to capture possible non-linear relationships between urban compactness and the longitudinal trends in business formation, exits, and survival rates (Wood, 2017). GAMMs are suitable for identifying critical thresholds or optimal compactness ranges conducive to sustainable business growth and longevity, exploring how interactions between urban form and temporal dynamics influence business outcomes.

By integrating spline linear growth curve models and GAMMs, this study offers a nuanced understanding of urban form's multifaceted impact on business dynamics over time. Findings from this research will equip urban planners, policymakers, and economic developers with actionable insights to design the built environments that promote sustained economic growth, entrepreneurial vitality, and robust business ecosystems. The research advances methodological practices by demonstrating the value of combined piecewise linear and non-parametric longitudinal modeling techniques, enhancing the analysis of complex urban economic dynamics.

When Did Deindustrialization Start? Reexamining Industrial Decline in Metro Detroit

Abstract ID: 1844.0.0.1053.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Andrew Guinn [Wayne State University] arguinn@wayne.edu, presenting author

Patrick Cooper-McCann [Wayne State University] cooper@wayne.edu

Deindustrialization is often acknowledged as a planning problem due to its connection with job loss, unemployment, loss of fiscal capacity, and the threat of population loss. The term, first introduced in the 1980s, is generally used to describe the erosion of manufacturing employment and investments at a national or subnational scale (Bluestone & Harrison 1982). Since that time, the threat and effects of deindustrialization have motivated and justified various local and state-led economic development planning and policy efforts—such as industrial retention, industrial diversification, cluster-based strategies and worker training programs—especially in regions that were highly specialized in manufacturing activities in “Rust Belt” areas of the US Northeast and Midwest (Wolman et al 2015).

But when did deindustrialization begin to impact cities and regions in the US Rust Belt? The beginning of deindustrialization in the US is often associated with the 1970s. Urban and labor historians have argued that cities in the Rust Belt began deindustrializing earlier, in the 1950s, as firms decentralized their factories and adopted labor-reducing technologies (Sugrue 2014). Other scholars focus on the 1920s as a turning point (Lewis 2020). This paper argues that the starting date of deindustrialization in the United States Rust Belt hinges on the scale at which it is studied. We develop this argument through a case study of manufacturing employment patterns in Metro Detroit. By examining industrial restructuring in Metro Detroit at the level of factory districts, this paper shows that the region’s oldest industrial zones began declining in the late 1910s and 1920s—not the 1950s or 1970s—due to the relocation of firms to outlying industrial areas and the decline of legacy industries. These older industrial districts entered a long-term process of downgrading and job shedding, and their gradual abandonment contributed to fiscal decay in Detroit and older suburbs such as Highland Park (Thomas 2013).

In reaching this conclusion we brought together a variety of sources indicating the location of industrial employment over time. First, we used statistics from the Census of Manufactures to understand two trends from 1889 forward: 1) the change in manufacturing employment within each municipality in Metro Detroit, and 2) the change in manufacturing employment within each of Detroit’s leading industries. Then, to understand employment changes within the city of Detroit, we gathered firm-level employment data from the Michigan Labor Department (1894-1920), and the Employers’ Association of Detroit (1920-1929). In conjunction with fire insurance maps, real estate maps, trade catalogs, and city directories, we used this data to track the development of Metro Detroit’s industrial districts over time and to roughly gauge employment levels within each district in the decades leading up to the Depression. To explain the trends we observed, we consulted a range of primary and secondary sources, including newspaper articles, trade journals, government reports, and academic studies. Based on our findings, we conclude that Metro Detroit’s oldest industrial districts were in fact declining by the 1920s, even as the city experienced tremendous growth on the periphery, both inside and outside of its municipal boundaries. We affirm the need for greater consideration of finer-grained spatial patterns of growth and decline in regional industry analysis.

Whose Image? Unraveling the Branding Image of Memphis, Tennessee

Abstract ID: 1844.0.0.413.2025

Track 3: Economic Development

Individual Paper Presentation Submission

Charles Santo [University of Memphis] casanto@memphis.edu, presenting author

Afsana Tarannum [University of Memphis] tarannum@memphis.edu

The concept of city image has been described in multiple ways in the literature about urban places and has evolved over time in public policy. For example, Lynch (1960) focuses on how physical elements shape a city's identity. Lefebvre (1991) argues that a city's identity is not just about buildings but also about how people live, interact, and feel about their surroundings. But in practice, city image is also constructed by policymakers and city boosters through city branding. In recent decades, shifts in the economic structuring of American cities, and changes in political economy have led cities to emphasize urban tourism, cultural amenities, and consumption-oriented development. In this context, cities must rely on place marketing to project a unique image to draw visitors and investors. However, the curation of image can lead to tension through cultural commodification. Cleave & Arku (2022) argue that any branding is the outcome of a growth machine.

Memphis, Tennessee, provides a robust setting to study the evolution and construction of city image. Memphis represents a typical mid-size southern American city that has dealt with deindustrialization, poverty, and resource constraints. It has been subject to all the rationales that make image an important part of public policy and has attempted to promote its cultural history to appeal to creative class workers and increase consumption-oriented development. The city has a rich culture to market – with signature food (barbecue), a well-known music heritage (blues, soul, and rock and roll) and iconic landmarks (Graceland, Beale Street.). As Memphis evolved from cotton-based agriculture and trade to manufacturing, and later to logistics and biotech, its internal and external imagery evolved as well. Phrases used to describe the city include “birthplace of rock and roll”, “America’s aerropolis”, and “grit and grind” – a term popularized by the NBA Memphis Grizzlies and adopted by many to represent the city. As Rushing (2009) argues, Memphis embodies a “paradox of place,” with each potential curated image creating opportunities for conflict and tension between authenticity and commercialization. For example, while “grit and grind,” may resonate with some, it might turn off others. An emphasis on the city’s musical past may have a negative impact on actors in the city’s current music scene.

This research is the first phase of a multi-step project. Phase one will focus on understanding current branding efforts in the city. This will provide a foundation for future research that will measure how residents perceive the authenticity of these branding efforts, and whether that varies by demographic differences.

The study will advance scholarship by bridging Lynch’s physical-centric model with Lefebvre’s tripartite framework of conceived, perceived and lived experience (Piazzoni, 2018). The study’s findings will illustrate a) how the branding of Memphis has evolved historically, b) who brands the city, c) what elements they choose to represent the city, and d) who the city is being marketed to. The findings will determine if these differ across organizational attributes. The study employs a purposive sampling for selecting case study organizations based on predefined attributes (architecture, history, science, society, culture, economy) and company types (formal/informal, local/international), followed by semi-structured interviews. The research also includes an archival review of branding materials, a literature review, and media representations to trace the evolution of Memphis’s image over time.

The implications of this research are significant for urban planners, policymakers, and marketers who seek to design branding strategies that are both economically effective and culturally authentic. The results of the study benefit mid-sized cities like Memphis, which are seeking to rebrand themselves or improve their existing branding strategies.

The Co-evolution of Innovative Industries in U.S. Older Industrial Region

Abstract ID: 1842.0.0.1140.2025

Track 3: Economic Development

Research-in-Motion Presentation Submission, Research currently in process

Nayoung Ko [The Ohio State University] ko.426@osu.edu, presenting author

In recent decades, scholars and policymakers have been increasingly interested in how regions foster new economic activities and adapt to industrial change. As global supply chain disruptions, geopolitical shifts, and national industrial policies reshape economic landscapes, understanding the mechanisms of regional path development has become more critical than ever. Many governments have introduced policies to secure domestic supply chains in key industries, while firms are reorganizing production networks to mitigate external risks. These shifts create both challenges and opportunities for regional economies, particularly in older industrial regions seeking to leverage existing capabilities for new industrial growth.

The research addresses the following research questions: How do local and non-local dynamics shape the path development of industries in the region? Furthermore, how do these dynamics drive the functional transformation of regions—including changes in factor conditions, institutional infrastructure, and skill and technological specialization? This study examines the evolution of two innovative but also incumbent industries—electric vehicles (EVs) and semiconductors—in Ohio, a core state in the U.S. industrial Midwest. I analyze firm entry and exit patterns, employment changes, and occupational shifts, considering the organization of production of each industry, governance structures, and the institutional environment.

In this Research-in-Motion presentation, I focus on analyzing the value chains of the EV and chips industries to identify related sectors and assess the role of Ohio's regional economies over time. This analysis utilizes firm data and sector-specific employment data. Additionally, by leveraging data on occupations within each industry sector, this phase of the study aims to uncover the specific functions these regional economies have undertaken and how they have evolved. Incorporating occupation- and job-related aspects beyond industry aspects, including firm data, helps address the limitation of industry-based analysis, which often fails to capture the regional capabilities embedded in occupational structures.

This approach enables a deeper understanding of the functions that regions perform and provides a foundation for exploring the interrelatedness and co-evolution of two seemingly unrelated industries. The following phase of research will focus on the role played by various agents and the institutional environment in leveraging regional assets and driving the functional transformation of these two industries. Furthermore, this study's focus on EVs and semiconductors captures how recent place-based policies, such as the Inflation Reduction Act (IRA) and the CHIPS Act, have created new opportunities for regional economic development and planning. Although the long-term effects of these policies are uncertain due to potential political and economic shifts, this research highlights how such policies can drive industrial diversification and economic transformation in older industrial regions. By bridging economic geography with regional planning, this research underscores the importance of aligning regional development strategies with evolving industrial policies and local capabilities, offering a framework for guiding economic renewal in the face of broader global shifts.

Understanding Neighbourhood Effects on Post-Pandemic Business Recovery in Vancouver, Canada

Abstract ID: 1842.0.0.1147.2025

Track 3: Economic Development

Research-in-Motion Presentation Submission, Research currently in process

Juri Kim [UBC School of Community and Regional Planning (SCARP)] jurikim@student.ubc.ca, presenting author

Stephanie Chang [UBC School of Community and Regional Planning (SCARP)] stephanie.chang@ubc.ca

Local businesses play a critical role in community recovery and resilience following disasters. However, the spatial context in which they operate has received limited attention. Previous economic recovery literature has primarily focused either on business-level strategies or broader macroeconomic outcomes. As a result, the influence of neighbourhood-level (meso-scale) characteristics on post-disaster business survival and recovery remains a missing middle. This study addresses this gap by investigating how neighbourhood contexts—including local economic conditions, neighbourhood safety, geographic location, and urban planning interventions—affect business survival across different phases following the COVID-19 pandemic in Vancouver, Canada. Specifically, it explores the question: “How do neighbourhood characteristics influence business survival in the immediate aftermath, during the sustained disruption, and in the extended recovery phases of the pandemic?”

The COVID-19 pandemic, which brought prolonged and large-scale impacts, offered a unique opportunity to understand disaster recovery. While some lessons and findings align with those drawn from natural hazard contexts, the pandemic has also highlighted distinct differences (Chang et al., 2022).

Adopting a mixed-methods approach, this study combines quantitative multilevel modelling and qualitative business interviews. The quantitative component applies multilevel logistic regression to hierarchical data (businesses nested within neighbourhoods) to identify statistically significant factors influencing business survival from 2019 to 2022. These findings guide the qualitative phase by informing participant selection and developing interview questions to explore mechanisms behind the statistical relationships. Interviews with both surviving and closed businesses contextualize how neighbourhood characteristics and planning interventions influenced their recovery experiences, including reasons behind the limited effectiveness of specific urban planning interventions like neighbourhood plazas and slow streets.

Preliminary findings indicate significant temporal shifts and disparities in neighbourhood influences on business recovery. In the initial phase of the pandemic, business-specific characteristics such as the age and size were particularly critical, while neighbourhood safety appeared to compound disruptions. As the pandemic continued, neighbourhood characteristics—including local economic conditions, business environment, and geographic location—became increasingly influential. Over the extended recovery phase, the broader neighbourhood context became even more significant, with business recovery strongly influenced by nearby business closures, downtown location challenges, and neighbourhood socioeconomic changes. These findings highlight the need for targeted planning approaches and interventions that consider neighbourhood contexts, especially during prolonged recovery from large-scale disruptions.

Understanding the Impact of Automation: The Case of Long-Haul Commercial Truck Driving in the U.S.

Abstract ID: 1842.0.0.548.2025

Track 3: Economic Development

Research-in-Motion Presentation Submission, Research currently in process

Henry Renski [University of Massachusetts, Amherst] hrenski@larp.umass.edu, presenting author

Tosin Bamidele [University of Massachusetts Amherst] ebamidele@umass.edu

Long-haul truck driving remains one of the largest and best-paying occupations for many workers, especially those lacking formal education. At the same time, automated commercial motor vehicles (ACMVs) are currently being developed and portend a transformational impact on the trucking industry and the close to 2.1 million workers that support it. Proponents argue that ACMVs provide enhanced fuel economy, lower travel times, and improved safety and offer a potential solution to the ever-growing supply chain and trucker shortage. The adoption of more automated driving assistance technologies might also make truck driving more attractive to a newer generation and different types of workers. However, while the gains from ACMVs might be widespread, the losses are likely to have acute effects on specific geographic regions and demographic groups — potentially worsening existing inequalities.

This study presents some initial results from an NSF-supported study of the impact of automated driving technology on long-haul truck driving. Not just in terms of lost jobs and income but on the people and communities that are most likely to be affected. We also situate our results for different possible adoption scenarios in terms of the timeline of adoption, extent of proliferation, suitable driving conditions, and whether they will still require a human in the cab or be driverless. Our analysis draws upon interviews with drivers, discussions with technology companies and developers, and the analysis of secondary occupational, demographic, and industry data. Our study offers valuable insights that planners and policymakers may find helpful in developing strategies to protect vulnerable communities in the face of economic and technological change.

What are the Barriers to Successful Brownfields Workforce Development Programs?

Abstract ID: 1842.0.0.629.2025

Track 3: Economic Development

Research-in-Motion Presentation Submission, Research currently in process

Charles Warnken [University of Oklahoma] cwarnken@ou.edu, presenting author

Workforce development is a term frequently used across economic development literature and is emerging as a key component of community economic development programs. Formally, Workforce development programs encompass programs, policies, practices and institutions that help labor market actors create, sustain and retain a skilled workforce (Schrock 2013, Leigh and Blakely 2013). Demographic and economic transitions, rapid changes in technology and changes in federal programs have created a changing landscape within which individuals, employers, public-sector and non-profit workforce development agencies operate within. Workforce development programs are often viewed as “people centered” economic development strategies and as a path to more equitable economic development (Tan et al. 2016; Garmise 2006) but reviews of current workforce development programs suggest that mainstream approaches to designing and implementing programs are dated and this may contribute to a “skills gap” between many in the workforce and potential employers (Lowe 2021; Zaber et al. 2019). In addition, questions exist about the effectiveness and efficiency of various workforce development programs (Hollenbeck and Huang 2016; Simons 2013; Eberts, Bartik and Huang 2011).

Presenting the results of 14 semi-structured interviews and three case studies of workforce development agencies that received EPA issued brownfields job training grants between 2018-2023, this Research in Motion paper identifies the organizational, contextual and programmatic issues workforce development agencies encounter in implementing job training programs. These organizations, termed “workforce intermediaries” (Lowe 2021) in that they work to directly match employer needs with a trained workforce, have emerged as key actors in training people for careers in the “green economy.” Working with key program informants at these agencies, the multiple case study method systematically identifies barriers to successful brownfields job training grant programs and adds to our understanding of factors that contribute to the successful implementation of workforce development programs.

Contested Waters: Planning at the Intersection of Human, Ecological, and Property Rights

Abstract ID: 1840.0.0.873.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.115.2025, 1844.0.0.399.2025, 1844.0.0.482.2025, 1844.0.0.761.2025

Charisma Acey [University of California, Berkeley] charisma.acey@berkeley.edu, organizer

This session explores the tensions and alignments among human, ecological, and property rights in water and land governance. Drawing from cases in Ecuador, Brazil, Ghana, and the U.S., panelists examine how rights of rivers, wetland conservation, exclusionary zoning, and land value capture intersect with planning systems and legal frameworks. The session highlights how environmental planning and governance is being reshaped by legal innovations such as rights of nature and by struggles over the human right to water, access, pollution, and resilience. Papers use methods from legal geography, political ecology, and spatial analysis to surface how planning mediates conflicts between ecological systems, infrastructure, and rights claims. Collectively, the panel calls for integrative planning approaches that center environmental justice, collective agency, and socio-ecological interdependence.

Learning Objectives:

- Analyze how legal innovations such as rights of nature and the human right to water are reshaping urban and regional planning approaches across diverse international contexts.
- Evaluate the role of planning institutions in mediating tensions between ecological sustainability, infrastructure development, and property rights, particularly in contexts of environmental injustice and urban informality.
- Identify integrative planning strategies that recognize both human and ecological rights and promote equitable access to water, land, and environmental decision-making.

Courts, Rights of Rivers, and the City of Quito, Ecuador

Abstract ID: 1844.0.0.115.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Mildred Warner [Cornell University] mew15@cornell.edu, presenting author

Andres Martinez [Univ. San Francisco de Quito] amartinez@usfq.edu.ec

Around the world more attention is being given to rights-based approaches to environmental protection of water and rivers (Eckstein et al., 2019; Kang, 2019). In this paper we explore the shift from an anthropocentric view of environmental protection, more common in Global North jurisprudence, to an ecocentric approach, which is emerging in the Global South (Martínez-Moscoso et al. 2023). Specifically we ask, How are Rights of Nature linked to anthropocentric concerns, even as they espouse more ecocentric positions? We explore how both positions appear in the legal arguments and lead to a broader ecosystem view that incorporates nature and society. We also explore how rights of nature links to rights to the city (Attoh 2011, Purcell 2022) in the context of water resource management.

We use the case of the River Monjas in Quito, Ecuador to show how judicial decisions have made rivers subjects of rights and how these are articulated in practice. Urban rivers promote habitats, support ecosystems, and provide human access to water. For cities in Latin America, lack of wastewater treatment generates contamination and risks people's right to safe, healthy, and pollution-free habitat. Citizen demand has forced politicians to expand environmental rights to include rights of nature. We find that, instead of a dichotomy between anthropocentric and ecocentric concept of rights, the two are combined in a broader ecosystem framework which links rights of nature (right of the river to flow, to be clean), to rights to the city (historical preservation, access to nature). We also show how the courts focused on the obligation of the City of Quito to ensure river rights, and not the role of the state or the private sector contaminators. This raises critical questions for planners about who speaks for nature and who pays for its protection.

Recognizing Nature, Rethinking Planning: Rights of Nature in Brazilian Municipalities

Abstract ID: 1844.0.0.399.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Luciana Barretto Lemos [University of Texas at Austin] lucianalemos@utexas.edu, presenting author

In recent years, several Latin American countries have recognized the Rights of Nature in their Constitutions, with Ecuador's 2008 case often mentioned as pioneering (Cano Pecharroman, 2018; Etchart, 2022). These legal innovations point to a broader shift toward frameworks emphasizing nature-society relations and Indigenous ways of knowing. This convergence opens an opportunity to rethink urban planning through decolonial principles of relationality, reciprocity, and collective responsibility (Porter, 2020; Radcliffe, 2017; Jackson, 2005). Yet, the implications of Rights of Nature frameworks for the way cities are planned and governed remain underexplored.

While countries like Ecuador were early to recognize nature as a subject of rights at the constitutional level, Brazil presents a compelling example for examining how these frameworks take shape through municipal initiatives. This article examines recent Brazilian municipal cases recognizing the Rights of Nature to explore whether and in what ways this movement is fostering forms of urban planning aligned with decolonial principles. Through the experiences of Florianópolis (Santa Catarina) and Guajará-Mirim (Rondônia), the study analyzes the legal and socio-political processes that led to the recognition of nature as a subject of rights, mapping the actors involved, the institutional mechanisms employed—such as amendments to municipal organic laws and judicial decisions—and the socio-ecological implications of these processes.

The paper draws on qualitative content analysis (Hsieh & Shannon, 2005), guided by theoretical insights from Rights of Nature approaches and decolonial planning theory (Porter, 2020; Etchart, 2022). It examines primary sources such as municipal laws, court rulings, legislative records, and publicly available information from official judicial and government websites, alongside semi-structured interviews with key stakeholders involved in these initiatives. Preliminary findings suggest that these legal innovations challenge longstanding human-centered planning paradigms, creating space for more inclusive, participatory, and ecologically grounded forms of governance—as exemplified by the multi-stakeholder council established to oversee the Conceição Lagoon in Florianópolis. By centering Indigenous knowledge systems and community-based advocacy, the cases point to an emerging shift toward relational and nature-centered planning practices.

A powercube analysis of cumulative rights and burdens in water-land access in Orchard Park, NY

Abstract ID: 1844.0.0.482.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Emmanuel Frimpong Boamah [University at Buffalo] efrimpon@buffalo.edu, presenting author

Kristin Heltman-Weiss [Providence Farm Collective] kristin@providencefarmcollective.org

Enoch Yeleliere [University at Buffalo] enochyel@buffalo.edu

Property is a bundle of cumulative rights, riddled with asymmetric power relationships. The cumulative nature of property rights implies that holding some rights (e.g., rights to access, withdrawal, management, exclusion, and alienation) often implies the (dis)possession of others (Lee, 2011; Frimpong Boamah et al., 2020). These rights are coded in institutional frameworks at multiple scales, including local, state, and federal regulations in areas such as zoning, soil and water conservation, land banks and trusts, water service agreements, and farmland protection (Fischel, 1987. Ashwood et al., 2019). This paper leverages the water-land nexus to probe the (1) actor-network of rights held by various actors in water and land resources, (2) power relations embedded in this actor-network, including the mechanisms through which various water and land rights are marginalized, and (3) spaces of resistance for those whose rights and interests in water and land are marginalized. The empirical case for the analysis unfolds around Providence Farm Collective (PFC) in Orchard Park, NY, which is a farmer-led nonprofit focused on promoting access to land for ecologically sound, culturally sensitive, and healthy food systems among under-resourced communities. PFC was started by refugees and immigrants, who organized themselves to purchase rural agricultural land for farming and agricultural entrepreneurship. Farmers' land and water rights soon became entangled in the complex web of institutional structures and power relations when the Orchard Park Town Board refused to sign off on a certificate of occupancy, preventing PFC's access to running water for their newly constructed \$2.3million barn. The paper's analysis draws from Gaventa's (2006) powercube framework to offer an understanding of how land and water rights become imbricated in the politics of exclusion, marginalization, and dispossession fostered through zoning, water (re)districting, and agricultural land stewardship. It also provides opportunities for conversations around the crucial role of collective action to resist and reform formal and informal governance arrangements, such as zoning ordinance and water districting plans, that work to marginalize water and land rights for under-resourced communities.

Land Value Capture and the Right to Avoid Water: The Case of Charleston, SC

Abstract ID: 1844.0.0.761.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

James Spencer [Louisiana State University] jhs@lsu.edu, presenting author

(Part of Special Session organized by Charisma Acey) Increased urban flooding in vulnerable coastal communities has presented a difficult question of how to provide mitigation infrastructure and how does it get paid for. Although there is quite some evidence of the positive impact of climate change adaptation on property values, real estate developers have been shown to be slow to incorporate the such costs into their developments, leaving public policy as the primary tool for mitigation, and Land Value Capture (LVC) has been proposed a viable, market-oriented solution. This case study of the Charleston, North Charleston, and Mount Pleasant region of South Carolina, which is extremely vulnerable to climate risk and in need of climate adaptation measures, assesses current efforts to limit urban flooding, reviews developers' willingness to pay for flood mitigation infrastructure, and assesses the appropriateness of LVC policies to meet the fiscal cost of mitigation infrastructure. In particular, the paper presents the LVC policies in the context of residents' abilities and rights to avoid water in the face of increasing flood events.

Living With Fire: Planning, Evacuation, and Recovery in the Face of Urban Wildfire

Abstract ID: 1840.0.0.974.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.800.2025, 1844.0.0.904.2025, 1844.0.0.954.2025, 1844.0.0.940.2025

Matthew Palm [University of North Carolina Chapel Hill] palmatt@unc.edu, organizer

Wildfires are increasingly reaching urban areas, revealing vulnerabilities in land use, transportation, and community resilience. This session opens with a comparative look at the 2023 Lahaina and 2025 Los Angeles wildfires, highlighting built environment impacts using geospatial imagery and emphasizing the need for restorative planning and community capacity building. A second paper examines how vehicle access shaped evacuation mode choice for LA transit riders, as well as health impacts, air pollution exposure, and transportation insecurity. The third paper explores where evacuees abandoned vehicles to escape on foot, testing for street network design effects. The final paper analyzes how the LA fires, associated smoke, and a temporary fare-free policy impacted LA Metro ridership and bus service performance. Together, these papers offer a multidisciplinary perspective on wildfire response—blending equity, infrastructure, and community recovery to inform future planning.

Learning Objectives:

- Understand how transit riders and people without vehicles evacuate from fast-moving wildfires.
- Understand how at-risk and vulnerable populations are harmed by fast-moving wildfires, and how fast-moving wildfires and associated air pollution impact transit ridership.

Planning for Resilience: Lessons from Lahaina and LA Fire Disasters

Abstract ID: 1844.0.0.800.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Karl Kim [University of Hawaii] karlk@hawaii.edu, presenting author

Emma French [University of California Los Angeles] emmafrench@ucla.edu

Using data from devastating fires in Hawaii and California, the challenges to planners and the communities they serve are described and analyzed. In addition to summarizing impacts derived from satellite, aerial, and 360 imagery and other data from other sources, response and recovery efforts are also described. While there are similarities between the Lahaina and Los Angeles fire disasters, the challenges of mutual aid, response and especially debris management for remote island communities are much greater than connected urban areas. Yet the concerns related to transportation systems especially related to evacuation and management of the movements of people, vehicles, and equipment before, during and after emergencies require attention to planning, prioritization, decision-making and allocation of assets and limited resources. In addition to the questions of the who, what, and where is saved or left behind, the need for cooperative, collective, community action is needed. During disasters, formal systems for search and rescue, mass care, and supporting the needs of vulnerable, at-risk people can be quickly overwhelmed. These constraints and limitations also impact debris management, cleanup and restoration, rebuilding and recovery. Especially with fire disasters, there are many opportunities for land use planning and risk reduction. Positive collective action and support of communities impacted by climate and extreme weather events requires more attention, resources, data sharing, and planning processes to not just hasten recovery but to ensure more equitable, just outcomes. Planners and community builders need more than ever to engage in sharing data and observations of what worked and what did not in terms of response and recovery efforts to be included in mitigation plans, adaptation strategies, risk transfer and insurance mechanisms and broader initiatives to build and sustain resilient communities. (Please note this paper is co-authored with Emma French)

Where Wildfire Evacuees Abandon Their Cars & What It Says About Our Road Network

Abstract ID: 1844.0.0.904.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Sarah Grajdura [Utah State University] sarah.grajdura@usu.edu, presenting author

Matthew Palm [University of North Carolina Chapel Hill] palmmatt@unc.edu

Madeline Brozen [University of California, Los Angeles] mbrozen@g.ucla.edu

Ryan Miller [California Polytechnic State University] rgmiller@calpoly.edu

Wildfire risk is increasing in many parts of the world, necessitating more evacuations to move people to safety. Fast-moving wildfires, typically fueled by harsh winds and dry conditions, are particularly dangerous, swiftly decimating communities and often leaving insufficient time for evacuation (Cova et al., 2021; Grajdura et al., 2021, 2022). In these events, evacuees can abandon vehicles to seek safety on foot. The decision to abandon a vehicle can mean life or death; many fatalities from both the 2018 Camp Fire and 2023 Maui wildfires involved individuals waiting in their cars for traffic to subside (Kelleher & Lauer, 2024; Miller, 2020). Evacuation planning does not yet account for this phenomenon, which creates complexities within the evacuation process and subsequent recovery, including impeding evacuation routes for evacuees and emergency responders and requiring agencies to procure additional resources to clear roadways. Further, transportation planners have not fully explored the potential role of street network design choices in contributing to this dangerous phenomenon.

The Palisades and Eaton fires encroached on the urban footprint of the Los Angeles basin. The first, which originated in the Santa Monica Mountains, overtook built out areas with elements of curvilinear, dendritic, and highly topographically constrained road networks, raising the risk of key arterials becoming bottlenecked during evacuations. At the fire's onset, multiple news outlets reported residents abandoning their vehicles and fleeing through these roads on foot. The Eaton fire, in contrast, burned past the curvilinear and dendritic edges and into more traditional neighborhoods characterized by gridded street layouts, with similar reports of residents abandoning vehicles and fleeing on foot.

We fill a critical gap in knowledge surrounding where cars are abandoned during wildfire evacuations; we ask where cars are abandoned in the road network and what is the relationship between these locations and the street network configuration? We carry out this research using traffic data such as origin-destination paths, road closures, and congestion data for the 2025 Los Angeles wildfires, combined with satellite imagery and interviews with key agencies and emergency personnel. Using the traffic data, we conduct hot-spot analysis and clustering of stopped trips to identify the problematic locations. Qualitative findings contextualize the results and provide guidance for identifying best practices in addressing abandoned vehicles in wildfire evacuations.

This work builds a foundation for improving health and safety of communities in fire-prone areas by providing much-needed information on managing evacuations given the risk of vehicle abandonment. Our findings provide planners with insights into how to design resilient communities that can provide residents with safe means of escape. This research will allow communities and decision makers to make informed choices on how to adapt to a changing climate, and to understand how, when, and where to manage vehicle abandonment risk.

The LA Basin Wildfires of January 2025 were characterized by the rapid fire expansion into urban communities, including Palisades and Altadena, California. As wildfires encroach deeper into urban communities with vulnerable and transportation-insecure households, public transit becomes vital yet understudied evacuation method (Goddard, 2024). Most existing studies of wildfire evacuations focus on vehicle-owning households and assume that evacuees will use their personal vehicles while evacuating. However, some studies have considered how evacuation outcomes change with reduced vehicle access (Grajdura et al., 2022). Further, while some studies help define transit-dependent evacuees' needs, no studies have collected near real-time data on transit riders' evacuation behavior or their adaptation behavior immediately post-evacuation. Transportation-insecure households are more likely to rely on public transit and thus face significant challenges during evacuations from fast-moving wildfires (Grajdura et al. 2021, Toledo et al. 2018). These households, often low-income and historically under-researched, also face compounded risks after evacuation: extended exposure to harmful air pollutants while evacuating and limited ability to adapt to bus service disruptions that may jeopardize access to healthcare and other essential destinations.

To better understand the evacuation experiences of these vulnerable populations, we surveyed transit riders across Los Angeles County via the Transit App in the weeks following the fires. Riders who evacuated were asked about their evacuation experiences and decision making. All respondents were asked for details about their physical and mental health before, during and after the wildfire events, and continued transportation barriers post-fires. Our survey sample includes 579 responses, with 25 percent of respondents indicating they evacuated. The sample is diverse in gender, race/ethnicity, and household composition and demographically similar to LA Metro transit riders.

Our findings show that households without access to a car were more likely to evacuate using transit or walking and faced longer evacuation times with additional barriers compared to car-owning households. Similar proportions of car-owning and non-car-owning households relied on rides from others to evacuate, stressing the need for people to prepare for emergency situations by knowing neighbors or other non-household contacts. We also asked non-evacuees their likelihood of using different modes if they needed to evacuate and found similar patterns to people who evacuated with rides from family or friends or public transit being the most likely approaches. Respondents also reported negative physical and mental health effects from smoke exposure and evacuations, which varied by respondent race/ethnicity and prior health conditions. This research has important implications for how transportation agencies and emergency preparedness planners manage risks for transit-reliant and zero-vehicle households in future urban wildfire scenarios.

Amy Lee [UCLA] amylee@g.ucla.edu

The January 2025 Los Angeles wildfires expanded rapidly past the wildland-urban interface into densely populated residential communities, generating dangerous levels of air pollution across the region. In response, Los Angeles Metro - the region's largest transit agency - suspended fares for over two weeks, rerouted service away from active fire zones, and offered ongoing discounted fares to residents directly impacted by the fires.

Previous research suggests fare free transit can increase transit ridership (Bull et al., 2021), but critics contend that it does so by drawing mode share away from walking and cycling (Zipper, 2022). However, in the context of wildfires, such a shift may advance public health goals by reducing travelers' exposure to air pollution, allowing them to travel in faster, ventilated vehicles instead of walking or biking. While transit users generally face higher exposure to air pollution than private vehicle users (Cepeda et al., 2017; Van Ryswyk et al., 2021) limited evidence suggests that wildfire-induced pollution encourages mode shifts from active travel to transit- even without policy incentives - and that this effect may extend hundreds of miles from the fires themselves (Han et al., 2024).

This study evaluates the combined effects of wildfire smoke and fare-free transit on ridership during the 2025 Los Angeles wildfires. Using ridership data and General Transit Feed Specification Real-Time (GTFS-RT) data, we assess how mobility patterns changed across the city. We hypothesize that ridership increased in communities with lower vehicle ownership and decreased in areas under evacuation advisories. Additionally, we expect that in the initial days of the fires, route performance declined in neighborhoods near, but not within, evacuation zones. Our findings will help transit agencies better understand and prepare for ridership changes during air quality emergencies and fast-moving disasters, enabling them to maintain essential service delivery.

Planners' Perspectives on Water - Climate Resilience and Adaptation

Abstract ID: 1840.0.0.699.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.810.2025, 1844.0.0.284.2025, 1844.0.0.685.2025, 1844.0.0.593.2025

Shruti Syal [Virginia Commonwealth University] syals@vcu.edu, organizer

Water is at the center of the climate crisis, but Planning is not at the core of global water conversations. Engineering is dominant due to institutional inertia and crisis-driven decision-making, despite advocacy for interdisciplinarity and power-sharing between engineers and social scientists for adaptive governance or evidence of reliance on infrastructure over governance hindering resilience. Amongst approaches identified to achieve water resilience in recent literature, impact of land use planning (Stoker et al 2022), need for socio-technical integration and interdisciplinarity (Cozier et al 2024), and importance of multilevel governance (Saikia & Jiménez 2023) and multi-stakeholder involvement (Huntjens et al 2015) depict a nexus of knowledge base and skill sets unique to planners, positioning them as key players in achieving resilience (Cesanek et al 2017, LUC 2023). This session provides localized actionable insights from Planning on these issues.

Learning Objectives:

- Focusing on water issue(s) within the climate resilience/adaptation milieu, addressing one/some of the critical ways planners/Planning can/has (perhaps uniquely) influence(d) resilience.
- Papers examine critical land-use and water resilience relationships, or navigating multilevel water governance, or collaborative or community-engaged planning for water, or resilience planning for water infrastructure
- One of three preorganized sessions aiming to recenter the role of Planning in water-related issues, emerging from an informal collective of ACSP researchers focused on water.

Socially Adjusted Vulnerability Assessment for Flood Mitigation at Jefferson Parish, Louisiana

Abstract ID: 1844.0.0.810.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Fahmida Akhter [Louisiana State University] fakhte1@lsu.edu, presenting author

Thomas Douthat [Louisiana State University] tdouthat1@lsu.edu

Adilur Rahim [Louisiana State University] mrahim@agcenter.lsu.edu

Rubayet Mostafiz [Louisiana State University] rbinmo1@lsu.edu

Federal agencies assess the suitability of flood mitigation projects based on Benefit-Cost Analysis (BCA). BCAs often focus on property values and ignore the distribution of damages across different populations and how this might lead to different outcomes on total social welfare. For effective flood risk management that considers social welfare, it is essential to assess the social factors that influence an affected community's ability to respond to or recover from it. In this context, a major driver of social vulnerability is the income and wealth of at-risk populations and their relative exposure to hazards. One way to address how property protection impacts people's resilience is to shift the focus of BCAs to social welfare estimates, where individual social vulnerability is considered through relative impacts on income. Here, we propose a methodology based on equity through the lens of diminishing marginal utility of income and tenure to estimate how flood reduction and exposure will differentially impact different populations. This paper aims to produce vulnerability-weighted damage impacts for households living in single-family dwellings that make income and tenure-informed estimates of flood damage estimates incorporating marginal utility. We present a case study based on Jefferson Parish, Louisiana, using INCORE interpolated structure-based social data. This approach advances BCA methodologies, and can provide new perspectives on how to best use limited public funds to reduce vulnerability and promote social welfare through hazard mitigation. We compare our method to existing equity weighting approaches based on social categories and vulnerability indexes.

Women's Empowerment in Practice: Insights from Mexico City's Rainwater Harvesting Program

Abstract ID: 1844.0.0.284.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Paroma Wagle [Virginia Tech] paroma@vt.edu, presenting author

Rainwater harvesting has long been used as a climate resilience measure in cities as it provides an alternative source of water, reducing dependence on traditional water supply systems and infrastructure that may be inadequate or vulnerable to climate extremes. In Mexico City, the city government has implemented the 'sistemas de cosecha de lluvia (SCALL)' program since 2019, involving the propagation of rainwater harvesting systems throughout the city to address the concerns of climate change, water stress, and water inequalities. Broadly considered a successful initiative in the city, over the last five years, almost 1,418 million pesos have been invested for the installation of more than 70,000 household-level rainwater harvesting systems as well as 2000 school-level systems in eleven municipalities of Mexico City.

Across the world, in many low-income communities, water provisioning for families is considered a women's task, and hence, women's empowerment is often equated with transferring the responsibility of water management systems to women. The SCALL program, predominantly led by women, challenged this narrative that 'water provisioning is a woman's task.' The leadership of the program refused to put the burden of managing rainwater harvesting systems on the already overburdened women beneficiaries of the program. They also challenged the program being put forward as a purely environmental or climate initiative and switched the narrative to make it a social initiative. Alongside, a precondition for availing of program benefits was also added, which required all family members, not just women, to participate in the system's management, undergo the necessary training, and participate in monitoring activities. The name and emblem of the rainwater harvesting system was changed from Tláloc (the god of storm) to Chalchiuhtlicue (the goddess of the lakes, streams, and rivers), signifying the change in narrative. Over time, the narrative of 'water management is a family task' seeped into the communities, and women beneficiaries could find up to an hour of daily respite to engage in leisure, social networking, and community-building activities. The paper thus is focused on the research question: How have these narrative changes led to the apparent success of the SCALL program?

To summarize, there are two levels of innovative changes in the narrative of the program that are of critical interest to this paper. The first is the change from an environmental to a social narrative while launching an initiative like rainwater harvesting and its impacts on various levels of administration and implementation. For clarity in this paper, I will call this change the 'environment to social narrative change'. The second is the change in narrative from 'water management is a woman's task' to 'water management is a family task' and its impact on beneficiaries and their day-to-day life. Through oral histories of people in leadership, the paper plans to document the iterative thought process as well as strategies that led to the design and implementation of the program over five years. This will be supplemented by quantitative and qualitative analysis of government survey data of the program. The paper aims to understand how such grounded narrative changes can be helpful in strengthening climate resilience-oriented programs and draw lessons for water management in growing Global South megacities in the era of climate change.

Abstract ID: 1844.0.0.685.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Shruti Syal [Virginia Commonwealth University] syals@vcu.edu, presenting author

Michael O'Grady [Virginia Commonwealth University] ogradym2@vcu.edu

In Delhi, India, storm drains (nullahs) carry runoff and un/partially treated sewage into river Yamuna, but ongoing remediation projects ignore Water, Sanitation, and Hygiene (WaSH) needs of >1 million residents of adjacent 'informal' settlements (JJs). This crisis has public health (flooding, diseases) and environmental (river pollution) dimensions. Despite substantial investment by many WaSH sector actors, access remains fragmented, hampered by tumultuous histories of "slum" eviction and institutional issues in service provision. An environmental challenge is interwoven with socio-political dynamics of service provision, requiring an approach addressing both social and ecological aspects. A decade of fieldwork, multi-stakeholder interviews, and institutional analysis revealed that Nature-Based Solutions (NbS) are being applied to WaSH and remediation projects, biophysically linking these agendas, but regulatory overlap obscures this connection and jeopardizes efforts to expand service access or remediate water bodies (Syal, 2019). At this critical juncture in Delhi's development, we provide city- and site-scale suitability analysis for nullah-adjacent JJs where NbS can be added to Community Toilet Complexes (CTCs) constructed as part of India's push to end open defecation, that are becoming pollution sources by releasing untreated or primary treated sewage into adjacent drains.

Starting with a list of 165 nullah-adjacent JJs, we eliminated sites too far away from a nullah or whose access to it is blocked by features (freeways, forests, etc.). Next, we used open-access or primary datasets for JJs and their population sizes, nullahs, and land cover for a city-scale suitability analysis identifying the subset of 107 nullah-adjacent JJs suitable for NbS based on suitable land vis-à-vis population estimates. We are conducting a sensitivity analysis using additional datasets to identify the final subset of potentially suitable sites (currently 35). For the final step—site suitability analysis—we first consolidated several literature reviews of NbS typologies used for wastewater treatment globally (Cross et al., 2021; others) to identify which ones are suited to our case based on already-established parameters like scalability (i.e., meeting population need), land requirements, filtration efficacy, and times. Next, we identified the parameters (like built-up area, rainfall, elevation, blackwater load, vegetation cover) to incorporate into the suitability analysis. We processed up-to-date spatial datasets for these parameters using open-source data where available (e.g., land use plans, satellite imagery from Maxar and Google Earth Engine), converting them into a single database of raster and vector layers. Expanding on the ALLOWS approach pioneered by Van Afferden et al. (2015) and Khurelbaatar et al. (2021), we will discuss a few cases at site scale (i.e., NbS design scale), including hydrology analyses demonstrating these projects can withstand Delhi's monsoons and avoid system overload issues common in Delhi's sewer networks.

This work complements an actor/institutional network mapping project analyzing WaSH and NbS sectors in India; together they aim to answer where and how coordinated WaSH-drain remediation projects can be implemented. While an NbS suitability analysis for Delhi exists (CSE, 2020), our paper highlights the socioecological justice opportunity provided by Delhi's interdependent drain pollution, flood mitigation, and "slum" upgradation agendas, adapting a new geospatial analysis method to the Indian context to do so. The city- and site-scale analyses provide actionable insights for NbS actors and government partners about where to pilot NbS integrated with CTCs and what typologies to explore. By offering practical insights into how NbS can prioritize vulnerable communities while

addressing critical environmental challenges, we contribute to broader discussions about climate justice in urban adaptation.

Urban wetlands are essential components of resilient and sustainable water systems in sub-Saharan Africa. These ecosystems maintain water quality, mitigate floods, and regulate hydrological cycles by absorbing rainwater and runoff while filtering suspended and dissolved solids from both surface and groundwater. However, despite their ecological significance, urban wetlands are experiencing rapid degradation, largely due to their marginalization in planning and governance frameworks. This neglect is particularly evident in Ghana's rapidly urbanizing coastal cities, where wetland loss is driven by weak institutional enforcement, the prioritization of property rights, and the dominance of engineered infrastructure over ecological considerations.

This paper critically examines the spatial-institutional and built environment dynamics that hinder the effective planning and conservation of urban wetlands in sub-Saharan Africa. It interrogates the role of institutional inertia, governance fragmentation, and land tenure regimes in shaping wetland futures. Using a mixed-methods approach that integrates multi-temporal satellite imagery analysis (NDVI, NDWI), policy review, and stakeholder interviews, this study tracks the transformation of wetlands from 1990 to 2024. Findings indicate a 30–50% decline in wetland areas, driven by privatization pressures and governance misalignments between water resource management and urban land-use planning. Despite growing global advocacy for nature-based solutions, wetlands remain overlooked in urban resilience strategies.

By reconceptualizing wetlands as both legal and ecological entities rather than expendable urban spaces, this paper advances the argument for governance models that balance property rights, infrastructure demands, and ecological imperatives. It situates wetlands within the broader discourse on water governance, advocating for adaptive, multi-level planning approaches that institutionalize nature-based solutions. The study contends that fostering urban resilience necessitates a paradigm shift from siloed, infrastructure-centric frameworks to integrative governance structures that embed ecological rights into urban planning. Strengthening institutional coordination and embedding wetland conservation into urban policy can promote more equitable and sustainable water futures for African cities.

The Capacity to Adapt: Property, Housing, and Agency in Climate Response

Abstract ID: 1840.0.0.547.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.225.2025, 1844.0.0.308.2025, 1844.0.0.506.2025, 1844.0.0.81.2025, 1844.0.0.82.2025

Yael Nidam [University of California Berkeley] yaeln@berkeley.edu, organizer

Many climate adaptation plans remain under-implemented, failing to address threats like wildfires, floods, and droughts. Meanwhile, everyday adaptations are constant, driven by people protecting assets and meeting basic needs. Yet planners often overlook the property institutions and governance structures that shape who can adapt. This session highlights how land use, property rights, and local governance constrain or empower those on the front lines of climate risks, including wildfire, sea level rise, and thermal insecurity. Case studies from Taiwan and California show how insecure tenure, complex permitting, and limited tenant rights reinforce unequal power relations. By revealing how official adaptation plans intersect with everyday actions, the session argues for reimagined property regimes and governance that foster equity and resilience. Participants will explore how to better support frontline communities, ensuring their needs are integrated into future planning processes.

Learning Objectives:

- Recognize how property institutions and governance arrangements influence everyday climate adaptation, especially for communities facing wildfires, sea level rise, and heat threats.
- Identify structural barriers—such as insecure tenure, complex permitting, and limited tenant rights—that undermine equitable climate resilience.
- Explore strategies for reimagining property regimes and municipal policies to enhance equity, community knowledge, and collective climate resilience.

The Centrality of Property Rights to Climate Adaptation: Cases from Taiwan

Abstract ID: 1844.0.0.225.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Linda Shi [Cornell University] lindashi@cornell.edu, presenting author

Shu-Mei Huang [National Taiwan University] shumeihuang@ntu.edu.tw

Kuei-Hsien Liao [National Taipei University] liaokh@mail.ntpu.edu.tw

Property rights regimes complicate climate adaptation in ways that are socially equitable and ecological reparative (Shi et al., under review). Contemporary property rights often come with static boundaries, individual ownership, and expectations of monetary value. This can challenge planners' ability to promote collective action, adaptation under uncertainty, and ecosystems restoration. Indigenous, informal, or low-income communities' tenure insecurity also limits their control over adaptation. How have communities living in environmentally dynamic places historically dealt with risk? How have their land relations changed over time with colonialism and developmentalism? Who loses land, property rights, and power under state-led adaptation?

We explore these questions through three cases in Taiwan, where settler colonialism has shaped property rights for over a century and where typhoons, earthquakes, and landslides are frequent. Two of the researchers have engaged these communities for years, and all three conducted community tours and interviews in 2025 with dozens of residents, community leaders, and civil servants about property rights, land relations, and climate impacts.

The first case concerns Shezidao, a peninsula in Taipei at the confluence of two rivers. Early Han Chinese migrants adapted to frequent flooding by rotating land to share risks, building physical changes to their homes, and sharing food across the community (Liao et al., 2023). Fifty years ago, the city built flood control infrastructure for the rest of the Taipei metropolitan area while banning housing reconstruction in Shezidao, eroding both cooperative and individual property rights. Now, a redevelopment plan aims to expropriate the entire peninsula (home to many low-income households), compensate owners for about 40% of their original land areas, displace some residents, and tear the community apart.

The other two cases concern the Paiwan (Kukus Village) and Rukai (Changchih baihe Village), Indigenous communities in southern Taiwan that have been repeatedly relocated out of the mountains by the Japanese, Kuomintang, and democratic government following Typhoon Morakot in 2009 (Huang, 2018). Beginning with the Kuomintang, Indigenous communities have been prohibited from registering land as communal (Yi-Shiuan Chen, 2018). Now they have no rights to the land in their relocation settlements, are limited in their right to sell or bequeath the house, and may not return to their old village.

This paper attempts to put into conversation the experiences of Taiwan's Han Chinese and Indigenous Tribes. These dialectical cases show that, despite centuries of conflict, these groups share similarities in adaptation to environmental dynamism, including cooperative and communal land sharing reflective of a deep understanding of local environmental conditions. These approaches diverge from efforts to harden and securitize property rights by armoring waterfronts or retreating from the mountains. Meanwhile, the government has eroded people's rights to renovate, rebuild, sell, or bequeath land. In effect, adaptation on Taiwan's frontlines of climate change has come at the cost of the land rights and land relations of its most marginalized residents.

For Taiwan, these cases reveal the lasting influence of the Kuomintang's settler colonialism and anti-Communist struggle in shaping Taiwan's political identity and current adaptation planning. For climate adaptation planners

anywhere, these cases demonstrate the centrality of historic and future property rights as a fundamental factor of adaptation. Procedural justice without land rights severely undermines the power of communities to enact their own vision of adaptation, while secure property rights in novel or cooperative approaches can support individual and community agency in achieving housing security, secure livelihoods, and the ability to live dynamically with the environment (Lamb & Vale, 2024).

The Power to Act: Property, Agency, & Transformative Climate Adaptation in Manufactured Home Parks

Abstract ID: 1844.0.0.308.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Zachary Lamb [University of California, Berkeley] zlamb@berkeley.edu, presenting author

Over 20 million Americans live in manufactured housing and approximately 1 million Californians live in manufactured home parks, otherwise known as “mobile home parks” or “trailer parks.” These neighborhoods provide essential affordable housing in communities across the state. However, many park residents face a ‘double burden’ of tenure insecurity and heightened vulnerability to climate change and other hazards. Mobile home park ownership is increasingly consolidating as investors and corporate owners buy parks previously owned by ‘mom-and-pop’ landlords. Simultaneously, public entities, non-profits, and resident cooperatives are buying parks to preserve their affordability. These varied ownership and governance regimes can exert powerful influences on residents’ lives under both everyday circumstances and in the event of climate change-linked disruptions.

This paper explores the question: How does manufactured home park ownership and governance shape residents’ vulnerability and adaptation to climate change related hazards? The underlying research includes a state-wide mobile home park ownership census and geospatial analysis of climate vulnerabilities. Drawing on these statewide analyses, this paper centers case studies informed by ethnographic fieldwork in climate vulnerable manufactured home parks across the San Francisco Bay Area and Delta regions. We find that mobile home parks can be venues for transformative adaptation, giving low- and moderate-income people the power to act in the face of climate change and other threats. However, these transformative potentials are mediated by ownership and governance arrangements, which shape residents’ security, agency, and resources. This inquiry offers insights on transformative adaptation across community types in California and beyond.

Alienated Adaptation: how rental relations shape access to decarbonization technologies

Abstract ID: 1844.0.0.506.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Zoe Hamstead [University of California, Berkeley] zoehamstead@berkeley.edu, presenting author

Isabel Peñaranda Currie [University of California - Berkeley] ipenaranda@berkeley.edu

Nationally, the building sector accounts for a substantial portion of greenhouse gas emissions, and is thus a key sector in which decarbonization investments will need to happen. Electrification, weatherization, and other types of retrofits can not only reduce emissions that are produced by residential energy consumption, but can also reduce the energy burden of low-income households who struggle to make ends meet. However, many low-income households are renters who do not have agency over their own residential built environment. The question of building energy efficiency and retrofits has often been framed as a technological one, centering on heat pumps, solar panels, and smart thermostats. Yet, we argue that such technological deployment is often situated in a central power relation which governs housing. Renters' access to publicly subsidized retrofits depends upon the willingness of landlords to engage in these programs. Moreover, poor housing quality is often what enables people to access affordable housing, low-income renters are often reluctant to make appeals to their landlords and even resist their own housing improvements.

This paper uses empirical research on the landlord/tenant relation in one of the hottest housing markets in the country—the San Francisco Bay Area of California—to show the ways in which property relations constrain adaptive agency in the face of dangerous weather and climate change. Drawing upon Peter Marcuse's formulation of "residential alienation" as the loss of the critical relationship to housing as a dwelling, we argue that such alienation also constitutes a form of climate violence, normalized by property regimes that continue to place low income communities and communities of color at a structural disadvantage. Short of addressing residential alienation, climate planners and other adaptation professionals will be extremely limited in their abilities to achieve equitable decarbonization and climate adaptation more broadly.

The Role of Cities in Housing Resilience and Decarbonization

Abstract ID: 1844.0.0.81.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Yael Nidam [University of California Berkeley] yaeln@berkeley.edu, presenting author

Carolina Reid [University of California Berkeley] c_reid@berkeley.edu

Housing decarbonization, a key component in municipal climate action plans, is managed and implemented by multiple sectors, requiring coordination between urban planners, energy providers, community organizers, organizations conducting the retrofits, and state agencies. If successful, these energy retrofits can not only cut carbon emissions but also improve residents' energy security, health, and well-being, contributing to urban resilience against extreme weather events and energy disruptions.^{1,2} Yet, prior research has shown that implementation efforts face an array of challenges (e.g., limited awareness, lack of time and funds, shortage of skilled labor, long permitting processes, eviction risk), leading to insufficient participation, especially among lower-income residents who are more vulnerable to extreme weather and higher energy bills.^{3–5}

To better understand the nature of these challenges and what it would take to implement equitable decarbonization, we conducted a statewide analysis of decarbonization efforts across California, a state that ACEEE ranked first in the nation for energy efficiency policies and programs in 2025. California is home to approximately 60 decarbonization programs, more than half of which are led by local municipalities. We interviewed 57 people who hold leadership positions in local and state governments, energy utilities, implementation companies, nonprofits, and community organizations. Our study is conducted in partnership with environmental justice and community-based organizations in a Participatory Action Research (PAR) model, to ensure findings are grounded in the experience of impacted communities.

We find that local governments already advance resilient and low-carbon homes through multiple pathways. Cities raise resident awareness of the energy status of their home through disclosure and benchmarking ordinances, rules requiring an energy assessment at the point of sale, reach codes that encourage electrification, and educational campaigns. Some municipalities have programs to assist potential participants in selecting contractors. Others manage their own energy utility or are members of a Community Choice Aggregation agreement, which enables them to offer more affordable electricity rates and manage their own programs based on the priorities of their constituents.

However, we also identified other ways local governments can support equitable decarbonization. More cities should streamline permitting to reduce labor costs and delays. Cities should also review their tenant stabilization policies to ensure that retrofits don't lead to rent increases. A more aspirational pathway involves municipalities taking a more central role in the coordination of decarbonization efforts, including serving as a central information hub. Ease of access to information can improve the local capacity of individuals and small businesses to participate by assisting with filling out forms and providing guidance throughout the process. In this role, municipalities can also use their local knowledge to coordinate program design with energy providers and state agencies, further contributing to overcoming barriers to participation.

While urban planners typically engage in decarbonization efforts through climate action plans, our study shows that cities can fill a more significant role in coordinating decarbonization efforts across scales and in overcoming barriers that are within the jurisdiction of the local municipality. For cities to assume these roles, there's a need for states to provide technical guidance and allocate resources for the local management of energy efforts, including

permitting, enforcement of renter rights, and serving as a central hub for information dissemination. Our findings are relevant to municipalities across the nation in creating comprehensive strategies to retrofit the building stock to meet resilience and carbon emissions reduction goals.

Disorderly Urban Adaptation to Climate Change: Finance, Land Use, and the Built Environment

Abstract ID: 1844.0.0.82.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Yael Nidam [University of California Berkeley] yaeln@berkeley.edu, presenting author

This article develops the concept of “disorderly” urban adaptation to describe processes of change that unfold through exogenous shocks, abrupt policy shifts, and sharp adjustments in asset valuations and risk ratings. Disorderly adaptation is disjointed in the sense that it is shaped by diverse stakeholders acting on local problems and interests. But it involves all kinds of planning and management by individuals, community groups, governments, and private firms. We present an approach to studying disorderly urban adaptation by mapping interactions among three urban sub-systems: the built environment, land use, and finance. This approach sheds light on key features of disorderly adaptation, such as temporal and spatial mismatches, balancing and reinforcing feedbacks, and lags that “desynchronize” processes of sub-system change.

We implement this approach to study urban adaptation to wildfires in the High Fire Risk Areas (HFRA) in California. Our research involved three components that were conducted iteratively: (1) Study system characterization involved identifying key actors and institutions of three sub-systems in the California HFRA: Land use, the built environment, and insurance; (2) Data collection characterized relationships within and among sub-systems to understand their change over time. It includes academic papers, evaluation reports, planning documents, and news articles, participation in public forums and stakeholder workshops, and 21 formal interviews with individuals in leadership positions in state and local governments, insurance industry, and community organizations. (3) Qualitative modeling employed both causal loop diagrams to characterize high-level relationships and detailed conceptual models of interactions among sub-systems.

Employing this model, we describe a significant regime shift that was precipitated by the 2017-2020 mega-fires in the state. Prior to the fires, California experienced a long period of housing development and fire risk accumulation in the HFRA¹. This risk accumulation regime was disrupted by the 2017-2020 fires. Perhaps the most important driver of this disruption was a dramatic shift in insurer risk perception that ramified through the HFRA system. The private insurance industry’s response to the fires has been rapid, with significant shifts in pricing, availability, and total coverage². The response to this disruption by state insurance regulators has lagged private sector adjustment. Changes in the built environment and land use, meanwhile, have been slower still^{3–5}. The result has been a period of disorderly change, as homeowners, community organizations, local and state governments, regulators, and the insurance sector adjust to significant disruptions in at best partially coordinated ways.

We suggest that this approach has lessons for understanding and planning for emerging trajectories of urban change in many contexts and in relation to various hazards. For example, we observe disorderly change processes like those described in California in many areas of the US (e.g., Florida) that are facing increasing losses due to climate/environmental hazards, insurance market disruption, and varying levels of adjustment in land use and the built environment.

Our analysis of disorderly adaptive change as a socio-ecological systems problem has important implications for urban scholars and practitioners. Planners who seek to understand how to shape adaptive change in patterns of land use and the built environment should look beyond the adaptation plans of local jurisdictions where such issues are explicitly addressed. More attention should be paid to mechanisms such as financial risk rating and regulation, to mitigation standards for landscapes and structures in shaping urban adaptation to environmental

risk, and to the complex decision-making arrangements—from property owners and community groups to local and state government—through which these are instituted and navigated.

Water Utility Governance Planning and Equity Outcomes

Abstract ID: 1840.0.0.251.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Session Summary

Session Includes: 1844.0.0.205.2025, 1844.0.0.213.2025, 1844.0.0.171.2025, 1844.0.0.197.2025, 1844.0.0.58.2025

Gregory Pierce [UCLA] gpierce@luskin.ucla.edu, organizer

This panel brings together 5 different studies, with each working at the intersection of drinking water utility governance and water equity outcomes for communities. Despite the common theme, the session will allow for rich comparison across high income and low-middle income country contexts, scales of analysis (national, sub-national, local), and methodological approaches. The session's papers primarily focus on affordability and accessibility as the equity outcomes of interest, but inform broader Sustainable Development Goal discussions and urban environmental planning threads of scholarship.

Learning Objectives:

- Participants will learn the nuances of utility governance and planning
- Participants will understand the cutting edge of Human Right to Water Scholarship
- Participants will be exposed to multiple methods and comparative local contexts

Water Utilities and National Affordability Mandates: Evidence from Colombia

Abstract ID: 1844.0.0.205.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Andrea Restrepo-Mieth [Rutgers University] andrea.rm@rutgers.edu, presenting author

The ability to afford water and sanitation services continues to be a challenge in the global South despite decades of initiatives such as the Millennium Development Goals and more recently, the Sustainable Development Goals (SDGs). SDG 6 calls for safe and affordable water and sanitation for all, however, meeting this goal requires overcoming local governance challenges given that most developing countries manage these services at the subnational level (Herrera, 2019). Improving water and sewer affordability requires understanding how those governance challenges can be addressed, particularly how water and sanitation utilities position themselves when new affordability initiatives emerge. This paper analyzes the positions taken by publicly owned and privately owned utilities, as well as the national association that brings them together, considering efforts by the Colombian government between 2023 and 2024 to adopt a water lifeline mandate. Water lifelines are basic volumetric allowances provided for free followed by normal tariff charges thereafter. This type of customer assistance program is considered “the best-case scenario” for non-tariff affordability assistance as it targets the poor while maintaining price or resource scarcity signals (Cook et al., 2020). Research on lifeline programs has centered on their genesis, design and impact (Contreras et al, 2018; Cook, 2020; Muller, 2008; Vargas et al, 2018). This paper focuses on how water utilities companies perceive these programs, how they position themselves when efforts to adopt them emerge, and the narratives they create to support or challenge the creation of a national mandate. Colombia was selected as a case study given efforts between 2023 and 2024 to adopt a national policy. Document analysis and interviews show that utilities develop their positions around three main criteria: administrative burdens and their financial implications, availability of technology, and concerns about unclear rules. Technological factors, such as the percentage of the population with water metering that a utility serves, are a key criterion for or against the adoption of lifeline mandates. Concerns around administrative burdens are significant among utilities in smaller municipalities while unclear rules present the most significant hurdle for utilities to lend support to these programs. Discourses calling for “universal access” are contrasted with terms preferred by utilities such as “access to a lifeline block” showing attempts to distinguish affordability from accessibility and perceived risks of policies targeting affordability becoming conflated with policies demanding improved accessibility. Findings show the importance of working with utility companies from the earliest stages of policy design given their centrality in implementing affordability policies.

Unintended Consequences: Hispanic Communities and Water Affordability in Wisconsin

Abstract ID: 1844.0.0.213.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Laura Morales-Whetstone [University of Wisconsin - Madison] ljmorales2@wisc.edu, presenting author

As state governments increasingly impose tax limitations on local municipalities, the hidden costs of fiscal austerity are being borne disproportionately by vulnerable communities. Payments in Lieu of Taxes (PILOTs), once a niche tool for offsetting public service costs, have become a critical revenue stream for municipalities facing budget constraints. However, our previous research revealed a concerning correlation between Hispanic population density and increased reliance on water utility PILOTs in Wisconsin, suggesting that these policies may exacerbate existing socioeconomic disparities.

Building on this finding, we now explore the nuanced spatial and temporal patterns of PILOT adoption in Hispanic communities, with a focus on small rural towns where agriculture is a primary economic driver. Using an interrupted time series analysis of 500 Wisconsin municipalities from 2000-2020, we examine how the 2007 state tax caps reshaped local fiscal strategies. Our research questions include: (1) How do socioeconomic factors in Hispanic-majority rural communities influence PILOT adoption rates? (2) What spatial patterns emerge in PILOT reliance across Wisconsin's changing demographic landscape? (3) How have these trends evolved over time, particularly in relation to Hispanic population growth and economic shifts in agricultural regions?

Our methodology combines quantitative analysis of municipal financial data with spatial mapping techniques to visualize PILOT adoption patterns. We control for variables including Democratic vote share, voter turnout, federal and state aid, property taxes per capita, percentage of Black residents, total population, and agricultural employment rates. This approach allows us to isolate the unique factors driving PILOT reliance in Hispanic communities.

Preliminary findings suggest that rapid Hispanic population growth in rural areas (135% increase from 2000 to 2015) may strain local infrastructure, potentially explaining higher PILOT adoption rates. We also observe that lower voter turnout and linguistic barriers in these communities correlate with increased PILOT reliance, raising questions about political representation in local fiscal decision-making.

This research contributes to planning scholarship by illuminating the intersection of demographic change, rural development, and municipal finance in an era of state-imposed austerity. By exposing potential inequities in water affordability resulting from PILOT policies, our study offers critical insights for policymakers seeking to balance fiscal constraints with equitable service provision in diverse, rapidly changing communities.

Digitizing Water Access in the Smart City: Governance Challenges and Equity Implications in India

Abstract ID: 1844.0.0.171.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Nidhi Subramanyam [University of Toronto] nidhi.subramanyam@utoronto.ca, presenting author

David Meyer [University of Toronto] david.meyer@utoronto.ca

Intermittently available piped water imposes unequal mental, physical, and financial burdens on a billion water users worldwide (Bivins et al., 2017). These burdens lighten when water is supplied according to a predictable, reliable, and accessible schedule. However, little research has examined the institutional and technical processes by which these schedules are produced and conveyed or their impacts on water governance and users' water security (cf. Kumar et al., 2018; Subramanyam, 2024). This paper critically examines the governance challenges, particularly the organizational and technical burdens that digitally conveying water supply schedules impose on utilities and the (un)equal benefits that such conveyance offers water-stressed residents. We focus on the case of Coimbatore, India, where the utility started posting water supply schedules online in 2022 as part of Smart City digital governance reforms.

Our analysis takes a mixed-methods approach, analyzing (1) in-depth, semi-structured interviews with nine key informants in the municipal water utility investigating the challenges involved in conveying schedules; (2) user responses to the 99 social media posts about water supply schedules; and (3) the structure and contents of the 101 schedule documents themselves. The effort involved in producing and conveying digital schedules, which we estimated to be 71 labor hours daily across 135 staff, far exceeds the institutional capacity of the utility. Precariously employed frontline valve operators provide more than two-thirds of this labor without corresponding empowerment in digital technologies, workflows, or governance. Additionally, online schedule conveyance exposes them to further scrutiny from residents, managers, and elected officials, discouraging their buy-in into digitalization processes. This has implications for the quality of water supply schedules communicated to water-stressed residents.

We also find that the posted schedules are inconsistently formatted and difficult to parse, limiting their usability for residents hoping to predict supply timings for their localities. Content analysis of social media posts shows that residents expressed appreciation for digital transparency but were unable to consistently interpret or rely on schedules due to formatting inconsistencies, delayed postings, and unreported supply deviations. Quantitative analysis of schedule data reveals that the inconsistent and unreliable schedule structure also complicates 'data wrangling' (Lodato et al., 2021) by researchers seeking to derive supply metrics such as frequency, duration, and continuity from the schedules for evaluating utility performance (Meyer et al., 2023) or for detailing spatial equity in these evaluations (Carolini & Raman, 2021). These barriers to consuming schedules undermine the transformative potential of digitalization reforms aiming to improve governance and water security. Our findings demonstrate how digital reforms, when layered onto analog bureaucracies without corresponding investments in institutional capacity-building, reproduce rather than resolve infrastructural inequalities, including unequal water access. Our paper makes contributions to ongoing discussions on improving water security in intermittent water supply systems across the Global South. Additionally, it contributes to critical research on smart governance (Datta, 2018; Parkar & Lama, 2023), tempering optimism about digital governance reforms by arguing that digital technological interventions alone are insufficient for reforming water governance or addressing water insecurity.

In conclusion, our paper offers practical recommendations to improve the conveyance of water supply schedules. If organizational, technical, and political challenges are surmounted, digital schedule conveyance could be a powerful

instrument for equity-centered, data-driven water governance, benefitting water users, water infrastructure planners, and regulators.

Water Governance Disparities and Utility Performance: Evidence from California

Abstract ID: 1844.0.0.197.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Maura Allaire [Arizona State University] mallair2@asu.edu, presenting author

Romeo Ignacio [Federal Reserve] romeo.i.ignacio@frb.gov

Drinking water and utility performance have traditionally been framed as a technological issue. Yet, the role of governance is increasingly apparent. This study examines accountability failures, focusing on water board elections. Local water boards shape access to water through key planning decisions such as infrastructure investment and water rate setting. Elections create incentives for officials to serve public interests, if held regularly. Elections are not held if opposing candidates do not run against incumbents.

In California, 176 boards govern drinking water for over 9.7 million people. Despite the magnitude of this responsibility, water boards are rarely examined. A data gap for local elections hinders research. We develop a novel elections dataset by linking information from county election results with IRS nonprofit tax filings. This dataset spans years 2009-2020 and all independent drinking water boards in California for systems serving over 3,300 people.

We examine the prevalence of uncontested water board elections and association with safe and affordable water, using negative binomial and probit regression. Safe water is represented by health-based compliance with the Safe Drinking Water Act, while affordability efforts are indicated by adoption of a low-income rate assistance program.

We find pervasive and persistent accountability failures within California water boards. During our study period, 57% of board seats up for election were uncontested, without significant variation across time. Low-income communities face more prevalent uncontested elections. In terms of utility performance, uncontested elections are not found to be significantly associated with water quality compliance. Yet, a strong association is found between uncontested seats and lower likelihood of adopting low-income bill assistance. These findings highlight political accountability as an overlooked factor for water affordability and governance inequities.

Changes in Water Shutoffs from Pandemic Policy Shifts: Implications for Household Affordability

Abstract ID: 1844.0.0.58.2025

Track 4: Environmental Planning & Resource Development

Pre-Organized Paper Presentation

Gregory Pierce [UCLA] gpierce@luskin.ucla.edu, presenting author

Utility service shutoffs resulting from an inability of households to pay utility bills can have severe consequences for their health and well-being, and are a symptom of broader affordability challenges. Insufficient access to potable water is associated with dehydration, exposure to contaminants, and insufficient hygiene, which leads to higher disease prevalence. Even the unrealized threat of a utility shutoff can place economic, broader opportunity, and stress burdens on residents, as they may be forced to make trade-offs among basic household needs such as utility costs, rent and mortgage payments, transportation, and food expenses. Further, late fees levied because an inability to pay utility bills on time can deepen financial distress for households struggling financially. Shutoff policy motivations and effects started to be better documented in the planning literature a few years before the onset of the COVID-19 pandemic (Swain, McKinney, and Susskind, 2023).

Yet the onset of the pandemic signaled a renewed recognition of water as an essential service for health, and was demonstrated to be so as service shutoffs were prohibited (Zhang, Warner and Grant, 2022). The pandemic also sparked a temporary but dramatic change in U.S. water utility policy to limit residential customer service shutoffs or disconnections due to non-payment and high debt levels, and a greater degree of associated scholarship (Pierce, Barnett and Hughes, 2024). However, state-level policy effects on disconnections have been understudied (Warner, Zhang and Rivas, 2020), especially following the initial years of the pandemic (2020-2021).

This study analyzes trends in payment-related water service disconnections for households in New Jersey a unique ZIP code-level panel dataset covering both the pre and post pandemic period (2019, 2022-2023), made available as part of New Jersey's landmark 2022 Water Affordability Transparency Law. The dataset contains information on seven major water utilities in New Jersey. Of the seven utilities reporting disconnection data, we focus on those reported by New Jersey American Water (NJAW), the largest utility in the state based on population served.

Overall, we find that levels of disconnections mirror changes in state policy, i.e., a low point is reached under a disconnection moratoria in 2020-2021, but modest increases in disconnections are observed in 2022-2023 as moratoria were lifted. We also find that levels of disconnections are lower in areas that are more non-Hispanic white, non-poor, and elderly than the state average, but higher where the percentage of homeownership is higher. These trends are largely consistent with sociodemographic inequalities in disconnections documented elsewhere, but also may signal positive targeted protections persisting for the elderly and renters.

This paper contributes to several different literatures. By shedding light on the practice of utility disconnections, this paper's contributions span multiple disciplines including public administration, urban planning, and public economics. In the literature, however, state-level policy effects on disconnection rates have been understudied, especially following the initial years (2020-2021) of the pandemic. We know very little longitudinally about debt and disconnection levels, following the height of COVID-pandemic policies, much less pre-post pandemic moratoria.

To our knowledge, this study is the first to examine the relationship between arrearage, disconnection, sociodemographics, and policy changes pre-post COVID protections. This paper more specifically contributes to the literature on water affordability, but also points to the need for further research exploration and policy evolution to understand the role of disconnection protections in ensuring water affordability in the U.S.

“As the rising temperature of the planet births bigger and more violent hurricanes, my aching body and the storm-wracked body of the world stumble around me, I enter the place our sick bodies have brought to us, a place where transformation begins”, Aurora Morales (2013)

Health conditions are embodied and place-based experiences re-shaped by the continuous interaction of disasters (both acute and slow). When formulated without community participation, climate adaptation planning can exacerbate pre-existing inequities and create additional layers of impacts on the health and wellbeing of communities. While those dealing with the highest levels of health and wellbeing burdens are frequently grasping what it means to inhabit the planet, staying within the incessant calls to be resilient or resistant, and trying to stay safe and healthy; many times, this planning comes from a lack of recognition that these communities have agency and valid knowledge.

This roundtable will provide a space to discuss the contextual ways climate change impacts communities' health and wellbeing, as well as the type of adaptation planning needed to advance healthier communities. Panelists will provide insights into how climate change impacts the health and wellbeing of communities in racialized and colonial contexts within the continuous iteration of disasters, both slow (environmental injustice, lack of affordable housing, displacement by urban development) and acute (hurricanes, flooding). The roundtable will also discuss the differential impact of top-down adaptation planning and a more bottom-up approach, and offer examples of some of the community mechanisms that can help to better adapt to climate change while reducing inequities and improving the health and wellbeing of communities. What are the institutional changes needed in planning to create paths for healthier and just living conditions? How can we learn from communities' strategies and knowledge to create healthy futures? As the continuous iteration of disasters becomes the norm, this roundtable with discussions contextualized on New York and Puerto Rico can shed some light on these and other questions.

Format: The roundtable is a topical discussion. It will have Malembe Dumont Copero as a facilitator and four discussants. The panel will start with the facilitator asking pre-formulated questions to the discussants Prof. Angeliz Encarnacion Burgos (UPR-RP), Prof. Ariam Torres (UPR-RP), Prof. Hugo Sarmiento (Columbia), and PhD candidate Katherine A. Pérez-Quiriones. Afterwards, the facilitator will open the discussion to the public to discuss and/or ask questions to the participants.

Community Planning for a Just Energy Transition

Abstract ID: 1843.0.0.857.2025

Track 4: Environmental Planning & Resource Development

Roundtable Submission, Topical Discussions

Holly Caggiano [University of British Columbia] holly.caggiano@ubc.ca, organizer

Evelyn Mayo [Initiative for Energy Justice] evelyn.mayo@iejusa.org

Madison Lore [Cornell University] madiclore@gmail.com

Sarah Mills [University of Michigan] sbmills@umich.edu

Alison Coffey [Initiative for Energy Justice] alison.coffey@iejusa.org

Recent scholarship has underscored the need for a renewed focus on decarbonization within the field of planning, particularly in relation to energy systems (Infield et al. 2023). The science is clear – the urgency of reducing emissions necessitates a rapid transition to renewable energy sources. Energy transitions, however, are often conceptualized and planned at the macro level, which can obscure the critical local dynamics that enable and constrain infrastructure development, despite the acute and intense local impacts of climate change, disaster preparedness and recovery efforts. Further, the implementation of renewable energy infrastructure is inherently place-based, with costs and benefits distributed unevenly across communities (Devine-Wright and Peacock 2024). To navigate the bumpy ‘mid-transition’—the period during which fossil-based energy systems coexist with new zero-carbon systems (Grubert & Hastings-Simon 2022)—planners must navigate tensions between different scales of governance, community priorities, and long-term goals.

This roundtable will be an interactive and forward-looking topical discussion, providing a space for attendees to reflect on how planning can evolve to meet the challenges of this pivotal moment in energy governance to promote climate resiliency, economic development, and increase civic engagement for our most vulnerable communities and populations. The ‘just transition’ framework calls for a restructuring of our energy economy to be based on renewable energy sources, locally governed and democratically operated, explicitly benefits workers and communities harmed by the fossil fuel industry, and accessible and affordable to all. Planning researchers and practitioners will consider current barriers and challenges to realizing these just energy transitions and consider what new practices we need to contend with them. We call on participants to engage in a critical discussion on how planning can more effectively address the spatial and social dimensions of decarbonization, and integrate energy justice in the context of existing planning frameworks.

Omur Damla Kuru [University of Utah] u6062513@utah.edu

Balakrishnan Balachandran [University of Massachusetts at Boston] br.balachandran@umb.edu

Post-disaster relocation has been subject to study for over four decades now- from early works on post-earthquake relocation in Peru to that in Turkey after the 1999 Izmit earthquake to the more recent works on relocation after hurricanes in the Caribbean. While much of this research maintains its relevance, there have been significant movements in this field recently that require taking stock once again: the world is experiencing catastrophes at an accelerated rate; more communities are facing the prospect of climate (not just disaster) relocation, and experiencing cascading and compounding hazards more frequently; and questions are emerging on what we know of relocation from one hazard type extends to all hazard types. FEMA-funded buyouts in the US have reached a point in history in which looking back is useful for forging a path ahead. At the same time, coastal communities across the world are increasingly asking, should they move before they have to? To add to all this, the political and policy landscape within which such relocation is enacted, empowered and funded is also changing rapidly, with significant implications for disaster relocation within the US and abroad.

This roundtable attempts to ask how the research agenda on community relocation after disasters should change in light of this changing landscape of community experience, science, society and governance. Participants will exchange insights from their own research and weigh in on the following questions:

1. How much of what we know of disaster relocation still stands;
2. What new insights have we gleaned from recent research on the topic of disaster relocation; and
3. What needs to change within disaster relocation studies to better address the changing landscape of science and society?

Urban Heat Mitigation and Management from a Planning Perspective

Abstract ID: 1843.0.0.730.2025

Track 4: Environmental Planning & Resource Development

Roundtable Submission, Facilitated Debates

Mehdi Pourpeikari Heris [Hunter College] mp5160@hunter.cuny.edu, organizer

Dana Habeeb [Indiana University] dhabeeb@iu.edu

Sara Meerow [Arizona State University] sara.meerow@asu.edu

Charles Gabbe [Santa Clara University] cgabbe@scu.edu

Ladd Keith [The University of Arizona] ladd@arizona.edu

We propose a roundtable discussion addressing key opportunities and challenges in implementing urban heat mitigation and management strategies. The session's central goal is to assess how conventional urban planning regulations and tools such zoning and design guidelines should evolve to achieve more effective and equitable heat-health outcomes (Habeeb, 2015 and Meerow, 2022). Although significant scientific advances have been made in understanding urban heat phenomena, the widespread practical implementation of heat mitigation strategies remains limited. Our core focus is identifying what has worked and persistent barriers to integrating these strategies into urban planning institutions.

The roundtable will address mitigation and management separately, recognizing that each requires distinct policy instruments and practices.

Firstly, we will explore barriers and opportunities to effective urban heat mitigation policy implementation. Despite increasing awareness of the urban heat island effect, obstacles to policy adoption persist, including limited understanding of impacts, lack of demonstrated real-world benefits, geographic transferability challenges, stakeholder coordination complexities, regulatory incentive deficiencies, and resistance to initial costs with distributed benefits(Keith, 2023). The discussion will highlight examples of strategies for overcoming these barriers by promoting co-benefits such as energy savings, enhanced public health, and improved stormwater management (Meerow, 2024). Discussions will also highlight necessary data and evaluation for heat mitigation and management.

Key questions regarding urban heat mitigation include:

What is the current state of urban heat mitigation strategies in local governments including, and particularly beyond, common methods such as tree planting, reflective roofing, and reducing impervious surfaces? How have these strategies been implemented using an equity lens, given our understanding of thermal disparities?

Should heat mitigation strategies be integrated into zoning and design guidelines, and what processes are effective for doing so? Do these tools work consistently across cities of varying sizes?

If knowledge and resource gaps, particularly in smaller municipalities, impede the adoption of heat mitigation strategies, how can local governments effectively address these gaps?

Secondly, the roundtable will focus on strategies for responding to extreme heat events (Gabbe, 2024). Discussions will address preparedness measures that local governments should adopt and examine the extent to which these emergency response strategies align with broader heat mitigation initiatives. We will discuss whether new institutional structures, such as dedicated heat officers, are necessary, drawing on experiences from cities that have

implemented such roles. We will also consider how urban planners can be more actively engaged in short-term responses, which past research has identified as missing in most local approaches to heat. Key questions include:

How can local governments – and particularly urban planners – better prepare for extreme heat events, and how closely should emergency response strategies be coordinated with mitigation measures?

Are new institutional structures required, such as specialized heat officers, and what insights can be gained from cities already employing these positions?

Can advocacy planning approaches be extended to include heat response efforts, and what roles do advocacy groups play in improving cities' readiness and response to heat events?

Track 4 Individual Paper Presentations

“Civilizing” Nature: Critiquing Wild vs Curated Approaches to Native Growth in Urban Spaces

Abstract ID: 1844.0.0.1046.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Chayce Kenny [Rutgers University] chaycekenny@gmail.com, presenting author

In preserving ecosystem integrity, fighting against biodiversity loss and facilitating the growth and health of endogenous plants, the language of nativity is often leveraged; we seek to increase the planting and cultivating of native plants, diminish that of those that aren't native, and approach environmental planning, farming, gardening, around this concept of the native.

This concept bleeds into our logics of larger ecosystems, changes the way we valorize and conceptualize what things belong in a space, and can be seen in our social ecosystem discourse and in our approaches to urban planning (urban parks and greenspaces are often lauded for using only or primarily native plants in their collections and curations). While the goal of facilitating nativity is one that has done much good for preservations of biodiversity and supporting environmentally friendly practices, it also comes with two main drawbacks.

First, if we are to strive forwards nativity then we must understand what the native is, and concepts of native and naturalized plants are heavily mutable and fluctuate over time; what makes something native is as much a political and social question as it is a scientific one.

Second, the nature of the native is changed through its intentional cultivating; we seek to reproduce native ecosystems and grow native plants, but we often do so in ways that try to translocate the native, that which is unplanned and natural, onto the highly modern and efficient concepts of modern urbanizations and questions of technocratic or aesthetic ideals. Our gardens and parks aren't simply reproductions of the forests or pre-urbanized ecosystems, but are reimagined and replanned to fit into our conceptions of what nature ought to look like.

I contend that this concept of native extends beyond the way we interact with natural ecosystems, but is also seen in the way we interact with social ecosystems, the way we categorize people and populations, and how we plan urban spaces. Those that are not indigenous to a place (white settlers) have come to be seen as native, those that are indigenous have their nativity carefully reproduced in cordoned off areas and in ways that don't challenge the goals and development of the modern (reservations and land theft).

This project, through historical text and discourse analysis seeks to trace this idea of nativity in urban and environmental planning, understanding what is covered under this idea, why it is valued, and how it is achieved, before engaging with a philosophical ethical critique of this idea, seeking to put it in conversation with a related, though distinct, concept, that of the wilds, that is the growth that is natural and “native” to a place without being constrained or planned or formatted along particular ideological or practical lines. This project will end with an imagination of what it might mean to center the idea of the wilds in our environmental and urban plannings, in our natural and social ecological thinking, and how this might impact how we approach which populations are given our attention, are allowed to grow, and how.

“Espinar es mi Hábitat”: Supporting Coastal Communities Beyond Disaster Frameworks

Abstract ID: 1844.0.0.93.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Katherine Perez [University of Texas - Austin] kathyperezq@utexas.edu, presenting author

Disaster planning often operates within a framework of urgency, risk, and uninhabitability—terms that are deeply embedded in economic and colonial logics that fall very short in accounting for people’s lived experience. This presentation explores these relationships through the case of Espinar, a coastal community in Aguada, Puerto Rico, where flood mitigation has long been entangled with financial speculation. Drawing from a year-long ethnographic research, I examine how large-scale flood control projects continue to prioritize property protection and economic assets over community-defined needs. By understanding the environmental history of this area, I trace how flood control efforts have been mobilized—or sidelined—based on investment potential (from plantations to luxury tourism) rather than environmental or social wellbeing.

At the same time, Espinar’s residents resist dominant disaster narratives as well as imposed relocation, and many have alternatives to ‘dealing with’ the flooding that prioritize social networks, lived experience, and their deep attachment to the place. Their varied perspectives, captured through oral history interviews, community mapping workshops, and everyday conversations with several neighbors, challenge the logics of state-led disaster management, and make visible the many different ways in which closely-knit communities like Espinar, assess risk beyond externally imposed frameworks.

Despite the absence of “formal” adaptation and disaster preparedness measures, my research highlights that Espinar’s ‘viability’ is sustained through informal planning practices and deeply rooted networks of support. A small group of dedicated residents uphold local traditions, safeguard the community’s economic and social well-being, and protect the local ecosystems. All these self-led initiatives have direct effects for the community’s wellbeing during, after, and beyond disasters. This presentation will share some of the stories of these community leaders to argue for an approach to disaster and adaptation planning that recognizes and values the agency of frontline communities, critically examines the funding structures and decision-making of federally funded projects, and resists the neocolonial logics embedded in mainstream adaptation and environmental planning discourse—such as the depoliticization of issues and reliance on technocratic solutions.

{Heat Vulnerability Dashboard: A Decision Support Tool for Extreme Heat

Abstract ID: 1844.0.0.763.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Dana Habeeb [Indiana University] dhabeeb@iu.edu, presenting author

Rahul Devajji [Indiana University] rdavajji@iu.edu

Lavanya Subramanian [Indiana University] lsubram@iu.edu

Liv Davis [University of North Carolina at Chapel Hill] livdavis@unc.edu

Jason Gumaer [Indiana University] jgumaer@iu.edu

Extreme heat kills more people annually in the United States than all other extreme weather events combined and these mortality rates are only intensifying with our changing climate. Urban residents have the highest exposures to extreme heat due to the urban heat island effect which occurs when pavement and tall buildings store and trap heat in cities, making cities significantly hotter than their rural surroundings. Determining an individual's risk of heat stress is challenging as extreme heat exposures vary dramatically throughout a city as do individuals' underlying health conditions, which can compromise a person's ability to regulate internal temperatures. Increased frequency of heat waves intensifies the necessity for communities to determine how best to prepare and recover from disasters. Data accessibility is critical to making climate data usable and actionable by communities. As many communities are resource constrained, it is important that an emphasis is placed on creating easily accessible and customizable decision support tools.

In this paper, we present a recently deployed heat vulnerability dashboard for the cities of Richmond and Clarksville, Indiana. The dashboard is part of a larger statewide Beat the Heat program. We have developed an interactive Heat Vulnerability(HV) dashboard, which enables communities to better understand their local vulnerability to heat and investigate best practices to support heat resilience . A Heat Vulnerability Index (HVI) is used to identify areas in a community where people are most vulnerable to heat. The common vulnerability indicators used in HVIs are environmental exposures (e.g. local temperatures), sensitivity (e.g. age) and adaptive capacity (e.g. access to air conditioning). Indices are often difficult to utilize and interpret as they are often highly sensitive to the selected input data, requiring caution when interpreting. One of our main aims for the dashboard is to allow users to select HVI data according to their own priorities which enables dynamic priority mapping. Dynamic priority mapping allows users to select a range of sociodemographic variables associated with susceptibility and adaptive capacity (age, social isolation, educational attainment, race/ethnicity, language barrier, and poverty), as well as different exposures variables associated with temperature (morning, afternoon, evening) to produce priority areas for their city. Based on variables selected, the dashboard highlights vulnerable geographies based on the selected metrics. All HV variables are aggregated at the Census block group level. We also scale down the HVI data to the Census block level and incorporate local context data at this scale. Local context data include environmental variables such as tree canopy, impervious surface and A.C. availability. Enabling our stakeholders to explore block level variations, our community partners are able to pinpoint priority areas on a resolution not currently available.

This work demonstrates how to support data integration for decision making by deploying a new interactive heat vulnerability dashboard for Indiana cities. This innovative dashboard highlights priority areas and local context conditions to help support decision making for effective heat response interventions. Future user experience (UX) evaluations are planned to integrate feedback and explore new features into the design of the dashboard. The HVI dashboard can be extended to cities across the United States, thereby making a positive impact to Indiana

communities and beyond and aiding in the targeting of resources and infrastructure in communities that need it the most.

A Historical Analysis of the Evolution and Implications of Natural Disaster Planning in Mobile, AL

Abstract ID: 1844.0.0.645.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Binita Mahato [Auburn University] bzm0054@auburn.edu, presenting author

Rebecca Retzlaff [Auburn University] rcr0001@auburn.edu

Chandana Mitra [Auburn University] czm0033@auburn.edu

Kurt Schmitkons [Auburn University] kws0035@auburn.edu

This paper examines the equity aspects of city plans responding to major natural disasters since the mid-twentieth century, focusing on Mobile, Alabama. The research explores the evolution of plans and their impact on vulnerable populations to determine if changes in disaster response planning have improved neighborhood resiliency in the city.

Urban resilience is the ability of urban systems to maintain or return to desired functions amid disturbances, adapt to changes, and transform systems that hinder future adaptability. Social vulnerability is often inversely related to resilience and is influenced by social, economic, political, and environmental factors, such as climate change, poverty, and discriminatory planning like redlining. Mobile, situated on the Gulf of Mexico, is prone to many climate hazards, including sea level rise, warmer summers and winters, and increased intensity and frequency of tropical weather events like floods, hurricanes, droughts, and urban heat islands. Historical, social, infrastructural, political, and natural shocks and stressors have shaped the city's development for decades. Parts of Mobile are socially vulnerable due to low income, high poverty rate, and the region's history of racial and ethnic oppression, white supremacy, and political disenfranchisement of people at risk from environmental forces. From Mobile's first city plan in 1950 to the citywide resilience assessment and plan in 2024, plans have evolved and responded to natural disasters and sought to improve resiliency. However, due to the city's history of socioeconomic inequity, the resiliency and planning in different neighborhoods have been uneven.

Crises like natural disasters and global pandemics can lead to quick changes in policies, plans, and institutions, allowing urbanists to analyze shifts in city governance. This analysis helps explain cities' diverse methods of addressing problems, reflecting the unique compromises formed during specific times and circumstances. The impacts of natural disasters often create urgent demands for new plans and policies, significantly influencing post-disaster recovery efforts and driving change in urban environments. This paper is the first part of a longer project to explore past, present, and future changes to urban resiliency and climate change impacts in Mobile. This part of the research uses archival and current policy and planning documentation and spatial analysis of historical data since the 1940s to identify the key junctures in plans that have contributed to resiliency or a lack of neighborhood resiliency. This analysis is overlaid with basic descriptive information on natural disasters affecting Mobile over time.

Our analysis shows that before the 1970s, flooding in low-income and African American neighborhoods was primarily acknowledged as an issue only when it affected nearby white neighborhoods. Public health concerns arose from open sewers and shared outhouses, particularly regarding disease spread during floods. Hurricanes prompted significant changes in urban planning in Mobile, with policies and planning structures being revised after major storms. Following Hurricane Camille in 1969, planners sought greater control over long-term hurricane planning after years of focusing on small infrastructure projects. After Hurricane Frederick in 1979 and the severe floods of 1980, a program was initiated to retreat from flood-prone areas, leading to the acquisition of easements and properties in vulnerable locations. As planning responding to natural disasters evolved from providing relief

post-disaster to mitigation strategies to resiliency planning, inequitable plans often make one neighborhood historically more vulnerable than the other, affecting future resiliency. This research promotes a need-based social vulnerability approach for disaster plans by including archival and historical plans and data in a resilience study.

A Machine Learning Approach to Predicting Hyperlocal Temperature in the Built Environment

Abstract ID: 1844.0.0.1045.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Rahul Devajji [Indiana University Bloomington] rdevajji@iu.edu, presenting author

Dana Habeeb [Indiana University] dhabeeb@iu.edu

Cities worldwide are becoming increasingly hotter due to climate change, intensifying the risks associated with urban heat islands. Traditional approaches to studying urban temperatures often rely on Land Surface Temperature (LST) from satellites or meteorological stations located at the outskirts of cities at suburban areas or airports. However, these methods fail to capture the fine-scale variations in air temperature that occur within cities, where local factors such as urban geometry, land cover, and anthropogenic heat sources create microclimates. Additionally, LST does not reflect humidity variations, a key component of thermal comfort and heat stress. To develop a more accurate representation of urban heat dynamics, high-resolution air temperature data is essential.

In this paper we present the results of a machine learning (ML) model developed to predict hyperlocal near surface air temperature data in cities, building on our previous research on classifying the built environment into Local Climate Zones. Our model integrates spatial, environmental, and climate data from satellite imagery, LiDaR, building footprint shapefiles and meteorological station climate data. We include three different temperature datasets derived from satellite data, mobile sensors and insitu measurements to train and test our machine learning models. Additionally, we compare the performance of different ML algorithms, including ensemble learning models and neural networks, to assess their effectiveness in predicting hyperlocal temperatures. We also examine the potential of predicting temperatures at different times of the day (morning, afternoon and evening) as well as throughout the summer season. The resulting temperature data is modeled at a 30 meter resolution.

Furthermore, we will investigate how to utilize both an urban sensor networks and our near surface temperature algorithm to accurately predict temperature in real-time. This work will help to determine the optimal number of in-situ sensors and their distribution needed for accurate temperature data collection. The results of the study will inform the development of policy and planning strategies aimed at mitigating the impacts of heat and other environmental hazards in urban areas, with the goal of promoting equity and sustainability. It will also involve collaboration with local governments to integrate the temperature analysis data into their smart city planning and emergency management processes.

A Mixed-Methods Assessment of Energy Insecurity in the US.

Abstract ID: 1844.0.0.72.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ariadna Reyes Sanchez [University of Texas at Arlington] ariadna.reyessanchez@uta.edu, presenting author

Josh Newton [University of California, San Diego] jdnewton@ucsd.edu

Luis Macias [University of Texas at Arlington] luis.macias@mavs.uta.edu

Vanessa Delgado [University of Texas at Arlington] vrd6033@mavs.uta.edu

An energy-just transition requires research and targeted solutions for energy insecurity faced by vulnerable households who are unable to meet their basic energy needs (Shelton and Eakin 2022). Energy insecurity can be driven by numerous factors, including economic hardship and the physical conditions of housing, and can result in a variety of behavioral coping strategies that expose residents' safety and health (Simes, Rahman, and Hernández 2023). Although energy insecurity is commonly associated with low-income Global South communities (Boateng et al. 2020), emergent research shows insecurities are prevalent in impoverished Global North communities (Simes, Rahman, and Hernández 2023; Hernández 2016; Jessel, Sawyer, and Hernández 2019). Yet, U.S. policymakers still largely ignore energy insecurities experienced by peri-urban unincorporated communities that remain invisible to planners.

Attention to energy insecurity is limited by national datasets, such as census, which poorly document energy expenditures, heating, ventilation, air conditioning (HVAC) access, and resident energy practices (Larsen et al. 2023). Previous literature focused on the energy-cost burdens of urban Northeast and West Coast multifamily buildings (Kontokosta, Reina, and Bonczak 2020). Consequently, the U.S. literature has largely disregarded peri-urban and exurban communities in metropolitan areas, as well as single-family and prefabricated housing—mobile homes and recreational vehicles (Jessel et al., 2019). Energy insecurity may be likely chronic in peri-urban unincorporated areas, such as informal subdivisions, which often lack running water, sewers, and energy infrastructure (Reyes et al. 2024; Guerra Uribe, Faust, and Charnitski 2019; Anderson 2008). The poor governance and neglect of counties to peri-urban communities have shifted the responsibility of infrastructure provision and services to impoverished households.

This study addresses gaps in literature and practice by proposing a mixed-methods assessment of physical, economic, and behavioral energy insecurity. To uncover physical energy insecurity, we present an index using tax appraisal district data from Dallas County, Texas—a rapidly growing U.S. region. The index identifies concentrations of precarious housing units that lack central heating, cooling systems, and both deficiencies. The index reveals large clusters of energy insecurity buildings in Southeast and West Dallas County in mostly unincorporated areas where building codes are weakly regulated and enforced (Anderson, 2008). The index can be replicated by planners and energy policy practitioners throughout the U.S. to identify and classify insecure communities requiring further qualitative research and targeted assistance.

Our study also demonstrates the use of the index to identify a high energy insecure, low-income, unincorporated subdivision in Southeast Dallas County for further research. We supplement the index with three years of field research—including in-depth surveys, interviews, and photovoice. Qualitative data collected through fieldwork illuminates the complex relationship between physical, economic, and behavioral insecurities of households. For instance, residents of an unincorporated informal subdivision face uncomfortable indoor temperatures, particularly during winter and summer, compounded by inefficient HVAC, inadequate insulation, and poor structural materials. Residents are thus forced to use inexpensive and inefficient devices to meet their daily energy needs. Our

qualitative assessment can provide a nuanced understanding of community-based solutions for supporting housing upgrading and an energy-just transition. Our mixed-methods assessment of energy insecurity can be used to craft more competitive state and federal funding applications and target technological innovations and participatory housing and energy upgrading strategies in the most vulnerable communities in our regions.

A Mixed-Methods Study of São Paulo's Park System Expansion Under the 2014 Master Plan

Abstract ID: 1844.0.0.577.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Giuliano Salvatore Magnelli [University of São Paulo] giulianomagnelli@gmail.com, presenting author

Nabil Georges Bonduki [University of São Paulo] nbonduki@usp.br

This study examines the evolution of green public spaces in São Paulo following the implementation of the 2014 Strategic Master Plan (Plano Diretor Estratégico, PDE), with a focus on the expansion of the municipal park system. Situating the analysis within the historical context of urban and landscape planning in São Paulo (Kliass, 1993; Bartalini, 1999), the research evaluates the city's 21st-century master plans, particularly the 2014 PDE and its monitored outcomes through 2024.

Central to the investigation is the application of urban planning instruments, such as the designation of existing and proposed parks as Special Environmental Protection Zones (Zonas Especiais de Proteção Ambiental, ZEPAM). This zoning mechanism aimed to mitigate speculative land valuation in areas of public interest, thereby reducing acquisition costs for future parks through the legal expropriation of private properties. The socio-spatial impacts of these interventions are assessed through a quantitative analysis of per capita park area—encompassing municipal and state parks—using census data (2010 and 2022), alongside spatial mapping of pre-existing and newly established green spaces between 2014 and 2024.

The study adopts the 2014 PDE's dual macrozone framework: (1) the Structuration and Qualification of Urbanization Macrozone (Macrozona de Estruturação e Qualificação Urbana, MEQU), characterized by high population density and infrastructural development, and (2) the Environmental Protection and Recovery Macrozone (Macrozona de Proteção e Recuperação Ambiental, MPRA), encompassing ecologically sensitive territories, including two major water reservoirs. Preliminary findings reveal pronounced disparities: the urban macrozone contains a higher concentration of parks, yet these are smaller in size (averaging 1 m²/inhabitant) and unevenly distributed, concentrated in central áreas and largely absent in peripheral areas, serving over 70% of the population. In contrast, the environmental macrozone—home to less than 30% of residents—achieves a per capita park area exceeding 50 m²/inhabitant, though spatial inequities persist due to fragmented accessibility.

To address these disparities, the study proposes a geospatial methodology for identifying priority areas defined beyond the 1-kilometer service radius of existing green public spaces above 20,000 m², as defined by municipal land-use criteria. Using QGIS v3.28 and metadata from the Municipal Department of Green and Environment, the methodology applies planar-projection buffer analysis. By overlaying the catchment areas of parks, plazas, and recreational zones, the analysis isolates underserved regions, prioritizing them for future interventions. This approach aligns with green infrastructure principles (Benedict & McMahon, 2002) and the 15-minute city concept (Moreno, 2024), emphasizing equitable access to ecosystem services, urban livability, and climate resilience.

Adhering to the WHO/UN-Habitat definition of urban green spaces—excluding private or restricted areas—the research underscores the urgency of universalizing access to green infrastructure within walkable distances. The urban macrozone's critically low park index (1 m²/inhabitant) highlights systemic spatial inequities, necessitating targeted interventions to bridge service gaps.

By integrating park index analysis with territorial mapping, this study provides actionable insights for urban planning strategies, reinforcing green infrastructure as a cornerstone of sustainable development. The findings demonstrate the critical need for mechanisms to equitably distribute green spaces across neighborhoods—a

capillary (fine-grained) approach—to address persistent inequities under current planning regimes. While focused on São Paulo, the methodology can be adapted to analogous contexts, such as Global South megacities that face similar challenges of rapid urbanization and spatial fragmentation.

A Plan Quality Assessment of Priority Climate Action Plans in the United States

Abstract ID: 1844.0.0.408.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Stephen Diko [The University of Memphis] skdiko@memphis.edu, presenting author

The US Environmental Protection Agency (EPA), through its Climate Pollution Reduction Grants (CPRG) program, allocated funding to organizations representing states, metropolitan statistical areas, and tribes or territories to submit a Priority Climate Action Plan (PCAP) in 2024. A total of 211 PCAPs were developed, each comprising a set of actions or measures to reduce climate pollution. The EPA defines priority actions as “near-term, high-priority, [and] implementation-ready measures” that contribute to reducing greenhouse gas (GHG) emissions and promote climate adaptation (US EPA, 2023: p. 28). Like climate action plans (Boswell et al., 2010; Aboagye et al., 2024), PCAPs outline the essential measures jurisdictions aim to implement to enhance their climate mitigation, adaptation, and resilience capacities. In the literature, the benefits of climate action plans are varied since their goals and actions are diverse and context-dependent, often tailored to the specific challenges of cities and regions. (Bassett et al., 2010; Boswell et al., 2010). Nonetheless, jurisdictions with climate action plans can effectively identify the causes, sources, and effects of GHG emissions, and the populations and areas most vulnerable to their impacts. These plans also provide a structured approach for stakeholders to tackle GHG emissions challenges and guide resource allocation for their reduction. Additionally, these plans create platforms for stakeholder collaboration, fostering accountability and transparency while developing synergies to tackle GHG emissions challenges and alleviate the burdens placed on affected communities (Aboagye et al., 2024; Bassett et al., 2010; Boswell et al., 2010; Deetjen et al., 2018). Some research reveals that climate action plans can significantly affect a city’s ability to effectively reduce GHG emissions and their impacts, albeit dependent on their content (Aboagye et al., 2024; Deetjen et al., 2018). Subsequently, this study uses a mixed-content analysis on the 211 PCAPs to understand how the different jurisdictions plan to reduce GHG emissions. Specifically, it seeks answers to four questions: What are the major sources and sectors contributing to climate pollution? What are the climate pollution measures commonly delineated in the plans? What authority do jurisdictions have to implement the identified climate pollution measures? and what are the innovations, strengths, weaknesses, and gaps in climate pollution reduction measures? Assessing the PCAPs will enable researchers, policymakers, and planners to understand the taxonomy of the measures to appreciate current practices and determine whether the plans offer concrete measures and targets for reducing GHG emissions. Overall, this assessment will provide valuable insights into the various climate pollution reduction measures, their adequacy and effectiveness, and offer opportunities to identify important practices and lessons that can enhance efforts to reduce GHG emissions and their associated burdens.

A Study of Local Emergency Management Agency Planning Resource Needs in the United States

Abstract ID: 1844.0.0.151.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Julia Crowley [University of Missouri-Kansas City] jcc45g@umkc.edu, presenting author

Bowen Liu [University of Missouri-Kansas City] bowen.liu@umkc.edu

Local emergency managers play a wide array of roles to keep our communities safe. This includes completing various tasks in the mitigation, preparedness, response, and recovery phases of emergency management. Competing priorities often place the focus of emergency managers on response at the expense of planning (Weaver et al., 2013). Past research and events have demonstrated a lack of priority for mitigation practices as more urgent needs take center stage in time allocation (Prater & Lindell, 2000). When hazard mitigation planning does occur, emergency managers tend to exclusively plan for the hazards of past disasters they have experienced (Labadie, 2011). Further studies found that emergency management offices tend to be more successful in developing plans than they are in carrying out the strategies put forth in the plans (Samuel & Siebeneck, 2019). Competing priorities often emerge throughout local emergency management agencies due to insufficient staffing and other resource constraints. For example, Smith (2008) indicates that hazard mitigation plan strategies are often not carried out because of a lack of dedicated resources in the communities. While there is a body of literature that examines local emergency management planning resource constraints, there remains a dearth of research that quantifies these constraints at the national level in the United States. Providing a quantification of these topics will enhance knowledge and subsequently begin the conversation of how to address local emergency management resource constraints towards plan development and implementation.

The purpose of this research is to examine and quantify local emergency management planning resource constraints at the national level in the United States. The following research questions were examined: (1.) To what extent do resource constraints inhibit local emergency management agencies from developing crucial disaster-related plans? (2.) To what extent do resource constraints inhibit local emergency management agencies from implementing crucial disaster-related plans? (3.) What is the overall effectiveness of collaborative relationships between local emergency managers and relevant planning stakeholders? The three research questions were addressed through the development of a survey that was distributed to local emergency managers throughout the United States. The first survey section covered resource constraints for developing local disaster-related plans. The second section addressed resource constraints for implementing the plans. The third section examined the effectiveness of collaborative relationships. Surveys were distributed at state emergency management conferences throughout the United States. Results highlight the resource deficiencies for local emergency management plan development and implementation. A discussion will be provided on the role of collaborative relationships in addressing these deficiencies.

Air quality disproportionately affects vulnerable populations, often as a result of complex interactions between environmental and social determinants of health (Sullivan & Thakur, 2020; Corburn, 2005). Urban areas, in particular, exhibit spatial inequities in health outcomes shaped by both historical legacies—such as redlining—and current structural and infrastructural dynamics, including traffic density and zoning patterns (Schuyler & Wenzel, 2022; Jung et al., 2022; Hutch et al., 2011). These disparities are particularly evident in respiratory illnesses like asthma, which has been found to be more prevalent in socioeconomically disadvantaged communities (Bryant-Stephens, 2009; Harris, 2019). This work examines these connections in the Greater Philadelphia Metropolitan Area at the census tract level ($n = 766$). The Greater Philadelphia Metropolitan Area, comprising nine counties, is characterized by its drastic socioeconomic contrasts and historical patterns of environmental inequity across neighborhoods due to historical development patterns, which provide an ideal context to examine these relationships. We analyze how air quality — measured by pollutant indices such as the national percentile of PM_{2.5}, NO₂, and Toxic Release — alongside community characteristics (including land use patterns and transportation infrastructure proximity) and sociodemographic factors contribute to disparities in asthma prevalence. We hypothesize that increased pollutant exposure and disadvantaged sociodemographic characteristics will be positively associated with asthma prevalence. Using a cross-sectional robust linear regression model, we find that asthma prevalence is significantly and positively associated with the percentage of Black and Hispanic populations, PM_{2.5} exposure, and toxic release levels. Interestingly, NO₂ levels and renter population share are negatively associated with asthma prevalence, while income is negatively associated as expected. Land use variables, including proximity to transportation infrastructure and percentage of industrial or green space land use, were not statistically significant in the asthma model when holding all else constant. These findings support our hypothesis that poorer air quality is linked to greater respiratory illness prevalence, though the relationships are conditioned by specific sociodemographic characteristics and reveal unexpected inverse trends for NO₂ and renter concentration. For urban planners, these results highlight the critical role of planning decisions in shaping environmental health outcomes. They point to the lasting impact of historical land use patterns, zoning, and infrastructural investments on community vulnerability. Our analysis underscores the need for equity-centered planning and policy interventions that integrate environmental justice, public health, and spatial planning frameworks to address the social determinants of public health.

An Assessment of Planning for Resilience in Sussex County, Delaware

Abstract ID: 1844.0.0.809.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ryan Kraus [University of Delaware] rkraus@udel.edu, presenting author

Nina David [University of Delaware] npdavid@udel.edu

Coastal communities face increasing hazards due to climate change. Their land use choices have a considerable impact on their ability to adapt to these risks, particularly with respect to flooding and sea level rise.

This project investigates whether growth management and land use policies in Delaware's Inland Bay communities advance climate resilience planning. The Inland Bay region is a uniquely appropriate site for this research. First, although Delaware is often considered a "growth management" state because of state involvement in local planning (Weitz, 2012), (Lewis, 2015), no prior research has examined the effectiveness of DE's growth management system. Second, the Inland Bays are highly susceptible to flooding and sea level rise, such that some towns may be fully inundated by the end of the century. Finally, Sussex County, where the Inland Bays are located, is one of the fastest-growing areas in the country, experiencing rapid development in the Bay region. This both increases the policy relevance of this research and creates an opportunity to explore the often-competing priorities of development and resilience. This project is also timely, as Delaware recently enacted legislation requiring counties and larger municipalities to address climate resilience in their comprehensive plans. It therefore contributes to the body of knowledge supporting communities' planning process considering these updated requirements.

The project uses the Plan Integration for Resilience Scorecard (PIRS) methodology (Berke et al., 2015) and longitudinal content analysis. The PIRS approach is spatial, analyzing the combined impact of multiple plans on resilience in hazard zones. It facilitates the comparison of different types of plans, such as comprehensive plans, sub-area plans, and hazard mitigation plans. In this assessment, we analyze 13 plans from 9 communities. It is also highly contextual, incorporating measures for physical and social vulnerability to assess how effectively plans address the areas most exposed to natural hazards. The PIRS analysis addresses this paper's first two research objectives: (1) investigate how Delaware's growth management policy, particularly through its 2020 Strategies for State Policies and Spending, contributes to hazard resilience (Lyles et al., 2025); and (2) identify factors that contribute to planning for resilience, such as physical and social vulnerability, development, and hazard exposure.

The PIRS assessment is followed by a longitudinal content analysis of plans and plan updates, focusing on a smaller subset of Inland Bay municipalities. This analysis contributes to a body of research that focuses on how plans are used. As part of Delaware's growth management and planning oversight, the state requires communities to submit annual plan updates. This analysis of the plans and updates supports objective (3): investigating how communities use and build on plans over time. In doing so, it contextualizes Delaware's Strategies among related growth management programs, particularly Maryland's Priority Funding Areas (Lewis et al., 2009).

This study finds that while Delaware's policy seeks to limit sprawl and development in natural areas, it does not necessarily re-direct development away from hazardous areas. The analysis of local plans indicates that communities vary substantially in their commitment to adaptation planning, and that their commitment is reactive based on physical vulnerability to the hazard. It does not find evidence that the state Strategies impact resilience planning. It also indicates that dedicated adaptation and hazard mitigation plans may be the most effective way to plan for resilience, rather than relying only on the comprehensive planning process. Finally, the analysis of plan

documents and updates over time reinforces the findings of the PIRS analysis. Communities act on the policies set forth in their plans but are not responsive to the state Strategies.

An assessment of public awareness gaps in climate change policies: from global and city perspectives

Abstract ID: 1844.0.0.306.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Shu Wang [New York University] sw5034@nyu.edu, presenting author

The effectiveness of climate policies depends on how closely governmental strategies align with public engagement. Although some studies have explored the disparities between policy priorities and public perceptions on both global and local scales, many rely on conventional survey data and methods that may lack timeliness or have limited coverage. To address these gaps, we employ ClimateBert to extract priority topics from the most recent Nationally Determined Contributions (NDCs) submitted by 195 Parties (194 countries plus the European Union) under the Paris Agreement before 2023. We then compile over 400,000 climate-related Twitter posts from 2022, embed them using the same approach, and calculate pairwise cosine similarities to measure how the public's attention aligns with government-defined policy topics.

We identify 38 government priority topics, grouped into nine broader categories, reflecting a global focus on emission targets, adaptation strategies, energy usage, and government regulations. The three most prominent topic groups are G1: Emission Accounting and Targets (30.7%), G2: Adaptation Strategies and Implementation (20.8%), and G3: Energy and Resources (15.5%). By analyzing Twitter data, we find that overall public attention to these core topics broadly aligns with government priorities. However, topics related to social inclusion, policy instruments, and transportation garner significantly higher public interest than reflected in governmental strategies.

To systematically quantify global differences, we define two key indicators. The first is NDC Topic Centrality, which measures how closely each country's NDC aligns with the identified priority topics. Our results reveal that developed countries such as Canada, Australia, and the United States exhibit strong leadership, with their NDCs showing high alignment scores. The second indicator is the PGA Ratio (Public-to-Government Attention Ratio), comparing public engagement with government focus for each topic. We observe that the PGA value is positively correlated with a country's income level but shows a weak correlation with its climate classification. This suggests that economic capacity may play a stronger role than climatic factors in shaping the extent to which public interests converge or diverge from governmental priorities.

Beyond the national scale, we also explore city-level variations in public awareness. Our dataset encompasses over 3,000 cities across six regions: three high-income (Australia, the European Union, and the United States) and three lower-income (India, Kenya, and Nigeria). We examine whether a city's coastal location, population density, and dependence on fossil fuels influence the PGA ratio. Preliminary evidence indicates that coastal cities tend to exhibit higher levels of public attention, potentially due to heightened climate risks and media visibility. Moreover, in developed countries, cities heavily reliant on coal mining also demonstrate elevated attention levels, possibly reflecting direct economic stakes in climate policies. However, population density does not appear to be strongly correlated with the PGA ratio, suggesting that urban size alone may not drive variations in public engagement.

These findings carry both scientific and practical significance. By integrating real-time public sentiment into climate policymaking, this study refines existing theories of structural and social diversity through the lens of community-level engagement. The results underscore the importance of targeted interventions in marginalized areas, where climate vulnerabilities often intersect with lower income levels and less policy emphasis. They also point to pilot

initiatives in high-engagement coastal cities, which can serve as laboratories for inclusive and equitable climate resilience.

Analyzing Compound Risks of Urban Form and Climate Change on Biodiversity in Mediterranean Countries

Abstract ID: 1844.0.0.1017.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Seoyeon Cho [University of Washington] cseoyeon@uw.edu, presenting author

Tzu-Hsin Chen [University of Washington] kthchen@uw.edu

The IPCC has highlighted growing concerns over the combined impacts of climate change and land use change on biodiversity (IPCC, 2022). Mediterranean countries, recognized as a global biodiversity hotspot rich in endemic species, are under increasing pressure from urbanization. Climate change further threatens biodiversity by accelerating habitat loss, driving species extinction, and altering agricultural and forest dynamics (IPCC, 2022). Despite the urgent need for environmental planning that addresses both urbanization and climate change, research that integrates these risks in this region remains limited.

To underscore the issue, a preliminary analysis was conducted using 30 arc-second data. Between 2000 and 2020, the effective proportion of habitat in Mediterranean countries declined by approximately 0.6% ($\sim 39,853 \text{ km}^2$). During the same period, the built-up surface area increased by about 33%, and average building height rose by approximately 14%. Approximately 92% of all grid cells experienced a decline in effective habitat proportion, and around 17 percent of these also experienced an increase in built-up surface area, indicating ongoing urbanization.

Urban growth is exerting a growing influence on natural habitats, yet the spatial dimensions of this process and the mechanisms through which it threatens biodiversity are still underexplored (McDonald et al., 2020). While most studies view urbanization primarily as a driver of increased exposure to climate-related risks, it also amplifies the severity of natural hazards within cities, such as elevated temperatures and intensified local precipitation (Garschagen & Romero-Lankao, 2015). Furthermore, when urbanization is not accompanied by income growth and is coupled with demographic changes like population aging, it can heighten vulnerability and constrain adaptive capacity. However, most previous studies have focused on climate science or ecological assessments, often using coarse spatial resolutions such as 15 arc-minutes or national-level scales. These approaches make it difficult to generate insights applicable to urban planning. In this context, there is a clear need for more detailed, spatially refined analysis at the neighborhood scale to support sustainable planning efforts.

To address these gaps, this study evaluates the combined risks of urban form and climate change for biodiversity in Mediterranean countries. An integrated risk assessment is performed using data at a fine spatial resolution of 1 kilometer, capturing historical changes over more than a decade. Special attention is given to urbanization threats across multiple dimensions, including population, economic activity, and changes in urban form. Urban form is assessed in horizontal, vertical, and structural dimensions, while temperature and precipitation are used to represent climate conditions.

To identify patterns of compound risks, K-means clustering is applied to group Mediterranean countries based on urban characteristics and to explain differences in biodiversity outcomes. A machine learning algorithm models the relationships among urbanization, climate change, and biodiversity loss. To interpret the model results, Shapley Additive Explanations (SHAP) are applied, revealing the relative contribution of each factor and allowing for comparison across the identified clusters. Through this approach, the study offers new insight into how urbanization threats and climate change interact to affect biodiversity in the Mediterranean region and provides a scientific foundation for more sustainable environmental and urban planning.

Analyzing The Impact of Green Roof Policy on Urban Heat Vulnerability in Chicago, IL

Abstract ID: 1844.0.0.190.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Mohsin Ramzan [University at Buffalo (UB), Buffalo] mohsinra@buffalo.edu, presenting author

JiYoung Park [University at Buffalo] jp292@buffalo.edu

Exposure to excessive heat kills more people each year in the US than deaths from all other weather-related events combined [1]. Some studies suggest that there were on average 1300 deaths per year from heat in 40 major American cities over a 30-year period and 320 heat-related deaths per year in four Canadian cities over a period of 47 years [2]. These fatalities primarily affect socially vulnerable groups such as the poor and elderly due to a lack of resources or support to combat extreme heat [1]. Cities all over the world are experiencing an increase in temperatures due to higher human activity, extensive development of impervious surfaces, and heat-retaining infrastructure. This results in the formation of hot spots in cities, also known as Urban Heat Islands (UHIs) which have been intensified over the past two decades. This can be attributed to multiple factors such as changes in land use, socioeconomic and demographic factors. Several solutions have been proposed to address this issue, green roof installation being one among such approaches [3]. This paper examines the potential implications of ‘green roof policy’ on the thermal landscape of the City of Chicago. Title 17 of the Chicago Municipal Code—referred to as “Chicago Zoning Ordinance” or “Zoning Ordinance” from here onward—introduced this policy in 2004 [4]. Title 17, Chapter 4, Section 10, Subsection 15A of the Chicago Zoning Ordinance allows floor area (FAR) bonuses for buildings incorporating green roofs. Additionally, the study is an attempt to evaluate the impact of different factors on urban heat islands and study the relation between UHI and different spatial and socio-demographic variables. The second objective of this study is to develop a UHI vulnerability index and monitor its variation over the period. Index-based approaches have been widely used in literature to identify spatial inequities for different phenomena [5]. We used this approach to explore the spatial distribution of thermal inequities and promote targeted interventions to reduce the impact of urban heat island and reduce vulnerability to heat inequities, and promote thermal justice. The study analyzed the correlation between Land Surface Temperature (LST) and various spatial, socioeconomic, and demographic indicators in Chicago from 2000 to 2020. Correlation results suggest that variables such as canopy cover, green spaces, and educational attainment exhibit a negative relation with LST, while impervious surfaces and driving alone to work indicated a positive correlation with LST. A paired t-test and chi-square analysis were also conducted to assess whether the changes in these variables were significant. Results revealed significant shifts in several variables over time, with an increase in variation in green roofs, driving alone to work, educational attainment, and median household income in 2020. A gap regression was conducted to assess how the variation in these variables resulted in a change in LST. Regression analysis revealed that changes in impervious surfaces and driving alone to work, along with redlining, contributed positively towards an increase in LST, while canopy cover was found to have a mitigating effect on LST. Furthermore, even though green roofs are known to improve thermal comfort, their effect was not significant at the census tract level. UHI vulnerability index developed through spatial analysis of different variables highlights that socioeconomic disparities are growing, disproportionately exposing the marginalized communities to higher LST. The study underscores the critical role of targeted urban planning and green infrastructure in mitigating UHI impacts and promoting a just approach to climate change in cities.

A growing body of work explores corporate climate risk management in terms of decarbonization and adaptation in situ, but there has been little attention to how climate may shift corporate location and relocation decisions. Firm location decisions have always relied on economic factors, such as local taxes, land and construction costs, and access to workers. Places in the Sunbelt offer affordable housing and low-tax environments. Silicon Valley became a hub for tech firms due to its proximity to a highly skilled workforce and the clustering of tech-related activities. However, as these same markets start to internalize the growing risks of climate disasters, the cost-benefit calculus for firms located there, or considering a location there, may start to change.

The impact of climate risk on firm location decisions can vary depending on the locational assets as well as the individual firm features. For example, more footloose firms—or those with lower set-up costs who can relocate more easily—may discount future risks in favor of lower rents in areas exposed to climate threats. Firms that rely heavily on the co-location of other firms or certain densities of nearby consumers may not be motivated to give up those benefits in favor of safer climate havens. On the other hand, if households start to move en masse away from places that are economically advantageous, but vulnerable to climate disasters, firms may follow.

In this paper, we test for evidence of climate-related firm migration during the mid-2000s, after several defining events, like Superstorm Sandy, raised the salience of climate risk for U.S. cities. We combine information on establishments and their locations between 2015 and 2020 from DataAxle with FEMA's national risk index for the 100 biggest metro areas in the U.S. We first document the various kinds of firm location decisions. For example, we expect that climate risk may be differentially internalized into location decisions in the cases of new openings, relocations, or expansions. We then test if these location patterns vary by features of the metro area, such as population or employment density, or by characteristics of the individual firms, such as size or sector. Preliminary results suggest that, with the exception of a few multi-establishment firm expansion decisions (where new locations are sited in lower risk metro areas), climate risk has not yet driven firm location decisions. Rather, most economic activity in the U.S. is increasingly concentrated in the riskiest places.

Individual Paper Presentation Submission

Peng Chen [The Ohio State University] chen.10996@osu.edu, presenting author

Maria Conroy [The Ohio State University] conroy.36@osu.edu

Urban areas face escalating challenges from the compounding effects of heat waves and urban heat islands, which pose significant environmental, social, economic, and health risks. These challenges historically burden socioeconomically and ethnically marginalized communities, who experience heightened adverse heat impacts while possessing limited adaptive capacities. This systematic imbalance has intensified advocacies for climate and environmental justice, highlighting the need for equitable heat adaptation planning. While cities are progressively developing heat adaptation strategies, most current practices prioritize technological solutions over social interventions, and few have formally, directly, or comprehensively incorporated equity considerations into their strategies (Turner et al., 2022). This oversight risks exacerbating socio-spatial inequalities (Swanson, 2023).

To help address this gap, we examine two research questions: 1) To what extent are equity considerations integrated into municipal networks of plans for heat adaptation? and 2) How do these integrations vary across cities, plan types, and plan quality principles?

This study systematically reviews networks of plans from the 30 most populous U.S. cities, focusing on plans related to climate adaptation and land use. We collect plan documents through online searches and verify them with city offices. Using keywords such as “heat,” “hot,” and “cooling,” we identify heat-related statements and use NVivo to code them based on seven plan quality principles with a systematic integration of equity-related criteria (Woodruff & Stults, 2016). We measure intercoder reliability using both percentage agreement scores and Krippendorff’s alpha to establish consistency and trustworthiness of content analysis (Conroy & Wilson, 2023). We then employ descriptive statistics to examine the significance of variations in equity considerations across plan types and quality principles, and further use stepwise logistic regression to investigate relationships between cities’ sociodemographic contexts and their integration of equity considerations.

Preliminary findings indicate a prevalent deficiency in the systematic incorporation of equity considerations within municipal heat adaptation planning, even within climate action, resilience, and sustainability plans where urban heat is a major concern. Other plan types, such as comprehensive, infrastructure, and environmental plans, typically neglect heat-related issues altogether. Municipal heat adaptation planning generally emphasizes plan quality principles related to fact bases, strategy, implementation, and collaboration, while neglecting dimensions including goal-setting, public participation, and uncertainty management. Furthermore, equity considerations are moderately incorporated only into fact bases and strategy identification, while remaining largely absent in all other areas. Results further suggest an overarching preference for “hard” infrastructural solutions (e.g., urban greening, cool pavements) rather than “soft” social strategies (e.g., public participation, outreach), despite the latter’s crucial role in advancing equity objectives. Moreover, findings indicate that larger municipalities and cities engaged in inter-organizational climate networks exhibit a more systematic integration of equity considerations into their heat adaptation planning.

These findings help elucidate the current state of equity integration within urban heat adaptation planning, highlighting existing gaps and variations across municipal contexts and planning practices. The results provide

practical insights for municipalities seeking to develop equitable heat resilience strategies and facilitate collaborative learning and knowledge exchange among urban planners and policymakers.

Climate change has emerged as a critical global challenge, profoundly affecting human life through increasingly frequent and severe extreme heat events. These heat events are particularly intensified in urban areas due to the urban heat island (UHI) effect, posing significant risks to human health, infrastructure, and overall urban resilience. While many studies have empirically explored the relationship between urban form and Surface UHI (SUHI), there is limited research examining how SUHI dynamics shift during extreme heat events, recently conceptualized as "heat resilience." Furthermore, existing analyses often rely on traditional regression models that assume linear relationships and arbitrarily define spatial units without investigating how varying study unit sizes influence urban heat analyses within a city context. To address these research gaps, this study explores nonlinear relationships between urban form characteristics, land surface temperature (LST), and heat resilience in Seoul, utilizing advanced machine learning (ML) techniques across multiple spatial scales. Specifically, two Landsat satellite images with minimal cloud cover, captured on May 30, 2020 (extreme heat day) and September 19, 2020 (normal heat day), were used to retrieve LST data. Heat resilience was quantified by calculating the difference in LST between the normal and extreme heat days. Urban form metrics—including cover ratio, floor area ratio (FAR), building height variation, vegetation and water coverage, elevation, and proximity to major landscape features such as parks, water bodies, and mountains—were derived at multiple grid sizes ranging from 120 m to 1.08 km at intervals of 120 m. By analyzing these datasets, the study provides insights into how urban form influences heat resilience under varying climate conditions. Four representative ML algorithms—Random Forest, AdaBoost, Gradient Boosting Decision Trees (GBDT), and Artificial Neural Networks—alongside spatial regression models, were applied and evaluated. Among these, the GBDT algorithm demonstrated superior predictive performance, exhibiting the lowest mean squared error (MSE). Subsequent interpretability analyses, including feature importance assessments and partial dependence plots, revealed complex and nonlinear relationships between urban form characteristics, and LST and heat resilience. Specifically, vegetation and building coverage emerged as the most significant urban form variables influencing increased LST during extreme heat events and contributing to enhanced urban heat resilience. Conversely, large-scale landscape features did not exhibit clear nonlinear relationships. Additionally, comparative analyses across varying unit sizes highlighted significant scale-dependent influences on these relationships. Overall, this research deepens our understanding of the intricate dynamics between urban form, UHI, and urban heat resilience under extreme heat conditions. The findings can support urban planners and policymakers in formulating informed strategies and targeted interventions to enhance urban resilience to increasingly frequent and severe heatwaves, thereby prioritizing most influential urban form factors for effective urban heat mitigation.

Flooding is increasingly one of the most devastating natural hazards globally, both in economic damage and loss of life. Nature-based solutions, often called natural infrastructure (NI), represent a rapidly growing approach to flood management, with advantages for water quantity and quality (Metcalf et al., 2017). However, one primary barrier stymying large-scale NI implementation concerns its cost profile, which can complicate the establishment of NI funding streams (BenDor et al., 2018). Furthermore, while substantial research has quantified NI's economic benefits, such as ecosystem service production, few studies have explicitly modeled NI's economic impacts, including employment and value added to the regional economy.

In this paper, we seek to evaluate the potential economic impacts of a large-scale NI investment program, including policy scenarios that differentially leverage public investment to sustain the program over time, even leveraging it as a regional economic development strategy. We focus on two common and one NI practice – wetland restoration, reforestation, and water farming –as strategies for temporarily retaining and storing floodwaters in the Neuse River basin of North Carolina (Hovis, 2021). This basin is a major agricultural region that drains into a densely populated urban coastal area. We ask, how does NI construction affect employment and economic output throughout a regional economy? How do NI policy changes alter the extent of these economic impacts? How would economic impacts manifest in a large-scale NI construction and maintenance program?

To measure the economic impacts of widespread NI in the region, we implement an input-output (I-O) model using the IMPLAN modeling platform, informed by interview data (Hovis, 2021), wetland restoration records (Doll et al., 2021) and a geospatial and hydrologic analysis of the region (Doll et al., 2021). We model a range of economic impacts on the State of North Carolina's economy, including the direct (payments to firms to build and maintain NI), indirect (these firms' supply chains), and induced effects (spill-over effects throughout the economy) of investing in, and maintaining, new NI. We estimate these impacts using separate I-O models for each practice and scenario, as well as for the maintenance investments required for each NI practice. Although the maintenance impacts are likely to be smaller, they occur annually, as opposed to construction impacts, which are incurred once when the NI project is built.

We develop three institutional investment scenarios to assess their economic impact. Scenario 1 is a one-off investment over a single year. Scenario 2 is based on the North Carolina General Assembly's 2021 one-time allocation of \$15 million state budget to the North Carolina Land and Water Fund to address flood risk with NI throughout the State. Scenario 3 explores a situation where an NI funding mechanism scaled to the level of development in each watershed across the State.

Understanding the economic outputs from NI investments could help to reframe governmental cost-benefit thinking and support decision-making on policies tackling flooding hazards. These findings strengthen the case for adopting NI into resilience planning and broader economic development strategies.

Behavioral and Organizational Drivers of Climate Adaptation Outcomes: A Mixed-method Study

Abstract ID: 1844.0.0.1178.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Sridipta Ghatak [University of California, Irvine] sridipta2016@gmail.com, presenting author

The burden of long-term adaptation to climate change impacts communities globally but its impacts are experienced in differing degrees by the different demographic groups. In a similar vein, the benefits of state-led welfare policies combating climate change distribute themselves differently across religious, racial, caste, and gender identities, leading to varying degrees of resilience to climate change. From a planning perspective, the variation in climate resilience is most prominently observed in terms of household adaptation behavior and regional economic inequality. What drives this variation in adaptation outcomes of state-level climate mitigation and adaptation policies across different regions?

This paper utilizes stakeholder interviews and a novel survey experiment to explain why the desired outcome of a state-level adaptation policy leads to varying dynamics of regional climate resilience. The survey (n=559) captures variables measuring representational hierarchy within participatory planning initiatives and administrative burden experienced by community members across the divides of religion, gender and caste. Drawing on the theories of participatory planning, representational hierarchy, administrative burden and multi-dimensional decision-making, this paper sheds light on the regional political economy of adaptation behavior. The paper specifically asks between policy attributes and policy agent attributes, what really drives policy uptake decisions, and how these uptake decisions influence resilience building as a direct result of state-level adaptation policy.

Theoretically, the paper is invested in identifying precisely the relative weight of ethnicity, representational hierarchy and administrative within beneficiary preferences for policy uptake. The identification is then utilized to generate plausibly causal relationship between place-based policies and regional resilience, informing planning theory on regional inequality, climate resilience, and participatory decision-making.

While survey experiments are widely used in competitive choice scenarios, particularly the ones where preferences appear in bundles and present the respondents with a multi-dimensional decision-making scenario, in this paper, the adopted methodology helps to distinguish policy attributes (features of the policy offerings) from policy agent attributes (characteristics of the policy agent, trust in the agent etc.), allowing for clear distinguishment across (i) social and cultural factors such as ethnic networks, (ii) planning strategy related factors such as observable policy benefits, and (iii) regional spatial inequality that influences household decision-making for short and long-term adaptation. Preliminary findings suggest that ethnicity, partisanship and access to platform economy determine much of the (in)equities arising as divergent outcomes at neighborhood and regional scales.

Bibliometric Insights on Circular Economy and EVs: Implications for Georgia's EV Planning

Abstract ID: 1844.0.0.1136.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Shambhavi Giri [Georgia State University] alwaysshambhavi@gmail.com, presenting author

This paper explores how global scholarship frames the integration of circular economy (CE) principles into the electric vehicle (EV) sector and translates those insights into context-specific strategies for Georgia's emerging EV ecosystem. As EVs are increasingly embraced as a climate mitigation solution, especially in high-growth states like Georgia, there is growing interest in ensuring that the EV transition is not only low-emission but also resource-responsible. Circular economy frameworks, which focus on reuse, recovery, and minimizing lifecycle impacts, offer a path forward. Yet, the way CE is discussed and imagined in the EV literature varies widely, and it remains unclear what types of change are being proposed and whether those models are adaptable to state or local contexts.

Using bibliometric methods, this study analyzes 42 peer-reviewed articles published between 2019 and 2023 at the intersection of CE and EV research. It applies tools such as VOSviewer and SPSS to identify major research clusters, collaboration networks, and thematic keyword patterns. Rather than a traditional literature review, this paper asks: What kinds of interventions dominate CE and EV discourse? Are scholars focused on technological innovation, policy design, behavioral shifts, or systemic change? What logics or theories of implementation can be identified across the literature?

The analysis reveals that while CE is often presented as a tool for environmental and economic optimization, there is a noticeable gap in regional and subnational applications. Most studies focus on EU or national-level systems, leaving a critical opening to translate global insights into localized, actionable strategies. In response, this paper develops a strategic framework for Georgia that connects the dominant themes and best practices in the literature to the state's unique industrial, policy, and economic conditions. The framework addresses key opportunities in battery lifecycle management, public-private partnerships, workforce development, education, and equitable access to infrastructure.

This research contributes methodologically by demonstrating how bibliometric analysis can surface embedded narratives and priorities within sustainability research. It also offers a practical model for planning agencies, policymakers, and scholars interested in integrating circularity into emerging EV markets. By linking research patterns with grounded strategy, the paper makes the case for more regionally responsive, data-informed approaches to implementing circular economy principles in transportation and environmental planning.

Bridging Territorial and Consumption-Based Emissions for Urban Climate Action Assessment

Abstract ID: 1844.0.0.1158.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ying Yu [The University of North Carolina at Chapel Hill] ying.yu@unc.edu, presenting author

Diego Manyá [UNC] diego.manya@unc.edu

Angel Hsu [UNC] angel.hsu@unc.edu

A critical challenge in urban climate planning is the accurate quantification of city-level CO₂ emissions, particularly consumption-based emissions that extend beyond city administrative boundaries. Previous climate planning efforts have often relied solely on territorial emissions, failing to account for carbon leakage and the full scope of cities' climate governance. This study addresses the following research questions: How can we define globally consistent urban boundaries to support comparable emissions accounting? And how can spatially explicit emissions inventories be developed to track and improve the assessment of urban climate planning, especially in underrepresented regions?

To answer these questions, we introduce a novel urban clustering method that detects administratively coherent and globally consistent urban boundaries using machine learning algorithms and remote sensing techniques. We then construct a bottom-up analytical framework for spatially explicit urban emissions inventories that integrates both territorial and consumption-based emissions. This framework enables consistent and comprehensive assessments of urban emissions across diverse geographies, including data-sparse areas in the Global South.

Our analysis reveals that consumption-based urban emissions account for approximately 90% of global CO₂ emissions, compared to 80% from territorial urban emissions. This 10% discrepancy, carbon leakage from urban to rural areas, highlights a blind spot in current urban climate mitigation strategies. Moreover, we find that many urban areas underestimate their emissions responsibilities by relying solely on production-based inventories within territorial boundaries, leading to gaps in comprehensive mitigation planning.

These findings have direct implications for urban climate governance and planning. By highlighting the carbon embedded in urban consumption patterns, our work supports more holistic mitigation strategies that address global supply chains and interregional carbon flows. It also provides a reproducible methodology for delineating urban boundaries, allowing planners and policymakers to better identify areas of untapped mitigation potential and to design climate planning practices that are both locally actionable and globally equitable.

Building heat resilience through an equitable planning framework for heat warning systems

Abstract ID: 1844.0.0.158.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Xiaofei Qin [Boston University] qinx@bu.edu, presenting author

Anne Short [Boston University] agshort@bu.edu

Patricia Fabian [Boston University] pfabian@bu.edu

Jonathan Lee [Boston University] jylee@bu.edu

Heat warning systems are designed to alert decision-makers and the public to impending dangerous hot weather and initiate preventive action to minimize the harm. As climate change increases the dangerous heat event, these systems are important tools in city's climate resilience actions. Most heat warning systems are based on city-wide forecasts, which can overlook or obscure the specific conditions of climate-vulnerable communities who are exposed to higher temperature but the least equipped to cope. There is a need to understand if and how heat warning systems address the needs of vulnerable populations within cities.

In this paper, we examine heat warning systems through the lens of equity and propose an equitable framework to guide the development of heat warning systems that better account for the conditions of vulnerable residents. We analyze how equity and justice concerns intersect with the four primary components of heat warning systems – forecasting, communication, response, and evaluation – and suggest how engagement with vulnerable communities can inform the development of more inclusive and effective heat warning systems.

Our analysis draws on a literature review and case study of heat vulnerable communities in Boston including: (1) temperature monitoring in seven heat vulnerable neighborhoods and (2) a photovoice study with 22 participants from two of these neighborhoods. We use the temperature data to examine the (mis)match of heat warning system to the temperature conditions in heat-vulnerable neighborhoods. The photovoice data provides insights into the ways participants' experiences and response behaviors align with the assumptions of heat warning systems as well as how participants' knowledge can inform the design of community-based warnings and actions.

We find that, first, forecasting methods do not reflect the uneven heat exposure across the city, which can lead to delays in issuing warnings and implementing cooling centers where needed. Second, current communication of heat warnings may not reach all vulnerable groups. Heat warning communication can be improved by further tailoring communication strategies to the specific needs and circumstances of various heat-vulnerable populations as well as establishing supportive community networks that can pass information and build trust. Third, while many cities and regions have crafted heat action plans that consider social equity, there is a critical need to enact responses that go beyond quantifying vulnerability (such as including Heat Vulnerability Index and Social Vulnerability Index in plans) and engage vulnerable residents to build targeted heat responses that account the varied circumstance that heterogeneous vulnerable populations face. Last, data inequity such as scarcity or absence of indicators (e.g., missing race or ethnicity information) and lack of surveillance systems in many low- and middle-income countries, limits the outcome-based evaluation to support the iteration towards an equitable heat warning system.

Based on these results, the paper proposes a planning framework that integrates environmental justice principles to guide the development of an equitable heat warning system.

Building Rural Resilience: A Comparative Spatial Analysis of Nature-Based Solutions in Louisiana

Abstract ID: 1844.0.0.876.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Yao Wang [Louisiana State University] yaowang@lsu.edu, presenting author

Qiong Wang [University of Georgia] qiong.wang@uga.edu

Climate-induced flooding is an escalating threat in Louisiana, driven by rising sea levels, intensifying storms, and increasing rainfall linked to climate change. These conditions are placing both coastal and inland communities at heightened risk. Currently, over 477,000 properties in the state are considered to have substantial flood exposure—a number expected to increase by nearly 69.7% within the next 30 years, affecting more than 809,800 properties. Although studies show that every dollar invested in natural hazard mitigation can save six dollars for future damage, rural communities often lack the resources and tools needed to prepare effectively. Key challenges include limited access to geospatial information and high-quality flood risk data, which restricts these areas' ability to plan for future hazards. Furthermore, most current research and planning frameworks prioritize urban contexts, focusing on green infrastructure solutions in cities while overlooking the specific needs of rural populations. This study seeks to address those gaps by investigating how spatial data and nature-based solutions (NBS) can support flood resilience in rural Louisiana. The research focuses on inland and coastal areas that face recurring flood threats but often lack the technical capacity to engage in comprehensive planning. By developing and analyzing a series of scenario-based models, the study assesses how different NBS interventions can help reduce risks and provide ecological and social co-benefits.

Research Questions-Research questions include 1) In what ways can Geographic Information Systems (GIS) improve the accuracy and relevance of flood risk assessments in under-resourced rural regions, and 2) what types of nature-based strategies are most viable for increasing resilience to flooding in both inland and coastal rural areas?

Methods-ArcGIS Pro is the primary spatial mapping tool used for flood risk analysis and the evaluation of NBS. The data used include digital elevation, land cover, hydrography, soil types, and other related parameters. We preprocess the digital elevation model (DEM) by performing fill, flow direction, and flow accumulation operations. This is followed by identifying flood-prone areas and analyzing flood risk levels categorized as high, moderate, and low. For evaluating nature-based solutions, we develop three scenarios focused on forests, wetlands, and agricultural/pasture lands. The methodology involves reclassifying land use types, running flood risk models for each scenario, and calculating the percentage reduction in high-risk areas.

Results-Results indicate that wetlands are the most effective NBS, showing the greatest reduction in flood risk in both coastal and inland areas. Therefore, wetlands should be prioritized for flood mitigation in rural areas across both landscapes. Next steps include incorporating additional parameters to better identify rural communities at high flood risk in Louisiana. We are also testing advanced modeling tools such as HEC-RAS, SWMM, and InVEST to evaluate NBS in greater detail, and plan to implement participatory GIS approaches to collect localized data for rural areas.

Conclusions-The project is designed with local governments and resilience professionals in mind, aiming to support evidence-based decision-making in communities that face high exposure but have limited planning resources. In addition to generating new spatial data, the research will produce visualizations and quantitative comparisons of multiple adaptation options. This will allow planners, engineers, and designers to evaluate trade-offs and make more informed choices about NBS implementation. Ultimately, the findings will support policy development and

investment strategies that are tailored to the realities of rural communities. By combining technical analysis with local knowledge, the project will contribute to more inclusive and effective climate adaptation efforts.

Monica Dean [University of Southern California] m.dean@usc.edu

Advancing urban forestry interests has become a critical topic in urban planning practice and research, due to the ways in which tree canopy coverage has been found to contribute to the overall resilience of urban communities. While gaps in urban canopy coverage exist in many metropolitan areas, there are often sub-regions that experience these dynamics more deeply, as longstanding discriminatory policies and practices have been known to contribute to environmental injustices, such as the lack of trees. However, despite the awareness of urban forestry benefits and tree-related needs, minimal work has explored how these interests fit within the broader needs and priorities of vulnerable communities.

To begin addressing these dynamics, we explore these questions through a qualitative case study analysis of tree planning efforts in South L.A., a diverse region of Los Angeles with high concentrations of low-income households and communities of color, and far lower percentages of trees compared to L.A.'s average tree canopy coverage. We conducted semi-structured interviews (n=34) with community leaders and representatives in South L.A. Our research question focused on assessing what community leaders identify as the key needs, challenges, and recommendations for current and future planning, policy, and advocacy efforts related to tree planning in South L.A.?

Our study findings highlight key factors critical for advancing effective and equitable tree planning efforts in vulnerable urban areas. This includes (1) understanding how tree planning activities intersect with other community needs and interests, such as addressing health, housing, financial, and systemic issues, and (2) grappling with the potential unintended consequences of tree planning on vulnerable communities, such as potential environmental gentrification impacts. Through this exploration, our study findings work to advocate for more inclusive approaches towards tree planning in South L.A., and other urban communities dealing with the long-term impacts and legacies of environmental injustices and inequalities.

Cashing out social capital, can online interactions improve long-term resilience? A case study of Buffalo Blizzards 2022, 2024

Abstract ID: 1844.0.0.505.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Fuzhen Yin [University of Colorado Colorado Springs] fyin@uccs.edu, presenting author

Diep Dao [University of Colorado Colorado Springs] tdao@uccs.edu

Yingjie Hu [University at Buffalo (UB)] yhu42@buffalo.edu

This study explores the roles of self-organized Facebook groups as an “urban commons” in facilitating mutual aid behaviors during two recurrent blizzards (2022, 2024) in the city of Buffalo NY (Ostrom, 2015). At the height of the Christmas travel season, Buffalo has encountered the most devastating storm in its long-storied history of snow. 4 feet of snow fell in about 48 hours. Storm-force wind speed has caused structural damage. The conditions were so bad that emergency services in numerous towns were suspended (e.g., Buffalo, Cheektowaga, Clarence, and Williamsville).

While the major infrastructure in the physical space has been shut down, Buffalonians have flocked to cyberspace to stay connected. Two Facebook (FB) groups, “Buffalo STORM” and “Buffalo Blizzard Response” become the main communication hub where people share information, and resources and coordinate collective behaviors. Through identifying mutual aid messages and analyzing users’ social networks, Yin et al. (2025) have found that FB groups can improve community resilience by introducing “weak ties” among group members. These weak ties extend people’s traditional social circles and facilitate the flow of information and materials among otherwise disconnected groups (Granovetter, 1973).

Despite Yin et al. (2025)’s findings on weak ties, it is unclear if such emergent and temporary digital connections can translate into long-term social capital for future crises. Particularly, one year after the blizzard in December 2022, Buffalo encountered another severe storm in January 2024. This study conducts a longitudinal study on the long-term impacts of self-organized FB groups in responding to two recurrent blizzards (2022, 2024) in the city of Buffalo. Methodological-wise, we have collected FB messages sent in the FB groups during the 2022 and 2024 blizzards. By combining machine learning algorithms (e.g., named entity recognition) with social network analysis, we construct two spatial social networks capturing users’ mutual aid behaviors. We compare the two networks to explore the mechanism through which weak (ties) convert to strong social connections. Additionally, mapping the social networks spatially allows us to understand spatial constraints on mutual aid formations.

Through a longitudinal analysis, this research extends the urban commons theory into a digital context. Specifically, this research can find that social media platforms (e.g., FB groups) are not just a communication channel during crises. Instead, these platforms are becoming digital “urban commons” that can facilitate long-term resilience. When the main infrastructure in the physical space is down, social media platforms provide alternative solutions for people to self-organize, self-help, and engage in spontaneous mutual-aid behaviors during emergencies.

Catastrophic Hurricanes and Migration Preferences in the US: Evidence from Hurricane Sandy

Abstract ID: 1844.0.0.1113.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Juanbo Pu [Hong Kong University of Science and Technology] jpu@connect.ust.hk, presenting author
Zhuoni Zhang [The Hong Kong University of Science and Technology (Guangzhou)] znzhang@hkust-gz.edu.cn
Chaosu Li [The Hong Kong University of Science and Technology (Guangzhou)] chaosuli@hkust-gz.edu.cn

This study investigates an interdisciplinary issue on how catastrophic hurricanes in the United States may reshape residents' cross-county migration networks and alter their migration preferences, particularly the interplay among economic, environmental, cultural, and political mechanisms. Using network analysis and causal inference method PSM-DDD, along with multi-source big data including IRS county-to-county migration records, disaster information, and socioeconomic attributes of counties, this paper takes Hurricane Sandy, which struck the northeastern United States, as a case study to investigate two research questions: First, do catastrophic hurricanes force or hinder migration in disaster-affected areas. Second, whether migration preferences under disaster conditions diverge from ordinary circumstances. Specifically, whether residents' migration is mainly driven by economic mechanism or shifting toward environmental, cultural, or political mechanisms. Innovatively, this study distinguishes between out-migration and in-migration networks to separately analyze how hurricanes and the four mechanisms influence outmigration during disasters versus in-migration post-disaster, offering insights for policymaking in disaster prevention.

Specifically, this study proceeds as follows: First, we designate treatment groups (counties severely impacted by Sandy) and control groups (counties unaffected by any major disasters during the same period). After screening, 41 of 132 Sandy-affected counties qualified as the treatment group, contrasted with 2,712 unaffected counties. Second, for each county in both groups, we construct annual county-to-county out-migration networks over five years (pre- and post-disaster), yielding 23,184 OD pairs for the treatment group and 285,937 for the control group. Each OD pair is characterized by origin-destination similarity across four dimensions: economic, environmental, cultural, and political. The same approach is applied to post-disaster in-migration networks. Finally, using PSM (Propensity Score Matching) to match comparable ODs in the control group, we employ DID (Difference-in-differences) and DDD (Difference in difference in differences) models to address the two research questions: whether disasters promote or hinder migration, and how the four mechanisms modulate the effects in DID.

Key findings reveal that out-migration networks exhibit lower migration rates from hurricane-struck areas, aligning with the "disaster suppression" literature. Migration preferences during disasters diverge from routine conditions, with environmental and cultural mechanisms dominating over economic factors—residents preferentially relocate to distant counties with greater cultural dissimilarity. Conversely, post-disaster in-migration networks demonstrate distinct dynamics: economic mechanisms prevail, as residents from less developed areas are more likely to move to disaster zones, with economic factors interacting with environmental and cultural drivers. These findings advance understanding of disaster-induced migration networks and preferences, offering insights for policymaking in disaster prevention.

Shengxiang Jin [UC Irvine: University of California Irvine] shengxj2@uci.edu

Christopher Ihinegbu [University of California, Irvine] cihinegb@uci.edu

Michael Méndez [University of California, Irvine] mamende6@uci.edu

Douglas Houston [University of California, Irvine] houston@uci.edu

In California, local jurisdictions are required to address greenhouse gas emissions (GHG), climate adaptation, and environmental justice in long-range planning processes, but they have discretion in how to integrate climate measures across different types of plans. Jurisdictions can prepare a climate adaptation or GHG reduction plan, prepare separate stand-alone plans for different topics, or integrate topics into other plans and processes. Although this approach provides cities and counties with flexibility in how to integrate and coordinate climate actions based on their needs and local context, it could result in poor and inconsistent integration of climate strategies across plans, leaving people and infrastructure vulnerable to hazards (Berke et al., 2015). Even within a single city, the strategies, goals, and actions to achieve climate adaptation can vary substantially depending on when the plans for each sector were adopted and whether they focus primarily on technology and science or address the needs of residents and justice concerns (Strange et al., 2024). Developing and implementing plans in “silos” could result in missed synergistic opportunities to more effectively and efficiently reduce risks (Matos et al., 2023). Conversely, coordination of climate strategies across a network of plans within a jurisdiction could encourage greater coordination across previously siloed departments (Grafakos et al., 2018; Woodruff et al., 2022).

In response to these uncertainties, we investigate the challenges and opportunities for climate action integration across climate action plans (CAP), local hazard mitigation plans (LHMP), and general plans (GP) for a sample of cities in Orange, San Bernardino, and Riverside Counties. The selected cities have adopted all three plan types, which represent a range of multi-hazard environments with varying levels of resources and a mix of political contexts. We develop a climate riskscape framework to analyze how the following three categories of climate impacts and protective measures are addressed within and integrated across CAP, GP, and LHMP: Hazards (GHG emissions and Climate Hazards), Amenities (Protective Governance and Protective Infrastructure), and Vulnerabilities (Vulnerability and Environmental Justice). For our analysis, we extracted the goals, policies, and actions sections from each plan. Our coding framework consists of two broad categories for Climate Hazards and GHG emissions reduction, allowing for a comprehensive assessment of adaptation and mitigation. In the first step, we employed NVIVO software for automated precoding using keywords to identify relevant text segments across all documents. Next, we conducted a detailed manual review to verify and refine the coding. Finally, we generated frequency tables for different coding categories to quantify the presence of various climate hazards, mitigation strategies, and vulnerabilities.

Our results indicate that flooding receives consistent and strong coverage across all cities, followed by wildfires. However, there is a significant gap in drought and extreme heat coverage despite regional vulnerability. Strategies, policies, and actions addressing climate hazards predominantly focus on preparedness, while recovery planning remains limited or absent from the plans of many cities. In terms of GHG emissions reduction, transportation and land use consistently receive the most extensive coverage across cities, followed by energy efficiency and

production initiatives. Lastly, we found that hazard interactions, intensification of hazards due to climate change, and environmental justice concerns receive minimal coverage across all cities. Results support local climate action planning by identifying the challenges and opportunities for integrating climate action strategies across CAP, LHMP, and GPs.

City-Scale Carbon Mitigation Plan Collaborating with LLM Multi-Agents

Abstract ID: 1844.0.0.226.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Yuyan Huang [Tongji University] huangyuyan@tongji.edu.cn, presenting author

Chao Liu [Tongji University] liuchao1020@tongji.edu.cn

Background: Accurate monitoring and interpretation of urban carbon emissions are critical for designing effective mitigation strategies and advancing sustainable development. Traditional methods, however, struggle with fragmented data integration, labor-intensive calculations, and human bias. While large language models (LLMs) have shown promise in processing heterogeneous data (Fu et al., 2024), their potential in multi-agent collaboration—particularly for synthesizing policy insights and spatial dynamics—remains underexplored (Almulhim et al., 2024). Recent studies highlight LLMs' capacity to simulate stakeholder interactions and optimize complex urban systems (Cao et al., 2022; Gamage et al., 2024), yet few frameworks bridge technical analysis with policy implementation. This study proposes a multi-agent LLM framework to automate city-scale carbon neutrality reporting, integrating emission data analysis, policy knowledge extraction, and scenario-based planning. We aim to establish a scalable technical pathway for transforming raw data into actionable policy recommendations.

Data and Methods: The study integrates three data sources: 1) CEADs datasets (1990–2023) covering city- and provincial-scale sectoral carbon emissions (industry, energy, transport, buildings, land use); 2) China's 2024+ climate policies, including national strategies, sectoral regulations, and social initiatives across five key domains; and 3) low-carbon city plan case studies (e.g., Shanghai action plan) and peer-reviewed literature. Raw policy texts underwent preprocessing (cleaning, tokenization, stop-word removal), followed by BGE-M3 vectorization and Retrieval-Augmented Generation (RAG) integration into Milvus. A Neo4j knowledge graph was constructed using LLM-assisted Named Entity Recognition (NER) and Relation Extraction (RE), linking policy entities (e.g., "carbon peaking targets") to urban entities (e.g., industrial zones) via TF-IDF and lightweight ontologies. The Dify framework orchestrates a multi-agent workflow with five specialized agents: DataCollector (aggregates emissions/GDP/population data), Analyzer (spatiotemporal hotspot detection), SectorContributor (sectoral attribution analysis), Advisor (policy recommendations via knowledge graph queries), and Summarizer (report generation). The system was benchmarked against GPT-4/DeepSeek/Claude/ChatGLM3 APIs, achieving state-of-the-art performance in retrieval metrics (hit rate, MRR) and response quality (relevance, correctness, credibility, BERTScore).

Key Findings: The analysis demonstrates three pivotal outcomes: 1) post-policy emission reductions in carbon-intensive sectors validate the robustness of LLM-driven policy-knowledge extraction, particularly in linking regulatory mandates to sectoral outcomes; 2) the LLM-constructed knowledge graph revealed systemic gaps in regional governance, such as fragmented carbon trading mechanisms in western China, offering actionable insights like cross-provincial quota coordination frameworks; 3) empirical validation through the Ningbo City case study highlighted operational efficiencies, with the framework reducing report generation time while maintaining high accuracy in policy alignment—demonstrating LLMs' capacity to streamline municipal planning workflows. These findings collectively underscore the transformative role of multi-agent LLM systems in bridging data fragmentation (Hao & Xie, 2025), enhancing policy accountability, and scaling climate action.

Implications: The study underscores the transformative potential of LLM multi-agent systems in urban carbon governance, while highlighting critical pathways for future research. Technical advancements could focus on enhancing domain-specific LLM alignment with textual analysis could further refine emission attribution models.

Climate Adaptation Co-Production and Residents' Changes in Adaptive Capacity

Abstract ID: 1844.0.0.724.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Katherine Lieberknecht [University of Texas at Austin] klieberknecht@utexas.edu, presenting author

This article asks: how does residents' participation in a multi-year climate adaptation co-production process relate to measures of adaptive capacity?

Researchers contend that knowledge held by residents, when used alongside technical/scientific data, can contribute to improved justice and effectiveness of climate adaptation planning. Scholars and practitioners suggest co-production as one pathway to better integrate local knowledge into climate planning. For this article, we define co-production as the process of working collaboratively within and beyond research-focused institutions to develop knowledge useful for decision-making. In the planning field, residents' participation in the development of planning outputs represents one aspect of co-production. Scholars have long debated the role of, and limitations associated with, residents' participation in planning. However, some evidence exists that residents' participation in climate adaptation planning increases their feelings of trust, responsibility, capacity, and agency; awareness and understanding of climate risk; capacity to work toward equitable climate adaptation; and levels of personal responsibility for preparedness. These attributes can be measured in part by evaluating adaptive capacity, defined here as the ability of people, both as individuals and as communities, to anticipate, adapt, and recover from impacts stemming from environmental and/or climate change.

We investigate changes in adaptive capacity through a case study from Austin, Texas, a rapidly growing city facing flooding, heat, drought, and wildfire, all within the context of continued segregation, disproportionate exposure to climate-related events, and uneven access to adaptation infrastructure. Residents of the Dove Springs neighborhood of Austin worked with a community-based organization, Go! Austin, Vamos! Austin (GAVA), to identify a need for an online portal to share knowledge about their community, climate-related events, and preparation for, response to, and recovery from events. In 2019, GAVA developed the Climate Navigators program, a group of community members trained in climate preparedness and community organizing, as a first step to develop the portal. In collaboration with GAVA, the research team received National Science Foundation funding to work with the Climate Navigators from 2020-2024 to co-produce and launch the portal.

To investigate changes in reported adaptive capacity characteristics, we interviewed 22 members of the Climate Navigators in 2020 and again in 2024, at the end of the project. All interviewees were Hispanic/Latina women and live in a low-income neighborhood experiencing severe climate impacts. Semi-structured interviews consisted of open-ended questions accompanied by a graphic showing aspects of adaptive capacity. Interviews were recorded, transcribed, and, for 18 of the 22 interviews, translated from Spanish to English. Three researchers from the team then coded the interview data into key themes through multiple rounds of analysis.

Overall, initial findings show that participants reported improvements in (climate-adaptation specific) relationships to technology, information, skills, and equity, with challenges remaining in areas of economic resources and infrastructure. Relationships to institutions were mixed, with strong agreement that connections to community-based organizations and a research university improved, but, for the most part, distrust of local government entities involved with climate adaptation and climate-event response continued. Our findings are relevant for planners and researchers working in communities impacted by environmental and climate change, those considering how to work with residents to develop and implement co-production processes focused on climate

adaptation, and residents and community leaders seeking to develop programs and processes to improve adaptive capacity.

Climate Gentrification in Florida: Perspectives from City and Housing officials in Tampa and Miami

Abstract ID: 1844.0.0.35.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

April Jackson [University of Illinois at Chicago] ajacks29@uic.edu, presenting author

Willian Butler [Florida State University] wbutler@fsu.edu

Tisha Holmes [Florida State University] ttholmes@fsu.edu

Anthony Milordia [Florida State University] acm11h@my.fsu.edu

“Climate gentrification” is the new turn of phrase used to highlight the disproportionate impacts of climate change on low-income populations of color. Sea level rise threatens to dramatically reshape life on the Florida coast. As waters breach the tops of sea walls and bubble up from below, they erode the risk tolerance of wealthier residents to remain on the coast as inundation becomes more permanent than a nuisance. Consequently, higher elevation neighborhoods are increasingly primed to become gentrification hotspots through speculation and permissive development incentives for migrating populations facing eventual retreat from the coast. The process of inland retreat may also lead to secondary displacement of long-term residents as the pressures of gentrification, investment and development take hold particularly in lower income communities of color. While there is growing attention to the potentials for mass migration and retreat from the coast, there is limited empirical analysis of the dynamics of displacement related to sea level rise and the planning mechanisms in place to manage impending neighborhood change in higher elevation communities.

This paper examines the planning efforts to address the risks of first order displacement from the coast related to sea level rise impacts and mitigate second order displacement in low income inland communities on higher ground. We employ a multi-staged research design to explore how major urban centers in Florida are planning for and developing policies to address the disproportionate impacts that marginalized communities are likely to experience in the face of sea level rise. The three stages of the research methodology include 1) mapping of displacement risk indicators, 2) a modified network of plans policy analysis, and 3) semi-structured interviews conducted with key resilience, housing, and planning actors in Miami and Tampa Bay regions.

This paper draws from our policy analysis and interviews with city officials, housing officials, and advocates. We find through the plan analysis there is a disconnect between resilience and environmental policies concerned about the effects of sea level rise and housing protection policies used to manage neighborhood change and prevent displacement. Likewise, our interviews show that all regions are operating in a pro-development political context and as long as property values remain high, the misalignment in timelines of developers working on short-term returns with the realities of the eventual long-term implications for these new developments on the coastlines will persist. In inland communities for each region, we find ongoing tensions between the interplay of revitalization initiatives and neighborhood preservation, where communities that receive upgrades, urban greening or flood proofing witness increasing property values and become targets for displacement of existing residents.

Local variations across the comparative cases reveal divergences in the salience of climate displacement perceptions and responses. In Miami-Dade areas that are primed for potential displacement are explicitly identified as inland communities of color which are already undergoing neighborhood change. In Tampa Bay-Pinellas, planners are in the process of understanding the vulnerabilities related to sea level rise, sources of affordable housing stock and identifying potential areas where primary and secondary displacement may occur.

This paper advocates for a more anticipatory model of planning and proactive examination of climate planning and housing policies focused on anti-displacement strategies to identify gaps in coverage and opportunities to promote greater equity and address the risks associated with first order and second order displacement.

Collaborative Capacity and the Role of Governance Platforms in Watershed Planning and Management

Abstract ID: 1844.0.0.752.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Richard D Margerum [University of Oregon] rdm@uoregon.edu, presenting author

Collaborative planning and governance has become an established approach to managing complex problems (Genskow 2009; Innes and Booher 2010). For ongoing collaborative efforts, there is typically an entity at the center of this effort that has been called a governance regime (Emerson and Nabatchi 2015), network administrative organization (Provan and Kenis 2008), and collaborative platform. Ansell and Gash (2018, 20) define collaborative platforms as an organization with “dedicated competencies, institutions, and resources” for ongoing collaborative projects or networks. Considerable research has been conducted on collaboration formation and operation, but there has been limited research on how different collaborative platform forms and functions affect capacity and stability (Bryson et al. 2015). One model proposes that collaborative platforms can be categorized by those reliant on staff, boards, and partners—suggesting that each type has strengths and weaknesses related to capacity and stability (Margerum et al, 2025)

There is a long history of collaborative platforms to support watershed planning and restoration work. Chaffin et al. (2015) identified 304 entities operating just in Oregon, Washington, and Idaho. In Oregon collaborative platforms have been operating for more than 30 years as “watershed councils,” which may represent one of the longest collaborative governance efforts in the US.

This article examines how the types and functions of platforms affect the capacity and stability of watershed management efforts in the state of Oregon. The project uses a mixed method and participatory approach, supplemented by feedback and follow up case studies. The methods included an online survey of watershed councils (n=49; 81% response rate), which addressed topics of internal operational practices, resources, governance, and partnerships. The methods also included in-depth review of documents and funding data for 10 councils representing a cross section of locations, capacity, and partnerships. Twenty one interviews were conducted for four councils representing distinct capacity contexts. Throughout the study, researchers utilized an advisory team of councils and agency staff to review preliminary findings, analysis, and interpretations. Since publication of an agency report on this work, additional research was conducted on several “failed” councils to examine the issues and context for their demise.

The study found several aspects of collaborative platform stability important for capacity and success. First, lead staff turnover was a critical factor related to capacity. This often related to collaborative platform type, board-staff relationships, and compensation. Second, recruitment of stakeholder boards with the skills, capacity, and networks to support the platform was important for building capacity, but those in rural regions faced a paucity of potential board members. Third, those platforms with strategic plans with clear priorities tended to exhibit a stronger trajectory, but the effectiveness of the plans were as much a performance measure of ability and capacity. Finally, external networks supported by staff and stakeholders were essential to the overall capacity, growth, and stability. However, there are clearly dense and sparse networking opportunities across the state that cannot be overcome by simply “working to developing more relationships.”

In summary, the study finds that these factors can compound to help spiral the stability and capacity of collaborative groups. We document many cases where increased capacity, staffing, board engagement, and partnerships lead to an upward spiral of funding levels and diversity of sources. We also explore several cases in

which platforms experienced a downward spiral in funding levels and diversity of sources. While these limited cases are hard to generalize, they highlight the very fragile nature of even strong and well-functioning collaborative platforms.

Community Building for Neighborhood Ecologies

Abstract ID: 1844.0.0.174.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Michael Zang [Florida State University] mcz18b@fsu.edu, presenting author

Within this chapter, I explore the Urban Ecology Center's (UEC) community-building approach to support neighborhood sustainability. I ask, "how or to what extent does community-building and engagement contribute to this end? What might we learn from their approach that informs neighborhood planning theory and practice for a more holistic, sustainable-ecological urbanism?"

The UEC engages with multiple endeavors from park planning to land management, civic science, and community education. Situated within 3 separate neighborhoods, the UEC is also committed to building community and fostering relationships with people, place, and nature as a basis for neighborhood improvement and wellbeing. This is implemented in several ways: by being physically embedded within neighborhoods; through basic social interactions and contact; through participation and engagement such as volunteer stewardship, community forums, environmental activities, and sustainability events; and by supporting and collaborating with aligned neighborhood groups, initiatives, and other organizations. A crucial, tangential question I ask here is: how does this integrated social-ecological approach mark a divergence from and transformation of more conventional and siloed neighborhood and environmental planning strategies of the past? Some of what I find is that, by working directly with residents and local communities, the UEC cultivates complex, socio-ecological that considers not only communities and the built and natural environments, but in recent years, has also emphasized the need for greater individual care, compassion, kindness, dignity, respect, and so forth. Incidentally, such elements are nascent topics of interest through literatures on planning (Healey, 2024), sustainable communities (Glennie, 2020; Yuille, 2023), resilience and capacity-building (Kan & Lejano, 2023; Helne, 2021).

Methodologically, this paper is based on ethnographic research conducted in summer and fall of 2023. I used participatory observations and research to collect data in the form of fieldnotes, interviews, and content analyses coupled with extensive literature reviews. Findings show that the UEC employs a multitude of strategies to build and strengthen community for sustainability and wellbeing. This, however, begins with a philosophical and practical reframing of care and ethics for both humans and the environment, built and natural. Conceptually, this is premised upon a pragmatic environmental ethic like Aldo Leopold's (1949) who espoused the need for an integrated, interdependent conception of community inclusive of other species, ecosystems, as well as other human communities and cultures. Despite its abstraction, Leopold envisioned such an ethic as embodied practically in the everyday relations between people and place. This is transformative for both planning theory and practice in numerous ways.

My findings show that the UEC's model consider community-building and environmentalism as a unified whole. This whole is, in turn, based on a social-ecological ethics of care (Healey, 2024) that presumes an expanded sense of wellbeing (Helne, 2021). Such community care is evidenced by the organizational vision and values as well the many words and deeds voiced by informants. Sustainability grounded in community, engagement, ethics, and care is of recent interest among some scholars (i.e. Yuille, 2023; Healey, 2024) and has garnered attention in sustainability and resilience (Helne, 2021; Glennie, 2020; Kan & Lejano, 2023). Collectively, these scholars suggest that sustainability cannot be decoupled from community which, in turn, requires care for both people and place. Such concepts are useless, however, without everyday, interactive practices in community. Hence, this research

explores an innovative, integrated approach that answers the call for more practical solutions to the issues of contemporary urbanism.

Community or Community-Owned Solar? An Empirical Study of Organizational Structure on Decision-making

Abstract ID: 1844.0.0.542.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Haoyu Yue [University of Washington] yohaoyu@uw.edu, presenting author

Jan Whittington [University of Washington] janwhit@uw.edu

Siman Ning [University of Washington] tatasky@uw.edu

Community solar refers to any solar project or purchasing program within a geographic area in which the benefits of a solar project are shared among multiple customers (Department of Energy, 2024). It offers advantages over traditional methods of energy production and delivery, providing benefits such as financial savings, economic growth, environmental sustainability, and social equity (Ning et al., 2025). Community solar projects can be developed and owned by utilities, private companies, or, in theory, the community itself, with benefits to all participants. However, in practice, there are very few community solar projects that are truly community-owned. Research suggests that this is largely due to the need to set up a special purpose entity for such collective action, which increases the legal and organizational complexity of solar development and community collaboration when handled outside of the capacity of a utility or private firm (Chun, 2023; Milun et al., 2022).

In Washington State, however, Public Utility Districts (PUDs) represent a unique form of utility structure. A PUD is a community-owned, non-profit, locally regulated utility created by a vote of the people under state regulation RCW 54. This enabling legislation raises the question: Are Public Utility Districts (PUDs) better positioned to advance community solar than municipal-owned or private-owned utilities? To what extent do differences in utility provider governance structure affect the capacity (MegaWatts) and configuration of community solar installations? Other factors of interest include solar resources, regulation mandates, funding sources, and organizational characteristics.

In this paper, we apply new institutional economics in an empirical examination of the effects of utility structures on decisions surrounding community solar projects. We use data from the National Renewable Energy Laboratory (NREL) on community solar and the U.S. Energy Information Administration (EIA) Annual Electric Power Industry Database. Our analysis covers 60 Washington State utilities, including over 20 PUDs, focusing on their involvement in community solar and evaluating their make-or-buy decisions regarding project development.

For planners, understanding how utility structure shapes community solar development enables more strategic, equitable, and locally grounded energy planning. Preliminary findings suggest that utility structure and governance characteristics are associated with community solar development. PUDs, with their elected boards, are more responsive to community needs and tend to prioritize collective interests, making them more likely to provide community solar as a club good. However, due to the geographic limitations of their service areas, the system sizes of PUD-led community solar projects tend to be smaller. Nonetheless, the PUD model may offer a more compatible framework for supporting community-owned energy systems than other utility arrangements.

Community-Led or Community-Washed: Analyzing Collaborative Urban Climate Change Planning

Abstract ID: 1844.0.0.427.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Emma French [University of California Los Angeles] emmafrench@ucla.edu, presenting author

Around the world communities that have historically been economically marginalized and burdened by pollution are now disproportionately vulnerable to the impacts of climate change. Pressured by environmental and climate justice advocates, governments are starting to direct public investments into these communities with the goal of simultaneously responding to climate change and addressing long-standing economic and social disparities. While many frontline communities support these targeted investments in theory, there are still concerns that, in practice, these efforts represent status-quo, top-down, urban revitalization efforts that ultimately reproduce environmental and climate injustices. As more public funding is directed into these targeted programs, more needs to be understood about how these investment programs are working on the ground. How are decisions made about how to spend public investments and who is involved in making these decision making processes? Finally, what are the possibilities and limitations of these efforts in terms of advancing multi-scalar and intergenerational climate justice?

To begin to answer some of these questions, I present a comparative case study of three neighborhoods in Los Angeles—Watts, Pacoima and South Central Los Angeles. Between 2018 and 2022, these three neighborhoods were awarded between \$23 an \$35 million through the State’s Transformative Climate Communities Program (TCC) to implement comprehensive, community-led climate change plans and projects. I use qualitative content analysis to examine in-depth interviews (n=56) and relevant documents related to the development of TCC-funded climate plans in each of these neighborhoods.

These three cases enable insightful comparison given that they are located within a single political jurisdiction, the City of Los Angeles, but they differ notably in terms of the planning process and outcomes associated with the TCC funding. In Watts, the City’s housing authority led a planning process centered around the redevelopment of one of their public housing sites, Jordan Downs. In Pacoima, an environmental NGO partnered with a grassroots environmental justice group to advance a plan centering around urban greening and revitalization of a channelized tributary. In South Los Angeles, a coalition of community-based organizations (CBOs) that organize across a range of issues put forward a climate plan that advanced inclusive economic development without displacement.

While each of these neighborhoods took a very different approach to climate planning, I find that the types of projects that are ultimately funded by the state are similar across the sites. In all three cases, I find that the realization of community priorities in the plans is limited to some extent by the program’s guidelines, which determine the types of activities that can be funded. I also find that while sites led by non-governmental organizations show more evidence of past direct community engagement with residents, the constrained timeline limited the ability of any site to engage in authentic community engagement during the plan development. Lastly, I find that disparities in institutional capacity inhibit the involvement and leadership of grassroots CBOs.

Community-Led Risk Assessment – Fighting Extreme Heat & Displacement in the Westside of San Antonio

Abstract ID: 1844.0.0.973.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jared Enriquez [State University of New York at Albany] kunduro@gmail.com, presenting author

Esteban López Ochoa [The University of Texas at San Antonio] esteban.lopezchoa@utsa.edu

Wei Zhai [University of Texas at San Antonio] wei.zhai@utsa.edu

Many cities prone to extreme heat also struggle to preserve housing affordability and accommodate population growth. Studies have shown that heat strategies are not well coordinated across plans, and that only 10% of planners reported that their municipalities addressed heat in building codes (Meerow & Ladd, 2022). Cities often employ heat management and mitigation interventions within publicly managed spaces and buildings, but they also need to scale up retrofits and renovations of residents' housing structures. Given that many dangers posed by extreme heat can be rendered invisible, and housing affordability and resident tenure can be ignored in risk assessments, this research asks the question, how can community-led environmental housing assessments better capture the risks of extreme heat?

The heat is inescapable in San Antonio's Westside neighborhood, a predominantly Mexican American neighborhood where the high ratio of asphalt— along with older, pre-World War II structures— creates a heat island effect that leads to higher energy consumption and a greater risk of related health problems. This paper explores a community-led housing assessment process, revealing hidden extreme heat risks in a neighborhood facing displacement from code enforcement and gentrification (Lopez Ochoa & Zhai, 2024). Co-developed by the Historic Westside Residents Association (HWRA) and university researchers, the study highlights how environmental dangers intersect with housing insecurity in vulnerable communities.

The research project employed multiple methods and phases. First, community leaders and researchers completed the housing conditions form to inventory housing repair needs in the neighborhood and assess residents' socio-economic and health vulnerability. PurpleAir sensors, low-cost environmental sensors, were installed both inside and outside of participating homes to record air temperature and air quality metrics, which represented the full range of neighborhood housing conditions, and households participating in the sensor study completed survey forms. Finally, the surveys and feedback from community engagement sessions were analyzed to develop recommendations for prioritizing home rehabilitation needs. Overall, this research process presents a model for measuring community vulnerability that supplements macro-level heat data with individual household building conditions and occupants' health and economic conditions, resulting in a deeper understanding of community vulnerability.

Residents reported positive behavioral changes due to greater awareness of air quality and extreme heat hazards with the presence of the low-cost sensors, but behavioral changes are insufficient within housing structures in need of many repairs. Results corroborate the literature in housing decay and its role on urban issues such as decline-induced displacement and gentrification (Seymour & Akers, 2023; Suglia et al., 2014). The paper also reveals significant demands for housing repair assistance and cultural clashes between neighborhood residents and city staff, who enforce building codes and standards that deny legitimacy to the incremental, autonomous methods of self-repair, employed by residents due to necessity, but also as *rasquachification*, the inventive practice of many Chicana/Mexican Americans to repurpose discarded or inexpensive materials to express identity through function (Ybarra-Frausto, 1989) and maintain their homes.

We conclude that a housing conditions assessment process can help reinforce community solidarity and strengthen climate resilience. Further, the data validates residents' long advocacy for more equitable decision-making from the City of San Antonio for more resources to maintain and rehab structures falling in disrepair, as existing city programs, such as the Home Repair & Lead Remediation Program and REHABARAMA programs, currently present many institutional barriers to access for neighborhood residents.

Comparing green infrastructure spatial planning in cities across the United States and Germany

Abstract ID: 1844.0.0.568.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Sara Meerow [Arizona State University] sara.meerow@asu.edu, presenting author

Stephan Pauleit [Technical University Munich] pauleit@tum.de

Cities worldwide are increasingly investing in nature-based solutions or green infrastructure (urban forestry, rain gardens, green roofs, larger parks or greenways, etc.) to enhance sustainability and resilience. While green infrastructure is often promoted for its ability to provide multiple benefits or ecosystem services to communities, previous research suggests that in practice green infrastructure has often not been strategically planned to maximize multifunctionality or equity. It is unclear to what extent these patterns are persisting in the wake of historic investments in green infrastructure in the United States (US) and Europe, and if so how data and tools might help transform green infrastructure implementation.

Green infrastructure spatial planning, or the decision-making processes for determining which green infrastructure functions are prioritized and where different types of green infrastructure gets implemented within cities, are not well understood. This is an important knowledge gap because research shows that there are tradeoffs between green infrastructure functions, designs, and locations, but these remain under-examined. Most green infrastructure ecosystem services and disservices are also localized, so spatial planning decisions have important environmental justice implications. This study unpacks current green infrastructure spatial planning in diverse cities across the United States (US) and Germany, including key actors, information sources, and decision-making processes. We compare the results of national surveys of local officials engaged in green infrastructure planning. Our two-pronged sampling strategy included a ‘targeted’ stratified random samples of 240 US cities and 121 German cities representing different regions and population sizes as well as a ‘convenience’ sample of officials participating in relevant professional organizations. Identified local officials were sent an online survey through Qualtrics with a mix of open- and close-ended questions. Our qualitative and quantitative analyses of over 150 completed surveys reveals considerable variation in the types of green infrastructure being implemented, the multiple benefits that cities seek to achieve through these investments, the data, tools, and processes for deciding where to invest, and common barriers for green infrastructure implementation. For example, results suggest that German cities are more focused on green infrastructure to enhance biodiversity, while US cities prioritize improving water quality. Although US cities report more formal consideration of equity in siting green infrastructure, German cities are more likely to consider future climate change projections. In addition to clear national differences, we compare how survey results differ by city size and region. These findings can support the design of more effective international green infrastructure planning guidance and decision-support tools.

Comparing Regional Climate Change Adaptation across Two Bay Areas

Abstract ID: 1844.0.0.853.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Isabel Qi [UC Berkeley] iqi@berkeley.edu, presenting author

Zachary Lamb [University of California, Berkeley] zlamb@berkeley.edu

Climate change impacts are generating planning challenges that require collaboration across municipalities, such as cross-jurisdiction flood infrastructure planning, regional cooling centers, and urban development in hazard-risky areas in high growth metropolitan regions. Practitioners and researchers have responded by turning to the metropolitan regional scale for climate adaptation planning. Research in the U.S. has shown that regional planning can facilitate effective climate change adaptation by overcoming limitations of local-scale planning in several ways, including: coordinating adaptation across jurisdictions; augmenting the planning capacity of resource-constrained communities; and sharing best practices. However, because regional governance structures vary significantly across political and institutional contexts, the role and effectiveness of regional planning for climate change may differ accordingly. Comparative analysis across different governance and urbanization contexts can thus yield valuable insights into how regional planning can contribute to climate adaptation.

This study compares regional climate change adaptation planning for flood resilience in the San Francisco Bay Area (SFBA) and the Greater Bay Area (GBA) in Guangdong China across three axes: (1) governance structure, (2) land ownership, and (3) urbanization context. The regional planning frameworks in place in both the SFBA and the GBA provide unique opportunities to study climate change adaptation planning at the regional scale. In this paper, we ask, how is metropolitan regional-scale planning constituted in the two “Bay Areas”? How are regional planning efforts addressing flood resilience in the two regions? How do the different land ownership regimes, governance structures, and urbanization contexts in the two “Bay Areas” shape different regional planning approaches for flood resilience? These questions are answered through field work in the two Bay Areas, semi-structured interviews with key informants from local, regional, and central government agencies, consulting firms, non-profit organizations, and universities, as well as analysis of public documents on infrastructure projects and planning initiatives for flood resilience.

We find that China’s “vertical” governance structures with centralized state ownership of urban land allow for top-down coordination, enabling relatively efficient and consistent planning across jurisdictions and levels of government. However, this high degree of centralization limits place-specific tailoring and innovation. In contrast, the “horizontal” planning context of the SFBA, characterized by greater local autonomy and planning pluralism, combined with highly fragmented and privatized property ownership, fosters locally context-sensitive solutions and diverse stakeholder engagement. Yet the decentralized approach can also lead to contentious debates, inefficiencies, and uneven policy implementation that can deepen spatial inequalities. These findings offer key insights into the forms and capacities of regional planning institutions from different settings, and challenge planning scholars and practitioners to move beyond viewing regional governance institutions as constrained by their dominant local contexts. Rather than viewing regional governance as strictly limited by the overarching political system, the comparative perspective provides alternative approaches to how regional planning can be achieved through expansive forms of metropolitan regional-scale institution-building that cater to the specific contexts of urbanization and land ownership to enable more effective and equitable adaptation planning.

Consultants and Hazard Risk Reduction – Lessons from Mitigation Planning and Sustainable Recovery

Abstract ID: 1844.0.0.697.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Yiwen Wu [University of Kansas] yiwen@ku.edu, presenting author

Ward Lyles [University of Kansas] wardlyles@ku.edu

Federal and local governments have invested millions of dollars in hazard mitigation planning and disaster recovery to address increasingly severe natural disasters. Effective resiliency planning requires diverse expertise and frequent collaboration (Li et al., 2020). However, despite these investments, the integration of mitigation planning with disaster recovery remains unclear. Specifically, we lack a comprehensive understanding of what mitigation planning has translated into projects on the ground and how it influences collaborative risk reduction efforts at the local level.

Local emergency managers play key roles as coordinators with responsibilities spanning coordination, facilitation, collaboration, and administration (Samuel & Siebeneck, 2019). However, we know little about the consultants hired to facilitate local mitigation planning. Even though planning consultants can boost local planning and administrative capacity, consultants also add a layer of complexity for understanding localities' navigating through federal and state programs like the federal mandate Disaster Mitigation Act executed by the state government (Linovski, 2016; Laurian et al., 2004). Given this dynamic, it is essential to understand how consultants contribute to effective hazard risk reduction and long-term recovery. Specifically, this study asks: (1) To what extent do planning consultants influence the frequency of intergovernmental collaboration? (2) To what extent do consultants impact the implementation of hazard mitigation and recovery projects?

We designed a survey targeting hazard mitigation planners across six states: Florida, Georgia, North Carolina, Iowa, Kansas, and Missouri. These states were selected to capture geographic diversity and variation in planning practices, legal frameworks, and community demographics. The survey was distributed to individuals responsible for their county mitigation planning. Respondents provided insights into the frequency of intergovernmental collaboration, the involvement of planning consultants in risk reduction efforts, and the extent to which mitigation and recovery projects have been implemented in their jurisdictions.

Descriptive statistics reveal that consultants play a broad role in hazard risk reduction. Approximately half of the surveyed localities employ consultants as grant managers, while the majority rely on them for drafting mitigation plans and facilitating planning meetings. Regression analysis indicates that consultants' involvement in grant management is positively correlated with the implementation of recovery projects but not with hazard mitigation projects. Additionally, consultants' participation in planning processes is associated with higher frequencies of intergovernmental collaboration, particularly between county administration, planning, and emergency management offices. Planners with more years of experience in hazard mitigation are also more likely to refer to plan documents regularly in their work.

These findings contribute to the broader understanding of planning for hazard risk reduction by highlighting the evolving role of consultants amid the hollowing out of local government and the outsourcing of planning responsibilities. This shift is particularly concerning in rural and small communities where hiring in-house planners is less feasible. While consultants do not directly influence the mitigation projects implemented, their involvement strengthens intergovernmental collaboration, a critical component for resilience building. Recognizing this, we offer policy recommendations for local governments working with consultants, ensuring meaningful engagement with

consultants for future mitigation planning and recovery efforts. Additionally, we provide insights for training future planners to navigate intergovernmental and cross-sector collaboration effectively, equipping them with the skills necessary to support environmental planning in complex governance systems.

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Andres Urcuqui Bustamante [University of Illinois Chicago] aurcuqui@uic.edu, presenting author

Poorly planned urban development creates significant social and environmental issues. Low-income urban communities and forcibly displaced rural populations, already burdened by historical marginalization, economic deprivation, and social exclusion, are frequently relocated to high-risk urban areas. In the Global South, the concentration of poverty, forced displacement, and disaster risk within large cities exacerbates these issues, raising concerns among marginalized communities, governmental agencies, urban developers, construction companies, and conservation organizations. When efforts to mitigate disaster risk, alleviate poverty, and achieve environmental conservation intersect, conflicts can emerge. This article examines the environmental conflict triggered by the construction of low-income residential buildings and the relocation of vulnerable populations from a high-risk area to an ecologically significant area within Melendez River watershed in Santiago de Cali, Colombia. This article explores how long-term residents resisted a publicly funded housing project through various means, including public hearings, community meetings, protests, roadblocks, and legal actions. Long-term residents gathered support from local non-profit organizations, environmental groups, the city council, and other key stakeholders. This article provides a comprehensive understanding of the conflict dynamics, offering insights into the roles that diverse societal factors of urban development and environmental planning play in urban disputes. This case study underscores the need for meaningful participatory approaches in urban planning and natural resource conservation that recognize and respect the diversity of actors, interests and social values involved. This article opens the opportunity for readers to engage in proposing potential intervention strategies, fostering a collaborative effort toward resolving such conflicts.

Convergence in Practice: Knowledge Integration in a Cross-Disciplinary Environmental Planning Team

Abstract ID: 1844.0.0.815.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Shruti Punjabi [Virginia Tech] shrutirp@vt.edu, presenting author

Shalini Misra [Virginia Tech] shalini@vt.edu

Megan Rippey [Virginia Tech] mrippy@vt.edu

Stanley Grant [Virginia Tech] stanleyg@vt.edu

Convergence research has gained prominence as a problem-oriented approach, focusing on integrating knowledge across disciplines to address complex societal challenges. Pressing environmental issues such as deforestation, biodiversity loss, and groundwater depletion require a cross-disciplinary approach to holistically understand and address the ecological, social, and institutional dimensions of these inherently interdependent problems. This paper examines how Knowledge Integration (KI) is conceptualized and operationalized by a cross-disciplinary team involved in an NSF-funded Growing Convergence Research Project (GCR) focused on catalyzing stakeholder-driven solutions to address the problem of freshwater salinization in the Occoquan watershed of Northern Virginia.

Despite growing recognition of the importance of Cross-Disciplinary Collaborations (CDCs), significant gaps remain in understanding how different forms of knowledge are integrated within these collaborations. Empirical studies that have systematically applied models and methods of knowledge integration and evaluated their intellectual outcomes remain sparse. This study addresses the following questions in the context of the NSF-GCR project: (a) How is convergence conceptualized and operationalized within the project, particularly in relation to KI? (b) What factors facilitate or constrain KI? (c) What challenges and barriers do team members encounter in integrating knowledge?

The study employs a multi-method approach. First, semi-structured interviews with 25 academic and professional experts involved in the GCR project revealed how participants interpreted the purpose, process, and challenges of KI across disciplinary and institutional boundaries. Second, a Social Network Analysis (SNA) mapped structural dynamics and collaborative ties, identifying key actors and knowledge brokers. Third, a thematic analysis of boundary objects, including publications, technical reports, and conceptual models, traced how integrative efforts are formalized, represented, and communicated.

An integrated analysis of multiple data sources reveals how a large cross-disciplinary team addressing a complex environmental challenge navigated across disciplinary and sectoral boundaries throughout a five-year collaboration. Preliminary findings show that KI is shaped by relational and motivational factors, with personal drive and openness to learning enhancing cross-disciplinary engagement. Rather than requiring constant participation from all the involved academic and professional stakeholders, a fluid team structure, where members contributed expertise as needed, proved beneficial to sustain productivity and created space for more inclusive and adaptive engagement. The team leader played a pivotal role as a boundary spanner and a knowledge broker, fostering connections across disciplinary and institutional boundaries and facilitating knowledge exchange. Notably, convergence extended beyond the project's formal timeline, generating lasting impacts such as enhanced transdisciplinary orientations among team members and sustained partnerships, highlighting the enduring value of a CDC.

The study advances our understanding of KI in convergence research and its application in addressing complex environmental challenges. Drawing on the perspectives of academic and professional collaborators engaged in

environmental planning and resource governance, it offers practical insights to foster effective knowledge co-production and coordinated action. Ultimately, these insights will benefit environmental planners, policymakers, academic researchers, and watershed managers in designing, supporting, and evaluating KI efforts and yielding more holistic approaches to managing environmental resources.

Decarbonizing Urban Industrial Sector in American Cities - The Missing Piece

Abstract ID: 1844.0.0.561.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jihyun Kang [Korea Advanced Institute of Science and Technology] jihyun4521@kaist.ac.kr, presenting author

Albert Tonghoon Han [Korea Advanced Institute of Science and Technology (KAIST)] albert.han@kaist.ac.kr

Cities and states across the United States establish Climate Action Plans (CAPs) to mitigate greenhouse gas (GHG) emissions from the urban sector. While these plans serve as critical frameworks for reducing emissions, their sectoral focus (e.g., transportation, building, industry) varies across jurisdictions. At the national level, industry accounts for approximately 30% of total U.S. GHG emissions, with direct emissions contributing nearly 23% of the total emission, making it the second-largest emitting sector after transportation and electricity generation (“Industry Sector Emissions | US EPA” 2025). Despite its significant contribution, industrial emissions are often overlooked in city-level climate action plans.

Bierbaum et al. (2012) highlight that while U.S. climate mitigation efforts have expanded, high-emission sectors like industry remain insufficiently addressed. The review emphasizes the fragmented nature of climate policies, with industrial emissions reduction typically seen as a state or federal responsibility, not a municipal priority. This misalignment creates a policy gap, where state-level strategies to reduce emissions from the industry sector are not effectively implemented at the city level. Basseches et al. (2022) and Dubash et al. (2022) stress the importance of aligning local and regional policies for effective climate action. Furthermore, discrepancies in emissions reporting complicate the integration of industrial emissions into climate action planning. U.S. cities underreport emissions by an average of 18.3%, with inconsistencies in fuel source inclusion and estimation methodologies (Gurney et al., 2021; Tomer et al., 2022). These reporting gaps hinder the establishment of effective mitigation strategies, further marginalizing industrial emissions in climate policies.

This research analyzes industrial emissions and their integration into city-level climate action plans (CAPs) using the U.S. EPA’s Greenhouse Gas Reporting Program (GHGRP) data and urban spatial data. By collecting and cleaning industrial emissions data from the GHGRP and integrating urban and environmental geospatial datasets, the study seeks to identify the association between GHG emissions from industrial areas in cities and urban and environmental factors such as urban infrastructure, population density, land cover, and land use. The analysis outcome from the quantitative analyses is then compared to the state and local CAPs to examine whether the state government and local governments with established CAPs are effectively addressing the issues regarding urban industrial GHG emissions. To test the effectiveness, the samples of this study are limited to states and local governments that have established and implemented CAPs.

Based on our comprehensive assessment, we seek to identify best practices and planning policy gaps to develop effective planning solutions that could help state and local governments achieve decarbonization of their industrial sector. This integration will not only enhance climate mitigation of the industrial sector but also contribute to decarbonizing cities based on the industrial economy.

Development within the wildland urban interface (WUI) has been on an upward trend in the United States since the 1990s, exposing people and property to wildfire and post-wildfire flood risk (Serra-Llobet et al., 2023).

Understanding flood mitigation behavior of WUI residents is critical in semi-arid regions such as Southern California experiencing intensification of environmental hazards due to climate change. Previous research suggests that place attachment, flood experience, self-efficacy, flood risk perception and trust in flood interventions influence homeowner intentions to adopt flood mitigation measures (Miao & Zhang, 2023). While studies show a positive relationship between disaster experience and perceived coping efficacy (Miao & Zhang, 2023) and a strong correlation between risk perception and protective decisions (Botzen et al., 2024), little is known about the factors that influence household intention to adopt different or multiple types of flood mitigation intentions (FMI). Rufat et al. (2024) hypothesized that insured households take fewer household preparedness measures, but little or no attention has been paid in the flood hazard literature to understanding household adoption of near-term protective actions (coping) versus longer-term protective actions (resilience). It is essential to distinguish between short- and long-term household FMIs because they have implications for household flood resilience building.

To expand our understanding of the factors that influence of household FMIs, we surveyed over 500 residents living in WUI areas within Southern California near recent burn scars in the Santa Ana and San Bernardino Mountain ranges in 2023. Drawing on the Protection Motivation Theory (PMT) and disaster resilience theory, we construct a conceptual model to examine the factors influencing the flood mitigation behavior of households living in WUI with respect to coping (near-term mitigation measures) vs resilience (longer-term mitigation measures) (Islam et al., 2022). Using Ordinary Least Squares (OLS) regression, we examine the factors influencing households' adoption or intention to adopt six FMIs: flood insurance, securing valuables, exterior minor maintenance to the property, exterior major maintenance to the property, purchasing flood supplies, and community actions. We also applied pairwise correlations to better understand factors associated with adopting both near-term and longer-term mitigation measures.

We find that self-efficacy (perceived capacity of the household to undertake flood mitigation action) significantly impacts flood mitigation behavior across all FMIs. Households with flood experience were associated with the adoption of short (exterior minor maintenance) and long-term (exterior major maintenance) flood mitigation measures; households concerned about the cost implications of adopting flood mitigation measures were associated with securing valuables from floods (short-term measure). Among the six FMIs, we find the strongest correlation between external minor and external major maintenance and the weakest correlation between flood insurance and purchasing flood supplies.

Our findings emphasize the importance of distinguishing between different types of FMIs within flood hazard scholarship and practice. Examining singular actions (such as flood insurance) in isolation or aggregating multiple actions (such as purchasing flood supplies and coordinating with neighbors) into composite mitigation summary measures masks critical information about the factors and motivations driving different household protective action against flood hazards. By disaggregating FMIs, our findings show that emergency preparedness programs and hazard risk communication can strengthen the capacities of WUI residents for both coping and resilience together.

Disconnects Between Project Planning and Implementation in Hurricane Sandy Recovery

Abstract ID: 1844.0.0.224.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Kanako Iuchi [Tohoku University] iuchi@tohoku.ac.jp, presenting author

Donovan Finn [Stony Brook University] donovan.finn@stonybrook.edu

Planners involved in disaster recovery face significant challenges due to the paradox between an inclusive process to rebuild resiliently and time pressures to rebuild quickly. On the one hand, an inclusive process is increasingly emphasized for its potential to build consensus and lead to better outcomes (Goodspeed, 2016). On the other hand, rebuilding quickly continues to be the priority to secure residents' life back to normal as early as possible (Alexander, 2013). A deliberate and careful process is considered critical for building long-term community resilience, but speed is also critical to keep recovery momentum (Chandrasekhar et al., 2014). While planning literature and practice address the growing need of recovering resiliently by achieving efficiency, speed and equity (Shiozaki et al, 2024), long-term collaborative recovery approaches are nevertheless minimally studied. We seek to understand how planners can effectively create and manage disaster recovery processes that balance complex needs including stakeholder collaboration, speed, and implementation feasibility.

The post-Hurricane Sandy case in New York City is unique for its collaborative process. To better understand how collaborative processes work in actual recovery, this study focuses on the East Side Coastal Resiliency (ESCR) project, initially called the BIG U, in the larger context of Sandy recovery. We have analyzed the planning and implementation processes of the project over 12 years, relying on information collected through our research projects. Specifically for this paper, we reviewed primary and secondary documents, retrieved information shared by key ESCR project stakeholders, interviewed additional stakeholders, and attended city-hosted meetings to develop a narrative of collaborative recovery. To evaluate the level of collaboration, we adopted Gunton and Day's four criteria (Gunton & Day, 2003).

We identify four distinct phases of the ESCR process. "Collaborative planning & visioning (Phase I)" took place between February 2013 to June 2014 as part of an innovative federal program called Rebuild by Design (RBD), notable for supporting a deeply engaged collaborative planning and visioning. The second phase, "Collaborative planning – Detailed Design" lasted from June 2014 to May 2018, furthering and deepening the envisioned plan. "Change of the Plan (Phase III)" then took place between September 2018 to November 2019, initiated at the time when the original ESCR plan was scrapped by the City of New York with government officials deeming the consensus design not realistic for construction. "Construction (Phase IV)" is now ongoing since 2020, after the approval of the revised plan by the New York City Council. In terms of the level of collaboration achievement, the first two phases show success on all four variables represented in Gunton & Day's criteria. However, in phases III and IV, when the project was implemented, the community satisfaction and social capital benefits gained from the first two phases were squandered in lieu of other considerations including efficiency and political expediency.

Findings suggest that, first, there is a critical disconnect between resilient planning and project implementations due to different rationales. Such divides suggest the need of including implementation perspectives at the beginning of collaborative efforts. Furthermore, even after changing the project design for implementation, various stakeholders experience differing satisfaction levels depending on the benefits received. We conclude that if planners recognize these inherent disconnects between project planning and implementation, and seek to mitigate a drastic shift between the phases, collaborative approaches can be more effective even in complex and challenging rebuilding situations.

Disproportionate Heat Exposure Duration: A Novel Metric for Urban Health Equity

Abstract ID: 1844.0.0.832.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

YunJae Ock [Portland State University] yunjae@pdx.edu, presenting author

Vivek Shandas [Portland State University] vshandas@pdx.edu

From 1961 to 2010, extreme heat events increased their frequency, duration, and intensity and generated health-related impacts that exceeded all other natural hazards in the United States. The current discourse on urban heat primarily examines intensity, while little attention is given to the role of duration of exposure, perhaps due to the lack of heat data that are spatially exhaustive and high resolution. This research addresses this critical gap by analyzing unique hourly temperature datasets across 34 U.S. cities, integrating historical segregation patterns with contemporary heat metrics. We introduce a novel degree-hour framework that quantifies both thermal intensity and exposure duration, revealing how discriminatory 1930s redlining practices continue to shape heat vulnerability through built environment characteristics.

Using National Integrated Heat Health Information System (NIHHIS) Heat Watch campaign data, we collected high-resolution air temperature measurements across two daily periods, afternoon and evening, in 108 neighborhood transects. These were overlaid with Home Owners' Loan Corporation (HOLC) maps that graded neighborhoods from "A" (Best) to "D" (Hazardous) based on racial composition and perceived investment risk. Our analysis demonstrates that historically redlined D-graded neighborhoods endure both higher temperatures and greater cumulative heat exposure compared to A-graded areas—a critical burden exacerbating climate health risks.

Statistical analysis revealed consistent disparities showing better graded neighborhoods with less heat exposure. D-graded neighborhoods exhibited afternoon temperatures of 86.47°F (2.18°F higher than A-graded) and evening temperatures of 83.43°F (2.82°F higher than A-graded). The degree-hour metric showed D-graded neighborhoods accumulate 3.388 more late-afternoon degree hours and 14.02 additional whole-day degree hours than city averages. Conversely, A-graded areas experienced 1.465 fewer late afternoon and 4.416 fewer whole-day degree hours, demonstrating significant cooling advantages. Normalized Difference Vegetation Index (NDVI) analysis of satellite imagery, which is urban greenery, revealed green space as a key mediator, with A-graded neighborhoods containing 25% more vegetation (mean NDVI 0.452 vs. 0.300 in D-graded).

The temporal-spatial specificity of our metric identifies intervention priorities. Neighborhoods that disproportionately experience cumulative heat exposure should be a heat mitigation intervention target. The heat disparities can be exacerbated through historical land cover legacy, in which affluent and white neighborhoods tend to have greater urban green spaces, including tree canopies, while lesser impervious surfaces than their counterparts.

Our findings underscore that equitable climate adaptation requires addressing both thermal intensity and exposure duration. As extreme heat events increase in frequency and duration, this dual-focused approach becomes critical for protecting vulnerable populations. The metric's ability to quantify cumulative heat risks during multiday events offers public health officials a refined tool for prioritizing interventions—from emergency cooling infrastructure to long-term urban forestry investments. By bridging historical spatial justice analysis with contemporary climate resilience planning, this research advances urban health equity in an era of escalating environmental challenges.

Point-source pathogen pollution is a critical yet underrecognized issue in environmental planning and water resource management, posing health risks through recreational exposure, drinking water contamination, and fish consumption. While prior studies have examined disparities in drinking water quality by race, income, and housing conditions, the influence of these community characteristics on point-source pathogen pollution remains understudied. This study investigates how demographic, economic, and housing characteristics are related to point-source pathogen pollution across urban, suburban, and rural gradients in Texas. To address this question, we compile and analyze data on pathogen loads from domestic sewage, wastewater, and combined sources, reported to the U.S. Environmental Protection Agency between 2010 and 2022. These discharge records are aggregated at the census tract level and linked with demographic, economic, and housing characteristics data from the U.S. Census and American Community Survey. Urbanization levels are classified into urban, suburban, and rural categories using housing unit density-based typologies. We use linear mixed-effects models to assess associations between pathogen loads and census tract characteristics, including racial/ethnic composition, household income, poverty, unemployment, educational attainment, housing age, multi-family housing, and lack of plumbing. These models allow us to capture relationships while accounting for spatial variation and tract-level heterogeneity. Our models distinguish between pollution sources, including combined sources, domestic sewage, and wastewater, while accounting for spatial variation and tract-level heterogeneity. Findings reveal strong and spatially differentiated patterns of exposure. In urban areas, tracts with predominantly White populations are associated with higher pathogen loads from both domestic sewage and wastewater sources. In contrast, suburban and rural tracts with larger Black and Hispanic/Latino populations exhibit higher pathogen exposure, though the dominant pollution source varies by region. Economic vulnerability—including low income and unemployment—is most strongly associated with elevated pathogen loads in suburban areas. Housing characteristics, particularly older housing and incomplete plumbing, further shape exposure risks across all settings. This research underscores the complex interplay of race, economics, housing, and geography in shaping point-source pathogen pollution. It calls for more targeted, source-specific planning strategies tailored to regional contexts. By highlighting spatial inequalities in exposure to point-source pollution, this study advances environmental planning discourse and broadens the scope of traditional water governance to include pathogen pollution control and equitable wastewater management. Our results support the development of targeted, regionally sensitive policies that address both pollution source and community vulnerability, particularly in the context of aging infrastructure and urban-rural disparities.

Do vulnerabilities moderate associations between gentrification beliefs and green space support?

Abstract ID: 1844.0.0.214.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Rexford Osei Owusu [University of Utah] rexford.oseiowusu@utah.edu, presenting author

Alessandro Rigolon [University of Utah] alessandro.rigolon@utah.edu

Introduction: Advocates frequently push for expanding green space access due to its multiple benefits, particularly in communities with limited provision. However, introducing new green areas in disadvantaged neighborhoods can lead to green gentrification, attracting wealthier residents and investment, such as real estate development. This often drives up housing costs, forcing many low-income renters to relocate, ultimately undermining efforts to ensure equitable access to green spaces and address health disparities.

Research has explored the relationships between residents' gentrification beliefs – support for development (i.e., encouraging public and private investment), neighborhood preservation (i.e., mitigating gentrification's adverse effects), and social integration (i.e., fostering connections between new and longtime residents) and their support for new green space investments. However, less is known about how different types of vulnerabilities to the negative impacts of gentrification (i.e., not owning a home and experiencing higher psychological distress) might moderate these associations. To address this gap, we analyze how different types of vulnerabilities might moderate the associations between gentrification beliefs and support for future green space investments.

Research questions: (1) What are the associations between gentrification beliefs and support for new green space investments? (2) How do different types of vulnerabilities (homeownership status, psychological distress) moderate these associations?

Methods: We study Salt Lake City's West Side, an underserved community that is experiencing some gentrification. In the next few years, Salt Lake City will build the Glendale Regional Park (a 30-acre park) and revitalize the Jordan River Parkway Trail (part of a 45-mile greenway). We used a mixed-method approach, including a survey with residents and in-depth interviews with residents and project stakeholders. The survey measured gentrification beliefs (e.g., neighborhood preservation, development support, social integration), support for green space, homeownership status, psychological distress, and control variables. We used multiple linear regression to analyze the link between gentrification beliefs and green space support, with interaction tests assessing the moderating effects of homeownership and psychological distress. We analyzed the interview transcripts through content analysis, including deductive coding based on content from the existing literature and inductive coding.

Results: The survey analysis shows a positive significant association between neighborhood preservation, social integration, and support for new green space investments. Interaction tests show that positive associations between neighborhood preservation and support for green space investments were only significant for non-homeowners and those experiencing higher psychological distress, whereas this link was not observed among homeowners or residents with lower distress. Additionally, social integration was linked to increased support for green space among non-homeowners, regardless of distress levels, but had no significant effect among homeowners. Interviews reinforced these results, highlighting neighborhood preservation efforts and social integration as key factors in boosting support for green space development.

Implications: Our results suggest that planners seeking to add new green spaces to underserved areas could increase vulnerable residents' support for these investments by concurrently developing strategies to mitigate gentrification and displacement. To make green space projects beneficial for all, planners and policymakers should tackle these vulnerabilities, support affordable housing, and involve residents in decision-making. This approach could help cities develop inclusive green spaces that improve the environment while promoting stability and equity in diverse communities.

EA Integration of Urban Flood Resilience: A Theoretical Framework and Index-Based Empirical Analysis

Abstract ID: 1844.0.0.1115.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jin Seong [Pusan National University] genie3511@gmail.com, presenting author

Juchul Jung [Pusan National University] jcjung@pusan.ac.kr

[Problems] Urban flooding poses a significant threat to cities, causing economic losses and environmental degradation. Despite the growing emphasis on sustainable development, Environmental Assessment (EA) frameworks—including Strategic Environmental Assessment (SEA), Environmental Impact Assessment (EIA), and Small-scale EIA—do not systematically incorporate urban flood resilience. Given that flood damages constitute a substantial proportion of disaster-related costs in South Korea, there is a pressing need to integrate urban flood resilience into EA processes. Existing EA methodologies primarily focus on environmental conservation and pollution control, neglecting the resilience capacities of urban infrastructure and spatial planning. This study addresses the gap by developing a theoretical framework that quantifies urban flood resilience and embeds it into EA evaluation criteria.

[Approach and Methodology] To integrate urban flood resilience into EA, this study develops an Urban Flood Resilience Index (UFRI), a composite index that quantifies cities' resistance, adaptability, and recovery capacities against flooding. The index incorporates spatial planning factors (e.g., green space ratio, floodplain zoning), infrastructure elements (e.g., drainage capacity, sewage system coverage), and EA implementation levels (e.g., presence of flood resilience assessment in EIA reports). A panel dataset covering multiple South Korean cities is constructed, combining official flood impact records, environmental assessment reports, and spatial planning data. A panel regression model is employed to analyze the correlation between EA-integrated flood resilience measures and flood-related outcomes, such as inundation area reduction and recovery time improvement.

[Findings and Implications] The results indicate that cities with EA frameworks incorporating UFRI demonstrate significantly lower flood damage and faster recovery times. These findings highlight the critical role of proactive flood resilience planning within the EA framework. The study provides methodological contributions by formalizing a quantitative assessment of urban flood resilience and validating its effectiveness through statistical analysis. In practical terms, the research suggests revisions to South Korean SEA and EIA guidelines to mandate flood resilience evaluation in urban planning projects. The findings also offer policymakers a data-driven basis for enhancing national flood mitigation strategies and urban resilience policies.

Ecological Competition: State Wetland Park Planning and the Contested Biodiversity in Shenzhen Bay

Abstract ID: 1844.0.0.480.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Li Hou [Harvard University] lhou@gsd.harvard.edu, presenting author

Yunjie Zhang [Harvard University] yjzhang25@gmail.com

Ecology has become an essential means and source of state power in China. From forest restoration to nationwide ecological reserve designation, there are significant tensions between the multiple aims of a vision that directs environmental protection, social transformation, green development, and urban beautification (Rodenbiker 2023). This research attempts to explore how ecological planning and restoration have been employed by different actors, i.e., national and municipal governments, elite organizations, scientists, landscape architects, and local residents, to form a unique coalition of social-ecological governance in Shenzhen Bay, South China Sea, and how these logics of governance shape techniques and policies that wield ecology of contested biodiversity.

Mai Po Wetland in Hong Kong and Futian Wetland in Shenzhen are located on opposite sides of Shenzhen Bay, an area situated along one of the most significant global flyways for migratory birds. This integrated ecosystem of plants, water, benthic organisms, and other elements supporting millions of birds has undergone drastic transformations for over fifty years. Notably, along with the fast expansion and densification of urban settlement, the coastal wetland area along Shenzhen Bay also underwent extensive human intervention and “ecological flourishing,” supporting some natures over others—with constant modification—and competing regionally as the landing point for migrating birds.

Through archival research, interviews, ecological data collection, and mapping, we inquire how the Chinese state and society wield ecology to shape nature and space through a series of “conservation” practices as the first step. Our findings reveal that ecological restoration in the Shenzhen Bay area reflects state responses to ecological competition across the border, supported by local elite groups with the aspirations of a globalized modernity. It is accomplished by both changing preferences for native species and prioritization of endangered birds, and differentiated views valuing exotic mangroves as both precious and hazardous, exacerbating the dynamic nature of the Shenzhen Bay ecosystem. The exchange between the two wetland reserves across the border, scientifically, social-politically, and ecologically, will also be documented. We argue that these techniques and practices represent a human-centered logic of conservation, focusing on the benefits to humans as recipients of ecosystem services rather than achieving “net gain for biodiversity.” Through that, our research hopes to provide insights into more equitable approaches to non-human nature in human-dominated landscapes.

Effectiveness of Heat Wireless Emergency Alerts and Planning Implications in Seoul, South Korea

Abstract ID: 1844.0.0.559.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ji Sun Lee [Korea Advanced Institute of Science and Technology (KAIST)] jisun2lee@kaist.ac.kr, presenting author

Albert Tonghoon Han [Korea Advanced Institute of Science and Technology (KAIST)] albert.han@kaist.ac.kr

As summer temperatures in South Korea have been rising, extreme heat has become a major health threat. To reduce health risks, some municipal districts have voluntarily issued wireless emergency alerts (WEAs) since 2018; such WEAs have increased dramatically, from 72 alerts in 2022 to 2,356 alerts in 2024 (Ministry of the Interior and Safety, n.d.). Public alerts have been regarded as effective means of early warnings to the communities, but few studies have evaluated the effectiveness of the system. Thus, in this research, we seek to analyze whether heat WEAs have influenced human travel behaviors to protect public health, accounting for various spatial and vulnerability factors.

Previous literature on the effectiveness of WEAs focused on destructive disasters such as floods, or pandemics like COVID-19. While limited, several researchers have investigated the effects of WEAs on mitigating impacts from heat stress. Weinberger et al. (2018) used a case-crossover approach to analyze the effects of heat alerts in reducing heat mortality rates, finding no significant improvement except in one city in the US. Benmarhnia et al. (2016) used a difference-in-difference approach to test whether alerts reduced difference in heat mortality for vulnerable populations in the US. In Korea, Hong et al. (2023) found that spatial factors such as mixed land use and a higher percentage of green areas increased the change in the floating population.

We used a spatial difference-in-difference (DiD) model to evaluate if heat WEAs were effective in changing floating population patterns for each administrative district (i.e., dongs) in Seoul during the summer of 2024. Since the goal of WEAs is to restrict movement during heat waves, hourly floating population was selected as the dependent variable. The treatment group was defined as the days WEAs were sent in the district during extreme heat; control group is when WEAs were not sent despite extreme heat. As our unit of analysis was tested to have spatial effects, we used the Spatial AutoRegressive-AutoRegressive (SARAR) model. Other spatial factors (e.g., percentage of commercial, industrial, residential, and green areas, public transit accessibility) and heat vulnerability factors (e.g. elderly and youth population, low-income population, number of vulnerable jobs) were included as independent variables to understand how such factors influence behavior.

The analysis showed that the interaction term of the DiD model for weekdays was statistically significant, indicating that heat WEAs were effective in changing floating population trends during heat waves. Moreover, certain spatial variables also showed significant correlation: the floating population increased in areas with a high percentage of residential, commercial, and green areas. There was a significant positive correlation with accessibility to bus stops, but not with subway stations. For vulnerability factors, the floating population decreased in areas with a high percentage of elderly populations and heat-vulnerable jobs (such as construction or facility maintenance).

Beyond showing that heat WEAs are effective in changing behavior, we derived planning implications to enhance heat adaptation of communities. More population headed to areas with ample green space and commercial buildings, possibly seeking shaded or air conditioned shelters. Such open areas enable people to quickly escape from heat without having to move far away, implying that mixed land uses can add versatility in adapting to extreme heat. Results also indicate buses can be a more accessible form of mobility. When planning for cooling shelters, locating them near or at bus stops can make cooling resources more accessible. Rather than building a few

large cooling shelters, distributing many smaller ones throughout the city can be beneficial for reaching vulnerable populations such as the elderly or people with physically demanding jobs, who are shown to have limited ability to adjust behavior upon receiving alerts.

Estimating the Effects of Toxics Mobility on Residential Preferences in Galveston, Texas

Abstract ID: 1844.0.0.278.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jiyeon Shin [Texas A&M University] jiyeon.s@tamu.edu, presenting author

Galen Newman [Texas A&M University] gnewman@tamu.edu

Yang Song [Texas A&M University] yangsong@tamu.edu

Environmental quality is consistently a critical concern in residential preference. Negative associations have been found between air pollution and housing markets, indicating that the housing prices tend to increase as air pollutant emissions decrease (Chay & Greenstone, 2005). Many other environmental toxics and pollutants are linked to human health concerns and may also have a possible negative impact on residential preferences (Leggett & Bockstael, 2000). In cities with multiple emission sources near residential areas, the effect of toxic emissions could be a major concern in the housing market as contaminants from emission sources (e.g., factories, landfills, etc.) have an inherent impact on tainting water, surface, and underground environments. The mobility of pollutants or the transfer of contaminants and mixing of toxic chemicals through flooding or other hazard events, can also has an inherent negative impact on the housing market. Toxic contaminants can travel not only through the air but also through floodwaters (Han et al., 2022; Presley et al., 2006), which enhances the concerns of contamination in residential areas with higher flood risks. However, there is a lack of research which seeks to capture the effect of toxic mobility and emissions on residential preference in flood-prone areas.

To fill this gap, this study assesses the impact of toxic mobility on single-family housing prices in Galveston, Texas, an area that has high flood risks and is characterized by high rates of industrial land uses. The mobilization of pollutants was considered by estimating the proximity to the emission source from each house. Pollutant emission was divided into two types—on-site emission and production-related waste—based on the emission data collected by the US Environmental Protection Agency to evaluate different effects by emission types. To consider mobilization through flooding, the flood risk of each property was also considered. Further, single-family housing sales data was collected from Realtor.com, a platform for properties and real estate trade.

Using a linear regression model, the effect of pollutant mobility on housing prices by flood risk level for 2022 was assessed by parcel. The results show that the proximity to the emission source had a significant negative effect on housing prices, indicating that people prefer to live far away from emission sources. Moreover, the effect of toxics varies by flood risk level. Houses with extreme flood risk showed a significant negative effect with housing prices, while pollutant amounts showed significant effects in houses with minimal to moderate flood risks. Further, we find that people prefer to live farther away from emission sources in areas at high risk of flooding, regardless of emissions. The proximity to toxic emissions dropped housing prices more in cases of high flood-risk, indicating that people are aware of the risk of possible mobilization of contaminants in floodwaters.

These results highlight the need for an integrated mitigation plan for residential areas near pollutant sources to protect from the inherent danger of exposure to toxics in adjacent or nearby in residential areas. There's an urgent need for protection since vulnerable populations tend to live in houses that have both a high risk of flood and exposure to toxic pollutants. Enforcing stricter industrial regulations on waste disposal procedures and renovating residential areas to mitigate the flood risk may help to protect residents and mitigate the effect of toxic pollutant mobility on housing prices. Green buffer zones between industrial and residential land uses should be implemented more. Integrated land use policies for choosing optimal locations for industrial development that

minimize environmental impact on residential areas, and the enforcement of stricter regulations on emissions and waste management are necessary.

Examining Extreme Heat Preparedness in Urban Plans for the City of Memphis, Tennessee

Abstract ID: 1844.0.0.784.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Stephen Leonard Mensah [The University of Memphis] slmensah2@memphis.edu, presenting author

Stephen Diko [The University of Memphis] skdiko@memphis.edu

The ravaging impacts of climate change events across the United States have been noted with deep concern across multi-scalar levels. Indeed, a recent National Preparedness Report released by FEMA (2022) has confirmed that climate change impacts and associated disasters have been felt across many communities and outpaced the capabilities of emergency management professionals. The report further revealed existing vulnerabilities among communities, as approximately 92% of communities identified climate change as an existential threat to the activities of emergency management institutions. Enhancing the adaptive capacities of vulnerable communities in climate change adaptation and mitigation efforts requires that significant attention and awareness be created to address preparedness gaps, especially from the policy front. In this paper, we shift the discourse on climate change preparedness to extreme heat preparedness due to the growing concerns about its deadly impacts. The National Weather Service (2018) has observed that heat is the deadliest weather-related hazard in the United States, even though most heat-related impacts are preventable by curating effective urban policies and designs to salvage the situation (Keith et al., 2023). Amidst these impacts and observations, the nuanced understanding of extreme heat impacts among at-risk population groups and often overlooked communities and cities has received little attention. This paper contributes to the extant extreme heat literature across the United States by emphasizing the role of urban planning in addressing extreme heat concerns in the Mid-South Region. Specifically, and using a qualitative content analysis, this study examines a range of urban planning documents focusing on climate and sustainability issues in the City of Memphis. The study attempts to answer the following research question: To what extent do urban planning documents mainstream extreme heat preparedness measures? The key findings indicate that extreme heat preparedness measures are not given significant attention in the plans. The findings further point to little engagement of residents in the implementation of extreme heat preparedness measures, as well as funding and resource constraints. This paper provides three crucial imperatives for addressing extreme heat concerns. First, and from the scholarship standpoint, it adds to the extant literature on extreme heat by focusing on the extent to which urban planning documents integrate extreme heat preparedness measures in the City of Memphis. The city of Memphis presents a good case to examine extreme heat preparedness due to its long history of socio-spatial inequalities and the weak capacities of emergency management agencies in addressing climate change events. Second, and from a practice lens, it contributes to the ongoing calls by early studies and professionals on the need to prioritize heat concerns in local government practice (Gabbe et al., 2021). In the context of Memphis, where socioeconomic inequalities are pervasive, planning for extreme heat preparedness from a policy front also addresses initial concerns on funding and other critical resources required for a successful implementation of preparedness measures. Third, and considering the reported impacts of extreme heat across the United States, this paper also creates awareness and makes a strong case for integrating extreme preparedness in emergency management plans. This will help address the challenges in pre- and post-extreme heat recovery

Explaining the spatial distribution of green spaces across metropolitan regions

Abstract ID: 1844.0.0.173.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Stephan Schmidt [Cornell University] sschmidt@cornell.edu, presenting author

Wenzheng Li [Cornell University] wl563@cornell.edu

The distribution of green spaces in metropolitan areas is shaped by multiple factors. Parks and open spaces serve various functions and reflect urban spatial structures and governance dynamics (Boulton et al., 2018). Research suggests that polycentric metropolitan regions—those with multiple independent urban centers—offer a greater diversity of amenities, including green spaces, and reduce travel time, thereby improving accessibility (Wang, 2021). Meanwhile, public choice theory posits that municipalities compete to provide attractive amenities, with local governance institutions playing a key role in open space acquisition and preservation (Schmidt & Paulsen, 2009).

This study examines the amount, diversity, and spatial distribution of green spaces across U.S. metropolitan statistical areas (MSAs), considering both urban spatial structure and municipal fragmentation. We analyze green space data from the ParkServe dataset, which includes over 150,000 records, of which more than 117,000 are located within MSAs. Using this dataset, we calculate landscape metrics such as open space density, contiguity, and diversity based on managing authority (City, County, State, or Federal).

Applying spatial analysis and Ordinary Least Squares (OLS) regression models, we find significant variation in the relationship between polycentricity and landscape indices across governance levels. Specifically, both municipal fragmentation and regional polycentricity exhibit a strong positive correlation with the amount of city-managed green space, with polycentricity having a larger effect. This suggests that metropolitan areas with higher polycentricity and fragmented governance structures tend to provide more green spaces.

Furthermore, both local government fragmentation and polycentricity positively correlate with green space diversity in terms of governing authority. While the coefficient for polycentricity is small, it remains statistically significant after controlling for other factors, indicating a modest but consistent link between a polycentric urban structure and increased green space diversity. The effect of government institution density is more pronounced but has a confidence interval that includes negative values, introducing some uncertainty.

These findings contribute to a deeper understanding of how urban form and governance interact to shape the spatial distribution of green spaces, with implications for urban planning and policy.

Exploring Resilience Definitions in Practice

Abstract ID: 1844.0.0.127.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Melina Matos [Florida Atlantic University] matosm@fau.edu, presenting author

Malini Roy [University of Arizona] maliniroy@arizona.edu

Sara Meerow [Arizona State University] sara.meerow@asu.edu

William Lima [Florida Atlantic University] limaw@fau.edu

Urban resilience has become a central concept in various fields, including disaster management, urban planning, and environmental science. According to Munoz-Erickson et al. (2021), the urban resilience literature organizes the definitions into five categories: (1) System property, outcome, and process; (2) Shocks and stresses; (3) Pathways of change; (4) Relationship to sustainability, equity, and anticipation; and (5) Social, Ecological, and technological resilience. While many studies discuss how academics define resilience, little attention has been given to how resilience is conceptualized across different urban contexts and among the actors that build resilience 'on the ground' (Munoz-Erickson et al., 2021).

Academic literature and policy discourse suggest that certain governance arrangements, or networks, are more likely to enhance resilience, leading major urban resilience initiatives to aim for reforms in city governance accordingly (Beilin & Wilkinson, 2015; Fastiggi et al., 2021). The literature on urban resilience governance emphasizes the importance of breaking down organizational silos and fostering collaboration between diverse actors. Yet, no study explored whether existing resilience governance networks share similar traits in resilience definitions and if they do, are they collaborating or siloed in flood resilience planning efforts?

The interpretation and application of resilience in practice often vary among different sectors and stakeholders. However, it is unclear whether there is a relationship between collaboration in resilience efforts and how these actors conceptualize resilience in practice. This paper addresses this gap by analyzing collaborative governance networks for flood resilience in four coastal U.S. cities that are at the forefront of resilience planning: Boston, MA; Baltimore, MD; Fort Lauderdale, FL; and Seattle, WA. The paper addresses the following research questions: (1) How do definitions of resilience differ across cities? (2) How do definitions of resilience differ across categories of actors? (3) To what degree do key actors of flood resilience planning networks share resilience definitions?

To investigate the collaborative governance networks for flood resilience, we employed social network analysis (SNA). This methodological approach allows us to examine the relationships among sets of network actors, in this case, organizations, and identify which ones occupy important structural locations within the overall network (Prell et al., 2009). Our survey consisted of a combination of open and closed-ended questions. The work presented here focuses on an open-ended question, which asked respondents: "The concept of resilience can mean different things to different people. In a few words, what comes to your mind when you think of cities (or your city in particular) as being resilient to climate change?" We coded open-ended survey responses to the resilience conceptualization question using a deductive coding approach, allowing us to classify the responses into five distinct categories based on Munoz-Erickson et al., 2021.

The results of our study highlight that, generally across the four cities, framings of resilience tend to converge around definitions that emphasize the ability to resist, cope with, or bounce back to previous conditions. However, perspectives related to sustainability, equity, and social-ecological-technological systems (SETS) are rarely associated with resilience. Notably, there are significant differences across cities and governance actors in the way

resilience is conceptualized. We unpack these differences and discuss their implications for resilience research and practice moving forward.

Few Bright Spots in Climate Planning: Insights from Iowa

Abstract ID: 1844.0.0.689.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Monica Haddad [Iowa State University] haddad@iastate.edu, presenting author

Greenlee Dahle [Iowa State University] gdahle@iastate.edu

Kristen Hoss [Iowa State University] khoss@iastate.edu

Rihana Parvin Nipa [Iowa State University] rihana1@iastate.edu

Climate change is a global phenomenon that affects communities worldwide, and action is needed at all levels of government to adapt and mitigate its impacts. Despite growing scientific evidence and support for climate action in the U.S., the federal government has demonstrated a lack of leadership in climate planning (Alexander, 2020). Furthermore, there is significant variation among U.S. states, regions, and cities in their climate actions, “ranging from no action at all to rigorous implementation of stringent climate regulations” (p. 10), and many individual cities lack the capacity and funding to implement robust climate actions (Alexander, 2020).

A few U.S. states are heading in the right direction concerning capacity and funding. The state of California, for example, offers many environmental programs to support municipal climate action and to help reach statewide goals (U.S. Climate Alliance, 2022). Additionally, the state of New York created a Climate Smart Communities program to support local governments with resources, incentives, information, and a network for climate planning (Allred et al., 2021).

Given that climate planning varies significantly across the U.S., there is a need to examine the contextual factors and institutional capacities that shape climate action the city, county, regional and state levels of government. There is a gap in the current literature regarding states with limited resources and weaker climate leadership engaged in climate planning. Particularly, we are looking for bright spots where different levels of government are succeeding in climate planning efforts despite the weak level of state climate leadership. By highlighting these champions, we aim to provide insights for planners and policymakers facing similar challenges.

This qualitative research contributes to the planning literature by using Iowa as a case study to (1) examine online media coverage; and (2) explore contextual factors and institutional capacities related to climate planning at all four levels of government. The research questions for Part 1 were: How do Iowa's online newspapers frame climate change in their news articles? What are the dominant themes in climate change coverage relate to planning by Iowa's online newspapers? To address these questions, we conducted a content analysis of 320 local online newspaper articles using NVivo. Findings indicate that city size influences media cover: larger cities had a higher frequency of climate change reporting. In contrast, smaller cities had minimal or no coverage of climate change-related issues.

The research questions for Part 2 were: What contextual factors influence climate planning across the four levels of government in Iowa? What are the institutional capacities of these four levels of government for climate planning in Iowa? Examples of contextual factors included frequency and severity of climate events, and political environment. Examples of institutional capacity included human resources and community engagement. To answer these questions, we conducted an online survey targeting planners working on sustainability issues to their engagement in climate change-related work. We chose to focus on sustainability rather than climate change in the online survey due to the political landscape of the state (43% response rate). Based on the survey results, we conducted in-depth interviews with 28 planners to explore how contextual factors and institutional capacities

shapes climate planning efforts across different levels of government. Findings indicate that while relatively few champions exist across the state, those who are engaged tend to work in institutions with strong and focused leadership and are personally committed to addressing climate change in their own lives. Their efforts are reinforced by committed residents, innovative solutions, a justice-oriented approach and collaborations, all of which contribute to advancing climate planning initiatives.

Filling for the Future: Governance of Sediment in San Francisco Bay

Abstract ID: 1844.0.0.774.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Courtney Humphries [Boston College] courtney@strangestsea.com, presenting author

San Francisco Bay is the largest estuary on the United States West Coast and contains 59,000 acres of tidal wetlands around which 7.7 million people live across 7,000 square miles of land. The Bay's coastal dynamics have been greatly altered by urban development, with an estimated 90 percent of tidal wetlands destroyed or seriously degraded. Numerous stakeholders are working toward a goal of restoring the Bay's natural ecosystems, efforts made more urgent and complicated with projected future sea level rise.

Habitat restoration was traditionally oriented toward the past, with a goal of recreating historic ecologies, but increasingly has been viewed as 'futuristic' restoration that aims to make habitats resilient in the face of a changing climate (Choi, 2007). In urban coastal environments like San Francisco Bay, restoration projects are increasingly called upon to function as natural habitats while also serving as nature-based solutions for climate change adaptation and as a substitute for traditional 'gray' infrastructure, providing services such as flood protection, wave dissipation, habitat protection, recreation, and wastewater filtration.

In practice, orienting restoration toward a dynamic future requires changes in resource use and governance. Coastal managers in the Bay Area envision a need to use large amounts of sediment to maintain coastal ecosystems with sea level rise. They anticipate a "long-term mass imbalance of regional sediment" (Dusterhoff et al., 2021; p. 112) that requires mobilizing increasing amounts of dredged sediment, waste sediment, and debris for use in creating and maintaining elevation of coastal wetlands. This suggests a view of the urban coastline that involves continuous cycles of replenishment and rebuilding, creating new urban industrial-natural ecologies in which securing an increasing local sediment supply and metabolism is critical management and policy focus for cities facing sea level rise.

Given past histories of filling wetlands to create land for urban development, current federal, state, and local regulations strictly limit the placement of sediment as fill along shoreline. In keeping with an interventionist and reparative vision of restoration, groups promoting Bay restoration have identified environmental regulations as one of the key obstacles to a resilient future (Goodrich et al., 2023), and increasingly characterize permitting processes as obstructive 'green tape.' to alter policies to streamline permitting, allow 'beneficial' uses of fill, loosen standards for sediment quality, and allow projects that use 'nontraditional resources' such as construction debris in climate adaptation projects. These changes have been the subject of debate among planning and coastal management institutions (Pinto et al., 2018).

This paper examines the discursive and policy implications of this shift in sediment management, focusing on decision-making processes and regulations around the use of fill for nature-based solutions in San Francisco Bay. It draws on field site observations, document analysis, and interviews with coastal stakeholders, focusing on projects requiring fill, including 'horizontal levees,' a type of constructed wetland used for water quality improvement and flood protection. It shows how stakeholders have employed numerous discursive practices, policy innovations, and social-institutional practices to overcome regulatory obstacles. The paper argues that for ecological restoration in the age of climate change to fulfill its potential to become a 'world-making practice' for creating new social-environmental futures (Usher, 2023) it must acknowledge key tradeoffs that break from a paradigm of environmental preservation and protection.

From Disciplinary Silos to Synergies: Uncovering Shared Principles for Systemic Sustainability

Abstract ID: 1844.0.0.1174.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ning Ai [University of Illinois Chicago] ain@uic.edu, presenting author

This research was motivated by the fragmented nature of knowledge in education and associated disciplinary jargons, which creates barriers to effective communication and collaboration across disciplines. While each discipline has its distinct focal areas and theories, core elements may overlap. For example, life cycle stages in environmental assessment parallel value chains in business management, stakeholder engagement in participatory planning aligns with social network analysis in sociology, and Environmental, Social, and Governance (ESG) in corporate governance share similarities with sustainable development goals in public policy. These shared foundations provide valuable opportunities for mutual learning that tend to be overlooked or underappreciated.

Drawing upon a multidisciplinary bibliometric analysis in academic databases, this research aims to identify and synthesize theoretical frameworks, concepts, and models across disciplines that share sustainability goals, with a focus on system thinking, resource optimization, multi-criteria decision-making, and inclusiveness. Preliminary findings confirm common themes across disciplines, such as interactions between humans and the environment, iterative and/or dynamic processes of analyzing uncertainties, system hierarchies, elements, and networks. The systematic review of this research also reveals that disciplines may vary in terms of the unit of analysis (e.g., individual, firm, community, institution, or region), system boundaries, stakeholder identification and engagement approaches, and methods for classifying various types of activities involved. These differences seem to manifest in variations in the scale of analysis and the extent to which vertical versus horizontal thinking is employed.

Further, this research highlights the importance of recognizing both convergences and silos in emerging practices, particularly in the context of circular economy (CE). Although there is a general consensus that CE transforms the traditional linearity of “take-make-discard” model, definitions and CE-oriented approaches vary greatly (Kirchherr, Reike, & Hekkert, 2017; Sauvé, Bernard, & Sloan, 2016). Bridging disciplinary silos and overcoming academic and engineering boundaries are essential for achieving society-wide benefits of CE (Iacovidou, Hahladakis, & Purnell, 2021). While CE has been often regarded as an economic development strategy supported by engineering solutions, this study specifically focuses on exploring the unique strengths as well as complementary roles of environmental planning in relation to other professions. The central hypothesis is that fostering a deeper understanding of the diverse approaches and processes across disciplines and stakeholders can facilitate collaborative, positive changes from a system perspective.

Great Salt Lake Water Conservation Interactive Tool

Abstract ID: 1844.0.0.932.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Kori Kurtzeborn [Utah State University] kori.kurtzeborn@usu.edu, presenting author

Carlos Licon [Utah State University] carlos.licon@usu.edu

The Great Salt Lake is the most defining feature of Utah's landscape and a vital ecosystem for many migratory and local species. The region is experiencing rapid population growth, resulting in a surge in demand for residential and other urban water uses. There is a pressing need to divert more water from this system to meet these demands. However, such diversions could exacerbate ongoing water scarcity issues in the region. Without careful consideration and planning, the water levels in the lake will continue to decline. It is crucial to adopt proactive measures that promote sustainable water management among users and mitigate the impacts of climate change. By embracing water conservation practices, we can ensure the long-term viability of the hydrological system and safeguard the well-being of both present and future generations.

To address the complex water management challenges facing the Great Salt Lake, it is essential to understand the path water takes as it is diverted and used to support human activities. We can identify potential conflict points and pinpoint water conservation opportunities by mapping the entire water supply chain, from diversion points to end-users. With this information, we can develop effective strategies and policies that promote sustainable water management practices, reduce water loss, and enhance efficiency. Furthermore, by understanding the complexities of the water system, we can develop a more informed and collaborative decision-making process that involves all stakeholders.

Graduate students in environmental planning utilized data from the United States Geological Survey (USGS) National Water Use Information Program to trace water as it moved through the watershed. The primary water uses include agricultural, industrial, commercial, and domestic appropriations. The Water-Related Land Use dataset from the Utah Geospatial Resource Center links water to land uses. The team developed an interactive, comprehensive computer tool that enables water managers to understand current water allocation, set goals, and generate future scenarios. This tool facilitates testing the impacts of future domestic conservation programs, agricultural and irrigation practice changes, and shifts in water use allocations. Outputs from this project include a comprehensive analysis of water use in the Great Salt Lake basin, illustrating diversions, depletions, and return flows for each sub-basin. This presentation will clarify the water flows associated with the primary uses throughout the system and the sub-watersheds. Furthermore, this presentation will describe the tool and provide examples of its application. The graphical information and the use of the quantitative tool, at different levels of aggregation from watershed to county scales, enable water managers and land use planners to collaborate in achieving conservation goals.

Green Equity Triangle: Visibility, Distribution, and Accessibility

Abstract ID: 1844.0.0.249.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Xiao Wang [Politecnico Di Milano] charlotte.x.wang@outlook.com, presenting author

Mingze Chen [The University of British Columbia] mingzec@student.ubc.ca

Xinyi Wang [The National University of Singapore] e0537035@u.nus.edu

Urban green equity is critical to fostering sustainable and resilient cities in the face of rapid urbanization and widening socio-economic disparities. However, conventional assessments often overlook the multidimensional nature of green equity. This study introduces the Green Equity Triangle framework—integrating visibility, distribution, and accessibility—to evaluate how these dimensions collectively enhance urban livability and environmental justice. The research bridges the gap between traditional area-based greenery assessments and innovative, multidimensional approaches that integrate spatial, social, and infrastructural factors.

Employing a mixed-methods approach, the study combines advanced geospatial analysis with qualitative policy and literature evaluations. An enhanced Two-Step Floating Catchment Area (2SFCA) model is developed to incorporate distance decay, demographic weighting, and park attractiveness in measuring green space accessibility. Comparative case studies of London and Singapore—cities with contrasting planning histories and governance systems—enable contextualized analysis across diverse urban environments. This integration of quantitative and qualitative methods offers a comprehensive understanding of green equity, encompassing both objective indicators and residents' lived experiences.

Key findings offer several novel insights. First, high visibility does not always correspond with high accessibility, underscoring that proximity to greenery does not guarantee equitable access—particularly where infrastructural connectivity is lacking. In London, suburban areas often feature high visibility and distribution, while central high-density zones suffer from limited, poorly connected green spaces. Conversely, Singapore's state-led planning model achieves more consistent greenery integration, particularly within public housing estates. However, private and landed properties reveal deficiencies in both visibility and accessibility, suggesting that market-driven development can compromise green equity.

Second, the study reveals significant correlations between socio-economic status and greenery access. In London, low-income and minority communities face limited opportunities for green space use, while in Singapore, elderly populations benefit from highly integrated green infrastructure. Despite differing governance models, both cities struggle to provide sufficient greenery in high-density urban cores, where spatial constraints pose major challenges.

Singapore exemplifies a top-down, coordinated model, embedding ecological corridors into housing and transport planning through long-term, multi-level strategies (Ernstson, 2013; Rahman & Zhang, 2018). In contrast, London relies on targeted urban renewal, prioritizing pocket parks, green transport links, and community-led interventions while addressing gentrification through public oversight (Kiss et al., 2022). Both cities have adopted innovations such as vertical greening, Green Plot Ratio, and hybrid ecological-recreational spaces to reconcile green equity and spatial limitations (Connop et al., 2016; Middle et al., 2014).

In conclusion, this study introduces a novel, three-dimensional conceptual framework for evaluating urban green equity and develops a robust methodological toolkit that synthesizes spatial visibility, distribution, and accessibility—grounded in actual tree location data and pedestrian movement modeling. By comparing the

decentralized spatial structures of London and Singapore, the research underscores how divergent planning legacies influence green space outcomes. While Singapore's regulatory framework ensures equitable greenery in public housing, London's green inequities are closely tied to socio-spatial and historic housing disparities. The findings emphasize the importance of integrating controlled planning mechanisms with real-world simulations to advance equitable and sustainable green strategies across global urban contexts.

Green Infrastructure in Urban Redevelopment: Climate Resilience Through Hydrological Planning

Abstract ID: 1844.0.0.543.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Elnaz Chitsazzadeh [University of Texas at Arlington] elnaz.chitsazzadeh@uta.edu, presenting author

Diane Allen [University of Texas at Arlington] diane.allen@uta.edu

Cities are growing rapidly, and at the same time, there is a strong need for redevelopment planning frameworks to rethink the strategies of the aging infrastructures (Suárez et al., 2021). Redevelopment of existing infrastructure must account for the evolving impacts of climate change. As research highlights, challenges such as intensified rainfall events, outdated infrastructure, and rapid urban development are placing increasing pressure on local stormwater systems (Deslatte & Chung, 2025). While climate change presents significant threats to urban systems, it also creates an opportunity to reimagine and transform cities. Integrating climate adaptation strategies into urban redevelopment frameworks is essential to advancing long-term urban resilience.

In many cities, there is a dual problem in terms of hydrology: the risk of urban flooding on one hand, and the need to ensure access to reliable water resources for residents on the other. These conditions are increasingly linked to climate-induced disruptions, where both flooding and water scarcity emerge as parallel consequences of shifting rainfall patterns and degraded ecological systems (Ramyar et al., 2021). Thinking about nature-based solutions for this situation is a must. Green infrastructure (GI), beyond its aesthetic role, can act as a planning tool and support long-term environmental and infrastructure goals (Zhao et al., 2024). In this study, GI is positioned not as an add-on, but as a functional system to manage runoff, recharge groundwater, and restore urban hydrological balance.

The main objective of this research is to integrate Water-Sensitive Urban Design (WSUD) into planning frameworks, which offers practical solutions for managing stormwater while supporting ecological functions in cities. Previous studies found that fragmented implementation remains a major challenge in many cases due to the lack of knowledge on stormwater resilience and weak institutional capacity (Deslatte & Chung, 2025; Suárez et al., 2024). GI can be used as a bridge between ecological theory and planning practice (Ramyar et al., 2021). This study responds to that need by developing a spatially grounded planning model that embeds GI into urban redevelopment through WSUD principles.

This research employs GIS-based spatial analysis to identify areas where green infrastructure can provide the most effective hydrological benefits. The study focuses on Dallas, Texas, a rapidly expanding city experiencing redevelopment pressures, aging infrastructure, and intensifying climate impacts. The analysis overlays NDVI, flood risk zones, land use, and groundwater recharge potential to locate zones where WSUD strategies can be most impactful. These findings are supported by a review of redevelopment plans and hydrological design strategies, with an emphasis not only on GI location but on performance within the broader urban water system.

This paper contributes a spatially scalable framework and redevelopment model that associates GI with flood mitigation and long-term water resource management. The framework supports runoff retention, aquifer recharge, and ecological functionality through practical and scalable strategies. Drawing on the need to overcome fragmented and piecemeal approaches to urban design, this study responds to the call for more cohesive and integrated planning visions (Marques & Alvim, 2024). It focuses on identifying problem areas, where green infrastructure can be most impactful, based on hydrological vulnerability and redevelopment potential. The model serves as a foundation for future planning efforts that may further incorporate tools, policies, and institutional strategies for broader implementation.

How Florida Local Governments Regulate New Residential Development in Flood Zones

Abstract ID: 1844.0.0.476.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Van Linkous [University of South Florida] elinkous@usf.edu, presenting author

This research examines Florida local government policies that address development in the places where people, property, and infrastructure are most at risk from storm surges. Under Florida Statutes, Coastal High Hazard Areas (CHHA) are defined as the area below the elevation of a Category 1 storm surge line and are those places most likely to be significantly damaged or submerged by sea water. Florida requires that local governments designate CHHA areas within the local comprehensive plan and limit CHHA development in accordance with the hurricane evacuation capacities supported by local transportation infrastructure. Although Florida's CHHA rules have changed over time since first adopted as part of the 1985 Growth Management Act, the overall intent has been to limit development in the CHHA for the purpose of maintaining evacuation capacity and minimizing loss related to public infrastructure and other public expenditures (Puszkin-Chevlin and Esnard, 2009).

Many Florida communities have long-established policies prohibiting additional residential density in the CHHA, resulting in zoning codes that are "frozen in time" (Puszkin-Chevlin and Esnard, 2009, 36). This led to concerns about the abilities of some communities to accommodate projected population growth, support economic development, and provide affordable housing. These concerns were amplified following a 2016 update to the Florida Sea, Lake, and Overland Surges from Hurricanes (SLOSH) model used to identify the CHHA. In many communities, the update resulted in a significant expansion of the CHHA. For example, the City of St. Petersburg faced a 41% increase in the CHHA following the 2016 model update; this in turn resulted in text amendments to their Comprehensive Plan in 2020 that shifted from a strict prohibition of new development in the CHHA to a criteria-based project evaluation approach.

This research provides a survey of Florida local government policies for accommodating residential density in the CHHA. Specifically, it addresses three research questions:

- What are the local government's baseline rules for addressing new density in the CHHA?
- How have requests for additional density in the CHHA been decided over the last decade?
- What changes to the CHHA density rules have been considered or adopted since the 2016 update?

The session will include results from a scan of Florida local government comprehensive plans that include Coastal Management Elements to identify policies for addressing new density in the CHHA. Policies were analyzed to identify major approaches, such as those that strictly limit new density, those that incorporate incentives such as transferable development rights that direct density to specific areas, and those that use criteria such as building code or hurricane evacuation standards to permit density increases. The research demonstrates that most Florida local governments strictly limit new residential density in the CHHA, although a trend of accommodating more residential density is emerging, especially in areas with high land values.

The research will provide information about best practices in addressing density in flood prone areas. Florida's experiences provide instructive lessons on the balancing act involved between protecting human lives and public assets, cooperating with market processes, preventing climate gentrification, and accommodating demand for housing and redevelopment near existing urban infrastructure.

Social capital has largely come to be accepted as playing an important role in community level disaster recovery today. Research has established that social networks, and the resources accrued through those networks, form an important pathway for the recovery of community residents affected by disasters. But the nature of this effect, or the variations of the effect based on different types of social capital forms remains to be explored. In particular, social capital may not always have a positive impact on disaster recovery, a facet that many empirical studies fail to capture although hints to this effect are evident in more qualitative research studies. As a result, there is a tendency in research to paint social capital, and all its forms, as having a uniformly positive effect on disaster recovery. This study investigates this claim by examining the effect of different forms of social capital on disaster recovery perception of households after disasters and the variances within.

Using a case study approach focused on post-hurricane recovery in Puerto Rico, we test the extent to which aid from specific social networks—i.e., bonding, bridging, and linking—mediates households' recovery perceptions experiencing high levels of damage. Data was collected through a stratified random sample household survey (n =251) in two Puerto Rican communities (Loíza and Comerío) affected by the 2017 Hurricanes Irma and Maria. Data was analyzed using ordinal logistic regression methods with interaction terms to test whether households with high or low disaster damage and that accessed financial aid and information through bonding, bridging and linking social networks had more positive or negative recovery perception. The study findings indicate that aid and information acquired from bonding, bridging or linking social networks have varying (positive and negative) effects on the recovery perception of high damage-experiencing households. Such finding points to the need for a nuanced approach to disaster aid that balances diversity of aid opportunities with adequacy of that funding to achieve recovery. The study also provides insights into the pathways through which social networks influence disaster recovery at the household level, specifically, the roles of different types of networks and their specific limitations.

Shaylynn Trego [Arizona State University] satrego@asu.edu

Saeideh Sobhaninia [Arizona State University] saeideh.sobhaninia@gmail.com

Increasing chronic and extreme heat poses a growing threat to communities everywhere, with 90% of U.S. planners reporting concerns about longer heat waves (APA, 2024). Arizona's expanding urban corridor is particularly vulnerable to the effects of increasing temperatures, due to both climate change and the urban heat island effect. To effectively confront this challenge, the full network of community plans that shape the future of the built environment and community operations must collectively advance heat resilience (Keith & Meerow, 2022). While heat planning and governance is still in its infancy, research suggests that silos and conflicts in networks of plans often impede resilience (Keith et al, 2023). Integrated heat resilience planning therefore requires a systematic and comprehensive analysis of the silos and conflicts relevant to heat resilience within communities' networks of plans. This study is the first to combine three emerging, complementary plan evaluation methods to assess how cities' networks of plans address heat resilience. We applied Plan Quality Evaluation for Heat Resilience, Plan Integration for Resilience Scorecard™ for Heat (Meerow et al, 2024), and social network analysis of plan cross-referencing (Woodruff et al., 2022) to 21 plans from seven Arizona cities: Phoenix, Tucson, Tempe, Flagstaff, Casa Grande, Mesa, and Nogales. Our sample of cities represents communities of different sizes, geographies, planning capacities, and heat risks. We find similarities and differences in how these cities' networks of plans address heat hazards. The plans have consistently high-quality participation and coordination principles but lack details on vulnerability and climate change uncertainty, suggesting a need to move beyond immediate heat risks. We also identify opportunities to diversify policy mechanisms, spatially target high heat risk areas, and enhance the connection between planning efforts. These results lay the foundation for future collaboration with decision-makers to more effectively plan for heat resilience.

Is Climate Change Driving Gentrification in Florida? Perspectives of affordable housing advocates

Abstract ID: 1844.0.0.354.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Willian Butler [Florida State University] wbutler@fsu.edu, presenting author

April Jackson [University of Illinois at Chicago] ajacks29@uic.edu

Tisha Holmes [Florida State University] ttholmes@fsu.edu

Anthony Milordis [Leon County] amilordis@fsu.edu

Climate gentrification theory suggests that as storms and sea level rise increasingly flood the coast, people who live in vulnerable coastal areas will move inland to higher ground or residents moving into a region may look to higher ground to avoid climate risks. According to a growing number of scholars, these dynamics are realigning real estate markets toward inland neighborhoods and higher ground (Keenan, et al. 2018; Best and Jouzi 2022; Taylor and Aalbers 2022; Kim and Park, 2023; Hao and Wang, 2024). In Florida, inland neighborhoods are disproportionately working class and lower-income (Butler et al. 2021). Increasing interest in these neighborhoods is leading to speculative investment, increasing housing prices, and growing displacement pressures on existing residents (Butler et al. 2021; Matteucci et al. 2024). These dynamics suggest an inevitable progression of gentrification in coastal cities throughout much of the US, especially in Florida where large urban coastal cities concentrate high value properties and wealthiest populations along the most vulnerable coastlines (Butler et al. 2021).

While previous studies of climate gentrification focus on housing market signals, this study elaborates on how individuals who work in the affordable housing space are navigating these tensions as they work in inland neighborhoods. We aim to understand the extent to which housing advocates are integrating the future threats of climate gentrification into their policies, actions and advocacy work to address new threats to displacement amid an existing affordable housing crisis. Our approach recognizes that climate gentrification as a concept is rooted in an environmentally deterministic view suggesting that climate change impacts will automatically initiate a social process of gentrification. This view ignores other social processes and simplifies the gentrification process to a singular cause.

This paper begins with a review of gentrification literature, with a focus on scholarly studies of climate gentrification and best practices for how cities can stop or at least mitigate gentrification pressures. Next, it summarizes the methodology which consists of a case study of South St. Petersburg Florida utilizing a grounded theory methodological analysis of interviews with housing advocates and officials. We provide a history of the case and then elaborate on the results of interviews to understand the drivers of gentrification in South St. Petersburg and the extent to which climate gentrification is seen as a driver of these gentrification pressures. We then conclude with a discussion that elaborates on multiple dimensions and scales of drivers of gentrification, including an exploration of the long-term effects of Florida's growth paradigm, a clarification of the inadequacy of local responses, and a suggestion of a posture of climate possibilism rather than determinism as a way to approach drivers of and responses to gentrification pressures in the face of climate change impacts.

It Takes a Network: Who is Carrying Out Urban Climate Action Plans?

Abstract ID: 1844.0.0.297.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Carla Chifos [University of Cincinnati] carla.chifos@uc.edu, presenting author

Luke Ourednik [Florida State University] lourednik@fsu.edu

Daniel Murphy [University of Cincinnati] murphdl@ucmail.uc.edu

The formal and informal actors working towards Cincinnati's sustainable future have converged on the issues of climate as the underlying *raison d'être* for environmental interventions. This is evident in the last two Green Plans (2018 and 2023) which couch all environmental, and many community development needs, into climate action initiatives. The 2023 plan adds an emphasis on inclusive collaboration, which inspired our research. Putting urban climate action plans into motion is not an easy task. The solutions suggested in such plans cross many scales and issue areas and can be fraught with political pushback. Literature on urban environmental governance highlights the need for cities to address climate change across scales (DiGregorio et al 2019) with collaboration a key ingredient. However, successful collaboration also requires a robust understanding of the organizations and relationships currently involved in addressing climate change – what we call a “climate network” (see also, Cunningham et al, 2016). Within this loosely defined network we want to know what organizations exist in Cincinnati that address climate change, how the Green Cincinnati Plan is used by these organizations, and what relationships exist among those addressing climate change.

Public sector, private-public sector agencies, activist groups, and community-based groups in Cincinnati have taken up initiatives towards meeting the Green Plan's goals. Our study strives to inform the planning field's discussions on the strengths and weaknesses of current climate action implementation and how to better activate linkages among planning, implementation, and resources as we move forward in addressing climate change. Our research identified and analyzed the range of public, private, and civil society actors that are taking actions to address climate impacts in Cincinnati. How much of this is connected to the plan? How connected or disconnected are the initiatives? What are the indications of collaboration and network building among these actors? Do the patterns of actions indicate integrated or disconnected network of actors? Over several years we have: (1) Identified climate action projects in Cincinnati. Our first cut of identifying projects was through websites, community meeting minutes, project reports. These findings were complemented with site visits and interviews at key high-profile projects and discussions with coordinators of the top government and civil society organizations. (2) Characterized the identified actors. We used web-based resources and targeted phone or in-person interviews to understand better both what they do and who they coordinate with. These descriptions were shared with key informants of these organizations to verify accuracy of what we found. (3) Created conceptual model(s) of the climate action network. We propose and analyze a network of relationships around climate problem solving.

We have found that top down and bottom-up initiatives are not always linked. It seems to depend on the area of climate issue being addressed. Some issues, such as the energy transition, which is addressing climate mitigation, have less public participation or initiatives due the types of changes that need to occur, even though ultimately the transition requires bottom-up participation. Many of the other sectors, which are more related to climate adaptation, and hence more in the area of urban planning and neighborhood development, have been more addressed by bottom-up localized projects. We conclude that more research is needed to understand how to better connect the different scales and types of actors to empower meaningful and impactful outcomes from climate action plans. It is often too complex for what are often small environmental offices within cities to orchestrate the

transition to climate resiliency. As such, our research looks to offer a direction for practice and research in how to improve connections among regional climate actors.

Gamification is a powerful and effective tool known for promoting engagement in educational settings and student learning outcomes (Wulan et al., 2024). Literature demonstrates how gamification has been gaining importance in the social and environmental sciences; however, the success of the approach is directly related to the context, framework selected and participants motivations (Cordero-Brito and Mena, 2018; Koroleva and Novak, 2020). In this work, we apply gamification as a tool to foster in-depth community engagement in environmental and territorial planning studies, by answering the following research question: “How can gamification be used to increase community engagement, reveal stakeholders perceptions and priorities in regions threatened by water-related hazard events?”. The Journey for Water Security (JWS) is a serious game primarily designed to disseminate information and raise participants' awareness of weather-related events and collectively develop creative solutions for urban and rural environments. The board game is collaborative and has three main components: perceptions, scenarios and resource cards. Each card represents situations faced by community members in their daily lives. For having an accurate representation of stakeholders' contexts, surveys were developed and applied with 385 community members of five municipalities in Paraíba state, Brazil. The surveys aimed to assess current awareness, perceptions, preparedness and coping capacities of residents towards water-related events (e.g., water shortage, flooding, water pollution). Perceptions shared by the community members were translated into “Perception Cards” integrated in the JWS. Perceptions aimed to reflect everyday situations experienced by the community, while Scenarios aimed to exemplify hypothetical, but possible, situations that are a result from extreme water-related hazards that may take place in the region (i.e., like water shortage or flooding events in a changing climate). Resource cards are adaptive capacity practices which can increase or decrease the community's exposure when facing those water events (i.e., flood barriers, rain barrels, green infrastructure, educational practices). To win the game, each team needs to suggest more integrated “actions” (i.e., or solutions) considering the multiple scenarios, resources and perceptions learnt. For ensuring applicability, the game was initially applied with researchers from the Federal University of Campina Grande, Brazil in June 2024. The pilot testing verified the acceptability, coherence and estimated average playtime, allowing for adjustments before implementation with community members. JWS was then applied during two workshops held in Boqueirão and Campina Grande municipalities in August 2024. 32 stakeholders, including residents, farmers, civil defense and members of local administration attended the workshops. By integrating real-world information and gamification, JWS has demonstrated potential to promote participatory research, environmental education, and community empowerment. JWS translates high-level research findings in an adaptive and collaborative way, becoming a valuable tool for collecting quantitative and qualitative data of municipalities facing urban planning and water challenges, sharing research findings, and contributing to creating participatory solutions and enhancing engagement with community members. JWS's

flexible structure also shows its potential for replication in other contexts with similar water challenges, strengthening the connection between environmental education, social equity and engagement, and the collective discussion of solutions with the support of the community.

The Paris Agreement outlines a global commitment to achieving carbon neutrality by 2050 to mitigate global warming. In this context, the conservation of land-based carbon sinks such as forests, grasslands, and wetlands has emerged as a critical strategy. These natural carbon sinks have the capacity to sequester carbon and thus play a vital role in reaching carbon neutrality targets. However, these carbon sinks are increasingly threatened by urban expansion. Land use conversions from carbon sinks to urban areas can occur directly, or indirectly through transitional land types such as farmland or forestland. These land use and land cover (LULC) dynamics not only shape urban form but also have significant yet understudied implications for carbon sink capacity, which is essential for climate change mitigation.

Previous studies have examined the environmental impacts of urban expansion. The role of land-based carbon sinks mitigating climate change has also been widely recognized. However, relatively few studies have investigated how urban-driven LULC changes affect carbon sinks. This study addresses this gap by providing a spatially explicit analysis of carbon sink dynamics in the context of LULC driven by urban development.

South Korea, particularly the Seoul Metropolitan Area (SMA), offers a compelling case of such dynamics. Large-scale urban development projects - particularly New Town development - and greenbelt relaxation have accelerated land use changes from natural carbon sinks to urban areas. These developments, aimed at alleviating development pressures and housing shortages in Seoul to adjacent areas, have frequently resulted in the conversion of carbon sinks into urban areas. The rapid extent of such transformations has raised concerns about the loss of carbon sinks. Despite their growing importance, urban development continues to progress, often at the expense of natural carbon sequestration.

This study focuses on the SMA during two key periods of intensive New Town development and greenbelt relaxation: 2000-2010 and 2010-2020. First, LULC changes were quantified to examine urban developments and the associated loss of carbon sinks using GIS. Second, regression analysis was conducted to analyze the association between the changes in carbon sink capacity and LULC dynamics. Given the geographical contiguity, spatial regression models were applied to control for spatial autocorrelation of residuals. These combined approaches allowed for a more robust analysis of how LULC transitions have influenced carbon dynamics across the SMA.

Preliminary findings from the GIS analysis indicate substantial urban development across both time periods, with a significant portion occurring on land previously classified as carbon sinks. Notably, the loss of carbon sinks was not limited to direct conversions; considerable indirect losses were also observed through transitional land uses changes (e.g., forestland to farmland to development, farmland to barren to development). The regression analysis revealed that LULC dynamics, along with several urban factors, influence the degree of carbon sequestration capacity.

The findings of this study offer valuable insights into land use and environmental planning for achieving carbon neutrality. By identifying the spatial patterns and drivers of carbon sink loss at a regional scale, the results highlight

the need for more careful control of urban expansion in areas while preserving both direct and indirect carbon sinks. As cities continue to grow, we argue that land use and environmental must be aligned with climate goals through more spatially informed decision-making of new developments and the incorporation of ecological indicators into existing planning frameworks.

This research investigates the interplay between risk, climate and hazard services, and advanced modeling techniques to improve local mitigation and planning strategies that protect municipal tax bases and creditworthiness. Traditional planning and hazard management systems often struggle to balance short-term economic interests with the long-term fiscal costs and obligations resulting from climate-induced hazards. Recent advances in computational modeling have improved simulations of hazards—including flood and wind impacts—and quantified their effects on built infrastructure. Early findings indicate undercapitalized risk in property markets (Gourevitch et al. 2023), underestimated liabilities in public infrastructure, and potential challenges to municipal credit, although these models are frequently developed beyond the direct control of local decision-makers (Condon 2023).

Planners have long recognized the fiscal risks posed by natural hazards (French et al. 2010; Shi and Varuzzo 2020), yet methods to integrate revenue modeling, cost-of-service analysis, and public asset valuation into comprehensive scenario planning remain inadequate. Without such integration, municipalities lack a feedback mechanism that reflects the cumulative, long-term fiscal consequences of infrastructure investments, land use, and mitigation strategies. This study poses the central question: How can local governments incorporate a feedback mechanism that captures the cumulative costs of infrastructure and planning decisions to better manage long-term fiscal health and risk? Addressing this is critical, as private planning firms offer promising approaches that often lack transparency and empirical validation.

To answer this question, we propose an integrative framework linking hydraulic and hydrodynamic (H&H) models with scenario planning based on fiscal impact analysis. Our methodology has two main components. First, we develop methods to link the outputs of H&H models that simulate flood risk at high spatial and temporal resolutions with hedonic property valuation, damage and insurance estimation, techniques to assess the impact of flood risk on property values and tax revenues. Second, we connect these simulations to a cost-of-service analysis estimating replacement and maintenance costs for flood-exposed roads, drainage systems, and other infrastructure. By merging environmental hazard modeling with fiscal analysis, our framework provides rapid, actionable feedback on the long-term fiscal implications of planning decisions.

We validate our approach through a case study in the Acadiana region of Louisiana, USA, focusing on revenue vulnerability due to undercapitalized flood risk in the housing market. In this region, we examine how changes in flood frequency and intensity affect property tax revenues and infrastructure maintenance costs. Integrating these insights into a unified decision-support tool can help local governments weigh the benefits of mitigation investments against the long-term costs of inaction. This project presents a novel framework that reconciles short-term economic goals with long-term fiscal responsibilities amid escalating flood and wind risk economic stressors. By integrating hydraulic modeling, revenue impact analysis, and cost-of-service assessments, we provide local governments with practical tools to make informed, sustainable planning decisions that enhance community resilience and fiscal stability.

Mapping 3D Urban Form to Inform Conservation Strategies

Abstract ID: 1844.0.0.960.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Morgan Rogers [University of California, Los Angeles] mrogers19@g.ucla.edu, presenting author

With 2.5 billion people projected to move into cities by 2050, urbanization is set to become a leading cause of habitat and biodiversity loss, making cities key battlegrounds for conservation efforts. At the same time, cities can sustain high levels of species richness and rely on biodiversity to provide essential ecosystem services such as water purification, plant pollination, natural pest control, urban heat reduction, and climate change mitigation. Recognizing this dual reality, the United Nations' Kunming-Montreal Global Biodiversity Framework identifies enhancing ecological connectivity—the degree to which landscapes facilitate species movement—as a key conservation strategy in cities. While many cities are embracing conservation plans that emphasize connectivity, many lack concrete goals and rely on insights from non-urban environments, as urban ecological connectivity remains a nascent area of study. Moreover, most efforts to measure connectivity depend on two-dimensional (2D) metrics that overlook the structural heterogeneity of urban landscapes. This study addresses this by asking: In what ways do the three-dimensional (3D) aspects of urban landscapes influence ecological connectivity, and how can innovative 3D modeling approaches improve conservation planning?

Using Los Angeles as a case study, this research develops and compares 2D and 3D connectivity models derived from remote sensing and LiDAR-based landscape metrics. These models are validated using field surveys and community science bird observations, incorporating generalized linear mixed models and omni-directional movement analyses to examine how built and vegetative structure shape movement potential. Findings reveal that 3D structural heterogeneity plays a significant role in shaping connectivity for birds. For instance, variation in building volume is negatively associated with bird movement, a relationship that would be obscured using 2D measures alone. These results underscore the limitations of traditional connectivity assessments and emphasize the need to incorporate vertical structure into urban conservation strategies. This work was conducted in partnership with the City of Los Angeles to help inform the city's Biodiversity Index and its Local Biodiversity Strategy and Action Plan. By demonstrating how 3D spatial analysis can be translated into planning decisions, this study offers a transferable model for other urban areas seeking to integrate ecological connectivity into land-use decisions. In doing so, this research advances both understanding of coupled human–natural systems and the practical tools available to planners working to conserve biodiversity in the Anthropocene.

Mapping Urban Heat and Injustice: A Community-Centered, Mixed-Methods Study in San Bernardino

Abstract ID: 1844.0.0.779.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Xijing Li [California State Polytechnic University, Pomona] xijingli@cpp.edu, presenting author

Nicole Lambrou [California State Polytechnic University, Pomona] nlambrou@cpp.edu

Climate change has intensified the frequency and severity of extreme heat events across the United States, with Southern California emerging as one of the most affected regions. Within this context, San Bernardino County presents a particularly vulnerable case due to its unique geographic features—being landlocked, arid, and topographically diverse—as well as long-standing socioeconomic disparities. Over the past two decades, San Bernardino has faced both the chronic stress of climate change and the acute pressures of urban decline. More recently, trends in urban redevelopment, including retrofitting efforts and changes in land use, have further exacerbated heat-related risks. These changes have disproportionately affected marginalized communities, revealing persistent patterns of environmental injustice.

This study employs a mixed-methods approach to investigate the spatial and temporal dynamics of heat vulnerability in San Bernardino County. Using cloud-based remote sensing technologies and machine learning models, we examine how different metrics of heat vulnerability have evolved alongside patterns of urban transformation over the last twenty years. In addition, the study integrates land use projections from the 2050 General Plan to anticipate future heat vulnerability and identify at-risk communities under future climate and urban redevelopment scenarios.

To ground the analysis in community experience, we incorporate data from travel surveys, including raw GPS traces and portable GPS device-based travel surveys, as well as community questionnaires. Framed by a heat vulnerability and environmental justice lens, this multi-scalar dataset allows for a nuanced understanding of local needs, behaviors, and lived experiences in high-risk areas. The study concludes by offering community-driven, design-based solutions that address both current and anticipated vulnerabilities. Ultimately, the research contributes to more equitable and climate-resilient urban redevelopment strategies in historically underserved communities.

New Approach to Monitor the Life Cycle of Urban Street Tree Canopies and Guide Tree Planting Efforts

Abstract ID: 1844.0.0.439.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ayda Kianmehr [University of Southern California] akianmehr@vt.edu, presenting author

Introduction-According to the Intergovernmental Panel on Climate Change (IPCC), it is predicted that global surface temperatures will increase by 0.3 to 4.8°C by the end of this century under different global warming scenarios (Pachauri et al., 2015). One common measure to mitigate the impacts of increased temperatures, which has been well-proven to be effective in cooling surfaces and ambient temperatures in cities, is the increase in the amount of vegetation, especially in the form of urban trees (Ellison et al., 2017). While trees play a crucial role in controlling the magnitude and duration of thermal exposure, tree mortality could have a detrimental impact on the long-term cooling capacity of current urban street tree canopies. To maximize the associated benefits of urban trees in a given city or neighborhood, it is important that the numbers of newly planted trees exceed the numbers of trees lost.

Research Goals-The goal of the current study is twofold. First, to estimate the age of the current population of street trees in the study area and calculate the number of tree losses due to aging under different longevity scenarios by the end of each decade from 2023 to 2100. Second, to identify locations that are in urgent need of tree planting based on the mortality data given the goal of maintaining or growing the existing street tree canopy.

Data and Methods-The case study area comprises six neighborhoods located within a mile or two of Downtown Los Angeles. This study area is the focal point of the University of Southern California's Urban Tree Initiative, a scientific effort aimed at maximizing the benefits of tree planting in a series of vulnerable communities near Downtown Los Angeles.

In this study, we utilized the diameter at breast height (DBH) of tree species in the study area to estimate their current age and assess trees' mortality and survival rates over the remainder of the 21st Century. We applied urban tree growth coefficients developed by a team of urban forest researchers at the US Department of Agriculture (McPherson et al., 2016). In the next step, we conducted a comprehensive literature review to establish the minimum, average, and maximum lifespan of the analyzed tree species. Using tree longevity estimates, we created three scenarios for estimating the survival rate of trees in the study area: better-than-normal (maximum longevity), middle-of-the-road (average longevity), and worse-than-normal (minimum longevity) scenario.

Findings-Our results demonstrate that under a typical (middle-of-the-road) longevity scenario, on average, near half of the current tree canopy in the case study area will have died by mid-century. In addition, by the end of the century, under this scenario, near 90 percent of existing trees will have died. Our results further revealed that, under the typical longevity scenario, on average, the case study area will lose about 10.8 percent of its tree canopy cover by the end of each decade.

Conclusion-In this research, we utilized individual tree growth and longevity data to portray the current and future condition of street trees in the study area.

Our approach in this study can serve as a model for cities to monitor the age and mortality rate of the urban tree canopy over time. Additionally, it enables efficient tree plantings and targeted resource allocations, thereby preserving the long-term vitality and the size of urban tree canopy and contributing to the resiliency of cities in a warmer future climate.

Nuancing Coastal Management Using a Best Management Process for Adopting Best Management Practices

Abstract ID: 1844.0.0.271.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Richard Norton [University of Michigan] rknorton@umich.edu, presenting author

Ocean and Great Lakes coastal shorelines are receding landward remorselessly, the former because of sea level rise and the latter because of geophysical processes (Norton, 2022). Communities confronting shoreline recession face three daunting challenges in responding to it: coastal shorelines are highly dynamic—increasingly so because of climate change; substantial lengths of shoreline are privately owned; and shoreland property owners want their properties to be stable. When reality hits expectation, the conventional response has been to install shoreline armoring like seawalls. Scientific research and lived experience, however, both make clear that it is often not possible to protect buildings placed too close to the shore through armoring without destroying natural coastal resources, or conversely to protect natural coastal resources without prohibiting or removing armoring—and the buildings they are designed to protect (Pilkey & Wright, 1988). Coastal communities thus unavoidably face difficult trade-offs when making coastal management decisions.

The first step toward reasonable and well-balanced decision-making is to undertake comprehensive planning. While good planning is necessary, however, it is not by itself sufficient. The next step is to move from planning to doing by adopting appropriate infrastructure policies, public outreach and education campaigns, and land use regulations. Those plans, policies, campaigns, and regulations should comprise “best management practices” (BMPs)—practical and effective public actions designed to promote the community’s long-term resilience and sustainability in the face of dynamic natural coastal processes and persistent near-shore development pressures (Beatley, 2009).

There are today numerous decision-making tools presenting a wide variety of potential BMPs that coastal communities might adopt to enhance their resilience. In fact, there are now so many that a fourth daunting challenge for coastal communities today is the need to wade through all the available options to select the BMPs that best meet their unique needs. In addition, and despite so many options, much of that guidance takes a one-size-fits all (install nature-based shorelines) or a once-and-done (adopt a setback) approach, suggesting that off-the-shelf BMPs can be adopted with relatively little analysis or trouble. That approach inappropriately downplays a fifth daunting challenge—the fact that effective coastal management requires thorough and systematic analysis, and that coastal localities might not only fail to become more resilient but also prompt more controversy by attempting to adopt seemingly easy or unduly optimistic coastal management programs.

Drawing from literature reviews, individual interviews of coastal community officials, and focus-group interviews of coastal officials and other experts familiar with coastal management, this paper presents a sequence of steps—a best management process—that a coastal locality might take to identify, adopt, implement, and justify the right set of BMPs for its long-term resilience and sustainability. In brief, that best management process includes gaining a working understanding of coastal resilience and hazard mitigation; knowing the community’s authorities to manage coastal shorelands, and the potential benefits and risks of doing so, and of not doing so; engaging community planning; and then considering and selecting appropriate BMPs strategically. That latter step involves, and the paper focuses on, the need to confront realistically the tradeoffs that different management strategies implicate, the need for triage in selecting appropriate strategies for different natural and built shoreline conditions, the need to tailor “model” approaches to meet local conditions and needs, and finally the benefits of transitioning

deliberately, where possible, from living on a dynamic coast using engineered structures to living with natural coastal dynamics over time.

One Size Does Not Fit All: Regional heterogeneity in heatwave warning effectiveness and health risks

Abstract ID: 1844.0.0.47.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Cherry Kim [Seoul National University] cherrykim@snu.ac.kr, presenting author

Heeyeun Yoon [Seoul National University] hyoon@snu.ac.kr

Climate change is reshaping how cities manage extreme heat, making adaptation policies such as heatwave warning systems increasingly vital. However, these warnings operate on the premise that heat impacts all regions uniformly, neglecting the diverse climatic and socio-economic contexts that influence local adaptation. While regional differences in temperature sensitivity may affect population responses to extreme heat, it remains unclear whether the effectiveness of heatwave warnings in mitigating health risks is similarly heterogeneous. This study examines whether heatwave warnings have differential effects on health risks across regions with varying temperature sensitivities and compares their effectiveness when warnings are issued based on a uniform national standard versus thresholds tailored to specific regional conditions.

This research employs a two-step empirical approach using daily panel data from multiple cities in South Korea between May and September, 2019–2024. First, Generalized Additive Models (GAM) identify region-specific temperature thresholds at which heat stress significantly affects cooling energy demand, serving as a proxy for local temperature sensitivity. This enables the detection of critical temperature points where populations begin to exhibit behavioral responses to extreme heat, establishing an empirical basis for region-specific adaptation measures. Second, a Mixed Effects Model (MEM) assesses whether heatwave warnings reduce health risks differently across regions while controlling for climatic variables (humidity, wind speed, precipitation) and socio-economic characteristics (income levels, air conditioner penetration, healthcare infrastructure). A key contribution of this study is the comparative assessment of two approaches to issuing heatwave warnings: one based on a fixed national standard and another utilizing city-specific temperature thresholds derived from the first-stage analysis. By incorporating spatial heterogeneity, this analysis determines whether heatwave warnings are more or less effective depending on regional variations in temperature sensitivity and adaptation capacity.

Preliminary results indicate that temperature thresholds for heightened heat sensitivity vary across regions, with Seoul at 30°C, Daegu at 33°C, and Gangwon Province at 28°C. The impact of heatwave warnings on health risks also exhibits regional heterogeneity; in Seoul and Gangwon Province, warnings are associated with a reduction in patient count, whereas in Daegu, where extreme heat is more frequent, their effectiveness appears limited. Moreover, findings suggest that issuing heatwave warnings based on region-specific thresholds may enhance their effectiveness compared to a uniform national standard. These results imply that a one-size-fits-all heatwave warning system may not be equally effective across all regions, underscoring the necessity of localized climate risk communication strategies that align with region-specific temperature sensitivities.

This study contributes to climate adaptation research by demonstrating that the effectiveness of heatwave warnings varies across regions with different temperature sensitivities. The findings emphasize the need for flexible, localized strategies that account for how populations perceive and respond to heat rather than relying solely on standardized heatwave alert criteria. Refining warning criteria to reflect local temperature sensitivities could enhance adaptation measures and reduce health burdens associated with extreme heat. By integrating empirical insights from climate, energy, and health data, this research highlights the importance of adaptive governance structures capable of addressing regionally differentiated extreme heat risks and informing the development of more effective climate adaptation policies.

Persisting on the Jersey Shore

Abstract ID: 1844.0.0.232.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Clinton Andrews [Rutgers University] cja1@rutgers.edu, presenting author

Many coastal settlements persist despite repeated damage from storms and flooding. This may be less about willful ignorance and more about the attractiveness of coastal amenities outweighing the perceived risks of living in a location for certain people. This study investigates how resort municipalities located along the beaches of the Jersey Shore differ from the rest of New Jersey, USA, with the purpose of clarifying the special features of Shore communities' housing stocks, real estate markets, and populations. The case study uses data from the U.S. Census and other governmental sources to create a quantitative portrait of the Shore and presents logistic regression model results showing that features associated with Shore communities include high seasonal vacancy rates, high median housing values, high FEMA damage claims, and year-round populations with lower non-white percentage and lower median household incomes than the statewide values. Jersey Shore municipalities host many second homes, have housing values that are higher than the statewide average and show little net growth in population and housing units, but see continued housing investment (new construction and alterations) at a rate averaging USD 2.2 billion annually in 2023 USD over 20 years. Implications for public policy are to incentivize risk management behavior by second-home owners and owner-occupiers differently from one another, and view nostalgia-based arguments for special treatment with skepticism.

Planning Beyond Crisis: The Promise of Insurgent Planning in Post-Disaster Mocoa

Abstract ID: 1844.0.0.936.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Juan Camilo Osorio [Pratt Institute] josorio@pratt.edu, presenting author

During the evening of March 31, 2017, a catastrophic landslide engulfed the Colombian city of Mocoa, killing at least 335 people in roughly thirty minutes. Seventy others disappeared, and over one hundred people were reported injured across 48 neighborhoods, and roughly 1,500 housing units were destroyed. With a total of 22,000 people impacted, this catastrophe was the deadliest disaster affecting Colombia in recent decades. Yet, despite an alignment of major national political commitments, international cooperation, and a multi-million-dollar humanitarian budget, reconstruction plans have not been completed eight years later. Why?

As the first comprehensive analysis of the landslide and its aftermath, this article is a novel investigation into the competing forces that ultimately canceled the central reconstruction plan, demonstrating that the kind of disruption caused by the disaster mobilized new actors and new forms of agency. In contrast to the popular perception that this kind of lack of remediation suggests the failure of urban planning, the article speaks to the success of local planners who have neutralized the national government's reconstruction plan because they perceived it as worsening the circumstances leading up to both the catastrophe.

Distinguishing between the "landslide" and the "larger disaster," the article further explains the government's proposed reconstruction plan within a history of violent extraction, dispossession and displacement. Framing an original case consisting of multiple ethnographic vignettes to trace actions, reactions and counteractions, I expose the reduction of the planning process as crisis urbanism. My research contributes to our understanding of variability among insurgent planning actors and their "invented spaces" for engagement in the context of disaster, by defining technocratic resistance as a valid form of dissent inside the government, and by proposing a new device for the study of insurgent planning called transformative spaces enabling local community's right to plan. Drawing on contemporary debates on anti-crisis, risk and decolonial thought, the article imagines an alternative paradigm for planning beyond crisis that enables radical community action through dissenting grassroots leadership.

Planning Consultants for Capacity Building? Mediating Roles in Hazard Grant Management

Abstract ID: 1844.0.0.701.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ward Lyles [University of Kansas] wardlyles@ku.edu, presenting author

Yiwen Wu [University of Kansas] yiwen@ku.edu

Over the past three decades, consulting planners have become highly prevalent with massive public planning work outsourced to private firms for cost-efficiency. In response to growing demands and pressures driven by climate change, many localities have worked with planning consultants for environmental planning. For example, many U.S. counties have engaged external consulting planners in some capacity to comply with state and federal mandates such as the Disaster Mitigation Act (Lyles, Pennel, and Riley, 2023). However, the specific responsibilities, performance levels, and broader patterns of consultant involvement remain unclear. Planning scholars emphasize the need for a holistic assessment of planning consultancy, particularly in areas such as plan development efficiency, project management success, and compliance with higher-level planning mandates (McLeod and Schapper, 2024). Hazard mitigation planning serves as a valuable testbed for evaluating consultants' effectiveness in delivering mitigation plans and additional services such as federal grant applications and management.

Hazard mitigation planning in the U.S. – often hired by county government and conducted by consultants – is complex due to significant variations in state planning contexts, hazard exposure levels, and states' discretion in environmental governance. This governance complexity provides an opportunity to examine the role of consultants in navigating environmental planning processes. To explore consultants' influence, we investigate their involvement in managing federal assistance grants that support local hazard mitigation planning. Specifically, we ask: (1) To what extent do consultants support the Hazard Mitigation Assistance Grant program? (2) To what extent do consultants assist with public and individual aid following major disasters? (3) Do consultants serve as mediators in helping localities secure federal mitigation grants?

We conducted a multi-state study to examine the impact of consultants on hazard mitigation planning outcomes, specifically focusing on federal grants received by local governments. We systematically reviewed planning documents from 105 counties across six states on consultants' involvement in local hazard mitigation planning. Additionally, we collected secondary data on federal grant assistance, hazard exposure, and county demographic characteristics. The federal grants analyzed included Public Assistance grants, Hazard Mitigation Assistance Grants, and Individual and Households Program funds. For the statistical analysis, we first employed confirmatory factor analysis to construct the concept of consultants' involvement in planning processes, capturing their roles in plan writing, grant management, meeting facilitation, and steering committee participation. We then applied structural equation modeling (SEM) to assess the mediating effects of consultants on federal grants received.

Our SEM results indicate that consultants are actively involved in meeting facilitation, plan writing, and grant management. Consultants significantly mediate localities' efforts in securing Public Assistance funding but not Hazard Mitigation Assistance Grants. As one of the few studies that have examined consultants' contributions to local environmental planning, our findings offer valuable insights into consultants' roles in administrative functions such as grant management. Beyond theoretical implications for the future of the planning profession (Campbell, Tait, and Watkins, 2014), our study provides practical guidance for local governments designing contracts with consultants, particularly those lacking the capacity for comprehensive planning processes beyond grant administration.

Planning for waste management in informal settlements: Spatial Analysis in Kampala, Uganda

Abstract ID: 1844.0.0.22.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Justin Hollander [Tufts University] justin.hollander@tufts.edu, presenting author

Elijah Mensah [Tufts University] elijah.mensah25@gmail.com

Rapid urbanization, population growth, and changing consumption patterns have significantly increased global waste, including municipal solid waste and plastic waste. This waste is widely linked to increased risks of urban flooding, vector-borne diseases, soil and water contamination, and air pollution. The rural-to-urban migration in Sub-Saharan Africa increases the rate of urbanization and population densities with its concomitant waste generation in cities, making it overwhelmingly difficult for authorities to address. This is due to the limited budget for waste management in the space of competing priorities such as hunger, water shortages, unemployment, and hunger that state governments need to grapple with. Further, this issue is connected to the lack of policy implementation and enforcement of regulations. Waste collection in Sub-Saharan African countries is widely recognized as inadequate, with collection rate of about 55% for 90% disposal at uncontrolled landfills and dumpsites.

This paper investigates environmental planning practices and the human health and environmental hazards associated with waste in the informal settlements of Kampala, Uganda, using Acholi Quarters, Kifumbira, and Ggaba as case studies. The research used a novel dataset extracted from Google Street View (GSV) imagery to provide insights into geographical locations of pollution accumulation and ArcGIS spatial mapping to locate chronic areas that require immediate attention. We found higher concentrations of waste within a 0.5-mile radius from the settlement centroids in two of the three settlements. A Local Moran's I analysis identified statistically significant clusters of high and low waste presence and outliers to suggest the influence of local factors. A review of environmental planning practices and policies revealed that local authorities are well aware of these hazardous conditions but lack the necessary resources to address them.

Amid growing water scarcity and water quality concerns in parts of the United States (US), the US Geological Survey (USGS) has embarked on a project mandated in the 2009 Omnibus Act that enables integrated water availability assessments to improve access to information about disconnects between demand and supply in different social-ecological water systems. As a component of this work, with the support of the USGS and of the Royal Society of New Zealand, a team of researchers has produced a water governance and management knowledgebase of twenty water governance case studies that exemplify the disruptive events, drivers and social factors and decisions affecting water availability, quality, condition, and uses over time (Glynn et al., in preparation). As water becomes increasingly integrated into land use planning and the built environment attendant choices affect its management. Urban and environmental planners who are trained to balance public and private tradeoffs are progressively engaging in this critically important area of study (Cesaneck, Elmer and Graeff, 2017).

To understand whether and to what extent water management plans and/or planners influenced the water outcomes in these twenty case studies of socio-ecological systems and their water availability, we employed a three-step approach. First, we assessed each case study to determine whether water management plans (WMP) had been created and used at any (or multiple) point(s) in the course of case-study evolution. If so, we characterized the WMP typology, content (where available) and its genesis, as well as documented its effects and noted any issues that emerged in the process, compared to those case studies without WMPs. Second, using supporting literature for each case study, we identified the roles of the planners associated with those WMPs, if at all. Where present, we also noted the potential for/actual presence of participatory planning and narratives to address issues identified in the case study management process(s) and compared them with the participatory planning literature best practices (Bryson et al. 2013; Innes and Booher 2018). Finally, we documented the contextual setting that influenced the plans and planners' efficacy in the process, assessing the role of stakeholder engagement and public participation in water management and their efficacy.

With this triangulated approach, we were able to empirically examine the presence of planning in a formal water management process (e.g., the Rio Grande/Albuquerque, NM) to other kinds of WMPs (e.g., the Alto Maipo river basin plan) to determine whether the intended management outcomes were actually achieved and the intervening factors that supported or hindered them. If they didn't work, we documented the obstacles, including the influences of persistent actors, political will, exclusion/inclusion of critical groups in plan generation, planning knowledge or training, and planning process leadership. Where they did work, we examined the role of the planners in improving the outcomes of those plans, as well as the potential blinders even when planning was involved. Additionally, we examined the role(s) of planners in introducing narratives and in incorporating integral

but often overlooked or undervalued non-consumptive water uses that affected overall water management outcomes. Finally, we compared these planning roles with those proposed in the Dyckman and Paulsen (2012) water planning organization (WPO) model to determine whether these WPOs are organically manifesting. This assessment of the water governance and management knowledgebase offers novel and bridging perspectives on the role(s) of plans and planners as they increase their foray into coalescing the processes around water management, governance, and built form in exemplified areas of disruption, competition, and tradeoffs in social-ecological system needs and water availability and/or quality/condition concerns.

Zhiqiang Siegfried Wu [Tongji University] wus@tongji.edu.cn

Global climate change is intensifying urban wet-heat stress (WHS) by simultaneously elevating temperatures and humidity—phenomena largely driven by urban heat islands (UHI) and urban moisture islands (UMI) (Zhang et al., 2023). While UHI has been extensively explored, UMI remains under-investigated, and few studies have integrated both aspects. Given that urban built environments (UBE) critically shape these effects, it is essential to evaluate how various UBE characteristics influence WHS to inform effective urban planning (Liu et al., 2021).

In this study, we propose a novel, unified framework that concurrently quantifies UHI and UMI dynamics across 1,635 urban agglomerations in China during the summer months of 2020 (June to August). Utilizing high-resolution satellite data combined with an advanced ensemble learning approach—integrating the LightGBM model with the SHAP algorithm—we assess the contributions of three key UBE dimensions: physical morphology, natural characteristics, and development indicators. The resulting models achieved R-squared values exceeding 0.9, underscoring the robustness of our approach in capturing the complex interplay between UBE factors and WHS (Aggarwal et al., 2019).

The results reveal that approximately 28.9% of urban areas experience concurrent UHI and UMI stress, with these effects being more pronounced in warm climatic zones and in cities categorized as Super Cities (populations over 5 million). This study identifies five major insights into the UBE's role in WHS: (1) Urban greening alleviates WHS, particularly in larger cities, effectively lowering UHI without substantially raising UMI. This finding addresses concerns from previous studies that vegetation may increase air humidity through evapotranspiration, potentially exacerbating WHS and offsetting cooling benefits. (2) Both high building density (BD) and impervious surface ratios (IR) concurrently intensify UHI and UMI, indicating that controlling their upper thresholds is crucial for mitigating combined WHS. (3) Once building height (BH) exceeds 10–12 meters, improved urban ventilation reduces both UHI and UMI, with this effect growing stronger in larger cities. (4) High albedo surfaces, such as glass curtain walls, exacerbate WHS by reflecting and concentrating solar radiation in localized areas, particularly in large cities. (5) Urban development indicators, including Night-Time Lights and Population Density, significantly increase UHI while inhibiting UMI, with this impact intensifying as city size grows.

Based on these findings, we recommend urban planning strategies that promote innovative greening solutions—such as rooftop and vertical gardens—to maximize green coverage in space-limited environments. Additionally, optimizing building morphology by regulating density and impervious surfaces, adjusting building heights to improve ventilation, and carefully selecting materials to manage surface albedo can collectively mitigate the adverse impacts of WHS. Furthermore, sustainable urban development practices should balance economic growth with environmental resilience.

In conclusion, our integrated framework provides a comprehensive tool for understanding and mitigating urban wet-heat stress by simultaneously addressing UHI and UMI. This approach offers valuable guidance for policymakers seeking to enhance urban sustainability and resilience in the era of accelerating climate change.

Receiving Communities in the Wake of COVID-19: Lessons from Rural Northeast Region

Abstract ID: 1844.0.0.475.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Omur Damla Kuru [University of Utah] u6062513@utah.edu, presenting author

Henry Renski [University of Massachusetts, Amherst] hrenski@larp.umass.edu

Paromita Shome [University of Massachusetts, Amherst] pshome@umass.edu

Elisabeth Infield [University of Massachusetts, Amherst] eminfield@umass.edu

Emily Hodos [University of Massachusetts, Amherst] ehodos@umass.edu

Perhaps surprisingly, there is very limited literature on COVID-era US population mobility. In this study we use an innovative mixed-methods approach analyzing mobility in Northeast (NE) Region, exploring the COVID-era population movement trends in the region, the drivers that motivated locational choices of movers, and outcomes of rapid population influxes for receiving communities. We first analyzed Statistics of Income (SOI) data to spatially analyze the number of exemptions filing a tax return in a different county from the previous year—as a proxy of flow of people. Results revealed that the population changes were focused on just a few largely rural locations – 75% of newcomers who moved to top receiving communities originated from densely urbanized NE counties. Then, we conducted focus groups with 27 local housing experts in 22 rural counties of NE that received the highest relative numbers of in-movers between 2016-2020. Respondents believed key push factors included socioeconomic challenges faced in big cities, and technological and lifestyle-related changes catalyzed by COVID. Pull factors to these rural areas were housing affordability, amenities (e.g., natural amenities, physical and social infrastructure) as well as familial or friendship ties. The movements created significant challenges for the housing market and services, placing disproportionate pressure on socioeconomically disadvantaged groups in rural communities. While COVID was unusual, rapid-pulse population movement due to disasters is not, and lessons can be learned for the future. Planning can help receiving communities ameliorate challenges and achieve more just and sustainable outcomes of pulse movements driven by similar types of disasters, while also promoting the well-being of existing communities.

Reconfiguring the Grid: A Socio-Technical Approach to Smart Microgrid Development in Chelsea, MA

Abstract ID: 1844.0.0.1065.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Anna Demina [Columbia University] ad4022@columbia.edu, presenting author

Infrastructure systems are often deemed invisible (Star 1999); however, as the new forms of distributed energy infrastructures populate urban and rural environments, what other, non-material transformations this new, more noticeable to the eye of urban residents, energy grid brings?

This project focuses on a particular type of distributed energy resource (DER): a smart renewable energy-based microgrid, which represents a localized solution for energy generation and distribution and plays a smaller role in the larger processes of energy transition than utility scale generation because of its smaller generation capacity. However, one of the key characteristics of infrastructure is the performativity of the technological choice that has intended and unintended consequences, including social and political ones (Winner 1980): for example, the decision of investing in a small-scale production and distribution system locks us into the inevitability of maintaining it in the near 30-40 years, being constantly incorporated into urban fabric and assumes the push towards further fragmentation of the grid and increased reliance of private and independent DERs (Coutard & Rutherford 2016, McCullough 2020). The islandability and adaptive capacity of the smart microgrid introduces the new set of challenges and implications for social and energy justice: with their deployment, the capacity to withstand the crisis becomes unevenly distributed, creating “pockets of resilience” for the loads that are deemed critical or for those who could afford the investment (Rutherford & Marvin 2023). Considering that it is common for a microgrid to have an anchor load that belongs to an institution, socioeconomic and political power imbalances may exacerbate the existing vulnerabilities (Gui et al. 2017).

In this project, I am interested in understanding how the project of the design and deployment of urban smart community microgrids can be transformed through the process of negotiation of different actors, their visions and their perceptions of the limitations and challenges (Latour 1992), and how the notion of “community” is reflected in the development of community microgrid. It is based on the case study of a virtual community microgrid in Chelsea, Massachusetts – a project that has been under development since 2016 and is still ongoing. As identified by McCullough (2020), local community microgrids are capable of shifting people’s expectations around energy, promoting values of self-sufficiency, sustainability, and increasing the interest in participation in energy production. Drawing on field site observations, qualitative analysis of project documents and legislature, and semi-structured interviews, I investigate Chelsea microgrid as a sociotechnical device, a configuration of particular political, economic, cultural, and material circumstances (Larkin 2013, Winther 2008, Nucho 2022). I explore its role in the process of increasing Chelsea’s resilience, both to power outages and in its economic, political, and social dimensions. This research contributes to the understudied phenomenon of the adoption of smart microgrids from a socio-technical perspective, sheds light on how microgrids are framed and perceived by the government, utility companies, and the communities and expands understanding of how the reconfiguration of energy infrastructure can inform collective imaginaries.

Rethinking Justice: Power Dynamics and Alternative Approaches in River Landscape Management

Abstract ID: 1844.0.0.732.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jidapa Chayakul [Wageningen University] jidapa.chayakul@wur.nl, presenting author

Rivers have historically shaped agrarian landscapes and urban settlements worldwide. As these landscapes face rapid urbanization, the conservation and restoration of riverine environments become increasingly critical. Recent trends indicate a shift toward alternative river protection and restoration approaches led by civil society organizations (CSOs) and grassroots networks (Boelens et al., 2022; O'Donnell & Talbot-Jones, 2018; Mallin, 2023). These approaches challenge traditional state-led strategies, which often impose uniform solutions that overlook local socio-ecological complexities. While alternative initiatives seek to restore ecological balance and support livelihoods, they may also produce unintended consequences. Additionally, interactions between state-led efforts and civil society interventions create a dynamic landscape of competing interests that can either reinforce or undermine conservation goals.

This research examines the role of CSOs and alternative practices in restoring the Ping River and the 700-year-old Muang-Fai irrigation system in Chiang Mai, Thailand. These water systems are vital to the region's ecological and cultural fabric, sustaining traditional agricultural practices and local livelihoods. However, environmental degradation and cultural shifts pose significant challenges. This study explores how grassroots actors develop innovative strategies to address these challenges while navigating broader power structures shaping river governance. A key research question guiding this study is: How have civil society organizations (CSOs) and other alternative practices envisioned and contributed to the protection or restoration of local culture, livelihood, and ecology of the Ping River?

The research contrasts state-led conservation strategies with community-driven initiatives, analyzing the power dynamics in alternative river management. While grassroots efforts tend to be more inclusive and context-sensitive, they may also lead to conflicts over resource access, shifts in livelihoods, and power struggles among stakeholders. Understanding these dynamics is crucial to evaluating the sustainability of grassroots conservation efforts.

Using qualitative methods, this study includes in-depth interviews between June 2024- April 2025 with CSOs, state actors, and farmers. Additionally, non-human entities, such as flora and fauna, are considered to assess broader ecological impacts. This multi-perspective approach provides a nuanced understanding of how alternative conservation practices influence river landscapes, social structures, and ecological health.

The theoretical framework integrates the concept of Rooted Water Collectives (Vos et al., 2020) with insights from critical feminist studies, bridging spatial planning, political ecology, and landscape ecology. This interdisciplinary approach offers a nuanced perspective on the social and political dimensions of ecological restoration.

Findings suggest that alternative approaches to river landscape protection and restoration in the Ping River basin remain largely human-centered and are often limited by the dominant discourses. While ecological restoration efforts exist, they are often shaped by human desires to control nature rather than allowing natural ecological processes to unfold. However, conservation strategies that integrate local ecological knowledge, traditional water management practices, and participatory governance appear to yield more socially and ecologically responsible outcomes.

By examining the role of CSOs and alternative approaches, this study highlights strategies that foster collaborative, inclusive, and context-sensitive environmental planning. These insights contribute to a broader understanding of environmental stewardship and planning in relation to broader landscape changes, offering pathways for navigating the complexities of river conservation in an era of rapid social-ecological transformation.

Simulating Urban Green Space's Cooling Impact on Sleep Quality Using Diverse Planning Approaches

Abstract ID: 1844.0.0.377.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Yuan Gao [The University of Hong Kong] gaoyuan1999hhh@gmail.com, presenting author

Shenjing He [The University of Hong Kong] sjhe@hku.hk

The intensifying global warming, coupled with urban heat island phenomena, have brought a wide range of health issues related to humid heat exposure, particularly in densely populated urban areas of tropical and subtropical regions (Zhang et al., 2023). Our prior research has demonstrated that humid heat exposure significantly jeopardizes adolescents' sleep health, with air temperatures ranging from 25-30 °C causing a three to sixfold increase in the risk of various sleep disorders. These findings underscore the urgent need for planning interventions.

Urban Green Space (UGS) mitigates heat in surrounding areas through enhanced evaporation, provision of shade, and improved air circulation, which is demonstrated a crucial pathway to reduce urban humid heat in a recent global scale work (Yang et al., 2024). While several studies have examined specific UGS types and their cooling effects in relation to landscape features and neighboring land uses (Aram et al., 2019; Wu et al., 2025), few have assessed the cooling potential of UGS in conjunction with public health benefits or explored the spatial mismatches from a regional scale, hampering effective planning.

Our study utilized survey data from 124,390 adolescents across six cities in China's Greater Bay Area, alongside land use data (30m resolution) and monthly climate data (1km resolution). We applied a random forest method to develop an atmospheric temperature prediction model, incorporating land use, NDVI, and various climate indicators, achieving an average accuracy exceeding 0.95. We evaluated four distinct planning approaches for introducing new UGS: expanding existing large UGS, expanding existing small UGS, establishing new large UGS, and creating new small UGS. All proposed UGS were based on patches that were bare ground during the survey period, with their average NDVI values equal to the existing UGS. We integrated simulated scenarios with the temperature prediction model and linked these to a nonlinear regression model analyzing sleep disorder risks. Our findings indicated that adding approximately 2.3 square kilometers of new UGS significantly reduced the risk of sleep disorders for about 50% of the sampled adolescents. Expanding existing large UGS benefited the largest number of samples, while expanding existing small UGS yielded the lowest Gini coefficient for sleep disorder risks across all samples, indicating the most equitable outcomes. Establishing new small UGS had the least impact on cooling and health benefits, likely due to their location in suburban areas.

The four scenarios we analyzed highlight the common trade-offs between economic and social factors in urban planning. In China, the hierarchical breakdown of land use indicators at the provincial, municipal, and county levels serves as a widely utilized policy tool often accompanied by mandatory UGS requirements (Lin et al., 2023). Selecting small, low-value bare land patches to meet these requirements is cost-effective and minimizes social issues; however, it may lead to inefficient resource use considering climate and public health benefits. Conversely, expanding existing large UGS in city centers incurs high development costs due to premium land values, presenting potential challenges. As public health and its equity in the planning and development of UGS has often been neglected in past practices, it is essential to prioritize these factors to attain more effective and sustainable outcomes.

Social Cohesion and Place Attachment in Wildfire and Flood Mitigation in Southern California's WUI

Abstract ID: 1844.0.0.636.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Omar Perez Figueroa [University of Illinois at Urbana-Champaign] operez10@illinois.edu, presenting author

Aishwarya Borate [University of California Irvine] aborate@uci.edu

Douglas Houston [University of California, Irvine] houston@uci.edu

As climate change intensifies the frequency and severity of wildfires and floods, understanding the social factors that influence mitigation behavior is increasingly critical for planning and disaster resilience. This research examines the role of social cohesion and place attachment in shaping residents' engagement with wildfire and flood mitigation efforts in the Wildland-Urban Interface (WUI) of Southern California. Given that community-focused mitigation strategies rely on collective action, this study seeks to answer the following research questions: How do social cohesion and place attachment influence individual and collective mitigation behaviors for wildfire and flood risks and what socio-demographic and structural factors mediate the relationship between social cohesion, place attachment, and mitigation behavior?

To address these questions, this study employs a structural equation model using a survey of over 500 residents of WUI communities in Southern California. The dataset includes key variables such as homeownership status, length of residence, vegetation density, social cohesion, and place attachment scores. The model examines the relationship between these factors and self-reported mitigation actions, including structural measures, defensible space creation, and participation in community-wide disaster preparedness initiatives. Findings indicate a significant positive association between social cohesion, place attachment, and mitigation behavior. Specifically, social cohesion is strongly correlated with wildfire mitigation behavior and moderately correlated with flood mitigation efforts. Similarly, place attachment is positively associated with both wildfire and flood mitigation behaviors. Notably, homeownership status is positively associated with wildfire mitigation actions, though not significant for floods.

These findings have important implications for planning scholarship and practice. First, they underscore the need for community-focused mitigation planning that leverages existing social networks and neighborhood cohesion to promote resilience. Programs that enhance social capital—such as neighborhood fire-safe councils, community flood preparedness groups, and participatory risk communication strategies—could significantly improve risk mitigation efforts. Second, the differential effects observed between wildfire and flood contexts highlight the importance of place-specific strategies in resilience planning. Wildfire mitigation appears to benefit more from community cohesion, while flood mitigation behaviors may be shaped by additional structural or policy-driven factors. For planning education, these findings contribute to the growing discourse on social dimensions of hazard mitigation by providing empirical evidence on the role of social cohesion and place attachment in disaster preparedness.

In conclusion, this study emphasizes that building resilient communities requires more than physical infrastructure—it necessitates fostering social connections, strengthening residents' attachment to place, and leveraging these ties for collective action. By recognizing and integrating social cohesion and place attachment into risk reduction strategies, planners can enhance both individual and community-level disaster preparedness, ultimately mitigating the impacts of climate-driven hazards in the WUI.

Socially Just Green Stormwater Infrastructure Solutions for Urban Flood Risk Management?

Abstract ID: 1844.0.0.544.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Qinquin Liu [University of Wisconsin–Madison] qliu329@wisc.edu, presenting author

The growing frequency of extreme storm events has prompted more U.S. cities to adopt small-scale, onsite Green Stormwater Infrastructure (GSI) to mitigate localized flooding. As a result, regional GSI plans have been widely shared and adopted among municipalities (Axelsson et al., 2021). Importantly, flood exposure is unevenly distributed—it disproportionately affects socially vulnerable populations (Cutter et al., 2013). Prioritizing GSI allocation to “high flood-risk areas”—where high flood exposure intersects with high social vulnerability—is therefore essential for socially just flood risk management (Chakraborty et al., 2023). This underscores the urgent need to assess how effectively implemented GSI plans direct resources to areas with greater flood mitigation needs (Matsler et al., 2021).

This research uses Milwaukee, Wisconsin, as a case study, given its leadership in GSI implementation, substantial socially vulnerable population, and influence on GSI policy development in other municipalities (Hopkins et al., 2018). It examines whether Milwaukee’s formal GSI plans (2014–2024) prioritized resource allocation to high flood-risk areas, compared to the earlier period (2004–2013) when no formal plan was in place. Specifically, it analyzes whether census block groups (CBGs) with higher flood risk were more likely to receive GSI investments during each period.

The analyses compare two definitions of flood risk (FR): an integrated index combining flood exposure and social vulnerability, and the city’s official definition. Flood exposure is proxied using wet basement records from storms exceeding the 10-year return period (2008–2010), while social vulnerability is measured using the CDC’s Social Vulnerability Index (SVI). The city-defined FR is represented by a composite score based on five weighted factors outlined in Milwaukee’s GSI plans, which do not incorporate SVI. Three additional control variables from the same plans are included: a GSI Implementation Opportunity Index (based on 13 weighted factors), a Water Quality Control Priority Index, and a GSI Implementation Feasibility Index. All variables are measured at the CBG level, except SVI, which is at the census tract level.

Given the limited GSI implementation prior to 2013, Binary Logistic Regression is first used to examine the association between FR and the presence of GSI (binary) across all CBGs. Ordinary Least Squares (OLS) regression is then applied to the subset of CBGs with implemented GSI to assess the association between FR and GSI storage volume (continuous). Hierarchical Linear Models (HLM) are used to assess the influence of spatial hierarchy on model outcomes. SVI scores are averaged separately for the pre- and post-2013 periods to account for changes in the index’s composition. All models include a time dummy variable and interaction terms between the post-2013 period and key independent variables to assess whether the effects of FR and other factors on GSI outcomes changed following the adoption of formal plans. Factor analysis is conducted to generate data-driven weights for comparison with the city-defined weighting scheme.

Regression results indicate that the GSI Opportunity Index remains a significant predictor of GSI distribution ($p < 0.05$) across all models in both periods. Prior to 2013, flood exposure is negatively associated with both the presence and storage volume of GSI ($p < 0.05$). After the adoption of formal plans, its association with storage volume becomes positive ($p < 0.05$), while the negative association with GSI presence persists ($p < 0.05$). Notably, the interaction between SVI and flood exposure in the post-2013 period yields a negative coefficient ($p < 0.05$) in

both OLS and HLM models, suggesting that the GSI plans and policies may have unintentionally reinforced inequities in flood risk management.

The Impact of Multi-Level Funding Structures on Flood Relocation Programs in the U.S. Mid-Atlantic

Abstract ID: 1844.0.0.144.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Melissa Tier [Princeton University] mtier@princeton.edu, presenting author

The limited number of climate-induced planned relocation programs that have occurred in the U.S. have largely been tackled through government-funded home buyout and acquisition strategies (Siders & Gerber-Chavez, 2021). Of particular importance is ensuring more distributive, procedural, and other forms of environmental justice – especially given that current data suggest unevenness in both access to and outcomes from such programs. Evidence consistently shows that relocation programs have suffered from long wait times, complex and uncoordinated multi-level governance processes, inadequate federal funding, lack of transparency, and insufficient monitoring and evaluation, among other concerns (CRS, 2024; Siders & Gerber-Chavez, 2021; Weber & Moore, 2019).

A 2024 Congressional Research Service report’s list of recommended improvements includes: dedicated funding for buyouts, pre-approval of buyouts before disasters, and ensuring affordable housing. Siders & Gerber-Chavez (2021) also recommend state programs that maximize stable, local funding – as opposed to sporadic funding via federal disaster appropriations. Despite these recognized needs, there has been little research on the funding mechanisms utilized by existing relocation programs. Many programs, in fact, incorporate multiple funding streams – due in large part to the fact that there is no one federal program or grant structure that oversees buyout implementation at the state or local level.

In this research project, I take a bottom-up approach to addressing the knowledge gap of how relocation programs are funded and how these funding structures impact equity-based planning and outcomes. First, I conducted detailed archival and interview data analysis on New Jersey’s multi-decadal, state-run buyout program, Blue Acres. I document how each state/federal pot that provides money to Blue Acres has its own stipulations for: appraising the fair-market value of a property, determining which properties are prioritized as high flood risk, which homeowners are considered vulnerable or disadvantaged, what is done with the land after a purchase, and so on. Municipal land use laws and local relocation incentives add to the complexity of the Blue Acres program’s structure, all in all creating a dizzying range of possibilities even within a singular program.

Second, I compare these results in NJ to parallel data collected from other programs in the Mid-Atlantic urban corridor: two post-Hurricane Sandy programs that have since ended (New York City’s Build It Back and New York State’s NY Rising) and four programs currently in design (Rainproof NYC “flood mobility”; NYS Blue Buffers buyout program; a secondary NYS managed retreat initiative; and Philadelphia’s to-be-named flood relocation initiative). As with NJ Blue Acres, these other programs draw on heterogenous funding sources that intersect with federal, state, and municipal policy. I compare these programs’ eligibility criteria, use of social vulnerability indicators, and definitions of climate and environmental justice communities.

Finally, I offer recommendations for improved urban relocation policies in the coming years – such as increasing community-driven planning, engaging with private-sector voluntary consensus standards, experimenting with innovative funding opportunities. Finally, I discuss ways in which these case study buyout programs, and the funding sources that they rely on, are resilient and ways in which they are vulnerable to targeted assaults under the current federal administration.

The Lahaina Wildfire: A Case Study in Polycrises and the Struggle Against Colonial Water Legacies

Abstract ID: 1844.0.0.211.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Chaeri Kim [Simon Fraser University] chaerik@sfu.ca, presenting author

Aida Arik [University of Grenoble Alpes, Laboratoire ÉcoSystèmes et Société En Montagne] aida.arik@inrae.fr

A budding scholarship on climate “whiplash”—referring to the massive interannual swings in climate events—is predicting greater frequency and intensity of these types of events, especially with regard to precipitation (Chen et al., 2022). Climate whiplash has additionally been linked to an increase in disaster events, such as wildfire recurrence (Homann et al., 2022). At the interface of the built and natural environment, cities and their infrastructures are grappling with compound crises driven and amplified by these devastating climate swings. Crisis events that are simultaneous but intricately linked, amplifying vulnerabilities through complex feedback loops have been referred to as “polycrises” (Lawrence et al., 2024). These types of crises span spatial, temporal, and institutional boundaries, challenging systems of governance and efforts towards better and just management. Nonlinear feedback loops introduce uncertainties, where actions taken to address one crisis may inadvertently exacerbate others.

The Lahaina wildfire of August 8, 2023, vividly exemplifies cascading risks and their compounding effects. While several synchronous system, management, and response failures led to complete devastation and destruction of the town within the span of a day, a broader time perspective reveals a long-standing struggle for indigenous Hawaiian land and water rights in legacy settler colonial water systems (Apoliona-Brown, 2025). This was further revealed through a debate over water management that was carried out through national media outlets following the Lahaina wildfire.

In this paper, we analyze two aspects of the Lahaina wildfire. First, we use the polycrisis framework (Lawrence et al., 2024) to analyze the events that fueled the devastation of the town of Lahaina. We situate this in the anticolonial management literature (Martinez et al., 2023) for a deeper understanding of the environmental justice aspects of this crisis event. Second, we consider how the discourse surrounding water management during and after the fire quickly became polarized and threatened decades of collaborative water management efforts. Findings from a Q-method study conducted shortly after the Lahaina fire add empirical evidence of this. We liken this to ‘public discourse whiplash,’ where crises lead to a resurgence of modernist thinking (e.g., singular and centralized engineering solutions, top-down management) rooted in a nostalgia for “what used to work.” The fallacy in this thinking lies in misplacing nostalgia in outdated water management strategies, rather than in the more stable climate regimes on which those strategies were originally based.

The Lahaina wildfire underscores the importance of systemic adaptation planning and strategies to address interconnected risks; it also highlights the role and vulnerability of environmental justice in catastrophic events and the need to resist backsliding into old management regimes.

The Nature of Dispossession: Private Trees, Public Policy, and Environmental Injustice

Abstract ID: 1844.0.0.831.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Rebecca Walker [University of Minnesota] rhwalker@illinois.edu, presenting author

Hannah Ramer [University of Minnesota] hjramer@umn.edu

Alicia Coleman [University of Minnesota] aliciac@umn.edu

Urban canopy is widely promoted as an unquestioned environmental good in cities, touted for providing benefits ranging from improved air quality, stormwater management, and mitigation of heat (McPherson et al. 2005) to decreases in crime and increases in property values (Kuo and Sullivan 2001, Donovan et al. 2021). Yet urban trees can also be experienced as an environmental burden, imposing maintenance costs and threatening damage to private property (Carmichael & McDonough, 2019). Here, through a case study of tree pest management from Minneapolis, MN, we explore this dual nature of urban canopy as both environmental good and burden, the ways those benefits and burdens intersect with notions of public and private realm, and the role of individual socioeconomic status and public policy in mediating the experience of goods and burdens.

We examine the impact of policies public officials implemented to manage the spread of the invasive pest emerald ash borer (EAB) to better understand the environmental justice implications of policies for managing urban nature. Drawing on qualitative interviews, document review, and spatial mapping, we evaluate EAB management approaches that aimed to protect the health of the urban canopy. We consider how racial and class inequalities shaped the development, implementation, and impact of these policies. In particular, we consider the use of an ordinance authorizing the condemnation of infested trees on private property to prevent further spread of the pest. Through this policy, the city's forestry department required the removal of thousands of private ash trees, with homeowners responsible for the cost of removal. Such costs can range from a few hundred to several thousand dollars per tree, resulting in substantial financial burdens for low-income homeowners or those living on a fixed-income. When homeowners cannot afford to pay the fees upfront, they become liens on the property, creating a new risk of tax delinquency and potential property loss through tax forfeiture. Public officials framed the tree condemnation as providing a service to residents; they reasoned that removing infested ash trees prevented safety hazards and the assessment process offered the option of spreading the cost out over multiple years. Further, citing the decades-long practice of condemning private trees for Dutch elm's disease, public officials were caught off guard by the intensity of community pushback that erupted in 2022 over the growing financial burden of ash tree condemnations. In contrast, this policy was experienced by low-income residents as an undue burden, a violation of private property rights, and an undermining of their access to the environmental benefits provided by trees. Eventually, in response to sustained community pressure, public officials secured federal and private philanthropic funding for programs to assist some homeowners with the cost of tree removals. However, for many residents the assistance came too late. Furthermore, it's unclear how many private ash trees remain in the urban canopy.

Although "race-neutral" in its design, we show the disproportionate financial and environmental impact of this policy on low-income communities and communities of color, resulting in the extraction of wealth from one of the city's most disadvantaged neighborhoods and the deepening of disparities in access to tree canopy and associated benefits. This case of forced tree removal demonstrates how—in the context of stark and racialized inequalities in wealth and the environment—managing urban nature through the administration of fees, costs, and fines linked to property rights, can undermine individual access to homeownership, and introduce a new vulnerability to

dispossession, and exacerbate inequalities in the benefits of urban nature. This work informs broader conversations about how we design policies to manage urban nature that advance more just and sustainable urban futures.

The Uneven Emotion of Green: A Multi-Scalar Analysis of Urban Park Sentiment in Detroit

Abstract ID: 1844.0.0.579.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Qiuyi Yang [University of Michigan Ann Arbor] qiuyi@umich.edu, presenting author

Urban parks constitute an integral component of the urban fabric, contributing not only to the aesthetic, ecological, and economic dimensions of the city, but also functioning as essential social infrastructures that foster community interaction and cohesion (Mullenbach, 2022). Beyond availability and accessibility, the vibrancy of these spaces, particularly how people perceive and emotionally respond to them, constitutes an essential dimension of urban placemaking (Huai & Van de Voorde, 2022). In shrinking cities like Detroit, long-term disinvestment and neighborhood transformation have led to uneven patterns of park use and satisfaction (Park et al., 2024). Observed disparities in both visitation and sentiment across parks and time raise critical concerns about spatial justice in urban green space (Kong et al., 2022; Liang & Zhang, 2021). Grounded in this context, the study seeks to answer the following research questions: (1) Which built environment features and activities contribute to positive or negative sentiment in urban parks, and how do these associations vary across parks with different seasonal and intra-day visitation profiles? (2) How does neighborhood context moderate the relationship between built environment features/activities and public sentiment?

This study integrated monthly mobility data from Advan and user-generated Google reviews for over 100 neighborhood parks in Detroit between 2021 and 2023. First, clustering techniques (e.g., dynamic time warping) were used to identify temporal usage types based on seasonal and intra-day visitation trends. User sentiment was quantified using natural language processing, producing a continuous sentiment score for each review. Built environment features and user-reported activities were extracted from the reviews and coded as binary indicators. A linear mixed effects model was employed to estimate how these features predict sentiment, controlling for unobserved heterogeneity at the park and monthly levels. This study further stratified the analysis by visitation type to assess temporal variation through subgroup regressions. A random forest model was used as a robustness check to capture potential non-linear and interactive effects. Finally, interaction terms were included to evaluate how neighborhood context moderates the impact of built environment features on user sentiment.

Preliminary findings suggest that features such as cleanliness, lighting, and playground facilities are significantly associated with higher sentiment scores, while mentions of safety concerns, poor maintenance, or lack of programming predict lower scores. The strength of these associations varies across park types. Neighborhood-level factors, including socioeconomic distress and land use diversity, moderate these effects: in distressed areas, basic infrastructure has a stronger influence on sentiment, whereas in gentrifying neighborhoods, aesthetic and cultural elements matter more.

This study advances an integrative, data-driven approach to understanding public perceptions of urban parks under conditions of urban decline. By combining mobility data and sentiment analysis within a robust modeling framework, it highlights how spatial and temporal disparities in park experience reflect broader social inequities. The findings provide actionable insights for planners aiming to prioritize equitable investment and responsive design strategies in neighborhood green spaces, especially in cities facing demographic and structural transitions.

The Vertical Premium: Relationship between Relative Height from Flood Elevation and Housing Prices

Abstract ID: 1844.0.0.90.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Youjung Kim [University of South Florida] youjungkim@usf.edu, presenting author

Bon Woo Koo [Yonsei University] bonwookoo@yonsei.ac.kr

Sungmin Lee [Texas A&M University] sungminlee@tamu.edu

Background: Flooding is one of the most common natural disasters globally. Despite continuous efforts by Canadian and local administrators' efforts to mitigate flood hazards and regulate development within floodplains, the historic trend of catastrophic losses has increased. Notably, the fiscal toll of severe weather events in Canada reached \$2.1 billion CAD in 2021 (IBC 2022). This increase in flood damage was caused by a combination of factors, including extreme precipitation and rising development, alongside escalating asset prices within flood-prone areas (ECCC 2019). The estimated Canadian population residing within 100-year floodplains is approximately 9% (equivalent to 3.31 million people), and this flood-prone population rate is expected to increase due to the influx of population into flood-prone zones (Andreadis et al. 2022).

Previous studies on housing prices near flood-prone areas were conducted by assessing floodplains or proximity to flood risks (Zhang & Leonard, 2019), or by analyzing direct property elevation (Mckinzie & Levendis, 2010). While distance-based assessments may be suitable in areas where land elevation gradually increases with distance, such an approach may not universally apply to all flood-prone regions. Additionally, direct elevation does not fully capture flood risks, as base flood elevations may not be uniform. This study uniquely employs the relative height between a property's elevation and the real flood elevation of the 2013 flood in Calgary, allowing it to accurately depict flood risk in terms of height compared to the absolute ground elevation or the base flood elevation derived from the 100-year floodplain. This study aims to investigate the relationship between relative height and housing prices in flood-prone areas, especially those adjacent to rivers, and assess whether these relationships remain consistent across various distance intervals from the rivers. Our research questions are as follows: 1) To what extent does relative height influence housing prices?, 2) How does the effect of relative height change following a flood event?, and 3) How do variations in distance impact the relationship between relative elevation and housing prices?

Methods: The unit of analysis for this study is single-family residential property sales transactions. We used the hedonic pricing model, including structural, transportation accessibility, location, and neighborhood characteristics. The sales transaction data encompasses a total of six years of transactions, including the three years before and after the 2013 flood event in Calgary. Our study focuses on single-family properties in the riverine areas, located within 1,600 meters of major rivers, namely the Bow and Elbow rivers, which are directly associated with the flood event. Accordingly, our study sample includes 24,488 single-family houses.

Results: Our findings indicate that relative height significantly positively affects property values both pre- and post-flood. Within 200-meter intervals from the rivers, we observe that the impact of relative height intensifies closer to the rivers but diminishes with distance. Specifically, we found a housing value increase ranging from 4.7% before the flood to 6.9%, or from \$28,752 to \$44,608 at the mean, after the flood for every 10-meter increase in height within 200 meters from the rivers. Beyond 200 meters from the rivers, the effect stabilizes while remaining statistically significant up to 1,200 meters. These patterns suggest increased buyer awareness of flood risk following the flood event. Overall, the findings demonstrate that prospective buyers recognize flood risks in riverine areas and are willing to pay a premium for properties at higher elevations.

Individual Paper Presentation Submission

Haowen Xu [Tongji University] tjuhaowen@gmail.com, presenting author

Xiaodong Xu [Tongji University] 2210959@tongji.edu.cn

Shiqi Zhou [Tongji University] zhoushiqi@tongji.edu.cn

With the growing frequency and intensity of extreme rainfall events, urban flooding has emerged as a serious challenge for high-density cities. However, most existing studies have primarily focused on the physical causes and environmental aspects of urban flooding, often overlooking the complex interplay of socioeconomic conditions, land use patterns, and spatial planning that shape risk exposure and unequal allocation of safety resources.

This study focuses on the Guangdong–Hong Kong–Macao Greater Bay Area (GBA), systematically evaluating flood risk and the spatial imbalance in the allocation of safety resources through a multidimensional assessment framework grounded in the “Hazard–Exposure–Vulnerability” (HEV) paradigm. The Dagum Gini coefficient and Lorenz curves are used to quantitatively assess spatial inequities in flood protection resources, enabling an in-depth examination of the severity of resource mismatch and its underlying driving mechanisms. Building upon this, a high-precision, multi-level flood risk prediction model is developed using a Bayesian-optimized LightGBM algorithm. Shapley Additive Explanations (SHAP) are applied to interpret the contributions and interactions of key flood-inducing variables.

The main findings of the study are as follows: (1) The Bayesian-optimized LightGBM model outperforms traditional methods in both predictive accuracy and generalization ability, effectively identifying high-risk areas with significantly lower error rates. (2) A clear coastal-to-inland decreasing gradient in flood risk is observed, with high-risk areas predominantly concentrated in densely populated urban clusters and river-intensive regions. (3) The distribution of safety resources lags behind actual flood risk patterns, and issues such as fragmented urban planning and isolated infrastructure in newly developed areas exacerbate resource inequality and undermine overall flood resilience. (4) The mechanisms driving flood risk show dynamic shifts, with primary contributing factors transitioning from topographic and physical variables at lower risk levels to hydrological and ecological factors as risk levels increase. (5) Impervious surface proportion (ISP) and fractional vegetation cover (FVC) are identified as key determinants of overall flood risk, while soil water retention (SWR) emerges as the dominant factor in high-risk areas.

By innovatively integrating flood risk assessment with spatial equity analysis, this study moves beyond the conventional hazard-centric approach, uncovering the deep-rooted structural inequalities among risk, resources, and spatial governance. The findings offer valuable insights and practical guidance for advancing climate-adaptive planning and equity-oriented policy development in high-density urban environments.

Tracing the Spatial-Temporal Transformation of Environmental Injustice in São Paulo, Brazil

Abstract ID: 1844.0.0.471.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Luisa Duarte Milani [University of Toronto] l.duartemilani@mail.utoronto.ca, presenting author

In this paper, I uncover how the spatial distribution of environmental injustices have changed over the last 40 years in São Paulo. The city, one of the largest in the world, is a key site for studying Environmental Justice (EJ) in the Global South. Similar to the rest of Brazil, São Paulo is defined by segregation and exclusion, which often puts racialized groups in areas of environmental hazards, primarily floods and landslides (Maricato & Colosso, 2021). Environmental injustices in the city are associated with a combination of the longstanding practices of altering waterways and residential/racial segregation. Over the decades, the city and the state of São Paulo have undertaken multiple projects to control the city's rivers, leading to their degradation and an increase in flood events (Bartalini, 2014). Decades of housing segregation have pushed many low-income, mainly Black or Brown, people into informal settlements in areas of floodplains or landslide-prone hills (Maricato & Colosso, 2021). Because of this history, EJ in the city is intrinsically connected to housing issues. Although policies that aim to tackle the problem have existed since the 1960s, little progress has been made (Maricato & Colosso, 2021). At the time of this research's development, there are no known studies that mapped the recent history of socio-spatial changes across São Paulo.

To understand the changes in environmental injustices in relation to informal housing, I compare demographic changes in the city from the past four national censuses (1991, 2000, 2010, 2022) at the census tract level. I also use historic aerial imagery to trace changes in the urban occupation across the years. This timeframe was selected to coincide with the period of democratic government in Brazil, since the current constitution was enacted in 1988. This spatial analysis will be a tool to analyse the impact of policies on the city's development. My research engages with theories of EJ which suggest that injustices are historically (re)produced through state practices (Horowitz, 2020) and with governance theories, which admit that power is not centralized in the state (Ansell & Torfing, 2022), showing "... how different actors, jurisdictions, levels and institutional arenas interact to exchange knowledge and ideas, coordinate action and collaborate in making authoritative decisions that produce collective outcomes." (Ansell & Torfing, 2022, p.1).

Research in the Global North that has traced the historic evolution of EJ in different cities largely focuses on state actions (Horowitz, 2020). However, in the Global South, urban informality is both an epistemology and a mode of urbanization, practiced both by the rich and poor and facilitated by the state (Roy, 2016). The governance processes that lead to environmental injustices in the Global South are different in the Global North, however, little is known about this process. Emerging approaches to environmental justice research in the Global South often establish a binary relationship between informality and the state, with the state being the main actor keeping informal housing in areas of environmental risk. My approach encourages a more nuanced understanding of how environmental injustices are produced and maintained in the Global South. Identifying spatial changes is the first step into assessing if policies are being effective and what other non-state forces are influencing spatial changes. This way, this research advances EJ frameworks by including other governance aspects beyond state practices. Preliminary results show vulnerability moving outside of city limits, raising the possibility of policies effectively reinforcing spatial segregation.

Shima Hamidi [Johns Hopkins University] shamidi2@jhu.edu

As urbanization accelerates, the urban heat island (UHI) effect has become increasingly severe worldwide (Zhang et al., 2024). This phenomenon leads to higher energy demands in buildings, greater carbon emissions, and serious health risks for urban populations, e.g., a total of more than 14,000 Americans have died directly from heat-related causes since 1980 (He et al., 2020; Yang et al., 2020). Existing research has explored how urban morphology, human activities, and building design contribute to UHI formation (Lopes et al., 2025).

However, there exists little evidence on the spatiotemporal effects of urban expansion patterns on changes in air temperature over time. An overdue yet unanswered question is whether and to what extent different patterns of new developments (infill development vs. suburbanization) affect the increase in air temperature in urban sections of metropolitan areas over time.

This study employs a longitudinal approach to examine the impacts of urban expansion patterns on heat intensity (measured as changes in high-resolution surface temperature) between 2010 and 2020 across 350 MSAs in the U.S. Our unit of analysis is the high-resolution Local Climate Zones (LCZs) within MSAs developed by Qi et al. (2024) which classifies built-up urban areas into 10 classes from compact high-rise to sparsely built and heavy industry. Changes in Urban expansion is measured using changes in total business and housing unit data across the first ten LCZ classes, including compact built-up areas (LCZ 1–3), open built-up areas (LCZ 4–6), lightweight low-rise (LCZ 7), large low-rise (LCZ 8), sparsely built (LCZ 9), and heavy industry (LCZ 10), capturing the growth of built-up areas within MSAs.

This study aims to address the following questions: (i) How has urban expansion patterns evolved from 2010 to 2020 across different urban classes? (ii) To what extent does urban expansion occur in compact, open, and low-density areas? (iii) How is the change in urban expansion in different urban classes affect changes in urban heat intensity between 2010 and 2020?

The results indicate that most urban expansion occurred in open and sparsely built-up areas, reflecting an increase in suburbanization rather than infill development. Additionally, MSAs with new developments in low-density urban classes (LCZ 6–10) experienced a greater increase in per capita temperature between 2010 and 2020.

The findings of this study have significant implications for urban planning and climate adaptation strategies. The observed trends of urban expansion occurring primarily in open and sparsely built areas suggests a shift towards urban sprawl rather than compact, infill development. This pattern contributes to greater land consumption, increased car dependency, and higher per capita temperature rise, particularly in MSAs where low-density urban classes (LCZ 6–10) have expanded the most. These insights highlight the need for policies that promote sustainable urban growth, such as densification and green infrastructure integration, to mitigate the adverse effects of urban heat islands and enhance climate resilience in rapidly growing metropolitan areas.

Transforming Local Energy Policies with AI-Driven Solutions

Abstract ID: 1844.0.0.1061.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Ayesha Islam [New York University] ai2702@nyu.edu, presenting author

Anton Rozhkov [New York University] anton.r@nyu.edu

Ladan Mozaffarian [University of Oklahoma] ladan.mozaffarian@ou.edu

In the age of AI-driven solutions, a transformative opportunity to improve climate adaptation and energy security policies appears within hyperlocal geographical locations, such as our test case with Tribal Nations in Oklahoma. Tribal communities face complex climate challenges, such as extreme weather events, water shortages and agricultural shifts (Whyte 2013). At the same time, they are under-resourced communities that can be revitalized if barriers such as regulatory complexities, funding limitations and equity disparities can be mitigated. Our research proposes an AI-driven geographical analysis approach to policy planning that can improve regulatory equity for tribal communities.

One of the greatest challenges in creating equitable regulations for tribal communities is a lack of understanding of the cultural and land-based nuances that policymakers must account for when developing policies for these communities (Schelly et al. 2020). AI can streamline this process to make information more accessible for both policymakers and community leaders to improve their understanding of one another. Developing these digital tools by automating extensive policy documents across tribal, state and federal levels can consolidate relevant works for stakeholders to improve the policy design process. Alignment with tribal sovereignty, historical effects of similar policies, economic growth and cultural preservation can be extracted as key insights to deliver these results. AI-driven Geographic Information Systems (GeoAI) and predictive analytics can enable us to visualize climate risks (Rawat et al 2024) and tribal energy potential (Kausika et al. 2021); for example, the use of satellite imagery with vision-based deep-learning models and machine learning models can assess land suitability for solar and wind energy projects while factoring local sentiments, fair access to the resources, economic disparities, land availability, cultural significance and more.

This work aims to introduce tools to democratize the decision-making process through available data and modeling processes. AI-powered governance tools allow tribal communities to engage the policy-making process by providing real-time feedback and determining alignment with local sentiments concerning land preservation, land priorities and local uses of their space. By the integration of AI-driven sentiment analysis and predictive modeling, policymakers can use insights to address equity-related concerns and ensure fair use of tribal resources. Moreover, reinforcement learning algorithms can optimize energy solutions by simulating policy scenarios; these simulations assess the impacts of various energy incentives (mainly renewable), funding mechanisms and policy adjustments, providing data-driven recommendations for improved policy design. AI can even automate grant application processes to connect tribal communities with appropriate funding sources, thus reducing bureaucratic obstacles to sustainable energy access.

This research thus aims to bridge the gap between policy innovation and responsible AI-powered recommendations to empower tribal communities with community-centric energy strategies that are sustainable and can be beneficial for all members of the communities. Furthermore, the proposed framework is designed to be adaptable, allowing its application to other territories, local communities, and regions seeking to integrate AI-driven insights into their energy policies. By tailoring the model to specific cultural, environmental, and economic contexts, this approach can foster resilience and sustainability in diverse energy ecosystems.

Uncovering Spatial Disparities to Reduce Flood Risks for Mobile Home Parks in Nebraska

Abstract ID: 1844.0.0.52.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Zhenghong Tang [University of Nebraska-Lincoln] ztang2@unl.edu, presenting author

Yunwoo Nam [University of Nebraska-Lincoln] ynam2@unl.edu

Jesse Andrews [University of Nebraska-Lincoln] jandrews30@unl.edu

Mobile homes provide an essential yet highly vulnerable source of unsubsidized affordable housing in the United States, particularly in rural areas. This study examines the spatial distribution and flood risk exposure of Mobile Home Parks (MHPs) in eastern Nebraska after their 2019's historical flood disaster event using high-resolution building footprint data and FEMA flood maps to assess disparities in flood vulnerability and inform resilience planning. A structure-level analysis and network assessment highlight substantial differences in vulnerability profiles. Rural Dodge County exhibits the highest risk, with half of its MHP units located in high-risk flood zones and lacking levee protection. In contrast, urban Douglas County has lower exposure, and suburban Sarpy County has no exposure. Network analysis shows that parks with higher flood exposure often have lower connectivity indices, compounding evacuation challenges. Despite these risks, Dodge County experienced steady MHP growth from 2018 to 2024, outpacing both Douglas and Sarpy counties. These patterns underscore how infrastructure investments and governance approaches vary across jurisdictions, influencing flood resilience. The 2019 floods further emphasized these disparities: Douglas County's robust levee system successfully protected MHPs, whereas Sarpy County experienced levee failures that led to localized damage. Dodge County, lacking comparable flood protection, suffered severe inundation. These findings illustrate how disparities in infrastructure investment, regulatory frameworks, and socioeconomic conditions shape MHP flood vulnerability, necessitating targeted policy interventions.

Findings reveal significant variations in flood risk exposure based on geographic context. Rural MHPs face disproportionately high exposure to FEMA-designated high-risk flood zones, while urban and suburban MHPs experience lower levels of risk despite their proximity to flood-prone areas. Preliminary analysis indicates a positive correlation between MHP growth and flood zone exposure, suggesting that high-risk areas are seeing increased park development. Additionally, variations in park characteristics—such as size, density, and connectivity—further influence flood vulnerability.

This study underscores the urgent need for flood resilience planning to mitigate disproportionate risks faced by MHP residents, particularly in rural areas. By employing structure-level analysis, this research offers a more precise understanding of flood vulnerability than traditional parcel- or census block-level approaches. Insights from this study can help policymakers, urban planners, and disaster management professionals develop more effective flood mitigation strategies to enhance community resilience among MHP residents.

Though it is easy to imagine that municipal utilities and related infrastructure providers consider community interests when making capital investments to improve resilience, the reality is that utilities often lack basic information about community preferences. This paper presents research designed to provide electric utilities with community preferences for facilities of interest for continued operation during power outages.

From June to October 2024, a team from the University of Washington Urban Infrastructure Lab and the University at Buffalo carried out research on this question in the city of Seattle. The research, conducted in partnership with municipally-owned Seattle City Light, consisted of a household survey (n = 117) and three focus group sessions with survey respondents conducted in economically disadvantaged areas of the city. Focus group sessions gave survey respondents the opportunity to discuss the reasoning behind choices made in the survey and, employing a modified Delphi method, to distill community preferences down to top ranked choices, reaching consensus regarding suggested capital investments for the utility.

Conducted across six neighborhoods (8 census tracts) in the city, this community-engaged research revealed household-level needs, preferences, and particular sensitivities during power outage. Survey results highlight facilities that residents use every day (blue sky events) and those that would be critical to remain open during power outages (black sky events). Locations featuring bundled services such as grocery stores, gas stations, and pharmacies clustered in proximity to one another were highly frequented by respondents. During black-sky events, residential homes were identified as important service-providing locations, particularly for meeting needs that many public locations lack (e.g., cooking, charging, washing). Respondents also preferred these locations for their safety, comfort, and familiarity.

A subset of households frequent services critical to health, such as dialysis centers, doctors' offices, and food banks, on a daily or weekly basis. This population was more likely to visit all points of interest more frequently than the rest of the responding households. Dependence on dialysis centers, importantly, was entirely within the non-white population. Notably, research results emphasized facilities that were not already slated for or provisioned with renewable or back-up power systems, either due to being classified as government-owned or qualification as critical infrastructure (e.g., community centers and hospitals).

Results show that the process of community-engaged electric utility planning can be leveraged to help address inequities and reduce the social impacts of future power outages. This research was part of a larger project supported by the National Renewable Energy Laboratory (NREL), funded by the US Department of Energy, and

conducted in partnership with Electric Power Research Institute (EPRI) to integrate the outcomes of community-engaged research into the analytic metrics of utility planning.

Uneven Burdens of Heat: Health Disparities and Planning Implications across Urban and Rural Texas

Abstract ID: 1844.0.0.153.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Kijin Seong [The University of Texas at Austin] kijin.seong@austin.utexas.edu, presenting author

Akhil Mandalapu [Harvard Medical School] akhilm@utexas.edu

Junfeng Jiao [University of Texas at Austin] jjiao@austin.utexas.edu

As climate change accelerates, extreme heat events pose a growing public health challenge—one that is often unevenly distributed across communities. This study examines spatial disparities in heat-related emergency department (ED) visits across urban and rural areas of Texas, addressing three key questions. First, it maps the spatial distribution of ED visits for heat-related diagnoses and examines how patterns differ by admission severity (outpatient vs. inpatient). Second, it examines how heat vulnerability factors—such as heat exposure, socio-demographic sensitivity, and adaptive capacity—impact the severity of heat-related illnesses and ED hospital admissions across zip codes. Third, it explores how urban and rural planning strategies can mitigate these disparities and inform more effective climate adaptation efforts.

To address these questions, we assembled a comprehensive dataset at the Zip Code Tabulation Area (ZCTA) level across Texas ($n = 1,660$), integrating health, environmental, and socio-demographic data. Heat-related ED visit records for 2019–2023 from the Texas Department of State Health Services were linked with community attributes from the American Community Survey, U.S. Climate Reference Network data, tree canopy, and land cover data from the National Land Cover Database. Using this integrated dataset, we employed negative binomial regression models to examine the associations between heat-related ED visit rates and environmental and socioeconomic variables. Interaction terms between extreme heat and urban (versus rural) status were included to test how heat impacts differ by community type.

The results reveal pronounced spatial disparities: urban ZCTAs in Texas experience substantially higher volumes of heat-related ED visits, with more cases requiring inpatient admission. Extreme heat exposure—measured by the maximum heat index—proved to be a robust predictor of increased ED visit rates across all types of heat-related diagnoses. ZCTAs with limited access to air conditioning, higher road density, and a greater proportion of children experience significantly higher rates of heat-related ED visits. Moreover, while urban areas exhibit a stronger impact on extreme heat in terms of ED utilization among both inpatients and outpatients, our interaction analysis indicates that heat-related ED visits rise more steeply in rural areas as the maximum heat index increases – highlighting heightened vulnerability and potentially lower adaptive capacity.

These findings carry implications for planning practice in climate adaptation policy. Targeted interventions—such as expanding urban tree canopy, preserving parks and greenbelts, and reducing impervious surface coverage—can help lower ambient temperatures and alleviate heat-related health burdens in neighborhoods. At the same time, the disparities between urban and rural areas underscore the need for context-specific adaptation measures: rural communities would benefit from dedicated cooling centers, improved healthcare outreach for outdoor workers during extreme heat events, and programs to increase residential HVAC access for vulnerable households. Integrating health metrics and heat vulnerability indicators into planning processes can guide more equitable climate resilience strategies, ensuring that the most heat-vulnerable populations are better protected against the escalating risks of extreme heat.

Unveiling the Invisible Forest: Conservation Easement Trends in Urbanizing Counties

Abstract ID: 1844.0.0.823.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Caitlin Dyckman [Clemson University] cdyckma@clemson.edu, presenting author

Stella Watson Self [University of South Carolina] scwatson@mailbox.sc.edu

David L. White [Clemson University] whitedl@clemson.edu

Anna Treado Overby [US Forest Service] anna.overby@usda.gov

Conservation easements (CEs) are the predominant mechanism to limit or stop growth on private lands in the United States (US). The reasons for CE ubiquity are variable and contextual, but can be attributed, in part, to governmental support of the instrument in lieu of other land conservation options. Possible CE placement drivers both posited and proven in the CE literature include: policy (nonprofit, local, state, and federal), federal and state fiscal tax incentives, landowner's ecological ethos, the size of the CE parcel, the type of land use underlying the CE parcel, and expansive purposes permitted for a valid CE. The Uniform Conservation Easement Act (UCEA), drafted by the American Bar Association from 1978 – 1980 and used as a model for at least 22 state CE enabling laws, has a very broad definition of CE purpose, allowing many potential purposes/forms of public benefit. Under the UCEA and the federal tax code, CEs are predominantly perpetual (except where prohibited by state law), and theoretically unalterable—unless there are changed conditions that alter their utility and/or defeat their purpose, nullifying the CE. Once they are in place, the CE purposes don't shift.

Concurrently, there is a pervasive and growing concern regarding tax abuse associated with their placement, given the huge societal investment in CEs and the requirement for some form of public benefit, in return. Since the mid-2000s, two policy trends may be altering CE use. The first is a call for greater transparency in CE placement and characteristics through national and/or state CE databases and/or registries (e.g., the National Conservation Easement Database). The second is a predominantly academic call for greater uniformity in CE drafting (McLaughlin & Pidot, 2013) even with the UCEA and accountability with (some of) the CE-holding entities to curb tax abuse (Cheever 1996; Pidot 2005). As a complementary aspect of this second call, several legal scholars (Flynn, 2021; Jay, 2022) suggest that there is a need to revise the "conservation purposes" section of the federal tax code.

Before introducing changes to the tax code, we need to understand the extent of its actual influence on CE instruments' design, the land trusts (LTs) who hold them (and their decision-making process), and the CE donor's objectives. Accordingly, we amassed a database of information on CE location and characteristics in rapidly urbanizing areas of the US, choosing counties in states with urbanization pressures, 25 or more CEs by county, exurban character and Level 1 ecoregion exemplification by size and representativeness. These counties include Sonoma and Sacramento, CA; Boulder and Mesa, CO; Douglas and Washington, MN; Lebanon and York, PA; Charleston and Greenville, SC; and Albemarle and Loudoun, VA. We collected 2823 CEs placed between 1997 and 2008/2009 and used intercoder reliability checks to develop our coding instrument through an iterative process for the CE purposes. Two research team members conducted semi-structured interviews with almost half of the land trusts in the study counties and first cycle coded these results using descriptive coding. Finally, we administered a survey to the population of CE donors listed in the CE instruments themselves. Our triangulated results allowed us to examine whether there is a significantly increasing use of direct IRS code language in the CE instruments over time, which may indicate a concern with compliance and a move toward uniformity. We also revealed the complex relationship between donative intent, LT conservation objectives, the reasons for the CE drafting approaches, and

the roles of policy accountability (institutionally) and federal tax regulations. These results will inform the direction of a tool whose ubiquity is impacting great volumes of land and its use in the US.

Urban Adaptation Trajectories: A Decade of Climate Discourse and its Implications for City Planning

Abstract ID: 1844.0.0.917.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Laura OConnell [University of Minnesota] l.katieoconnell@gatech.edu, presenting author

Nisha Botchwey [University of Minnesota] botchwey@umn.edu

Over the last decade, public discourse surrounding climate change has undergone a significant transformation, shifting from abstract future projections to immediate adaptation imperatives. This evolution reflects changes in urban planning approaches, which have increasingly transitioned from technocratic mitigation strategies to more complex frameworks that integrate adaptation, resilience, and justice considerations (Fitzgerald 2022; Goh 2022). In this context, understanding the nuances of how climate discourse has evolved offers valuable insights for planning practitioners seeking to address the growing urgency of climate impacts in urban environments.

By examining social media discussions about climate change, this paper investigates the following question: How has public discourse around urban climate adaptation evolved over the past decade, and what implications does this evolution have for urban planning theory and practice? To address this question, the paper traces shifts in language, temporal framing, and thematic focus in climate-related discussions, with particular attention to how these changes reflect and potentially influence planning approaches.

To address this question, a longitudinal analysis of Reddit posts across various climate-focused communities from 2015 to 2024 illustrates distinct phases in the evolution of climate discourse. The dataset includes over 50,000 climate-related posts categorized under 15 key climate topics, such as "climate change," "global warming," "climate crisis," "sea level rise," and "carbon footprint." The analysis identifies three distinct phases: an early awareness phase (2015-2018) characterized by future projections and mainly coastal-centric vulnerability narratives; a transition phase (2019-2021) marked by increasing recognition of immediate impacts and an expanding discussion of urban climate risks; and a crisis response phase (2022-2024) centered on implementation and equity concerns. Notably, 2020 signified a crucial inflection point, as discussions about renewable energy, carbon neutrality, and climate justice gained substantial momentum amid a 41% increase in discussions about greenhouse gas emissions worldwide since 1990.

The analysis identifies both theoretical shifts in conceptualizing climate challenges and practical implications for urban planning approaches. The elements of climate discourse that have gained prominence in recent years emphasize interconnections between environmental and social systems, focusing on substantive adaptations rather than merely technical solutions. This evolution serves to complement and extend traditional mitigation-focused planning approaches, suggesting the need for more integrated frameworks that address both long-term sustainability goals and immediate adaptation requirements. Shi et al. (2016) have similarly advocated for justice-oriented approaches to urban climate adaptation, while Anguelovski et al. (2016) have documented the equity impacts of urban land use planning for climate adaptation.

A key implication of this evolving discourse, which this paper argues, is the necessity for planners to recalibrate their temporal horizons and communicative approaches. As Sabherwal et al. (2021) demonstrated, shifting public discourse on climate change has significant implications for climate action and policy support. The findings suggest that planning processes should explicitly integrate climate justice frameworks, as discourse increasingly connects concerns of environmental and social equity. Additionally, planning horizons need recalibration to address accelerating climate impacts, with a greater emphasis on immediate adaptation alongside long-term mitigation. By

recognizing these discursive shifts, planners can develop more responsive frameworks that address both the physical infrastructure needs and the social dimensions of climate resilience in urban contexts.

Urban Greenway as Urban Eco-tourism: A Case Study of Tianfu Ring-shaped Greenways in Chengdu, China

Abstract ID: 1844.0.0.157.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Jing Huang [University of Waterloo] j635huan@uwaterloo.ca, presenting author

Zhu Qian [University of Waterloo] z3qian@uwaterloo.ca

The unsustainable urban development and severe environmental issues have prompted the introduction of urban green infrastructure. Urban greenways (UG), as a form of green infrastructure, have demonstrated positive impacts in controlling urban sprawl, building green open spaces, and enhancing residents' physical and psychological well-being (Theeba Paneerchelvam et al., 2020). In planning, most scholars have focused on how greenways influence socioeconomic conditions, built environments, and public health. However, these studies overlook the underlying motivations and user satisfaction of UG as a form of urban ecotourism. Therefore, it is essential to focus on the user experience of UG, assessing the relationship between UG and urban ecotourism.

This study focuses on the Tianfu Ring-shaped Greenways at the Park City of Chengdu, an ambitious project representing Chengdu's exploration of achieving high-quality socioeconomic development and ecological protection (Zhang & Wu, 2024). Based on it, this study addresses the following questions: (1) What are the current conditions for urban ecotourism of the Chengdu Tianfu Ring-shaped Greenways? (2) What characteristics and satisfactory themes of the greenways are reflected in user-generated content? (3) Do these themes align with the officially promoted themes and urban ecotourism of the Park City?

User-generated Content (UGC), defined as creative works published by users on online platforms, has been extensively used in tourism research, focusing on evaluating tourism service quality, destination reputation, and tourist experiences (Lu & Stepchenkova, 2015). This study collected UGC of the Tianfu Ring-shaped Greenways from two reputable Chinese living experience-sharing online platforms: Dianping and Xiaohongshu. Latent Dirichlet Allocation (LDA), a topic analysis model, is frequently employed in text mining to uncover hidden thematic information within big data contexts (Guo et al., 2017). Consequently, LDA was applied to extract greenways-related satisfactory topics from the user side, and a descriptive analysis of policies and literature was conducted to analyze the underlying motivations from the provider side. The primary object is to offer novel insights into urban ecotourism and UG management.

This study anticipates that the extensive coverage of the case may not function as an independent urban ecotourism attraction. Instead, the greenways that connect with surrounding parks and wetlands serve as recreational open spaces for residents and tourists. The motivation for the urban ecotourism development does not generate tourism revenue through ticket sales; however, it contributes to building the "Park City" branding, thus attracting land investments, secondary industries and tertiary investments, and population inflows, which create alternative revenue streams for municipal government. Although most online texts reveal a generally positive attitude towards greenways, few equate it with urban ecotourism. Instead, most citizens and tourists recognize it as green infrastructure for cycling, a perception reinforced by official narratives that emphasize the integration with sports-related activities, which has led to conflicts among different users.

Urban Heat Islands and Social Exposure: A Multi-Dimensional Analysis of POI-Based Behavior

Abstract ID: 1844.0.0.164.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Haoming Qin [University of Texas at San Antonio] haoming.qin@my.utsa.edu, presenting author

Wei Zhai [University of Texas at San Antonio] wei.zhai@utsa.edu

Yun Zhou [Indiana University] yzh7@iu.edu

Urban heat islands (UHIs) are not only physical climate phenomena but also spatial expressions of social and environmental inequality. In many cities, areas most affected by extreme heat also face structural disadvantages in income, housing, and access to green space (Hsu et al., 2021). These overlapping vulnerabilities raise critical questions about who bears environmental risks and how those risks intersect with patterns of urban mobility and behavior (Jesdale et al., 2013; Yabe et al., 2023).

This study investigates the relationship between UHIs and socio-spatial behavior by analyzing how human movement patterns reflect and reproduce environmental inequality. We focus on the micro-level interactions that occur through visits to points of interest (POIs), such as stores, parks, and workplaces, which offer insight into everyday urban encounters. Utilizing high-resolution mobility data from Spectus, that captures anonymized, time-stamped, device-level visits, we analyze 5.9 million POI records in San Antonio, Texas. These are spatially joined with block-group-level demographic characteristics and remote-sensing-derived land surface temperature (LST) data. Using Local Moran's I, we identify statistically significant high-temperature clusters (High-High) as urban heat island zones (Li et al., 2017; Ochoa et al., 2024).

We introduce a three-part analytical framework to investigate the relationship between environmental conditions and socio-spatial behavior:

- (1) POI Income Diversity, calculated using a customized diversity index (D_a) based on the income composition of POI visitors;
- (2) Social Interaction Types, defined by comparing the income level of visitors and POI locations as Upward, Downward, or Balanced interactions;
- (3) Individual Exposure, which measures the extent to which individuals interact with diverse income groups through their POI visitation patterns.

Results reveal distinct behavioral differences between heat island and non-heat island areas. POIs in UHI zones exhibit significantly lower income diversity compared to those outside, with differences confirmed by both t-tests and Mann-Whitney U tests. A multinomial logistic regression model shows that POIs in heat island zones are more likely to exhibit Upward and less likely to exhibit Balanced (not significant) interactions compared to Downward interactions. These findings suggest that UHIs may reinforce asymmetric interaction patterns, limiting social mixing.

At the individual level, we analyze the top and bottom 10% of users by income exposure index and find that lower-exposure individuals tend to live in socially and environmentally vulnerable neighborhoods. This highlights the intersection of climate burden, spatial segregation, and limited cross-class interaction in UHI zones.

By integrating mobility data, socioeconomic profiles, and environmental stressors, this study offers insights into the social consequences of heat in urban areas. These findings contribute to emerging efforts to develop just, data-driven responses to urban heat and its uneven social impacts.

Urban Human-Nature Interaction: A Deep Learning Approach to Global Social Media Imagery

Abstract ID: 1844.0.0.416.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Mingze Chen [The University of British Columbia] mingzec@student.ubc.ca, presenting author

Keunhyun Park [The University of British Columbia] keun.park@ubc.ca

As cities across the globe increasingly embrace nature-based solutions for health, climate resilience, and social equity, a key planning question emerges: how do people actually interact with urban nature in their everyday lives, and how can we measure these interactions across diverse global contexts? Traditional methods—such as field observations, surveys, and sensor data—often lack the spatial breadth, temporal continuity, or cultural comparability to answer this question at scale. This study proposes a computer vision-based approach for systematically detecting human-nature interactions (HNIs) from social media images collected in major cities across five continents.

Drawing from world-popular social media platforms such as Instagram, Google Review, Flickr, Weibo, etc., we curate a large-scale global dataset of geotagged photographs representing public life in over 30 cities (Ghermandi et al., 2022). These include Shanghai, Tokyo, London, Berlin, New York, Los Angeles, Rio de Janeiro, Melbourne, Cape Town, and others—selected to capture a variety of climates, cultures, and urban forms. Each image is manually labeled into one of 15 types of HNIs—such as walking, sitting, jogging, dog walking, photographing, flora observation, and recreational use of green infrastructure—based on an interdisciplinary taxonomy derived from environmental psychology and urban behavior studies (Matasov et al., 2023).

We then train and evaluate a suite of deep learning models to classify these images based on the YOLO (You Only Look Once) architecture (Salazar-Miranda et al., 2023), including convolutional neural networks and vision transformers. Among them, transformer-based models demonstrate superior performance in recognizing complex, nuanced human-environment relations embedded in real-world urban scenes. Beyond classification accuracy, our spatial-temporal analysis reveals meaningful differences in how residents across regions use and perceive urban nature. For instance, cities with dense, multifunctional green space networks tend to support a greater diversity of HNI types, while others exhibit clustering around limited activities like walking or sitting. Cultural and infrastructural factors further shape interactions—dog walking is prominent in North American cities, while landscape photography dominates in East Asian megacities.

This study contributes to urban planning in several ways. First, it introduces a reproducible and scalable framework for mapping human-environment relationships in cities using volunteered photographic data—an underutilized but increasingly available resource. Second, by visualizing and quantifying how different populations engage with nature, we provide planners with evidence to evaluate inclusivity, accessibility, and multifunctionality in urban green spaces. Third, we highlight the potential of artificial intelligence not only to monitor urban dynamics but also to amplify lived experiences as a basis for bottom-up design, planning, and policy.

To support future research and practical applications, we have also developed an interactive online platform that publicly showcases the global HNI dataset and provides access to our trained classification models. This tool enables planners, researchers, and educators to explore human-nature interaction patterns across cities, test model predictions on new images, and generate visual analytics to support comparative studies (Dong et al., 2024). Our approach offers planners a novel method of inquiry and a shared infrastructure for evidence-based, inclusive, and adaptive landscape design (Gupta et al., 2024). In doing so, we provide planners and policymakers with

concrete tools to monitor public space use, evaluate spatial equity, and support data-driven design decisions that improve the accessibility, quality, and resilience of urban nature.

Rapid urbanization has made many African cities very susceptible to potential climate change impacts. Nevertheless, granular analyses of African urban spatial structure remain rare (Prieto-Curiel et al. 2022), and the relationship between the spatial structure of African cities and sustainability indicators, such as the urban heat island effect, is even more so. In order to examine the relationship between urban spatial patterns and urban heat, we develop the first high-resolution spatial maps of urban morphology - the physical form and spatial arrangement of human settlement patterns - for all urban regions with over 10,000 population in Kenya, Tanzania, Togo, and Ghana.

To do so, we utilize three major innovative data sources to quantify the metrics of our interests: (1) the urban regions delineated by the Africapolis.org using satellite imagery and machine learning algorithms, which offers a homogenized definition of urban regions across Africa; (2) the Google AI Africa Open Buildings dataset and the Global Human Settlement Layer (GHSL), used to develop a range of urban morphological metrics using data-driven approaches, including kernel density estimations, urban sprawl indices, land cover fragmentation (and contiguity), and the degree of polycentricity; and (3) our key variables of interest, the urban heat island effect (UHI), defined as the temperature gap between the urban and rural regions, quantified using the MODIS Land Surface Temperature Product via Google Earth Engine platform.

These novel metrics are used in regression analysis to examine the relationship between the UHI effect and urban morphology, with the UHI as the dependent variable and a set of urban morphology metrics as independent variables. Based on the preliminary OLS regression covering 636 urban regions, we find that more aggregated urban fabric and high population (building) densities contribute to increased urban heat, whereas mixed use of land is associated with low urban temperatures. These findings corroborate previous research conducted in the US, Europe, and China (Li and Schmidt, 2024; Debbage and Shepherd, 2015; and Liu et al. 2021). However, our preliminary results do not reveal any significant contributions to the UHI effect from urban green spaces distribution or polycentric urban forms. Further regression testing the heterogeneous impacts suggests that region size, distinct climate zones, and the composition of surrounding rural areas (e.g., the proportion of desert land) may contribute to our unique results within the African context—a region previously lacking empirical evidence.

Our ongoing research will further clarify the distinctive relationships between urban morphology and the UHI effect in African cities. The findings will directly inform our project partnerships in the four studied African countries and, therefore, contribute to their policymaking in land use and sustainable development.

Urban parks provide significant benefits to public health, social cohesion, and overall well-being (Bratman et al., 2015). Regardless of the positive effect of urban parks, previous research highlights significant disparities in park access and use, both spatially and socioeconomically (Rigolon, 2017). Urban segregation policies have played a key role in shaping disparities in park use for marginalized communities; however, their role in shaping these disparities remains insufficiently examined (Nesbitt et al., 2019). Current literature about park usage inequality focused on (1) lack of usable parks or (2) limited accessibility for park. Many studies assume that park presence or proximity ensures usage, often relying on accessibility metrics like buffer zones. However, these methods fail to capture actual visitation patterns, revealing a disconnect between modeled access and real-world behavior. To address this gap, this study had a research objective: how urban segregation moderates the relationship between social vulnerability in the community and park visitation.

We investigated how Interstate 35 (I-35) moderates the relationship between social vulnerability and park visitation in Austin, Texas. We set I-35, highway across Austin, as a binary variable. Area located in East (1) is known as strongly predominantly minority and low-income populations compared to Western (0). We used the SafeGraph and Advan mobility dataset on park visitation, covering the period from January to December in 2019. We compiled a City of Austin Park visitation dataset incorporating human mobility patterns, demographic and socioeconomic characteristics, transportation modes, weather conditions, park facilities, land use, and geospatial attributes. To measure social vulnerability, we utilized social vulnerability index (SVI) from the Centers for Disease Control (CDC), which constitutes four aspects: socioeconomic status, household characteristics, racial and ethnic minority status, and housing types and transportation (Flanagan et al. 2011). The fixed effect model is employed to control for unobserved location and season-specific factors that may influence park visitation. In this study, we controlled for monthly variation and park type.

We found that socially vulnerable communities have lower park visitation rates, and interaction term tended to strengthen the effects between SVI and park visitation. Four themes of SVI—characterized by lower socioeconomic status, higher minority populations, poor housing and transportation conditions, and a higher proportion of children, elderly, or disabled individuals— had significantly negative associations with park visitation. These findings confirm a consistent pattern observed in previous studies: socially vulnerable groups tend to rely more on urban parks for recreation and daily activities. Further, interaction terms for SVI-I-35 were negatively significant in socioeconomic status and household composition, suggesting that the negative effect of social vulnerability on park use is stronger east of I-35.

These findings can help planners and practitioners more efficiently prioritize equitable resource distribution by enhancing park infrastructure and accessibility in historically disinvested areas, recognizing that marginalized communities actively engage with local parks despite facing socioeconomic challenges. Integrating community-

driven insights into planning processes can help create more inclusive and resilient green spaces that address both spatial inequities and current usage realities.

Urban forestry in the United States is the responsibility of federal, state, and municipal government agencies. For example, the federal Urban and Community Forestry Program administered through USDA Forest Service provides technical, educational, and financial assistance to US states, territories, communities and partners, and also monitors urban forestry programming, support, and investment through the Community Accomplishment Reporting System (CARS). The role of states may range from acting as intermediaries of federal financial and technical resources, to directly funding and supporting urban and community forestry initiatives across sectors within the state, often with collaboration at the local level (Rines et al 2011).

In the United States, grassroots responses have emerged to supplement urban forest management efforts traditionally led by local, county, and federal governments. Urban tree committees are one such grassroots response, whose service exists between a formalized organization and ad-hoc task force (Elton et al. 2022). While past research has described the roles and responsibilities of various urban forest management actors, no studies have previously established a baseline understanding of regional urban tree committees, including the membership of volunteer committees, their programming/educational initiatives and subject matter, and key audiences.

In this study, we distributed a participant survey to all known urban tree committees of the six state area of New England, a subregion that shares a highly urbanized land cover, bucolic exurban landscapes, and unique political systems. Our study successfully recruited representation across small and large cities of each New England state. Findings are summarized in three sections: an overview that describes urban committees by geography, guiding missions, and motivators of committee formation; the operational scope led by committees, including personnel, guiding documents, and funding sources; and the program, activities, and participants engaged by urban tree committees. This study identifies the presence and prominence of urban tree committees throughout the New England region, elucidates the ongoing need for resident engagement in local natural resources management, and highlights the reliance on unpaid personnel in the municipal urban forest governance. Cities of similar sizes may share more in common than those of different sizes in the same state – and there is significant opportunity for cross-disciplinary research and practice to build upon existing regional strengths.

The case for regional (subnational) urban forestry presents itself as an increasingly important way to describe and analyze interrelated socio-ecological dynamics of urban and community forests (Johnson et al. 2020). There remains a lack of information about sub regional organizational origins, partnerships, and volunteer networks of local urban tree committees (Hargrave et al. 2024) and how financial investment and project development creates momentum for continued activities, maintenance, and stewardship. Given the importance of spatial proximity and connectivity to urban natural resource science and management (Forman 2008), we also expect the social and ecological interaction and outcomes of urban forestry to be shared by closely located, similar sized cities. This may

be due to a number of factors including similar governance arrangements, land use and development histories, nursery stock/planting norms, and pest and disease pressures.

US Internal Climate Migration: Lessons and Future Research Pathways for Planners

Abstract ID: 1844.0.0.795.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Paromita Shome [University of Massachusetts, Amherst] pshome@umass.edu, presenting author

Omur Damla Kuru [University of Utah] u6062513@utah.edu

Elisabeth Infield [University of Massachusetts, Amherst] eminfield@umass.edu

Climate migration entangles many factors that need the attention of planners in the long term. Research shows that human migration may face substantial increases in the future and is often considered an adaptation response to climate change-related risks. In 2018, the US ranked fourth among all countries for internal disaster-related displacements.

The internal climate migration-related studies of the US are focused on specific subjects such as developing relevant models, exploring the locations of the destinations, or addressing factors affecting the choices of these locations. However, the existing studies fall short of offering a comprehensive synthesis that brings these components together and maps out future research directions. This underscores the significance of reviewing multidisciplinary literature to integrate current knowledge and support the development of more robust research pathways.

To bridge this gap, we used a systematic literature review method. After systematically reviewing multidisciplinary literature, this paper analyzes what we already know about internal climate domestic migration in the US, and the future research directions in terms of four aspects; internal climate migration modeling, destinations, and sending and receiving communities.

Regarding internal climate migration modeling, the findings suggest that it has been difficult to distinguish the climate influences from the broader push-pull factors of migration to date. Similarly, more work is needed to investigate whether migrants respond differently to sudden-onset versus slow-onset movements. Developing models at a smaller spatial scale than the county level would help explore the localized impacts and adaptation solutions. Also, integrating findings from different model types for validating the outcomes is still unexplored in existing studies.

Surprisingly, according to research to date, climate-related migration in the US is a regional phenomenon. Typically, the movements take place within metropolitan centers, even to more disaster-prone locations, although climate migrants are popularly thought to be long-distance movers. Future studies may benefit from comparing the drivers of choosing destinations to better inform in-situ solutions to climate change.

Concerning sending and receiving communities, the study found that out-migration generally instigates from areas already experiencing demographic and infrastructural hardships. Scenario planning may help the areas that think they may be sending or receiving communities. Also, research is required about predicting future population decreases and facilitating a planned retreat at the local scale. Future research should examine policies like infrastructure improvement, and accessibility to several facilities by the local governments of climatically vulnerable areas to control out-migration.

Climate-related migration adds uncertainty to demographic projections, which has implications for land-use planning. In general, climate-related migration often resembles other experiences of speedy population growth or decline, and studies using previous local and regional experiences can offer lessons for handling climate-related

migration. These insights may inform planners to take sustainable and inclusive approaches to integrate migrants with the receiving communities.

Utility-Scale Solar in Virginia – Land Conversion, Community Impacts, and Local Permitting

Abstract ID: 1844.0.0.198.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Damian Pitt [Virginia Commonwealth University] dpitt@vcu.edu, presenting author

Aaron Berryhill [Virginia Energy] aaron.berryhill@energy.virginia.gov

[Note that this research was accepted for presentation at ACSP 2024 in Seattle, but the lead author had to cancel at the last minute due to an unexpected family matter. This abstract addresses the research that was to have been presented in 2024, along with additional new findings for 2025.]

Like many states, Virginia is experiencing a rapid increase in utility-scale solar energy capacity. While utility-scale solar provides many benefits related to climate change mitigation, pollution reduction, and tax revenue for the impacted localities, it also raises concerns. These include the possible loss of farmland, forest land, and sensitive ecosystems (Hernandez, et al., 2014; Kaza and Curtis, 2014), as well as environmental justice concerns from concentrating these facilities in low-income and/or minority communities (Mulvaney, 2019). Research into the impacts of existing solar facilities can help planners and policymakers mitigate those impacts, through siting agreements and other local regulations, and guide the future location of utility-scale solar through zoning codes, comprehensive plans, and other policy tools (Dias, et al., 2019; Poggi, Firmino, and Amado, 2018).

Our key research questions are as follows:

- What is the total acreage of land dedicated to utility-scale solar development in Virginia thus far, and the average acreage per megawatt (MW) of installed utility-scale solar generation capacity?
- Does utility-scale solar development occur disproportionately in counties that are lower-income and/or have high minority populations, compared to the statewide average?
- What types of land uses are most often converted to utility-scale solar development (agricultural, forested, open lands, etc.), and do these patterns vary significantly by region?
- To what extent is utility-scale solar impacting “prime” agricultural or “high conservation value” forest lands, versus farm or forest land with lower agricultural or conservation values?
- Based on current trends, what are the potential future impacts on agricultural and forest land if utility-scale solar grows, as expected, per Virginia’s clean energy and climate mitigation goals?

To answer these questions, we have built a new Geographic Information Systems (GIS) database of all utility-scale solar facilities currently operating in Virginia. Maintaining this data set requires meticulous cross-referencing of information from aerial photos, site maps (e.g., from county-level special use permit applications), and other sources to geo-reference the actual impacted site areas for each new utility-scale solar project. This includes the solar panel footprints as well as additional land converted around the panel area, but not any undisturbed land on the applicable parcels. After georeferencing the individual project sites, we overlay those project footprints with the Virginia Land Cover Dataset to identify the previous land uses at those locations. We found that over 75% of the impacted acreage had been former forest (50%) or cropland (28%), and that nearly half of the impacted cropland was of Very High agricultural soil quality. We also found that the largest utility-scale solar facilities were disproportionately located in Census tracts with a high percentage of African-American residents.

This research will inform policy recommendations to support further growth of utility-scale solar, while mitigating negative land use impacts. It will also identify best practices for tracking the impacts of utility-scale solar in a given state or locality. Finally, it will contribute to the evolving research on the impacts of utility-scale solar on forest and agricultural use, as well as related environmental justice concerns.

Where Do Evacuees Go? Evacuation Destination Choices in Georgia during Hurricane Milton

Abstract ID: 1844.0.0.203.2025

Track 4: Environmental Planning & Resource Development

Individual Paper Presentation Submission

Chaeyeon Han [Georgia Institute of Technology] chan303@gatech.edu, presenting author

Subhrajit Guhathakurta [Georgia Institute of Technology] subhro.guha@design.gatech.edu

Hurricanes are among the deadliest and most destructive weather disasters in the U.S. history according to National Oceanic and Atmospheric Administration. Also, they have triggered the largest mass evacuations. As hurricane intensity and the date and time of landfalls can be predicted, authorities are able to notify the population about the risks. People from high-risk areas can evacuate either voluntarily or due to evacuation orders before the hurricane strikes. Understanding where evacuees relocate and how they spend their time and money has been an active domain of policy and economic development research (Strobl, 2011; Tran & Wilson; 2020). From a planning perspective, better anticipation and preparation for mass evacuations can help alleviate stress on transportation systems, reduce strain on public resources, and even present economic opportunities (Li & Mostafavi, 2022). Without clear insights into evacuee movements and their duration of stay, cities struggle to allocate resources effectively, leading to housing shortages, overwhelmed public services, and economic instability.

Hurricane Milton, which made a landfall in October 2024, prompted an estimated six million Florida residents to evacuate, according to Federal Emergency Management Agency. This mass evacuation caused significant disruptions, including severe traffic congestion and fuel shortages, not only in Florida but also in neighboring states such as Georgia (Reuters, 2024). Due to its proximity and strong existing social network with Florida, Georgia became one of the major out-of-state evacuation destinations. Major cities in Georgia also suffered with prolonged traffic congestion due to the influx of hurricane evacuees (11Alive, 2024).

This study examines where Florida residents relocated during Hurricane Milton, and the factors associated with the destination choices. Additionally, we investigate whether evacuees from more severely impacted areas exhibit different destination choices compared to those from less affected regions. Utilizing mobile GPS-derived daily POI visit data retrieved from Advan Research, we quantify the anomalous influx and outflux of visitors at the Census Tract level in Georgia and Florida. To analyze the factors associated with POI visitor influx during the hurricane period, we employ OLS regression, considering variables such as transportation accessibility (proximity to airports and highway exits), socioeconomic factors (income levels, population, distances from city centers), POI accessibility (number of gas stations, home improvement stores, etc.), and social ties.

Our findings suggest that social ties, along with the availability of gas stations, supermarkets, day care facilities, disaster relief services, and home improvement stores serve as major pull factors for evacuees' destination choices. Furthermore, evacuees from the most severely impacted areas are more likely to relocate based on social ties, whereas those from less affected areas show stronger correlations with distance from their origin and the number of accessible POIs at their destination. The insights from this study can inform urban and regional planning, disaster preparedness, and economic development strategies, helping both receiving and sending cities build resilience against future hurricane-related displacements. Using high-resolution digital trace data, this study enables cities and emergency managers to be proactive rather than reactive to peoples' relief needs.

The urban heat island (UHI) phenomenon occurs due to factors such as changes in land cover, artificial heat emissions, and increased building density during the urbanization process, which leads to problems such as increased summer heat waves, increased energy consumption for cooling, and worsening air pollution. In particular, South Korea is showing a warming rate faster than the global average, and the deterioration of the urban heat environment is emerging as a serious problem. Jinju-si, Gyeongsangnam-do has continuously expanded its city since the development of an innovation city, but the heat island phenomenon is becoming more severe in the old downtown area due to the relatively high building density and aging of buildings. Against this background, this study utilized ENVI-met simulation to analyze the thermal environment of the old downtown area of Jinju-si and derive effective heat island reduction strategies. First, the spatial distribution of the thermal environment was identified and hotspot clusters were identified by analyzing the land surface temperature (LST) of all administrative districts of Jinju-si. As a result of the analysis, Gye-dong, a legal dong within the old downtown area, was confirmed to have the highest average LST, and was selected as the simulation target site. Afterwards, the current status of Gye-dong was analyzed to confirm the thermal environment characteristics and building density, and a simulation was performed applying the heat island reduction strategy (building density and layout adjustment, etc.) derived through prior research and theoretical consideration. The simulation results confirmed the effect of improving the thermal environment in Gye-dong through building density adjustment and securing wind paths. In addition, it was verified that building density plays an important role in the formation of urban wind paths. Based on this, this study proposes an urban planning plan to improve the climate adaptability of the old downtown area of Jinju City, and it is expected to contribute to the establishment of thermal environment management policies in small and medium-sized cities with similar climate and spatial characteristics in the future.

Challenges in Estimating Use of Long-Distance Hiking Trails

Abstract ID: 1842.0.0.850.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Greg Lindsey [University of Minnesota, Humphrey School of Public Affairs] linds301@umn.edu, presenting author

Managers of long-distance hiking trails need information about trail use to attract funding and inform trail operations and maintenance. Methods of estimating use include field observations, video recordings, automated video sensors, surveys, social media, and GPS tracking. Factors affecting choice of methods include organizational capacity, cost, and validity of results. This case study reports research in progress to estimate use of the Superior Hiking Trail, a 340-mile trail in Northeastern Minnesota that runs from south of Duluth, MN to Canada. In 2023, in collaboration with Arrowhead Regional Development Commission and the City of Duluth, the Superior Hiking Trail Association (SHTA) implemented a new monitoring program based on the approach used by the Minnesota Department of Natural Resources to monitor use on bicycle trails. This approach involves segmentation of the trail into monitoring sections, deployment of automated infrared sensors at permanent (i.e., mid-May through early November) and short-duration (about one month) monitoring locations, and use of the day-of-year (DOY) factoring method that uses patterns from permanent count stations to extrapolate short-duration counts into hiking season total counts. Based on staff capacity and the availability of monitoring equipment, planners designed the program to complete monitoring of the entire trail over a three-year period.

Planners initially divided the trail into six segments, each of which includes multiple monitoring sections defined by road crossings and other factors. The number of sections per segment ranges from 6 to 14, with more in the urban area around Duluth. The total number of monitoring sections is 50; each section on average represents about 7 miles of trail. In 2023, the SHTA deployed infrared sensors and completed monitoring on 21 sections, including 2 permanent and 19 short-duration locations. Following extrapolation of short-duration counts, the average daily trail use across these sections ranged from less than 1 on an access trail to 513 hikers per day on a section of a trail in a state park. The mean and median hikers per day across these sites were 82 and 31, respectively. To obtain an interim estimate of total trail traffic, planners imputed the median value for the remaining 29 sections. Then, to convert trail traffic to trail visits, planners assumed 85% of hikers completed out-and-back trips and had been counted twice. Trail traffic counts then were adjusted, yielding an estimate of 407,000 visitors in 2023. In 2024, the SHTA monitored an additional 13 sections. Across these sections, trail use ranged from 4 to 88 hikers per day, a smaller range than in 2023. The median use for the 34 segments monitored in 2023 and 2024 was computed (25 hikers/day). The estimate of total hikers on the SHT then was estimated at 392,000, a reduction of about 4% that can be attributed partly to revised imputations of traffic on sections not yet monitored. Plans for 2025 are to complete monitoring of all remaining sections on the trail.

Several insights with implications for similar monitoring initiatives can be gleaned thus far. The approach has been dictated by the capacity of staff and resource limitations. For example, unexpected staff turnover between 2023 and 2024 resulted in monitoring fewer segments than planned in 2024. Funds for sensors and staff time for traveling to remote sections of the trail also have constrained monitoring. Results illustrate technical decisions that introduce uncertainty into estimates and affect their validity. These choices include designation of monitoring

sections, timing and duration of monitoring, methods of handling missing and erroneous data, method of extrapolation, and evidence and rationale for converting traffic counts into trail visits. Results in 2025 will provide a foundation for standardization of monitoring methods and support future demand modeling.

Corporate Climate Havens: Resilience as Business Attraction Strategy in the Great Lakes Region

Abstract ID: 1842.0.0.143.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Hannah Teicher [Harvard University Graduate School of Design] hannah.teicher@gmail.com, presenting author

Climate migration is already well underway. Millions of Americans are being permanently displaced in the wake of floods and wildfires every year while others have been choosing to move due to chronic climate stresses. Over the coming decades, climate migration of many types will only accelerate. In response, an ecosystem of organizations has begun to grapple with how to facilitate more equitable, sustainable relocation, engaging with cities and communities in this work. Given the immediate human toll of evacuating in response to a disaster or relocating due to crippling climate conditions, most of the research, advocacy, and policy development in this domain has focused on residential relocation.

However, climate-related migration is not limited to the movement of individuals and households; it extends to the private sector. Real estate and development companies have begun to factor physical climate risks into location and investment decisions while some corporations have relocated their headquarters or diversified their holdings in response to these signals. In addition, a small but growing niche of investment advisory firms is capitalizing on the opportunity to promote climate resilient investments. But the redirection of capital to relatively climate resilient locations is much more than a business matter. It is likely to shape and constrain employment opportunities, housing availability, and well-being for the individuals and households who are similarly seeking refuge from climate extremes.

The prospect of people moving to places that are less disaster-prone has given rise to the concept of the climate haven, one which is complicated and questionable, yet has gained currency by neatly encapsulating the notion of relative safety. The Great Lakes region is one area that journalists, researchers and advocates have pointed to as a haven due to the abundance of freshwater, the temperate climate, and infrequent natural disasters. Building on this concept and combining it with established forms of corporate havens such as tax havens and special economic zones, this project proposes and interrogates the notion of the corporate climate haven.

This project seeks to lay a foundation for untangling the implications of these larger issues by first answering the following questions: 1. For economic development organizations in so-called climate havens, is climate a selling point, and if so, how? 2. For firms considering these locations, to what extent does climate enter into their decision-making process? Answering these questions will help to describe the contours of the emerging phenomenon of corporate climate havens.

This research was conducted through a case study of two states in the Great Lakes region involving interviews with economic developers and site selection professionals as well as content analysis of promotional material and industry publications. Preliminary findings suggest that for economic development organizations in these states, climate is only one selling point among many, however water availability, the absence of natural disasters, and grid reliability do play a role in marketing these locations. In corporate decision-making, climate is dwarfed by conventional factors such as land, labor, and infrastructure. However, climate factors are slowly becoming more important, and for certain types of businesses ranging from food and beverage to semi-conductor fabrication, they can already be decisive. While these factors present advantages for businesses, they also raise concerns for local communities about water diversion and unsustainable land use trade-offs. This research sets the stage for a more robust analysis of urban futures as people and capital seek shelter from climate impacts.

Inundation, Isolation, and Municipal Vulnerability in Coastal Planning

Abstract ID: 1842.0.0.192.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Qian He [Rowan University] he@rowan.edu, presenting author

Saeed Saleh Namadi [University of Maryland] saeed@umd.edu

Deb Niemeier [University of Maryland] niemeier@umd.edu

The U.S. is experiencing increasing frequency and severity of natural hazards and disasters (Frijters et al., 2023; Shepherd & Dissart, 2022). Among these threats, sea-level rise (SLR) and associated coastal flooding are expected to significantly disrupt coastal communities through both direct inundation and indirect impacts (Best et al., 2023; Logan et al., 2022). A critical concern for urban and municipal planning is that SLR will devalue or destroy coastal properties, eroding the local property tax base and precipitating fiscal stress for coastal municipalities.

Recent studies assessing SLR's impact on local government finances have primarily focused on properties directly inundated (Shi et al., 2023; Shi & Varuzzo, 2020), overlooking the fiscal risks to properties that remain physically dry but become isolated due to flooded access routes. This study addresses that gap by investigating how both direct inundation and indirect isolation from SLR affect property values and municipal fiscal resilience. Specifically, we ask how rising seas—through both submergence of properties and loss of connectivity—might undermine the revenue base of coastal communities in spatial and temporal dimensions.

Our analysis focuses on Dorchester County, Maryland, a coastal community with significant exposure to SLR. We integrate NOAA SLR projections with parcel-level data on property values, construction years, and local land use zoning. Using GIS-based flood modeling, we identify parcels projected to be inundated under various SLR scenarios and estimate potential losses in assessed value. To capture indirect impacts, we analyze road networks to determine which parcels, while not flooded, would lose convenient access to critical services such as fire stations and schools due to surrounding inundation. Preliminary results indicate substantial potential loss of taxable property. At 4 feet of SLR, approximately 25% of properties in Dorchester County could be directly inundated. Such flooding would likely render these properties uninhabitable and drastically reduce their value. An additional 32% of properties may remain dry but would become functionally isolated from emergency services and schools. Notably, homes constructed in the mid-20th century (circa 1940–1950) emerge as the most vulnerable cohort across all SLR scenarios, reflecting historical development patterns in low-lying areas. These findings suggest that fiscal impacts will not be distributed evenly in space or time but will be concentrated in particular neighborhoods and age cohorts of housing.

The consequences of short, extreme events and longer-term weather changes in property devaluation pose a serious challenge to urban fiscal resilience and urban planning. A shrinking property tax base, combined with increased expenditures for emergency response and climate adaptation, could strain municipal budgets and undermine the financial stability of local governments. By examining the magnitude and distribution of these risks, this study provides planners and policymakers with evidence to support climate-informed land use decisions and proactive fiscal planning. Our findings contribute to planning theory and practice by integrating climate adaptation with municipal finance, highlighting the need for adaptive zoning, infrastructure investment, and fiscal policies that bolster the long-term sustainability of coastal municipalities.

Lasting Effects of Historical Redlining on Present-day Heat Inequities in Philadelphia

Abstract ID: 1842.0.0.1038.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Meen Wook Jung [The Ohio State University] jung.763@osu.edu, presenting author

Sunho Choi [University of Washington] sunhoch@uw.edu

Meen Chel Jung [Yonsei University] jungmc@yonsei.ac.kr

Historical injustices institutionalized in urban planning and housing policies have contributed to neighborhood landscape dynamics, thereby impeding the equitable distribution of heat adaptation measures in contemporary US cities. One of the historical institutional discrimination policies is redlining, which primarily created structural barriers to homeownership against low-income racial minorities as well as thermally unfavorable landscapes in historically marginalized neighborhoods. The spatial patterns of redlining and associated heat inequities are often depicted using the residential security maps created by the federal agency, Home Owners' Loan Corporation (HOLC). Specifically, compared to high HOLC-graded (non-redlined; "A") neighborhoods, low HOLC-graded (redlined; "D") neighborhoods tend to exhibit higher land surface temperatures, more impervious surfaces, and less green surface cover despite variations in datasets and spatial domains. Additionally, redlined neighborhoods often have high population density and a high proportion of socioeconomically disadvantaged residents, collectively facing greater risks from extreme heat events. Despite the previous efforts to examine the disproportionate heat risks of redlined neighborhoods, existing frameworks remain incomplete, particularly in understanding the micro-scale temporal dynamics of heat exposure.

This study examines whether the legacy of redlining persists in heat disparities at multiple scales in the summer in Philadelphia, Pennsylvania. This study conducts two main analyses at different scales: a neighborhood-level comparative analysis, and a block-level simulation analysis. For the neighborhood-level analysis, this study employs boxplots to analyze the cross-sectional distributions of tree canopy cover ratio, building area ratio, and land surface temperature values between HOLC grades. Then, nonparametric Kruskal–Wallis H tests and post-hoc multiple comparison tests are conducted for each variable to assess statistical differences in median values across the HOLC grades. For the block-level analysis, this study utilizes ENVI-met, a tridimensional microclimate model, to simulate 24-hour temporal variations—from 7 a.m. on July 20, 2019, to 7 a.m. on July 21, 2019—in air temperature at 1.5 m above ground level in selected census blocks based on the neighborhood-level results. This study also develops three different greening scenarios census blocks located in the redlined neighborhood, assessing the effectiveness of greening strategies in cooling at the micro-scale.

The finding of the neighborhood-level analysis indicates that the contrasting HOLC grade pairs, "A" and "D," had statistically different median values for tree canopy cover, building area ratio, and land surface temperature levels. The simulation results indicate that the hourly average air temperature levels of the HOLC grade "D" census blocks were significantly higher than those of their HOLC grade "A" counterparts throughout the simulation period. Notably, the disparity reached approximately 1.22 °C at the hottest time (3 p.m.). The simulation results of three different greening scenarios show that the combined strategy of grass and tree planting can diminish the average temperature by 0.31 °C at the hottest time, superior to the single planting strategies. Building on these findings, this study identifies the legacy of redlining on heat inequities across scales in present-day Philadelphia. Overall, this study emphasizes the significance of greening initiatives for residents currently living in historically discriminated neighborhoods to effectively reduce inequal microthermal dynamics.

Mountain Strong: Lessons in Resilience Planning from Post-Helene Appalachia

Abstract ID: 1842.0.0.5.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Christine Quattro [Appalachian State University] quattrocm@appstate.edu, presenting author

In late September 2024, Hurricane Helene struck the High Country of Western North Carolina, causing unexpected and unprecedented damage. In the aftermath, the region's communities faced both immediate and long-term challenges, many of which were amplified by the area's rural and mountainous geography. Despite these difficulties, the resilience and strong community spirit of the residents played a crucial role in overcoming obstacles.

As community-based recovery continues, clear themes are emerging that highlight how assets, challenges, and opportunities in disaster recovery planning can strengthen or hinder long-term sustainable resiliency. This study presents the findings from a mixed-methods, interdisciplinary, and civic focused approach evaluating community responses, exploring challenges, and identifying key themes and their impacts on regional planning, public health, and community development. It seeks to understand how these themes translate into tangible obstacles and actionable solutions. The results pinpoint effective strategies for community restoration and assesses potential for long-term efficacy.

Municipal Design Standards and Urban Tree Planting Space: Case Studies Along the Mississippi River

Abstract ID: 1842.0.0.829.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Yumi Kashihara [University of Minnesota] kashi030@umn.edu, presenting author

Alicia Coleman [University of Minnesota] aliciac@umn.edu

Leah Rumon [University of Minnesota] rumon004@umn.edu

There are many decision support tools for planners and natural resource managers to inventory urban trees. However, few resources comprehensively evaluate where trees can be planted using high-resolution spatial models alongside constraints imposed by local policies, regulations, and design standards. This research pilots a methodology with the following goals: 1) to integrate land use, land cover, and tree-related design standards, 2) to identify which types of trees can be planted, and 3) to assess the potential environmental benefits and tradeoffs of various design standards. Five major metropolitan areas along the Mississippi River were chosen as case studies: Minneapolis and St. Paul (Minnesota), Davenport (Iowa) and Rock Island (Illinois), St Louis (Missouri), Memphis (Tennessee), and Baton Rouge (Louisiana).

Two datasets were processed for this analysis. First, tree-related municipal policies and design standards were extracted from municipal codes, zoning regulations, and city planning documents. A systematic keyword search guided the extraction of relevant information from these documents. To verify data, we consulted with the city foresters, land-use planners, and parks and recreation representatives. After coding, an inter-rater reliability process was used to assess and correct for standardized data input.

Second, GIS data was collected and processed to evaluate the physical tree-planting potential. Federal and state GIS repositories were primarily used and supplemented by municipal sources. Suitable planting spaces were identified using pre-classified land cover datasets, prioritizing 1-meter or higher resolution (Wu et al. 2008). Land cover classes were reclassified based on similar research (e.g. Merry et al. 2013) into four categories: "Existing tree canopy" (deciduous and evergreen canopy); "Not plantable" (impervious surfaces such as buildings, roads, and parking lots); "Dig-ready plantable space" (soft surfaces such as turfgrass, bare soil, low vegetation, and agricultural fields); and "Water" (waterbodies and wetlands).

We discovered that local policies and design standards for urban forests vary significantly across cities. Tree preservation ordinances were less common, whereas tree planting design standards were more prevalent but inconsistent. While most GIS data was collected without issues, design standard-specific data, particularly critical infrastructure with tree planting restrictions (e.g., fire hydrants) required direct contact with municipal staff. The initial result of the plantable space assessment for the City of St. Paul, for example, revealed that out of the total 56.19 square miles, 41.97% is not plantable, while 22.70% is plantable. However, these initial numbers do not yet account for city-specific planting policies or critical infrastructure, which further limit available space. When overlaid with the policy and design standard data, we expect the total plantable to decrease from the initial result reported earlier due to policy constraints. For instance, in St. Paul, trees must be planted at least 10 feet from fire hydrants and utility poles. Such restrictions necessitate an additional category, "Limited planting," to more accurately represent the land suitable for planting.

This research bridges spatial analysis with policy evaluation in urban vegetation management. By integrating local policy and design standards in GIS, this research helps municipal and regional planners align urban forestry initiatives within existing regulations. The data produced by this research can also incorporate population

demography or nature equity considerations to ensure tree-planting efforts benefit all residents equitably. Finally, this research also highlights the value of interdisciplinarity - integrating geospatial analysis, policy analysis, and urban forestry - which is a valuable teaching tool in urban planning and natural resource management courses.

Nature Play & The City: A Case Study of Nature Play Areas in Austin, TX

Abstract ID: 1842.0.0.898.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Melissa VanSickle [Florida State University] mv09f@fsu.edu, presenting author

To address concerns regarding decreasing time in nature in urban areas, cities implement green infrastructure projects, such as local parks, which aim to increase access to green spaces and promote nature connection (Parker et al., 2020). One benefit of increasing access and connection to nature is children's engagement in nature play. Although nature play can provide well-being benefits, inequities persist, as access to and inclusion differ across social stratifications of income, race and ethnicity, age, gender, and ability, indicating the role of social structures in urban development (Wolch et al., 2014). Through exploring the socio-political production of play areas in Barcelona, Spain, Pérez del Pulgar et al. (2020) challenged widely held assumptions that child friendly green spaces of play produce universal benefits. Building on the framework applied by Pérez del Pulgar et al. (2020), a mixed-methods case study approach was employed to nature play areas located in six parks across the city of Austin, TX.

To explore the socio-political production of these spaces, planning materials and documents related to each of the parks were reviewed. In addition, semi-structured interviews were conducted with four key representatives from local government and non-profit organizations that participated in the planning of the nature play areas. A cross-case synthesis approach was applied to summarize and compare data related to parks' background, surrounding social composition, level of gentrification, scale of transformations, framing/visions, and role of public and private partners. A checklist was used to collect data on the availability and quality of features and amenities in the parks, along with neighborhood demographic characteristics. Semi-structured observations of children's nature play were also performed over multiple weeks in March and May 2024, applying protocols as outlined by Cox et al., (2018). These observations captured children's demographics, types of play, social interactions, and nature interactions, serving as indicators of their relational well-being.

Initial findings reveal differences in neighborhood characteristics, as well as the frequency and type of use in the parks observed. School and neighborhood parks had significantly smaller numbers of observations than the larger metro and district parks. Therefore, the nature play areas in school and neighborhood parks also had lower levels of nature engagement. Differences in the demographics and engagement of users also differed. For example, one school park, located in a late-stage gentrifying neighborhood, had mostly adult users, typically with their dogs, and few children at the park during public park hours. Additional structured observations of children's play were employed at the two larger parks to quantitatively explore aspects of children's relational well-being. A total of 842 observations were collected at the two larger parks over multiple weekdays and weekends, and at various times of day. Summary statistics and chi-square tests reveal associations between observed demographics and the type of play and interactions performed in the parks. A regression analysis will be employed to assist in exploring these relationships and the differences in indicators of relational well-being across the two parks.

Findings from this study contribute to environmental justice literature through applying a mixed-methods case study approach, revealing additional contextual data about the parks' history and planning processes, not obtained through other methods. This study considers aspects of the production of space and their potential influence on the use of that space, which are important to the implementation of equitable green infrastructure. The direct observations of children's play also provide information useful to cities and planning professionals by revealing the social and environmental interactions performed in planned nature play areas.

Nature-Based Solutions for Climate Resilience: An Analysis of Urban Planning Strategies

Abstract ID: 1842.0.0.126.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Willian Lima [Florida Atlantic University] limaw@fau.edu, presenting author

Stephanie Wakefield [Florida Atlantic University] swakefield@fau.edu

Melina Matos [Florida Atlantic University] matosm@fau.edu

Climate change impacts rising temperatures, increasing the frequency and intensity of extreme weather events, escalating the threat of sea-level rise, and exacerbating urban heat island effects (Folke et al., 2021). Addressing these complex issues requires developing and implementing comprehensive and integrated strategies designed to foster urban resilience, effectively mitigate the impacts of climate change, and facilitate adaptation to its inevitable consequences. Nature-based solutions (NBS) have emerged as a promising and potentially transformative approach to tackling these interconnected climate challenges within the ongoing discourse surrounding urban adaptation.

Despite a growing interest in NBS, a knowledge gap persists regarding cities' practical application of these solutions to effectively address climate change and enhance urban resilience. There is a pressing need for further research to comprehensively understand NBS's full potential, inherent limitations, and effective implementation strategies within the complex and dynamic context of urban environments.

In a global context characterized by economic constraints and governance limitations at both local and international levels, it is important to develop a clear and evidence-based understanding, aided by performance indicators, of how these adaptation actions, which prioritize strategic changes in urban design, can effectively bolster resilience and foster equity within urban areas. Therefore, the proposed research aims to investigate the multifaceted role of NBS within urban landscapes to simultaneously address the complex challenges posed by climate change, with a specific focus on enhancing resilience, achieving climate mitigation, and facilitating climate adaptation. This research will employ a mixed-methods approach, integrating quantitative data analysis, qualitative interviews with key stakeholders, detailed content analysis of relevant urban plans, and spatial analysis of plan policies.

The initial phase of this research involved a comprehensive content analysis of 213 urban plans focused on climate action, adaptation, resilience, and sustainability, sourced from 156 American cities members of ICLEI, to identify the prevalence of NBS proposed in plans. The results revealed that only 11.2% of these plans explicitly referenced NBS. While Resilience Plans exhibited the highest proportion of NBS mentions (50%), Sustainability Plans demonstrated the lowest (2.7%). Action Plans and Adaptation Plans contained 8.8% and 8.6% of plans, respectively.

To further explore the findings, we conducted an in-depth case study to examine whether cities implement Nature-Based Solutions without explicitly using the term. To identify whether a policy is classified as a nature-based solution, we used the European Research Executive Agency (2024) conceptualization. The first step is identifying whether the policy strategy is inspired by nature. If it is, we should identify whether it promotes environmental, economic, and social benefits. The case studies will examine the climate plans of four cities recognized as leaders in climate planning: Miami, FL; Washington, DC; San Francisco, CA; and Cincinnati, OH.

A preliminary analysis of the 91 strategies presented in the 2020 Miami Forever Climate Ready Adaptation Plan shows that only 8.8% were identified as nature-inspired or supported. Of these, only four strategies provided environmental benefits, and five provided social benefits. Notably, none of the strategy articulated economic benefits in their descriptions. This likely suggests that even when accounting for the absence of explicit NBS

labeling, the policies still have a limited presence of nature-inspired strategies. Furthermore, the articulation of co-benefits—particularly economic ones—is minimal.

Revealing disparities and drivers of compound exposure to urban heat and PM2.5 with low-cost sensors

Abstract ID: 1842.0.0.820.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Yarong Cao [university of utah] u1531768@utah.edu, presenting author

Tristalee Mangin [University of Utah] tristalee.mangin@utah.edu

Kerry Kelly [University of Utah] kerry.kelly@utah.edu

Nancy Daher [University of Utah] nancy.daher@utah.edu

Heather Holmes [University of Utah] heather.holmes@chemeng.utah.edu

Simon Brewer [University of Utah] simon.brewer@ess.utah.edu

Alexandra Ponette-Gonzalez [University of Utah] alexandra.ponette@utah.edu

With a warming climate, extreme heat events are becoming increasingly frequent, while worsening wildfires and prolonged droughts are intensifying fine particulate matter (PM2.5) pollution. Urban areas are particularly vulnerable to the compound impact of extreme heat and PM2.5 pollution due to the urban heat island effect and concentrated emissions sources. Additionally, complex and varied urban landscape lead to substantial intra-urban variability in both extreme heat and PM2.5 concentrations, meaning that some communities face disproportionate compound exposure and adverse health outcomes. However, current sparse regulatory monitoring networks and coarse-resolution remote sensing data are insufficient to capture fine-scale spatiotemporal dynamics of air temperature, humidity, and PM2.5 concentrations within cities. Moreover, although the frequency and duration of co-occurring extreme heat and particulate pollution are projected to increase, few studies examine them jointly. These gaps hinder the understanding of heterogeneity in compound exposures and pose significant challenges for advancing environmental justice.

In recent years, expansion of crowdsourced low-cost sensors has enabled spatiotemporally dense monitoring of temperature and PM2.5 concentrations. When combined with machine learning-based Land Use Regression (LUR) models, this offers a robust approach for exploring the spatiotemporal patterns of extreme heat and PM2.5 pollution across urban areas. In addition, machine learning algorithms have strong advantages in capturing the nonlinear relationships between various predictor variables and temperature or PM2.5 concentrations.

The goal of this study is to reveal spatial disparities in compound exposure to extreme heat and PM2.5 pollution and to identify key urban environmental drivers contributing to both stressors in Salt Lake City, Utah. We integrate measurements from low-cost fixed-site sensors with a spatial random forest-based LUR model to model and map the spatiotemporal distribution of summertime extreme heat and PM2.5 concentrations. Hourly air temperature, relative humidity, and PM2.5 concentration data were obtained from PurpleAir ($n = 118$) and Tellus ($n = 20$), while hourly air temperature and relative humidity data were collected from Weather Underground ($n = 62$), covering the period from June to August 2024. These data are combined with urban environmental covariates, including land use, topography, transportation infrastructure, building density and form, to conduct high-resolution modeling of the heat index and PM2.5 concentration. We will visualize the spatiotemporal distribution of compound exposure to extreme heat and PM2.5 concentration in Salt Lake City, identify communities with elevated exposure levels, and highlight the key urban environmental factors that drive these patterns. The methods and results of this study can help identify communities vulnerable to elevated exposures and provide spatially targeted guidance for short-term public health interventions. In addition, this study can provide quantitative evidence on green infrastructure, land use and zoning regulations for long-term climate-adaptive urban planning to mitigate extreme heat and PM2.5 pollution.

Tailoring Structured Decision-Making for Climate-Resilient Transportation: Lessons from Hawai'i

Abstract ID: 1842.0.0.1010.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Suwan Shen [University of Hawai'i at Mānoa] suwans@hawaii.edu, presenting author

Climate change and sea level rise pose growing threats to transportation systems in coastal regions, with Hawai'i facing particularly acute challenges as an island state (U.S. Global Change Research Program, 2018; Keener, 2013). Increasing flooding, shoreline erosion, and infrastructure vulnerability underscore the urgency of implementing effective climate adaptation strategies (Moser and Boykoff, 2013). While structured decision-making (SDM) frameworks are widely used in natural resource and environmental management (Gregory et al., 2012), their application in climate adaptation planning has not been thoroughly examined in practice (Martin et al., 2011). This study explores how an SDM framework can be to support transportation adaptation planning in an island context.

We conducted semi-structured, in-depth interviews with 29 stakeholders involved in adaptation planning, including government agencies, NGOs, and community organizations. Participants were recruited using typical case and snowball sampling. The analysis identifies key concerns, objectives, tradeoffs, evaluation criteria, and barriers that shape planning outcomes. Recurring themes include the challenge of siloed planning, outdated or mismatched data, uncertainty in future scenarios, limited resources, and social or political inertia. In transportation specifically, challenges also included aging infrastructure, lack of redundancy in critical corridors, and difficulty aligning adaptation goals with land use and housing objectives.

Drawing on stakeholder insights, we propose a modified SDM framework that better supports cross-sector collaboration, integrates diverse stakeholder priorities, and accommodates long-term uncertainty. Key enhancements include: (1) early and ongoing engagement with communities to articulate shared values and manage tradeoffs; (2) alignment of adaptation efforts with broader planning goals to achieve co-benefits; (3) iterative feedback loops using updated spatial and temporal data; and (4) strategies to build trust, consolidate institutional support, and reduce implementation barriers.

This work contributes to planning scholarship by translating structured decision-making into a usable, iterative framework for climate-resilient transportation planning. The findings offer practical insights for local planners and policymakers working in coastal and island communities, where integrated and adaptive frameworks are essential to strengthening resilience. While grounded in Hawai'i, the study offers transferable lessons for other regions facing similar climate-related pressures.

The Missing Link: Why Local Plans Matter for Wetland Conservation

Abstract ID: 1842.0.0.51.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

Zhenghong Tang [University of Nebraska-Lincoln] ztang2@unl.edu, presenting author

In the U.S., federal and state agencies have made significant efforts to protect and restore wetlands. Local jurisdictions play a crucial role in wetland conservation, as wetlands are often adjacent to key water bodies that serve critical ecological and community functions. While federal regulations and policies guide wetland conservation, their implementation at the local level remains uncertain.

Local comprehensive plans, hazard mitigation plans, and watershed plans each contribute to land use management, hazard risk reduction, and natural resource management. This study evaluates how well wetland conservation is integrated into these plans in Nebraska. It addresses three key questions: (1) How effectively do local jurisdictions incorporate wetland conservation into local planning systems? (2) What are the strengths and gaps in wetland conservation planning among these plans? (3) How can wetland conservation be better integrated into local planning?

Findings reveal that most local plans provide limited direct attention to wetland conservation, though conservation efforts are often embedded within broader environmental protection frameworks. Among the evaluated indicators, water resource protection received the highest score, reflecting strong local awareness of natural assets. Comprehensive plans adequately emphasize conservation policies, hazard mitigation plans address riverine wetlands within floodplains, and watershed plans focus on surface water resources and water quality improvements related to wetlands. However, the goal of achieving "no net loss" of wetlands received the lowest score, highlighting a significant gap between national conservation objectives and local implementation.

The study underscores the need for more proactive and targeted local government initiatives to enhance wetland conservation. It also offers practical recommendations for integrating wetland conservation into local planning efforts, providing valuable insights for planners worldwide, particularly in developing countries.

What happens to the promise of resilience and equity in post disaster recovery?

Abstract ID: 1842.0.0.637.2025

Track 4: Environmental Planning & Resource Development

Research-in-Motion Presentation Submission, Research currently in process

APIL KC [University of Michigan] apil@umich.edu, presenting author

Despite global consensus around the need for resilient and equitable recovery, post-disaster housing reconstruction often reveals a persistent gap between policy frameworks and their implementation, as core commitments are frequently sidelined in practice. This disconnect between intention and outcome is not accidental; rather, it is shaped by the inherent complexity of post-disaster recovery, characterized by urgency, limited resources, institutional fragmentation, and shifting political and donor agendas. In Nepal, early policy documents following the 2015 Gorkha earthquake explicitly committed to inclusive recovery. Yet, as reconstruction progressed, these commitments gradually faded from policy narratives and decision-making. This raises a broader question: how and why do resilience and equity goals shift during the period of recovery?

I argue that these shifts are not merely administrative but are shaped by evolving governance logics, shifting donor priorities, and debates over the technical framing of recovery. These debates shape how recovery is defined, measured, and managed, often sidelining equity and long-term resilience.

This research examines the institutional, political, and technocratic dynamics shaping recovery over the implementation period. Using Nepal's post-earthquake recovery as the central case, the study explores how stakeholders interpret, adapt, or overlook recovery objectives on the ground. Furthermore, I examined recovery cases from Sri Lanka after the 2004 Indian Ocean tsunami and the Philippines after the 2013 Typhoon Haiyan to evaluate if these patterns are unique to specific contexts or reflect broader systemic trends. Using a qualitative method approach, I first conducted content analysis of key documents from the disaster recovery efforts in each of the four countries, including national and INGO recovery policy framework, NGO publications and evaluation reports. This enabled a systematic tracing of shifting narratives, priorities, and institutional rationales over time. In addition, 20 semi-structured interviews (Nepal(12), Philippines(4) & Sri Lanka(4)) with engineers, planners, and policymakers provide grounded insights of recovery policies and practices.

Initial findings from interviews reveal two critical patterns. First, there is a widespread lack of awareness among implementers regarding the overarching goals of resilient and equitable recovery, highlighting a disconnect between centralized policy and local-level practice. Second, even when institutional inconsistencies are identified, front line government staffs expressed limited authority to adapt strategies, reflecting bureaucratic rigidity and hierarchical control. They also pointed to deeper structural disempowerment and institutional inflexibility. Moreover, an initial review of recovery documents suggests that data limitations, as commonly argued, are not the primary constraint in achieving resilient and equitable recovery. In Nepal, after the earthquake, the World Bank conducted a detailed damage assessment alongside a comprehensive socio-economic census of over six million affected individuals. However, this rich dataset was not extensively used to make recovery decisions. Instead, issues of equity and resilience were gradually sidelined through a pattern of strategic ignorance, where politically sensitive information as of caste, land tenure, and informal settlements, was excluded. This reflects a deeper issue concerning whose knowledge is recognized and acted upon.

Further, I explore how shifting donor priorities, political transitions, and institutional reforms shape which forms of knowledge remain in recovery. This knowledge explains how resilience narrows from a multidimensional ideal to a

narrow technical formality. By following changes in policy commitments, I explore the post-disaster governance and recovery's contested path, aiming to inform just and resilient recovery planning.

Artificial Intelligence (AI) has potential to address the unique planning challenges faced by under-represented communities, particularly older adults and people with disabilities. This roundtable aims to explore the opportunities and challenges of AI's impact on creating inclusive spaces for these communities (Ye et al., 2023). Is AI a boon that helps overcome challenges in planning for aging and disability communities, by providing tools for more targeted and responsive solutions (Czaja et al., 2022)? Or is it a burden that can potentially perpetuate existing inequalities and introduce new challenges (El Morr, et al., 2024)? Scholars from diverse subfields in planning will discuss the implications of AI-based solutions in the built environment. The conversation will focus on both the advantages and disadvantages of using AI for planning and designing inclusive spaces, and the specific needs of older adults and people with disabilities (Gallistl et al., 2024; Ran et al., 2020). The roundtable is an opportunity for planners to think about the nexus of AI, disability, and aging in the interest of creating inclusive built environments while acknowledging the potential challenges and adverse impacts AI may introduce or exacerbate. This will be one of the first debates about AI, disability, and aging in the field of planning.

Ethically engaged feminist urban research, especially involving long-term collaboration with communities and multiple sets of interlocutors, demands reflexivity—a critical examination of the researcher’s positionality, the research process, knowledge production and representation, as well as power relations that are neither fixed nor one-dimensional, and of the contested space we embrace as ‘the field’. Fieldwork in engaged urban research is always complex, contextual, embodied, emotional, relational, and politicized (Sultana, 2007), and poses unique challenges for women and queer researchers, especially when navigating male-dominated, patriarchal spaces.

In this roundtable, we—a group of feminist planning scholars who have conducted fieldwork on different dimensions of socio-spatial reproduction of cities—embark on a journey inspired by intersectional reflexivity (Rodriguez and Ridgway, 2021) to explore how our intersecting identities (gender, sexuality, class, race, nationality, religion, caste, education, language, marital status, institutional affiliations, and other vectors of difference) shape our ‘otherness’ in the field and our access to spaces and interlocutors. We move beyond fixed notions of intersectionality and employ ‘thick intersectionality’ (Yep and Mutua, 2016) to understand identity formation and embodiment as fragmented, reframed, and renegotiated within specific geopolitical, historical, and sociospatial contexts. This lens helps us identify our privileges and disadvantages and acknowledge our contextual vulnerabilities as othered, intersectional bodies, as well as, highlights the solidarity and connection formed through ethical collaborations.

For researchers embodying intersecting identities and subjectivities, critical reflexivity unpacks fieldwork complexities, shapes evolving researcher-interlocutor relationships, and can lead to transformative knowledge production (Nagar and Geiger, 2007). Even when native researchers like us ‘return home’ for fieldwork, dilemmas persist, and we face the ‘native yet the other’ question (Sultana, 2007)—where our intersectional identities shape our otherness even at home. These tensions also affect non-native researchers, who navigate expectations tied to their identities and contend with sociocultural norms and gendered behavior codes that may feel unfamiliar or restrictive. Native or not, researchers with intersecting identities negotiate performances of femininity or masculinity, respectability, and conduct expectations that vary across contexts, complicating access, trust, and legitimacy (Johansson & Jones, 2020). These norms are deeply embedded in place, and nonconformity can jeopardize research or place researchers at risk. At the same time, this heightened awareness must be accompanied by an ethics of care for oneself, recognizing that the labor of adapting and absorbing these expectations is often invisibilized. Creating safe, ethical, and relationally grounded fieldwork spaces is impossible if we, as researchers, feel unseen, unsafe, or unsupported (Billo & Hiemstra, 2013). Attending to our well-being—physical, emotional, and psychological—is a political imperative, particularly when our research involves co-creating safe spaces for our interlocutors. As engaged urban planners, through this roundtable, we embark on this

collective reflexive journey to explore ways to navigate our hope, hopelessness, and vulnerabilities, and deepen our relationships with places and people we encounter in the everyday field to produce ethical, meaningful, transformative research to support the causes and actions of our interlocutors for just existences in cities. The discussion will also encourage critical reflection on how academia supports—or fails to support—field researchers and why centering care, safety, and solidarity is essential for building more equitable research environments.

The AICP Code of Ethics espouses the importance of training and engaging underrepresented communities. Among planning programs, gender parity has been addressed while there has been incremental progress in diversifying racial/ethnic student enrollment (PAB, 2023). To address the latter group, ACSP and various groups—including POCIG and the ACSP Committee on Diversity—have extensively analyzed racial/ethnic student and faculty issues.

However, the 2023 Supreme Court ruling that banned race-conscious admissions is among the latest changes to federal, state, and university policies that are targeting efforts to diversify non-white students in higher education. Planning programs have also shown to perpetuate elite hiring networks, which reward students and faculty who adapt “cultural competence” to the culture of prestigious universities and affluence (Lee, 2022).

In this political environment, first-generation students may be one of the only permissible groups that planning programs can make concerted and explicit efforts to recruit, retain, and support. Based on other studies, first-generation students are also disproportionately underrepresented in graduate programs—only 3% will earn a master’s degree or higher (Redford & Hoyer, 2017), and they continue to experience barriers beyond completing an undergraduate degree (Cameron, 2021). Yet, there is scant scholarship on first-generation student experiences in planning programs. Accordingly, the roundtable is an introductory effort to focus on first-generation student experiences.

Questions the roundtable panelists seek to address include:

1. Understand the lived intersectional experiences of first-generation students
2. Identify systemic and institutional barriers and asset-based strategies that first-generation students experience
3. Discuss strategies, policies, programs, or recommendations for planning programs to lower barriers and support first-generation students at various levels of higher education

Danielle Spurlock [University of North Carolina at Chapel Hill] dspurloc@live.unc.edu

Tabitha Combs [University of North Carolina at Chapel Hill] tacombs@live.unc.edu

The 15-minute city promises a retrofitting cure for many modern urban design problems that we can trace back to the mid-twentieth century, including car dependency, social isolation, sprawl, and economically segregated neighborhoods (Kjavarian-Garmsir et al, 2023). However, the implications of a 15-minute city for our current inequitable built environment must be examined through racial and economic justice lenses (Mouratidis, 2024). In this study we ask two interrelated questions. First, to what extent can 15-minute cities address not just poor connectivity but also a wide range of urban and societal inequities? Second, how might 15-minute cities be used to address failures in the planning process, especially by building meaningful participation and community involvement?

Our comparative, mixed-methods case study examines two 15-minute city applications within a few miles of each other in North Carolina: the first in the 1950s era, technology oriented, industrial Research Triangle Park (RTP) and the second in the city of Durham (Thompson, 2024). RTP's 15-minute city plan is the latest attempt to solve the "original sin" of isolating regional economic anchors from housing and retail. Durham embraced the 15-minute city concept in its latest comprehensive plan as a part of a growth management strategy aimed at building more equitable, accessible, and affordable neighborhoods.

We interrogate these interrelated cases along three distinct themes. First, we look for evidence of 15-minute cities disrupting or confirming development as envisioned by political and business elites; here, we consider 15-minute cities as descendants of both regional anchor industrial parks and Ebenezer Howard's plans for Garden Cities as profit-generating Victorian developments. Second, we explore the potential for retrofitting car-dominated spaces, in particular evaluating the extent to which 15-minute cities adequately address long-standing segregationist planning patterns. And finally we look for evidence of how, if at all, 15-minute cities address planning's ongoing struggles to integrate meaningful public participation into efficient, equitable processes.

While in theory 15-minute cities could tackle many legacy problems, we argue that—like predecessor movements—current iterations have been co-opted by developers in order to extract development profits and reinforce urban power arrangements. As a result they cannot overcome underdeveloped system-of-systems thinking, poor community engagement, business-driven development and the under-provision of affordable housing and other public needs. We therefore caution that American iterations of 15-minute cities alone are not a panacea to address systemic racial and economic injustices and may in fact exacerbate them. Still, their simplicity of concept leads us to believe that improvement is possible—especially if we learn from past work on creating equitable, inclusive streets and spaces. We thus conclude with a series of policy suggestions for moving 15-minute discourse away from simple examinations of transportation and land use and towards a system-of-systems model

that integrates meaningful public participation and improved governance (Conrad et al 2011, Taylor 2007) with more complex concepts of equitable, just streets and urban spaces.

Assessing Spatial Exposure: Public Infrastructure Access Among Immigrant Mobility Patterns in Denver

Abstract ID: 1844.0.0.539.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Daniel Schumacher [University of Colorado Denver: College of Architecture and Planning]

daniel.schumacher@ucdenver.edu, presenting author

Sneha Tallavajjula [University of Colorado Denver] nagasneha.tallavajjula@ucdenver.edu

Immigrant communities frequently face structural barriers to accessing public spaces in U.S. cities, contributing to spatial inequalities and social exclusion. Although immigrant populations are often concentrated in specific neighborhoods in Denver, their access to public spaces, transit systems, and other urban infrastructure remains understudied, along with the associated sense of belonging that is critical for people arriving in a new environment. To think about access to public amenities is to consider mobility patterns that enable one to navigate to them, as immobility can relate to spatial isolation and exclusion (Wander, 2025).

This study examines the spatial dynamics of immigrant communities in Denver by drawing on the concept of “exposure” (Kemmer et al., 2022) to evaluate the degree to which immigrant communities are visible and integrated within public spaces, as well as the extent to which they experience social and infrastructural inclusion or exclusion. If integration is considered part of a broader spectrum of urban mobility, then with the concept of exposure, we can hypothesize the degree of inclusion that is experienced by immigrant communities. This is within the framework of “critical mobility thinking,” in which it is suggested that fluid spaces of being mobile within the city provide opportunities for cultural production and the formation of relationships (Jensen et al., 2009).

This research aims to answer three key questions: (1) To what extent do immigrant communities in Denver have access to essential public urban infrastructure? (2) How does the concept of exposure help explain the spatial experiences of immigrant communities? (3) With the mindset of critical mobility thinking, how successfully do public spaces and urban infrastructure decisions among immigrant populations influence their exposure to public services and the ability for relationship formation between people and place? To answer these questions, this study will utilize a spatial analysis that integrates multiple accessibility variables to measure immigrant communities’ access to public spaces. Demographic data from the American Community Survey (ACS) and immigrant population data from Denver Human Services will be used to map the density of foreign-born populations and identify socio-economic patterns. Public space availability will be assessed using land-use and zoning data to determine the distribution and quality of parks, and other public spaces. Transit infrastructure will be evaluated using General Transit Feed Specification (GTFS) data and data from the Regional Transportation District (RTD). Additional environmental and neighborhood characteristics, including tree canopy cover from the Denver Regional Council of Governments will be incorporated.

A Multi-Criteria Decision Analysis (MCDA) framework will guide the analysis of these factors, producing a suitability map that categorizes neighborhoods on their level of exposure to public infrastructure and services. This will reveal how immigrant-dense neighborhoods compare to access patterns in neighborhoods that have a lower number of foreign-born populations. Findings will identify systemic disparities and highlight areas where targeted interventions could improve accessibility. By applying the concept of exposure to critical mobility thinking within immigrant communities and their spatial experiences, this study aims to broaden the understanding of urban accessibility and engagement with various public infrastructure. Conclusions will offer a foundation for designing more accessible urban environments, where immigrant populations can engage more fully with public spaces, from simply passing through to lingering. This research contributes to the growing body of work on spatial justice,

infrastructure accessibility, urban mobility patterns, and immigrant integration, offering insights for urban planners and policymakers seeking to address structural inequalities in cities.

With the rapid urbanization and increasing population mobility, cities worldwide are facing severe challenges related to segregation and inequality. A diverse population composition is vital for fostering social cohesion within urban areas. Income segregation, stemming from the uneven spatial distribution of income groups, could profoundly undermine urban residents' equitable access to amenities and resources. This phenomenon manifests not only as static residential segregation tied to housing disparities, but also as dynamic segregation in daily activity spaces. Such activity-space based segregation may impede spatial integration among diverse groups, utterly eroding urban vitality.

In recent decades, the rapid expansion of urban rail transit networks has not only significantly enhanced urban mobility, but also exert profound influences on regional economies and social structures. Urban rail transit provides residents with a more efficient and sustainable travel option and reshapes the spatial distributions of income groups by altering urban economic activities and population flows, thus potentially affecting the income segregation within activity spaces. Some research posits that rail transit development could accelerate gentrification, exacerbating wealth disparities, and intensifying income-based activity space segregation. Conversely, other studies highlight the potential for public transport infrastructure to improve urban mobility and accessibility, thereby alleviating income segregation and fostering social integration. Nevertheless, the causal mechanisms driving these impacts remain unclear, highlighting the need for further investigation.

Shanghai, a key economic and financial hub in China, faces pronounced challenges related to urban social spatial segregation. In this study, we leverage a large-scale mobile signaling dataset for millions of users and difference-in-differences (DID) models to analyze the causal impact of the inauguration of Shanghai Metro Line 15 on income-based activity space segregation and its heterogeneity across income groups and urban locations.

The research results indicate that the opening of new subway lines can promote encounters and interactions among different income groups, thereby alleviating spatial segregation of activity areas. Specifically, the opening of Line 15 significantly increased the number and duration of visits by low-income and lower-middle-income groups in the surrounding areas, and the positive effect on the travel convenience of low-income groups continued to strengthen. Among different station types, the decline in spatial segregation of activity areas was more pronounced in existing transfer hubs, with an increase in low-income populations. This demonstrates that subway development has significant economic and social empowerment effects. Its opening substantially reduced the travel costs for low-income and lower-middle-income groups, while also providing convenient access to high-quality public services. At the social level, subway development promotes social equity and integration, lowering the travel barriers for low-income groups and enabling people from different income strata to equally utilize this public transportation resource.

The study provides useful insights into the social equity implications of rail transit development. When planning for new metro lines, governments and relevant agencies need to fully consider the impact of new rail transit

development on the socio-economic structure of the corridor. It is crucial to ensure the mobility and activity space of low-income groups, allowing diverse income groups benefit from the new transit infrastructure and facilitating their encounters and interactions.

Auto-Ethnographies of Home: Latine Immigrant Women Explain the Housing Crisis in Colorado.

Abstract ID: 1844.0.0.1145.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Hector Fernando Burga [University of Minnesota] hfburga@umn.edu, presenting author

The data collection methods that define urban planning work emphasize the analysis of quantitative data in a broad range of planning topics, including access to safe and affordable housing. Their findings, however, may only identify the disparities experienced by large population groups present in the US census. Quantitative analysis does not capture the experience, personal narratives and histories of under-represented individuals of mixed immigration status who may not appear in census estimates yet struggle to secure housing. Based on participant observations of Campeones del Sistema - a policy literacy program sponsored by the department of Public Health in Eagle County, Colorado - this analysis asks two related questions: (1) What are the experiences of Latine immigrant women in securing safe and affordable housing and (2) how can the Auto-ethnographic method – a qualitative data collection method informed by an author/researcher’s personal experience to describe and interpret a context, belief, or practice – be applied to participatory action research advocating housing and public health policy. These questions are answered through an in-depth case study approach combining the analysis of housing policies, archival documentation, the coding analysis of 10 housing auto-ethnographies and open ended and semi-structured interviews with their authors as well as policy makers. The analysis finds that auto-ethnographies of housing may provide relevant qualitative data bridging an understanding between the structural forces shaping Colorado’s housing crisis and the interpretation of individual life-histories. A lack of affordable housing and the absence of new construction foment a housing market where women with mixed immigrant status experience prolonged, unstable and multi-sited housing tenure. This condition in combination with a record based on personal narrative and memory upholds key themes: The experience of life-long housing challenges; the condition of transnational housing insecurity; the dependency of male dominated family structures; and the threat of gender violence and trauma in housing tenure. Additional findings also demonstrate that the auto-ethnographic method can successfully be in participatory action research by centering the role of authorship as a mode of agency, social learning and reflexive practice in the collection of data. Additionally, the collection of qualitative data may serve as a platform for advocacy through the support of community liaisons who identify opportunities to uplift the qualitative data in policy-making processes.

Bridging the Digital Divide: Public Spaces and Public Libraries in the City of Dallas

Abstract ID: 1844.0.0.565.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Shadin Nimery [University of Texas at Arlington] shadin.nimery@mavs.uta.edu, presenting author

Deden Rukmana [University of Texas at Arlington] deden.rukmana@uta.edu

In the current era of digital media, there is a lot of attention to what is the role of city planners in facing the digital technologies that are becoming part of our cities (Geertman & Stillwell, 2020; NTIA 1995;1998;2000, Van Dijk 2006; Van Deursen & Van Dijk 2010). Many studies call urban planners to redefine urban planning practices and culture and move to digitalization planning (Nummi et al., 2023; Gabriela & Martin; 2023, Potts & Milz, 2024). The overarching purpose of this study is to position the role of urban planning in bridging the social and economic implications of the Digital Divide (DD), using an equity lens, through urban design interventions and innovative solutions. The DD is the gap between those who does and does not have access to the internet, that is part of the daily fabric of living in the digital era (Sanders & Scanlon 2021). Today, the DD research has developed by scholars into three levels : the first level deals with access to the Internet (NTIA 1995;1998;2000, Van Dijk 2006; Van Deursen & Van Dijk 2010, Scheerder et al, 2020), the second level deals with skills needed to use online resources and digital literacy (Bucy,2000; Hargittai, 2002; Gordo 2002; Hargittai & Hinnant 2008, Deursen & Helsper,2015; Lindsay,2005; Van Dijk 2006, Scheerdt et al.,2017; 2020,,) and the third level deals with who understand the Internet and benefit from it (DiMaggio et al., 2001, Hampton 2010; Deursen & Helsper., 2015; Scheerder et al., 2017;2020).However, there is little research from an urban planning perspective on the third level of the digital divide and how it impacts low-income communities . This paper aims to explore the equity implication associated with the third level of the digital divide within the context of the city of Dallas exploring the role of public spaces and public libraries in bridging the third level of the digital divide. The theoretical framework used for this study is Susan Feinstein's just city theory , Manual Castle theory of power and Kevin Lynch " Edges". This study is a qualitative case study using interviews, NVivo, and content analysis. The findings of this study emphasize the importance of the interdisciplinary urban planning field to develop informed solutions and call for a new language of narrative that suggest (architecture, art, urban planning and design) solutions that are extracted from lessons learned from the history. The study contribution is new in creating innovative interdisciplinary ideas in neglected public spaces such as under highways. The proposed public space ideas of this research could be replicated in other cities and policy makers can develop effective policies that focuses on digital equity from a bottom-up approach. Highways infrastructure should be equipped with internet fibers (first level of DD) to foster an inclusive public space for communities to gather, exchange ideas, and learn from each other (second and third level of the DD).

Can City Walk Strategies Expand the Optimizing Scope of Public Space in Historic Residential Areas?

Abstract ID: 1844.0.0.1021.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Ziying Zhang [School of Architecture, Southeast University] 18191553580@163.com, presenting author

Xiaosu Ma [Southeast University, School of Architecture] maxs@seu.edu.cn

In historic urban districts, older residential areas often face a shortage of public spaces, which hinders the government's efforts to attract new residents as part of its strategy to tackle demographic challenges. However, these neighborhoods frequently border underutilized public spaces that hold the potential to become attractive. Furthermore, the rising popularity of city walk has expanded people's daily activities, encouraging them to explore more extensive urban environments. It is thus vital to assess the diverse needs of residents and determine whether their activity spaces can be extended further. This study seeks to broaden the scope of public space improvement by connecting various areas through streets to create spatial corridors, thereby increasing their appeal to new residents.

Despite this, much existing research on public spaces has primarily focused on improving individual locations rather than adopting a comprehensive approach at the regional or larger scale. To address this gap, this study chose the Xianxia Road Community in Nanjing as the site, given its limited internal public space resources. It then identified potential resources within the broader surrounding area. For example, historical and cultural landmarks in the vicinity were mapped using ArcGIS, and natural resources were categorized according to land use data. Analyses also included the accessibility of the road network and the coverage of public space. Initial surveys indicated that various potential public spaces could be linked within a 15-minute walking radius of the community. Additionally, panoramic video samples were collected during fieldwork to identify usable resources and typical areas for potential pathway development. After assessing the quality and characteristics of these samples and processing the videos, 28 representative scenes were selected for a statement preference (SP) questionnaire. This questionnaire aimed to understand the target group's perceptions and preferences regarding various built environment features, cultural and historical elements, and ecological aspects of public spaces. Using data from the questionnaire and establishing the SEM-Logit model, factors affecting preferences for public space choices were measured, and scores for adjacent public spaces were established. By integrating this with respondent attributes, including travel distance, time, and type of activity, the urban walking route was refined. In the end, an optional walking route connecting surrounding historical locations of the site, such as Qingliang Mountain and National Defense Park, was proposed, demonstrating the scalability of this research approach.

In summary, this study leverages the trend of city walk to propose a novel approach to enhancing the spaces around urban residential areas, shifting from isolated improvements to a connected network. It also incorporates additional dimensions from the questionnaire, such as visual and auditory experiences, to provide recommendations for optimizing and upgrading public spaces based on the significance of these indicators. Furthermore, it illustrates how activity paths can connect natural, historical, and cultural resources to maximize the appeal of these spaces for the intended audience.

Heritage interpretation can be understood as storytelling about places and landscapes, drawing on original objects, first-hand experience, and illustrative media to reveal meanings and relationships for visitors to make sense of sites, collections, and events (Tilden, 1977). Interpretive planning has traditionally been premised on the material basis of heritage, thus foregrounding state-sanctioned built structures, historical figures, and narratives while glossing over intangible memories and experiences that give meanings to landscapes. Instead, from the perspective of critical heritage studies, heritage can be understood as multilayered performances of remembrance and constructions of place, belonging and understanding which can serve to negotiate a range of identities (Smith, 2006). This is particularly important in the case of heritage preservation in underserved and neglected communities which, from the perspective of state-sanctioned heritage conservation elites, ostensibly lack sites, events, and people worthy of state-sponsored preservation. Such communities draw on heritage as a recourse to contest neglect and exclusion, seeking greater influence in the construction of interpretive plans in order to place people at the center of interpretive planning (Cheong, 2021).

Such equity-based interpretive planning has been at the center of a five-year project led by residents of a primarily Spanish-speaking neighborhood in Austin, Texas. Working in partnership with faculty and students at the University of Texas and a variety of non-profit organizations and supportive officials from the City of Austin, a group of neighbors have led “story circles” (Curthoys et al., 2012) to document neighbors’ memories and relationships with a small community park located within the Williamson Creek Greenbelt East. These conversations inform development of a critical heritage interpretation plan based on the community-based storytelling, memories, and everyday place-making that give meaning to public spaces in the neighborhood. To develop an interpretive plan that reflects the multiple stories of the park and the neighborhood through signage, programs, and various digital and audiovisual forms inside and outside the park space, the project draws on decolonizing principles of research that emphasize critical reflexivity, reciprocity and respect for self-determination, embracing “Other(ed)” ways of knowing, and embodying a transformative praxis (Thambinathan and Kinsella, 2021). In doing so, the project seeks to create an identity for the park that reflects the character of place while fostering a sense of community ownership.

Digital Divide and Regional Inequality: A Multidimensional Literacy Framework in South Korea

Abstract ID: 1844.0.0.572.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Jaewon Park [Pusan national university] pjw1138@pusan.ac.kr, presenting author

Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

[Research Questions and Objectives] As digital technologies evolve, the divide between those who can use them effectively and those who cannot is deepening. This digital divide is not just a technical issue but a structural driver of social inequality—shaping access to education, economic mobility, and civic participation. Yet, existing measurements remain simplistic, relying heavily on indicators like internet access or device ownership. These fail to capture how digital capabilities are formed, differentiated, and spatially distributed. This study addresses these gaps through three core questions: (1) How can digital literacy be redefined to reflect current technological realities and enable empirical measurement of digital inequality? (2) What digital inequality classifications emerge from this measurement? (3) How are these classifications spatially distributed, and what do they imply for regional inequality and planning?

[Data and Method] To answer these questions, we designed a national survey with 48 items covering four dimensions of digital inequality. These are based on a well-established multi-level framework: first-level (access to internet and devices), second-level (digital skills and usage frequency), third-level (outcomes in education, employment, and civic life), and fourth-level (data literacy and algorithmic awareness, including understanding of recommender systems and digital surveillance). The survey was conducted in early 2025 with 1,200 respondents, sampled across all 17 metropolitan and provincial regions in South Korea to ensure demographic and geographic diversity. Latent Class Analysis (LCA) was used to classify individuals into distinct digital groups based on their profiles. These classifications were then analyzed through multilevel spatial regression, combining individual-level factors with regional-level indicators such as digital infrastructure, education investment, and urbanization.

[Main Findings] The analysis identified five distinct digital types, each reflecting a different configuration of access, skill, and awareness. Notably, a “trapped potential” group emerged—individuals with high data and algorithmic literacy but low access to institutional support or smart infrastructure. This group illustrates how capability alone does not ensure participation without structural support. Conversely, digitally excluded groups scored low across all dimensions and were overrepresented in rural and aging regions. Algorithmic awareness proved to be a stronger predictor of digital engagement in civic and economic spheres than traditional metrics like device ownership or usage frequency. Spatial clustering showed that digitally empowered groups are concentrated in innovation-oriented cities like Seoul, Sejong, and Daejeon, while marginalized groups are clustered in post-industrial or rural areas like Gyeongbuk and Jeonbuk.

[Implications] This study offers three key contributions to planning research and practice. First, it reconceptualizes digital literacy to include algorithmic awareness alongside access and skills. Second, it develops a multidimensional and spatially sensitive classification of digital inequality. Third, by combining LCA with multilevel spatial regression, it provides a scalable method for detecting digital stratification. Policy-wise, the study highlights the need for place-based strategies that go beyond broadband expansion or skills training. Effective digital inclusion must align with local institutional capacities and lived realities. Ultimately, we propose redefining digital justice not just as access, but as equitable capacity to shape and participate in digital systems—grounded in both personal literacies and regional opportunity structures.

Disability Initiatives in Planning Practice: An Analysis of Planning and Disability Needs in Alabama

Abstract ID: 1844.0.0.702.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Binita Mahato [Auburn University] bzm0054@auburn.edu, presenting author

Doris Hill [Auburn University] hilldol@auburn.edu

The key to creating just environments in our communities and averting exclusionary practices has been the use of Universal Design (UD) standards to design products, spaces, and structures equally accessible to people of all abilities. Planners, policymakers, and rehabilitation specialists facilitate this objective of integrating individuals with disabilities into mainstream society. However, there is often a lack of collaboration among these actors, hampering UD efforts' effectiveness. This study, therefore, asks: How can collaboration between community planners and those with expertise in supporting individuals with disabilities be fostered? We aim to identify the gaps and barriers of UD community planning initiatives and opportunities to overcome such barriers.

The integration of UD into community planning is essential as urban health policies for individuals with disabilities are lacking. The need for equitable access and inclusive planning for people with disabilities calls for strategies to improve information dissemination on accessibility, involve them in decision-making, ensure continuity of care, provide economic assistance, and fight discrimination. However, research indicates significant gaps in accessibility within planning frameworks, and engaging individuals with disabilities can lead to better outcomes. In Alabama, adults with disabilities represent 33% of the population. More than half of seniors aged 65 and older have some form of disability, with mobility and cognition issues being the most common disabilities. There is a pressing need for inclusive community design, accessible housing, healthcare facilities, and support services in the state. While planning has the potential to address disability needs, many communities fall short in Alabama due to a lack of progressive planning practices, absent or outdated comprehensive plans, and the dearth of institutional structure for systematic planning.

To understand Alabama's disability landscape, this study employs two approaches: 1) examining the planning landscape for disability needs and 2) identifying parallel initiatives not necessarily initiated by planners. A Disability Assessment Index (DAI) was created using variables such as the percentage of the uninsured, individuals living in poverty, and those with disabilities. The DAI categorizes Alabama tracts into low, moderate, and high needs for disability accommodations. Additionally, we reviewed existing community plans for 22 municipalities and 12 regional councils to assess their incorporation of disability standards, focusing on their disability accommodations. We also mapped other inclusive and therapeutic programs for disabilities in Alabama, creating a directory of these programs and their initiatives.

We find that most areas with moderate to high disability needs are predominantly rural, whereas urban areas tend to show lower disability needs. Although a majority of the studied city plans include disability initiatives, their approaches are not comprehensive. None of the plans include people with disabilities or disability experts in the plan-making process. There is also a gap between identifying disability needs and incorporating initiatives to address them. Plans in major cities tend to be more comprehensive in addressing these initiatives compared to small cities, signifying issues of planning priority and funding. We also find that areas that showed high disability needs are not necessarily served well by disability programs. Especially in rural areas, regional council plans are not sufficient in creating an inclusive built environment for people with disabilities. We propose strategies that can foster collaboration between planners and disability specialists, remove urban and rural gaps, and find funding opportunities to prioritize disability initiatives in planning practice.

Enhancing Public Space Vitality in Historic Urban Areas through Intergenerational Integration

Abstract ID: 1844.0.0.653.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Lin Zheng [Southeast University, School of Architecture] irrelevantvariable@gmail.com, presenting author

Xiaosu Ma [Southeast University, School of Architecture] maxs@seu.edu.cn

China is experiencing significant demographic aging, and a trend that is particularly pronounced in historic urban areas (HUA). In response, China introduced the strategy of "youth-friendly cities" to enhance urban vitality and social resilience. The local authorities in Nanjing have taken proactive measures to attract young people to settle in HUA, promoting urban revitalization. As demographic structures evolve, fostering intergenerational integration between youth and the elderly populations has become essential for sustaining urban vitality in historic areas, which is a continuous process. While public spaces serve as primary activity sites for both groups and function as key interaction platforms for their social engagement, making these spaces a crucial focus of this study.

However, existing researches solely concentrate on either youth or elderly groups independently, with limited analysis of intergenerational interactions within shared spaces.

Intergenerational integration is not a singular process of spatial adaption but a dynamic stage of the development. This study, therefore, examines the subjective experiences and mutual attitudes of young and elderly populations in public spaces. This study identifies current demographic composition and activity preferences through field investigations and interviews, and a Stated Preference (SP) survey is conducted to collect data on respondents' socioeconomic attributes, attitudes toward activities, and multidimensional evaluations and preferences for typical scenarios of public spaces in HUA. A SEM-Logit model framework is established to quantitatively assess the impact of five key dimensions—visual environment, soundscape, historical character, crowd dynamics, and activity intentions—on scenario selection results for both groups. This study further compares intergenerational differences in space utility over the short and long term, calculating marginal utility to explore effective strategies to foster intergenerational integration.

Preliminary results reveal that generational differences in public space preferences extend beyond activity habits and spatial attributes, encompassing perceptions of crowd dynamics and engagement in various activities. Within the SEM-Logit model framework, this study aims to identify key factors influencing intergenerational interaction, also to develop spatial optimization strategies from both short-term and long-term perspectives. In the short term, measures such as facility upgrades and event programming can enhance the appeal of public spaces to different generations and foster interaction. However, these efforts may be constrained by existing social structures and resident behavior habits, hindering sustainable intergenerational development. In the long term, population mobility and community building will become central considerations. Strategies should be tailored to the unique spatial characteristics and socio-economic contexts of each different shared space in HUA. Furthermore, by recognizing generational preferences, public spaces can be adapted along a progression, ranging from "Spatial Separation" to "Social Interaction" and "Mutual Support", thereby ensuring varying degrees of intergenerational participation.

In summary, this study aims to provide planning guidance for fostering intergenerational integration in public spaces within HUA, utilizing a SEM-Logit model framework. In the short term, it explores the relationship between elderly-friendly adaptations and youth-friendly enhancements. In the long term, it proposes localized environmental improvement strategies based on population structure optimization and neighborhood relationship

enhancement. The findings offer scientific support for historic urban areas' renewal, contributing to the development of more inclusive public space systems.

Finding the Optimal: Balancing Accessibility and Need in EV Charging Station Allocation

Abstract ID: 1844.0.0.526.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Chang Xu [Michigan State University] xuchang1@msu.edu, presenting author

Noah Durst [Michigan State University] durstnoa@msu.edu

The rising prevalence of electric vehicles presents challenges in determining the optimal placement of charging stations. There is no single solution that fits all circumstances and slight differences in placement can lead to significant variations in access. Motivated by these considerations, this study examines how accessibility is influenced by various allocation criteria. The study considers four common criteria for Electrical Vehicle Charging Station (EVCS) allocation, including daily commuting distances (Fridgen et al., 2021), destination popularity (Pal et al., 2021), housing types (Hardman & Tal, 2021), and proximity to highways (Huber & Bogenberger, 2015). The analysis explores several EVCS coverage scenarios by assigning charging stations to 5, 10, 15, 20, or 25 percent of the block groups in the Grand Rapids and Detroit metropolitan areas. In addition, the study evaluates how these criteria affect disparities between underserved groups and non-underserved groups and assesses the extent to which the accessibility of underserved groups is compromised relative to the optimal distance under different allocation priorities. A heuristic optimization approach is employed to determine the optimal allocation of charging stations for each criterion under varying coverage scenarios, and the nearest travel distance to the nearest EVCS is computed as a measure of accessibility. The results show that accessibility does not improve much when charging station coverage increases to 15 percent of block groups. Workers consistently enjoy better access than residents regardless of the allocation criterion. Moreover, prioritizing locations with high work-to-home commuting distances significantly reduces the disparity between underserved and non-underserved groups. Overall, renters are identified as the most vulnerable group because their actual travel distance to the nearest charging station far exceeds the optimal travel distance for most allocations.

From reaching destinations to real accessibility: Commuting time and access to jobs in Mexico City

Abstract ID: 1844.0.0.13.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

David Lopez-Garcia [University of Illinois Chicago] lopezgar@uic.edu, presenting author

Accessibility has been defined as the ease of reaching destinations. There is an ongoing debate in the accessibility literature about whether the ease of reaching potential job opportunities translates into real access to employment. This study contributes to the debate by examining whether the ease of reaching destinations predicts real job access in key job concentrations of the Mexico City Metropolitan Zone (MCMZ). The analysis focuses on public transport commuters, using four indicators of the ease of reaching employment subcenters: average commuting time to subcenters Central Agglomeration, Santa Fe, Naucalpan, and the nearest employment subcenter. Spatial Autoregressive Combined (SAC) models assess the relationship between commuting time and job attainment while controlling for transport, urban structure, and socioeconomic factors. Four explanatory frameworks are tested: the Spatial Mismatch Hypothesis, the Choiceless Mobility Hypothesis, the Limited Mobility Hypothesis, and the Skill-Matching Hypothesis. Findings reveal that the ease of reaching destinations influences some employment subcenters while not affecting others. Even where accessibility matters, it is not the primary determinant. Accessibility interacts with urban structure and socioeconomic factors differently across employment concentrations. Real access to the Central Agglomeration aligns with the Choiceless Mobility Hypothesis, Santa Fe with the Skills Mismatch Hypothesis, Naucalpan with the Spatial Mismatch Hypothesis, and the closest employment subcenter with the Limited Mobility Hypothesis. These results suggest that real job accessibility is shaped by mechanisms specific to different employment concentrations. Thus, understanding who gains access to which jobs requires considering broader urban structure and workforce characteristics beyond the ease of reaching destinations.

How Does Disability Influence Extent of Visit to Activity Centers?

Abstract ID: 1844.0.0.329.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Md Musfiquir Rahman Bhuiya [Institute of Transportation Studies] mrbhuiya@ucdavis.edu, presenting author

Jesus Barajas [Department of Environmental Science and Policy] jmbarajas@ucdavis.edu

Prashanth Venkataram [Institute of Transportation Studies, University of California Davis] pvenkataram@gmail.com

In a social milieu, an individual has a demand for traveling to different lands to perform different activities. These activities include not only working but also participating in non-work trips. Fulfilling this demand is necessary to earn a livelihood, maintain social relationships, provide nourishment for mental health, and enhance productivity (Marquez et al., 2020; Yen & Lin, 2018). An accessible and affordable transportation system is necessary to visit these land uses and to participate in these activities. However, many individuals in the United States (US) are not able to access these land uses using transportation systems and services due to physical and cognitive disability. While there have been studies exploring the mobility challenges faced by people with disabilities, rarely have any studies shed light on their frequency of trips to visit activity centers. To understand the influence of disability on the performance of various activities, we examine how different types of disabilities affect trip frequency to the workplace, grocery stores, friends' and relatives' residences, parks, and restaurants by surveying 1,896 respondents, including individuals with and without disabilities. For all activities, people without disabilities make fewer trips. The percentage of respondents who never visit the workplace or restaurants is significantly higher (around 10 percentage points) among people with disabilities. For non-work trips, people with disabilities show a relatively lower percentage of trip frequencies exceeding three times per week. Modeling trip frequency to these activity centers using ordinal logistic regression shows that having disabilities, in general, negatively influences the trip frequency of all considered activities, but different types of disabilities have varied influences on trip frequency for different activities. To pursue the research question, disability is classified in seven types: mobility impairment, vision impairment, hearing impairment, speaking impairment, cognitive impairment, psychological disabilities, and driving-limiting disabilities. Mobility impairments have a negative influence on trip frequency for all considered activities. Cognitive impairments negatively influence trip frequency to the workplace, friends and families' residences, and restaurants; and hearing impairment negatively influences trip frequency to the grocery store. Driving-limiting disabilities negatively influence trip frequency to workplaces, friends and relatives' houses, and grocery stores. In most cases, predicted probability shows that having particular types of disabilities reduces the probability of making the trips at higher frequency and increases the probability of making the trips at lower frequency, particularly never visiting the place. The most significant influence of disability is found in mobility impairment in terms of increasing the possibility of never going to workplaces by 22%. Driving-limiting disability can reduce the possibility of going to grocery stores at a higher frequency of 1-3 times/week significantly by 20%. The study provides recommendations to increase the frequency of visits to these activity centers by increasing the accessibility of the transportation system, ensuring better accessibility inside these activity centers, and providing community support to assist them in the movement of people with disabilities.

Compromised water quality is an increasingly pressing issue, particularly along coastal regions of Island communities. Water systems along coastal regions are increasingly overburdened as a consequence of climate change and an increasing global population (Sullivan 2016). There is a lack of awareness of the role of degraded water quality on ocean and coastal ecosystems that directly influence health and economic outcomes for coastal residents. Beyond human consumption, water that meets minimum quality thresholds supports plant and animal species and diverse economic sectors such as recreation, fishing and tourism.

Vulnerability literature has shown that impacts of environmental hazards such as degraded water quality are not evenly distributed among communities (EPA, 2021). Spatial measures of socio-economic vulnerability would allow to assess differential impacts on coastal communities (Portelli et al, 2020). A previous coastal socio-economic vulnerability profile for Puerto Rico at the Census Tract level based on US Community survey 2012-2016 data (Santiago et al 2021) was used as a baseline for our study. Existing databases were updated to estimate a more recent Census Tract level coastal socio-economic vulnerability assessment (2019-2023) for the study area.

We have tested for significant correlations between social vulnerability and coastal water quality indicators. Spatial regression analysis was then used to estimate the significance and magnitude of socio-economic vulnerability indicators (i.e., population > 65 and <17 years old, with a disability, with no 9th or 12th grade diploma, households earning less than \$10,000 a year or renters paying less than \$500 a month) on water quality parameters (Enterococcus, pH, temperature). The proposed baseline was a non-spatial pooled OLS regression model, expanded to include spatial interaction effects. A geographically weighted regression model (Fotheringham et al., 2003) was used to determine how well geographically contaminated areas predicted the occurrence of underserved communities.

Project findings have not only provided specific social coastal vulnerability and water quality profiles for Puerto Rico, but also identified locations that should be prioritized for cleanup based on pressing community needs. Statistically significant associations between socially vulnerable communities and lower levels of water quality would inform policies that seek to address coastal water quality pollution in communities and sectors whose livelihoods are affected by degraded water quality. Key affected sectors include subsistence, commercial and sports fishing, and tourism.

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Junsik Kim [UC Berkeley] profjunsik@gmail.com, presenting author

Andy Hong [University of Utah] a.hong@utah.edu

Extreme heat is a serious public health issue because it significantly affects human health directly and indirectly and leads to an increase in morbidity and excessive mortality (Vose et al., 2017; Mazdiyasni et al., 2017; Pirard et al., 2005; Pascal et al., 2013). Previous studies have shown that about 5,000 to 12,000 excess deaths occur annually in the U.S. due to extreme heat (Kochanek et al., 2011; Lowe, 2016; Weinberger, 2020; Shindell et al., 2020; Abbinett et al., 2020). Also, more than 65,000 people in the U.S. visit the emergency room due to heat-related illnesses (Crimmins et al., 2016).

In 2018, South Korea experienced its most severe extreme heat event in 111 years. According to the Korea Disease Control and Prevention Agency, the number of reported heat-related illnesses surged by 188% compared to 2017, resulting in 4,536 cases and 48 fatalities. In response, the South Korean government legally designated extreme heat as a natural disaster and implemented comprehensive nationwide adaptation strategies aimed at reducing heat vulnerability, with a particular focus on socioeconomically disadvantaged populations.

This study evaluates the effectiveness of this policy shift in reducing heat-related mortality by mitigating heat vulnerability between 2012 and 2022 across South Korea, applying the IPCC's climate risk framework. Recognizing that policy impacts may vary across socioeconomic groups, we further analyze the Heterogeneous Treatment Effect (HTE) by subgroup, including age, sex, educational attainment, occupation type, and region, to assess differential impacts.

Using an interrupted time series (ITS) analysis combined with generalized least squares (GLS) and the corARMA model, our findings indicate a statistically significant 72% nationwide reduction in heat-related mortality compared to the counterfactual scenario, translating to 7.6 preventable deaths per month (95% CI: -14.8, -0.4, $p = 0.04$). Furthermore, HTE analysis reveals that the intervention was particularly effective in mitigating heat vulnerability among socioeconomically disadvantaged groups, with mortality reductions approximately 12 times greater in older adults and 7 times greater in individuals with lower educational attainment.

These findings underscore the effectiveness of extreme heat adaptation policies in reducing heat-related mortality by addressing vulnerability, particularly among vulnerable populations, and reinforce the role of climate policy in addressing heat inequalities.

Individual Paper Presentation Submission

Jae-Woong Sim [Ulsan national institute of Science and Technology] ryghl1994@unist.ac.kr, presenting author

Gi Hyoun Cho [Ulsan National Institute of Science and Technology] gicho@unist.ac.kr

Throughout the 20th century, segregation, defined as the spatial separation of racial and socio-economic groups, has been a central topic in urban studies (Cutler & Glaeser, 1997). However, population ageing—driven by increasing life expectancy and declining birth rates—has introduced a new dimension of segregation into academic discourse: age-based segregation (Harper, 2014). Although earlier research examined younger populations migrated toward suburban or peripheral areas, scholarly interest in residential age segregation has grown considerably since the 1990s (Sabater & Finney, 2023).

In South Korea, as younger age cohorts—particularly individuals in their 30s—relocate to areas offering greater employment opportunities and relatively affordable housing, such as Gyeonggi Province and central Seoul, older adults remain in aging residential zones. This demographic shift has resulted in the formation of “islands of elderly,” characterized by low-rise housing and an increasing share of low-educated, socially isolated older individuals. As younger populations relocate, the availability and quality of essential services in these areas decline, exacerbating older residents’ vulnerability to social isolation, psychological distress, and substandard living conditions (Hagestad & Uhlenberg, 2005). These spatial and demographic dynamics contribute to a reduction in intergenerational contact and diminish the economic vitality of local communities.

This study advances the conceptual understanding of age segregation. A key contribution lies in distinguishing Residential Age Segregation from Vitality Age Segregation, which means segregation in spaces of daily activity and social interaction. While previous research under the framework of ‘aging in place’ has emphasized housing preferences, relatively little attention has been paid to the structural and spatial organization of segregated neighborhoods (Miliadis & Psyllidis, 2022). For a more comprehensive understanding of age segregation, it is essential to finding the separation in activity spaces. To analyze these dynamics, this study conceptualizes Vitality Age Segregation using the urban vitality index, a widely recognized metric of population activity and spatial engagement (Q.-Q. Li et al., 2022). By utilizing mobility data of older adults in Seoul, this study identifies the actual spaces occupied by elderly individuals and evaluates whether spatial concentration in these zones facilitates or limits their engagement in daily activities.

This study computes a localized segregation index for both Residential and Vitality Age Segregation at the 250-meter grid scale. Mediation analysis is employed to assess whether age segregation mediates the relationship between neighborhood-level variables and elderly inactivity. In addition, structural equation modeling is utilized to explore heterogeneous effects.

The findings indicate that both forms of segregation are associated with reduced levels of activity at the regional level. However, Vitality Age Segregation, when observed at the scale of daily activity zones, can foster engagement among older adults. These results challenge the prevalent notion that elderly segregation is a natural or benign demographic process, instead highlighting its role in constraining participation and reinforcing spatial inequality.

By analytically distinguishing between residential and activity-based dimensions of age segregation, this study addresses a critical gap in existing literature and presents a more nuanced conceptual framework. The findings suggest that age segregation may function as both a mechanism of exclusion and a potential source of

empowerment, depending on spatial context. These insights call for urban planning approaches that extend beyond housing allocation to promote inclusive, intergenerational, and activity-oriented urban environments.

Inclusion and Emergency Response: Place, Identity, Politics, and Trust

Abstract ID: 1844.0.0.229.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Kathy Quick [University of Minnesota] ksquick@umn.edu, presenting author

The fact that racial and ethnic minorities, younger people, and urban residents in the U.S. are increasingly wary about calling 911 dispatch centers when they need help reflects connections between place, identity, and safety (Quick, 2022). Differences among geographic regions in trust in emergency services is an example of place-associated aspects of inclusion and exclusion (Zapata and Bates, 2015; Jackson et al., 2023), relating to Whiteness as an “encompassing and veiled” quality of access to the advantages of planning government policies and protection in the U.S. (Goetz et al., 2020, p. 145).

Issues of access to and trust in emergency response have been particularly acute in Minnesota following the 2020 murder of George Floyd by police officers. Some Minnesota communities now advise against calling 911 and are self-organizing other resources for safety and emergency response. The lack of trust in public safety professionals and the heightened anxiety of people interacting with first responders during emergencies may elevate responders’ burnout, risks, and trauma (Jacob et al., 2024).

This paper explores what Minnesotans expect from first responders, including 911 dispatchers, police officers, firefighters, and emergency medical technicians. We examine public expectations descriptively (i.e., respondents’ assessment of the quality of these aspects of emergency response) and normatively (i.e., what values they believe should be prioritized in improving emergency response). Through an anonymous survey, we collected data from 907 Minnesotan adults in 2023. Respondents were asked about their recent use of 911, whether they do or do not feel safe around different first responders, the reasons they might feel more or less likely to call 911 for help, their confidence in different kinds of responses to mental health emergencies (including social workers), and which values they believe should be prioritized in the implementation of and investment in the emergency response system as a whole.

Through descriptive statistics, data visualization, and statistical tests, we explored whether there are patterns of difference in attitudes by place of residence (urban, suburban, or rural), gender, race and ethnicity, age, income, and political affiliation. A substantial majority have a positive perception of 911 dispatchers, though less so for mental health emergencies. Study respondents’ feelings of safety are weakest around police officers (compared with other firefighters and EMTs), with statistically significant differences by age (with those aged 18-34 feeling least confident), race (with less than half of BIPOC respondents feeling safe), and income. Political affiliation was also statistically significant, with Republican respondents markedly more confident of their safety and being the only group to disagree with having social workers respond to mental health emergencies.

Investigating Mobility-Impaired Older Adults' Travel Behavior: Evidence from Shanghai

Abstract ID: 1844.0.0.656.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Zizhan Wang [Tongji University] 1810149@tongji.edu.cn, presenting author

Haixiao Pan [Tongji University] panhaixiao@tongji.edu.cn

Xiaolin Shi [Northeastern University] x.shi@northeastern.edu

Huan Dong [Tongji University] 2211335@tongji.edu.cn

The global aging population is growing rapidly, with the United Nations projecting 22% to be aged 60 and above by 2050. In 2018, 39.6% of China's population, including the elderly, disabled, and low-income groups, faced significant challenges in urban environments and public transport accessibility.

Outdoor activities and travel frequency serve as indicators of senior citizens' physical and mental health and quality of life. The lack of outdoor activity and daily trips is linked to restricted mobility, which in turn contributes to poorer health conditions. Research on the factors influencing elderly travel behavior has recognized the heterogeneity within this group, arising from factors such as age, different types of physical, sensory, and cognitive impairments, economic status, social and family support, and the accessibility of local built environments.

However, recent qualitative studies indicate that varying degrees of mobility impediments or disability severity exert more direct constraints on travel frequency and mode captivity.

Regarding family support, studies often associate family structure factors with the division of household responsibilities. It is noteworthy that living with family does not necessarily imply caregiving duties. Studies that explicitly verify the division of family responsibilities are scarce, and the relationship between living arrangements, household responsibilities, and trip frequency needs further exploration.

To improve the quality of life in the local community, Shanghai implemented the 15-minute community living circle initiative, equipping each local community with a list of service facilities. Studies have shown that the density of activity destinations, which signifies the accessibility of facilities and services, has a significant positive impact on elderly outdoor activities. However, due to various physical barriers in the local community, will this initiative benefit elderly individuals with physical mobility constraints?

The survey data from 1,049 respondents in Shanghai show that 59% of them reported mobility difficulties. This study incorporates "mobility limitation" as a grouping dimension, which includes self-reported mobility impediments and degrees of mobility difficulty, such as the use of crutches, wheelchairs. It also considers roles related to family responsibilities, including daily chores, caregiving for co-residents, community activities and duties, and the role of being cared for. The built environment factors were calculated based on a reduced range of their walking in 15 minutes. Logistic regression, Lasso, and Logistic regression with interaction terms were applied to analyze the differences.

The results show that, after accounting for "mobility limitation" category, mobility limitation is a more focused factor than physical impairments in elderly individuals, significantly negatively affecting travel frequency. For individuals with mobility restrictions, the family responsibility role—caregiving for others—has a more direct impact on maintaining a higher travel frequency than simply co-residing with family members. Meanwhile, the influence of local built environment factors—such as facility density and public transportation accessibility—is much weaker for this group compared to healthier individuals.

This analysis highlights the necessity of separately identifying and addressing mobility-restricted elderly groups in urban renewal, transportation planning, and travel behavior studies to avoid their needs being overshadowed by those of healthier elderly groups. For this population, research priorities should shift from conventional built environment optimization to the enhancement of micro-level barrier-free environments and universal design.

Last-Mile Rail Transit in Suburban Communities: Income, Accessibility, and Transfer Time

Abstract ID: 1844.0.0.167.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Yiwen Zhang [Southeast University] zhangyw_seu2022@163.com, presenting author

Wenzhu Zhou [Southeast University] zwz-1234567@163.com

In the context of urban development and suburban transformation, vulnerable transportation groups within China's suburban communities face significant "last mile" connectivity challenges to rail transit. This study explores the first/last mile connections of rail transit, employing a hierarchical regression model to analyze how income levels and multimodal accessibility (including cars, buses, cycling, and walking) influence transfer times. Utilizing travel survey data from 2,204 residents across suburban communities in Nanjing, our findings reveal that low-income groups experience more pronounced effects on transfer times linked to walking and cycling accessibility, while high-income groups effectively mitigate transfer times through car access. Moreover, the impact of multimodal accessibility demonstrates spatial heterogeneity: optimizing car transfer facilities significantly reduces transfer times for outer suburban communities, whereas enhancements to walking networks improve efficiency for inner suburban areas. Sensitivity analyses indicate that for low-income residents, improvements to last-mile bus accessibility can significantly diminish transfer times, irrespective of community location. This research provides vital empirical support for enhancing the accessibility and efficiency of rail transit systems in suburban communities and suggests that policymakers must consider income disparities to promote transportation equity and sustainability.

Making Space for Ethnic Culture: Identifying Banquet Halls as Important Ethno-cultural Spaces

Abstract ID: 1844.0.0.39.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Sneha Mandhan [University of Toronto] sneha.mandhan@mail.utoronto.ca, presenting author

The Greater Toronto Area is home to people with diverse ethno-cultural backgrounds, many of whom are increasingly bypassing dense downtowns to live in the suburban areas and municipalities in the region. Despite the growing ethno-cultural diversity in the area, local municipal planning efforts do not comprehensively accommodate the ethno-cultural practices and spatial needs of these communities (Viswanathan, 2009; Zhuang, 2021a). This has resulted in ethnic entrepreneurs taking on the responsibility of creating spaces such as places of worship and event spaces, many of which are located in areas zoned for industrial uses (Basu & Fiedler, 2017; Zhuang, 2021b). These spaces serve as critical community infrastructure but are not often formally recognized or supported by local municipalities.

Using the example of privately-owned event spaces serving South Asian communities in the municipalities of Toronto, Brampton, and Mississauga, this paper interrogates cultural planning efforts in these cities to ask: Are privately-owned event spaces currently understood and recognized as being culturally important spaces per planning definitions and regulations? Do these event spaces qualify for any municipal support or protection? What are some of the ways in which these spaces can be integrated into or accommodated by local cultural planning efforts?

This paper uses an analysis of policy documents and interviews with owners and operators of event spaces, and municipal staff working in cultural planning or cultural services to answer the questions posed. Initial findings indicate that most municipal cultural planning efforts focus on cultural production from an economic lens, and fall short of accommodating spaces for the practice of ethnic cultures. Cultural planning efforts currently also do not adequately support the emerging Do-It-Yourself event community, which rely on spaces like banquet halls for their work. This paper contributes to the emerging body of literature on the ethno-cultural use of space and multicultural planning practice.

Planning for Maternal Health Equity Among Low-Income Latina Women in Texas

Abstract ID: 1844.0.0.152.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Vanessa Delgado [University of Texas at Arlington] vrd6033@mavs.uta.edu, presenting author

Urban planning profoundly shapes the physical, social, and environmental conditions that impact community health (Wang et al., 2020) yet it has long overlooked maternal health as a planning priority. While growing literature from public health and medicine highlights connections between the built environment and maternal health outcomes (Vinikoor-Imler et al., 2011), planning tools have largely failed to incorporate maternal health as a pressing concern. For instance, The American Planning Association's Healthy Communities Policy Guide, a foundational resource for integrating health into planning practice, does not mention maternal health. This disconnect is especially alarming in the context of the maternal health crisis in the United States, where maternal mortality rates are three times higher than in other high-income countries and recent policy shifts have deepened inequities in reproductive care (Hoyert, 2021). Latina women, in particular, face compounded barriers related to immigration status, poverty, racial discrimination, and geographic isolation, yet their experiences are often absent from planning discourse.

This study seeks to address these gaps by asking the following question: What are the key built environment factors, such as housing quality, transportation access, and neighborhood infrastructure, that contribute to maternal health outcomes among Latina women? By framing maternal health as a place-based and gendered issue, this research challenges traditional planning approaches and calls for greater integration of maternal health into planning community-based frameworks, tools, and policies that help address maternal health issues experienced by low-income Latina women.

To approach this question, this study employs a mixed-methods approach. Existing quantitative studies on the connection between maternal health and the built environment often rely on difficult-to-access datasets like birth records, which are typically siloed within health departments and inaccessible to most planning professionals. This study will analyze available quantitative data on maternal health to demonstrate the limitations of these statistics in capturing the lived experiences of low-income Latina women in US communities. Drawing on the planning index for maternal and child health developed by Wang et al. (2020), the study will incorporate county-level data from sources such as the HRSA and the NVSS to identify communities with poor maternal health. This study supplements quantitative data with data collected through mixed-method planning methods, such as surveys and in-depth interviews, to generate narrative-driven data. To engage Latina women in these communities, the study collaborates with promotoras or community health workers, who are trusted members of the community. To complement these narratives, street-level observations and evaluations of neighborhood attributes will help ground these individual stories in their broader spatial context.

Texas offers a unique context given its location as a border-state, high maternal mortality rate, restrictive reproductive policies, limited Medicaid expansion, and geographic disparities (IRWGS, 2024). Latina women in Texas have already seen a sharp rise in births while also facing longer travel times and higher medical costs (IRWGS, 2024). This research will be informed by feminist planning theory perspectives such as Chicana feminist frameworks that may help center the voices and knowledge of Latina women facing maternal health issues. Rather than proposing immediate solutions, this paper focuses on documenting spatial barriers to maternal health, laying the groundwork for future planning interventions. This research challenges planners to see maternal health not solely

as a health issue, but as a measure of spatial justice and community well-being. Broadly, this may serve as a reference for other cities in the US with high maternal health concerns.

Planning with Disability: Understanding Facilitators and Obstacles

Abstract ID: 1844.0.0.922.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Carlos Licon [Utah State University] carlos.licon@usu.edu, presenting author

Valerie Novack [Utah State University] valerie.novack@usu.edu

Jefferson Sheen [Utah State University] jeff.sheen@usu.edu

Keith Christensen [Utah State University] keith.christensen@usu.edu

Core values in planning and policy-making are community building, engaged participation, and meaningful opportunities available for all individuals. Social structures and the physical environment play a crucial role in either facilitating or inhibiting access and inclusion for individuals with disabilities. The design of physical infrastructure, facilities, or spaces, together with implementing programs and services, can intentionally or unintentionally ease or restrict participation for people with disabilities. Embedded planning dimensions and results from explicit policy, planning, and design efforts shape each of these features.

Access is the foundational step in creating an environment that allows individuals with disabilities to interact with their surroundings effectively. However, planning for true inclusion requires going beyond accessibility; it demands opportunities for individuals to be included, participate fully, and contribute meaningfully to their communities and society at large. This study explores how various aspects of life act as facilitators or obstacles for individuals with disabilities and how these elements collectively inform planning and policy-making opportunities for inclusion.

This study compiled a list of over 500 environmental and social conditions identified through an extensive literature review, where individuals with disabilities highlighted elements that either support or hinder their well-being and participation in community life. A panel of experts classified each facilitator and obstacle on four significant dimensions relevant to planning and policy-making: interaction scale (individual to society at large), responsible entity or agency (government, private, NGO), planning area (services, incentives, adopted plans, codes, standards, participation), and policy domain (well-being, learning, self-determination, inclusion, productivity, full citizenship). To understand the aggregated implications for planning, the classification of facilitators and obstacles was analyzed using contingency tables, chi-squared analysis of differences, and multiple correspondence analysis to generate clusters of facilitators and obstacles. Cluster analysis produced seven clusters of facilitators and seven clusters of obstacles, illustrating how different combinations of planning and policy aspects create opportunities or barriers for individuals with disabilities. For instance, some facilitator clusters effectively link planning standards and codes to institutional responsibilities. Others highlight the limited opportunities for personal growth facilitated by planning efforts or the insufficient initiatives to enhance participation and social interaction. Conversely, obstacle clusters reveal institutional challenges in enforcing well-being conditions or creating opportunities for personal development, among other issues.

Understanding the interrelated dimensions of these facilitator and obstacle clusters provides insight into how governmental and social responsibilities intersect with efforts at various scales to achieve specific planning and policy goals. This understanding can inform strategies to enhance inclusion in planning and policymaking. A discussion of these clusters will help identify strengths in inclusive planning, unaddressed planning areas, gaps in community and governmental efforts, and roles for advocates and policymakers. Ultimately, this study contributes to a more comprehensive and effective approach to fostering inclusivity in planning and policy design.

Queer Social Movement Displacement in Greenwich Village

Abstract ID: 1844.0.0.755.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Joe Gallegos [University of California, Irvine] jgalleg@uci.edu, presenting author

Gentrification has long been known to displace populations by removing previous, often poorer people and replacing them with more affluent groups largely driven by a rent gap (Smith 1996). These previous populations have already established their own social, economic, and community lives over generations, and this includes social movement organizations and nonprofits that serve these populations in various capacities. What happens to these organizations in this process? Do they remain? Do they move along with their constituencies? At the same time, do their missions and claims change?

Specifically, what has happened to various LGBTQIA+ social movement organizations and nonprofits in New York City's Greenwich Village as gentrification has accelerated and displaced poorer queer populations and replaced them with increasingly affluent ones? Do these organizations remain in place and attempt to serve a more dispersed population from their original home bases, or do they attempt to move along with their constituents? At the same time, do new organizations focused on more affluent populations take their place?

Work similar to this has been done by Gieseeking (2020), but little work has focused on mapping this displacement in relation to claims made by the organizations. Additionally, we see that where marginalized populations exist, there tends to be the creation of social movements and other autonomous organizations to create community (Chauncey 1995; Nicholls 2016). But does this movement creation translate when it comes to people displaced within a given city?

This paper seeks to find out how these movements move through space while also measuring which, if any, of their claims change over time. I will accomplish this through a newspaper database analysis of approximately 1,000 New York Times articles from 1990-2020 in which I will examine the locations of organizations and their protests, actions, and areas of focus. I will supplement this by examining the tax returns found on the IRS Form 990s of any tax-exempt nonprofit organizations to find the addresses of organizational offices.

This database will also be used to examine the types of claims that these organizations make over this same period. Do they continue to advocate for the most marginalized groups if that was their mission before, or do they change their focus to the new groups of people coming in? For example, could a group that might have had an anti-gentrification focus give that up to focus on other things?

Preliminary findings show some evidence of this displacement and change of claims. My examination of the queer youth organization FIERCE (Fabulous Independent Educated Radicals for Community Empowerment), which was focused on anti-gentrification work in Greenwich Village in the 1990s and early 2000s, shifted their focus away from that to primarily focusing on rights organizing for queer youth. At the same time, the organization, formerly in Chelsea, close to Greenwich Village, ultimately found themselves at the north end of the Bronx, far away from their previous area of focus in Greenwich Village. Thus, FIERCE seems to have moved to a less affluent part of the city while also changing their focus.

This has important implications for planning scholars and even practitioners. Empirical data on what happens to the organizations that serve marginalized populations during the process of gentrification can assist planners in

thinking about the needs of populations newly displaced from gentrified parts of cities. Planners can use this to direct assistance to these populations if needed, and to assist organizations in their provision of services.

Rethinking the Child–Adult Divide: Reviewing and Reimagining Planning for Child-Friendly Cities

Abstract ID: 1844.0.0.710.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Jiewen Li [Department of Geography and Planning, University of Liverpool] javen@liverpool.ac.uk, presenting author

Cities offer great potential for children’s learning, development, and socialization. Yet, urban inequality continues to threaten children’s rights and well-being. These inequalities exist not only among children but also between children and adults. Modern cities have long been criticized for being unfriendly to children - excluding them from shared spaces, restricting intergenerational mobility, and providing low-quality play environments (Brown et al., 2019). Despite decades of research and increasing policy attention, there is still a long way to go to build a truly child-friendly city. This persistent paradox raises the main question of this paper: why is progress in building child-friendly cities still so limited?

To address this question, this paper reviews and analyses how planning has historically responded to children’s needs integrated with an understanding of childhood and adulthood. Before the 1970s, children were not seen as distinct planning subjects; they were considered primarily in relation to designated spaces like schools, playgrounds, and residential zones. Under Fordist ideals, the “standard adult”—typically a stable, male worker—was positioned as the normative urban subject, while children were viewed as incomplete, dependent, and marginal (Lee, 2001). Planning practices reflected this hierarchical binary.

From the 1970s to the 1990s, feminist critiques and the decline of Fordism destabilized this male-centered norm. Initiatives such as Growing Up in Cities and Adventure Playgrounds emphasized children’s spatial experiences and perspectives. However, since the 1990s, children’s needs have again been side-lined again. The expansion of automobility and heightened safety concerns have severely curtailed children’s independent mobility. Structured schedules and the commercialization of play have reduced their autonomy and reinforced social inequalities (Malone, 2007). Meanwhile, the intersection of neoliberal economics and conservative social values has blurred the boundaries between childhood and adulthood: children’s lives increasingly overlap with adult domains, while adults—especially parents—reinforce strict spatial and temporal boundaries around childhood.

Current child-friendly planning strategies—namely, (1) the provision of exclusive child spaces and (2) efforts to promote children’s participation—reflect this divide in different ways. The first isolates children from shared urban life, while the second often becomes tokenistic and neglects the distinctiveness of childhood. All of these contradictions underscore the persistence of a binary that casts adults as “human beings” and children as “human becomings” (Qvortrup, 2005).

The solution, this paper argues, does not lie in addressing the increasing ambiguity between children and adults or in simply equating children with ‘human beings’ as adults used to be. Rather than reinforcing vertical hierarchies, planning should cultivate horizontal, collaborative relations between children and adults. As Moore (1980) suggested, building child-friendly environments is not only about children—it’s about improving urban life for everyone everywhere. In fact, practical examples like Canada’s family-friendly initiatives and critiques of the current child-friendly planning models show that this shift is already beginning, even sometimes unconsciously.

Ultimately, this paper offers conceptual and practical insights for rethinking child-friendly urbanism. It calls for a shift in planning logic: a truly child-friendly city is not just about children, but about all of us, and about reimagining the social and spatial relationships between children and adults. Can we envision a city that is more inclusive, more

equal, more interesting—and more encouraging of explorations and more tolerant of mistakes? The answer, I think, is yes. And it begins by rethinking how childhood and adulthood coexist in an uncertain urban world.

The Hidden Costs of Electric Vehicle Adoption: the Erosion of Aging-Friendly Communities

Abstract ID: 1844.0.0.367.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Huan Dong [Tongji University] 2211335@tongji.edu.cn, presenting author

Haixiao Pan [Tongji University] hxpank@online.sh.cn

Muzhao Yu [Tongji University] muzhao.yu@outlook.com

The rapid expansion of electric vehicle (EV) adoption in China's megacities, driven by global carbon neutrality goals, presents complex yet underexplored implications for community sustainability. Government subsidies and supportive policies have incentivized EV ownership. While China has not yet experienced a rebound effect from EV usage, the potential risks merit careful consideration (Du et al., 2023). Existing research has extensively examined the rebound effect of EVs, frequently using spatial clustering analyses to identify factors influencing EV adoption (Selena Sheng et al., 2022). However, a critical gap remains: the lack of urban planning perspectives (Jiang et al., 2024) assessing the spatial impacts of EV proliferation on community life circles.

This issue is particularly relevant given the rapidly aging population. Does the widespread promotion of EVs hinder the development of age-friendly communities? Although China's megacity centers are characterized by high construction density —potentially mitigating the suburbanization trends linked to increased motorization—the large-scale adoption of EVs may still encroach upon public spaces and alter the spatial distribution of amenities. Such changes could undermine the fundamental principles of the community life circles, which seek to promote pedestrian accessibility to daily necessities through a diverse and well-integrated network of local resources.

Shanghai has one of the highest rates of EV ownership among Chinese cities. As a megacity, its central districts are characterized by high-density and well-developed facilities, making them well-suited to the operational patterns of EVs, which are primarily used for shorter trips (Mukherjee & Ryan, 2020). To examine EV adoption and its spatial impacts, we conducted a survey of 400 participants across Shanghai, including both EV and conventional vehicle (CV) users. We applied a difference-in-differences (DID) model to assess behavioral shifts resulting from EV adoption. Additionally, we developed a structural equation model (SEM) to explore the mediating effects of increased motorization, encroachment on community spaces, and the resulting decline in community age-friendliness.

Our research yields several key findings:(1) For first-time car buyers, electric vehicles significantly increase mobility dependence, leading to a notable rise in short-distance driving frequency compared to pre-purchase travel behavior. (2) In multi-vehicle households, the acquisition of an EV does not result in a reduction in CV usage. (3) Temporally, EV adoption reduces commute times, particularly in central urban areas where well-developed facilities support efficient travel. Spatially, EV users exhibit a broader travel range, often extending beyond the boundaries of the 15-minute community life circles, potentially weakening the effectiveness of localized community facility services. (4) A majority of respondents reported previously or habitually using street or community road space for parking, with some experiencing conflicts with elderly residents within the community. Notably, the implementation of community speed limits has been shown to mitigate conflicts between EV users and elderly residents, enhancing pedestrian safety.

This study critically points out that electric vehicle policies are overly focused on the environmental benefits of reducing carbon emissions, but the underlying social costs are ignored. By analyzing the impact of EV adoption on public spaces and community facilities, we demonstrate how the widespread promotion of EVs may hinder the

development of age-friendly community life circles. Given these findings, megacities need to regulate motorization within community life circles, ensuring that age-friendly principles are prioritized in the continued expansion of EV adoption.

Travel Experience and Social Identities: A Comparative Study of Mobility in Austin and Boston

Abstract ID: 1844.0.0.122.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Minyu Situ [The University of Texas at Austin] minyusitu@utexas.edu, presenting author

Limited access to transportation can marginalize certain populations, creating transportation-disadvantaged groups. These individuals face challenges such as longer travel times, greater distances, higher costs, and the inability to complete essential trips, limiting their participation in social, political, and cultural life. To address these challenges, planners must consider individuals' lived experiences. Social identities, including race, disability status, gender identity, sexual orientation, language ability, and immigration status, significantly affect transportation experiences and access to opportunities and resources. Emerging research highlights these factors as key determinants of travel experiences.

Transportation planning in the US has been shaped by racial and gendered assumptions, reinforcing systemic inequities. Historically, racial planning has privileged white neighborhoods, stigmatized minority areas, and justified resource deprivation through white supremacy and spatial racialization. Environmental injustices and gentrification further entrench disparities, while the binary gender framework has centered the needs of able-bodied, middle-to-upper-class white men, marginalizing women and LGBTQ+ populations. These issues emphasize the need for inclusive, gender-responsive planning that considers diverse racial, ethnic, and gender identities. Addressing these disparities requires transportation planners to reassess mobility challenges and develop policies that serve all communities, fostering a more just and inclusive system.

Austin and Boston, though demographically similar, offer distinct transportation contexts. Boston's multimodal system contrasts with Austin's car-dominated, monomodal network. This study examines how disability, gender, race, and socioeconomic factors shape mobility experiences in both cities, based on 28 qualitative interviews (16 in Austin, 12 in Boston) with college students at the intersection of race and gender identities.

The findings reveal that transportation challenges are not equally experienced. Participants with disabilities or chronic conditions faced significant barriers, with women with disabilities expressing the most frustration over limited travel options. Lower-income and racial minority groups prioritized economic and structural barriers over health-related concerns. LGBTQ+ and female participants identified hygiene and safety as significant concerns. Harassment, influenced by race, gender expression, and identity, was a widespread issue. Women frequently reported unwanted attention, while LGBTQ+ individuals, especially those from marginalized racial backgrounds, described heightened vulnerability. Measures such as increased surveillance and staff presence could improve perceptions of safety and create a more inclusive environment.

GIS mapping of interview data reveals spatial gaps in transit connectivity. In Boston, less accessible areas include suburban or natural sites outside the subway network and neighborhoods with high concentrations of Mexican, Black, and low-income residents, where access often requires more transfers from the city center. In contrast, Austin's less accessible areas are emerging hubs that are car-dependent or require more than two transfers via public transit. This analysis shows that accessibility is shaped not just by the presence of transit routes but also by factors such as minimizing transfers between origins and destinations.

These findings highlight the need for transportation policies that address systemic barriers to safety, affordability, and accessibility. By prioritizing the needs of marginalized populations, policymakers can create more equitable and inclusive mobility systems that serve all communities.

Trends and Challenges in U.S. Urban Planning Faculty: Stability, Structural Shifts, and Career Paths

Abstract ID: 1844.0.0.40.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Chunwu Zhu [Texas A&M University] chunwu.zhu@tamu.edu, presenting author

Xinyue Ye [Texas A&M University] xinyue.ye@tamu.edu

Tom Sanchez [Texas A&M University] twsanchez@exchange.tamu.edu

Wenyu Zhang [Texas A&M University] wenyu.zhang@tamu.edu

This study examines trends in tenure and tenure-track faculty positions within US urban planning programs from 2015 to 2024, offering insights into workforce stability and structural changes influenced by the COVID-19 pandemic. Drawing data collection from 89 urban planning programs, it analyzes faculty composition, recruitment, tenure and full professor proportions, mobility, and retirement at both national and program levels. The total number of faculty has declined slightly by 2.9%, indicating relative stability in urban planning academia. Meanwhile, the proportion of female faculty has increased from 36.54% in 2015 to 42.42% in 2024, reflecting progress toward gender parity in hiring. However, promotion disparities persist, with women underrepresented in higher academic ranks, underscoring ongoing systemic barriers. The growing competitiveness of academic careers in urban planning is reflected in trends related to hiring, tenure, and promotion to full professor. The COVID-19 pandemic has introduced new challenges to the academic workforce, causing both short-term disruptions and long-term structural shifts in hiring, promotion, and mobility.

Smaller urban planning programs face greater challenges in recruitment and retention, potentially limiting diversity of thought in the field. Although hiring rates for female faculty have improved, fewer women advance to senior positions, highlighting inequities in career progression. This study underscores the need for institutions to adopt strategies that support diverse hiring, equitable promotion processes, and inclusive academic environments.

Further research should explore racial and ethnic diversity in faculty dynamics to provide a more comprehensive perspective on academic workforce trends. While progress toward gender equity has been made, persistent disparities in promotion demand continued efforts to dismantle systemic barriers. Enhancing diversity and inclusion in urban planning academia will strengthen its capacity to address complex societal challenges. This study contributes to the discourse on faculty dynamics, emphasizing the importance of understanding stability and change in this specialized academic field.

Understanding How Transit Accessibility Shapes Children's Activity Range Using Mobile Phone Data

Abstract ID: 1844.0.0.327.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Shi-Ting Huang [Harbin Institute of Technology, Shenzhen] stingwonga@outlook.com, presenting author

Peiling Zhou [Harbin Institute of Technology, Shenzhen] lindaplzhou@gmail.com

Understanding how urban transit promotes children's mobility is crucial for inclusive transportation planning and children's well-being (Waygood et al., 2017). While extant research often prioritizes walking or cycling over car use, the role of public transit accessibility in shaping children's travel patterns remains insufficiently explored (Roberts et al., 2018). This absence is largely due to challenges in capturing children's actual activity patterns. Moreover, traditional approaches that focus primarily on home-based communities often oversimplify the spatial dynamics of children's mobility (Cai and Kwan, 2025). While schools function as critical mobility hubs structuring children's daily routines (Chaskin and Richman, 1992), existing research has yet to systematically compare the dual influences of home and school environments on children's travel behaviors and access to urban transit.

Building on these considerations, this study utilizes anonymized mobile phone data to bridge the existing gaps. Through a four-step procedure—comprising school-based stratification, temporal filtering, demographic clustering, and socioeconomic validation—the study identifies complete travel activities among child mobile phone users. Leveraging machine learning techniques, this study explores the nonlinear relationships between three transit modes (walking, bus, and metro) and three levels of children's activity range (compact, moderate, and extensive) across both home and school contexts.

Results indicate that the relative importance of transit accessibility increases as children's activity range expands, with this effect being particularly pronounced in the school context. Among three transit modes, road density emerges as the most influential factor in shaping mobility patterns. While transit accessibility generally facilitates children's activity range at the moderate level, its impact turns negative at the extensive level, suggesting potential constraints associated with parental concern. Notably, children residing in lower-cost neighborhoods appear to derive the most substantial benefits from enhanced transit access, underscoring the pivotal role of public transportation in fostering equitable mobility.

This study contributes to children's mobility research by adopting an innovative, integrated perspective on the interplay between children's travel activities and surrounding transit infrastructure, utilizing new data sources. The findings identify effective thresholds for public transport systems, offering actionable insights for child-centered transportation planning, and highlighting the priority of child-friendly public transit and school-focused planning strategies to support children's mobility and well-being.

Who Is Truly Served by TOD? A Micro-Scale Analysis of Walkability and Transit Equity in Shanghai

Abstract ID: 1844.0.0.700.2025

Track 5: Inclusion and Accessibility in Planning

Individual Paper Presentation Submission

Siying Li [Tongji University] 2859855342@qq.com, presenting author

Haixiao Pan [Tongji University] panhaixiao@tongji.edu.cn

Song Sun [Beijing Planning Institute] 654902544@qq.com

Transit-Oriented Development (TOD) is widely promoted as a strategy for creating compact, walkable, and transit-accessible urban environments. However, TOD planning often relies on simplified assumptions, such as using fixed-radius buffers (300–800 meters) to define metro station catchment areas, assuming uniform accessibility within. This method overlooks real street networks, physical barriers, and differences in walking ability across groups. More importantly, TOD often fails to address a central equity question: Are metro stations truly serving those who need them most? Low-income populations, highly dependent on public transit, are frequently excluded from walkable access. Without social targeting and spatial integration, physical proximity does not equal functional accessibility, leading to overestimated access and masked inequities at the micro scale.

To address these issues, this study proposes a micro-scale, path-based framework for assessing pedestrian accessibility, using route data from the Amap (Gaode) API. Focusing on 407 metro stations in Shanghai, it delineates walkable service areas within a 1-km threshold. A 50m × 50m grid system is applied, and pedestrian paths from grid centroids to the nearest entrances are computed based on real street networks, capturing more behaviorally accurate access patterns. The study develops four spatial structure indicators—coverage, gaps, compactness, and eccentricity—to quantify service area quality. These metrics are used to classify stations through Principal Component Analysis and K-means clustering, revealing structural disparities and spatial patterns.

To explore transit equity, accessibility results are overlaid with socio-economic data, including population density, elderly ratios, low-income housing, and land use. Special focus is placed on areas where vulnerable groups live near metro stations but are functionally excluded due to barriers such as disconnected streets or missing entrances. These mismatches show that transit investment without equity considerations may reinforce exclusion.

Findings highlight that in many peripheral and older neighborhoods, metro stations are geographically close but practically inaccessible. Fragmented walkable areas and persistent “access voids” overlap with vulnerable populations, resulting in compounded disadvantage.

In response, a multi-dimensional station prioritization framework is introduced, combining accessibility and vulnerability indicators. Planning recommendations include reorienting entrances, improving pedestrian connectivity, and enhancing last-mile access through modes such as e-bikes or community shuttles.

Evaluating the Inclusive Environment of Regenerated Waterfront Spaces: A Case Study in Shanghai

Abstract ID: 1842.0.0.330.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Yanwen Xue [Tongji University] yanwenxue013@gmail.com, presenting author

Weizhen Chen [Tongji University] 03022@tongji.edu.cn

Introduction-This study examines the inclusivity of regenerated waterfront spaces, focusing on accessibility for elderly residents. Using the Suzhou River waterfront in Shanghai as a case study, it explores whether redevelopment enhances or restricts access for hinterland communities. The central questions are: Do these spaces remain equitable and functional for long-term residents, particularly vulnerable groups? Does the transformation prioritize recreational and economic benefits over local needs? By analyzing spatial accessibility and usage patterns, this research contributes to the urban equity discourse, providing insights into how waterfront planning can better balance development goals with the everyday experiences of local communities.

Methodology-A comprehensive dual-method approach was adopted. First, Urban Network Analysis (UNA) was employed to quantify spatial accessibility along the waterfront. This method integrated multiple transportation modes and mapped the connectivity between residential areas and the waterfront, incorporating the density of accessible facilities along pedestrian routes. Second, an AHP-Fuzzy Comprehensive Evaluation method was utilized to develop an inclusive evaluation system based on seven key characteristic indexes. These indexes captured critical aspects, including the quality of the surrounding route environment, the natural and built features of the waterfront space, and the provision of public service facilities.

Results-The evaluation indicated that the regenerated Suzhou River waterfront provided good overall accessibility. However, significant differences emerged in the usage patterns and demands of local elderly residents versus visitors. While strong transportation networks and well-distributed accessible facilities were present, certain river segments exhibited divergent usage: local elderly residents frequently engaged in informal activities—social gatherings, exercise, and leisurely strolls—in non-designated spaces, whereas visitors tended to concentrate around established public amenities. Additionally, mixed sentiments among local residents were evident, with some expressing nostalgia for the river’s pre-regeneration state alongside recognition of the improvements.

Discussion-These findings highlight the complexity of designing inclusive waterfront environments that serve both community residents and visitors. The study underscores the necessity of addressing not only physical barriers but also the emotional and social connections residents have with public spaces. Consequently, tailored optimization strategies are proposed, including enhancements to pedestrian pathways, improvements in the spatial distribution of public facilities, and an increase in accessible entrances. Furthermore, incorporating flexible design elements that preserve cultural and historical contexts is recommended to reinforce local identity and foster a sense of belonging.

Conclusion-By linking quantitative spatial analysis with qualitative assessments of user perceptions, this study offers valuable insights into public space utilization within urban regeneration. The results suggest that waterfront regeneration should balance the attraction of tourists with the daily needs of local communities. Ultimately, the

integrated approach advocated in this paper contributes to a broader understanding of inclusivity and accessibility in urban planning, promotes design strategies, and improves social equity so that urban waterfront spaces can be enjoyed by everyone.

Globally, especially in developing countries, people do not have equal access to water and sanitation services. Inequalities exist based on the area, urban/rural, gender, rich/poor, and other factors (Mason & Mosello, 2017). Likewise, there are disparities in access to water and sanitation services across districts in Punjab state, Pakistan. Around 35% of the population do not have access to safely managed drinking water, and 51% do not have access to safely managed sanitation services. The government of Pakistan is committed to achieving universal and equitable access to safe drinking water and adequate and equitable access to safely managed sanitation and hygiene for all by 2030 (Hureem et al. 2020). Equitable access to WASH (Water, Sanitation, and Hygiene) requires the implementation of social, economic, political, and administrative governance components, including equitable financial strategies (Bayu et al. 2020). Despite the government of Punjab's substantial investment in the WASH sector, people lack equitable access to WASH services. It is significant for the government and policy framework to ensure WASH financing strategies prioritize marginalized and vulnerable communities, and financial allocation addresses equity and inclusivity to reduce the burden of waterborne diseases and improve their quality of life (World Health Organization, 2015).

In this regard, this study aims to analyze the trends in the distribution of public financial resources in the WASH sector at the local level (across districts) and examine how WASH financial allocation benefits those who lack services and are in most need. The GIS analysis is conducted by using secondary data on poverty, and public WASH expenditures to track the trends in public financial allocation to WASH projects and the population's equitable access to WASH services at the local level. The results indicate the unequal allocation of WASH financial resources and reveal that the districts/local areas that lack access to WASH services and are in most need are getting less public funding compared to others. The study results will help to identify the barriers to providing equitable access to WASH and suggest targeting financial allocation in vulnerable and poor areas to meet universal and equitable access to WASH services in Punjab, Pakistan.

Micro-Videos Analysis of Digital Spaces for Youth Participatory Planning Approaches

Abstract ID: 1842.0.0.1164.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Dian Nostikasari [Drake University] dian.nostikasari@drake.edu, presenting author

MD Alimoor Reza [Drake University] md.reza@drake.edu

Jane Rongerude [Iowa State] jrong@iastate.edu

Planning and designing parks and open spaces for people between the ages of 14-24 years can be very challenging. Further attention to how and to what extent young people use these parks and other leisure spaces and what they do as part of their play and or leisure can lead to more effective utilization of the physical spaces and maximize the value of investments by local governments. Youth are actively using spaces in their environment as evident in the use of hashtags, micro-videos challenges— engagement in these hybrid cyber-physical spaces demand a reframing of the ‘the right to the city’ beyond physical spaces to include an ‘informational right to the city (Shaw and Graham 2017). This research builds on the applications of a wide range of digital technologies expanding the capability of the Youth Participatory Action Research (YPAR) model in gaining insights into health behaviors, learning experiences, and meanings associated with places. While digital technologies and social media can extend youth experiences, they can also lead to increased disconnection from their immediate networks of caretakers and friends, making it more challenging to identify critical signs of distress. This research addresses the critical gap in understanding how youth from various backgrounds navigate public, lived physical, and cyberspaces to engage, inform, and inspire others as ‘storytellers’—part of their right to the city (Ortiz 2022).

We ask the following questions: (1) How can analysis of micro-videos inform understanding of how young people use open, public, park, or other play spaces?; (2) To what extent can insights into the emotional state and activities conducted in these spaces inform organizations and local governments when planning, designing, and offering programming in these physical spaces?; (3) How can civic organizations and governments work with young people as part of a community-based engagement system?

Using AI/Computer Vision-based predictive modeling and Geographic Information System (GIS), this project investigates the range of uses and activities of youth in parks, and other public spaces. The preliminary data collection and analysis of 100 micro-videos offer insights into youth’s emotional struggle and the environment amplifying these struggles and what needs to happen for local governments and other agencies to build a smart, community-based response system. This insight can inform the development of youth-led programs and services that cultivate a sense of agency, creating long-lasting connections between youth and their communities (Domínguez and Cammarota 2022). Assessing youth engagement in these cyberspaces can provide valuable insights into their everyday experiences, the relationship-building that occurs, and what must happen for cities and civic organizations to prioritize youth in planning public, open, and park spaces.

Negotiated Right to the City? Hispanic Street Vending in a Sun Belt Suburb

Abstract ID: 1842.0.0.1076.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

David Schlifka [Georgia State University] dschlifka1@student.gsu.edu, presenting author

My research aims to understand how Hispanic street vendors in suburban unincorporated Gwinnett County, Georgia assert their right to the city by negotiating access to suburban space and producing lived space. I examined Hispanic street vending in Gwinnett as both a case study and a phenomenological study to better understand suburban governance, street vendors' lived experiences of suburbia, and street vending policy. Gwinnett's Hispanic population increased by over 36 percent during the 2010s, and the county contained considerably Georgia's largest Hispanic population by 2021 (Atlanta Regional Commission, 2021).

I asked about the implications of population growth and demographic transitions on the governance of suburbia. I also assessed the lived experiences of metropolitan transformations through the lens of Hispanic street vendors, who epitomize demographically and spatially changing suburbia. My findings reveal how Hispanic street vendors experience suburbia, how they navigate county government regulations that prohibit street vending and negotiate with commercial property owners, and the role of street vending in Gwinnett's Hispanic community.

My data collection methods consisted of archival research, windshield surveys and interviews, direct participant observations, and in-depth interviews. The research participants included Hispanic street vendors, food truck operators who invest more material resources into their vending practices, representatives of nonprofit organizations, current and retired county planning and code enforcement employees, elected officials, and commercial property and brick-and-mortar business owners where street vendors operate. I conducted critical discourse analyses of the data I obtained to understand the codification and reproduction of Anglo-American expectations and dominance in relation to suburban governance and the regulation of space.

I studied street vending within the context of metropolitan transformations in the United States. Current street vending scholarship focuses on the Global South more than the Global North, the urban core spaces of large cities with long histories of mass immigration, northern and west coast cities in the United States, and urban public spaces, such as sidewalks and parks, rather than suburban private property, namely parking lots of strip shopping centers and at the entrances to gated garden-style apartment complexes. My study of individuals' lived experiences of street vending and how it is governed within Gwinnett's Sun Belt suburban context is antithetical to the environments where scholars research this practice.

My findings fulfill knowledge and population gaps in the existing literature on street vending and North American metropolitan transformations. Nicolaides (2024) describes the "new suburbia", in which suburbs transition from bastions of white racial segregation into multiracial yet economically unequal demographic landscapes. Despite demographic shifts, regulations of the suburban physical landscape often undermine difference and reproduce white privilege (Lung-Amam, 2017). Furthermore, suburban governance frequently favors the interests of privileged sources of capital at the expense of demographically changing, economically and socially marginalized suburban populations (Peck, 2011; Ekers, Hamel, and Keil, 2012). My findings contribute to scholarship on metropolitan transformations by discussing (1) the discourses that a suburban government employs to justify maintaining and selectively enforcing Anglo-centric regulations, such as those that prohibit street vending, despite demographic transitions; (2) the effects of suburban geography and governance on the lived experiences of Hispanic street vendors; and (3) how they negotiate the use of space to satisfy their needs where private property

predominates. Finally, I recommend planning interventions to help enfranchise street vendors and advance suburban diversity planning.

Pharmacy Access Paradox: Shortages Amid Abundance - Measuring with Accessibility Index

Abstract ID: 1842.0.0.675.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Joy Adeleye [University of Louisville] jaadel02@louisville.edu, presenting author

Pharmacy services are crucial in the U.S. healthcare system, extending beyond prescription dispensing to provide essential health services that make them vital community health hubs. The COVID-19 pandemic further highlighted the importance of pharmacies as strategic public health partners, ensuring care during health emergencies. However, despite their widespread presence, community pharmacies are not equitably accessible to all U.S. residents when social determinants of healthcare access (age, income, mobility, and health-related factors) are considered (Solomon et al., 2022; Kaalund et al., 2022; Berenbrok et al, 2022; Shi & Stevens, 2021). These disparities in access continue to worsen, exacerbating broader public health inequities and underscoring the need for research into pharmacy accessibility and the growing phenomenon of pharmacy deserts (Constantin, Ullrich & Mueller, 2022).

Focusing on Jefferson County, Kentucky, the study explores an enhanced Pharmacy Accessibility Index (PAI) that moves beyond simplistic distance-based measures by integrating the spatial distribution of pharmacies, sociodemographic data, potential user populations, pharmacy service quality indicators, and actual pharmacy usage patterns derived from smartphone location data (Placer.ai). While existing measures of pharmacy accessibility often rely on global-level distance metrics and neighborhood demographics, such analyses can obscure critical localized disparities in access. Hence, applying the Local Anselin Moran's I, the study addresses two questions: (i) To what extent do the micro-scale patterns of pharmacy accessibility deviate from macro-scale models of equitable spatial access (e.g., distance-based thresholds) in Jefferson County? (ii) How do these localized disparities in pharmacy access disrupt expected spatial patterns of healthcare availability, and what underlying socioeconomic and sociodemographic factors explain these mismatches?

Preliminary work suggests that traditional proximity-based measures may significantly overestimate actual access, consequently, the study highlights two key insights: (i) Beyond Numbers: The Need for Localized Context – Traditional global analyses often miss localized disparities and unquantifiable factors. Local Moran's I analysis provides a more nuanced, localized understanding of accessibility issues, enabling targeted interventions for equitable access. (ii) Spatial Inequity and its Public Health Implications – Systemic inequities, shaped by socioeconomic and sociodemographic factors, manifest spatially and impact public health. By filling these gaps, this study offers actionable insights to address pharmacy deserts and reduce healthcare disparities in Jefferson County.

Spatiotemporal Behaviors in Shanghai's Lujiazui: Multi-Group Activities and Adaptations

Abstract ID: 1842.0.0.305.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Yu Zhang [Tongji University] 2330332@tongji.edu.cn, presenting author

This study examines how diverse population groups interact within Shanghai's Lujiazui CBD using time geography theory. Unlike traditional CBD research focusing on spatial form, we analyze how different social groups create distinct activity patterns within shared environments.

Our methodology combined mobile phone data analysis (250,000 daily records), surveys (n=517), in-depth interviews (n=43), GPS tracking (n=217), and fixed-point observations (240 hours), with special attention to service workers often overlooked in urban studies.

Key findings: Temporal Rhythms: Four distinct patterns emerged: financial executives with flexible schedules, white-collar workers following standard hours, service workers with extended schedules, and platform workers showing peak-responsive patterns. The area displays a "double-peak, single-valley" daily structure with staggered peak hours creating a "temporal gradient."

Spatial Utilization: Different groups exhibit distinct activity ranges and paths. Financial elites concentrate along main axes, while service personnel navigate broader areas but primarily occupy marginal spaces. We observed "temporal space sharing" where the same physical spaces accommodate different groups throughout the day.

Activity Chains: High-income groups demonstrate "simplified efficient" activity chains (averaging 3.7 points daily), middle-income groups show "multi-point connection" patterns (5.2 points), and service personnel exhibit "task-driven" movements (6.5 points, mostly mandatory).

Behavioral Adaptation: Various informal activities emerge within the structured environment: breakfast vendors at specific times, temporary "food belts," transformed marginal spaces, and delivery rider networks. Groups develop tacit rules through daily practice, creating complex yet functional spatiotemporal patterns.

Based on these findings, we propose optimization strategies including institutional innovations, adaptive design approaches, supportive facility systems, and enhanced environmental planning that embrace temporal flexibility and social inclusivity.

This research contributes theoretically by combining time geography with social interaction analysis, methodologically by integrating big data with micro-behavioral observation, and practically by providing insights for inclusive urban planning that supports diverse population needs in high-density urban centers.

The Smart City Paradox: Digital Utopias or Neoliberal Urbanism?

Abstract ID: 1842.0.0.17.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Critique related to a hot topic in planning research

Duane Ebesu [Columbia University] de18@columbia.edu, presenting author

The mass deployment of smart city programs has engendered as much optimism as it has trepidation in the practice of urban planning. While proponents argue that digital government and data-driven policy enhance efficiency, sustainability, and public service delivery, others argue that smart city policy reinforces neoliberal urbanism, widens sociospatial inequalities, and advances corporate interests above democratic city government. This study investigates whether smart cities are inclusive models or tools of exacerbating power asymmetries and spatial injustices. The central research question is: Does smart city policy lead to more resilient and more equitable cities, or do they serve as tools of privatization and social control?

This study employs a critical policy analysis and comparative case studies to examine smart city projects in world cities. The study assesses models of government, mechanisms of citizen participation, and the distribution of smart infrastructure investment, employing theoretical models of the political economy of the city and critical planning studies. The study finds that smart technologies have the capacity to govern the city but deployment is typically in the interests of the corporate world and not the public good. The majority of smart city policy is driven by public-private partnerships with technology firms having disproportionate influence over the government of the city, compromising public accountability and transparency (Lombardi & Vanolo, 2015). Consequently, the models tend to focus on high-income areas for the construction of smart infrastructure, exacerbating spatial inequalities and reinforcing exclusivity patterns (Praharaj et al., 2018).

More significantly, the implications of smart city technocracy demonstrate the risks of shifting decision-making power away from democratic institutions to data-driven and algorithmic models of municipal government (MacDonald et al., 2014). Automation and predictive analytics do not address the root of such issues as the unaffordability of housing, social polarization, and environmental justice (Ferm & Tomaney, 2018). Surveillance technology also raises issues of privacy, civil liberties, and increased policing and social control (Watson, 2009). The use of facial recognition and predictive policing underscores the need to solve these issues prior to implementation into models of government.

This criticism also identifies that smart city technologies prioritize efficiency over inclusivity. While smart mobility options and energy-efficient infrastructure present themselves as symbols of being sustainable, they primarily benefit wealthier citizens (Sidney, 2010). Urban service commercialization reinforces socioeconomic stratification, but research identifies that technology-based alternatives such as congestion pricing disproportionately impact low-income groups by restricting their mobility (Palermo & Ponzini, 2010). Despite such problems, other models of smart cities prioritize democratic government and citizen-driven innovation. Cities that experiment with open-source digital platforms, decentralized data management, and citizen-driven urban technology demonstrate that smart urbanism could be reoriented to a common city future. But these programs still lack money and do not scale due to institutional blockages by hegemonic technology actors (MacDonald et al., 2014), while research finds that smart city paradigms must be reimagined to make technological progress serve the public good, and that planners and policymakers must critically examine smart city rhetoric. Otherwise, smart city strategies risk consolidating neoliberal urbanism, privatizing public space, and exacerbating sociospatial exclusion. Future research must address how alternative digital models of urbanism can be institutionalized so that smart cities serve overall social justice ends and not as techno-utopian branding exercises.

Unjust Spaces: A Spatial Inquiry into Temporary Worker Living Conditions in Toronto

Abstract ID: 1842.0.0.1128.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Usama Nasim [University of Toronto] usama.nasim@mail.utoronto.ca, presenting author

“For nearly every injustice in the world, there is an architecture that has been planned and designed to perpetuate it,” wrote architect and activist Bryan Lee Jr. This is particularly true for the housing designed for Canada’s 775,000 temporary workers, who often face economic exploitation and spatial marginalization. Under Canada’s Temporary Foreign Worker Program (TFWP), employers can hire migrant workers for low-wage jobs, tying their migration status and labor conditions to a single employer. A 2024 report by the UN Special Rapporteur on contemporary forms of slavery described the program as a “breeding ground for contemporary forms of slavery,” while a 2025 Amnesty International report highlighted how its design exposes laborers from the Global South to severe abuse and discrimination.

A 2024 scoping review of material housing conditions of temporary foreign workers in Canadian agriculture highlighted various health inequities that have led to preventable illness and death. While human rights organizations and activists have highlighted similar patterns across Canada, no in-depth study has been carried out in urban centers and major government and non-governmental housing demand assessments largely overlook temporary foreign workers. Moreover, architects and planners — despite their critical role in shaping urban spaces — remain largely absent from this crucial conversation, resulting in the issue being largely framed through the lenses of rights abuses and labor relations.

This study aims to reframe this urban issue through a spatial lens by documenting and highlighting the material living conditions of racialized temporary foreign workers in Toronto. Recognizing the interconnected nature of this issue, this study adopts a cross-disciplinary approach, integrating human rights documentation with architectural visualization techniques to bridge the gap between human rights practitioners and built environment professionals.

A scoping review of media reports and academic literature on urban temporary migrant workers would be carried out to highlight key housing challenges and identify suitable Toronto neighborhoods for carrying out in-depth analysis. Three of these neighborhoods would then be shortlisted in close consultation with human rights experts to conduct at least two anonymized Key Informant Interviews per neighborhood. These interviews would be augmented by site documentation through photography and architectural drawings that would compare temporary worker housing conditions with the seven aspects of the Right to Housing as defined by the UN: Security of Tenure, Affordability, Availability of Services, Habitability, Accessibility, Location, and Cultural Adequacy. A final set of refined architectural drawings will be produced to conceal the true identity of these spaces and their inhabitants while enabling planners and architects to fully engage with the spatial dimensions of the challenge.

By bridging human rights advocacy and design practices, the study will highlight a rights-based approach to addressing socio-spatial issues while fostering dialogue between human rights practitioners, architects and planners to promote more just and inclusive living spaces for one of Canada’s most vulnerable populations.

Vulnerable Urban Populations Have Inequitable Access to Essential Health Services

Abstract ID: 1842.0.0.998.2025

Track 5: Inclusion and Accessibility in Planning

Research-in-Motion Presentation Submission, Research currently in process

Amrit Tiwana [University of British Columbia] amrit.tiwana@ubc.ca, presenting author

Martino Tran [University of British Columbia] martino.tran@ubc.ca

Christina Draeger [University of British Columbia] christina.draeger@posteo.de

Ben Mumford [University of British Columbia] ben.j.mumford@gmail.com

Background: Ensuring equitable healthcare access remains a pressing challenge amid rapid urbanization, particularly for vulnerable populations. Surrey, British Columbia - one of Canada's fastest-growing and most diverse suburban cities - is undergoing a major public transportation expansion. However, it is unclear whether such developments will effectively reduce existing healthcare accessibility disparities. Spatial, socioeconomic, and transport-related barriers may disproportionately affect certain groups, further exacerbating health inequities. Accessibility, defined as the ease with which individuals can reach essential services, is a cornerstone of livable and sustainable cities. Understanding how different socio-demographic groups navigate healthcare access is crucial for informing infrastructure investments and advancing equitable urban planning.

Methods: This study assesses geographic healthcare accessibility within Surrey's multimodal transportation network using origin-destination matrices and high-resolution socio-demographic data at a 1-kilometre grid scale. The analysis focuses on vulnerable populations, including children and youth, seniors, racial minorities, individuals without a high school diploma, and low-income residents. Healthcare facilities considered include walk-in clinics, urgent care centers, and hospitals. Road and pedestrian infrastructure data are sourced from OpenStreetMap, while public transit data in General Transit Feed Specification (GTFS) format is obtained from the regional transportation authority. Travel times are estimated in one-minute intervals between 8:00 and 9:00 AM on a typical weekday (Tuesday, September 24, 2024), with results reported at the 50th percentile. The proportion of each subpopulation within 30-, 45-, and 60-minute travel thresholds is compared to the general population to identify healthcare accessibility disparities, with separate assessments for public transit/walking and driving.

Results: Preliminary findings indicate notable geographic disparities in healthcare access across Surrey. Central areas have shorter travel times and stronger public transit connectivity, while outer suburban neighborhoods face longer travel times and limited healthcare facility access. Children and youth, seniors, individuals without a high school diploma, and low-income residents appear to experience less access to healthcare facilities compared to the general population. These disparities become more pronounced at longer travel thresholds and are more severe for those reliant on public transit rather than driving.

Discussion and Conclusion: This study combines travel time analysis with high-resolution socio-demographic data to reveal disparities in healthcare access among vulnerable populations. Seniors and low-income residents, who rely heavily on public transit, face some of the greatest accessibility challenges. These findings highlight the need for strategic urban planning and transportation investments to reduce inequities in healthcare access. Future research should assess whether Surrey's ongoing transit expansion effectively bridges existing gaps in accessibility.

Track 6 Pre-Organized Session Summaries and Abstracts for the Sessions

Rental Housing (1): Private Owners, Public Impact: Investigating the Business of Rental Housing

Abstract ID: 1840.0.0.1039.2025

Track 6: Housing

Pre-Organized Session Summary

Session Includes: 1844.0.0.78.2025, 1844.0.0.521.2025, 1844.0.0.411.2025, 1844.0.0.616.2025

Jane Rongerude [Iowa State] jrong@iastate.edu, organizer

This session explores the business practices and decision-making logics of individual (non-institutional) residential rental property owners (RRPOs). Housing insecurity is not only rooted in financial constraints but also shaped by social relationships that create or dissolve housing arrangements—relationships that urban planning can help regulate and reimagine. Most U.S. rental housing is privately owned and operated as an investment, yet the process of acquiring, renting, and profiting from property unfolds in varied ways. These papers examine how RRPOs act as key agents within local housing systems, both constraining and expanding opportunity. They challenge us to consider how planning can engage with and influence RRPO behaviors to promote housing justice and improve tenant security.

Learning Objectives:

- Recognizing the different categories of rental housing investors and the heterogeneity within those categories.
- Identifying the relationship between the varied business practices associated with the provision of rental housing and housing outcomes for both tenants and places.
- Identify opportunities for planners to leverage existing practices of residential rental property owners to further housing justice goals.

Rent Seeking Rent Seekers: Do residential landlords view new housing development as competition?

Abstract ID: 1844.0.0.78.2025

Track 6: Housing

Pre-Organized Paper Presentation

Daniel Kuhlmann [University of Arizona] dok@arizona.edu, presenting author

Jake Wegmann [University of Texas] jagw@utexas.edu

Jane Rongerude [Iowa State] jrong@iastate.edu

Elizabeth Mueller [University of Texas] ejmueller@utexas.edu

Taylor Cook [University of Texas] taylormcook@utexas.edu

In this project, we examine whether residential landlords oppose new housing development if they worry it will constitute new competition for their units. To do so, we design and administer a vignette experiment to elicit whether residential landlords are sensitive to new rental housing development near their existing rental portfolios. We present participants with a description of a proposed development and ask whether they support or oppose it and whether they would attend a planning meeting to voice their support or opposition. In the description, we randomly vary the type of building (for-rent residential, community-serving retail, and for-sale residential) and the distance of the proposed development to one of

the respondent's rental properties (a short walk, a short drive, and the same city). Our analysis examines whether the type of the proposed development and its distance from the respondents' properties affect reported levels of support or opposition. We find that respondents who received the residential framing were less likely to support and more likely to oppose the proposed new development than respondents who received the retail vignette. We also find some evidence that distance matters, with respondents who received the prompts describing the proposed development closer to their investments less likely to express support for the hypothetical project.

Investigating How Property Managers Use Residential Property Technology to Set Rents

Abstract ID: 1844.0.0.521.2025

Track 6: Housing

Pre-Organized Paper Presentation

Wonyoung So [MIT] wso@mit.edu, presenting author

Jenna Davis [University of California, Berkeley] jennamkdavis@berkeley.edu

In recent years, scholars have turned their attention to the behaviors and management practices of landlords, including how landlords select tenants, engage in rent-setting, acquire new investments, and match tenants to specific neighborhoods (Kuhlmann et al. 2025; Rosen et al. 2021). A growing body of work has examined how residential property technology (or “prop tech”) shapes landlords’ business practices, including how automated tenant screening and algorithmic eviction processes influence housing access and stability (McElroy et al. 2022). A key focus of this work has been to explore how various social and racial biases are often baked into these technologies and how using these technologies can harden social and racial inequalities in the rental market (So, 2023). Despite this progress, relatively little research to date has examined how landlords and property managers interact with technologies that use algorithmic rent-pricing, such as RealPage. These technologies often use proprietary and publicly-available data to algorithmically determine rental prices for units, a shift that may have profound implications for housing affordability and market dynamics. This gap in the literature is particularly pressing given that a considerable share of multifamily property management companies use algorithmic rent-pricing technologies, raising the question of how setting rents algorithmically might depart from traditional methods of rent-setting (Vogell et al., 2022). Moreover, emerging evidence suggests that rent-setting algorithms may contribute to negative tenant outcomes, such as higher rates of eviction and systematic rent increases (Vogell et al., 2022). Indeed, a series of pending lawsuits allege that property management companies that use software like RealPage engage in price-fixing, colluding to drive up rents in multifamily housing markets. Given both the widespread adoption of technologies that use algorithmic rent-pricing and the potentially negative consequences that using these technologies could have on the broader rental market and tenant outcomes, additional research needs to explore how these technologies shape the market behaviors of various housing market intermediaries, including property managers and landlords. This study will examine how property managers who use RealPage interact with the platform and how the technology shapes their market behaviors, such as rent-setting and vacancy management strategies. Using a dataset of property management companies that use RealPage software across the United States, we recruit property managers and landlords from three major metropolitan areas in the U.S. with a high share of multifamily units. Through in-depth interviews, we explore key questions such as: How do property managers perceive and interpret algorithmic pricing recommendations? To what extent do they override or adjust these recommendations? How does this technology shape broader management practices, such as vacancy management strategies? In particular, we examine how property managers conceptualize algorithmic rent-setting—do they view it as analogous to other forms of dynamic pricing, such as airline fares or ride hailing companies, or do they believe that housing should be treated differently due to its essential nature? We complement our interviews with a descriptive analysis of the kinds of properties and neighborhoods where property management companies use RealPage, shedding light on whether algorithmic pricing tools are more commonly deployed in certain types of neighborhoods or housing submarkets. Collectively, this study will shed light on the specific mechanisms through which emerging residential property technology mediates and shapes market behaviors.

Slipping Into and Out of Arrears: The Dynamics of Spells in LIHTC Housing

Abstract ID: 1844.0.0.411.2025

Track 6: Housing

Pre-Organized Paper Presentation

Kristen Tauber [New York University Furman Center] knt2029@nyu.edu, presenting author

Ingrid Gould Ellen [New York University] ingrid.ellen@nyu.edu

Katherine O'Regan [New York University] katherine.oregan@nyu.edu

In the past few decades, rent burdens have increased for renters of all income levels, putting them at greater risk of falling behind on rent when faced with financial shocks (JCHS, 2024).

However, little is known about patterns of rent payment and how often, and how soon, renters recover after they fall behind, if at all. To what extent, that is, do shocks lead to a sustained inability to pay rent, versus a temporary spell of arrears? Understanding arrears spells is critical to optimal landlord forbearance and eviction practices, as well as to the design and targeting of public policies related to eviction protection, perhaps especially in the case of publicly subsidized housing. Of course arrears spells can be truncated by landlords' decisions to evict: If tenants are forced to leave as soon as they fall behind they will not have the opportunity to recover. In essence, landlords face a tradeoff between the risk of foregone rent and prematurely evicting a household that would have self cured. And the nature of this tradeoff may vary across economic and policy contexts (Nelson et al 2021).

We aim to explore these trade-offs by leveraging unique, individual-level rent roll data to better understand resident payment behavior and the dynamics of arrears spells in Low Income Housing Tax Credit (LIHTC) housing, a critical component of the affordable housing stock. Our data include 170 developments with nearly 27,600 units across multiple states from early 2023 to 2025. Importantly, our LIHTC properties share a common landlord and management company, allowing us to investigate how resident arrears dynamics and a landlord's eviction and forbearance decisions vary under different market conditions and policy regimes.

In aggregate, we observe that 27 percent of residents are behind on rent in an average month. But this static picture conceals considerable cycling in and out of arrears and increases and decreases in those arrears over time. Residents are just as likely to enter arrears as they are to exit them each month.

Looking over a longer time-frame, we find that over a third of households that fall behind on rent in a month pay back that amount within three months. Some households may not be given a chance to pay back their rent: on average 9 percent of those who fall behind on rent leave the building without paying within 3 months, presumably through a forced move.

Despite our focus on LIHTC housing, these average patterns are broadly consistent with Humphries et al. (2024), who study renters in unsubsidized buildings in the Midwest. But we show considerable variation across state policy regimes. The share of households that fall behind on rent in a month ranges from 3 percent to 29 percent across the 16 states in our sample. Similarly, we see large differences in the rate at which residents move out after falling behind - in some states this is as low as 4 percent within 3 months and in others as high as 28 percent. This suggests that in some states, landlords move much more quickly to evict non-paying tenants, and they may push out some households who could cure their arrears spells if given time.

While landlords may find that some patience can reveal information about whether additional generosity is optimal for a tenant, such patience can be costly for them. However, evictions are incredibly costly for tenants - leading to longer term health and economic consequences (Collinson et al., 2024). Policymakers might consider offering subsidies to landlords to support what are essentially small-balance loans to vulnerable renters in order to encourage more socially optimal patience.

The Relationship between External Shocks and Residential Rental Property Owner Satisfaction

Abstract ID: 1844.0.0.616.2025

Track 6: Housing

Pre-Organized Paper Presentation

Jake Wegmann [University of Texas] jagw@utexas.edu, presenting author

Jane Rongerude [Iowa State] jrong@iastate.edu

Concern is growing about the ability of non-institutional Residential Rental Property Owners (RRPOs) to weather various kinds of external shocks (Garboden, 2023; Lambie-Hanson, Li, & Slonkosky, 2022). The completion of the final wave of a major survey of RRPOs in the United States (“RRPO Survey”) makes it possible to gauge the impact of such shocks on the responding RRPOs as measured by their self-assessment of their prospects, which we shorthand as “satisfaction.” Following earlier research, we measure self-reported satisfaction along three dimensions: affective (i.e., respondent’s qualitative assessment of their own satisfaction with owning multifamily rental property), retrospective action (i.e., reported sale or purchase of rental property in the last year), and prospective intention (i.e., reported intention to buy or sell rental property in the next year). (Cook et. al 2024.) Taking advantage of the collection of the RRPO Survey over three waves (one per year over three years) and in nine cities, we aim to detect the impacts, or lack of impact, of three types of shocks to the RRPOs that unfolded across or in-between waves. These are disaster shocks (2024 Houston derecho; Hurricanes Debby/Helene/Milton affecting Tampa and Miami from August to October 2024; and the January 2025 snowstorm in New Orleans), policy shocks (imposition of rent control, and subsequent withdrawal in Minneapolis; strengthened fire egress requirements in Des Moines; and tightened lead abatement requirements in Cleveland), and market shocks (unusually rapid increases in insurance rates or property taxes, or decreases in rents). We identified the policy shocks mentioned from earlier interviews of RRPOs. In this study, we assess the relationships between shocks and RRPO satisfaction by i) comparing RRPOs in shocked to non-shocked cities in the same survey waves; ii) comparing RRPOs within single cities in waves preceding and postdating shocks; and iii) via results collected from a supplemental “exit survey” of RRPOs who reported leaving the multifamily rental business altogether. Our findings have implications for multifamily rental housing markets within US cities with respect to tenant stability, and to long-term changes in ownership structure including the possibility of movement away from non-institutional and towards institutional ownership in post-shock markets (Shiffer-Sebba, 2020; Eichholtz et. al., 1995).

Rental Housing (2): Power, Precarity, and the Practices of Rental Property Owners

Abstract ID: 1840.0.0.1077.2025

Track 6: Housing

Pre-Organized Session Summary

Session Includes: 1844.0.0.943.2025, 1842.0.0.215.2025

Jane Rongerude [Iowa State] jrong@iastate.edu, organizer

Rental housing plays a crucial yet understudied role in shaping urban housing markets and social inequalities. This panel examines the complexities of rental housing across diverse contexts. One paper explores how migrant women in Bengaluru face discrimination and violence in rental homes, revealing how rental markets reinforce social hierarchies. Another investigates Vancouver's rental submarkets through online listings, highlighting how language barriers impact immigrant housing access. A third study examines why small-scale rental property owners exit the market, challenging assumptions about their role in housing stability. Finally, an analysis of opposition to multifamily housing in Arizona uncovers racially coded language in public deliberations. Together, these papers illuminate how rental markets are socially constructed, shaped by discrimination, policy, and ownership dynamics, and call for planning interventions that promote housing justice.

Learning Objectives:

- Analyze how rental housing markets are shaped by social, economic, and policy factors.
- Evaluate the implications of the practices of residential rental property owners, tenant experiences, and public discourse on housing insecurity and urban inequality.
- Identify potential planning interventions to promote housing security and justice

Exit Interviews: When Individual Residential Rental Property Owners Leave a Market

Abstract ID: 1844.0.0.943.2025

Track 6: Housing

Pre-Organized Paper Presentation

Jane Rongerude [Iowa State] jrong@iastate.edu, presenting author

Taylor Cook [University of Texas at Austin] taylorcook@utexas.edu

Jake Wegmann [University of Texas] jagw@utexas.edu

Daniel Kuhlmann [University of Arizona] dok@arizona.edu

Elizabeth Mueller [University of Texas] ejmueller@utexas.edu

It has become common wisdom to assume that cities are better served by individual residential rental property owners (RRPOs) over institutional investors and local investors over investors who live at a distance. As one housing advocate explained, “I like rental property owners who live on my block, who are my neighbor.” Assumptions regarding who owns rental properties, their business models, and their motivations have shaped how housing advocates, planners and local decision-makers understand the production and preservation of existing rental housing. What we do know is that when a unit turns over, it is much more likely to result in rental increases for tenants. Therefore, it is important for cities to take seriously the question of why individual rental property owners sell and what opportunities may exist to preserve affordability when an RRPO exits the market.

This paper uses interviews and three years of reporting from RRPOs in nine US cities that have experienced a range of market conditions to understand the conditions under which RRPOs leave the market. Results show that both exogenous (city policies, disaster events) and endogenous factors (retirement) impact an owner’s decision to exit. This paper demonstrates the heterogeneity of RRPO experiences and the importance that cities pay attention to the turnover of rental properties and changes in ownership entities.

Emotionally charged conflicts about multifamily housing (MFH) projects are slowing attempts to improve housing affordability through increases to density and supply. Coded racism, such as anti-Black stereotypes that MFH will bring the inner city or crime to the neighborhood, has been detected in these conflicts. Yet the prevalence of this language is poorly understood. This research addresses this gap by asking: How prevalent is racially coded opposition in MFH deliberations?

We answer this question by using manual and machine learning methods to apply a racial meaning decoding tool to publicly available textual data on grounds for opposition to MFH in deliberations reported in Arizona local news media and public meetings from 2021 to 2024. The racial meaning decoding tool assists in detecting coded race talk by evaluating whether the words in questions might 1) have racial meaning (i.e., use common racial tropes), 2) lead to a disqualifying effect on racial power relations, and 3) have techniques that help to obscure or efficiently convey racial meaning (e.g., figurative language or othering). Words are scored based on these evaluations, with higher scores indicating a higher chance of racial coding. We then use descriptive statistics to examine the prevalence and forms of potentially racially coded grounds for opposition across varied geographic and demographic settings in Arizona.

Our preliminary findings reveal that grounds for opposition to new MFH commonly concern traffic, undesirable newcomers, parking, density, height, safety, incompatible land uses, dislike of developers, and neighborhood character. Potentially racially coded opposition is rare but occurs in diverse geographies and exhibits common themes, such as fears of contagion from MFH and its presumed residents. Overall, this research will deepen knowledge of the use of racial code words in deliberations about MFH and help municipalities, fair housing agencies, courts, and researchers more reliably recognize coded racism.

When Do Housing Policy Reforms Promote Housing Affordability?

Abstract ID: 1840.0.0.234.2025

Track 6: Housing

Pre-Organized Session Summary

Session Includes: 1844.0.0.108.2025, 1844.0.0.163.2025, 1844.0.0.233.2025, 1844.0.0.114.2025

Nicholas Marantz [University of California, Irvine] nmarantz@uci.edu, organizer

This session examines how recent housing policies and zoning reforms—ranging from U.S. state-level initiatives to national mandates in France—are reshaping the production, location, and use of affordable and middle housing. Papers assess the real-world impact of legislative tools like Oregon’s HB2001, Florida’s Live Local Act, California’s ADU laws, and France’s SRU law, using empirical data and policy analysis. Collectively, they assess whether these reforms are meeting their stated objectives, where they are falling short, and what conditions enable or constrain their effectiveness. The session provides a comparative, interdisciplinary lens on how design standards, administrative implementation, market dynamics, and institutional actors influence housing outcomes.

Learning Objectives:

- Identify and compare the mechanisms and outcomes of recent zoning reforms and housing policies in the U.S. and France.
- Evaluate how administrative implementation and local political dynamics shape the efficacy of housing production reforms.

Producing Middle Housing in Oregon after HB2001: The Role of Design Standards

Abstract ID: 1844.0.0.108.2025

Track 6: Housing

Pre-Organized Paper Presentation

Rebecca Lewis [University of Oregon] rlewis9@uoregon.edu, presenting author

Christina Bollo [University of Oregon] bollo@uoregon.edu

In 2019, the Oregon legislature mandated that cities adopt zoning reforms to allow multi-dwelling buildings (duplex, triplex, four,-plex, cottage cluster and townhouse) in areas that formerly allowed only single-family dwellings. Research by Kuhlmann (2021) and Dong(2024). provides preliminary evidence into the overall production outcomes of middle housing zoning reform.

Cities were directed to enact design and development guidelines for Middle Housing, either on their own or by a Model Code. Prior research by Lewis et. al. (2024) showed that landowners and developers face challenges navigating these standards. Thus, while the HB2001 removed regulatory barriers to Middle Housing, construction may lag if design standards are difficult to envision. This study seeks to close the visualization gap between regulation and implementation.

We analyze the regulations through drawing to visually describe and compare typical buildings that could be built under the design guidelines, particularly related to cottage cluster and townhome types. We inventory the architectural characteristics of the Middle Housing built since HB2001 was adopted. Interviews with planners and developers offer insight into:

- Which cities have been most successful in the new construction of cottage cluster and townhome as compared to other lower-density forms?
- What are the challenges of middle housing development under existing design standards?

This research provides valuable insight into other states and cities considering reforming zoning codes to allow more diverse housing types. We hypothesize that cities with more streamlined design standards will produce more units of housing and will be perceived as more approachable by developers.

The Impact of Florida's Live Local Act on Housing Production

Abstract ID: 1844.0.0.163.2025

Track 6: Housing

Pre-Organized Paper Presentation

Minjee Kim [UCLA] minjee.kim@ucla.edu, presenting author

Zoning reforms have become one of the most common strategies for addressing housing affordability challenges throughout the U.S. In 2023, the Florida legislature passed a landmark legislation known as the Live Local Act (LLA). Most famously, the legislation included a sweeping provision that overrides local zoning ordinances for multifamily housing projects that set aside at least 40% of the units for households making up to 120% AMI. LLA allows such projects to be built on any land within the state zoned as commercial or industrial and overrides the height and density restrictions. Projects still have to comply with other local and state regulations other than use, density, and height restrictions.

LLA has been celebrated by housing advocates as an exemplary zoning reform that would unlock the production of affordable and missing middle housing. This paper asks whether LLA, in fact, is delivering the much-desired housing production and answers this question by interviewing market rate and affordable housing developers, local planning staff, and statewide housing advocates, and by analyzing the applications submitted for the state's Low-Income Housing Tax Credit (LIHTC) subsidy program from 2022 through 2025.

I find that LLA thus far has largely fallen short of meaningfully increasing housing production or making housing more affordable in Florida. As of March 2025, two years after LLA, there are 104 projects known to have taken advantage of the land use override provision of the Act. However, the majority of these projects remain only as a proposal; some have been approved but not constructed; less than ten projects have actually been constructed. I further identify the reasons why the Act is falling short. Developers reported that in most parts of the state, use, density, and height restrictions are not what's keeping developments from happening and that the property tax exemption component of LLA is the key to making projects pencil out. However, the current law does not allow developers to take advantage of the tax exemptions for construction financing. Moreover, both affordable and missing middle housing developers reported that local governments can still intentionally delay the process because developers must get a form signed by local governments certifying that the project meets all other local regulations except for use, density, and height.

Beyond housing production, LLA could have had the effect of bringing down land acquisition costs by opening up more land for multifamily construction. However, conversations with tax credit developers revealed that due to the state housing agency's strict site scoring rubric, land suitable for tax credit development remains extremely limited. The experience of Florida's LLA suggests how zoning reforms could fail to meet the intent of the reform when they are out of tune with market realities and are not coordinated with other relevant housing policies and programs. These findings offer lessons for designing more effective zoning reforms in the future.

Assessing the Residential Impact of California's ADU Reforms

Abstract ID: 1844.0.0.233.2025

Track 6: Housing

Pre-Organized Paper Presentation

Nicholas Marantz [University of California, Irvine] nmarantz@uci.edu, presenting author

Jae Hong Kim [University of California, Irvine] jaehk6@uci.edu

Idil Tanrisever [University of California, Irvine] itanrise@uci.edu

Accessory dwelling units (ADUs) are increasingly recognized as a potentially important source of affordable market-rate housing. Between 2016 and 2020, California enacted a series of laws requiring local governments and homeowners associations to permit ADUs as-of-right on nearly all single-family parcels statewide. These reforms are associated with a sharp increase in ADU permitting. In seven large California cities, ADU permit applications increased more than tenfold between 2015 and 2017. From 2018 to 2021, ADUs accounted for approximately 13% of all new units in the Bay Area and about 32% in Los Angeles County.

However, ADUs can only alleviate housing affordability challenges if they are used as residences. This paper analyzes two key questions: (1) Are ADUs supporting the formation or maintenance of multigenerational households? (2) Are ADUs permitted after state reforms being used as housing, rather than as home offices or short-term rentals? Multigenerational households—those in which at least two generations of adults co-reside—can provide health benefits for older adults and economic support for younger ones, including reduced housing and child care costs. California has the second-highest rate of multigenerational households in the U.S., following Hawaii. Nationally, such living arrangements are significantly more prevalent among people identifying as Black, Latine, or Asian than among those identifying as white. Understanding how ADUs are actually used is therefore crucial to evaluating the impacts of state reforms on housing supply and affordability.

Whereas prior studies have largely relied on surveys to determine how ADUs tend to be used, we leverage geo-referenced individual- and household-level data to provide the most comprehensive estimates to date. Our primary data sources are DataAxle (formerly InfoGroup), a marketing dataset that tracks household composition, and the California Secretary of State's voter registration file, which includes names and residential addresses. We infer familial relationships based on age proximity and surname similarity.

Our study area includes five Southern California counties (Los Angeles, Orange, Riverside, San Bernardino, and Ventura) and the nine Bay Area counties (Alameda, Contra Costa, Marin, Napa, San Francisco, San Mateo, Santa Clara, Solano, and Sonoma). We conduct parcel-level multivariate regressions for all single-family parcels in these regions. In the first model, the dependent variable indicates whether a parcel houses a multigenerational household; the key independent variable is whether the parcel contains an ADU. In the second model, restricted to parcels with ADUs, the dependent variable indicates whether the ADU has resulted in a new address with at least one resident, signifying its use for housing. Control variables include parcel-level attributes (e.g., lot size, slope), block group characteristics (e.g., poverty rate, educational attainment, racial/ethnic composition, share of foreign-born residents), and fixed effects for the city in which each parcel is located.

25 years of fair share zoning: evaluating France's SRU Law outcomes on social housing geographies

Abstract ID: 1844.0.0.114.2025

Track 6: Housing

Pre-Organized Paper Presentation

Magda Maaoui [Harvard University Graduate School of Design] magda_maaoui@gsd.harvard.edu, presenting author

Twenty five years ago, in December 2000, the SRU Law (Loi Solidarité et Renouvellement Urbain) was passed in France, requiring selected municipalities to devote 25% of their local stock to social housing, in order to curb growing trends of segregation. In this paper, I ask what impact this law has had on the rebalancing of social housing stocks for municipalities across the country, particularly those not complying with set quotas. Building on previous research, this paper is part exclusionary politics analysis, part supply analysis, and part neighborhood outcomes analysis--particularly when it comes to health outcomes. I use GIS and regression models to underscore how much of the mission set twenty five years ago, of "moving people to opportunity", and unlocking resources to offer them a better quality of life, has been achieved. I hypothesize that the reality is that we are faced with a patchwork of outcomes depending strongly on local land use regimes and political willingness to comply with a state-mandated law. I also hypothesize that while a lot of rebalancing still needs to happen, particularly in the most exclusionary municipalities, the mission of rebalancing social housing stocks, and hence unlocking access to better amenities and resources, has indeed overall been met.

There is perhaps no urban region around the world that today remains sheltered from the housing crisis (Madden & Marcuse, 2016). One way in which urban populations have been adapting to changing housing landscapes has been to rely increasingly on rental markets to address housing needs. This shift is particularly pronounced in home owning nations, where a large proportion of people are no longer able to afford ownership, and in cities that host students and migrants, who require temporary living spaces. In the absence of adequate public supply, private rental markets have emerged as a primary resource that supplies critical housing in cities worldwide. Current policy debates concerning the state of rental housing markets are primarily focused on supporting private actors to increase the number of available units as a way of addressing rapidly growing demands (Molloy et.al, 2022). However, this focus has failed to examine the several other issues that renters in private markets are facing today.

Like any other housing sector, rental markets are grounded in the particular social, political, and cultural contexts in which they are located (Blomley, 2020). In home owning nations, it is the landlord's right to private property that continues to be overwhelmingly favoured over tenants' right to living spaces (Power & Gillon, 2022). As private property owners, landlords are empowered to shape housing outcomes in this market. The imbalance in power dynamics between landlords and tenants has subjected the latter group to several forms of vulnerabilities that impact and shape their housing experiences, including, but not limited to, housing unaffordability, discrimination in access and forced evictions. Against this backdrop, this roundtable brings together scholars who examine distinct issues that tenants are currently experiencing in rental housing markets globally. In doing so, we aim to collectively paint a more nuanced, in-depth picture of the vulnerabilities plaguing this sector and foster discussions on how these issues can be addressed to create more equitable rental housing for all.

“They Are Dumping On”: Understanding Drivers of Community Opposition to Middle Housing

Abstract ID: 1844.0.0.709.2025

Track 6: Housing

Individual Paper Presentation Submission

Jeeson Oh [University of Louisville] jeeson.oh@louisville.edu, presenting author

Sumei Zhang [University of Louisville] sumei.zhang@louisville.edu

As the housing affordability crisis deepens in many American cities, planning scholars and practitioners are increasingly advocating middle housing in single-family neighborhoods as an alternative housing that can offer diversity in housing options, improve housing affordability, and thus promote housing equity (Parolek, 2020). A growing number of cities—such as Portland, Minneapolis, and Austin—and states have enacted laws (for instance, Oregon's House Bill 2001) that permit higher-density housing options in single-family neighborhoods with goals of addressing housing affordability challenges and advancing housing equity (Dong, 2024).

Despite successes in these cities and states, local policymakers' and planners' efforts to develop middle housing in single-family neighborhoods have often faced major barriers—particularly community resistance to opening single-family neighborhoods to more diverse housing types in historically exclusive single-family neighborhoods (Dong, 2025). In response to community opposition, planning researchers have examined the impacts of multifamily housing development on housing market dynamics (Dong, 2024; Freemark, 2024). Yet, little research has focused on the underlying drivers of the community opposition to middle housing in single-family neighborhoods.

Louisville, Kentucky's largest city, exemplifies the challenges of implementing middle housing in the face of community resistance. The development of middle housing in single-family neighborhoods has encountered opposition from community residents and homeowners' associations (HOAs), which ultimately led to the passage of Kentucky House Bill 18. The bill would prohibit local zoning boards from upzoning to increase residential density for the foreseeable future.

Using the case of Louisville (KY), we integrate spatial analysis with content analysis of 383 public comments posted in 2024, as well as semi-structured interviews with affordable housing advocates, private developers, HOA members, city council members, and planning staff. The guiding questions are: (1) What are the primary drivers of community resistance to middle housing in single-family neighborhoods? (2) Are there variances in how communities react to the introduction of middle housing, and if so, to what extent do community characteristics explain these variances?

The preliminary findings show that concerns about “inadequate infrastructure” and “preserving quality of life” primarily drive resident resistance. Concerns about property value are more implicit in the opposing comments. Importantly, the analysis of public comments indicates that misinformation and confusion about what middle housing actually entails play a role in the resistance. Interviews with professionals in the affordable housing field further confirm this confusion about what the meaning of “middle.”

This research contributes to planning practice and scholarship by offering a set of recommendations for how planners can (re)frame the middle housing discussion in ways that counter misinformation while acknowledging

self-interests. First, the findings highlight the need for a more thorough analysis of residents' issues and interests, enabling planners to better anticipate and manage misinformation and confusion surrounding middle housing. Secondly, they call for facilitative leadership (Forester, 2013) in guiding planning processes where residents' concerns and interests are acknowledged, and planners can (re)frame middle housing around shared interests that are unique to each neighborhood. Lastly, the findings point to the need for further research on the impact of middle housing on home prices in mid-to-high-income neighborhoods. In order for planners and policymakers to effectively address residents' concerns about property values, longitudinal research examining different types and forms of middle housing and their impacts on home prices in various neighborhoods is warranted.

Absentee Ownership: Investor Owners and Tenant/Landlord Relationships in Single Family Rentals

Abstract ID: 1844.0.0.870.2025

Track 6: Housing

Individual Paper Presentation Submission

Evan Davis [University of Minnesota] davi3739@umn.edu, presenting author

Anthony Damiano [University of Minnesota] damia025@umn.edu

Edward Goetz [University of Minnesota] egoetz@umn.edu

This paper examines the effect of large scale investor ownership on tenant/landlord relationships. Institutional investor owners, including private equity firms and publicly held real estate investments trusts (REITs), are increasingly prominent in the single-family rental market since the 2008 foreclosure crisis (Seymour et al., 2023). These investor owners are often national or international in scale and operate their large portfolio of rental properties on business models distinct from those typical of local and small-scale owners (Decker, 2023). Recent research documents how large-scale owners file evictions at higher rates, increase rents more rapidly, and disregard tenant concerns more often than small-scale owners (Damiano & Goetz, 2024; Reosti et al., 2024; Raymond et al., 2018).

We use a mixed-methods approach, including quantitative survey analysis and qualitative focus groups, to better understand the experiences of tenants and the quality of their relationship with their landlord based on the portfolio size of the property owner. Our survey findings show that tenants living in large-portfolio owned properties (20 or more units) report less communicative landlords, higher maintenance expectations without compensation, worse treatment, and higher rates of harassment, discrimination, or retaliation. We consolidate these outcomes into a tenant well-being index, and show that these owner portfolio size trends hold consistent when we control for tenant, housing unit, and neighborhood characteristics. While the largest landlords are associated with the worst outcomes, we find that tenant experiences are lower on average in all but the smallest portfolios. The focus groups with tenants confirmed the divergence in the quality of the relationship between tenants in small- and large-portfolio owners. Our qualitative findings suggest less communicative and impersonal large landlords compared with more responsive and accommodating small landlords.

This research provides evidence of worse tenant experiences and more problematic relations associated with large-portfolio investor owners. It lends support to ongoing policymaking efforts to limit the scope of large-landlord holdings and to enhance tenants' ability to respond to the adverse conditions produced by large-portfolio owners.

Adapting to Climate Change: Analyzing the Impact of Wildfires on Housing Development in California

Abstract ID: 1844.0.0.380.2025

Track 6: Housing

Individual Paper Presentation Submission

Hongwei Dong [California State University, Fresno] hdong@csufresno.edu, presenting author

Climate change is intensifying the frequency and severity of wildfires in the United States, especially in California (California Office of Environmental Health Hazard Assessment, 2022). These wildfires cause significant loss of life and properties, as well as sky-rocketing fire suppression costs, particularly in the wildland-urban interface (WUI) areas (Kramer et al., 2019). The fast expansion of WUI areas, mainly driven by housing development, has been a major contributor to wildfire ignitions and associated damage (Radeloff et al., 2018). Despite these risks, housing development in California's fire-prone areas continues to grow, driven by worsening housing affordability in large metro areas, the rise of remote work, and the appeal of natural amenities (Dong, 2024).

This study aims to analyze the impact of wildfires on housing development in California's fire-prone areas using a quasi-experimental research design. By combining California's Housing Element Annual Progress Report data with wildfire perimeter data, I analyze annual housing permit trends from 2018 to 2024 in neighborhoods affected by recent wildfires (treatment group) and comparable neighborhoods that were not (control groups). I then construct a panel dataset and estimate wildfire impacts through a staggered difference-in-difference (DiD) event analysis.

The preliminary results show that wildfires reduced housing development, with effects that persist beyond the wildfire year. Notably, the temporal patterns of the impact is non-linear. Housing development saw a 23% decrease in the wildfire year, recovered somewhat in the following two years, but then declined again in the 3rd and 4th years.

The findings from this study suggest that recent large wildfires have heightened awareness of wildfire risk among developers, homebuyers, and land use policymakers. This increased risk perception may be contributing to a slowdown in housing development in fire-prone areas. While such a shift could reduce future wildfire vulnerability, it may also lead to decreased economic activity and municipal revenue—posing challenges for some local jurisdictions.

Key Words: wildfire, housing development, climate change

An Analysis of Hispanic Homeownership Attainment in the United States: Native vs Foreign Born

Abstract ID: 1844.0.0.1173.2025

Track 6: Housing

Individual Paper Presentation Submission

David Flores Moctezuma [University of Southern California] rosasflo@usc.edu, presenting author

Homeownership rates are often used as an economic indicator to represent upward economic mobility. These rates among different ethnoracial groups often reveal substantial homeownership rate disparities among races in the United States. The disparity of homeownership rates between two ethnoracial groups is commonly referred to as a homeownership gap. Homeownership gaps between race groups often indicate financial and demographic disparities between those respective groups (Haurin et al., 2007; Cortes et al., 2007).

Previously, the primary focus of this literature was the white and African-American homeownership gap (Sanchez-Moyano, 2020). Recent interest in the Hispanic homeownership gap can be partially attributed to the population and household growth of Hispanics in the United States. Perhaps the most important recent phenomenon is the recent Hispanic migration to communities in the United States that have previously had low concentration of Hispanic households. Hispanic migration in the 1980s was primarily concentrated in gateway cities such as Los Angeles; Chicago; Miami; and New York (Frey, 2018). This trend has now shifted to states or metropolitan areas such as Atlanta. The current areas reflecting significant Hispanic population growth include locations where prior Hispanic presence was not significant (Frey, 2018; Massey and Capoferro, 2008).

In this study, we will pay close attention to the Hispanic homeownership gap. Specifically, the difference between white and Hispanic homeownership rates. We will pay special attention on investigating how the Hispanic homeownership gap differs among Native-Born Hispanic and Foreign-Born Hispanic homeowners in the United States. Cohort visualization of age profiles of homeownership is a method that can help represent offsetting forces that both raise and lower the homeownership rate. By constructing a separate line linking age groups every five years, it is possible to visualize homeownership trajectories of the same age profile over the study period (Myers and Lee, 2016).

This paper investigates the logic of using homeownership gap indicators; explores different variations of the Hispanic homeownership gap definition, specifically when analyzing the gap by Native-Born Hispanics and Foreign-Born Hispanics; and investigates trends following nonoverlapping 5-year files of the American Community Survey (ACS) for the years 2007, 2012, 2017, and 2022 (Myers and Flores Moctezuma, 2020). Specifically, by utilizing "Integrated Public Use Microdata Series" (IPUMS) data that allows a fine-grained comparison analysis of the Hispanic homeownership gap among different Hispanic enclaves in the United States and California. A close examination is needed regarding the achievement of Hispanic homeownership among different states. In recent years, there has been an influx of Hispanic cohorts to states not traditionally considered home to Hispanic populations. By drawing state comparisons, we find that recent trends can help explain not only differences among Native-Born Hispanic and Foreign-Born Hispanic homeowners but also how trends over the study period can lead to the implementation of favorable policies that promote homeownership for all ethnoracial groups.

An Analysis of Immigrants' Residential Mobility Trajectories in South Korea

Abstract ID: 1844.0.0.1171.2025

Track 6: Housing

Individual Paper Presentation Submission

Hyojoo Han [Seoul National University] gywn4746@snu.ac.kr, presenting author

Jaemin Song [Seoul National University] jaemins@snu.ac.kr

The influx of immigrants and their residential mobility are emerging as critical research agendas in contemporary urban planning, as they can significantly impact local demographic structures. Previous studies on immigrant mobility have predominantly focused on the determinants of whether immigrants move or not, with limited attention given to the temporal dynamics of mobility or duration of residence. However, the timing and length of residence in a particular location can influence the quality of the residential experience. Therefore, there is a need to complement prior research through the use of panel regression on time-series data and sequence analysis to capture these dimensions. This study aims to analyze the residential mobility trajectories of registered foreign nationals aged 18 and older who lived in South Korea for more than five years between 2016 and 2022. The research has three main objectives: (1) to compare the characteristics of immigrants who moved and those who did not, (2) to examine whether immigrants experience spatial and economic assimilation over time or show signs of ethnic clustering preferences, and (3) to compare how initial characteristics—such as country of origin, income level, and whether they initially resided in co-ethnic neighborhoods—are associated with different mobility trajectories.

The results show that country of origin is a significant factor influencing residential mobility, and that patterns of assimilation or co-ethnic clustering vary depending on both income and nationality. Furthermore, the initial conditions of immigrants upon arrival appear to have lasting effects on their subsequent residential trajectories.

Unlike prior cross-sectional studies that primarily identify static determinants of mobility, this study contributes to the literature by analyzing dynamic mobility trajectories over time, incorporating often-overlooked dimensions such as timing of moves and length of residence.

Analyzing the Impact of Regional Employment and Industrial Characteristics on Housing Demand in City

Abstract ID: 1844.0.0.581.2025

Track 6: Housing

Individual Paper Presentation Submission

Jimin Kim [University of Seoul] ehld0801@uos.ac.kr, presenting author

Myungje Woo [University of Seoul] mwoo@uos.ac.kr

In South Korea, the imbalance between housing demand and supply in the Seoul metropolitan area and non-metropolitan areas has been a persistent issue. To address this, the government has sought to increase the housing supply through new town developments over the past several years. The nationwide housing supply-demand imbalance is largely driven by population concentration in the metropolitan area. The resulting changes in the demographic structure of cities due to population migration are a key factor influencing housing demand. Since migration primarily occurs due to job opportunities, it is crucial to consider the employment and industrial characteristics of cities when estimating housing demand.

Furthermore, due to agglomeration economies, industries tend to share homogeneity at a regional level rather than at an individual city level. As a result, the relationship between urban employment, industrial characteristics, and housing demand may vary across different regions. Therefore, when estimating a city's housing demand, it is essential to account for the employment and industrial characteristics of the broader region where the city belongs.

This study analyzed the impact of regional employment and industrial characteristics on urban housing demand using Hierarchical Linear Modeling (HLM) and Geographically Weighted Regression (GWR). Regions were defined based on interconnected industries, and the effect of regional employment and industrial characteristics on the housing demand of individual cities was examined. The analysis results confirmed the following research hypotheses:

First, Urban housing demand varies depending on regional employment and industrial characteristics.

Second, The impact of specific industry sectors on housing demand differs by region.

Third, Each region has specialized industries, and these specialized industries positively influence the housing demand of cities within the region.

Fourth, In the Seoul metropolitan area, the fourth industry had a positive impact on housing demand, whereas in non-metropolitan cities, the manufacturing-based secondary industry had a positive influence.

Based on these findings, this study provides the following policy implications for estimating and supplying appropriate housing demand at the municipal level in connection with industrial characteristics:

In metropolitan cities, information technology, high-tech, and arts-related industries influence housing demand. Therefore, housing supply should be planned in accessible locations that align with these industries.

In manufacturing-based growth cities in non-metropolitan areas, a higher proportion of non-regular workers tends to increase housing demand. As such, public housing policies for non-regular workers should be considered to address housing needs effectively.

Avoiding the Risk of Trial, But Taking on the Risk of Agreement: Eviction Cases in Portland, Oregon

Abstract ID: 1844.0.0.1057.2025

Track 6: Housing

Individual Paper Presentation Submission

Minji Cho [Portland State University] minji2@pdx.edu, presenting author

Colleen Carroll [Portland State University] cpc4@pdx.edu

In the United States, many tenants enter into stipulated agreements to avoid a trial in eviction cases. Similar to a settlement, stipulated agreements are court-enforced agreements that dictate the terms by which an eviction case will be dismissed. The most common types of agreements are (1) agreements to move out by a certain date or (2) agreements to pay and stay in the unit, which often include a payment plan. Previous studies claim that they require more than legal proceedings from tenants due to power imbalances and disparities in legal representation between landlords and tenants (Goldstein et al., 2020; Summer, 2023; Summers and Steil, 2024).

We revisit stipulated agreements in eviction court to address the following research question: How does what a landlord can win/extract differ between when a stipulated agreement is used and when it is not? We focus specifically on noncompliance, where tenants fail to comply with the terms stated in a stipulated agreement. More specifically, we seek to answer the following questions: (1) How many tenants are noncompliant with all or part of the terms of a submitted stipulated agreement? (2) What are the causes of noncompliance? Utilizing a sample of nonpayment cases filed in Multnomah County Circuit Court from July to December 2023, each involving at least one stipulated agreement, we conduct a content analysis of agreement documents from the Oregon Judicial Case Information Network.

We demonstrate that stipulated agreements can be used to extract additional concessions from a tenant than would be possible through legal proceedings. Tenants often struggle to comply with provisions requiring larger payments through a payment plan or timely future rent payments. Consequently, they frequently face a judgment of eviction despite partially or fully paying the owed balance. We underscore the need for policy reforms to regulate the terms that can be included in stipulated agreements and highlight the importance of providing tenants with better legal support to navigate eviction proceedings.

Beyond Shelter: Understanding the Growth and Distribution of Tiny House Villages

Abstract ID: 1844.0.0.18.2025

Track 6: Housing

Individual Paper Presentation Submission

Yetimoni Kpeebe [University of North Carolina at Charlotte] ykpeebe@charlotte.edu, presenting author

Krista Evans [Missouri State University] kristaevans@missouristate.edu

Tiny house villages have significantly increased in number across the US, offering not just shelter but also integrated services such as mental health care, job training, and communal support systems. This research, building on a study conducted by Evans in 2020, seeks to provide a comprehensive analysis of tiny house villages including their physical and social characteristics, their spatial and political distribution as well as the funding structures that sustain them. The research aims to generate insights that will inform planners and policymakers on how these villages are being developed, where they are concentrated, and what contextual factors influence their adoption. To enhance public engagement and data accessibility, this study also introduces a more user-friendly interactive online mapping tool that enables real-time tracking and community participation in data collection.

A mixed-methods approach was employed, gathering primary data through email and phone interviews, alongside secondary data from organizational websites and social media platforms. Additionally, Geographic Information Systems (GIS) were used to analyze the spatial distribution of tiny house villages across all fifty states. A density-based clustering tool in ArcGIS was applied to identify regional trends and spatial disparities in the presence of tiny house villages.

Findings from the study reveal a pronounced clustering of tiny house villages along the West Coast, particularly in California, Oregon, and Washington, indicating a wider regional adoption for this housing model. Furthermore, the analysis found a higher concentration of tiny house villages in Democratic-leaning (“Blue”) states compared to Republican-leaning (“Red”) states, raising critical questions about how political ideologies and regulatory environments potentially shape their development. In terms of funding structures, only 19% of villages were found to receive exclusive public funding, while the majority (43%) rely solely on private contributions, indicating significant disparities in financial support. A good number of tiny house villages allow pets, which may make this housing model more attractive for individuals experiencing homelessness. This is particularly important because many unhoused individuals form deep emotional bonds with their pets, often considering them as family.

Drawing from the findings of the study, the study makes recommendations as follows: First, the limited public funding of tiny house villages underscores the need for stronger public-private partnerships to ensure their long-term sustainability. Given that a majority of these villages rely on private funding, increasing public investment and fostering collaboration between government agencies, nonprofit organizations, and private donors will be critical for their expansion and long-term viability. Also, addressing regulatory barriers and expanding tiny house villages in underrepresented regions with high homelessness rates is necessary for equitable access to this housing model. The spatial analysis underscores the need for policies that facilitate their development in areas where homelessness is prevalent, but tiny house villages remain scarce or nonexistent.

Michael Storper [University of California, Los Angeles] storper@ucla.edu

It is widely agreed that there is declining housing affordability for substantial parts of the population in most high-income countries. A “new mainstream” analysis of this crisis holds that it is caused by limited housing supply, in turn due to restrictions on construction, principally from zoning and regulation. The mainstream advocates for regulatory reform, which they claim will increase construction of market rate housing, thereby creating affordability for households at a broad range of income levels. We argue that this series of causal linkages is not well-supported in the literature. We empirically support this argument by simulating the impact of a large supply shock in high-cost local U.S. housing markets using different estimates of filtering rates and the elasticity of prices to supply from existing studies. We then construct an alternative, and more theoretically defensible, understanding of how we arrived at the current crisis, emphasizing three principal causes: increasing income inequality, the pattern of spatial sorting by income, and the exhaustion of easily developable land in much of the metropolitan U.S. Together, they generate a crisis without precedent in American history, and in turn, drive many of the other commonly cited causes of declining affordability, including overly restrictive zoning, regulation, and financialization. It is these economic geography fundamentals that are largely ignored in much of the academic work that has shaped the policy debate.

Individual Paper Presentation Submission

Alejandra Reyes [University of California, Irvine] lreyesru@uci.edu, presenting author

Recent housing reforms in California are pushing local governments to plan for local and regional housing needs. Besides pressure from the state, grassroots organizing in Southern California is also challenging past governance tactics and driving some cities to shift their housing politics and policies. While overwhelmingly affluent jurisdictions continue to oppose housing development, some lower- and middle-income cities have leveraged state laws to pass stronger rent control and tenant protections in response to political pressure from local residents and activists. In northern Orange County (OC), a historically exclusionary and influential subregion, some racialized communities have reached a critical mass to exert political and economic influence in certain cities. In previous decades, communities in North OC organized to resist conservative and anti-immigrant policies. Displacement pressures and acute housing needs are similarly gathering increasingly diverse and mobilized residents clashing against the demands of wealthier and more homogeneous homeowners who feel as though their suburban life and property values are under attack. Most jurisdictions, however, are facing pressure to roll back initiatives that restrict housing development, implement or expand inclusionary zoning ordinances, and establish housing funds, among other strategies.

This research offers a rich inter-scalar analysis of the evolution of housing politics and policies at a period of reform, shedding light on the challenges and prospects for promoting regionally balanced development and housing access in exclusionary geographies. Contentious housing politics, notable ethno-racial and socioeconomic segregation, and unaffordability pressures make Orange County an important and understudied case for analysis. Shedding light on how Racially Concentrated Areas of Affluence (Goetz et al. 2019) are evolving, this context-dependent analysis adds nuance to our understanding of planning and housing policy change by triangulating three main data sources: news articles, public meetings, and government documents. Quantitatively and substantively, news makes up the predominant data source with 221 sources, followed by 72 public meetings and 58 government documents covering 29 out of 34 cities in OC.

Denied: Housing Characteristics and Racial Disparities in Mortgage Denial Rates

Abstract ID: 1844.0.0.1033.2025

Track 6: Housing

Individual Paper Presentation Submission

Elizabeth Delmelle [University of Pennsylvania] delmelle@design.upenn.edu, presenting author

Isabelle Nilsson [UNC Charlotte] inilso1@charlotte.edu

Decades have passed since the Fair Housing Act outlawed discriminatory practices in the housing market. During this time, America's racial composition has become increasingly diverse, and measures of racial tolerance have improved. Yet, segregation by race in American cities remains persistently high. This enduring pattern may be attributed to continued preferences for living in neighborhoods with members of one's own racial group. Alternatively, it may result from continued discriminatory practices in the housing market perpetuated by realtors and mortgage lenders. Prior research has found evidence that minorities have been less likely to secure loans in gentrifying neighborhoods, suggesting that observed shifts in the location of poorer and minority residents might not simply reflect changing preferences but rather continued discriminatory practices in housing markets, particularly in mortgage lending. These practices perpetuate historical patterns of segregation and limit housing opportunities for minority homebuyers, despite legal protections.

In this paper, we build upon our prior research that connected housing advertisement text with neighborhood mortgage approval rates. We previously applied a semi-supervised text classification model to longitudinal property listing data to derive a housing typology that follows an investment-disinvestment-renewal continuum. This approach allowed us to categorize neighborhoods based on the language used to market properties within them, providing insights into how racial disparities manifest across different neighborhood types. Our earlier findings revealed that Black homebuyers overwhelmingly applied for and were approved for mortgages in neighborhoods with a high share of disinvested properties—those not advertised for long-term wealth generation. This relationship held even when examining middle-and higher-income Black homebuyers, suggesting factors beyond individual financial resources are at play. The current study expands this analysis to examine mortgage denial rates using similar text classification techniques across a larger set of metropolitan areas. We analyze trends in loan denial to loan origination ratios by race and neighborhood type using Home Mortgage Disclosure Act data paired with Multiple Listing Service data. We then correlate these changes with denial-to-loan origination ratios by race, examining how marketing language relates to disparate lending outcomes. Next, we estimate the probability of an applicant being denied a loan as a function of individual, borrower, and neighborhood characteristics across metropolitan areas and policy-relevant time periods. Our results point to distinctly unequal mortgage lending practices by race. Black homebuyers are nearly six times more likely to be denied mortgages in neighborhoods characterized by homes marketed as "expensive investments." Additionally, Black homebuyers face higher denial rates in gentrified neighborhoods or those classified as "renewed." These patterns are particularly acute in metropolitan areas experiencing rapid growth and neighborhood renewal. These findings significantly impact our understanding of persistent segregation and inequity in housing markets. They suggest that discriminatory mortgage lending patterns help explain continued residential segregation, with institutional barriers—rather than merely preferences—shaping neighborhood composition. Our methodology offers a novel approach by leveraging property listing language to reveal patterns of discrimination that traditional measures may miss.

Developing an Anti-Displacement Assessment Tool: For and with the Tenant Union & Louisville Metro

Abstract ID: 1844.0.0.1056.2025

Track 6: Housing

Individual Paper Presentation Submission

Andre Comandon [University of Southern California] comandon@usc.edu, presenting author

Kenton Card [University of Minnesota] kenton@umn.edu

Loretta Lees [Boston University] llees@bu.edu

How can governments mitigate displacement in the affordable housing development process? Urban planners and policymakers have long grappled with this question. From Austin to Boston and from California to New York, cities and states have enacted laws to protect residents from rising housing costs associated with gentrification and unequal income growth (Chapple and Loukaitou-Sideris, 2021). Despite these efforts, housing cost burden is at its highest recorded level (JCHS, 2024). Research detailing the impact of housing cost burden on housing insecurity and displacement has focused on large cities, liberal states, and international cases (see Been et al., 2025 for a review), leaving a gap in research about smaller and mid-size cities that face more restrictive legal environment.

Louisville Metro, KY, is a mid-sized city scarred by the legacy of institutionalized racial segregation that has experienced accelerating gentrification in the last decade. A group of tenants began organizing in 2019 to advocate for a law that would protect historically Black communities. In collaboration with a newly elected council member in 2020, the effort expanded to cover the entire city and focus on residential displacement associated with Metro supported housing developments. The resulting ordinance called for a team of academics to develop a tool that would guide the decision to support new housing projects with Metro resources.

This paper documents the process of developing an Anti-Displacement Assessment Tool (ADAT) for the Louisville Metro Government. The tool was developed in close collaboration with the Office of Housing and Community Development, Councilman Arthur who sponsored the ordinance, and the Louisville Tenants Union. The process culminated with the bipartisan, unanimous adoption of the ADAT by the Metro Council in November 2024. Drawing on interviews and reflection on our own practice (Schön 1984), we provide an overview of the political process involved in ensuring that the tool would follow the ordinance and the pass the scrutiny of a council that was initially reluctant to support the ordinance and highlight the shift in discourse to emphasize a pro-development, but anti-displacement approach.

The political context and demographic context influenced the development of the tool, providing unique insights into how a method that has been widely used in cities (e.g., Bates, 2013) can be adapted for a mid-sized city in a conservative state. In addition, the tool, being tied to an ordinance with a specific application for developers, needed to meet requirements that led to several innovations. First, the tool takes a project-first approach. The infrastructure of the tool is built around the site a developer has identified for a project. We use open-source software to enable a user to enter an address that is geocoded and used to produce an assessment based on the location of the project and the characteristics of the project. The tool uses the location to create an assessment based on a modified version of existing displacement risk toolkits. The tool draws on data from the Metro Government, census data, and Renthub to develop a risk assessment for every location in the city. We use the measure of risk to determine how likely the specific project is to exacerbate displacement pressures. Finally, in consultation with all actors and based on our research, we created a matrix of conditions under which the risk of displacement would be appropriately mitigated by the addition of affordable housing.

The result is a tool that mandates that every development contribute meaningfully to the supply of affordable housing where it is most needed (at or below 50% of AMI) and streamlines the process of approval by providing a transparent set of criteria for qualification. Louisville's anti-displacement assessment tool illustrates how cities can mitigate displacement without discouraging development of new affordable housing.

Developing Moves to Opportunity: Understanding the Residential Mobility Patterns of LIHTC Tenants

Abstract ID: 1844.0.0.139.2025

Track 6: Housing

Individual Paper Presentation Submission

Laura Sullivan [Cornell University] lrs263@cornell.edu, presenting author

The Low-Income Housing Tax Credit (LIHTC) is the largest source of federal funding for affordable housing. Historically, LIHTC has been used to develop affordable housing in high-poverty areas. Recently, states have begun to use LIHTC to promote access to lower-poverty areas in response to the Texas Department of Housing and Community Affairs v The Inclusive Communities Project 2015 Supreme Court ruling that LIHTC developments in Texas were reinforcing racial segregation. Beginning in 2018, California awarded extra points to applications of large family developments in higher-resource areas. While where you live is important for later life outcomes, the effectiveness of moving to opportunity programs is mixed (Ludwig et al. 2013). These policy changes have concerned some developers and affordable housing advocates who worry that focusing on high-opportunity areas will result in lower amounts of affordable housing being built because it is more expensive to build in these areas. However, recent work has shown that the policy change has resulted in more applications for and sitings of LIHTC developments in higher resource areas (Owens and Smith 2023). Reprioritizing LIHTC comes even though little is known about the mobility patterns of LIHTC tenants. Prior work on residential mobility among lower-income populations has come from studies of housing voucher recipients and public housing tenants. Little work has focused on the demographics or mobility patterns of LIHTC tenants, mostly due to data limitations. One recent study used consumer trace data to overcome common data limitations and found that LIHTC tenants typically experience increases in poverty and lower amenities when they move into LIHTC (Kuai 2024). Additionally, qualitative work has shown that LIHTC residents' perceptions of opportunity areas were more nuanced than the opportunity maps used by California to award LIHTC to developers, which has important implications for policy design (Reid 2019).

In this paper, I use unique residential history data from Infutor to examine who benefits from LIHTC developments in higher-resource areas and if states can use LIHTC to disrupt historic patterns of segregation. Even though California only recently began incentivizing developments in high-resource areas, there are still LIHTC developments built in these areas before 2018. By understanding who moves into these developments, we can better understand how tenants may respond to an increase in LIHTC in high-resource areas. I begin by studying the changes in neighborhood conditions for new LIHTC tenants between 2010 and 2021 before comparing the mobility patterns of LIHTC tenants in high versus low-resource areas and compared to similar private-market tenants. In doing so, I address the following research questions: (1) Where do LIHTC developments in high-resource areas draw new tenants from? (2) Does the probability of moving to a high-opportunity LIHTC development differ by race? I find that LIHTC tenants often sacrifice neighborhood resources to access affordable housing. Additionally, LIHTC developments in high-resource areas do not help facilitate moves to opportunity for a majority of their tenants but instead attract tenants from nearby high-resource areas, which contributes to racial disparities in who has access to these developments. Overall, LIHTC reinforces the "stickiness" of neighborhoods, as LIHTC tenants are far more likely to move to nearby areas than low-income private market tenants. Overall, LIHTC reproduces patterns of segregation and fails to disrupt typical residential mobility patterns of low-income tenants. This paper seeks to understand how potential LIHTC tenants respond to LIHTC developments in higher resource areas and provides a clearer picture of LIHTC tenant mobility. In doing so, I bridge the gap between person-based and place-based policy research by showing how supply-side housing programs influence the residential mobility of low-income tenants.

Differential Rates of Mortgage Approval to Black Applicants in Texas' Largest Cities, 2018-2021

Abstract ID: 1844.0.0.279.2025

Track 6: Housing

Individual Paper Presentation Submission

Michael Frisch [University of Missouri Kansas City] frischm@umkc.edu, presenting author

The rates of Black homeownership have been declining in many areas of the country. The overall decline in Black homeownership in Texas' largest cities: Austin, Dallas, Fort Worth, Houston, El Paso, and San Antonio; has been steeper than average. This decline has continued while the overall homeownership rate has begun to recover. Many factors influence the rates of black homeownership. Planners and mortgage lenders constitute two set of institutional policy actors that could be influencing this decline. What roles do mortgage lenders play in the relative rate of mortgage application acceptance to Black applicants? Does the extent of exclusionary zoning and single-family residential land use as the result of long-term planning policy impact this rate?

Two main methods are used to answer this question. An analysis of all mortgage applications for single unit owner-occupied housing units was conducted for the metro areas of these six cities. Using data from the Home Mortgage Disclosure Act dataset, the American Community Survey, and the USPS address dataset from HUD; a regression analysis is done to estimate factors influencing relative rates of mortgage application approval by racial category at the census tract level. A similar analysis is done to explain the different rates of mortgage approval by firm.

The last set of analyses examine the impact of zoning and land use policy on approval rates. Do mortgage lenders approve a higher rate of black applicants in census tracts that have, or had, exclusionary land use regulation? Data on the local geography of exclusionary zoning districts and the extent of areas with single-family residential land uses is added to the analysis to test the impact of these planning policies.

Results show different firms have different mortgage application results. Differences may also be found depending on whether units are in newly developing tracts. High rates of mixed land uses in a tract tend to dampen mortgage approvals for Black applicants. The results point to a significant degree of agency in individual lending institutions to improve mortgage lending outcomes for Black applicants.

Does Florida's Geographic Opportunity Map Influence LIHTC Placement?

Abstract ID: 1844.0.0.554.2025

Track 6: Housing

Individual Paper Presentation Submission

Chao Wang [Florida State University] cw22k@fsu.edu, presenting author

Poverty de-concentration is a critical discourse in affordable housing policy. The placement of Low-Income Housing Tax Credit (LIHTC) is often at the center of this discussion because LIHTC projects have been disproportionately placed in high-poverty, low opportunity, and minority neighborhoods (Freeman, 2004; McClure & Schwartz, 2023).

Scholars argue that siting LIHTC projects in high opportunity areas with low levels of concentrated poverty, high performing schools, and strong local employment may benefit residents (McClure & Schwartz, 2023). For instance, McClure (2019) argues that placing mixed-income LIHTC projects in these areas may help reduce the stigma related to subsidized housing and encounter less neighborhood resistance.

Empirical evidence investigating the influence of LIHTC project placement on neighborhood change shows mixed results. For instance, Woo et al. (2016) found that LIHTC projects in Cleveland, Ohio positively influenced nearby properties values, while those in Charlotte, North Carolina, had a negative impact, depending on local economic context.

The debate over LIHTC placement is mostly well-known by the 2015 Supreme Court ruling in favor of the Inclusive Communities Project's (ICP) claim. ICP argued that Texas Department of Housing and Community Affairs (TDHCA) had disproportionately awarded tax credits in predominantly Black neighborhoods. Since the ruling, many states have encouraged the placement of LIHTC projects in high opportunity areas by adjusting their Qualified Allocation Plans (QAPs), which outline how state governments review LIHTC applications and award tax credits (McClure & Schwartz, 2023).

This research investigates how policy changes in Florida have influenced LIHTC location patterns. Florida was selected as the setting for two main reasons. First, it is one of the largest states in the US. Second, in 2016, the state government created a Geographic Areas of Opportunity Map based on census tract indicators, including median income, education, and employment. This map was integrated into the state's QAP to encourage the placement of LIHTC in high opportunity areas.

Specifically, this research asks: what are the socio-demographic characteristics of LIHTC neighborhoods before and after the introduction of Florida's Geographic Opportunity Map? How has the introduction of the map influenced LIHTC placement patterns in Florida?

To address these questions, I first analyzed the socio-demographics of census tracts containing LIHTC projects, using census tracts as neighborhood proxies. I used ACS 2015 and ACS 2022 five-year estimates to represent pre- and post- map periods, respectively. I then conducted a two-sample t-test comparing socio-demographic differences between LIHTC neighborhoods inside versus outside opportunity areas. Finally, I used a Difference-in-Differences (DiD) regression model to evaluate the map's impact on LIHTC placement by comparing two dimensions: before versus after 2016, and inside versus outside opportunity areas.

Initial findings suggest that, despite the intervention of Florida's opportunity map, the majority of LIHTC projects built after 2016 remain outside opportunity areas. Additionally, neighborhoods with LIHTC projects inside opportunity areas have higher shares of white and Asian population, while those outside opportunity areas have

higher proportions of Black and Hispanic populations. My initial findings suggest that the efficacy of the state government's intervention of policy is limited and that additional incentives are needed to encourage the placement of LIHTC projects in high opportunity areas.

This research provides new empirical evidence on how state-level affordable housing policies shape the outcome of the geographic placement of affordable rental housing. The study provides suggestions on how policymaking can benefit the low-income and minority residents living in subsidized housing units in promoting housing equity.

Does Hurricane Flood Risk Impact Property Values? A Bayesian Approach to Flood Risk Estimation

Abstract ID: 1844.0.0.716.2025

Track 6: Housing

Individual Paper Presentation Submission

Mengjue Zhu [Georgia Institute of Technology] mzhu356@gatech.edu, presenting author

Subhrajit Guhathakurta [Georgia Institute of Technology] subhro.guha@design.gatech.edu

Barnali Dixon [University of South Florida] bdixon@usf.edu

This study examines the impact of flood risk on property values in St. Petersburg, Florida, amidst the backdrop of increasing urbanization and sea-level rise in coastal cities. With the rise in popularity of coastal living leading to expanded impervious areas, this research evaluates whether flood risk serves as a significant attribute in determining housing prices. The research on the influence of actual or perceived flood risk on property prices is unsettled. Some scholars claimed that property values decline in neighborhoods frequently hit by storms, yet storm risks do not deter coastal development (Walls et al., 2018). Other scholars found that the coastal real estate market adapts to the increasing flooding risk because people purchase them at high prices to make money through renting (Fu and Nijman, 2021). Typically, flood risk is estimated using flood zones and seawalls (Jin et al., 2015). Some studies found no significant effect of flood zones on property values, while others suggested that high-risk zones may even increase them (Eberbach and Hoagland, 2011; Atreya and Czajkowski, 2014). Similarly, the effect of seawalls remains debated – some studies indicate they raise property prices, whereas others report the opposite (Kreisel and Friedman, 2002, 2003; Hamilton, 2007). One reason for the inconclusive relationship in previous studies is that flood risk varies substantially within the high-risk flood zone. And many seawalls are too outdated to protect people from floods.

In this study, we utilize a Neural Network with Monte Carlo Dropout to develop a flood risk variable based on crowdsourced data. The analyses compare different models that include and exclude flood risk attributes. The findings highlight significant spatial heterogeneity in property value responses to flood risk, suggesting that while some neighborhoods experience notable declines in value due to flooding, others may adapt positively to such risks, ultimately influencing future real estate development and exposing urban areas to greater flood dangers.

Dual-Function Housing Demand in Korea: Revisiting Mankiw-Weil for End-User and Speculative Roles

Abstract ID: 1844.0.0.585.2025

Track 6: Housing

Individual Paper Presentation Submission

Youngshin Kang [Pusan National University] jubilate88@naver.com, presenting author

Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

[Introduction and Objectives] In South Korea, nearly all housing policies emphasize protecting so-called “real” demand. The distinction between “end-user” (real) and “speculative” (excess) demand is deeply embedded in public discourse, yet such terminology is uncommon internationally. This suggests that South Korea’s unique institutional and financial environment—particularly the 'Jeonse' system—has shaped distinct housing acquisition and investment behaviors. The Jeonse system, based on large upfront deposits rather than monthly rent, operates alongside traditional mortgage financing. Landlords often use Jeonse deposits, which range from 50–80% of property value, as de facto mortgage substitutes. This system lowers investment entry barriers and facilitates “gap investments,” where properties are acquired not for personal use but for capital gains, often by buyers classified as end-users in policy terms. This study aims to disentangle two types of housing demand: (1) end-user demand, defined as purchases for owner-occupancy, and (2) speculative demand, defined as purchases followed by leasing via 'Jeonse' or monthly rent. This distinction aligns with broader planning concerns about differentiating shelter-motivated demand from asset-based behavior.

[Data and Method] To estimate latent housing demand, we apply a modified Mankiw-Weil (MW) model, which originally linked age-specific population cohorts to housing consumption. While later studies incorporated income and user cost (Ioannides & Rosenthal, 1994), the MW model remains limited in capturing speculative behavior, which often diverges from residential utility motives. We address this gap by combining two data sources: (1) National population census microdata to estimate baseline end-user demand by region and (2) Transaction-level microdata from the Ministry of Land, Infrastructure and Transport’s Real Estate Transaction Management System to identify purchases not used for self-occupancy. Here, follow-up lease registrations (Jeonse or monthly) are used as proxies for speculative demand. This dual-source approach allows for a behaviorally disaggregated and spatially nuanced modeling of housing demand.

[Main Findings and Implications] Our analysis yields two distinct demand curves: one for owner-occupied housing and one for speculative purchases. Total demand is based on transacted floor area, while speculative demand is inferred from rental market activity. This segmentation reveals spatial patterns and behavioral asymmetries that traditional models obscure. By operationalizing speculative demand, the study offers a new foundation for differentiated policy interventions. High-speculation zones can be targeted with tailored instruments—such as loan-to-value (LTV) limits, holding taxes, or lease conversion restrictions—to curb volatility and mitigate displacement risks. Meanwhile, areas with high end-user demand can be prioritized for affordable or public housing provision. Additionally, the dual-demand model supports more rigorous ex post evaluations of housing welfare policies. If beneficiaries of subsidies or mortgage guarantees are engaging in speculative activity, it calls into question the redistributive goals of such policies. Integrating this behavioral distinction strengthens the accountability, equity, and responsiveness of urban housing frameworks.

Examining Predatory Contract for Deed Practices through Eviction Court Data

Abstract ID: 1844.0.0.646.2025

Track 6: Housing

Individual Paper Presentation Submission

Yi Wang [Washington University in St Louis] yiw1@wustl.edu, presenting author

Patrick Fowler [Washington University in St Louis] pjfowler@wustl.edu

A Contract for Deed (CFD) is a rent-to-own arrangement where buyers purchase a home through monthly installments over an extended period. CFDs are often regarded as predatory because they impose the responsibilities of homeownership and the disadvantages of renting without providing the corresponding benefits (Coates, 2014; Immergluck, 2018; NAACP, 2019). The seller retains ownership until the purchase price is fully paid and is not responsible for property maintenance (Kennedy, 2022). Buyers are held accountable for property taxes, insurance, and maintenance. If buyers fall behind on payments, sellers can evict them and reclaim the property. Despite the exploitative nature and adverse impact on low-income and minority buyers, there is limited research on the unfair terms embedded in these contracts.

This study uses a novel dataset of approximately 7,300 residential leases filed in support of over 15,000 St. Louis eviction proceedings in 2024 to examine the prevalence of predatory CFD practices, the geography of these cases, and the unfair terms embedded in these contracts. Tesseract, an optical character recognition tool, was used to extract information from lease documents, and fuzzy searching with regular expressions was employed in Python to extract lease details. Statistical analysis was conducted using Stata.

Our preliminary findings reveal the following: (1) In 2024, there were 95 CFD eviction filings in the City and County of St. Louis, constituting 1.3% of all eviction cases with exhibits. (2) CFD eviction filings were concentrated in predominantly Black neighborhoods in North St. Louis City and County. (3) The average sale price for CFD properties in St. Louis was approximately \$67,798 (SD = 15,804). (4) The average interest rate for CFD properties in St. Louis was 13.28% (SD = 2.52). (5) The majority of the loans had a term of 30 years, with some final payments extending to 2054. (6) Almost all CFDs include a clause stating that if the buyer defaults and the seller files for eviction, the buyer will be responsible for any collection-related expenses, including the seller's attorney's fees.

These findings underscore the predatory nature of CFDs and their detrimental impact on already vulnerable low-income households. They also highlight the need for policy and legal reforms to address these exploitative practices.

For the next steps, we will continue to collect lease documents and investigate further into the following areas: (1) Comparing selling prices to appraised values and the prices when the seller obtained the property to determine how much buyers were being overcharged and how much sellers profited from this process. (2) Assessing the number of housing code violations associated with CFD properties. (3) Measuring the time from the start of CFD agreements to the occurrence of eviction.

Exploring Accessibility, Travel Behavior, and Affordability Effects of ADUs in Sacramento, CA

Abstract ID: 1844.0.0.921.2025

Track 6: Housing

Individual Paper Presentation Submission

Jamey Volker [University of California, Davis] jvolker@ucdavis.edu, presenting author

Luca Aldana [University of California, Davis] jalioto@ucdavis.edu

Accessory dwelling units (ADUs) – also called in-law units, secondary units, or granny flats – ADUs are small self-contained dwellings that share the site of a larger dwelling structure, either as a standalone structure or as a converted portion of the larger dwelling itself. Permitting of accessory dwelling units has skyrocketed over the last five years in California, as recent state laws have made permitting easier than ever. This has ramifications for California’s housing supply (Volker & Handy, 2023), the affordability of its housing stock (Chapple et al., 2023; Marantz et al., 2023), and the state’s efforts to reduce vehicle miles traveled (VMT) and greenhouse gas (GHG) emissions (Volker & Thigpen, 2022).

In this study, we investigate the affordability and accessibility of recently constructed ADUs in Sacramento, California, as well as the effect of ADU construction has on off-street parking supply, vehicle ownership, and travel behavior generally. We focus on the more than 400 ADUs that were permitted in 2021. We administered and analyzed a survey of the ADU permittees, which we pair with spatial and sociodemographic analyses using US Census data, grocery store data, and other data.

We find that recently permitted ADUs are mostly used for housing, but not necessarily affordable housing. The ADUs are located in areas with moderate rent levels – not the highest, but also not the lowest. The rents reported by the ADU owners similarly indicate moderate rent levels, albeit much lower rents for family members and friends. With respect to accessibility, we find relatively good access to public transit, grocery stores, and green spaces. However, while the accessibility attributes might portend travel behavior shifts for ADU renters, our survey indicated very little travel behavior change for ADU owners after ADU construction. On average, we found almost no change in off-street parking spaces on the subject parcels, almost no change in vehicle ownership of the ADU owners, and almost no change in travel behaviors of the ADU owners. Our findings generally support previous findings that ADUs provide somewhat affordable housing (Chapple et al., 2023; Marantz et al., 2023) and are unlikely to overwhelm existing parking supplies (Volker & Thigpen, 2022). But the jury remains out about the net effect on VMT – ADUs might not have a big effect on the travel behaviors of ADU owners, but we still do not know how tenants change their behaviors after moving into an ADU. We are currently studying that latter question in an extension of this study. Answers to these questions are useful to local and regional governments and policymakers as they develop and prioritize strategies to increasing affordable housing and reduce VMT and GHG emissions, including in sustainable communities strategies (per SB 375 in California), general plans, climate action plans, and VMT mitigation banks and exchanges.

Exploring Home Repair as Micro-Stabilization for Low Income Seniors in Cleveland Neighborhoods

Abstract ID: 1844.0.0.666.2025

Track 6: Housing

Individual Paper Presentation Submission

Kelly Kinahan [Florida State University] kkinahan@fsu.edu, presenting author

Jenna Dublin-Boc [San Diego State University] jdublinboc@sdsu.edu

Stephanie Ryberg-Webster [Cleveland State University] s.ryberg@csuohio.edu

In older industrial cities confronting decades of population decline and economic contraction, affordability concerns can be less acute due to depressed property values, compared to places with steady population growth and economic expansion. However, housing quality is a widespread issue in shrinking cities. Cleveland's built environment is characterized by an aging housing stock in various states of disrepair with high rates of vacancy and abandonment across the city, particularly lower-income and Black communities (Tighe & Ryberg-Webster, 2019). Demolition is a common policy response, but this approach can limit the use of older housing to fill affordable homeownership needs, especially for vulnerable populations including elderly and low-income residents (Mallach, 2011; Rosenman & Walker, 2016).

Deferred maintenance of older housing is a factor that contributes to poor housing quality, housing vacancies, and abandonment. As responsibility for home repairs falls on owners, many owner-occupants face significant barriers to correcting structural deficiencies, improving outdated heating systems, or installing accessibility modifications (Louis et al., 1998). Such challenges disproportionately affect elderly and low-income residents who are also disabled, single, or from minority communities, exacerbating inequities in housing stability (Millard & Metraux, 2023). Access to home repair funds can be an important factor influencing whether households are able to remain in their homes when facing changes (e.g. advanced age, reduced income, diminished able-bodiedness) that could otherwise result in forced moves due to maintenance burdens. Home repair funding is particularly salient given that lower-income families are often constrained to aged and poorly maintained housing from the moment of purchase, due to historic patterns of structural disinvestment that place them in declining or distressed neighborhoods (Hernandez & Trupkin, 2021). Lower-income owners experience twice the number of housing problems than higher-income owners and address the problems less frequently and spend less on repairs (Millard & Metraux, 2023).

Publicly subsidized home repair programs represent one policy approach aimed at reducing maintenance costs and enabling homeowners, especially low-income and elderly residents, to maintain safe, habitable living conditions and remain in their homes. Home repair programs also have the potential to serve as a tool for neighborhood revitalization and stabilization. Using Cleveland, OH as a case study, this research examines the challenges of housing maintenance and explores the role of local rehabilitation programs in funding essential repairs. We explore the relationship between investments made through two citywide programs, Repair-A-Home (RAH) and Senior Homeowner Assistance Program (SHAP), and whether these program function as a form of stabilization for low-income, senior households. We ask: what is the relationship between home repair investment and the presence of low-income, senior homeowners? We hypothesize that the amount of home repair investment funds flowing into a neighborhood will help stabilize low-income, senior homeowners. Using data from the City of Cleveland's Department of Community Development and American Community Survey 5-year estimates for 2005 and 2014 at the census tract level, we estimate a regression model to understand the effect of home repair investments on changes in the share of cost-burdened low-income owner-occupied households aged 65 and older. Preliminary findings suggest that high levels of home repair investments helped to stabilize the presence of elderly low-income

households, particularly in lower and middle-income Black neighborhoods. The findings provide important insights into the role municipal home repair programs play in ameliorating health, safety, and housing quality challenges stemming from long-term decline and disinvestment.

Exploring Racial Disparities in Home Appraisals and Their Impacts

Abstract ID: 1844.0.0.289.2025

Track 6: Housing

Individual Paper Presentation Submission

Hye-Sung Han [University of Kansas] hshan@ku.edu, presenting author

Previous studies on appraisal bias have shown that properties in predominantly minority neighborhoods—particularly Black and Hispanic communities—are often appraised at lower values than comparable properties in predominantly white neighborhoods, even after controlling for factors such as home size, condition, and location (Faber, 2020; Freddie Mac, 2021; Perry et al., 2018). However, these studies primarily used neighborhood racial composition as a proxy for race, without directly accounting for the race of homeowners. This approach may conflate neighborhood-level effects with individual-level biases, potentially overlooking more subtle forms of discrimination tied to homeowner race rather than just neighborhood demographics.

This study leverages the Uniform Appraisal Dataset (UAD) appraisal-level Public Use File (PUF)—the first publicly available dataset that includes both appraisal data and homeowner race/ethnicity—to provide a more precise analysis of racial disparities in home appraisals. By utilizing spatial regression techniques, this research examines the extent of appraisal bias and identifies the individual and neighborhood-level factors that contribute to it while controlling for land market values, geographic variability, and regional economic conditions. Additionally, this study explores the broader consequences of appraisal bias on communities of color. The findings offer deeper insights into systemic inequities in property valuation and their role in perpetuating racial wealth gaps, informing future policy interventions aimed at reducing bias in the appraisal process.

Track 6: Housing

Individual Paper Presentation Submission

Salam Lattouf [University of Texas at Arlington] sml6737@mavs.uta.edu, presenting author

Ariadna Reyes Sanchez [University of Texas at Arlington] ariadna.reyessanchez@uta.edu

Past research in the Global North has overlooked the housing issues faced by low-income refugees with limited resources for housing (Brown et al., 2024). Meanwhile, housing literature in the United States has primarily examined disadvantaged communities and people of color, such as low-income African American and Hispanic populations (Rothwell & Massey, 2010; Aiken et al., 2021; Reina & Aiken, 2021). Low-income refugees must navigate the pervasive issue of lack of affordable housing nationwide, which already affects low-income communities and minorities (Aiken et al., 2021). Refugees in the U.S. face multiple housing challenges, including language barriers and limited knowledge of the housing market, which affect their employment opportunities (Noyori-Corbett & Moxley, 2017; Bhattacharjee & Corbett, 2023; Cicek-Okay et al., 2023). Despite their non-citizen status, some refugees, who comply with regulations and are considered "qualified immigrants," can access housing support through different federal programs (McCarty & Kolker, 2023). However, similarly to low-income Hispanic households, refugees and immigrants are often overlooked in housing assistance and homeless programs (Aiken et al., 2021; Reina & Aiken, 2021). Regardless of the goals of the Housing Choice Voucher program in providing access to higher-opportunity neighborhoods for low-income households, findings show landlord discrimination based on income source (Tighe et al., 2017). Although the literature on housing accessibility for refugees is scarce in the United States, we argue that the Arab population in the U.S. is especially overlooked, with limited studies of the Arab refugees' resettlement experiences (Darawsheh et al., 2022; Cicek-Okay et al., 2023).

This study addresses the gap by examining Arab refugees' accessibility to public housing in Dallas County. The research question is as follows: what are the experiences of Arab Refugees' resettlement in accessing public housing in a U.S. metropolitan region? We chose Dallas County because it is a rapidly growing metropolitan area that attracts refugees searching for housing and employment opportunities, and may help investigate their levels of accessibility of public housing, focusing on the challenges they encounter in obtaining adequate housing policy assistance, if any, and integrating into society. This study uses a mixed-methods approach, including GIS mapping of Arab population distribution in Dallas County using ACS data. Our research revealed limitations of the publicly available data for the targeted population. This limitation is associated with the ways in which the U.S. census classifies Arab people who can be identified as Middle Eastern and North African populations, but many of these residents identify as White. This fact, in turn, means that these groups are often neglected and underserved in accessing services that could benefit them (Strmic-Pawl et al., 2018). The map allows the identification of spatial concentrations of Arab populations that may house refugees' families in Dallas County. We supplemented the spatial analysis of Arab refugees with qualitative research, including up to 30 semi-structured interviews with Arab refugees to identify barriers to public housing assistance, including legal status, language barriers, and socio-economic factors. By examining the relationship between housing policy, refugee needs, and social integration, this study aims to expand the literature on housing refugees', particularly with the apparent gap of the underrepresentation of the Arab population in research. Also, to provide actionable recommendations for enhancing housing accessibility policy and encouraging better integration outcomes for refugees in urban areas. In addition, to inform more equitable housing policy for refugees, thus providing planners with insights to support these approaches in Dallas County. Findings may inform housing policy in other counties throughout the Country.

Many U.S. cities are grappling with a recent influx of asylum-seeking migrants while also facing pre-existing, unmet housing needs and growing populations of homeless individuals and families (Colburn & Aldern, 2022; Colburn et al., 2024). While asylum-seeking migrants wait years for their cases to be heard, they typically remain in the U.S. outside of detention but unable to apply to legally work for 150 days after filing for asylum. As a result, many need short-term housing, but cannot pay for it and turn to emergency shelter systems. Previous research has assessed the entry and reentry of families into emergency shelter (Kim & Garcia, 2019) but has not yet determined how migrants and non-migrants differ in their use of emergency shelter. This project explores the following research question: What factors are associated with exiting emergency shelter systems for asylum-seeking migrants and non-migrants?

To answer this question, we focus on Hennepin County, Minnesota, where the family shelter system was estimated at 400 percent capacity as of December 2023 and over half of the families in the shelter system were likely asylum-seeking migrants. Within this context we conducted a mixed-methods research project that included an analysis of administrative data and thematic coding of 40 interview transcripts from migrant and non-migrant adults in families living in emergency shelters between November 2024 and April 2025.

The administrative data included records of migrant and non-migrant families living in the emergency shelter system between January 2021 and May 2024. Using this data, we conducted a survival analysis that assessed factors associated with whether and how quickly migrant and non-migrant families exit the shelter system. Specifically, we examined the relationship between migrant status and shelter exit using Kaplan-Meier estimates of survival times and Cox Proportional Hazard regression analysis. Our results suggest that migrants remain in emergency shelter longer than non-migrants even after accounting for family size and the number of adults in the family. A thematic analysis of interview transcripts indicates that migrants stayed in emergency shelter longer than non-migrants due to their temporary inability to legally work or access support measures (e.g., TANF and SNAP) available to non-migrants. Migrants were also less likely to search for permanent housing opportunities using case managers, instead relying on social media contacts which often failed to provide promising housing solutions. These results help inform local planning responses to support asylum-seeking migrants during a period of federal inaction on comprehensive immigration reform coupled with insufficient support for affordable housing.

Fintech and Traditional Mortgage Lending in California's Wildfire Risk Zones

Abstract ID: 1844.0.0.596.2025

Track 6: Housing

Individual Paper Presentation Submission

Tyler Hauptert [New York University Shanghai] tyler.hauptert@nyu.edu, presenting author

Jesse M. Keenan [Tulane University] jkeen@tulane.edu

As climate risks become increasingly common, a growing body of literature assesses the intersection of climate risks with real estate finance (Contat et al. 2024). Studies find that mortgage credit markets are adjusting to climate hazard risks, and emphasize the importance of soft local information in shaping institutional evaluations of credit risk (Duan & Li 2024). However, to date, a limited body of research has evaluated how mortgage lenders with differing access to local information evaluate and account for the risk of climate disasters during loan underwriting (e.g. Allen et al. 2023), and none has focused specifically on the growing threat of wildfires. Against this backdrop, this paper addresses two fundamental research questions: how have mortgage lenders changed their lending behavior, if at all, in the face of growing wildfire risks in California and do traditional and fintech lenders behave in a manner that suggests an internal capacity to integrate wildfire and climate science data and information into their underwriting and origination processes? These core questions are referenced within the broader concept of 'bluelining,' which suggests that a growing number of mortgage lenders are using a mix of soft and hard information to outline a geography of climate risk that is shaping the availability and pricing of financial services (Keenan and Bradt, 2020).

Following previous work focused on comparing fintech and traditional mortgage lending (e.g. Hauptert 2022) we construct an original dataset categorizing mortgage lenders as fintech or traditional, which is then paired with loan-level data for all loan application in California in 2018, 2019, and 2020 provided by the Home Mortgage Disclosure Act, and wildfire risk measures from the Federal Emergency Management Agency's National Risk Index. We use these data to construct a series of econometric models controlling for an array of applicant, lender, and neighborhood covariates. The models isolate the impact of wildfire risk on the approval rate and interest rate pricing strategies of fintech and traditional lenders.

Results suggest traditional lenders assign significantly greater risk to loans collateralized by homes in neighborhoods at high-risk of wildfires than do fintech lenders, both in terms of loan approvals and interest rate pricing. This may be because fintech lenders, which operate online and lack brick-and-mortar offices and local staff, have less local knowledge on the physical risks posed by wildfires. Alternatively, traditional lenders may be more effectively incorporating climate risk data into their loan underwriting processes. Results further suggest that fintech lenders are actually more likely to approve and assign low interest rates to home loan applications in high wildfire risk neighborhoods relative to neighborhoods with little or no wildfire risk. This counterintuitive finding may indicate fintech lenders are playing an arbitrage role, satisfying consumer demand in areas where the traditional lending market deems climate risk too high. Understanding the variation in risk management techniques between different lenders is insightful for assessing the future availability and pricing of mortgage capital that shapes everything from the relative affordability of housing to long-term fiscal stability of local governments whose tax-bases are compromised by climate impacts, including the growing risk of wildfires. As housing, insurance, municipal bond, and mortgage markets begin to internalize or capitalize risk, there are strong economic incentives for households and local governments to make adaptation and hazard mitigation investments that reduce risk. The apparent lack of climate risk considerations among the rapidly growing fintech lending sector holds important implications for planners making decisions about the suitability of different areas for residential zoning.

Casey Dawkins [University of Maryland at College Park] dawkins1@umd.edu, presenting author

Elijah Knaap [San Diego State University] eknaap@sdsu.edu

Sophie McManus [University of Maryland at College Park] smcmanus@umd.edu

Nicholas Finio [National Center for Smart Growth, University of Maryland at College Park] nfinio@umd.edu

In recent years, the shortage of housing available to accommodate rising housing demand has received substantial attention by scholars, advocates, media, and policymakers (Khater, Kiefer, and Yanamandra, 2021). The YIMBY movement owes its existence to the pervasiveness of this problem. It is widely recognized that one cause of the nation's housing shortage is the scarcity of land available to accommodate housing built at a variety of densities. In recognition of the need to expand the supply of land available to accommodate projected housing growth at different densities over a planning horizon, there is a growing need for simple, back-of-the-envelope methods that planners can use to identify impending shortages of buildable residential land.

Estimates of residential land capacity are generally derived from one of three approaches: (1) Some produce static estimates of buildable land capacity, adjusted for policy-based and geographic constraints, using survey data or local GIS data (Saiz, 2010; Monkkonen, Manville, and Lens, 2024). The main disadvantage of this method is that it is not forward-looking and tends to ignore future housing demand. (2) Others rely on detailed local zoning data to produce "build-out" analyses of what could be constructed under the maximum envelope imposed by current zoning (Conway and Lathrop, 2005). This method also ignores future housing demand and bears no relation to the actual number of homes that would be constructed over a planning horizon. (3) Others rely on sophisticated computable general equilibrium or simulation-based methods to simulate local housing markets over a given time period, assuming land supply constraints are binding during the simulation period (Waddell, 2002). This third method, while more theoretically sound, requires large amounts of local data and sophisticated econometric techniques that are difficult to implement and yield results that are not readily transparent to citizens, creating a "black box" problem when communicating findings to the public.

In this paper, we propose a new approach to forecasting residential land capacity that has the following advantages: (1) It relies on easily accessible public data from the US Census and the National Geological Survey's National Land Cover Database (NLCD) and does not require detailed parcel-level data, (2) It relies on minimal assumptions and transparent back-of-the-envelope methods, allowing planners to open up the "black box" of the methodology to easily account for different urbanization scenarios and development assumptions. (3) It can be easily scaled up or down to produce residential land capacity estimates for small areas as well as cities, counties, regions, states, or the entire nation.

We demonstrate the method using US Census data, the NLCD, and household projections for the state of Maryland. We employ the method to forecast residential land capacity to the year 2045 under alternative housing demand scenarios, replacement housing scenarios, urban density scenarios, and policy constraints. We conclude by discussing potential applications and limitations of the proposed method.

From Paradox to Exploitation: Re-theorizing Latinx/e Housing

Abstract ID: 1844.0.0.794.2025

Track 6: Housing

Individual Paper Presentation Submission

Revel Sims [University of Wisconsin-Madison] revel.sims@wisc.edu, presenting author

Carolina Sarmiento [University of Madison-Wisconsin] carolina.sarmiento@wisc.edu

Scholarship on Latinx/e housing in the United States often begins with what Susan González Baker (1996) described as the “Latino paradox”. That is, despite existing disproportionalities in income and poverty that impact affordability and security, the Latinx/e population tends to be underrepresented among both the unhoused population and housing subsidy programs (Yzaguirre, Arce, and Kamasaki 1999; Aiken, Reina and Culhane 2021; Reina and Aiken 2021). The primary theories that have emerged to explain the departure from expectation in these areas are mutual self-reliance and, to a lesser extent, assimilationism that are assumed to reduce housing insecurity and deter the utilization of housing assistance (Aiken, Reina and Culhane 2021). These analytical perspectives are problematic because they minimize the role of discrimination and present an uncomplicated conceptualization of social factors and their outcomes. For example, as Carrillo, Patillo, Hardy, and Acevedo-Garcia (2016) show, while a reliance on social networks for support during times of crisis may help Latinx/e households secure new housing, the resulting short-distance moves effectively contribute to the maintenance of racial and class segregation.

In order to investigate these questions further, we partnered with a local nonprofit housing services organization and organized a community-based research (CBR) project utilizing intake data to identify potential participants. Thirty-two (32) semi-structured phone interviews in both Spanish and English with tenants in Dane County, Wisconsin were conducted and a hybrid process of inductive and deductive thematic analysis was used to interpret the data. Our results reaffirm the importance of mutual self-reliance among Latinx/e renters for finding housing, however we also uncover evidence of exploitative relationships in the form of poor housing quality and persistent conflicts with landlords and property managers that reveal discriminatory patterns. The results suggest that mutual self-reliance is only a partial explanation at best and that special predatory housing submarkets may also contribute to the “Latino paradox.”

Garden-Style Preservation: Building institutional & informational capacity for housing in MD

Abstract ID: 1844.0.0.405.2025

Track 6: Housing

Individual Paper Presentation Submission

Kathryn Howell [University of Maryland] khowell@umd.edu, presenting author

Chester Harvey [University of Maryland] cwharvey@umd.edu

Nicholas Finio [National Center for Smart Growth, University of Maryland at College Park] nfinio@umd.edu

A common image of suburban housing is one of subdivided single-family communities in which low- and moderate-income households have been largely excluded due to their need for rental housing and more affordable homes. However, as the demand for connected, urbanized neighborhoods both inside and outside city boundaries has increased, the suburbs have become an important source for affordable housing accessible to jobs across a given region. In the Washington, DC suburbs, the Purple Line, a 16-mile transit route opening in 2027, will connect gentrifying, dense suburbs and three lines of the DC Metro System (Finio, 2023). This will create unprecedented transit access to points across the region. However, this new accessibility has also created anticipatory effects on home prices and apartment rents in these relatively dense suburban communities (Peng et al., 2024). To combat this, members of the Purple Line Corridor Coalition have formed the Purple Line Preservation Network (PLPN). Based on the experiences of places such as Denver and Washington, D.C. (Howell et al 2019), the PLPN is a network of housing actors, including public agency staff, advocates, organizers and legal service providers to share data and develop solutions to preserve housing affordability at the building level. Researchers at the National Center for Smart Growth (NCSG) are supporting the PLPN by developing a database of risk factors and a coordinating early-warning tool to identify multifamily buildings that pose a high risk for displacement of affordable housing along the corridor.

The suburbs present unique challenges for the preservation of affordable housing because they have less developed organizational and informational frameworks than many central cities. Howell (2016) argues that successful preservation requires an “ecosystem for preservation,” including buildings to preserve, a network of organizations and data and a policy framework. In the suburbs, organizing is at both a temporal and spatial disadvantage compared to traditional social service organizing in cities (Lung Amam, 2024). Much of the existing affordable housing stock is unsubsidized, given political decisions in the 20th century to block construction of public housing in the suburbs. The existing, aging, garden-style multifamily housing stock is privately owned and extensive cooperation between private owners, nonprofits, and local government is required to preserve affordability. Data on these multifamily properties is scattered across public and private data sources, which must be integrated to paint a picture of need, and predict risk of loss of affordability. We find that, while the policy framework includes county rights of first refusals and local funding, the other elements of a preservation ecosystem were a larger challenge with roots in suburban development patterns.

Our approach to this community-engaged research builds both organizational and informational capacity in the Purple Line’s suburban context. The PLPN convenes agencies with knowledge of opportunities for preservation and the capacity to activate preservation work, such as acquisition of subsidies or properties. NCSG’s database and early-warning tool support this work by merging fractured data on risk factors from multiple jurisdictions and sources and providing recommendations for high-risk properties to review. The early-warning tool is trained initially by theory about how risk factors lead to instability. As the PLPN convenes and refines its list of high-risk buildings, the model is continually trained on this grounded knowledge to provide better recommendations. These

institutional and informational developments help give suburban communities along the Purple Line corridor capacity to preserve affordable housing that is more comparable to their central-city neighbors.

Gentrification and Displacement in Light Rail Corridors – a Case Study of Salt Lake City, UT

Abstract ID: 1844.0.0.1054.2025

Track 6: Housing

Individual Paper Presentation Submission

Justyna Kaniewska [The University of Utah] u1324755@utah.edu, presenting author

Reid Ewing [University of Utah] ewing@arch.utah.edu

To date, there have been very few attempts to quantify or measure displacement and some researchers go so far as to claim that “there are no statistical data available for such a task” (Marcuse, 1985). “Some of the key problems in the measurement of displacement are the lack of comparable data which continues to plague this research area.” (Easton et al., 2020) However, recently, the Consumer Reference Dataset (CRD) produced by Data Axle have been increasingly used in residential mobility studies due to their granularity and comprehensive information related to household characteristics (Diamond et al., 2019; Greenlee, 2019; D. C. Phillips, 2020). In our study, we rely on Data Axle Consumer Data to measure gentrification and displacement within light rail corridors in Salt Lake City, Utah.

The question asked and answered in this paper is whether low-income minority households are being displaced from Salt Lake City’s light rail station areas and if so to what extent. First, we examine changes in a set of socioeconomic indicators (extracted from Data Axle Consumer Data for the years 2015-2022) within the 0.25-mile buffer along TRAX light rail corridors and Salt Lake County in general. Then we measure the number of households moving in and out of the buffer and examine socioeconomic characteristics of each group (also using Data Axle Consumer Data). Secondly, we identify all TOD-like stations in Salt Lake County (with at least two multifamily building within a one-block distance from a TRAX station and some mixed-use development) and conduct a similar analysis for these stations (20 in total). Our study is among very few to use Data Axle to quantify displacement.

When looking at the light rail corridors in their entirety, we found no signs of displacement between 2015 and 2022, that is the households moving out of the corridors were not replaced by higher income white households. In fact, what we noticed is that a large proportion of those moving out became homeowners within one year of moving. Conversely, those moving in are lower-income households attracted by a rental market that is still affordable. Finally, ethnic composition of both household groups was nearly identical for the studied period of time with the share of minority households slowly increasing, also reflecting the general trend in the county and the region.

However, when looking at the TOD-like station areas, we noticed that while almost all of the 20 TOD-like stations experienced a significant growth in both low- and very low-income households between 2015 and 2022 (on average 145% and 134% respectively), the number of extremely low-income households (earning less than 30% of AMI) remained at the same level, although some of the households did relocate between station areas in search of deed restricted affordable units as only such units are affordable to this type of households. Thus, half of the TOD-like stations experienced displacement of extremely low-income households, and the other half of the stations (those with a higher availability of affordable units) experience an influx of such households. The station areas that welcomed the largest number of extremely low-income households are the ones with the largest pool of naturally occurring affordable housing in the form of older apartment buildings.

We also found that disproportionately more extremely low-income households live in TOD-like station areas. While, by default, half of the households living in Salt Lake County earn an income higher than the Area Median Income, the same was true of slightly more than 20% of households living in TRAX corridors in general in 2022, and only 2% of those residing within TOD-like stations (with multifamily housing options). On the other hand, there are

significantly more extremely low-income households residing in the TOD-like stations (64% in 2022) and in TRAX corridors in general (32%), compared to 15% in the county.

Geographic Concentration and Revenue Distribution of Short-term Rentals within Arizona MSA

Abstract ID: 1844.0.0.928.2025

Track 6: Housing

Individual Paper Presentation Submission

Aurora Munoz Casarrubias [Arizona State University] ammunozc@asu.edu, presenting author

The global rise of STRs (STRs) has raised concerns about their impact on housing markets and local communities. Recent studies have correlated the proliferation of short-term rentals (STRs) with a decrease in the supply of long-term rentals, leading to an increase in rental prices. While STRs are mostly concentrated in major cities, new research warns about their expansion to small towns and rural areas. Additionally, international studies have raised concerns about the industry's shift from home-sharing to corporate hosts. Canada's top 10% of rental owners generated the most revenue, and nearly 50% of Airbnb's revenue came from commercial operators. The shift towards corporate ownership could exacerbate the housing shortages impacting local communities. In the United States, little is known about the concentration of STRs, who owns them, and their effects on already disadvantaged communities such as Hispanics.

This research addresses this gap by examining to what extent corporate hosts control the STR market and where STRs are concentrated within the Metropolitan Statistical Areas (MSAs) of Arizona. Arizona has a sizable Hispanic population (32.5%) and record-breaking tourism. Preliminary findings show that small Arizona cities are already experiencing increased corporate host and housing shortages. Using quantitative methods to triangulate data from AirDNA and the Census from 2015 onward, this study answers two research questions: (1) Where are short-term rentals (Airbnb and Vrbo) concentrated, and how is the revenue distributed across different hosts (individual versus corporately) in the MSA of Arizona? (2) What are short-term rentals' longitudinal growth and concentration in predominantly Hispanic vs non-Hispanic neighborhoods?

To answer these research questions, this study employs spatial analysis to identify the distribution of short-term rental listings within the Arizona MSA. The results include maps that show the concentration of short-term rentals, focusing on neighborhood-level granularity and employing a hotspot analysis to identify clusters of short-term rentals within each MSA within Arizona. This research has the potential to significantly impact our understanding of ownership patterns and may reveal an uneven distribution of STRs' economic benefits, affecting local communities, particularly Hispanics. While focused on Arizona, the findings will have broader implications for addressing housing inequalities in other locations that are seeing similar rises in STRs.

Good RAD Gone Bad? Rental Assistance Demonstration and Displacement in New York City

Abstract ID: 1844.0.0.845.2025

Track 6: Housing

Individual Paper Presentation Submission

Yining Lei [University of Pennsylvania] yiningl@design.upenn.edu, presenting author

Launched in 2012 under the Obama administration, the Rental Assistance Demonstration (RAD) program aims to address the unresolved backlog of capital needs in existing public housing. By converting traditional Section 9 public housing into project-based Section 8 housing, RAD seeks to attract private financing, investment, and/or management. RAD can be viewed as an improvement over earlier housing programs, such as the HOPE VI program, which has been criticized for contributing to displacement. As a preservation program, RAD causes far less disruption to residents' lives, making it somewhat less conspicuous. Moreover, unlike HOPE VI, RAD does not mandate rescreening for residents to return.

Transitioning from "tear down to rebuild" to "preservation," RAD's anti-displacement strategies appear promising to residents and housing advocates alike. Yet, there is no evidence showing that RAD stops displacement. Residents can still face the threat of being displaced due to private management under RAD. With New York City, the most active RAD participant in the U.S., as the geographic focus, this study aims to assess whether RAD's anti-displacement strategies are effective. I compare public housing projects that have been converted under RAD against those that have not and ask: Do RAD sites have lower eviction rates than projects remaining under Section 9? I examine this question through an Adjusted Interrupted Time Series approach, using eviction filing data to compare displacement patterns before and after the RAD conversion.

As disadvantaged communities across North America struggle against steeper odds amid a new wave of urban redevelopment, it becomes important to understand the effectiveness of anti-displacement strategies now incorporated into housing programs like RAD and other redevelopment initiatives. Answering the research question would have broader implications for housing and community development and help inform policy interventions that better achieve the anti-displacement goal.

Hidden and Neglected: Lived Experiences of Housing Informality in U.S. Peri-Urban Areas

Abstract ID: 1844.0.0.421.2025

Track 6: Housing

Individual Paper Presentation Submission

Josh Newton [University of California, San Diego] jdnewton@ucsd.edu, presenting author

Ariadna Reyes Sanchez [University of Texas at Arlington] ariadna.reyessanchez@uta.edu

Though typically seen as a problem of the Global South, housing informality is now recognized as a pervasive issue in U.S. metropolitan areas (Reyes-Sánchez et al., 2024). Informal subdivisions, a locus of housing informality in peri-urban and rural communities, face housing and infrastructure precarity, as well as environmental and climate injustices, due to being hidden and neglected by county governments (Herbert et al., 2024). Scholars estimate over 2 million households live in peri-urban and rural informal subdivisions in the U.S. (Durst, 2019). Many live in precarious mobile homes and RVs. Because many of these subdivisions are unincorporated, state interventions are sparse and unevenly applied, and residents are forced to develop their own solutions to housing, infrastructure, and environmental injustices. While much of the literature on informal subdivisions has focused on describing the inadequacies of these communities and mapping subdivisions using big data and geospatial analysis, residents' lived experiences of housing informality and precarity lack attention.

To illuminate resident experiences of housing informality and precarity, we rely on emerging housing informality theory from the U.S. and participatory methods. Recent theory suggests that housing informality is not a binary—informal or not—but rather a continuum based on discontinuities in the relationship between the state and society (Harris, 2017). These discontinuities occur when residents and local bureaucrats individually or collectively act, or not, within housing regulatory regimes—property rights, property transfer, subdivision regulation, land use and zoning, and building codes (Durst & Wegmann, 2017). To understand how these discontinuities occur in informal subdivisions and create precarity for low-income residents, we co-produced participatory action research in an unincorporated subdivision in Dallas County, Texas. We chose to use participatory action research because of its power to co-produce planning knowledge and create more inclusive planning outcomes (Binet et al., 2023). This research included four years of architectural and infrastructural observations, resident surveys and oral histories, photovoice, community-engaged mapping, and resident science.

Through this co-produced research, we illuminate how one informal subdivision moves along a continuum—from latent to diffuse informality (Harris, 2017)—to explain how housing informality manifests and concentrates in peri-urban areas of metropolitan areas. Likewise, we reveal how actions and reactions in regulatory regimes of subdivision regulation and building codes produce manifestations of housing informality, and thus precarious conditions for residents. This includes analysis of how local government bureaucrats catalyze and exacerbate housing informality through selective enforcement and non-enforcement of regulations, as well as de-regulation, and how residents experience and respond to systemic housing and urban development issues through non-compliance with the same regulations.

The implications of this research reveal the “actually existing” nature of the relationship between the state and society, as well as the regulatory regimes in which discontinuities manifest. We also demonstrate how participatory action research produces the depth of data needed to connect theory to real world places. Likewise, we make an intervention in the U.S. literature which has largely used the words precarity and informality interchangeably without delineating the relationship between the two. Finally, we point to the inefficacy of policies pursuing formalization and displacement and demonstrate the need for participatory solutions for housing and infrastructure upgrading for sustainable and resilient communities.

Home Ownership and Reinvestment: A Tale of Two Cities

Abstract ID: 1844.0.0.843.2025

Track 6: Housing

Individual Paper Presentation Submission

Clemens Pilgram [University of Cincinnati] pilgracs@ucmail.uc.edu, presenting author

Gary Painter [University of Cincinnati] paintegd@ucmail.uc.edu

Saani Rawat [University of Cincinnati] rawatsa@mail.uc.edu

We examine whether reinvestment in single-family homes (SFHs) varies by housing tenure and by landlord size in terms of the number of properties owned. This work responds to previous work on how different types of owners differ in their property maintenance (Galster, 1983; Gatzlaff et. al., 1998), as well as to work showing that larger landlords are more likely to “milk” properties for financial returns by avoiding maintenance (Decker, 2023; Rose and Harris, 2022). The latter is particularly topical given the recent increase in prevalence of large – if not institutional – owners of permanent rental single family homes (Ky and Starling, 2023).

Using micro-level parcel data for all single-family homes in Minneapolis, Minnesota (2017–2024) and Charlotte, North Carolina (2004–2023), we link annual tax assessor records with publicly available building permit data to measure how reinvestment and maintenance activity relate to who owns a property, and how they use it. Rental properties are identified via homestead exemptions and mailing addresses, and large landlords are defined based on property-ownership thresholds. Per our regression analysis and after controlling for property and neighborhood characteristics, rental SFHs in Minneapolis file 22% fewer building permits and invest 33% less in permitted work than otherwise comparable owner-occupied units. In Charlotte, rental SFHs file 9% fewer permits and invest 1–2% less in dollar terms. Moreover, homes owned by large landlords – defined as landlords who own 20 or more properties within the metro area - in both cities file 26 to 56% fewer permits and invest 6 to 34% less into their properties than smaller landlords. Further, we find no statistical difference in plumbing permits, suggesting that landlords and large owners will forego proactive reinvestment, but not primarily reactive repair activity. Taken together, these findings suggest that the growing prevalence of rental occupancy and large-scale ownership in the SFH market may lead to diminished reinvestment activity over time, thus increasing depreciation of the overall housing stock. As such, it is necessary for planners and policymakers to consider what policy levers are available to stimulate reinvestment by parties that may not otherwise be inclined to reinvest into existing residential properties.

Housing Market Segmentation and Young Homebuyers' Trade-Offs: Evidence from Singapore

Abstract ID: 1844.0.0.592.2025

Track 6: Housing

Individual Paper Presentation Submission

Minghang Yu [National University of Singapore] minghang.yu@u.nus.edu, presenting author

Cristian Badarinza [National University of Singapore] cristian.badarinza@nus.edu.sg

Kwan Ok Lee [National University of Singapore] kwan.lee@nus.edu.sg

Hau Wei Teng [London School of Economics and Political Science] h.teng1@lse.ac.uk

Central Theme: This study examines how policy-induced housing market segmentation shapes young homebuyers' trade-offs between housing attributes. While prior research has extensively examined price variations across submarkets with different spatial and structural characteristics, limited attention has been paid to how consumers directly respond to policy-driven submarkets classifications. We investigate these responses, particularly latent trade-offs between housing attributes in a dynamic policy context, to enhance hedonic modeling-based insights. Singapore recently restructured its presale public housing (Build-to-Order, BTO) classification system, shifting from a two-tier (mature vs. non-mature) to a three-tier (prime, plus, standard) location-based scheme. This policy change redefines submarkets by bundling locational attributes with varying regulations on minimum occupation period and subsidy recovery when being transacted. We leverage this policy shift as a natural experiment to examine its impact on young-aged adults' homebuying decisions. Given that 80% of Singaporeans reside in public housing flats, we anticipate substantial behavioral shifts among young homebuyers.

Data and Methodology: Our study comprises two main components. First, we leverage the application data for presale public housing flats (Build-to-Order, BTO) and transaction data for resale public housing flats in Singapore from 2019 to 2025 to develop a hedonic model. This model quantifies how trade-offs across public housing attributes, such as location, size and the choice between BTO and resale public housing units, evolve in people's responses to the shifted policy. Second, we draw on data from a nationally representative survey of 506 young Singaporeans aged 21 to 35. The survey was conducted in late 2023 and intended to capture intended housing choices before and after the policy's implementation. We employ discrete choice models to capture latent preference shifts among respondents with different personal particulars.

Findings: Results from application and transaction data show that with the effect of new location segments in the public housing market, preferring plus locations faces fewer trade-offs, while preferring prime locations faces more trade-offs. Besides, we have three results from our survey on young-aged prospective homebuyers: a) People choose different options almost uniformly, which validates the survey design and indicates that respondents end up trading off attributes when stating preferences; b) More people prefer presale (BTO) flats rather than resale flats, and prefer not-advantaged locations (standard, non-mature in pre-policy) than advantaged locations (prime and plus, mature in pre-policy) in the new policy context, showing the effectiveness of such a new policy; and c) The preference switch from mature locations to non-mature locations is driven by moving expectations, while the switch from resale flats to presale flats is led by people's financial constraints (income levels).

Implications to planning practice: Our study is expected to contribute to both academia and public housing policy practices in following aspects: First, we advance the existing literature on market segmentation by analyzing policy-oriented housing segments with quasi-experimental design; Second, we enhance the understanding of housing choices by unpacking the trade-offs among stated preferences on different attributes, supplementing the existing evidence on factors affecting revealed preferences observed in hedonic models; Third, we offer more thorough

evaluations of housing policies by reporting heterogeneous outcomes by personal characteristics, providing important reference for future public housing policy implementations.

Housing Shortages and Metropolitan Well-being when Housing Grows Slower than Employment

Abstract ID: 1844.0.0.952.2025

Track 6: Housing

Individual Paper Presentation Submission

Dowell Myers [University of Southern California] dowell@usc.edu, presenting author

Seongmoon Cho [University of Southern California] seongmoc@usc.edu

Recent public debates and academic research have focused growing attention on housing shortages in the United States, yet there remains substantial disagreement on how to measure the extent of housing shortages (McClure & Schwartz, 2024; McCue & Huang, 2024). National estimates range from zero to over 20 million units, depending on the method employed—whether based on population growth, vacancy rates, or adjusted headship rates (Freemark 2024; Freddie Mac, 2021; Up for Growth, 2024). Each approach carries theoretical and empirical limitations, particularly due to endogeneity between housing supply and the very demographic indicators used to measure need. A gap in the literature is the lack of dynamic, demand-driven measures that capture labor market pressure on housing markets. This paper addresses that gap by proposing and testing an employment-centered metric of housing shortage, based on the differential growth rate between employment and housing supply. An added advantage is ease of understanding by local residents who often resist greater housing production. Unlike other methods, this approach directly captures demand for shelter generated by job growth. While organizations like the National Association of Realtors have begun to track ratios of job creation to building permits, the planning literature has not fully explored how labor market growth outpacing housing supply can reshape housing outcomes in locally undesirable ways.

We compile a panel dataset of 100 U.S. metropolitan areas (2011–2023) using employment data from the Bureau of Labor Statistics, building permits from the Census Bureau, and microdata from the American Community Survey. We construct the delta shortage measure as the difference between three-year employment growth and three-year cumulative permit issuance per occupied unit, lagged by one year. Using fixed-effects regression models, we test the association of this measure with metro-level indicators of housing well-being (e.g., headship rates, mobility, homeownership) and with a novel outcome: worker density per household.

Our findings provide evidence of how job-driven housing shortages shape metropolitan housing conditions. A one percentage point increase in the delta shortage measure is associated with a 0.37 percentage point decline in household formation among adults aged 25–34, a 0.12 percentage point drop in residential mobility among the same group, and a significant decline in homeownership rates among adults aged 35–44, the prime age group for buyers. These results offer a clear empirical validation of the delta shortage measure as a meaningful metric for identifying housing need in the context of economic growth.

We further investigate how housing shortages driven by job-housing imbalance affect the structure of households. Empty-worker households (with no employed members, mostly retirees) decline slightly with greater shortages but are largely explained by aging demographics. Multiple-worker households (with three or more employed individuals) rise sharply in high-shortage metros by “doubling-up” among working adults.

By framing housing need in terms of shelter for workers, this paper reframes the shortage debate in relation to labor market dynamics and planning priorities. In doing so, it also underscores the urgency of expanding housing production not only to improve affordability, but also to prevent constraints on workforce accommodation and regional economic growth. This work contributes to planning scholarship by offering a novel and policy-relevant method for measuring housing shortages—one that is grounded in employment trends and household composition

rather than static assumptions. It encourages a shift in housing policy discourse toward labor-aligned housing planning, with implications for zoning, regional growth strategies, and infrastructure investment.

Housing, Rent Control, and the Slow-Growth Movement in Cambridge MA

Abstract ID: 1844.0.0.1141.2025

Track 6: Housing

Individual Paper Presentation Submission

Julan Hartman [Cornell University] jh2853@cornell.edu, presenting author

Housing in Eastern Massachusetts is a topic which has garnered increasing attention from the public and policy makers in the past several years, with the passage of the MBTA communities act which seeks to induce housing production in suburban towns, the state's first housing production plan, and the recent elimination of single family zoning in Cambridge. But the housing crisis is not new in Eastern Massachusetts, with debates over what to do about the rising cost of housing in Cambridge extending back into the 1960s. This paper examines debates over housing densification, zoning, and rent control between 1960 and 2020 in order to answer the question of how Cambridge went from growth restriction to eliminating single family zoning.

Growth machine theorists have asserted that the slow-growth coalition has not had a significant effect on urban development in the United States (Molotch, 1993), but recent research has argued that anti-growth movements have had the effect of preserving built environment of a small town while accelerating gentrification, especially in university towns in large metro areas (Anbinder, 2023; Winling, 2018). I argue that in Cambridge, slow-growth movements have had a significant effect on the town.

In alliance with homeowners and environmentalists, tenant movements were successful in slowing housing construction but unsuccessful in stopping the growing dominance of universities and R&D-oriented industry, which homeowners generally supported. The success of radical movements in opposing growth in housing, combined with their failure at inducing changes to the political economy of the region, created conditions for YIMBYism to succeed. Struggles over rent control in the 1970s were also acute, and the design of Cambridge's rent control policy also contributed to gentrification.

My research is through a mixed-methods qualitative approach. I conducted interviews with Cambridge residents who have been involved in pro and anti-growth coalitions over the course of the past decades, analyzed local policy documents from the past 60 years, and drawn on archival materials of tenants' movement coalitions and public debates about housing. These findings will help scholars and policymakers understand what factors and political dynamics have led to changing approaches in the urban governance of housing production.

How Do Low-Income Housing Tax Credit (LIHTC) Residents Travel? Findings from the Chicago Area

Abstract ID: 1844.0.0.1036.2025

Track 6: Housing

Individual Paper Presentation Submission

Kyuhyun Lee [University of Illinois, Urbana Champaign] klee181@illinois.edu, presenting author

Transportation challenges within the LIHTC program—Low-income individuals often lack reliable mobility options, which exacerbates transportation insecurity, economic instability, and employment precarity. Households supported by the Low-Income Housing Tax Credit (LIHTC) program are particularly susceptible to these challenges. The program predominantly serves socially and economically marginalized populations, including extremely low-income families, older adults, people of color, and individuals with disabilities. These groups are frequently categorized as transportation-disadvantaged, unable to meet essential travel needs due to limited access to transportation. While the LIHTC program's primary goal is to address affordable housing needs for low-income families, ensuring adequate access to transportation must also be integrated into the policy discussions.

Understanding the travel behaviors of LIHTC residents is a fundamental step in addressing their transportation needs. However, there is a significant research gap regarding how low-income families living in LIHTC properties meet their everyday travel demands. This gap persists largely due to the absence of suitable data resources. Travel patterns are typically captured through household travel surveys, yet there is currently no systematic survey dedicated to the LIHTC program, nor have the LIHTC administrators collected such data. These knowledge and data deficiencies hinder the development of tailored transportation policies, forcing reliance on generalized findings from broader studies on low-income populations.

Research Questions—By leveraging existing household travel survey data (2018-2019) from the Chicago metropolitan area, this research addresses the following questions:

1. How do low-income individuals living in LIHTC housing travel?
2. Are their travel patterns significantly different from other low-income populations living in non-LIHTC housing?

Methods—I first identified LIHTC-assisted households among survey respondents by matching their home addresses to LIHTC property addresses from the Department of Housing and Urban Development's database. After determining each participant's LIHTC status, I compared trip-making patterns between LIHTC and low-income non-LIHTC residents, using descriptive statistics and Coarsened Exact-Matching (CEM) to account for confounding factors influencing travel behavior.

Findings—The findings reveal that LIHTC residents are more likely to belong to socioeconomically marginalized groups—such as unemployed individuals, older adults, people of color, individuals with disabilities, and non-drivers—and are even more marginalized than their low-income counterparts. This heightened marginalization translates into suppressed travel behaviors, including making fewer trips and a greater tendency to remain at home. Notable differences also emerged in mode shares and trip purposes: LIHTC residents relied more heavily on public transportation and ride-share services compared to their non-LIHTC counterparts. Additionally, LIHTC residents exhibited a higher frequency of healthcare-related trips, which was significant even after controlling for confounding factors (e.g., income, age, disability status) in the CEM analysis.

Planning implications—These findings carry important planning implications for housing authorities, particularly in Illinois and potentially in other states. Given LIHTC residents' limited access to personal vehicles and heavy

dependence on public transportation, it is essential to situate LIHTC properties in neighborhoods with robust transit infrastructure. Furthermore, transportation solutions for these communities should consider the complex mobility barriers created by their heightened marginalization. The high demand for healthcare-related trips also underscores the need to prioritize proximity to healthcare services during tax credit allocation processes.

How Municipalities Can Scale up Non-Market Housing for Lower-Income Households: Canadian Case Study

Abstract ID: 1844.0.0.576.2025

Track 6: Housing

Individual Paper Presentation Submission

Elizabeth Ballantyne [University of British Columbia] elizabeth@ballantyne.com, presenting author

Despite a growing consensus that the private sector cannot meet the housing needs of low-to-moderate-income households, current policies and financial support for non-market housing in the U.S. and Canada are inadequate for generating sufficient units to meet the need. The stock of non-market housing across North America is among the lowest across peer OECD countries at only 3.5% of total dwellings (Young, 2023). This deficiency is manifested visibly at the municipal level in expanding homelessness, and less visibly in increasing evictions and an exodus of households in search of affordable housing options. These trends have serious social and economic impacts at local, regional and national levels.

Municipalities have a long track record of collaborating with community housing sector groups to facilitate affordable housing solutions along the spectrum from homeless shelters to below-market rentals. Many cities have adopted proactive measures to expand this supply, such as Seattle's workforce social housing tax levy and San Francisco's right of first refusal for non-profit organizations to purchase at-risk affordable rental properties. In Canada, Montreal's 20/20/20 inclusionary zoning mandating a proportion of non-market and below-market rentals in projects and Vancouver's purchase of private single-room-occupancy hotels for operation by non-profit organizations at social assistance rates. However, even by combining municipal ingenuity and creativity with increased funding and policy tools from senior governments, only small numbers of non-market units are being generated annually, and it is unclear how municipalities might substantially expand the supply of non-market housing.

This research seeks to identify pathways to scaling up non-market housing by combining an analysis of key documents proposing reforms to Canada's housing system with key informant interview in four British Columbia (B.C.) municipalities. These four municipalities capture a range of city sizes and institutional capacities as well as a breadth of geographic, demographic and housing contexts, allowing for comparative lessons to be drawn from across the cases.

The first stage of the methodology involved reviewing the policy literature on housing reform in a thematic analysis, identifying key ideas for expanding non-market housing that could significantly enhance existing municipal capacity. This analysis identified five themes among the proposals for how to improve Canada's housing delivery system: 1) Embed a rights-based approach in housing policy; 2) Convene allies, enter into coalitions, and collaborate with peer and senior governments to establish equitable housing as planning norm; and 3) Expand the legal and historic urban land stewardship role to facilitate a land strategy based on a vision for equitable housing; 4) Increase capacity for leadership and creativity in non-market housing provision by applying lessons from leadership and policy innovation in areas such as climate change and social procurement; and 5) reconceptualize housing as core social infrastructure.

In the second stage of the research, key informants engaged in non-market housing policy and delivery in four cities in southern B.C. were selected for semi-structured interviews to obtain perspectives on: 1) successes and challenges of delivering non-market housing and opportunities for significant expansion of supply; 2) the relevance to their own work in non-market housing of the five themes identified in the policy literature review; 3) specific

strategies they consider to have the potential to substantially increase the proportion of non-market housing; and 4) barriers to expanding non-market housing supply and how they might be overcome.

The analysis of the findings will provide insights into how municipalities can build on their existing capacity and experience to scale up the delivery of non-market housing.

Innovative Housing Solutions: Shanghai's "Aging + Rental" Policy for Inter-generational Integration

Abstract ID: 1844.0.0.1066.2025

Track 6: Housing

Individual Paper Presentation Submission

Wei Zhao [School of Architecture and Urban Planning, Tongji University] zwunion@tongji.edu.cn, presenting author

Central Theme - The study explores Shanghai's pioneering "Aging + Rental" policy aimed at mitigating housing mismatches between older adults and young people through strategic bulk rental arrangements. This policy reallocates aging housing in central areas to newer suburban developments, enhancing living conditions and fostering intergenerational integration and urban renewal. The research analyzes the outcomes of policy implementation, resource reallocation effects, and its broader implications for optimizing future housing policies.

Approach and Methodology - Employing a mixed-methods approach, the study integrates policy analysis with empirical research. Data collection spanned 14 pilot neighborhoods in Shanghai, utilizing participant interviews and policy effectiveness assessments. The analysis focuses on the policy's impact on housing supply-demand alignment, improvements in living experiences, and social integration, alongside its long-term effects on market stability and social equity.

Key Findings - Findings indicate the policy effectively addresses short-term housing needs for both older adults and young residents, improving convenience and environmental quality. However, challenges such as social isolation, weak community bonds, and policy sustainability concerns persist. Older adults experience limited integration into new communities, while young residents report parking issues and low neighborhood interaction. Long-term social effects, especially in reducing social segregation and fostering intergenerational coexistence, require further exploration.

Relevance and Implications - The study provides empirical insights into innovative housing policies addressing supply-demand imbalances in metropolitan areas. It underscores the potential of rental market reforms to optimize housing resources and promote social equity. The policy's experiences offer valuable lessons for urban planners and policymakers globally, highlighting the necessity of balancing immediate housing solutions with long-term social integration objectives.

Locating a fiscal funnel in the rental market: Racialized geographies of 1031 exchange in Memphis

Abstract ID: 1844.0.0.965.2025

Track 6: Housing

Individual Paper Presentation Submission

Michael McCanless [University of Kentucky] michael.mccanless@uky.edu, presenting author

This paper conceptualizes the IRS tax code as an urban infrastructure that funnels capital into cities in vitally important ways. By examining how local actors and dynamics (Weber, 2010) shape the practice of housing financialization (Fields & Raymond, 2022), I situate the tax code—particularly the 1031 exchange—within a fiscal geographic framework that shows “the specific ways that states – at all scales – are actively shaping [financial] processes through tax and other budgetary systems” (Tapp & Kay, 2019: 1). The 1031 exchange generates substantial liquidity across U.S. real estate, with estimates from Ernst & Young showing that over 500,000 exchanges occurred between 2008 and 2017, transferring approximately \$1.6 trillion in real estate assets.

Building on this framework, I argue that the IRS’s 1031 capital gains deferral program has created a ‘fiscal funnel’ in Memphis, Tennessee—the nation’s largest “turn-key” rental market—where large, local property management networks acquire, rehab, sell, and manage properties for a diverse range of clients, including institutional investors and affluent retail investors from coastal markets.

Using a dataset of computationally linked property ownership (An et al., 2023) and interviews with turn-key executives, I argue that deferred capital gains have created a ‘fiscal funnel’ within Memphis’s rental market. This funnel links proceeds from property sales in high-cost coastal markets with investment sites in Sunbelt and Rustbelt cities. Two interrelated factors drive this phenomenon. First, the overvaluation of housing in coastal markets enables retail investors to make cash purchases in many Midwestern and Southern housing markets. Second, the undervaluation of properties in these regions creates conditions conducive to cash-flow investments, where retail investors often prioritize passive income over long-term property appreciation. In this context, turn-key operators channel 1031 exchanges into cities with significant racial appreciation gaps (Markley et al., 2020), exploiting artificially deflated property values to generate passive income for retail investors, primarily from California.

Ultimately, this paper provides evidence that retail investors—facilitated by property management networks and the IRS tax code—collectively operate in Memphis at a scale and scope typically associated with corporate landlords. In some areas, this combination of management networks and tax programs has enabled turn-key properties to far exceed the portfolios of Memphis’s corporate landlords. Thus, this research offers a framework for understanding how the contours of the U.S. tax code become spatialized in neighborhoods across the country, bringing together and consolidating unlikely actors in the process of housing financialization.

Location, residents, and owners: An in-depth analysis of Canada's Manufactured Home Communities

Abstract ID: 1844.0.0.733.2025

Track 6: Housing

Individual Paper Presentation Submission

Cloe St-Hilaire [University of Waterloo] csthilai@uwaterloo.ca, presenting author

Martine August [University of Waterloo] martine.august@uwaterloo.ca

Manufactured home communities (MHCs) or land-lease communities are a small segment of the housing market yet considered essential for its contribution to affordable housing provision (Durst et al., 2019). These communities typically own the housing structure but rent the land on which it sits (Formanack, 2020). In the United States, MHCs are the homes of various precarious and/or marginalized populations, including seniors, lone-parent families, and immigrants (Formanack, 2018). Researchers have studied the precarious legal ground on which MHCs rest (Ly, 2018), and the struggles MHC residents have had to deal with in relation to mass evictions (Sullivan, 2017) and stigma (Sullivan et al., 2022).

Even though there are 190,000 households living in movable dwellings in Canada (including MHCs), little research is available on MHCs in the country (Kremarik & Williams, 2001; Lund, 2021). Yet, critical events influencing the stability and affordability of MHCs are occurring in Canada and requires further scrutiny. In recent decades, multiple MHC closures have raised concerns about residents' rights to remain and the precarity of MHC living (Lund, 2021). Recent MHC sales onto the hands of financialized landlords have been flagged in relation to potential evictions and rent increases. Lastly, the rise of the appeal of manufactured housing construction in policy and the media requires further reflection on the role MHCs play in providing affordable housing to Canadians.

In this paper, we present the first country-wide account of MHCs in Canada. We answer the following questions: Where are MHCs located in Canada? What are their size and socio-demographic composition? How have MHCs been perceived by Canadian media and policy? Who owns MHCs in Canada? How has the ownership profile of MHC owners changed in recent decades, and how does it relate to housing financialization?

The methods for our research are separated in three parts. First, we used a mixed method approach to localize and count Canadian MHCs combining news articles, industry webpages, Google Maps satellite images, and census data cross-validation. This enabled an exhaustive account of MHCs, including their location and their size, along with a socio-demographic portrait of areas where MHCs are located. Second, we conducted a scoping review of news media to provide a synthesis of the topics related to MHCs, using thematic coding to quantify the main themes surrounding MHCs in the media, including the experiences of MHC residents. Lastly, we analyzed the ownership of MHCs using an investigative analysis combining corporate reports, ownership records, and sales transactions, focusing on financialized landlords having acquired MHCs.

We find that MHCs are of larger size in New Brunswick, Alberta and Ontario, whereas British Columbia has the most MHCs, but tend to be smaller. Quebec is the province with the higher share of municipally owned MHCs. In the media, main topics surrounding MHCs pertain to infrastructure quality, rent increases, and park closures and evictions, speaking to the main challenges MHCs residents face. As a financial asset, MHCs have been discussed as a sought-after product for investors given its stable returns in part due to the lower turnover rates of its residents and the growing affordability concerns making MHCs a suitable option. As a result, financial landlords have acquired large amounts of MHCs primarily in Ontario, the Maritimes, and Alberta, leading to concentrating MHC ownership in those provinces. We conclude by stressing the importance of monitoring MHCs across Canada and highlighting how land use, zoning, and laws contribute to the precarity of MHC residents across the country.

Medicaid Pathways to Housing for Adults with Serious Mental Illness in Arizona

Abstract ID: 1844.0.0.674.2025

Track 6: Housing

Individual Paper Presentation Submission

Atticus Jaramillo [The University of Arizona] atticus@arizona.edu, presenting author

Darin Jin [The University of Arizona] daehyunj@arizona.edu

Joy Kuhlo [The University of Arizona] jkuhlo@arizona.edu

Maia Ingram [The University of Arizona] maiai@arizona.edu

Arlie Adkins [The University of Arizona] arlieadkins@arizona.edu

The 2010 Affordable Care Act (ACA) created new opportunities for state Medicaid offices to provide intensive care coordination to high-cost, high-need beneficiaries with chronic physical or mental health challenges (NASHP, 2021). Across the nation, states are increasingly using these opportunities to coordinate housing-related services for low-income adults with “serious mental illness” (SMI), an official designation given to people with chronic mental health challenges that limit their ability to function in daily life (Kleinman et al., 2017; Silberberg et al., 2024). Limited research, however, has explored the challenges states face in implementing and sustaining these initiatives.

This study highlights implementation challenges that, if left unaddressed, could curb the effectiveness, reach, and long-term sustainability of Medicaid housing initiatives. We do so by evaluating the implementation of Arizona’s Housing and Health Opportunities (H2O) initiative. This initiative uses some of the opportunities created by the ACA to fund specialized housing-related services for adults with SMI who are at risk of or experiencing homelessness. Launched in October 2024, the services funded through H2O range from proactive street outreach to home modification financing to transitional housing services with case-management. By 2026, Arizona’s Medicaid office will decide if H2O should be continued and, if so, what modifications are needed to sustain the initiative going forward.

Since H2O’s launch, we have conducted recurring in-depth interviews with over 20 “frontline” workers involved in implementation, including high-level administrators, housing specialists, case managers, and clinical mental health therapists. In addition to asking about general implementation challenges, we have focused our interviews on workforce challenges in light of prior research that highlights staff burnout and turnover as challenges for initiatives like H2O (Fletcher et al., 2022; Kertesz, 2017). Through our initial interviews and qualitative analysis, we identified key implementation challenges and, as an ongoing research project, we will continue our interviews to learn about how, if at all, these challenges are being effectively addressed.

Our initial evaluation findings highlight four key challenges. First, vertical collaboration between high-level administrators and on-the-ground housing specialists and clinicians has been a challenge. Second, H2O’s complex eligibility determination and expense reimbursement processes have proven difficult to navigate. Third, partner organizations providing direct services to H2O clients do not have enough staff to fully support the initiative, and they are reluctant to hire more staff due to concerns about future funding availability. Fourth, existing federal statutes make it challenging to seamlessly transition H2O clients from state-funded transitional housing to long-term housing assistance provided by the Department of Housing and Urban Development. Currently, the state of Arizona’s Medicaid office is working to address these issues through program reforms and enhanced technical assistance, and in the coming months and years these efforts may help illuminate best practices for implementing Medicaid housing initiatives.

More than Shelter: Tenant Organizing for Livable and Healthy Housing

Abstract ID: 1844.0.0.864.2025

Track 6: Housing

Individual Paper Presentation Submission

Mimi Hutchinson [University of Texas at Austin] mimi.hutchinson@utexas.edu, presenting author

Drew Yearwood [The University of Texas at Austin] ddy283@my.utexas.edu

Alex Karner [The University of Texas at Austin] alex.karner@utexas.edu

The share of renters is growing in the United States, as is the share of households spending more than 30% of their income on rent. Yet, the precarity of renting extends well beyond financial strain. For example, many renters reside in poorly managed and maintained homes but lack the political power to initiate reform. Our research examines how this combination of substandard housing and marginalization results in poor health outcomes, particularly for racialized and low-income renters. Conversely, we also analyze the health benefits of renter empowerment, namely those experienced by renters who are involved in tenant organizing.

Our research has two key aims: first, to establish clear links between housing and health in Austin, TX, and second, to uncover how tenant organizing improves renters' health vis-à-vis more livable housing conditions. To achieve these aims, our study combines qualitative information from tenant focus groups with quantitative data from surveys and indoor environmental quality (IEQ) sensors. Through these data streams, we gather (1) information about tenants' views on organizing; (2) accounts of specific health issues tenants experience and how they relate to their housing conditions; (3) insights into rental ownership and management practices; and (4) objective measures of indoor living conditions.

At this point in our research timeline, we have conducted two out of an anticipated four focus groups with Austin tenants; all participants are involved in organizing in some capacity. Preliminary findings reveal strong links between housing quality and health outcomes. Tenants have thus far reported a range of both housing quality and housing management characteristics, as well as accounts of how these characteristics impact their physical and mental health.

Prevalent housing quality and management characteristics include thermal discomfort, the presence of mold, deceptive repairs, and lack of or restriction on communal gathering space. Participants say these factors contribute to adverse health outcomes including anxiety, respiratory illness, elevated blood pressure, and loneliness. In contrast, participants have reported that engagement with tenant organizations serves as an antidote by facilitating social connection and offering solutions to housing disrepair. Additionally, data from IEQ sensors in participants' homes has shown that indoor particulate matter and humidity measurements often linger at unhealthy levels and correspond with some of residents' self-reported symptoms.

To advance this research, the next step involves finishing the collection and analysis of IEQ and survey data from at least 25 additional homes in Austin. Subsequently, qualitative data from focus groups will undergo thematic coding, while quantitative data from surveys and IEQ sensors will be modeled using standard regression techniques. Data visualizations will also be prepared.

Our work presents implications and opportunities for planning research. First, it draws attention to the link between housing and health. In housing literature this connection is often overshadowed by issues of affordability and displacement, though they are closely related. Second, our work further legitimizes tenant organizing as a mode of changemaking, especially for racialized and low-income residents who have been overlooked by more

institutional approaches to housing reform and health promotion. Third, we expect that our work will elucidate pathways for planning scholars to better support tenant organizations and renter wellbeing through research.

New Waves of Neighbourhood Disruption: Airbnb, Student Housing, and Local Rental Market Impacts

Abstract ID: 1844.0.0.378.2025

Track 6: Housing

Individual Paper Presentation Submission

Parian Hoseini [University of New South Wales] p.hoseini@unsw.edu.au, presenting author

Hal Pawson [UNSW] h.pawson@unsw.edu.au

Laura Crommelin [UNSW] laura.crommelin@unsw.edu.au

Regardless of geography, private rental housing markets are shaped by diverse supply and demand factors, alongside policy interventions. In global cities like Sydney, part of this demand originates from overseas, reshaping residential neighbourhoods through what has been termed 'transnational gentrification'. Users of platforms like Airbnb and international higher education (HE) students—both strongly represented in Sydney—are globally recognised examples of such forces. Notably, unlike many comparator cities, concentrations of Airbnb and international student tenancies significantly overlap in Sydney's eastern and inner suburbs.

While Airbnb's impact on rental affordability and availability has attracted substantial academic attention since the late 2010s, the rental market impacts of international HE student demand has only recently re-emerged in Australian academic, media, and policy debates. This follows a post-COVID rent surge, with claims that student renters are a key driver of inflation.

This paper presents findings from a PhD project examining how Airbnb and student private tenancies contribute to rent pressures in Sydney's private rental market. The project adopts a mixed-method case study design across three different inner-Sydney neighbourhoods: Bondi, Chippendale, and Kensington. These sites were selected to reflect varying intensities of Airbnb activity and student tenancies either in mainstream private sector or in form of Purpose-Built Student Accommodation (PBSA). Bondi represents a high-density Airbnb suburb; Chippendale, a hub of private student tenancies; and Kensington, a mixed site with both relatively pronounced representation of both submarkets, with a substantial and growing stock of PBSA, including on- and off-campus developments.

By tracing these dynamics across the three case studies, the research demonstrates the value of disaggregated, neighbourhood-level analysis in revealing how rental market pressures unfold on the ground. It highlights the limitations of relying on citywide indicators and argues for more scale-sensitive approaches to inform effective policy.

NIMBYism and Workforce Housing in Tourism-Dependent Communities

Abstract ID: 1844.0.0.38.2025

Track 6: Housing

Individual Paper Presentation Submission

Misun Hur [East Carolina University] hurmi@ecu.edu, presenting author

Emily Yeager [East Carolina University] yeagere18@ecu.edu

Caramia Landis [East Carolina University] landisca23@students.ecu.edu

Kylie Tannenbaum [East Carolina University] tannenbaumk20@students.ecu.edu

Dare County, North Carolina, stretches along 110 miles of the Outer Banks coastline, is a premier U.S. tourist destination, with visitor spending reaching \$1.97 billion in 2023. Tourism directly supported 12,030 jobs (45.5% of local employment), underscoring the county's economic dependence on the industry. However, the county faces a persistent affordable housing shortage, exacerbated by a predominance of single-family detached homes (78.8% of occupied units) and the rapid expansion of short-term rentals. As a result, median home values have nearly doubled in a decade, rising from \$264,563 in 2014 to \$508,528 in 2024—far exceeding the affordability threshold for the local workforce.

In 2024, Dare County secured funding to develop essential and workforce housing projects, including up to \$12 million through a public-private partnership and \$35 million in non-recurring state funds. However, the county ultimately returned both funds. While several factors contributed to this decision, a strong resident opposition—commonly referred to as Not in My Backyard (NIMBY) sentiment—played a significant role.

Prior research has documented NIMBY opposition to various developments, including human service facilities, waste facilities, unwanted activities, and compact development. However, NIMBYism towards affordable housing is not driven by a single motivation; concerns range from property value declines to decrease public service quality, poor aesthetic qualities, increased traffic volume, and parking, reluctance in the socioeconomic mix, and the increased density in the area. Monkkonen and Manville (2019) pointed out that opponents “cycle through a catalog of objections.”

This study examines two key questions: (1) To what extent does NIMBY opposition influence workforce housing development, and which specific concerns have the greatest impact? (2) Does the effect of NIMBYism vary based on participants' ties to the local community?

An online survey distributed via local government websites, social media, news outlets, and the Outer Banks Visitors Bureau has received 849 responses as of March 2025 (data collection ongoing). Respondents evaluated their overall support for workforce housing, 13 NIMBY-related indexes in the context of workforce housing, their satisfaction with current housing in the community, perceived urgency for workforce housing, and several socio-demographic questions. Statistical analyses included factor analysis, generalized linear model (GLM), and regression analyses.

Factor analysis grouped the 13 NIMBY indexes into three core dimensions of NIMBY opposition: (1) Perceived Community Disruptions, (2) Socioeconomic and Workforce Impact, and (3) Infrastructure and Traffic Concerns. All three NIMBY factors negatively influenced the support for workforce housing, with Perceived Community Disruptions emerging as the most substantial deterrent. Notably, support levels varied significantly by respondent type—resident homeowner, renter, worker, property owner, business owner, and visitors.

Given the pronounced impact of aesthetic and community-character concerns (variables in the Perceived Community Disruptions NIMBY factor), policy solutions should prioritize housing models that integrate seamlessly into existing neighborhoods. Strategies such as accessory dwelling units (ADUs) and incentivizing short-term rental conversions to long-term rentals may prove more politically viable than large-scale developments. These findings have broader implications for communities across the U.S., including both tourism-dependent regions and urban areas grappling with opposition to infill housing.

Nomadic Embeddedness: Understanding the Atypical Housing Pathways of Digital Nomads in Dali

Abstract ID: 1844.0.0.1117.2025

Track 6: Housing

Individual Paper Presentation Submission

Song Han [Tsinghua University] hs18thu@gmail.com, presenting author

Ni Yan [Tsinghua University] yannimail2024@gmail.com

Zhengxu Zhou [Tsinghua University] zhouzhengxu@mail.tsinghua.edu.cn

The burgeoning phenomenon of digital nomadism is reshaping traditional notions of work and residence. Embracing remote work and a mobile lifestyle, digital nomads often move beyond conventional housing markets. While extensive research has explored the work and lifestyle of digital nomads, housing practice—the anchor of this lifestyle—remain underexplored.

This research seeks to investigate the atypical housing pathways of digital nomads in Dali, China, a city increasingly recognized as a key hub for mobile creative class in China, addressing the following three progressive questions: 1) What core features characterize the atypical housing pathways of digital nomads in Dali? 2) What decision-making mechanisms drive such pathways? 3) How do such pathways further influence the housing market and community dynamics in Dali?

Methodologically, this research employs a mixed-methods approach, using Dali Old Town and surrounding villages as case study sites. Quantitative data is collected through questionnaires distributed to digital nomads, focusing on housing preferences, decision-making processes, and living experiences. The empirical identification and analysis of housing pathways are achieved using multiple-sequence analysis and cluster analysis, supplemented by qualitative data from semi-structured interviews with digital nomads, co-living space operators, and local agents. Interviews explore housing decision-making processes, living experiences, and responses of local stakeholders. Additionally, the analysis of online platforms including Trip.com and digital nomad community will provide insights into market responses and the living experiences of digital nomads.

The research reveals that digital nomads construct atypical housing pathways characterized by mobile short-term rentals, mixed-use spaces, and community-oriented co-living. The study further uncovers the interplay of economic, cultural, and social factors, as well as the opportunities and constraints imposed by the drivers, that propel young individuals to adopt such atypical housing pathways. Notably, emotional factors play a crucial role in the long-term evolution of digital nomads' housing decisions. A sense of belonging to Dali motivates over one-third of digital nomads to transition from mobile short-term rentals to longer-term "bases" or even semi-permanent leases, while the housing pathway featuring co-living spaces also significantly contributes to the formation of this sense of belonging.

The rising of digital nomads brings about rapid growth of short-term rental and co-living spaces in Dali, particularly in areas favored by nomads such as the Old Town and around Erhai Lake. Residential differentiation is evident among digital nomads, with newcomers concentrating in areas with well-established facilities and a strong community atmosphere, while established nomads may disperse to villages with a more local feel, which has differentiated impacts on the social dynamics of different areas. While current impacts on Dali's housing market remain moderate, without significant rent increases or conflicts with local residents, this study emphasizes that the growing digital nomad influx necessitates scholarly and policy attention to potential fissures—including enclaving, spatial segregation and gentrification.

Integrating mobility into housing research, this study provides empirical evidence on the housing practices of a large and growing high-mobile population, revealing how mobile residents shape urban spaces and social dynamics. The findings offer valuable reference for cities experiencing an influx of digital nomads, helping them to incorporate the dynamics of mobile labor and their housing needs into urban planning and housing policies. Furthermore, this research underscores the need to better integrate the dynamism and entrepreneurship of digital nomads into local community development, addressing potential conflicts between digital nomads and local residents.

Population Change and the Housing Stock Dynamics in Post-Socialist Cities

Abstract ID: 1844.0.0.529.2025

Track 6: Housing

Individual Paper Presentation Submission

Irina Golovitskaya [Massachusetts Institute of Technology] irinasg@mit.edu, presenting author

As global politics and economies shift, numerous cities face potential shrinkage. Historically, urban development has been guided by the goal of growth and shrinkage was viewed as an unintended outcome of political and economic factors. Reasons for shrinkage vary widely, including deindustrialization, political transformations, and climate conditions among many others. As the population declines, housing and neighborhood infrastructure become excessive and get vacated and abandoned. This leads to changes in the built environment, challenges management, and reshapes urban experiences. Decline materializes itself differently depending on the context, the historical legacies, and forms of governance.

The various effects of the decline of populations on the built environment are extensively researched in the context of North American cities. It was noted, that cities decline much faster than they grow, and that housing stock decline with a significant time lag from the population decline. Also, housing typology matters in the process of losing the housing stock in shrinking cities. Thus, detached single-family houses seem to be the most vulnerable category that gets ruined faster than other types — such as attached single-family homes, row houses, and multi-family units. However, North America's built environment—shaped by capitalist development—is characterized by a predominance of single-family homes and low-rise multi-family houses. By comparison, in the former Soviet Republics, as well as the countries of the former Eastern block, the housing stock is dominated by the large-scale housing project and mass-manufactured housing blocks of 5 and later 9 storeys. Given all mentioned above, this study aims to explore how Russia's urban environment, which is influenced by Soviet-era legacies, and inherited and mass-produced Soviet housing blocks responds to a change in population. It also asks if there is a correlation between the population decline and the loss of durable housing stock, and examines how large-scale dynamics are affecting different localities.

The main research question of this study is the following: in the context of Russia, does population decline result in a corresponding reduction in housing stock? If so, how does it affect both the quantity of housing and its quality—where housing quality is defined as the ratio of dilapidated units to the total housing stock? Using the state data on population, housing stock, dilapidated housing, and the estimates of the average size of the household in all municipalities across the country this study seeks to uncover the relationship between these three variables. Descriptive statistics, in conjunction with regression analysis, are applied to uncover potential linear relationships.

The secondary research question is asking if a country-scale quantitative study like the one outlined above in the context of limited data availability can provide actionable insights for policy interventions. What can this data tell us about shrinkage in post-Socialist cities where the housing stock is mostly comprised of the mass manufactured multi-family housing?

The foreclosure crisis of 2007 to 2009 significantly impacted long-term economic and social dynamics, notably increasing rentership rates and the number of single-family rental (SFR) properties. Previous studies have explored the links between high foreclosure rates, neighborhood demographics, and the rise of SFRs (e.g., Immergluck 2018, Pfeiffer et al. 2020, Charles 2019). However, there is limited understanding of the specific pathways that individual properties follow into the rental market, which is crucial for grasping the origins of the SFR stock and its effects on housing market dynamics. In this study, we address the following questions: What ownership pathways do properties take before and after foreclosure events? How do these pathways vary over time and among different owner types (e.g., small, medium, and large investors, REITs, and Private Equity firms)? How do these variations explain changes in SFR concentration and conversion over the past two decades? To investigate these questions, we conduct a quantitative analysis of foreclosure auctions in two metropolitan Minnesota counties from 2005 to 2023, utilizing annual parcel-level administrative data, neighborhood demographic data, and a novel ownership dataset. We employ both descriptive and inferential analyses, examining foreclosure and ownership pathways at the property level, spatial shifts in the SFR market, and ownership outcomes for properties that experienced foreclosure versus those that did not through a difference-in-differences style setup. Additionally, by tracking property-level sales data, we create a measurement of difference in sale velocity which can in turn explain divergences in neighborhood outcomes. We hypothesize a significant and persistent link between foreclosure events and increased rental conversion, highlighting common pathways to SFR ownership, particularly among large institutional investors. However, this effect is anticipated to vary based on spatial and demographic neighborhood characteristics, influenced by different investment strategies in areas with lower property values and higher populations of residents of color, reflecting historical patterns of racial housing discrimination and connecting to present-day disparities in housing quality outcomes.

Evan Davis [University of Minnesota] davi3739@umn.edu

The rise of institutional investors in the single-family rental market since the Great Recession has concerned researchers, advocates, and policymakers alike. Previous studies have shown that larger owners are more likely to evict tenants and use tactics such as serial eviction to extract rent, and their presence in the market may decrease the supply of affordable homeownership opportunities for first-time homebuyers.

It has also been hypothesized and reported anecdotally that these large investors tend to charge more rent and fees than smaller landlords. However, to our knowledge, no large-scale study has been conducted to test these hypotheses.

We test this hypothesis using a novel survey of renters living in single-family homes in the Minneapolis-St. Paul metro area. Utilizing multivariate hedonic regression modeling, we find that even after controlling for tenant characteristics like race and income, housing unit quality and size, and neighborhood fixed effects, larger landlords (owning at least 20 units) charge 15%-20% more for similar units compared to smaller landlords. This premium amounts to an extra \$250 per month for a typical unit. We find a similar pattern with fees paid and estimate, using similar models, that large landlords charge 48 percent more in fees compared to smaller landlords.

In a secondary analysis, we will also examine a longitudinal database of online single-family rental listings in the Twin Cities to explore rent patterns over the past decade to better understand how the growth of large landlords, including institutional investors, has impacted rents and test hypotheses related to rent setting through market power and spatial concentration and test for heterogeneity in rent setting strategies between different types of large investor landlords.

Extreme heat mitigation strategies in most US cities have been normally concentrated in public spaces: adding trees in public parks, building/expanding cooling centers, adding cool pavement to streets, etc. These efforts have been rooted in several policy and academic articles that have made the case that heat mitigation policies in public spaces are the most practical, possible and even required first step towards creating more environmental justice (Gober et al., 2009; Guardaro et al., 2024; Keith & Meerow, 2022; Lopez Ochoa et al., 2024; Meerow & Keith, 2022). However, and given the growing evidence of the looming housing conditions crisis in the US (Harrison et al., 2024; Lopez Ochoa & Zhai, 2024; Martín et al., 2024; Robinson & Swanstrom, 2024), adding to the well-know and vast literature on the adverse health effects from poor housing conditions (Barton et al., 2007; Bonnefoy, 2007; Braveman et al., 2011; Chimed-Ochir et al., 2021; Keall et al., 2010), it is of paramount importance that heat resilience strategies are first and foremost thought as housing policy interventions towards improving the immediate spaces where vulnerable residents spend most of their time. This paper proposes a data-driven method to prioritize heat mitigation interventions at private residential settings. Using the case of the City of San Antonio, this paper tells the story of the process of engaging with different city departments to set up an experimental design approach to both deploy and measure the impact of heat mitigation interventions within residential private properties using environmental sensors and simulations. Combining a data fusion approach with traditional quantitative methods such as spatial clustering and locally weighted regression modelling and city official's input, a set of prioritized parcel-level data sets are produced and delivered to city officials for community engagement as well as for placing environmental sensors. Initial results show that both spatial clustering and matching techniques are efficient tools to select specific residential areas within pre-defined heat-island neighborhoods to target the application of different heat mitigation interventions towards improving both housing conditions as well as the immediate exterior environmental conditions. Different criteria and data are used to target cool-roofs, home rehabilitations, tree plantings and cool pavement – which yield different treatment settings in different neighborhoods thought the city. This research approach is important for a number of reasons: a) provides a reproducible method for planners and practitioners for testing and deploying measurable heat mitigation strategies, b) prioritizing interventions based on their impact and feasibility helps to target scarce environmental mitigation resources instead of placing them in areas with low impact, c) contributes to the growing need to connect environmental resilience to housing stability and conditions, d) provides a tractable way to make sense of the complex nature of built environments and the design of heat mitigation interventions in real life settings.

Ryan Pardue [Georgia State University] rpardue1@student.gsu.edu

Eric Seymour [Rutgers University] eric.seymour@rutgers.edu

America's rental housing stock is increasingly distorted by a price-fixing algorithm developed by the real estate analytics firm RealPage. Antitrust lawsuits filed by the US Department of Justice and state Attorneys General indicate that millions of rental units in the US feed data into RealPage's software and enable landlords to collude widely. Despite their significant size and scope, actual RealPage users are largely hidden from the public, blackboxing tenants, regulators, and policymakers from understanding and addressing the concentrated market power that shapes their lives. This presentation sheds light on the geography of this monopolistic practice and the methods required to analyze it by asking: who uses RealPage and whose data does RealPage use? To answer this question, we combine national-scale tax assessor data with web-scraped data from RealPage and the 50+ property managers listed by name alongside them in several ongoing antitrust lawsuits. Using R programming language and geospatial analysis, we identify the property owners who use RealPage or feed their property data into its algorithm and map these market dynamics. The findings from this project are relevant to planners and policymakers looking to use local, state, and federal antitrust law as a tool to protect affordable housing.

Reconceptualizing Being Unhoused: Lessons from the AANHPI Homelessness Experience in California

Abstract ID: 1844.0.0.907.2025

Track 6: Housing

Individual Paper Presentation Submission

Lois Takahashi [San Jose State University, College of Social Sciences] lois.takahashi@sjsu.edu, presenting author
Vinit Mukhija [UCLA] vmukhija@ucla.edu

California and other states across the country are experiencing a homelessness crisis. The crisis has led to growing public and policy attention to homelessness and debates regarding what constitutes homelessness. Policymakers recognize that homelessness or the lack of a home can take the form of being unsheltered or sheltered homelessness. Both are increasingly referred to as being unhoused. Unsheltered homelessness refers to people living on the streets, in parks, or in their vehicles without any form of stable accommodation. Sheltered homelessness includes living in temporary accommodations like beds in emergency shelters and safe havens provided by public agencies and nonprofit service providers.

We argue that it is necessary to adopt an inclusive and even more comprehensive view of homelessness and to conceptualize the conventional concept of homelessness to include individuals who temporarily share living arrangements and double up to shelter themselves.

The U.S. Department of Housing and Urban Development (HUD) collects national data on homelessness through its Point-in-Time (PIT) counts and provides federal support for addressing it accordingly. It estimates both sheltered and unsheltered homelessness by collecting original data annually in both categories to calculate the total size and scope of homelessness in the country. We appreciate HUD's broader approach to include sheltered homelessness but find it inadequate and misleading. On the contrary, we argue that the definition and concept of being unhoused must be expanded from unsheltered and sheltered homelessness to include individuals temporarily doubling up and sharing living arrangements to shelter themselves. The doubling-up category of homelessness must include families with children renting or sharing a room, or even a part of a room, often with friends and family, to avoid being unsheltered or sheltered homeless.

We use the case of homelessness in California's Asian Americans, Native Hawaiians, and Pacific Islander (AANHPI) community to understand the magnitude, scale, diversity, and experience of being unhoused, including temporarily doubling-up homelessness, in the state and differences across ethnic groups. We focus on eleven California counties with the highest concentration of AANHPIs. We draw on state-level homelessness data collected by the California Department of Education (DOE), which includes estimates of the state's school students temporarily doubling up as experiencing homelessness. We contend that the state's data more accurately estimates the number of school-going children experiencing homelessness in California. We compare and contrast state data with federal homelessness numbers in HUD's PIT counts to highlight significant discrepancies and deficiencies in the national estimates.

We also draw on original interviews with AANHPI homeless service providers to learn from their insights on the severe housing precarity in the state and the significance of temporarily doubling up as a form of homelessness. Our respondents note that the California AANHPI homelessness experience, in which doubling-up homelessness plays a significant role in coping with the lack of affordable housing, is generally invisible to policymakers as well as public service providers. Finally, we discuss the potential advantages and challenges associated with expanding the broader concept and operational definition of being unhoused in public policy, including political hurdles to policy

recognition, data collection and estimation challenges, and cultural and social barriers to accepting temporarily doubling up as a form of homelessness.

Reducing Housing Cost Burdens through Nominal Cash Grants

Abstract ID: 1844.0.0.788.2025

Track 6: Housing

Individual Paper Presentation Submission

Jerry Anthony [University of Iowa] jerry-anthony@uiowa.edu, presenting author

Introduction: In this paper, I report on a study on increases in housing security experienced and perceived by households that received a one-time nominal cash grant. Housing costs have increased sharply since 2000, and over half of US households spend over 30% of their income on housing costs (Joint Center, 2021). Higher housing cost burdens (HCBs) have negative effects on physical and mental health, educational outcomes and economic growth (Anthony, 2023; Desmond, 2016). Federal funding for housing programs for low-income populations has declined significantly (Kingsley, 2017). States responses to the housing affordability crisis have not been robust (Schwartz, 2021). Local support for low-income housing has been constrained by zoning restrictions, NIMBY opposition and city and county budget constraints. Could an ad-hoc short-term local relief program help?

In 2022, a progressive Midwest US county implemented a one-time, unrestricted use \$1,400 cash grant program for low-income households. Other than the income cap and a local address, there were no restrictions to receive this grant. About 2,240 households qualified and were mailed a check for \$1,400 – an amount equal to 84% of the average monthly income of program beneficiaries. Over 70% of the low-income households (both renter and owner) in the county were housing cost-burdened in 2020. Among beneficiary households, housing insecurity decreased from 50% before to 35% after the grant. Given this change with a relatively low-cost per household, should other locations institute such programs?

Data: Through a university-county collaboration, I was able to design the county's program application form, as well as conduct two surveys of beneficiary households to assess program outcomes – one soon after they received the check and a second a year later. Through these, I procured data on beneficiary characteristics, including housing costs, type of housing, severity of housing cost burden, owner versus renter, monthly income, and how the grant money was spent. The response rate for the two surveys was 46% and 35%, respectively; about 25% of the beneficiaries (583) provided detailed information on housing costs and food insecurity at all three data points, and these were used in the analysis. About 25% of the respondents received public housing assistance (either housing choice vouchers or living in public housing), 16% lived in mobile homes, 43% rented without any housing assistance and the rest (16%) were homeowners.

Methods and research questions: Using logistic regression techniques, I explored what characteristics of beneficiary households were correlated with:

- a) Being housing cost-burdened (HCB) before receiving the grant.
- b) Experiencing a decrease in HCB after the grant.
- c) Feeling housing secure (that is, confident about making the next rent/mortgage payment) after receiving the grant.

Preliminary findings:

- a) Black and Hispanic households were 2.5 and 1.7 times as likely, respectively, as White households to be HCB, after controlling for a variety of factors such as income, education, and household size.

- b) Households living in mobile homes and who were homeowners were 2.5 times as likely to be HCB as those receiving public housing assistance.
- c) Race/ethnicity and receiving housing assistance were the primary factors that correlated with feeling housing secure after receiving the grant.

Discussion: Even though the grant program seemed to decrease HCBs, the reasons for the decline appear to be idiosyncratic. Race/ethnicity had a negative effect on housing affordability for non-White households even in a progressive county, reinforcing the continuing need for addressing race-dependent housing outcomes. Receiving housing assistance was the primary factor correlated with lower HCBs and feeling housing secure, highlighting the need for expanding public housing assistance, perhaps through locally funded programs.

Regenerating Aging Communities via Intergenerational Symbiosis: The Case of Yulin, Chengdu

Abstract ID: 1844.0.0.785.2025

Track 6: Housing

Individual Paper Presentation Submission

Hongyuan Niu [Chongqing University] draconhy@gmail.com, presenting author

Panpan Zhang [China Academy of Urban Planning & Design] zpanpan0227@163.com

As China rapidly enters a deeply aging society, traditional aging-in-place solutions often fail to address both physical and emotional needs of elderly residents, resulting in outdated spaces and social isolation. This research proposes a new framework for regenerating aging urban communities based on the concept of intergenerational symbiosis, emphasizing cooperation, interaction, and exchange among different age groups.

The study investigates the applicability of intergenerational strategies to community renewal, using Chengdu's Yulin neighborhood as a case. It combines spatial analysis, field surveys, and questionnaires to identify key problems—marginalized seniors and decaying community spaces—and explores public attitudes toward intergenerational practices. Findings indicate that over 80% of respondents favor integrated intergenerational spaces while expressing concerns about practical design feasibility.

To address these challenges, the paper constructs a spatial translation framework focused on forgotten people and places, and proposes a three-stage regeneration path: co-existence, interaction, and symbiosis. This includes reprogramming community space through flexible, multi-scalar updates along three dimensions: time (7x24-hour scenario planning to synchronize daily rhythms), space (blended areas balancing independence and interaction), and memory (preserving local identity through cultural mapping).

The Yulin case demonstrates how intergenerational urbanism can reshape both tangible and intangible layers of the community. The area underwent renewal in four dimensions: morphology (dynamic streets and pocket parks), function (mixed-use day-night cycles), ecology (green-blue networks and sponge infrastructure), and culture (heritage preservation and placemaking). A hybrid governance model integrating public, private, and community actors supported long-term operational viability.

This model offers a replicable pathway for aging cities worldwide. It enhances livability for seniors while promoting spatial justice, social inclusion, and intergenerational value co-creation—advancing truly age-friendly and socially vibrant communities.

Rent Stabilization in the U.S.: The Tenant Movement and Landlord Response

Abstract ID: 1844.0.0.828.2025

Track 6: Housing

Individual Paper Presentation Submission

Edward Goetz [University of Minnesota] egoetz@umn.edu, presenting author

Kenton Card [University of Minnesota] kenton@umn.edu

Across the U.S. tenants' rights activists and their political allies have put rent stabilization on the policy agenda at the municipal and state level. The effort has produced a strong response from the real estate industry and landlord groups. In this paper we examine 1) the form of rent stabilization laws being proposed and enacted across the country, 2) the political strategy employed by tenants' advocates, and 3) the counter-arguments and actions of real estate and landlord groups in opposition. This paper is part of a larger work offering a history and analysis of the contemporary tenants' movement in the U.S. In part one of this paper, we examine the most common features of rent stabilization proposals being considered across the country for their provisions related to rent caps, exemptions for new construction and small-scale landlords, vacancy control, and protections against eviction. In addition to profiling proposals, we conduct a political framing analysis of the arguments made by tenant and landlord groups, respectively, for and against. Preliminary results suggest that rent stabilization proposals have changed over time to reflect an emboldened tenants' movement nationwide. This is reflected in initiatives that are more likely to contain price controls on vacant units, shorter exemption periods for newly constructed units, and accompanying protections against eviction. Nonetheless, lobbying and financial contributions of powerful oppositional interest groups, notably apartment associations, realtors, and developers, stifle passage of tenant-friendly legislation in some locations. In part two, we examine how both the tenants' movement and landlord groups engage with academics and academic research on rent control. Both tenant and landlord groups reference academic studies to support contrasting claims about the impact of rent control, from claims by tenant groups about the decelerating impacts of rent limits (Heskin et al., 2000; Sims 2007) and the lack of impact on housing production (Gilderbloom and Ye, 2007; Sims 2007), to claims by landlord groups about decline in housing quality (Kholodolin, 2025) and withdrawal of units from the local market (Diamond et al., 2019).

Considerable research addresses the systemic connections between land use and transportation. Considering public transit as a sustainable mobility option, extensive studies have provided important insights into the direct impacts of the built environment and land use on transit ridership (Cervero and Kockleman, 1997; Ewing and Cervero, 2001 and 2010; Kim et al., 2016a). A similarly large number of studies have investigated the reverse: how a change or intervention on the side of transit systems and infrastructure can affect land use and real estate market prices (Cervero and Landis, 1997; Giuliano, 2004; Kim et al., 2016b).

However, the previous research underestimated the heterogeneity of land use changes/developments around transit systems. The development can be classified into two distinct types: vacant lot development and redevelopment. It is reasonable to hypothesize that the expected nature, spatial patterns, and magnitude of these types are likely to be different. Nonetheless, much research does not specify the types of development around transit systems. One of the reasons for the lack of research on this topic is the lack of a comprehensive inventory that topologizes the development and systematically identifies the locations of vacant lot development and redevelopment (Jun et al., 2024; Kim et al., 2024).

This paper addresses this limitation by employing a deep-learning algorithm and examining the factors that influence vacant lot development around transit systems. For this empirical analysis, we utilized a deep learning model to detect residential vacant lot development, comparing and analyzing longitudinal satellite images in high-quality transit areas (HQTAs) in Los Angeles County. Taking the outputs of the detection as the dependent variable, we constructed a multi-level logistic regression model that tests the influencing property and neighborhood attributes on vacant lot development. The model outputs suggest that property characteristics at the property level and urban forms at the neighborhood level are the most influencing factors on vacant lot development. The properties that developers expect high returns (despite high investment) are likely to be developed (e.g., properties at a higher value and smaller size). The likelihood of vacant lot development increases in balanced neighborhoods with the features of conventional residential areas (e.g., lower land use diversity and accessibility to shopping centers) and urban amenities (e.g., higher regional job proximity and walkability). This probably indicates that the development tends to occur in areas with residential features in the study area where land use and amenities are already dense, diverse, and accessible. This paper contributes to deepening the discussion about the importance of land use and transportation integration for sustainable urban development.

Rethinking the Spatial Distribution of LIHTC Developments: Implications for Racial Segregation

Abstract ID: 1844.0.0.671.2025

Track 6: Housing

Individual Paper Presentation Submission

Jinhyun Bae [Texas A&M University] jinhyun2009@tamu.edu, presenting author

Youngre Noh [Texas A&M University] ynoh@arch.tamu.edu

Since its creation in 1986, the Low-Income Housing Tax Credit (LIHTC) program has financed nearly three million affordable housing units, making it the largest source of federally subsidized rental housing in the United States. Despite its extensive reach, longstanding concerns remain that LIHTC developments are disproportionately sited in socioeconomically and racially marginalized neighborhoods, thereby limiting access to opportunity-rich environments and perpetuating structural inequities. These concerns align with the “geography of opportunity” framework, which highlights how neighborhood conditions—including education, employment, and health resources—significantly shape life outcomes (Galster & Killen, 1995; Ellen & Turner, 1997).

Early studies raised alarms about the clustering of LIHTC projects in disadvantaged areas (Van Zandt & Mhatre, 2009), and more recent work has documented ongoing spatial concentration, spillover effects, and racial disparities in site selection (Won, 2022; McClure & Schwartz, 2023). Although federal guidance emphasizes equitable distribution, it remains unclear whether LIHTC actively mitigates—or inadvertently perpetuates—racial segregation at the neighborhood level. This question is especially pressing given the nation’s heightened focus on racial equity and housing justice.

In response, this study investigates whether the spatial allocation of LIHTC developments fosters residential equity or unintentionally reinforces existing racial segregation. Centering on Cuyahoga County, Ohio (including Cleveland), the analysis examines whether LIHTC siting from 2010 to 2020 aligns with or challenges long-standing patterns of neighborhood segregation. We first assess how neighborhood characteristics changed between 2010 and 2020 in areas that did and did not receive LIHTC developments, offering insight into the correlation between baseline segregation or demographic conditions and subsequent public investment. Building on this temporal comparison, we then model the relationship between 2010 neighborhood variables—including racial composition, segregation indices, and housing tenure—and the likelihood of LIHTC allocation in the following decade. Grounding the analysis in pre-existing local contexts allows for a clearer understanding of how place-based inequalities may be either perpetuated or disrupted through affordable housing policy.

Our findings indicate that neighborhood diversity—rather than the proportion of any single racial or ethnic group—is a statistically significant predictor of LIHTC siting. Although this suggests some alignment with policy objectives to promote integrated communities, the noted spatial clustering of developments underscores enduring concentration patterns. These results highlight the need for more robust equity-driven site selection mechanisms and community engagement strategies. By examining the intersection of racial segregation and affordable housing policy, this study contributes to the literature on spatial justice and housing equity. Ultimately, the findings offer timely guidance for refining the spatial logic of LIHTC allocation—supporting legally sound, racially sensitive, and inclusion-oriented planning consistent with the goals of the Fair Housing Act.

Scaling Shared Equity Homeownership Models to Grow Affordable Housing Supplies

Abstract ID: 1844.0.0.292.2025

Track 6: Housing

Individual Paper Presentation Submission

Meagan Ehlenz [Arizona State University] meagan.ehlenz@asu.edu, presenting author

Housing affordability continues to be a critical issue in the United States. Housing prices are surging far beyond what many communities can afford, profoundly affecting lower-income households. This trend warrants the need for strategies that promote the production of a larger and more affordable housing supply. Yet, developing these strategies faces several challenges. Some factors hindering progress toward affordability include limited access to financing and capital, restrictive public policies, and real estate market dynamics.

Shared equity homeownership (SEH) is one tool that has the potential to grow affordable housing supplies. This research examines the opportunities and barriers associated with the scalability of the SEH model, in a state-wide context. We ask two primary questions: (i) what are the current characteristics, scale, and effectiveness of SEH organizations in providing housing affordability solutions, and what are their plans for future expansions? And (ii) what are the barriers that SEH organizations face in creating additional housing supplies, and what potential mitigation strategies could promote wider adoption of SEH models?

To answer these questions, we surveyed existing SEH programs across Arizona, validating our list with a web search and review of existing data sources, including the 2022 national census on CLTs from Grounded Solutions Network (GSN). Respondents included large community land trusts (CLT) with 100+ units to smaller and/or newer organizations, to provide critical context for exploring how the SEH model can ensure access to affordable housing across various income categories and the barriers that may hinder the large-scale adoption of SEH in Arizona. Our survey focused on the organizational structure, capacity, and portfolios of SEH programs across the state. We supplemented this data with organization-specific data on property-level portfolio characteristics. Together, we consider the feasibility and efficiency of expanding the affordable housing supply in terms of housing production (i.e., acquiring existing housing units versus undertaking new construction projects), the financial mechanisms that support or impede the implementation of SEH programs, and the alignment of SEH principles with the housing demand in the target context. Our findings identify supply trajectories, as well as pinch points, for SEH programs in Arizona. SEH responses also provide insights into the opportunities for and obstacles to growth in light of local, state, and federal policies, as well as mitigation strategies.

While this study has a local focus with the aim to address housing issues in Arizona, the findings yield insights with broader implications at the national level by informing similar SEH initiatives and identifying actionable strategies that could allow policymakers to promote affordability and housing stability across the United States.

Soft De-densification: The policy landscape and effects of dwelling unit combinations

Abstract ID: 1844.0.0.43.2025

Track 6: Housing

Individual Paper Presentation Submission

Matthew Adair [McGill University] matthew.adair@mail.mcgill.ca, presenting author

There is a paradox in current planning practice: whereas considerable effort is expended to increase the number of housing units through densification, almost none is expended to prevent the loss of housing units through unit mergers. Indeed, home combinations are celebrated in the media as creative endeavors of interior design, and only a few cities have so far introduced measures to prohibit the practice. A prime example of what can happen when a municipality lacks unit merger regulations is New York City, where 104,000 housing units have been lost through dwelling combinations since 1950 (Brodheim, 2023). As planners permit greater density as one strategy to ease the housing crisis, these combinations raise questions about the coherence of supply-oriented solutions. If planning continues to champion the benefits of greater density, then it must directly address the density-reducing practice of unit mergers.

To expand the understanding of this practice, this paper asks two questions: (1) To what extent are unit combinations regulated in large U.S. cities?, and (2) What are the general effects of unit combinations? The paper answers these questions in two parts. First, a policy evaluation of the principal cities of the 50 most-populous metropolitan statistical areas in the United States. Second, a case study of German Village, a strictly controlled historic district in Columbus, Ohio.

Findings of the policy scan show that regulation of unit combinations is exceedingly rare in the United States. Among the cities analyzed, only Chicago, San Francisco, and Los Angeles have municipal regulations that limit the practice. The remaining cities consider dwelling unit combinations purely as home renovations, requiring only standard building permits. However, there is ample evidence that practitioners in places with regulations recognize unit combinations to have negative impacts. For the case study component, GIS analysis of parcel data from 1998 through 2024 show three distinct results among structures built before 1940 in the German Village district. First, the size of single-family homes has increased; second, the number of duplexes has decreased; and third, the number of single-family homes has increased.

In addition to offering empirical findings, this paper challenges tacit assumptions in the field of planning that rarely frame density reductions as problematic in the urban context. Within a culture of “suburban hegemony” that has historically positioned multifamily housing as innately less desirable than detached dwellings, most regulations do not apply friction when property owners seek to create single-family homes out of multiple dwelling units (Flint, 2006, p. 35). Influenced by the lineage of *Euclid v. Ambler* (1926), the dominant twentieth-century belief was that detached dwellings offered “a superior family life” while multi-family structures were viewed as both inferior and harmful (Hirt, 2014, p. 175). As a result of this legacy, applications to change a land use from multi-family to single-family encounter few objections.

If the planning discipline finds the production of new housing to be one valid solution to affordability, then planners should likewise conceive of housing loss by mergers as necessarily detrimental. Indeed, cities around the nation are currently reforming zoning codes to allow ‘soft densification’, a diametrically opposite movement that encourages ADUs in traditionally single-family neighborhoods. Consequently, jurisdictions should consider implementing housing unit preservation rules to complement supply-focused reforms. Against the legacy of hierarchical zoning, this research challenges planners to consider the negative impacts of density-reducing

practices in urban neighborhoods. The interrogation of unit combinations serves as a useful heuristic to move planning beyond ideologies that center, defend, and protect the detached single-family dwelling above all else.

Spatial Mismatches and Employment Outcomes for Subsidized Low-Income Households

Abstract ID: 1844.0.0.490.2025

Track 6: Housing

Individual Paper Presentation Submission

Alex Ramiller [University of Toronto] alexramiller@gmail.com, presenting author

It has long been argued that where people live can have an important impact on their ability to access employment opportunities, particularly for low-income households and households of color, who are more likely to be burdened by “spatial mismatch” between sites of affordable housing and job centers (Kain, 1992). However, empirical evidence regarding the impacts of spatial mismatches on employment outcomes are mixed: while some studies find that a lack of spatial access to employment opportunities predicts labor market disadvantage, others argue that the most substantial employment impacts come from a lack of reliable access to a car (Fan, 2012; Hu & Wang, 2019).

This study examines the impact of spatial access to employment opportunities on low-income households by examining the labor-force participation outcomes of households that move within the Housing Choice Voucher (HCV) program – the largest source of rental assistance for low-income households in the United States. In addition to providing financial subsidies, the housing voucher program has the potential – if often unrealized – to provide households with the flexibility to move in response to life course effects or changing needs. Therefore, it might also be expected that voucher recipients would move closer to employment opportunities to obtain better employment outcomes, particularly given that voucher holders tend to have limited access to automobile transportation. However, existing evidence suggests that voucher recipients are not more likely to move to areas with greater employment opportunities, with voucher households in the workforce either unable to move to jobs-rich areas or making housing choices based on other factors (Lens et al., 2019). Indeed, public housing residents – rather than voucher recipients – have historically lived in areas with greater access to employment opportunities, owing to the location of site-based housing programs often closer to urban centers (Lens, 2014).

Focusing on households that moved within the HCV program between 2005 and 2018, this study uses a two-stage modeling framework controlling for neighborhood selection to explore the direct impact of neighborhood employment access on labor-force participation. In addition to employing a novel methodological framework, this analysis also expands upon existing studies by considering three discrete measures of employment access: overall access to employment as well as access specifically to low-wage employment and to jobs occupied by workers without a high school diploma. Model results reveal important differences: while voucher recipients do not experience substantive improvements in employment outcomes after moving to neighborhoods with high levels of access to employment overall, they experience gains in labor-force participation after moving specific to neighborhoods with greater access to low-wage employment opportunities. This indicates the importance of spatial labor market segmentation in shaping employment outcomes for low-income households, and points to the need for a greater alignment in planning between low-income housing and equitable economic development.

Special Assessment and Its Impact on Neighborhoods and the Condominium Housing Market

Abstract ID: 1844.0.0.1071.2025

Track 6: Housing

Individual Paper Presentation Submission

Yanmei Li [Florida Atlantic University] yli22@fau.edu, presenting author

In the early morning of June 24, 2021, a 12-story condominium tower, Champlain Tower South, in the beach town of Surfside, FL, in Miami-Dade County, collapsed and led to over 100 casualties, including 98 deaths and 11 injuries. The reasons leading to the collapse are multifold, including water penetration to the basement level, where the garage is located, and the chronic erosion of the steel structure in the foundation and the basement (Simons et al., 2022). These damages had been recognized before the collapse, and the remedial project had been approved. Before the collapse, Florida legislation required a 40-year certification of structural integrity for all condominium buildings taller than three stories. Responding to the collapse, all levels of government enacted stricter financing and building requirements, significantly impacting the condominium market's price, supply, and demand (Goodman & Neal, 2023; Sterk & Weisbord, 2024). In May 2022, Florida legislation passed Senate Bill 4-D, establishing a statewide mandate of the initial 30-year certification (25 years if the building is located within 3 miles of the coastline) and subsequent 10-year certifications for all the condominium buildings taller than three stories. The policy responses may help protect the structural integrity of condominium buildings but often require special assessments to bring the buildings to certification standards. These special assessments profoundly impact the condominium housing market, particularly on older buildings.

Many condominium owners attempted to sell the units due to the financial burden associated with these special assessments, changing the dynamics of the condominium market. To empirically explore the impact on the condominium market and neighborhoods, this study asks the following questions:

- 1) Which condominium buildings were affected the most, and which neighborhoods are they located in?
- 2) What was the condominium housing market and neighborhood trend before and after the collapse of the Champlain Tower South?
- 3) What was the condominium housing market and neighborhood trend before and after the new state legislation?

The study uses the historical condominium unit transaction data in Miami-Dade County to help answer these questions. A series of paired t-tests were conducted to explore condo housing prices and days in the market before and after the Champlain incidence and/or the Senate 4-D Bill. Explorative and descriptive analysis of the spatial distributions of condominiums affected mainly by the new legislation is conducted. Spatial hedonic housing price models were used to explore the determinants of condominium unit pricing and days on the market, controlling housing attributes, neighborhood characteristics and amenities, dummy variables of before and after the Champlain collapse, dummy variables of before and after the 4-D Bill, distance to the CBD, and distance to the coast.

The results of the study attempt to measure the magnitude of the impacts and propose possible policy interventions, particularly regarding policies to stabilize the housing market and neighborhoods.

Tax Delinquency and Foreclosure among Heirs' Properties in the Dallas-Fort Worth Metroplex

Abstract ID: 1844.0.0.136.2025

Track 6: Housing

Individual Paper Presentation Submission

Noah Durst [Michigan State University] durstnoa@msu.edu, presenting author

Heather Way [University of Texas Law School] hway@law.utexas.edu

Heirs' property – land or real estate that is inherited by multiple family members, usually without a clear or legally documented ownership structure – is recognized as a highly unstable form of property ownership that exacerbates the racial wealth gap in the United States (Cole, 2021; Smith and Cubbage, 2024). However, the full extent of these vulnerabilities and their impact on wealth generation among Black and Latino landowners remains underexplored, particularly in urban contexts (Gaither and Zarnoch, 2017; Thompson and Bailey, 2023). In this study, we examine the concentration of residential heirs' properties in Dallas and Tarrant Counties. These two urban counties in the Dallas-Fort Worth Metroplex of North Texas are home to a diverse population of 4.7 million residents, including 936,000 African American residents and 1.7 million Latino residents. We examine the incidence of tax delinquency and foreclosure among heirs' properties at both the property and neighborhood level. We find heirs' property is heavily concentrated in minority communities and that heirs' property homeowners have markedly higher rates of tax delinquency and are at considerably higher risk of tax foreclosure than other homeowners in these same counties. Moreover, we find that both heirs' property and tax foreclosures are highly concentrated in census tracts in the urban core and that heir rate is a consistent and strong predictor of the tax foreclosure rate at the census tract level. We conclude by discussing how this research can inform policy interventions designed to enhance housing stability for families who inherit their homes and better safeguard the intergenerational transfer of wealth within Black and Latino households.

Affordable housing development often raises property values, creating concerns that it may also raise rents for the surrounding community (Craw 2023). The facts do not justify these concerns, at least in Miami-Dade County, Florida – an area where housing costs increased rapidly from 2000 to 2020. We model multifamily unit rents patterns in apartment buildings in neighborhoods with and without low-income housing tax credit (LIHTC) affordable housing developments. We use sophisticated difference-in-difference and interrupted time series methods to control for unit, building, and neighborhood level characteristics and trends. Across a variety of specifications and subsamples, there is no evidence of any inflationary impact of new Low-Income Housing Tax Credit (LIHTC) developments on the rents of nearby market-rate apartments across two decades of rent data, likethe more general literature of all apartment construction on nearby rents (e.g., Asquith et al. 2023 or Loewenstein and Willen 2023). In fact, in some neighborhoods, new Low-Income Housing Tax Credit (LIHTC) developments significantly reduced market-rate rents, in line with Damiano and Frenier (2020) analysis of Minneapolis or Oluku and Chang's (2024) national analysis. These findings suggest that LIHTC housing both benefits its tenants and can help reduce costs for some surrounding renters. This analysis provides evidence for practitioners looking to both expand affordable housing supply and maintain affordability of nearby rental housing units.

The Good Case for "Good Cause:" Do Good Cause eviction laws reduce the rate of housing production?

Abstract ID: 1844.0.0.875.2025

Track 6: Housing

Individual Paper Presentation Submission

Kenton Card [University of Minnesota] kenton@umn.edu, presenting author

Evan Davis [University of Minnesota] davi3739@umn.edu

Edward Goetz [University of Minnesota] egoetz@umn.edu

Jeremy Schwartz [Loyola University Maryland] jsschwartz1@loyola.edu

Do Good Cause eviction protections reduce the rate of housing production? Our preliminary analysis suggests not; housing production in California, Oregon, and New Hampshire did not decline after passage of Good or Just Cause relative to nearby states without the legislation. Across the USA, state legislatures are considering legislation that requires landlords to document "Good Cause" when evicting renters (Vasquez 2022). Stakeholders make contrasting claims about the potential impact of the policy. In support, tenant advocates argue that it helps families stay in their homes amidst a housing affordability and homelessness crisis. In opposition, landlord lobbyists suggest that Good Cause will disincentivize developers from building new multifamily rental housing and lead to a decline in housing supply, and, thus, exacerbate the housing crisis. Little research has examined the impact of tenant protections on housing supply in the fields of housing policy and planning; one notable exception is Jofre-Monseny et al. 2023. We set out to investigate the existing empirical research, and, subsequently, identified a gap across the fields of planning, policy studies, and housing economics on the impact of Good Cause on housing markets in the United States. We gathered data from three states – California, Oregon, and New Hampshire – where "Good" or "Just Cause" laws passed over the last decade. We conducted a difference-in-difference analysis on whether the trend in new permits at the county-level in states subject to the passage of Good Cause were different from the trends in nearby counties in states not subject to the law. The model controlled for other factors: county-level GDP, population, unemployment, and per capita income. We found that permits did not decline in California, Oregon, or New Hampshire counties relative to the changes occurring in surrounding states, all other things being equal. Building on existing research that suggests that Good Cause is popular among voters (Stein et al. 2025) and will keep families in their homes because it results in lower rates of evictions (Cuellar 2019) and displacement (Chapple et al., 2022), our findings suggest that passing Good Cause eviction protections will not result in reduced rates of new housing production or, subsequently, housing supply.

The Impact of Mandatory Inclusionary Housing: A Descriptive and Causal Analysis from New York City

Abstract ID: 1844.0.0.470.2025

Track 6: Housing

Individual Paper Presentation Submission

Chengyan Pu [Zhejiang University] puchengyan@zju.edu.cn, presenting author

Zhan Guo [New York University] zg11@nyu.edu

Providing affordable housing is a critical link between sustainable urban development and social equity. This issue is particularly salient in New York City, where high housing costs and stark income inequality pose persistent challenges. Introduced by the Bloomberg Administration in 2016, the Mandatory Inclusionary Housing (MIH) program mandates private developers to include permanently affordable units in new residential developments as a condition for zoning changes. Since its inception, MIH has garnered sustained attention from both practitioners and scholars. However, despite growing debate over the past nine years, there remains a significant lack of empirical understanding regarding the policy's implementation and effectiveness. This gap stems largely from limitations in data availability and methodological challenges that have hindered robust causal evaluation of the policy's impact on housing supply.

This study aims to provide a systematic and data-driven evaluation of the MIH program, assessing both its development characteristics and its impact on housing production. The research proceeds along two dimensions. First, it conducts a descriptive statistical analysis based on a comprehensive compilation of MIH project data. It examines the spatial distribution, zoning changes, and development types of MIH projects to build a detailed picture of their macro- and micro-level characteristics. Second, the study establishes a rigorous causal identification strategy using a Difference-in-Differences (DID) design to estimate the policy's effect on new housing production at the local level.

The initial analysis has produced several thought-provoking findings that provide a foundation for the subsequent stages of this study:

- (1) As of today, New York City has approved 134 MIH rezoning areas and 205 MIH developments—100 of which are fully affordable housing projects, and 105 are mixed-income—yielding a total of 10,437 residential units.
- (2) MIH developments are widely distributed, spanning 80% of the city's Community Districts, with notable concentrations in the Bronx and Brooklyn.
- (3) Except for two cases, all MIH rezonings involved upzoning, with transitions from M1 to R7 and from R6 to R7 being the most common.
- (4) Considerable heterogeneity exists across MIH developments: most developers opt for Option 1, and the number of housing units per project varies significantly.
- (5) At a macro level, housing development activity within MIH zones has increased markedly. The number of permitted new buildings rose from an average of 93 per year (2003–2015) to 339 following MIH implementation. However, signs of strategic developer behavior also emerged—specifically, the number of buildings with fewer than 10 units (thus exempt from MIH requirements) jumped from 1 to 15 per year.

This study contributes to the growing literature on affordable housing policy by constructing a parcel-level panel dataset and applying a causal inference framework to evaluate MIH's real-world impact. It sheds light on the

complex interplay between policy design and developer behavior, offering both empirical evidence and methodological tools to inform future urban housing initiatives.

The Impact of Multi-family Units on Single-Family Property Values in Louisville, Kentucky

Abstract ID: 1844.0.0.257.2025

Track 6: Housing

Individual Paper Presentation Submission

Sumei Zhang [University of Louisville] sumei.zhang@louisville.edu, presenting author

Jeeson Oh [University of Louisville] jeeson.oh@louisville.edu

The issue of missing middle housing in urban environments and the urgent need for its inclusion have been extensively documented and explored over the past two decades (Baqutaya et al., 2016; Frederick, 2022; Parolek, 2020). Among the various efforts across different governmental levels—ranging from federal public housing programs to local fair-share housing mandates—there is an increasing call for comprehensive zoning reforms (Lerman, 2006; Mukhija et al., 2010).

Louisville, Kentucky, stands as one of the cities currently undertaking a local zoning reform aimed at permitting higher-density housing in low-density residential areas. However, this process has faced significant opposition from both the public and state legislators. Public feedback gathered through a voluntary survey reveals consistent objections to the proposed reform. Kentucky House Bill 18, if enacted, will deprive local unelected zoning boards' power to approve multi-family, high-density developments in single-family zones.

This public resistance to zoning reform can be partially explained by prevailing stereotypes and public opinions linking density, minority populations, and poverty to perceived negative impacts on property values, safety, and traffic (Tighe, 2010). Craw (2023) offers one of the few empirical studies addressing these negative public perceptions in housing research, focusing on Little Rock, Arkansas, as a case study.

This study aims to contribute further empirical evidence on the effects of multi-family unit additions on housing market dynamics. Using Louisville, Kentucky, as a case study, we seek to address the following research questions: (1) What are the heterogeneous characteristics of multi-family properties? (2) How has the location strategy for multi-family properties evolved? (3) What are the impacts of introducing multi-family properties on the prices of single-family homes?

To support this analysis, we will collect data from multiple sources, including multi-family building permit records from the Louisville Metro Planning Department, housing transaction data from the Parcel Valuation Assessor's office, socio-economic data from the decennial censuses, and neighborhood physical quality data from LOJIC, our local GIS agency. First, we will conduct a spatial analysis across time to examine the spatial distribution of multi-family units and assess how this pattern has evolved. Subsequently, we will perform a spatial hedonic analysis of housing transaction data from 2014 to 2024 to determine whether the introduction of multi-family housing has had a detrimental effect on single-family property prices.

Individual Paper Presentation Submission

Elizabeth L Sweet [University of Massachusetts Boston] betsy.sweet@umb.edu, presenting author

Sowmya Balachandran [University of Massachusetts Boston] sowmya.balachandran@umb.edu

Erin Graves [University of Massachusetts Boston] erin.graves@umb.edu

Massachusetts Chapter 40B, also known as the Comprehensive Permit Law, is a state-level fair share housing policy enacted in 1969 to address exclusionary zoning and expand access to affordable housing across municipalities. It allows developers to bypass local zoning regulations through the Zoning Board of Appeals (ZBA) in communities where less than 10% of the housing stock qualifies as affordable, provided that a portion of the proposed units are permanently income restricted. While existing research has evaluated the siting outcomes of 40B developments—demonstrating their relative success in penetrating racially economically segregated neighborhoods—less attention has been given to the institutionalized democratic processes that shape how these developments evolve during implementation.

This paper examines the local political and participatory dynamics that emerge during Chapter 40B application reviews, particularly in suburban communities with a strong tradition of home rule and active resident engagement. Through in-depth case studies of Newton, Brookline, and Framingham Massachusetts, this study investigates how zoning board compositions, public hearings, and neighborhood feedback influence changes to proposed developments, including affordability levels, design characteristics, parking ratios, and environmental standards. By analyzing publicly available materials—such as ZBA meeting minutes (which include public comments), and planning documents—as well as interviews and direct observation of the permitting process, the paper traces how negotiations with developers both reflect and reshape local values, institutional priorities and design decisions.

Rather than treating 40B as a blunt legal instrument, this analysis reveals the subtle and often contentious ways in which community actors reinterpret the law's mandates through a lens of local autonomy, aesthetics, and infrastructure concerns. The paper explores the extent to which these processes either dilute or reinforce the core fair housing objectives of the policy and considers how municipal discretion and citizen participation interact with centralized state efforts to promote inclusion. Ultimately, this research contributes to broader scholarly debates on spatial equity, procedural justice, and the capacity of decentralized governance systems to advance redistributive goals within the constraints of market-driven development.

The Right to Housing Lost in Translation: Allophone Tenants in Parc-Extension, Montreal

Abstract ID: 1844.0.0.747.2025

Track 6: Housing

Individual Paper Presentation Submission

Irtaza Hussain [Concordia University] irtaza.hussain@mail.concordia.ca, presenting author

Leila Ghaffari [Concordia University] leila.ghaffari@concordia.ca

Tenants often face structural barriers that leave them vulnerable to exploitation, whether through precarious rental conditions, power imbalances with landlords, or exclusion from legal protections. Among these barriers, language inaccessibility plays a crucial but often overlooked role, limiting tenants' ability to secure stable housing, assert their rights, and access justice. Research from diverse housing contexts has shown that when tenants cannot navigate rental agreements, dispute resolution processes, or government services in their primary language, they face heightened risks of eviction, discrimination, and substandard living conditions. In cities with complex tenant protection frameworks, linguistic exclusion effectively denies tenants access to justice, reinforcing power imbalances between landlords and renters. Building on this broader discussion, this study examines how Quebec's language policies intersect with housing inequality, focusing on the experiences of allophone tenants in Parc-Extension, Montreal.

Quebec has a unique linguistic landscape where French holds a special status as the official language, deeply tied to the province's identity and history. Efforts to protect French, such as Bill 96, which limits immigrants' access to government services in languages other than French to their first six months in the province, are often framed as necessary for preserving Quebec's cultural distinctiveness. However, these policies also contribute to patterns of exclusion, particularly in access to housing. The absence of multilingual services in key institutions, including the Tribunal Administratif du Logement (TAL)—the regulatory body overseeing tenant-landlord relations—raises critical questions about how language barriers impact housing justice.

This paper investigates whether the lack of services in languages other than French at TAL contributes to housing inequality by making the legal process more complex and discouraging allophone tenants from asserting their rights. By analyzing the intersection of language policy and housing justice, this study aims to shed light on how linguistic exclusion reinforces broader socioeconomic disparities in Montreal's rental market.

Using a narrative interpretive framework, this study explores the housing experiences of 14 allophone tenants—individuals who speak neither French nor English—and those they interact with throughout their housing journey in Parc-Extension, one of Montreal's most diverse and lowest-income neighborhoods. This sector of the population is often underrepresented in housing discourse, despite facing heightened barriers to secure, adequate housing. The study includes interviews with two main groups: tenants who have experienced housing instability or challenges navigating the system, and key actors in their housing journey, such as tenant support staff, landlords, lawyers, and interpreters. The research focuses on three South Asian languages—Urdu, Hindi, and Punjabi—which are among the predominant non-official languages spoken in the neighborhood.

Findings indicate that navigating housing disputes without linguistic support increases tenants' vulnerability and discourages them from seeking justice. Tenant narratives highlight how language barriers at TAL intersect with precarious immigration status and financial instability, compounding housing insecurity. These stories illustrate that language inaccessibility is not an incidental challenge but a mechanism that reinforces systemic exclusion and exploitation.

By centering tenants' lived experiences, this research situates language inaccessibility within a broader system of exclusion that deepens housing inequality and reinforces power imbalances between tenants and landlords. It calls for policy reforms that recognize language access as a fundamental dimension of housing justice and tenant protection.

The Role of Corporate and Non-local Ownership on Post-disaster Housing Recovery

Abstract ID: 1844.0.0.947.2025

Track 6: Housing

Individual Paper Presentation Submission

Maria Watson [Shimberg Center for Housing Studies, University of Florida] maria.watson@ufl.edu, presenting author

Renz Torres [Shimberg Center for Housing Studies, University of Florida] torres.re@ufl.edu

Housing recovery research has long illustrated the role disasters play in exacerbating inequalities in communities, yet less is known on the effect of corporate and non-local ownership on recovery outcomes. On one hand, homes in marginalized communities may be targeted by investors who invest minimally to "milk" a property of the tenants' rent and hindering recovery. On the other hand, investors may capitalize on the post-disaster context and high housing demand by purchasing damaged homes from residents unable to finance their own recoveries. Though this might lead to the restoration of a property to its pre-disaster value, it would be at the expense of the most vulnerable homeowners in recovering communities.

This paper explores the effect of owner type post-disaster by examining the recovery trajectories of single-family homes in Bay County, Florida, after Hurricane Michael in 2018. We operationalize recovery in two ways: 1) we examine recovery intention through the type of first action – repair or sale – a property owner takes after a disaster and 2) we examine recovery speed and extent as whether a property is restored to its full publicly appraised improvement value two years after a disaster. We interweave publicly available parcel data, building permit recovers, sales transactions, census data, and aerial imagery to build our dataset. Using multinomial and logistic regression models, we identify the effect of structural characteristics, damage, corporate and nonlocal ownership, and neighborhood contexts on these recovery outcomes.

We find that independent of other variables, corporate and non-local owners are less likely to first repair their properties; instead, they are more likely to sell their properties after disaster. Whether other surrounding property owners also repair or sell their properties bears positively on the property owner's decision to do the same. Whether surrounding owners were corporate or non-local mattered for repair but not for sale outcomes. Two-year property value restoration was negatively affected by the property owner being nonlocal or corporate. Whether a property was sold in this two-year period positively affected restoration. However, the largest effect on a property's restoration was whether the surrounding properties also were able to recover. These findings are consistent with differences in social attachment, where those geographically or emotionally less attached to an area may be less likely to act quickly or invest in improvements. However it also reveals the potential for a compounding challenge of pre-disaster corporate and non-local investment and post-disaster recovery delays on housing planning.

Individual Paper Presentation Submission

Hyojung Lee [Seoul National University] hyojung.lee@snu.ac.kr, presenting author

Jinah Park [Seoul National University] pjapja0823@snu.ac.kr

Ho Kim [Seoul National University] hokim@snu.ac.kr

Preterm birth, defined by the World Health Organization as birth occurring before 37 weeks of gestation, remains a critical global public health challenge due to its significant contribution to neonatal mortality and long-term health complications (Torche, 2024). In South Korea, a country with one of the world's lowest fertility rates, the preterm birth rate has notably increased from 6.0% in 2011 to 9.8% in 2022. This upward trend highlights the urgent need to identify modifiable risk factors and develop strategies to address them. Previous studies have established associations between maternal stress, environmental exposures, and housing instability with adverse birth outcomes (Basu et al., 2010; DiTosto et al., 2021). However, research on the joint impact of these factors remains limited, particularly within the Korean context. Given that environmental heat and housing instability can function as both chronic and acute stressors during pregnancy, understanding their combined effects is crucial for developing targeted and effective prevention strategies.

This study explores the individual and interactive effects of ambient heat exposure and housing instability on preterm birth in South Korea. In doing so, we utilize comprehensive, register-based census data (100% sample) from Statistics Korea, covering a cohort of individuals born between 1983 and 1995. The longitudinal panel data not only includes birth year and month, gender, and birth weight of the babies born from 2015 to 2022, but also contains demographic, socioeconomic, and housing characteristics of their mothers. Birth outcomes were identified for mothers who delivered during this period, with preterm birth defined as births occurring between 20 and 36 weeks of gestation. Heat exposure was measured using satellite-derived ERA5-Land temperature data, assigning monthly average temperatures based on maternal residential locations one month before delivery. Housing instability was assessed across three dimensions: (1) poor housing quality (e.g., non-residential accommodations, built more than 30 years ago), (2) frequent residential moves, and (3) overcrowding, defined according to South Korea's Framework Act on Residence.

Statistical analyses were conducted to assess the independent and combined effects of heat exposure and housing instability on preterm birth, controlling for maternal age, education, employment status, marital status, parity, fetal sex, household income, district-level access to obstetric and gynecological services, and timing of delivery (month and year). Additional subgroup analyses examined potential variations in effects based on maternal education, employment status, and marital status.

We included 1,532,171 singleton birth (116,564 (7.6%) of preterm birth) from 1,137,707 females in our analysis. Preliminary findings indicate a statistically significant association between higher ambient temperatures in the month prior to delivery and increased odds of preterm birth. Independently, housing instability also significantly elevated preterm birth risk, with a notable synergistic effect observed when heat exposure coincided with unstable housing conditions. These results highlight the compounded risks posed by simultaneous environmental and social stressors, emphasizing the importance of integrative public interventions addressing both public health and housing policies (Arcaya et al., 2024; Reece, 2021). Further research is recommended to investigate underlying biological mechanisms and identify vulnerable subpopulations that could benefit most from targeted prevention strategies.

The Role of Multifamily Property and Owner Level Characteristics on Disaster Impacts and Recovery

Abstract ID: 1844.0.0.665.2025

Track 6: Housing

Individual Paper Presentation Submission

Wayne Day [Texas A&M University] waynecday@gmail.com, presenting author

According to the Census' 2021 Rental Housing Finance Survey, approximately 54 percent of all rental housing units are in multifamily properties with 5 or more units – making multifamily housing (MFH) a significant portion of the rental housing stock. In the disaster circles, MFH is recognized as lacking a sufficient and effective policy response: federal disaster finances are lacking – especially in comparison to single-family, owner-occupied. And while foundational, the more prominent research including multifamily housing disaster recovery is dated and other research tends to be more anecdotal. More recently in the real estate economics literature, research combines multifamily with other classes of commercial real estate (CRE) to analyze asset pricing and loan performance outcomes with respect to hazard risk and exposure.

Given that MFH – and CRE more broadly – is primarily owned for investment purposes, anticipation of and responses to disasters falls to the owner establishing an inter-dependency between owners, housing, and renters. This research seeks to expand our understanding of rental housing related outcomes in the disaster recovery context, variation with the heterogeneous class of MFH and between owner types, and using large-scale, fine-resolution data on properties and owners for more robust and generalizable findings. A single event is studied – Hurricane Harvey's impact in Harris County, Texas – due to its extensive impacts, recency, and enough time having elapsed to adequately observe recovery outcomes. This research examines hazard risk, exposure, shorter-term disaster impacts, and longer-term recovery trajectories across MFH differentiated by property and owner characteristics. MFH properties with market-rate units are the primary units of analysis.

Limited access to commercial real estate data has hindered research on this topic. For this research, proprietary, industry-leading longitudinal data with broad coverage was obtained detailing property characteristics, quarterly occupancy rates and rents, and ownership characteristics. Other publicly available, longitudinal data are incorporated into the analyses (i.e., Census, Harris County Appraisal District). Key property- and owner-level characteristics are informed by the real estate, housing, and disaster literatures suggested to influence property-level financial performance and disaster period outcomes – namely, an industry-relevant owner typology, firm location, and economic scale, among others. A series of cross-sectional and longitudinal regression models examine how property- and owner-level characteristics and market segmentation are associated with being at risk (located in the flood zone); hazard exposure (whether inundated and to what extent); immediate and shorter-term impacts (changes in occupancy rates and tax-assessed improvement values); and longer-term recovery trajectories (occupancy rate and improvement value stabilization).

Steep declines in occupancy rates are observed in flooded areas in the 4th quarter of 2017 returning to market levels in 2nd quarter of 2019. Results demonstrate a fairly even distribution of risk and exposure across property and owner characteristics while market segmentation and ownership become more meaningful for predicting recovery period outcomes. Unsurprisingly, occupancy rates in high-rise structures were higher than garden-style, demonstrating the vulnerability of properties with shorter and wider configuration. Lower-priced units were more likely to be occupied despite flood exposure masking actual property damage and habitability concerns highlighting the demand for alternative and affordable housing – or lack thereof. Properties owned by some types of large-scale, institutional owners recovered more quickly attributable to owners being locally situated, construction sector connections, and general capacity and expertise.

The Significance of Elected Leadership in Homeless System Change

Abstract ID: 1844.0.0.241.2025

Track 6: Housing

Individual Paper Presentation Submission

Taylor Cook [University of Texas at Austin] taylormcook@utexas.edu, presenting author

When Houston's Mayor Annise Parker was battling for reelection in 2013, she committed to making homelessness a top priority for her administration. Mayor Parker, a former software analyst and Controller for the City of Houston, partnered with the Obama Administration to implement a Housing First Continuum of Care (CoC) (Fraser, 2013). Utilizing practices that were later promulgated in rules to enact the federal HEARTH Act, the City of Houston created a CoC that includes more than 100 organizations aligned in a technologically enabled system to categorize and prioritize people for housing.

Within five years of the initiative, the City of Houston saw homelessness decline by more than 60% (Kimmelman et al., 2022). Even more remarkably, the system that was created under Mayor Parker has maintained that reduction for more than a decade. For the last several years as housing prices and homelessness have risen nationally, state and local leaders from around the country have flocked to Houston to learn from this success. Articles and research about Houston's model have discussed the significance of collaboration and other factors, but very little attention has been given to the Mayor's role in leading system change. This paper examines the role that elected leadership plays in organizing homeless services systems using a Housing First CoC model. I use Houston as a case study and, through archival research and interviews, identify critical moments in the implementation of a Housing First CoC where executive decisions and leadership were key to creating system change. The data is analyzed within a framework that considers the strategies leaders use to respond to problems and the conditions that make systemic change possible (Callahan et al., n.d.; Howlett et al., 2015) and explores how Mayor Parker was successful in defining and committing to a solution, creating a network of organizations to execute on the solution, and maintaining the network with resources, shared success, and the formation of group identity.

The article concludes with a discussion of questions that are raised about local leadership and Housing First. Since homelessness is often described as a wicked problem (Head, 2022) and concerns a highly stigmatized population, bottom up pressure and grassroots advocacy alone has not been able to mobilize sufficient resources and effect systemic change (Foscarinis, 1991). With this example in mind, do such problems require centralized power to frame the issue and solution, align resources, and incentivize collaboration? Second, a body of research suggests that model fidelity is important for a Housing First CoC to demonstrate success the way that Houston, and Salt Lake City before it, has. However, movements and political will to address homelessness is cyclical, which begs the question: are there windows of opportunity for effective system change, and if so, what are they and how can willing leaders prepare to seize those moments when they arise? Finally, the future of federal policy supporting Housing First and CoCs are increasingly in doubt. Critics on the right see it as too permissive (Glock, 2022) and others have critiqued Housing First for prioritizing efficiency and cost savings through atomizing, hierarchical systems (Willse, 2010). Are there other models for addressing homelessness that can achieve system change but might be conducive to more diffuse leadership and governance structures capable of weathering a devolving political context?

Toxic Grounds: Segregated Soil and the Legacies of Racialized Zoning in West Texas

Abstract ID: 1844.0.0.725.2025

Track 6: Housing

Individual Paper Presentation Submission

Asma Mehan [Texas Tech University] asma.mehan@ttu.edu, presenting author

This paper examines the entanglement of environmental toxicity, housing segregation, and planning legacies through the lens of soil as both material and metaphor in Lubbock, Texas. Drawing on my broader research project *Segregation by Design*, the study investigates how historically racialized zoning practices have not only shaped housing patterns but also embedded environmental injustices deep into the ground—literally and figuratively. Using soil toxicity data, zoning maps, oral histories, and archival planning documents, the paper argues that soil contamination in historically Black and Latinx neighborhoods is a living residue of segregated urban planning and infrastructural neglect.

This work explores how the physical properties of soil serve as an index of long-term exposure to industrial pollutants and proximity to infrastructural hazards, such as railroads, highways, and utility easements—all disproportionately situated near communities of color. These environmental conditions, compounded by housing disinvestment and discriminatory lending practices, create a layered geography of vulnerability that persists today. The paper considers how urban soil functions as both an ecological witness and a political terrain for imagining more just futures in housing and land use. Ultimately, the paper contributes to an interdisciplinary understanding of how environmental and housing injustices are co-constituted through the ground itself. It calls for new planning paradigms that center soil health, community agency, and ecological reparations as essential components of housing justice.

Tracing the Social Constructions of Whiteness Through Restrictive Housing Covenants in Massachusetts

Abstract ID: 1844.0.0.772.2025

Track 6: Housing

Individual Paper Presentation Submission

Wonyoung So [MIT] wso@mit.edu, presenting author

Justin Steil [MIT] steil@mit.edu

Catherine D'Ignazio [MIT] dignazio@mit.edu

Takeo Kuwabara [MIT] takeok@mit.edu

Emilia Charno [MIT] ercharno@mit.edu

Restrictive covenants, embedded in property deeds, were central to institutionalizing residential segregation and furthering racial inequality across the United States throughout the mid-19th to mid-20th century. Enforced through private agreements, these covenants explicitly prohibited property ownership or occupancy based on race, ethnicity, religion, and national origin, profoundly shaping neighborhood demographics, patterns of wealth accumulation, and community development. Although the Supreme Court ruled that restrictive covenants were legally unenforceable in *Shelley v. Kraemer* (1948), their lingering social and economic impacts continue to influence contemporary disparities. Furthermore, many of these covenants are still found on property deeds today. Despite growing scholarly attention (Brooks, 2013; Gordon, 2023; Gotham, 2000), significant gaps persist in understanding the nuanced mechanisms through which racial categories were constructed and enforced in part through restrictive covenants, especially the critical role of private real estate developers in subdividing land and distributing standardized exclusionary clauses.

This study addresses these gaps by analyzing historical property deeds collected from two counties in Massachusetts, Northern Middlesex and Norfolk, digitized specifically for this research. Employing a Large Language Model (LLM)-based classifier, supplemented by manual verification from the research team, we identify and map restrictive covenants across space and time, showing how patterns of exclusion evolved. Our findings illustrate how the definition of racial categories embedded within covenants shifted dramatically over several decades, from vague prohibitions against "disorderly" persons, initially targeting Irish immigrants, to explicit exclusions of both "Irish" and "Negro" occupants, ultimately culminating in restrictions limiting occupancy exclusively to "Caucasian" individuals. These exclusions are likely to change across geographies, providing insights into waves of anti-immigrant sentiment and conceptions of whiteness in Massachusetts (Bushee, 1903; Muhammad, 2019). Furthermore, our case study uncovers the influential role played by real estate developers who strategically implemented standardized covenants during land subdivision, embedding racial hierarchies into the physical fabric of suburban communities.

By illuminating the evolving language of racial exclusion and the pivotal role of developers in promulgating restrictive covenants, this research highlights race as a socially constructed category, continuously redefined through practices of abstraction and differential treatment codified within private practices. These findings contribute essential nuance to ongoing scholarly conversations about racial formation and property-based inequality. Moreover, our work calls for an expanded, nationwide digitization and analysis of historical property records to comprehensively document these exclusionary practices. Such an effort could inform policy measures aimed at reparative lending and equitable reinvestment in historically marginalized communities, addressing the persistent economic legacies of restrictive covenants.

Understanding the Rising Costs of Homeownership and the Implications for Affordability

Abstract ID: 1844.0.0.869.2025

Track 6: Housing

Individual Paper Presentation Submission

Alexander Hermann [Harvard University Joint Center for Housing Studies] alexander_hermann@harvard.edu,
presenting author

Homeowner affordability has deteriorated considerably in recent years. The number of homeowners who spend more than 30 percent of their income on housing has increased by 3.6 million households between 2019 and 2023, leaving 24 percent of all homeowners—20.3 million in total—with housing cost burdens (McCue, Airgood-Obrycki, and Whitney 2025). Rising cost burdens are especially concentrated among lower-income homeowners and older adult households more likely to be on a fixed income.

Mortgage payments are often the largest expenditure for homeowners, but non-mortgage costs have increased even more in recent years, including insurance premiums, utility costs, and property taxes, drawing increased scholarly attention. Average insurance premiums, for example, rose more than 20 percent between 2020 and 2023 after adjusting for inflation (Koller 2024). Similarly, rising utility costs have led to increased energy burdens, a particular challenge for lower-income homeowners (Ayala and Dewey 2024). These increased costs force households to make significant tradeoffs. Over 7 percent of all homeowners go without insurance, for example, due to rising costs and reduced access (Cornelissen, Heller, and DeLong 2024).

In this study, we use a longitudinal survey to determine how much homeowner costs have risen in recent years, overall and by detailed cost components. We examine how those costs rose before and since the start of the COVID-19 pandemic, and how they have varied by the income, race/ethnicity, age, and location of the household. Our preliminary research questions include:

- To what extent have housing costs for homeowners risen between 2015 and 2023? What specific costs (including mortgage payments, insurance premiums, property taxes, and utilities) have risen most? How have cost increases varied before and since the pandemic?
- How have housing cost increases varied by household characteristics and geography?
- To what extent have rising homeowner costs affected homeowner affordability?

To answer these questions, we use panel data from the American Housing Survey for 2015-2023. The survey is uniquely suited to this purpose, with detailed information on individual and aggregate homeowner expenses. The survey is also longitudinal, allowing an examination of how specific homeowner costs have changed for individuals over time. Methodologically, we use descriptive statistics and multivariate regression models to determine how cost increases are associated with different household characteristics. To estimate changing costs, we will look at matched pairs of homeowners over every two-year period (2015-2017, 2017-2019, etc.) to determine how costs have increased for existing homeowners.

In preliminary tabulations, total monthly costs for homeowners nationally increased 31 percent from 2015-2023. Property taxes had the largest increase, rising 63 percent, followed by insurance (46 percent), utilities (30 percent), and mortgage costs (28 percent). Housing costs have risen especially sharply in 2021-2023, when housing costs rose 13 percent. Over this period, utility costs for homeowners rose 20 percent, followed by insurance costs (12 percent) and mortgage payments (11 percent). Additional research will explore how costs have grown for individual

households over time using the longitudinal nature of the survey as well as examine how cost increases have contributed to the rise in cost burdens.

Better understanding the drivers of housing cost growth will have important implications for planners and policymakers. As non-mortgage costs rise, local officials can invest in policies and programs to address affordability concerns, especially for existing lower-income homeowners and homeowners on a fixed income who are most vulnerable to increased costs. Potential policies include energy retrofits or energy rebates; insurance subsidies or other programs to make homeowners insurance more widely available; and property tax rebates.

Unequal Burden of Growth: Housing Cost Pressures on Renters Near Prominent Firm Entries

Abstract ID: 1844.0.0.381.2025

Track 6: Housing

Individual Paper Presentation Submission

Eunjee Son [Georgia Institute of Technology] eson38@gatech.edu, presenting author

Brian An [Georgia Institute of Technology] yan74@gatech.edu

Business developments have significant social and economic impacts on the communities in which they are established, generating jobs, attracting additional firms and workers, and driving housing demand and real estate investment (Greenstone et al., 2010; Hartman-Glaser et al., 2023). This economic activity often reshapes local housing markets, and can lead to rising property values and shifting neighborhood dynamics (Chapple & Jeon, 2021; Chen et al., 2023; Pope & Pope, 2015). While existing research primarily focuses on how these changes affect homeowners and property values, the implications for renters remain underexplored. At the same time, the issue of housing affordability among renters has gained increasing attention in planning literature and policy discourse. Previous studies highlight a growing cost burden on renters, particularly low-income households, and its severe impact on their well-being and health (Acolin & Reina, 2022; Berlin, 2024; Collinson, 2011; Fernald, 2015; Seymour et al., 2020). More recently, this concern has extended to moderate-income renters, highlighting growing financial strain on a broader segment of the population due to rising rent and stagnant incomes (Colburn et al., 2024; Garcia & Metcalf, 2024; Hermann et al., 2024). Given the significant role that high-impact firms play in transforming local housing markets, it is essential to understand how their presence affects renters across income levels, particularly as rising property values and housing costs may disproportionately burden those who do not own homes.

This study investigates how placement of prominent businesses in neighborhoods affects the share of renter households burdened by housing costs—defined as spending more than 30% of household income on housing. The analysis examines renter groups by Area Median Income (AMI) in census tracts near firm locations across Georgia, a state that has attracted numerous major investments due to its pro-business environment. Using a staggered difference-in-differences framework (Callaway & Sant’Anna, 2021; Sun & Abraham, 2021), the study estimates group-time treatment effects, leveraging data on publicly announced entries of prominent firms compiled by Georgia Power Economic Development (2015–2022), along with tract-level time-series Comprehensive Housing Affordability Strategy (CHAS) data from HUD.

Results indicate a statistically significant increase in the percentage of moderate-income renters (80% to 120% AMI) experiencing housing cost burden in neighborhoods with new firm locations compared to control areas, with effects persisting across multiple years after treatment. Notably, five years after firm entries, the share of cost-burdened moderate-income renters increased by approximately 8.88 percentage points ($p < 0.001$), even after adjusting for neighborhood characteristics such as racial composition, educational attainment, population density, rent levels, and housing stock. In contrast, renters in other income groups did not exhibit statistically or substantively significant impacts.

This study contributes to the literature on housing affordability challenges faced by renters, particularly in relation to market dynamics and local economic growth. Findings suggest that high-impact firms can exacerbate financial pressure on moderate-income renters in nearby areas, likely due to heightened competition for limited housing supply. For planners, these results underscore the importance of anticipating housing demand—across housing submarkets and income groups—associated with business-driven developments, and of expanding affordable housing options particularly for households that fall outside traditional subsidy programs. Future research should examine variations in firm characteristics and evaluate the role of local housing regulations in mediating these

impacts, helping to inform policies aimed at addressing housing affordability challenges linked to regional economic development.

Upland Expansion: Co-Producing Eco-Culturally Healthy Housing for Coastal Adaptation by Tribes

Abstract ID: 1844.0.0.1020.2025

Track 6: Housing

Individual Paper Presentation Submission

Daniel B. Abramson [University of Washington Department of Urban Design and Planning] abramson@uw.edu,
presenting author

Julia Kriegh [University of Washington] jak33@uw.edu

Dylan Stevenson [University of Washington Urban Design & Planning] dylste@uw.edu

Lynne Manzo [University of Washington] lmanzo@uw.edu

On the north shore of Willapa Bay in Pacific coastal Washington, the Shoalwater Bay Indian Tribe (SBIT) is developing sustainable and culturally relevant strategies for upland expansion in response to climate change-driven sea level rise and other threats to their coastal ecosystems and community. The situation is urgent as the reservation is located in the most rapidly eroding stretch of Pacific coastline in the US, on near-sea-level land that is vulnerable also to catastrophic tsunamis from a Cascadia subduction megaquake, and is also vulnerable to storms and landslides that threaten access, communications, and power supply. In anticipation, the Tribe has purchased back from timber harvesting corporations upland tracts adjacent to their reservation, where they seek to both develop relocation housing and also re-establish healthy and climate change-resilient forest ecology. SBIT recently received \$25m from USDOT to build an access road into the uplands to enable future relocation; \$6m from HUD to build two duplexes of affordable housing in the uplands and prepare a site for a third; \$1.25m from the US Economic Development Administration to develop a master plan for the upland community; and \$500k to improve Tribal broadband connectivity. These investments are only a start; over time, the Tribe seeks to develop additional sites for housing, services and programs, including Tribal Housing and Elder Assisted Living, an Economic Development District, a Justice Center, administrative buildings, museum, Health Clinic and “edible trails” for food sovereignty, active living, and retention of cultural identity and traditions according to the principle that “culture is health.” This long-term vision is challenged by the immediate need for affordable housing in the existing coastal lowland community, by residents' attachment to living close to the shore, and by concerns that upland development will conflict with biodiversity and habitat restoration, by residents' attachment to living close to the shore, and by concerns that upland development will conflict with biodiversity and habitat restoration. While many tribes in the Pacific Northwest are engaged in similar “moves to higher ground,” they are constrained by the standards and procedures required by the federal grant programs that fund them. To more effectively address the challenges mentioned above, the proposed solutions require freedom to innovate and test new prototypes. Since 2022, a partnership between the Tribe and a team from the University of Washington’s College of Built Environments has co-produced regenerative designs for housing that: (1) use locally produced materials (mycelium and sargassum fiber insulation) with local labor according to Passive House energy conservation performance standards and pin pile foundations to minimize soil disturbance and hydrological impacts; and (2) can be built modularly with prefabricated panels and other components that can be assembled, disassembled and reassembled to occupy different sites in sequence. The designs thus allow housing to minimize energy demand; to “grow” or “split” to accommodate changing household family sizes and structures; be erected on sites with minimal need to convert forest or wetland; and to be moved from site to site if necessary to avoid hazards such as retreating shorelines or wildfires, to make way for wetland and forest restoration, and to support a sense of continuity of dwelling and home-identification through the relocation process. Such modularity and dis/re-assemblability echoes historic plank house building practices that supported Shoalwater people through seasonal migrations between home sites across a traditional territory that was much larger and more ecologically diverse than the reservation to

which their community has been restricted since Euro-colonization. Development of these prototype designs is still underway, but this presentation describes the work's process, aims, and planning policy/professional implications.

Nations and cities face challenges of providing affordable housing for lower income families. Housing scholars have noted a global trend of residualization of affordable housing policy due to the neoliberal policy transformation since the 1980s. Housing is increasingly viewed via the lens of homeownership, investment, and wealth accumulation, while government-assisted housing programs are reserved for only poorest families. Comparative housing policy literature thus contrasts residual and universalistic housing regimes, based on observations in advanced capitalist economies in North America and Western Europe (Kenney, 1995).

However, other scholars argue that such dichotomous distinction is insufficient to account for East Asia housing policy systems where housing is utilized as an instrument for advancing economic goals, making it a productivist housing regime (Holliday, 2000). In China, while the government dramatically expanded public investments in affordable housing policy, scholars nevertheless suggested a hybrid housing model where affordable housing serves national developmental agendas (Zhou & Ronald, 2017). While debates over housing regimes primarily focus on cross-nation variations, recent literature has emphasized local-level variations often through comparative case studies (e.g., Zhou & Ronald, 2017; Li & Shamsuddin, 2022). Scholars have argued that national housing policy is subject to how localities reinterpret the policy goals and targets, bundle it with local priorities, eventually forming localized policy discourses and actions (Ma and Liu, 2024). While many studies focus on local policy actions and outcomes, little is known about how localized discourses about affordable housing evolve, diverge, and converge over time, reflecting the temporal dynamics between national policies and local actions.

Adopting the discourse network analysis approach (Leifeld, 2013), this article investigates structural and temporal characteristics of local discourses of the public rental housing program, a core component of China's national affordable housing framework. Through extensive web search we compile a total of 3,549 news reports on local PRH programs, covering a total of 167 cities during 2009-2019. We conduct systematic content analysis to identify local discourses of PRH's target populations over time, and construct city-discourse networks across different stages of the PRH program.

Preliminary analysis identified cross-city divergence between a residual model (PRH serving lowest and low-income families) and an inclusive model (expanding coverage to moderate-income families). Yet despite this divergence, our analysis shows the dominance of diverse discourses linked to a productivist housing regime, where local PRH programs target economically important groups (e.g., talents, new employees, migrant workers, enterprise workers, employees at industrial parks), while also revealing an undercurrent reminiscent of work-unit based welfare allocation (e.g., government employees, essential workers). Further discourse network analysis expects to find: (1) cross-city variations and emulations of productivist discourses, reflecting how a social policy such as PRH is bundled with local growth priorities, and (2) a recurring trend of divergence and convergence among local discourses, reflecting intricate dynamics between national policy design and local actions. Our research contributes to the international scholarship on to the intergovernmental dynamics of affordable housing policy evolution.

What use is housing evaluation in a changing climate? Learning with Alaska

Abstract ID: 1844.0.0.931.2025

Track 6: Housing

Individual Paper Presentation Submission

Meghan Holtan [SUNY University at Buffalo] mtholtan@buffalo.edu, presenting author

Alaska is a region marked by rapid climate change, housing innovation, and nested Indigenous and nation-state governance structures. Extreme weather events, wildfires, flooding, permafrost melt, and rising sea levels impact housing, which in turn influences community health and well-being. Tribal housing providers are on the front lines of the climate response in Alaskan communities. Policymakers and planners use evaluation to “close the loop” on climate adaptation and to avoid maladaptive practices. However, there is a lack of practical strategies for small local governments and community-based organizations to incorporate evaluation and monitoring into their housing efforts. This research draws on housing evaluation literature from the fields of social work, planning, and public policy, and theory from science and technology studies (STS) to examine how evaluation can help housing organizations plan for climate adaptation in Alaska. Entities like housing providers are a key link between government policymaking and the implementation of housing strategies that support climate adaptation and action.

This paper answers the question: How are organizations using monitoring and evaluation at the intersection of climate adaptation, housing, and community development? I interview and compare findings from two sets of interviewees: housing providers working on the ground in Alaska and evaluation experts from around the globe. The underlying aims of this research include understanding: 1) how climate change impacts or does not impact housing providers in Alaska, 2) what information and metrics related to housing and climate adaptation are most useful and where it comes from, and 3) how housing providers make decisions or “evaluate” options in this context. From this research, I recommend evaluation best practices that fit within housing providers’ current knowledge needs and workflows.

This research is guided by and produced as part of larger project to support tribal, Indigenous, and community-based housing providers to evaluate and communicate their work in a changing environmental and political climate.

Where's the Shortage? Housing Supply and Neighborhood Quality Among and Within Metro Areas

Abstract ID: 1844.0.0.524.2025

Track 6: Housing

Individual Paper Presentation Submission

Rolf Pendall [University of Illinois Urbana-Champaign] rpandall@illinois.edu, presenting author

Yonah Freemark [Urban Institute] yfreemark@urban.org

Housing is increasingly unaffordable in the United States—not only in coastal regions long known for high prices, but also in many communities across the country’s interior. A range of factors contributes to the crisis, including rising mortgage interest rates, which directly affect homeownership affordability. However, many scholars and policymakers have focused growing attention on a more systemic cause: inadequate housing supply (Glaeser & Gyourko, 2003; Mallach, 2023). This perspective has gained traction at the national level. For example, Kamala Harris’s 2024 presidential campaign called for a 50% increase in housing production over four years to close the supply gap. One frequently proposed strategy to meet this goal is to reform zoning and other land-use regulations to facilitate the construction of more housing (Been et al., 2019).

While national estimates suggest that several million additional housing units are needed, the location and nature of that need remain unclear. Even if supply is increased significantly, it is unlikely that adding units in one part of the country will improve affordability in another. The shortage—if there is one—is not monolithic; it is spatially uneven, varying across regions, metropolitan areas, and even between adjacent neighborhoods. Understanding where shortages exist and what drives demand in different places is essential for designing more effective and equitable housing policies (Hilber & Schöni, 2022; Rosenthal, 2021).

This project focuses on the intra-metropolitan scale and asks: where, within metro areas, is the housing shortage most acute, and where, by contrast, might we say there is a neighborhood quality shortage? This breaks down into two related research questions. 1. To what extent would more people live in a given neighborhood if they could afford to do so? 2. What factors contribute to the persistence of low demand in neighborhoods that, on paper, appear to have desirable physical and geographic characteristics?

To answer the first question, we develop a typology of neighborhood housing demand using two axes: affordability (e.g., housing costs relative to incomes) and environmental or social quality (e.g., school ratings, life expectancy, and exposure to pollutants—drawing from HUD’s AFFH data). We hypothesize that neighborhoods high in quality tend to be less affordable, and vice versa. We then assess how this typology aligns with actual indicators of housing demand, including homeownership and rental rates, tenure-specific vacancy and turnover rates, and net migration. This allows us to identify neighborhoods where latent demand may exist and estimate how many additional housing units would be needed to meet it.

To address the second question, we compare high- and low-demand neighborhoods within each metro area. We explore differences in housing growth and population change, the spatial distance between demand extremes, and how unevenly growth is distributed. For example, in Chicago, some neighborhoods have experienced significant population loss while others nearby have rapidly gained residents. These contrasts suggest that metro-level dynamics—such as transportation access, legacy disinvestment, and racial or economic segregation—shape neighborhood demand in complex ways. By analyzing both demand indicators and the metropolitan conditions that surround them, we aim to develop a more nuanced understanding of how housing shortages manifest at the neighborhood level and how targeted policy responses can address them.

Who's Not Forming Households? A Demographic Decomposition of the U.S. Housing Shortage

Abstract ID: 1844.0.0.1047.2025

Track 6: Housing

Individual Paper Presentation Submission

Seongmoon Cho [University of Southern California] seongmoc@usc.edu, presenting author

Declines in household formation have raised urgent questions about housing shortages in the United States. While some argue that housing supply has kept pace with household growth (McClure & Schwartz, 2025), this interpretation overlooks latent demand. That is, households that could have formed but did not, often due to affordability constraints. A measure of housing shortages, therefore, must consider how changes in household formation behavior differ from what would be expected given population structure.

There has been a body of literature that explains trends in household formations. On the one hand, economics literature has explored headship rate declines—particularly among young adults—mostly relying on regression-based Oaxaca-Blinder decomposition method (Paciorek, 2016; Acolin et al., 2024). These models capture the effects of changes in population composition but fail to explain shifts in headship rates by subgroup of population. On the other hand, in planning literature, demographic standardization has been applied to estimate “expected” household formation, offering an alternative way to estimating unmet housing needs (Monkkonen 2013; Myers et al., 2002). Building on these approaches, this paper introduces a demographic decomposition method to explain changes in headship rates within subgroups, revealing which populations have most altered their household formation behavior since 2000.

Using 2000 decennial census and 2019 1-year ACS Public Use Microdata, I decompose the change in aggregate household formation into two components: (1) demographic shifts in age, racial-ethnic, and housing type composition, and (2) changes in subgroup-specific headship rates. The results show that approximately 40% of the decline in household formation can be attributed to racial composition—particularly the growing share of non-White populations, who historically have lower headship rates. However, most of the decline is driven by within-group changes in household formation preferences, especially among White young adults aged 25–34, whose headship rates have fallen disproportionately. Notably, the preference for owner-occupied single-family housing also decreased more than for other housing types.

Extending the analysis to census tracts, I apply 2000 subgroup headship rates to the 2020 population structure to map localized unmet housing needs. Findings reveal that preference for outer suburban areas has declined, while central city neighborhoods have remained stable indicating a reversal of suburbanization trends. These geographic variations are correlated with urban form, including distance to CBD, neighborhood morphology, measured using urban morphometric indicators.

This paper’s methodological contribution is practical. The decomposition requires only two cross-tabulated datasets—population and household counts by subgroup—and can be implemented at small geographic levels using publicly available census data. In contrast to regression-based methods, which are data-intensive and limited to metropolitan or national scales, this technique provides a transparent, replicable framework for identifying unmet housing needs in neighborhoods. In sum, this research provides an application of demographic decomposition to housing shortage estimation, offering empirical insights into which populations and neighborhoods are most affected by housing shortages. By revealing the behavior of household formation and enabling neighborhood-level analysis, this work contributes both new evidence and a usable tool for planners and housing policymakers.

Aging, Housing Affordability, and Homelessness

Abstract ID: 1842.0.0.300.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Jinyhup Kim [Keimyung University] jyk@kmu.ac.kr, presenting author

The primary objective of this study was to expand research on community-level factors influencing homelessness, with a focus on examining the interactions between aging, housing affordability, and homelessness. By employing the Department of Housing and Urban Development (HUD)'s point-in-time counts of homeless persons without shelter and those in shelters gathered on a single night in January 2020 across 396 Continuums of Care in the United States, multilevel regression models revealed that as the percentage of renters earning less than 30% of the area median family income (as defined by HUD) increased, there was a significant increase in both overall and chronic homelessness. Similarly, a higher proportion of renters in this income bracket was associated with a substantial increase in both sheltered and unsheltered homelessness. Notably, when lower-income renters included a greater number of older adults, the severity of homelessness significantly worsened. These findings highlight the need for policy changes to reduce homelessness rates, particularly in aging societies.

Differences in Investor Behavior in Post-Financial Crisis Property Tax Lien Markets

Abstract ID: 1842.0.0.955.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Patrick Alcorn [University of Illinois Chicago] palcor2@uic.edu, presenting author

Since 2013, investors have purchased approximately \$350 million in delinquent residential property taxes in Cook County, Illinois. When owners do not pay their property taxes, Illinois state law requires local jurisdictions to auction the delinquent taxes to recover a portion of the lost revenue. After a tax lien certificate is purchased, the homeowner is then obligated to repay the tax amount plus penalties and interest to the lien holder. If they are unable to pay the full amount within a specified period, the lien holder can petition to take possession of the deed. However, this is a rare occurrence. Most tax liens are redeemed and the owner retains possession of their home. Tax lien purchases are thus more similar to financial instruments than outright property acquisition strategies.

Broadly, both property tax delinquency and tax lien purchases are spatially concentrated, reflecting racialized geographies of property. The racialization of home ownership is well documented, including “predatory inclusion” in mortgage markets (Taylor 2019) through subprime lending and racialized differences in housing price appreciation (Markley et al 2021). Research also demonstrates how Black and Brown homeowners are disproportionately harmed by inflated property tax assessments (Berry 2021) and tax foreclosures (Akers and Seymour 2018). Others have further explored the growing use of complex financial instruments and the fiscal restructuring of municipal governance (Peck and Whiteside 2016). In this presentation, I explore the interconnections between municipal tax policy, predatory finance, and racialized logics of property as they are articulated within the property tax lien market. I address the question: how does the financial and geographic structure of the property tax lien market create attractive investment opportunities for different types of tax lien buyers?

Using data from the Cook County Treasurer’s Office, I use spatial and quantitative methods to analyze the property tax lien market. Through a series of generalized linear mixed models, I compare the spatial patterns of investment of various types and sizes of tax buyers, finding significant differences in their respective portfolios in terms of their property- and neighborhood-level characteristics. Large institutional investor purchases are concentrated in predominately Black and low-income neighborhoods with the highest volume of available tax liens. While these liens are likely considered riskier due to redemption uncertainty and higher property value volatility, the structural characteristics of large investors enable them to bear heightened risk in exchange for earning higher interest rates. Smaller investors, on the other hand, are less likely to pursue such liens, and are more likely to purchase less risky, lower return liens in neighborhoods with higher property values and a lower percentage of Black residents. The result is that when low-income homeowners, particularly Black homeowners, become tax delinquent, they experience a unique modality of financial extraction as the tax liens on their property are more likely to bear higher interest rates.

My contribution is twofold. First, I demonstrate the diversity in the activities of investors as a result of the geographic and financial segmentation of the tax lien market. Second, while abundant research has addressed systemic racial inequities in home ownership and tax foreclosure, investor activity in tax lien certificates has been underexplored. Planners and policymakers must understand the particularities of tax lien investment, particularly how it creates opportunities for financial extraction and exacerbates racialized landscapes of homeownership.

Enhancing Interagency Collaboration for Equitable Housing Recovery in Baltimore County

Abstract ID: 1842.0.0.295.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Sayma Khajehei [Towson University] skhajehei@towson.edu, presenting author

Baltimore County, situated in the mid-Atlantic region, faces escalating risks from climate-related disasters, including flooding, severe storms, and hurricanes. Its geographic location and proximity to the Chesapeake Bay exacerbate these threats, particularly for socially vulnerable populations such as low-income households and residents of subsidized housing. These groups encounter disproportionate challenges in disaster recovery due to systemic barriers, including limited financial resources, bureaucratic complexities, and inadequate access to recovery assistance. Given these vulnerabilities, effective interagency collaboration is crucial for ensuring an equitable housing recovery process. This research examines the current state of interagency coordination in Baltimore County, identifies barriers to effective collaboration, and explores strategies for improving housing recovery efforts for at-risk populations.

This study employs a qualitative research approach, integrating a comprehensive review of Baltimore County's disaster management plans, policies, and programs with semi-structured interviews with key informants. These informants include representatives from emergency management services, housing departments, public health organizations, and community-based organizations. The research investigates how agencies interact, the challenges impeding coordination, and best practices that can enhance collaborative efforts. Data analysis is conducted using qualitative content analysis in Atlas.ti to identify key themes, obstacles, and potential solutions.

Preliminary findings suggest that while agencies recognize the importance of collaboration in housing recovery, several persistent challenges hinder effective coordination. These include fragmented communication, overlapping roles and responsibilities, resource and capacity limitations, and inequitable access to assistance. These findings underscore the need for policy and procedural reforms to improve interagency collaboration and ensure that socially vulnerable communities receive timely and sufficient post-disaster housing support. By addressing these gaps, this research aims to provide actionable insights for policymakers, emergency planners, and housing advocates. Strengthening interagency coordination will ultimately contribute to more equitable recovery outcomes and bolster community resilience in Baltimore County and beyond.

Housing and Food Insecurity among College Students: What can Planners and Legislators do?

Abstract ID: 1842.0.0.1130.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Azza Kamal [University of Colorado Boulder] azza.kamal@colorado.edu, presenting author

This research attempts to answer two questions, 1) how could planners and campus administrators of the US higher education respond to the housing crisis, and 2) what are the tools that the US campuses could employ to mitigate housing and food insecurity and homelessness?

Research shows that more college and university students every year report experiencing housing insecurity and homelessness (Goldrick-Rab, S. et al., 2018). An NPR report indicates that more than 1.5 million college students in America are homeless. Eight percent of American undergraduate students are homeless, according to a survey of more than 2,000 colleges by the U.S. Department of Education, and five percent of graduate students are homeless. Students who cannot find a safe and permanent place to live cannot achieve their potential in our classrooms. To achieve education equity, it is imperative that campuses come together to address this issue and create a funding stream and partnerships across the beyond the local community. Researchers assessed housing insecurity through surveys to establish a baseline for housing and food demand. Vogt et al. (2018) developed a Student Housing Insecurity Mapping (SHIM) tool for a self-assessment inventory. The tool was helpful to initiate a broad conversation across campus. It recommended conducting training for faculty and staff to address housing insecurity, establishing partnerships with community organizations, assessing students' needs during breaks, initiating alternative housing options, creating an emergency housing partnerships, and offering emergency funds for students. Before joining higher education system, and under the McKinney Vento Homeless Assistance Act (National Center for Homeless Education, 1987), youth experiencing homelessness receive intentional support and guidance during their elementary and secondary education. To continue to support them in the higher education system so they can excel and thrive, Vogt et al. (2018) recommended that, campuses may have a member of the staff act as a single point of contact (SPOC). Legislations in nine states have created support system and designated a homeless liaison on college campuses (School House Connection, 2025).

The campus of the University of Colorado Boulder is a case study for this research to develop a publicly accessible geospatial, navigation tool to access and monitor campus resources for students who have reported housing or food insecurity or experienced -or at risk of- homelessness. Namely, Housing and Food Navigator [HAFN], the tool connects students during times of adversity, inclement weather conditions, and emergency needs with immediate access to resources including safe and quality housing and food and other permanent solutions to mitigate the risk of homelessness and starvation. HAFN's critical support system connects students with campus and community resources, support their success, and ensure a pathway -similar to their peers- for graduation with dignity and empowerment. As reports from campuses nationwide indicate that minority and international students are the most vulnerable categories among undergraduate and graduate cohorts, HAFN tool offers an equity lens, through which I am examining environmental and economic justice to study the impacts of climate change and financial burdens on students.

The outcome of this research addresses the lack of reciprocal benefits that could increase resources from a campus-community partnership, examines housing legislations and programs in the community, maps existing resources using Esri GIS Apps, and establishes an interactive Dashboard and Story Map using Esri platforms for creating housing and food navigation tool. Anonymous testimonials from two focus groups with students will be

included in the StoryMap, and semi-structured interviews with leaders of several divisions that oversee student service offers insights on funding and budgetary concerns.

This presentation will share preliminary findings from a HUD-funded study aimed at enhancing the effectiveness of the U.S. Department of Housing and Urban Development's (HUD) Housing Choice Voucher (HCV) program. The study examines the experiences of communities displaced by gentrification in the Greater Nashville Region, marked by rapid demographic shifts and significant minority population displacement.

The overall research focuses on three main objectives: (1) mapping the relocation patterns of displaced populations, (2) exploring the housing challenges they face in new environments, and (3) evaluating the effectiveness of HUD's HCV program in meeting their housing needs. While existing literature connects gentrification and displacement, it often overlooks the housing experiences of those affected. This study aims to bridge that gap by integrating insights from these areas.

The presentation will highlight preliminary findings on factors influencing residential decisions and housing experiences among displaced populations. Using qualitative methods such as focus groups and in-depth interviews, the researcher aims to uncover motivations for relocating from gentrifying areas, the choices of new residential locations, and the challenges faced.

Ultimately, this research seeks to provide insights that can improve the responsiveness and effectiveness of HUD's housing assistance programs, fostering equitable urban development amidst gentrification.

Research Questions:

- What motivations led disadvantaged populations to leave gentrifying neighborhoods?
- What perceptions attracted them to their current neighborhoods?
- Does the new neighborhood offer necessary amenities?
- What key housing challenges are they experiencing?
- What challenges do renters and homeowners face?
- Is the current location providing a better housing experience?

The methodology will involve testing interview and focus group instruments. The researcher will collaborate with the Nashville International Center of Empowerment (NICE) to identify displaced individuals for evaluating their residential choices.

Gary Taylor [Iowa State University] gtaylor@iastate.edu

Monica Haddad [Iowa State University] haddad@iastate.edu

Restricted zoning regulations are widely considered to be a factor contributing to the affordable housing crisis in North America (Wegmann, 2019). Over the years, zoning reforms such as upzoning and flexible zoning have been introduced to alleviate this crisis. While upzoning has led to increased housing production in some cases, its effectiveness in achieving affordability and density objectives remains inconsistent (Gabbe, 2018; Kuhlmann, 2021).

Among various zoning reform strategies, Planned Unit Development (PUD) emerged as a tool to provide zoning flexibility to encourage higher-density, mixed-use, and innovative development while allowing developers to bypass traditional restrictions (David, 2019). However, their adoption has declined over time, despite their potential. This decline is often attributed to political uncertainty, inconsistent approval processes, and lengthy negotiations over public benefits (Moravec, 2009). Challenges such as extended approval timelines, developer risk, and political opposition have constrained PUDs' effectiveness (David, 2019). Some studies suggest that PUDs can facilitate higher-density development, yet others highlight that uncertainty in the approval process discourages their utilization (Moravec, 2009).

The impact of PUDs on housing prices and density remains underexplored, particularly in comparison to conventional zoning approaches. To explore this, this study seeks to investigate the use of PUDs and whether PUDs have contributed to increased housing affordability, housing supply, and higher-density development in one U.S. Midwestern suburb. The City of West Des Moines, Iowa, presents a valuable case study due to its extensive use of PUD zoning, with around 142 designated PUD zones over the course of 50 years. This study aims to answer the following research questions:

1. What was the quantity of housing developed through the use of PUDs versus conventional development units in West Des Moines from 2010 to 2020?
2. How did housing prices vary in PUDs compared to those in conventionally zoned areas in West Des Moines from 2010 to 2020?
3. How did housing densities vary in PUDs compared to those in conventionally zoned areas in West Des Moines from 2010 to 2020?

This study employs a mixed-method approach. For the background of this study, we will conduct interviews with public officials to understand the use, intent, and objectives behind PUDs' adoption and utilization in West Des Moines since 1973. For the first question, we will geocode building permit data from West Des Moines, which will allow us to calculate and compare the total number of housing units developed under PUD and conventional zoning from 2010 to 2020. For the second question, we will use hedonic difference-in-differences (DiD) model to estimate the effect of PUD designation on housing prices as the dependent variable. Each permit entry will be assigned to a dummy variable indicating whether it falls within a residential PUD or a conventionally zoned residential area. We will include control variables such as the number of rooms, the lot size of the units, and the number of parking spaces. For the third question, we will examine development density between 2010 and 2020

by extracting the permitted residential density values from zoning documents for both PUDs and conventional zones. Using kernel density estimation, we will present the findings on the variation in densities for PUDs versus what we get when developed conventionally over time.

The findings of this study will provide empirical evidence for urban planners and policymakers seeking data-driven insights on the outcomes of zoning flexibility through PUDs compared to conventional zoning, particularly in suburban contexts. As cities consider zoning reforms to address housing shortages, this study offers a grounded understanding of whether PUDs are a meaningful mechanism for housing production and pricing outcomes.

Promoting Housing Production Through Brownfield Redevelopment

Abstract ID: 1842.0.0.298.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Gabriel Roberson [Kansas State University] gsroberson@ksu.edu, presenting author

Susmita Rishi [Kansas State University] srishi@ksu.edu

Shakil Kashem [Kansas State University] shakilkashem@ksu.edu

The availability and affordability of housing continue to be pressing concerns across the United States. As housing cost -burdens continue to rise for both renters and homeowners, there is an urgent need for innovative strategies to address the crisis—particularly for disadvantaged populations. Brownfields— previously developed sites adversely affected by actual or perceived contamination—present an unrealized opportunity to address this housing crisis (Alker, 2000). With over 450,000 such sites nationwide, brownfields offer significant potential owing to existing infrastructure, proximity to urban amenities, and alignment with smart growth principles (Schopp, 2003). Despite their potential, brownfield-to-housing projects remain underexplored in planning scholarship, with existing research primarily focusing on either general brownfield redevelopment or post-development impacts (Adams, De Sousa, & Tiesdell, 2010). This study intervenes at this juncture to ask: How can brownfield redevelopment be leveraged to expand housing supply and improve affordability? In doing so, it contributes actionable insights for municipalities, planners, and policymakers seeking equitable and sustainable solutions to the nation’s housing crisis (Glaeser & Gyourko, 2018).

This study was conducted in two phases, using a multi-source qualitative design. In Phase I, we conducted a systematic literature review to assess the current state of knowledge on brownfield-to-housing redevelopment, with a particular focus on policy frameworks, redevelopment models, and implementation barriers. Phase II involved a comparative case study analysis of selected brownfield-to-housing projects. An inventory of successful redevelopment projects was developed in collaboration with the Technical Assistance to Brownfields (TAB) Program. Projects were evaluated based on location, funding structure, number of housing units created, and redevelopment scale. From this inventory, three case study cities were selected to ensure variation in municipal population size, project scale, and financial models. For each case study, we conducted stakeholder interviews with local planners, government officials, housing agencies, nonprofit organizations, and community representatives. These were complemented by document analysis of policy reports, planning documents, and funding records to evaluate regulatory frameworks, redevelopment processes, and financing strategies.

Preliminary findings point to three critical factors influencing the success of brownfields-to-housing projects. First, the presence of a community champion or lead institution is essential. This entity— whether a public agency, nonprofit, or private organization—serves as the driving force behind the redevelopment process, ensuring continuity and stakeholder engagement. Second, remediation costs and liability concerns must be addressed before sites are transferred to developers. Developers are often reluctant to assume responsibility for environmental cleanup due to its high costs and legal risks. Third, housing projects for specific population groups— such as veterans, transitional housing, or elderly populations— have higher success rates. These targeted projects often access additional funding sources and garner stronger political and community support, expediting project approval and completion.

By identifying these key success factors, this research provides evidence-based guidance for improving the feasibility of brownfield-to-housing projects. It fills a critical gap in urban planning scholarship and advances policy relevant strategies for addressing the affordable housing crisis through land reuse and equitable redevelopment.

Spatial Dynamics of Gentrification and Housing Choice Voucher Use in the Greater Nashville Region

Abstract ID: 1842.0.0.731.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Research currently in process

Rafael Harun [Tennessee State University] sharun@tnstate.edu, presenting author

Victoria Amoako [Tennessee State University] vamoako@my.tnstate.edu

The greater Nashville region is undergoing significant urban transformation, driven by economic growth, population growth, and rising real estate values. These changes have led to shifts in neighborhood characteristics, including evolving socioeconomic conditions and increasing challenges with housing affordability. Housing Choice Vouchers (HCVs), a federal program designed to assist households in accessing affordable housing, are particularly influenced by these dynamics. Understanding how HCV use varies across neighborhoods experiencing different levels of change is critical for evaluating the program's effectiveness and informing housing policy decisions. Despite the importance of this issue, limited research has systematically examined the relationship between neighborhood change and HCV use, underscoring the need for a detailed investigation into these patterns and their implications.

Focusing on the Greater Nashville Region, This study addresses three key research questions: (1) Which neighborhoods in the greater Nashville region are gentrifying? (2) How does HCV use differ across neighborhoods experiencing varying levels of gentrification? (3) What are the broader implications of spatial differences in HCV use across neighborhoods registering distinct levels of gentrification? To answer these questions, neighborhoods are first categorized into distinct levels of change using a Gentrification Index developed by integrating real estate prices, income levels, and other socioeconomic variables. Statistical analysis is then conducted using data on HCV use obtained from the U.S. Department of Housing and Urban Development's (HUD) open data sources. This analysis examines the percentage of voucher households across neighborhoods with varying levels of gentrification to identify patterns and disparities in voucher utilization. Finally, findings from these analyses inform an evaluation of regional dynamics and their implications for housing policy interventions.

The results of this research aim to provide a deeper understanding of how neighborhood dynamics influence HCV use patterns and offer evidence-based recommendations to support effective housing policies. By addressing these critical questions, this study seeks to contribute to sustainable urban development strategies that address housing affordability challenges while ensuring that housing assistance programs remain responsive to changing urban conditions. The insights generated will be valuable for policymakers, housing authorities, and urban planners working to adapt housing strategies in rapidly evolving metropolitan areas like Nashville.

Worth the Risk? Forming an Organizational Insurance Captive to Support Affordable Housing

Abstract ID: 1842.0.0.555.2025

Track 6: Housing

Research-in-Motion Presentation Submission, Innovative practices, concepts, and ideas for pedagogy

Matthew Gebhardt [Portland State University] mfg@pdx.edu, presenting author

In 2024 there were 27 separate weather and climate events that resulted in over \$1 billion in damages. This trailed only 2023, which saw 28 \$1 billion weather and climate disasters (Smith 2025). The increasing prevalence and costliness of these events is one significant factor influencing the increasing cost of insurance for housing. Sharply escalating insurance premiums are one of the most significant drivers of operating expenses for multiunit rental properties, including affordable housing, increasing at a rate more than triple that of the next closest operating expense in 2023 (JCHS 2024). Affordable housing is often also assigned higher premiums due to perceived risk associated with construction quality, population, and operations and required to carry higher levels of coverage by lenders and tax credit investors (Schneider 2024). Affordable housing projects operating with fine margins are poorly situated to weather these escalating costs, as they are restricted in their ability to raise rental rates to offset these expenses. Rising insurance premiums are threatening the viability of an increasing number of affordable housing buildings and portfolios.

This project explores the use of insurance captives as an approach to controlling operating expenses in affordable housing through a case study of a recently created insurance captive formed by Home Forward, the public housing authority for Portland and Multnomah County, OR. Drawing upon interviews with staff and participant observations (disclosure: I am Chair of the Board of Commissioners for the organization) and review of documents associated with the formation of the insurance captive, this project presents the decision-making process that resulted in the captive, the risks and benefits of this approach, and the lessons and implications for the larger affordable housing field. This case study further examines the captive performance in response to the January 2024 ice storm that caused significant damage to several Home Forward properties as a stress test of the concept.

Community and State Responses to Precarious Housing

Abstract ID: 1840.0.0.743.2025

Track 7: International Development Planning

Pre-Organized Session Summary

Session Includes: 1844.0.0.447.2025, 1844.0.0.639.2025, 1844.0.0.419.2025, 1844.0.0.720.2025

Leslie Martínez-Román [Texas A&M University] lmartinezroman@tamu.edu, organizer

The starting point of this panel is the issue of precarious housing globally. Precarity, rather than informality or homelessness, refers to larger structures and inequalities shaping lived experiences related to precariousness, reflecting systemic housing failures, as well as commodification, financialization, and the housing conditions entangled with inhumane and racial capitalism. While precarious housing has been acknowledged in academic and policy communities, solutions to such challenges strive to achieve affordable and adequate housing alternatives. Solutions to precariousness are diverse, drawing considerably on different contexts. This panel seeks to contribute to debates on responses to tackle housing precarity in diverse contexts through collective means, bottom-up strategies, state and national approaches, slum upgrading, and cooperatives. Drawing on solutions to precarious housing, we interrogate alternative urban strategies and the notion of precarious housing itself.

Learning Objectives:

- The key objective of this panel is to consider how and under what conditions responses and solutions to precarious housing across different contexts can be advanced to contribute to more equitable cities and spaces.

Community-Based Slum Upgrading in Southeast Asia: Precarious Improvements Along Many Dimensions

Abstract ID: 1844.0.0.447.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Hayden Shelby [University of Cincinnati] shelbyhm@uc.edu, presenting author

Residents of self-built settlements in the Global South experience precarity along many dimensions. These can include physical instability, insufficient basic services, or insecurity due to a lack of recognized land rights. These dimensions are captured by the terms “slum,” and many governments around the world have instituted slum upgrading schemes that have grown more comprehensive over time. Southeast Asia has been at the forefront of state-sponsored slum upgrading for several decades. Multiple generations of policies have been tried, seen varying degrees of success, and served to inform the subsequent programs of neighboring countries. From Indonesia’s Kampung Improvement Program (KIP), touted as the world’s first government-led slum upgrading program in 1969, to Thailand’s current Baan Mankong (“Secure Housing”) policy, multiple countries in Southeast Asia have, in their turn, proffered global models for reducing housing precarity of the urban poor. In this paper, I rely on a combination of literature review and insights from primary ethnographic research to examine the trajectory of slum upgrading in Indonesia, the Philippines, and Thailand. I illustrate how these programs have evolved, learned from each other, and often struggled with the same limitations. I argue that these limitations are inherent to the project of attempting to solve the many dimensions urban precarity through community-based upgrading. This calls into question how scalable or comprehensive these solutions can be.

Taken together, slum upgrading programs in Southeast Asia have followed a trajectory of addressing increasing the number of dimensions of precarity in their goals, from physical to economic to social. From the primarily physical aims of the original KIP to the comprehensive community-driven aspirations of Baan Mankong, upgrading the housing of slum residents is no longer seen to be just about housing security. Instead, it is about using housing as a basis from which to remake politics (Mitlin 2008), empower the poor (Herrle and Ley 2015), and establish new land relations in the city (Pérez-Castro and Somsook Boonyabancha 2019).

These are laudable goals. And sometimes they are achieved, in part. But they are rarely, if ever, fulfilled to the expectations of the strongest proponents of these programs. Quite often, these projects are constrained by limited resources, foiled by conflict, and marred by exclusion of the poorest (Berner 2000; Das 2015). I argue that these efforts to provide greater housing security by upgrading not just shelter but lives and communities have a way of (re)producing other forms of precarity, at least for some residents. This happens for three main reasons. First, the emphasis on cost recovery, specifically the use of collective finance, inherently excludes the poorest residents, sometimes leaving them in an even more precarious state. Second, the processes themselves are precarious, as they require the coordination of vast numbers of people and organizations. Finally, when achieved, formality comes with costs. Debt acquired during upgrading or the costs of transportation in the case of relocation can all move residents from the precarity of informality to financial precarity. Though improvements on these programs have been made at the margins, we seem to be learning these same lessons over and over again. Housing certainly can be a site of empowerment for some people. But the evidence from these programs should also make us ask, should empowering oneself be a prerequisite for achieving stable housing?

Interrogating Experiences of Collective Property: The Case of Rio de Janeiro

Abstract ID: 1844.0.0.639.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Abigail Friendly [Utrecht University] a.r.friendly@uu.nl, presenting author

Land regularization is a global challenge, and has been recognized as key to guaranteeing access to land and affordable housing. In Brazil, land regularization is especially problematic given the scale of informal urban areas. While Brazil's 1988 Constitution includes tools allowing for land regularization, these are increasingly recognized as ineffective in making progress towards access to land. Acknowledging this challenge, several Rio de Janeiro communities began implementing a model based on collective property. Drawing on global experiences with Community Land Trusts (CLT), a type of shared equity ownership where land is separated from buildings on it, this tool became known in Brazil as Termo Territorial Coletivo (TTC).

In this paper, I interrogate recent experiences in implementing alternatives to individual ownership through collective property, specifically drawing on the case of TTC. In the context of debates on precarious housing globally, I explore experiences in the neighbourhood of Grupo Esperança in the western periphery of Rio de Janeiro, a community implementing the TTC model. The case is unique as it is an example of self-built housing constructed through Brazil's federal Minha Casa Minha Vida-Entidades (MCMV-E) housing program, with the houses finalized in 2015. On completion of the MCMV-E project, however, the lack of sufficient documentation led community members to seek alternative arrangements through collective property to secure their permanence, drawing on the community's considerable knowledge and experience with housing autogestão. In such contexts, residents do not have de jure security, meaning that their permanence on the land remains highly tenuous, putting them at risk of eviction.

Exploring the implementation of TTCs in Rio, the article has relevance for broader debates on access to land and regularization in informal communities globally. Despite growing interest in TTCs in Brazil, there has been little exploration of its implementation. I examine the conditions whereby collective property can be effective in challenging the multifaceted issues faced by communities at risk of displacement. Therefore, I ask the following question: Are alternative property arrangements effective strategies to equitably address basic housing and service needs in low-income communities experiencing displacement pressures? Based on qualitative research in Rio de Janeiro in 2023 and 2024 with residents, community leaders, technical advisors and experts in Grupo Esperança and beyond, the article reflects on the broader relevance of strategies related to collective property and precarious housing in Brazil.

Gentrification and Gentefication in Post-Disaster Puerto Rico: Stories of Resilience and Struggle

Abstract ID: 1844.0.0.419.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Ivis Garcia [Texas A&M University] ivis.garcia@tamu.edu, presenting author

Clara Irazabal [University of Maryland College Park] irazabal@umd.edu

This chapter, included in the Routledge Handbook of Precarious Housing, examines gentrification and gentefication in Puerto Rico in the wake of Hurricane María, illuminating the multifaceted forms of housing precarity experienced by residents amid disaster recovery. In line with the Handbook's aim to bridge Global North and South housing debates and explore precarious housing beyond simplistic binaries, the chapter highlights the entanglement of informality, exclusionary federal aid, market speculation, and migration in shaping housing insecurity on the island.

Hurricane María damaged over 1 million homes, disproportionately affecting informal, self-built housing often excluded from Federal Emergency Management Agency (FEMA) and Community Development Block Grant-Disaster Recovery (CDBG-DR) programs due to lack of formal property titles. Personal narratives like those of Rosa, Carlos, Juan, and María illustrate both the structural barriers to aid and the resilience of Puerto Ricans rebuilding with limited resources. These stories underscore how colonial legacies, legal exclusion, and bureaucratic inefficiencies compound vulnerability in the context of disaster.

The chapter further explores how federal recovery programs, such as the R3 and Title Clearance Program, fall short in addressing informal housing, forcing residents to navigate a complex aid system while facing competition in an increasingly commodified housing market. Gentrification and gentefication processes are central to this tension. Diasporic Puerto Ricans, empowered by remote work and tax incentives like Act 22, are returning to the island, investing in property, and often unintentionally displacing long-term residents. While these investors may bring capital and revitalization, they also drive up prices, limit affordable options, and challenge the cultural continuity of existing communities.

Gentefication, defined as a form of gentrification led by affluent Latinx individuals, complicates traditional narratives of displacement. In places like San Juan and Cabo Rojo, even well-intentioned diaspora returnees contribute to real estate speculation and a shrinking pool of affordable housing. Simultaneously, global trends such as the rise of short-term rentals (e.g., Airbnb) and U.S.-based investors purchasing properties for vacation or retirement exacerbate the crisis, converting community homes into commodities.

The chapter also highlights forced migration off the island, as thousands of families—especially those with children—relocated to the U.S. mainland due to destroyed housing, school closures, and stalled recovery. Those who stayed were often older or less mobile, continuing to rebuild under precarious conditions with limited formal support.

In conclusion, the chapter advocates for a multidimensional response to housing precarity in Puerto Rico—one that recognizes informality as a legitimate mode of urbanization and retools aid systems to be more inclusive, culturally competent, and community-driven. Recommendations include expanding aid eligibility criteria, regulating speculative investments, promoting affordable housing, enforcing short-term rental policies, and investing in title regularization. By amplifying the voices of those on the margins, this chapter aligns with the Handbook's broader goal: to reconceptualize precarious housing in ways that address systemic inequalities, colonial legacies, and global housing commodification.

In Defense of Autogestão: Overcoming Barriers to Collectively Managed Housing in Brazil and Uruguay

Abstract ID: 1844.0.0.720.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Ana Paula Pimentel Walker [The University of Michigan, Ann Arbor] appiment@umich.edu, presenting author

The majority of urban housing production for individuals with zero to low incomes in the Global South has occurred through self-help construction in initially informal and precarious settlements. Until the late 1990s, public housing ownership and, to a lesser extent, social rental housing were minimal. However, the new millennium has seen state-sponsored financialization of low-income housing, with large-scale developers leading massive construction projects.

This paper focuses on an often-overlooked approach to low-income housing development led by the third sector, known in Brazil as Autogestão and in Uruguay as Autogestión y Ayuda Mutua. The Uruguayan model of mutual aid cooperative housing was launched in 1970 and has withstood various neoliberal restructuring and neo-developmental policies. This model, which has inspired Brazilian housing movements to propose similar programs and policy reforms, is membership-based. This means that the future residents of the houses take charge of all stages of housing development.

The main objective of this paper is to define autogestão housing production, explain how it differs from other forms of participatory and cooperative housing, and highlight its importance as a form of third-sector housing production. The paper also identifies the challenges faced by autogestão housing, which include bureaucratic obstacles, market-oriented urban development practices, and ideological opposition from various perspectives.

Since 2017, the author has been involved in Participatory Action Research projects and international service-learning capstone experiences with housing movements in São Paulo, Brazil. These movements have many years of experience in drafting programs and producing low-income housing projects through self-management and mutual aid. These engagements resulted in the co-production of reports, physical interventions, grant applications, and capacity-building materials that informed this paper. In March 2023, the author conducted fieldwork in Montevideo, Uruguay. Data was collected through interviews with seven cooperatives at various stages of development, from renovation projects to those still under construction. Uruguay's case is crucial for understanding policy transfer, but it is especially significant due to the durability of its institutions.

The housing and cooperative movements driving these projects in Brazil and Uruguay are undoubtedly the key factors behind the above-average success of these initiatives in a favorable political and institutional environment. They are also responsible for the resilience of these efforts under periods of neoliberal governance. This paper discusses alternatives to overcome the bureaucratic obstacles and market-driven urban development practices, particularly regarding the issue of urban land. Additionally, it reflects on the ideological and ethical questions raised by critics across the political spectrum.

Session Includes: 1844.0.0.270.2025, 1844.0.0.206.2025, 1844.0.0.170.2025, 1844.0.0.351.2025

Flavia Leite [University of California, Berkeley] flavia_leite@berkeley.edu, organizer

Over 83% of Latin America's (LA) population lives in urban areas, and issues of access to affordable housing, the right to the city, and the distribution of land values are central to the region's urban future and are actively debated among social movements, state, and private actors. For this same reason, LA cities have developed some of the most innovative policies and instruments for providing housing, land-based financing strategies and infrastructure. Nearly 30 years after Brazil's City Statute and Colombia's Land Use Law, it is time to critically assess the trajectory and implementation of housing and land policies in the region. This panel is part of a two-part series dedicated to this task. Part I focuses on housing, exploring how state actors regulate and finance housing and infrastructure in LA. The papers examine how state action (or inaction) allows for the rise of corporate landlords, unequal housing subsidies, increasing residential mobility, and spatial inequality.

Learning Objectives:

- Learn how housing policy design, socioeconomic conditions, and institutional practices influence residential mobility and access to public subsidies for low-income homeowners in Brazil.
- Learn about the role of the state in the emergence of corporate landlords in Latin America and the impact of these private actors in the region's housing market.
- Learn about subnational actors' access to climate finance for social infrastructure in Amazonian cities, discussing what is being financed, from which institutional sources, and in which communities.

Returning the Keys: Residential Mobility for Low-Income Homeowners in Brazil

Abstract ID: 1844.0.0.270.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Flavia Leite [University of California, Berkeley] flavia_leite@berkeley.edu, presenting author

Despite the construction of over eight million housing units since the launch of the Minha Casa Minha Vida (MCMV) program in 2009, Brazil's housing deficit has been persistently increasing. Scholars point to a combination of factors to explain this paradox. On one hand, housing regulations and other exclusionary policies have made formal housing more inaccessible, and under constrained economic conditions, low-income families were pushed toward informality (Maricato, 2014; Rolnik, 2022). At the same time, MCMV itself has often operated more as a stimulus to the real estate sector than as a response to the housing needs of Brazil's low-income population, leading to a mismatch between what is built and where the housing deficit is concentrated (Shimbo et al., 2022; Cardoso et al., 2018).

This paper introduces a novel explanation that remains largely unexplored in the literature: the possibility that MCMV fails to reduce the housing deficit also because many low-income families do not remain in the units they receive. Focusing exclusively on the lowest-income tier of the program, this research shows that many beneficiaries exit the program by informally selling or renting out to relatively higher-income people — frequently returning to their previous informal homes. In other words, those who leave the MCMV program return to become part of the housing deficit.

This research adopts a mixed-methods approach that combines quantitative and qualitative data. Using panel data from Cadastro Único, Brazil's unified registry system for low-income people, I identify beneficiaries of the MCMV (Faixa 1) in the city of São Paulo and monitor changes in their residence, family and socioeconomic characteristics, over time. Importantly, I differentiate between two types of residents: those forcibly relocated to MCMV units through favela removal policies, and those who voluntarily applied to the program. Using a survival analysis approach, I estimate the likelihood of remaining in an MCMV unit over time and identify the factors associated with early exits. I find that housing stability varies substantially across demographic and project characteristics. Women with children and older individuals are more likely to remain in their MCMV units. Also, those living in projects with lower condominium fees are also more likely to remain in place. Importantly, those who were forcibly relocated tend to leave more quickly than voluntary movers.

To give texture to the quantitative findings, I draw on over 50 semi-structured interviews with MCMV residents in 10 projects in the city of São Paulo. Many interviewees describe the high cost of housing, in terms of condominium fees and utility payments, as the main reason for leaving their newly allocated apartments. Others describe social isolation, distance from work, and lack of adaptation to condominium living as reasons for informally selling and renting these apartments. Some respondents even expressed a preference for monetizing their home (by renting and selling) over long-term homeownership.

Taken together, these findings call into question the equation of housing formality with a permanent improvement in housing conditions. While MCMV expanded access to ownership on paper, its ability to generate stable housing outcomes is limited by both program design and people's preferences. For some low-income families, MCMV housing can be a long-term home, but for others it is better used as an asset that they can tap into through informal sale or rental to supplement their low incomes (Spader & Quercia, 2011). These findings raise important

questions about the sustainability of large-scale homeownership policies, and their ability to address the housing deficit, highlighting the need to rethink them in light of the everyday strategies and priorities of the urban poor.

Disentangling the State's Role in the Emergence of Corporate Landlords in Santiago, Chile

Abstract ID: 1844.0.0.206.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Andrea Urbina Julio [Cornell University] aru8@cornell.edu, presenting author

The growing connection between housing and finance has altered how housing is perceived and defined. Indeed, housing financialization processes are taking place globally, with international actors playing a role in shaping the financial aspects of the housing market (Aalbers, 2016). The incorporation of new actors into the Latin American housing market, particularly "corporate landlords," is creating significant shifts in the expansion and structure of housing patterns. This trend is establishing new practices and financial instruments. Institutional investors, such as investment funds, insurance companies, family firms, and listed real estate companies, can be described as financial actors who own and manage residential buildings, offering thousands of units for rent. Corporate landlords use specific real estate instruments to invest in the residential rental market, such as equity funds, hedge funds, or REITS (Real Estate investment trusts).

Currently, four countries in Latin America have the presence of corporate landlords: Chile, Colombia, Mexico, and Brazil; while this is still a new trend, the escalation of this model is increasing fastly. In Latin America, the model's appearance is related to new multifamily high-rise buildings expanding in downtown areas of metropolitan cities. For example, in Santiago, Chile, by 2023, more than 130 buildings will be under operation with more than 30.000 units. On the other hand, in Bogotá, where 45% of the population lives in a rental housing solution, this new real estate business has also arrived through the hands of local and international corporations.

Through the housing financialization process, the State has been key to the development and proliferation of corporate landlords worldwide, creating the mechanism, regulation, and instruments to allow this process. For example, in Spain, State intervention played a crucial role in strengthening the participation of private investors. Similarly, the active role of the State in the promotion of a subsidy system for the homeownership and mortgage debt system in Latin America; countries such as Chile and Mexico are examples of the economic and financial transformation of the housing market. However, little has been studied on the connections between state policies and the arrival of corporate landlords, the role of local governments, and specific local mechanisms and regulations that have allowed the possibility of a new rental market trend.

This paper looks to untangle the State's role in the emergence of corporate landlords in Latin America. Thus, to understand and identify the legal and financial regulations and strategies that allow the development of Corporate Landlords. Specifically, this paper analyzed the legal framework and institutional capacities by looking at the Chilean case. Through in-depth interviews with public officials and staff members and document analysis of legal and financial regulation, this paper provides an understanding of how housing deregulation has permitted the expansion of corporate landlords in the region.

I argue that by analyzing the Chilean case, this research will contribute to the understanding of the impacts of corporate landlords in the region and examine the relationship between the State and landlords, looking at the implications of the political economy of Latin American cities and the consequences to the local housing affordability crisis.

Climate Adaptation Financing in the Rapidly Urbanizing Amazon

Abstract ID: 1844.0.0.170.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Gabriella Carolini [Massachusetts Institute of Technology] carolini@mit.edu, presenting author

Mrinalini Penumaka [Massachusetts Institute of Technology] mpenumak@mit.edu

Sylvia Jiménez Riofrío [Massachusetts Institute of Technology] jimenezs@mit.edu

The Amazon region intersects urbanizing areas in Bolivia, Brazil, Colombia, Ecuador, French Guiana, Guyana, Peru, Suriname, and Venezuela. Seismic climatic changes to its biosphere—through deforestation, severe droughts, forest fires, fossil fuel extraction—and their concomitant impact on land use, settlement patterns, water resources, and, critically, Indigenous communities who have long stewarded rural lands, is precipitating major challenges in the Amazon. These challenges have resulted in the displacement of vulnerable groups and rapid, unplanned population growth. In extant financially scarce resource contexts, sub-national groups and municipal governments therein have an acute need for climate finance to both stem displacement and to better accommodate urban growth in the Amazon to ensure more sustainable and equitable urban futures. Despite a diverse and complex host of public and private financing sources supporting climate mitigation and adaptation actions, scholarship knows little about how well cities and subnational groups in this region fare in securing funds to tackle the intersecting crises of climate change, urban poverty, Indigenous displacement, and their implications for urban development. Research on urban climate adaptation in the Amazon region is scant. Instead, scholarship on the Amazon has primarily focused on biodiversity, climate change, hydrology, and hydropower within the region. Notable exceptions include research by Inoue (2012) on Amazonian municipalities, Malhado (2017) on climate governance and regulatory frameworks for agricultural expansion, and Londres et al. (2023) on place-based sustainability initiatives led by local grassroots organizations with extended engagement in the Amazon.

Building on this smaller body of research, we examine the landscape of institutional climate finance available to and accessed by subnational players in the Amazon biosphere, with a particular focus on understanding those who have successfully secured funds for adaptation. We ask a basic but complicated question: where and what does climate finance reach within the urbanizing Amazon? More specifically, in this paper, we explore which projects get financed, from what institutional sources, and which communities and geographies. Drawing on a novel dataset comprising financial data and projects financed by over twenty multilateral climate finance funds and coupling this with environmental, socioeconomic, and geospatial data, we analyze the interscalar and urban governance of climate finance in the region. This paper identifies characteristics among sub-national actors that have accessed climate finance (particularly for adaptation), the nature of climate projects financed, and the technical aspects of that finance in explicitly addressing the Amazon region's urbanization and climate change challenges. Although there has been significant progress in monitoring biodiversity and bioclimatic uncertainty and deforestation using geospatial techniques, we show that an information gap persists, especially when it comes to up-to-date information on rural urbanism, extended urbanization, and proto-urbanism as emergent fields of research and on Amazonian settlements as targets of urban climate funding. We conclude with key recommendations to institutions financing climate adaptation in the region to better ensure climate finance collaborations are attuned to the needs of subnational governments and Indigenous groups as they confront rapid urban growth, dynamic and cascading climate stress, and environmental inequities across rural, peri-urban, and urban areas in the Amazon biosphere.

Designed to Include, Structured to Exclude: How Brazil's MCMV Policy Fails Its Poorest Beneficiaries

Abstract ID: 1844.0.0.351.2025

Track 7: International Development Planning

Pre-Organized Paper Presentation

Julia Paiva [University of Illinois at Urbana-Champaign] jdpaiva2@illinois.edu, presenting author

Flavia Leite [University of California, Berkeley] flavia_leite@berkeley.edu

Minha Casa Minha Vida (MCMV), Brazil's flagship housing policy, has delivered over 8 million units since 2009. Designed to increase homeownership for low-income households through supply- and demand-side subsidies, MCMV operates within two competing objectives: reducing the housing deficit and promoting economic growth. Fifteen years after its inception, the literature on MCMV indicates that economic growth ended up being prioritized to the detriment of reducing the housing deficit. Several authors have pointed out this contradiction and analyzed how the program outcomes serve the real estate sector, but not Brazil's low-income population (Klintowitz, 2016; Shimbo et al., 2022; Rolnik, 2019; Cardoso, 2013; Paiva, 2024). While these critiques focus mainly on implementation outcomes, little attention has been paid to the program's design—specifically, how homeownership is constructed as a policy solution for the housing deficit and whether affordability is truly achieved.

This paper addresses that gap by asking whether MCMV, as currently designed, effectively delivers homeownership to its intended target groups. By answering this question, we show that MCMV's design systematically benefits higher-income households within each income bracket, undermining the goal of increasing access to affordable housing and homeownership for lower-income groups. We provide empirical evidence of how affordability is distributed across income groups participating in the program and propose a broader research agenda for evaluating mass homeownership programs in Brazil through the lens of affordability.

We analyze MCMV administrative data linked to Brazilian census data to identify patterns in access and affordability across income brackets and regions. Using the universe of MCMV-financed mortgages, we estimate the maximum affordable mortgage payment for beneficiaries in each income range and compare these values with the actual unit purchased and household income. We find that as housing prices increase, beneficiary incomes don't keep up—calling into question the program's assumption that higher-priced units go to people with proportionally higher incomes. Our findings reveal a troubling pattern: higher-income households within each bracket are more likely to access the cheapest units, leaving lower-income eligible households with limited or no viable options. In practice, this means the upper end of each income range disproportionately benefits from the available housing supply.

Secondly, by analyzing income eligibility levels across different phases of the program, we find that broader income brackets reinforce exclusion within the eligible population and reduce affordability. Moreover, our results reveal a spatial pattern of exclusion across Brazil, with intensity varying by municipality size and level of economic development.

These dynamics show how both State policy design and private sector practices interact to shape exclusion. In particular, we describe how the State plays a key role by designing income brackets too wide to capture the high levels of poverty and inequality in Brazil or account for the diversity of the over 5.5 thousand municipalities. This leads to poor targeting of public resources—especially under fiscal austerity—where political incentives favor subsidies to less risky, higher-income households. These findings are especially relevant for Brazilian housing policy given the recent MCMV expansions to higher-income groups, which risk deepening inequality.

This paper reveals the urgent need to reassess both the design and implementation of mass homeownership programs. We argue for recalibrating income thresholds, improving targeting, and guaranteeing affordability so that homeownership can truly advance housing justice. More broadly, our findings call for a housing policy agenda in Brazil that places affordability at its core—an approach still largely absent from current literature and policy debate.

Track 7 Roundtables

Improving Development Finance for Sustainable Urban Infrastructure in the Global South

Abstract ID: 1843.0.0.291.2025

Track 7: International Development Planning

Roundtable Submission, Topical Discussions

Paul Smoke [New York University] paul.smoke@nyu.edu, organizer

Eugenie Birch [University of Pennsylvania] elbirch@design.upenn.edu

SHISHIR MATHUR [San Jose State University] shishir.mathur@sjsu.edu

David Jackson [UN Capital Development Fund] david.jackson@uncdf.org

Mauricio Rodas [University of Pennsylvania] rodas@upenn.edu

Urban finance is one of the most neglected aspects of urban planning. It is well established that major investments in public infrastructure are required in the Global South to increase economic growth, to promote inclusive development and to address the global climate crisis, among others. Needs are expected to surge as (mostly urban) population continues to grow, inequalities worsen, and climate change demands accelerate in many countries.

Urban governments play or could play a major role in providing more public infrastructure. Unfortunately, deficiencies in local and intergovernmental governance/accountability, planning and financing mechanisms result in underperformance on this front. Yet there is ample reason (and evidence) to expect subnational governments in many countries, particularly metropolitan and city governments, to contribute more to sustainable development through public investments, public revenue generation, and managing public functions that contribute to both local and national goals.

Innovations in funding are essential to alleviate infrastructure gaps. Much urban infrastructure in the Global South is financed by intergovernmental fiscal transfers and special mechanisms that provide concessional finance (often from international finance institutions like the World Bank) that require sovereign guarantees, making them risky for a finance ministry. Grants and subsidized lending for local infrastructure remain essential in many countries, but if inappropriately used they can discourage creditworthy cities from commercial borrowing and deprive disadvantaged local governments of grants and subsidized loans. Green investment funds and facilities to guarantee subnational debt, among others, could increase available financing and relieve some of the burden on national governments of financing urban investment and providing subnational debt guarantees.

More appropriately structured and targeted investment finance along, however, is insufficient. Sustainable urban investments require provisions to cover recurrent costs. Once infrastructure is built, it must be operated and maintained, and any debt used to build it must be paid off. Thus, in many countries, broader governance and fiscal reforms are needed. Recurrent revenue mobilisation is needed from both traditional (e.g., property taxation and user fees) and innovative (e.g., land value capture) sources. Implementation of even the best development plans depends on these funds.

A range of efforts are underway globally to help solve the sustainable infrastructure finance crisis. One such effort is the Sustainable Development Solutions Network (SDSN) Global Commission for Urban SDG Finance. This panel will report on research and efforts by this Commission and a range of other actors to meet the investment finance challenges faced by cities in the Global South.

Building on sessions at past ACSP conferences, the roundtable will consider these questions:

- How can new means to finance urban investment in the Global South reduce challenges with existing mechanisms, increase available resources, and target finance appropriately? What can cities do independently and what support/coordination is needed from higher levels of government, neighboring jurisdictions, and external organizations?
- How can cities use existing and develop new revenue sources for more effective and equitable operation and maintenance of infrastructure and to service any debt incurred to build it?
- How can planning academics and practitioners conduct better research and devise actions needed to improve urban finance for sustainable development planning?

This panel includes ACSP planning academics and practitioners from international development organizations working on these issues to share their ideas, findings and experiences. The panelists will offer comments and generate discussion among the roundtable participants.

Urban development driven by developmentalist capital states—whether through state-led infrastructure development, speculative urban redevelopment, or large-scale housing projects—remains the predominant force transforming cities across Asia (Doucette & Park, 2028), Latin America (López-Morales et al., 2023), and Africa (Panell & Pieterse, 2010). Today, we are witnessing diverse ways in which developmentalism—an ideology and practice that prioritizes economic growth and progress through strong state intervention—continues to shape planning and govern cities across different geographies. With the spread of neoliberalism and financialization, the traditional boundaries of developmental states as bureaucratic institutions have become more fluid. Moreover, distinguishing between ‘state’ and ‘non-state’ actors has become more challenging as these diverse forces become more intertwined in planning initiatives. Emerging and hybrid forms of developmentalism differ from conventional models in that states’ presence becomes more subtle, dispersed, and nuanced (Shin et al., 2020; Tomba, 2014) while also increasingly functioning at the urban scale (Doucette & Park, 2018). As social and spatial marginalization persists in developmentalist cities globally, these shifts call for a renewed analytical lens to reassess the challenges and potentials of developmentalist cities—past, present, and future—especially in contexts where the state is both omnipresent and absent.

In this context, we invite participants to critically examine fundamental questions of planning in contemporary developmentalist cities: (1) “Who are the planners in developmentalist cities?”, (2) “What planning goals do development projects serve for the public?” and ultimately, (3) “What does planning entail in developmentalist cities?” Through these discussions, we aim to deepen our understanding of the lived experiences of planning and its implementation on the ground. We also aim to raise critical theoretical questions regarding the applicability and transferability of planning theories from the Global North, such as communicative planning and equity planning, that have imposed specific responsibilities on planners.

By re-examining the multifaceted manifestations of planners in developmentalist cities, this session will discuss various possibilities for moving beyond existing theoretical frameworks of understanding developmentalist cities. These possibilities include but are not limited to (1) critically engaging with prevalent views that characterize the state as a centralized and omniscient figure and (2) highlighting the temporal dimensions when the state manifests through diverse interactions and encounters in planning projects. Towards the end of the roundtable, we will explore the broader question of what developmentalism means and how it has evolved in planning. By bringing scholars and practitioners working in diverse contexts of developmentalist cities, this session aims to foster collective reflections on alternative urban possibilities and futures.

Over the past few decades, China's rapid urbanization has been a key shaper of global urban development. At the same time, ongoing geopolitical tension between China and the U.S. has greatly reduced scholarly exchange and knowledge about urban planning issues in contemporary China.

China's urban transformation over the past four decades has not only reshaped its domestic spatial, social, and political landscapes but has also become a critical reference point for understanding urbanization in the Global South/East and beyond. The country's large-scale infrastructure projects, planning institutions, experimental governance, and urban-rural restructuring have generated a wealth of empirical cases and theoretical provocations for the field of urban planning. Yet, amid intensifying geopolitical tensions and the contraction of academic exchange between China and the United States, research on urban China is becoming increasingly siloed and is often excluded from comparative dialogues that shape global planning discourses.

This roundtable will feature a range of scholars working on urban China, focused on the question of what research on China can contribute to broader planning research and policy. Participants will reflect on how empirical studies of China's urban development provide unique insights into major planning challenges, including transportation, infrastructure, housing policy and affordability, digital governance, climate resilience, and low-carbon urban transitions. Special attention will be given to how China's distinctive political economy, institutional arrangements, and experimental urbanism challenge conventional planning theories rooted in liberal-democratic contexts. This conversation will offer some comparative reflections on China's progress made in areas such as infrastructure planning, climate change adaptation/low-carbon planning, digital planning, and housing development—focusing on trends emerging in China in the last five years or so. Challenges facing China's urban development, such as population decline, real estate downturn, and the strain on local finances will also be touched on. The roundtable will reflect on what lessons research on China's development planning can offer cities in the U.S. and elsewhere.

Another area of conversation is the future of China-U.S. scholarly exchange on planning—focusing on issues such as professional exchange and Chinese students studying in U.S. planning programs. The roundtable also explores methodological and pedagogical questions. What challenges do researchers face when conducting fieldwork in China amid growing restrictions? How can planning programs in the U.S. meaningfully incorporate Chinese urban experiences into their curricula? How might we rethink comparative planning in light of limited data access, censorship, and declining academic exchange?

Finally, the roundtable will discuss the future of China-U.S. scholarly collaboration in urban planning. With fewer Chinese students entering U.S. planning programs and professional exchanges under strain, the roundtable will discuss strategies to maintain open, critical, and productive channels of dialogue across national boundaries. By placing research on urban China at the center of a broader conversation about planning theory, method, and

education, this roundtable aims to reinvigorate transnational engagement at a time when it is most urgently needed.

Aspirations for a Post-digital Rural Landscape: A Typological Study of Digital Solidarity in China

Abstract ID: 1844.0.0.1134.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Sufeng (Sophia) Xiao [Harvard University] sxiao@gsd.harvard.edu, presenting author

Based on an 8-month fieldwork study, this research paper catalogs spatial manifestations in rural areas of China's Yangtze River Delta Region and examines the social and spatial processes that support their emergence, replication, and maintenance. It illustrates how village-centered digital solidarity is becoming a powerful engine for transforming the rural landscape into a post-digital era. That means, with the widespread adoption of digital technologies, these villages are encountering new opportunities for industry diversification and integration. This transformation is leading to a renewed focus on lifestyle changes for local farmers, residents, and "new" villagers.

Using a descriptive case study approach with ethnographic methods, this research examines villages that have undergone digitalization and have experience collaborating to learn, build, and operate digital tools and platforms for new rural businesses (such as e-commerce, Airbnb, and social media livestreaming). Through multiple site visits and in-depth fieldwork, I found these villages have developed social relationships that extend beyond traditional rural Chinese kinship and neighborly ties. Multiple groups now share compatible long-term visions for their village's future, forming lasting collaborative partnerships to pool resources and contribute to various development projects in one area. Many participants have even become permanent residents, settling in as new villagers and facilitating new forms of reciprocity in the villages.

Through analysis of planning documents and local government budgeting reports, this paper first examines the spatial transformation processes in the case study villages and investigates common space typologies that reflect, support, and amplify digital solidarity. Drawing on participant observation as a planning researcher and designer, along with semi-structured interviews with key stakeholders—including government officials at various levels, village leaders, new and old villagers, agricultural technology companies, large farms, rural tourism operators, and business coaches from poverty-alleviation foundations—the research reveals how social and spatial processes are deeply intertwined.

Despite widespread incentive policies under Rural Revitalization directives, rural development remains challenging, with few examples of stable, self-sustaining success. Infrastructural improvements, policy and funding support, or well-designed projects alone cannot guarantee success. This research offers a bottom-up perspective by examining the socio-spatial relationships between digital solidarity and post-digital rural spatial practices. It reveals where challenges, conflicts, negotiations, and shared interests emerge throughout these processes. This approach not only helps local stakeholders co-develop projects and build solidarity groups but also guides planners and policymakers in China and beyond to recognize and protect the subtle features of rural landscapes that allow solidarity to flourish and visions to materialize.

Individual Paper Presentation Submission

Tahir de Noronha [University of California, Berkeley] tnoronha@umich.edu, presenting author

Solano Jose Savio Da Silva [BITS Pilani] solano@goa.bits-pilani.ac.in

Democratic planning around the world faces a critical challenge: the instrumentalization of planning institutions for political patronage. Benjamin (2008) argues that planning in India operates through informalized governance structures that privilege elite interests over formal democratic mechanisms. We argue that this isn't an Indian issue alone – one can look at Indonesia, where Suharto's regime created several parastatal land agencies headed by a coalition of military and political leaders, and monetized land on the periphery of Jakarta (Shatkin, 2017) and the US, where a few months ago federal interventions and changes in leadership within the Department of Transportation nearly derailed congestion pricing in New York City.

Special purpose governments (SPGs), Planning and Development Authorities (PDAs), and other parastatals have long been used in democracies to bypass local governments—whether to push through locally contested projects or separate infrastructure debt from municipal budgets (Foster, 1997). In Goa, India these entities serve an even more explicit political function. This paper argues that planning positions function as political capital, solidifying coalition governments and rewarding legislators who “defect” across party lines. We term this phenomenon “planning as currency.”

India's smallest state has developed a parallel governance structure through a proliferation of parastatal planning agencies, accommodating coalition legislators and centralizing land use and infrastructure planning, effectively circumventing constitutional mandates for local government autonomy and democratic checks and balances.

This study utilizes mixed methods including document analysis of appointment orders, legislative records, and land conversion approvals, supplemented by interviews with political actors and planning officials. We analyze the history of the parastatals, and appointment patterns of state legislators across nine key parastatal planning authorities from statehood in 1989 to 2024, documenting how these positions correlate with political defections and coalition formation in the state government at the cost of local autonomy.

Our findings reveal that planning positions—rather than cabinet berths—have become the preferred currency for political accommodation. Legislators reported to be the architects of the three most recent coalitions in 2017, 2019 and 2022 for example, have all been given the Town Planning ministry (Prabhudesai, 2021), arguably because this portfolio allowed them to dictate memberships of multiple PDAs. A state legislator we interviewed corroborated this, saying they “preferred a Planning and Development Authority (PDA) to a ministerial berth.”

We identify three mechanisms through which planning as currency operates: (1) Land monetization (Shatkin, 2017), a phenomenon observed across South and South East Asia, where the state through public policy facilitates the conversion of peri-urban land for capital interests, (2) infrastructure project allocation to a cabal of politically-connected contractors and developers (Heller et al, 2016), and (3) selective enforcement of regulations against some constituencies (Benjamin, 2008).

The consequences for planning practice are significant: climate-conscious objectives in Goa's Regional Plans, the State Agriculture Policy, and the State Action Plan for Climate Change are systematically undermined by a shadow planning regime that prioritizes elite interests over accountability. The deep empirical base and access to historical

records in Goa allows for an analysis of how planners and political scientists can anticipate plan monetization and strategise solutions in the future.

Beyond the rural-urban divide: Trust in local government among three populations in China

Abstract ID: 1844.0.0.1052.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Chen Zhang [Duke-Kunshan University] cz167@duke.edu, presenting author

Kathy Quick [University of Minnesota] ksquick@umn.edu

The legacy of rural-urban developmental imbalance and China's household registration (i.e., the hukou system) institution stratify Chinese citizens into three populations — rural residents, urban natives, and rural-to-urban migrants. These three populations have fundamentally distinct values, lifestyles, and socioeconomic status. They have also been assigned to different tiers of social welfare. Effective governance of these diverse and divided populations in urbanizing China requires a deeper understanding of their potentially different political orientations and attitudes toward government. However, urban scholars have limited knowledge regarding the geography of political trust, especially how rural-to-urban migrants' attitudes might be different from their rural and urban non-migrant counterparts. Our study fills this knowledge gap by examining the trust levels of these three populations in the county-level governments where they reside. We utilize data from the China Family Panel Study (CFPS) in 2014 and employ the propensity score matching method to match rural-to-urban migrants and rural residents with comparable propensities to migrate. This comparison found that rural-to-urban migrants are 6.7% less trusting of the county government than their rural non-migrant counterparts. Such a comparison captures the joint effects of migration and residential environment (rural vs. urban) on individuals' political trust. Then the method of mechanical matching is used to compare rural-to-urban migrants and urban natives. This comparison found that rural-to-urban migrants are 3.5% less trusting than their urban counterparts. This difference reflects the joint effects of migration and institutional identity (rural hukou vs. urban hukou) on individuals' political trust. Without matching, people who live in the countryside are 8.2% more trusting in government than people who live in cities. Migrants' lower political trust levels signal a problematic citizen-government relationship, which generates challenges for both rural-to-urban migrants and local governments in fast-urbanizing countries. Different populations' various relationship with local government therefore merits additional attention to place-based policy to rebuild trust, complementing the existing policies mainly focusing on economic and social improvements.

Bridging through NGO Collaborations: Polycrisis response in Lebanon and Turkey.

Abstract ID: 1844.0.0.1159.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Hayfaa Abou Ibrahim [University of british columbia] hayfaai@student.ubc.ca, presenting author

The world is facing a complex array of interconnected crises. From the persistent implications of the COVID-19 pandemic and hazards intensified by climate change to interrelated environmental, socioeconomic, and political crises, wars, and acts of genocide, we are witnessing increased exposure of ever-more vulnerable populations (Oliver-Smith, 2022). As these social, environmental, and natural hazards converge, the risk of compounded crises is rising, and collaborative action is increasingly viewed as necessary to deal with these challenges effectively and humanely as a community (Bryson et al., 2006). When compounded crises collide - they produce what has been termed “polycrises” - a phenomenon typified by interwoven and overlapping crises. This research seeks to understand how nongovernmental organizations (NGOs) providing shelter and basic urban services tackle the challenge of collaboration and bridging - a task increasingly required due to the growing complexity of overlapping risks and disasters.

This research compares the role of NGOs under different governance modes and asks how they manage to collaborate and bridge gaps across different actors and institutions when hit with multiple crises, i.e., in the case of polycrises. It focuses on Beirut (Lebanon) and Gaziantep (Türkiye), which have been struck by unprecedented natural and manmade disasters while also grappling with multiple protracting, overlapping, and interconnected crises. In February 2023, catastrophic earthquakes hit Southern Türkiye, causing mass displacement of 3.3 million people and forcing 2 million to take shelter in tent camps and container settlements. In August 2020 a huge blast, the largest non-nuclear explosion in human history, rocked Beirut, resulting in significant casualties and destroying more than 300,000 housing units. In addition, Türkiye hosts one of the largest refugee populations in the world, whereas Lebanon hosts the world’s largest number of refugees relative to its national population. In both countries, the most pressing need in the face of polycrises is providing shelter and basic urban services. Access to shelter and urban services is imperative for survival after disasters and crises. The majority of affected populations by the polycrises in Lebanon and Türkiye struggle to access shelter or are inadequately sheltered and live in overcrowded, precarious, and insecure conditions.

Whether NGOs are “thrust into” roles or voluntarily “step up” to address needs in crisis response, they often do so by forming collaboration activities and creating bridges across actors and institutions (Simo & Bies, 2007). In countries where governments are highly involved in disaster response, it is often state institutions that call for collaboration and coordinate actions. This has generally been the case in Türkiye, which has long-established earthquake response plans and institutions and has typically coordinated disaster response through its central government. However, even in the face of a strong role for the Turkish central government in disaster response, preliminary findings show that NGOs played important roles following disasters, as was documented following the devastating Türkiye-Syria earthquake of February 2023, particularly the cooperative and collaborative role played by nonprofit organizations such as Syria-focused nonprofits and others established to respond to the Covid 19 pandemic. In Lebanon, nonprofit organizations have always played a critical role in post-disaster response, often leading disaster and crisis response plans. They have deep historical roots, often predating the establishment of the state – and have fulfilled various roles, especially in response to disasters and crises. This role was exemplified after the 2020 Beirut Port Blast response which was completely governed by nonprofit organizations. Similarly to the 2023 Türkiye-Syria earthquake, previously established NGOs played an important role.

Claiming Right to the Waterscape: Spatialized Ambiguity and Politics of Placemaking in Chattogram

Abstract ID: 1844.0.0.942.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Samira Binte Bashar [The University of Texas at Austin] samira.proytee@utexas.edu, presenting author

The right to access and shape urban waterscapes in Bangladesh is constrained by complex power dynamics defined by class, gender, religion, and caste. In the case of the city of Chattogram, urban Hindu fisher communities have thrived along varied water edges for almost five generations despite their exclusion from urban planning processes. My research explores how these communities claim their rights to the waterscape and hence to the city itself by using spatialized ambiguity as a discursive instrument. Building on Roy's (2009) argument that informality gets operationalized through ambiguity, I argue that ambiguity is neither static nor one-dimensional. In the case of the Hindu fisher communities in Chattogram, ambiguity serves as the basis for claims against external actors but also reproduces unequal social relations within the communities themselves.

I use the term 'waterscape' to refer to the deeply intertwined character of water and society. In the context of South Asian countries like Bangladesh, where informality is a way of life and a dominant mode of urbanism, the concept of waterscape provides a prism through which to investigate 'who controls, who acts, and who has the power to produce what kind of socionature' (Swyngedouw, 1999). Viewing waterscape through a socionatural assemblage lens (Ranganathan, 2015) provides a basis for reimagining the fluidity, permeability, and socionatural materiality of land, water, and in-between spaces and identifying the relational politics that shape the nature of contestation over such ambiguous spaces.

Following the decades-long trajectory of an urban Hindu fisher community's struggle to access the waterscape, I explore residents' politics of placemaking on different 'grounds' – land, water, and in-between spaces. The community, located in Akmal Ali Ghat along the waterfront of Chattogram City, constitutes a multiply marginalized urban minority in terms of class, religion, and caste. Residents identify themselves as "jaladas" (slaves to water) and still largely depend on fishing or fishing-related activities for their livelihoods. The community continues to confront the threat of diminishing access to the different "grounds" that constitute their waterscape. Based on 10 months of ethnographic research, I argue that residents center ambiguity as a discursive instrument in a variety of ways. Maintaining collective ambiguity over fishing ground territory in the fluid 'sea-ground' deters speculation from external actors. Meanwhile, calculated ambiguity surrounding 'khas' land—the damp, transitional coastal zone—allows the community flexible access to public land for various temporary uses. However, when securing rights to 'solid, unwet ground', the community seeks to eliminate ambiguity, asserting land claims through the production of historical documents. Placemaking on these various grounds thus becomes a mobilization of geographical imaginaries, where relationships with nature and the built environment are produced and reproduced by socialized, ecologized, spatialized, and embodied subjectivities (Subramanian, 2009; Sultana, 2009).

As my research demonstrates, the community pursues placemaking practices that are highly attuned to the socionatural ambiguities of the waterscape, thus challenging dominant waterscape planning strategies. At the same time, however, residents deploy ambiguity to maintain and reinforce hierarchies within the community itself. Examining this politics of placemaking will thus further our understanding of contested waterscape production in the context of informal urbanism.

Climate Action Lags in Himalaya: Local Plan Making in Sarkegad Municipality of Humla District, Nepal

Abstract ID: 1844.0.0.463.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Ratna Mani Nepal [Tribhuvan University] ratna.nepal@cnas.tu.edu.np, presenting author

Jiwnath Ghimire [Iowa State University] jghimire@iastate.edu

Remote communities all over the world are facing uncoverable consequences of climate change, even though their carbon footprints are none or minimum. Some of the dire impacts are unfolding in indigenous communities of the Himalayas, where the temperature is rising 1.5 times faster than the global average (Shrestha et al., 2012), resulting in more than 25% glacier loss in the region since the 1980s (ICIMOD, 2011). These changes have created an existential crisis for these communities, creating livelihood havoc and limiting essential ecological services (Pandey and Bardsley, 2015). The rugged geographies, limited options for basic needs, and generational investment gaps in public infrastructures interacted with climate change impacts and associated disasters, incubating social, economic, and cultural vulnerabilities in these Himalayan communities. With the case study of Sarkegad Rural Municipality of Humla District of Nepal, this study strives to explain the growing climate change impacts on Himalayan indigenous communities and the disconnect between these impacts and local planning efforts.

With 10,688 residents in eight wards, Sarkegad Rural Municipality is one of the seven municipalities of Humla district of Karnali Province, disconnected from the national highway networks. The Municipality is experiencing drastic changes in rainfall, snowfall, vegetation, and temperature patterns in recent years. Forest fires and disease outbreaks directly impact livestock and people's livelihoods (Thapa, 2023). The Karnali River, the longest glacier river in Nepal, flows through the municipality and has experienced significant seasonal flow fluctuation in recent years. This study uses 211 household surveys, 8 focus group discussions, and 15 key informant interviews to analyze the impacts of climate change in eight wards of the municipality and local planning efforts to adapt to these impacts. The study finds that the infrastructure and economic priorities overshadowed the climate adaptation actions in local development plans despite the widespread experience of the impacts among the residents of all wards. Local development plans could not mainstream climate change impacts in their future priorities. The situation of Sarkegad Municipality represents the growing climate threat and local planning gaps in the Himalayan regions. Municipalities in the area must be empowered with context-specific planning guidelines and tools to mainstream climate change in the local development planning efforts to build resilient communities in these remote regions.

Professionally grounded spatial practices working in low-income communities blend the technical expertise of the design and planning professions with an understanding of localized needs. They emphasize social justice, community participation, and contextuality in creating functional and empowering spaces, responding to calls for inclusive and democratic approaches to city-building, and a deeper understanding of how urban spaces reinforce or challenge entrenched social inequities. The literature on how NGOs improve living conditions in low-income communities is well established. It includes studies of local and global networks that address various urban issues, from shelter and services (e.g., REHOUSE) to establishing poor women's collectives to manage credit and savings (e.g., Slum Dwellers International, Mahila Milan, SEWA). Such NGO efforts empower residents, particularly women, to gain control of their lives and resources. Their networked approach, connecting local efforts to global movements, has been pivotal in addressing inadequate housing and access to water and sanitation, among others. However, scholarship on how design practices and their technical assistance networks use architecture and urban planning to support poor communities is nascent.

Research on how architectural design can address housing deficits or improve public space through concepts such as self-help and sites-and-services focuses mainly on slum upgrading; few studies explicitly examine the work of justice-oriented professionally grounded spatial practices. Such practices help create spaces that meet technical shelter or infrastructure requirements, and respond to the specific needs of communities, incorporating local knowledge, indigenous and vernacular building traditions for creating sustainable solutions resilient to urban growth, environmental degradation, and the impacts of climate change. Yet, arbitrary conventional housing standards, building codes, and zoning regulations continue to render adequate shelter largely unattainable for the poor. Even sound building attempts outside of formal codes are deemed "illegal" and face the threat of eviction, thereby dissuading the poor from investing in permanent materials. Architectural NGOs are most active in disaster relief and community development (e.g., Habitat for Humanity, Open Architecture Collaborative, Emergency Architecture & Human Rights). However, in the last decade or so, funding from organizations such as the Re:Arc Institute has expanded their scope, shifting the dialogue between architecture and society.

We examine how professionally grounded spatial practices contribute to promoting socially and environmentally just cities, and how they engage in the collaborative creation and dissemination of urban knowledge. Our research draws on discourses of socially engaged architecture, which foreground working towards the public good through design activism, shifting focus away from architecture as an acritical and apolitical market-driven profession, and participatory planning practices in the global South, where poor communities engage with the state to improve their living conditions through coproduction. We present a qualitative case study analysis of two such practices in India and Indonesia, respectively, with expertise in architecture and urban planning. Content analysis, interviews, and site observations offers insights into the guiding principles, tools, methods, and partnerships they leverage to influence policy and shape the built environment. Our findings indicate that their projects are not only a response to persistent socio-technical problems (e.g., shelter, services, public spaces, urban resilience) but also a way to

understand the spatial experiences of diverse marginal subjectivities vis-à-vis city-making processes and establish communication among stakeholders to induce change.

Electricity Access Beyond the Grid: Reliability and Off-Grid Energy Use in sub-Saharan Africa

Abstract ID: 1844.0.0.1089.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Heerae Lee [University of North Carolina at Chapel Hill] heerae@unc.edu, presenting author

Despite continuous efforts for grid expansion, electricity access in sub-Saharan Africa (SSA) remains uneven (IEA, 2022). While some areas have electricity, many households experience unstable supply and others remain entirely off the grid. Ensuring fair and reliable access is central to energy justice, which focuses on equitable distribution and just transitions promoting clean energy solutions (Jenkins et al., 2016; Sovacool & Dworkin, 2015). This perspective requires understanding both cases where grids exist but remain unstable and where grid access remains unavailable. Few studies differentiate between grid availability, household connection, and reliable electricity supply. This simplification may overestimate the benefits of electricity access and underestimate persistent barriers to technology utilization in sub-Saharan Africa. Thus, we examine two key aspects of electricity access in sub-Saharan Africa, assessing variations in access, connection, and reliability. First, we analyze how grid connection and stability affect the use of electricity-powered devices. Even in areas with grid access, frequent outages, high energy costs, or transmission infrastructure hinder adequate energy use. Instability is a pronounced problem as electricity can power devices like mobile phones and the internet, which is crucial for access to information, education, and social interactions (Blimpo et al., 2020; Ingrams, 2015; Aker & Mbiti, 2010).

Second, we investigate off-grid areas where households rely on decentralized renewable energy sources like solar, wind, and battery storage. Given that grid expansion is costly and challenging to maintain, identifying the characteristics of households adopting alternative energy sources and understanding the regional contexts in which these households are concentrated can inform targeted policies supporting sustainable energy transitions.

We utilize nationally representative Afrobarometer household survey data from 34 African countries to classify electricity access into grid availability, actual connection, and stable supply. We apply multivariate regression and quasi-experimental methods, including propensity score matching and synthetic control models to estimate the effects of electricity access and reliability while accounting for confounding factors.

Our findings contribute to the literature by explicitly demonstrating that stable and reliable electricity access significantly increases consistent technology usage among households. Furthermore, we empirically investigate how decentralized energy activities that utilize renewable sources operate and identify their potential to support stable energy use in off-grid regions. Patterns in the data suggest that households with stable electricity access are more likely to report frequent use of mobile phones and the internet, underscoring the importance of reliability in shaping everyday technology use. These insights highlight the need for policies prioritizing reliability enhancements, infrastructure expansion, and planned decentralized renewable solutions. By clearly distinguishing between various dimensions of electricity access, we apply the energy justice framework to emphasize a nuanced approach to achieving equitable and effective energy provision in sub-Saharan Africa.

Fallowing the Fields, Feeding the Fabs: Uneven Ecologies of High-Tech Development in Taiwan

Abstract ID: 1844.0.0.125.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Justin Kollar [Massachusetts Institute of Technology] justinmkollar@gmail.com, presenting author

Across the globe, the expansion of high-technology production has become a cornerstone of national economic strategy and geopolitical positioning—yet beneath this drive lies an extractive infrastructure that reconfigures ecological systems and territorial governance to sustain digital accumulation. In Taiwan, semiconductor production has become a defining force in contemporary territorial politics, anchoring the island's role within global supply chains while restructuring the ecological infrastructures on which everyday life depends. At the center of this transformation is water—reengineered, rerouted, and revalued to sustain high-tech manufacturing. While reservoirs, pipelines, and water recycling systems are heralded as solutions to climate risk and economic resilience, they simultaneously obscure the processes of dispossession and uneven development embedded in their operation. This article argues that the expansion of semiconductor science parks in Taiwan is underpinned by a hidden infrastructure of resource reallocation—where water is systematically redirected from agriculture to industry, enabling the metabolic functioning of chip production while intensifying socio-environmental precarity in rural regions. The study situates this process within broader debates in infrastructure studies and urban political ecology, treating water not as a neutral resource but as a site of political struggle and institutional restructuring.

The central research question guiding this study is: how has the demand for industrial water in Taiwan's semiconductor sector reconfigured hydrological governance and spatial planning, and with what consequences for agrarian systems and territorial equity? The article draws on multi-scalar fieldwork, including interviews with state officials, planners, and farmers; spatial analysis of land use and infrastructure; and a close reading of planning documents and water policy instruments. Empirically grounded and analytically attuned to institutional power, this approach uncovers how science parks—designed to operate semi-autonomously from municipal oversight—have come to dominate not only land use decisions but also the political economy of water allocation. Through mechanisms such as emergency fallowing policies, inter-basin water transfers, and infrastructural guarantees, state agencies have increasingly subordinated agricultural uses of water to the priorities of the semiconductor industry. These reallocations, though often framed as temporary responses to drought, have become normalized, codified through national security logics and planning exceptions that protect industrial continuity at the expense of rural sustainability.

The findings reveal a deeply uneven landscape, where rural regions bear the ecological burdens of an industrial strategy centered on global competitiveness. Since the early 2000s, over 400,000 hectares of farmland have been fallowed during water crises, with compensation regimes masking the structural erosion of agrarian water rights. Meanwhile, the institutional apparatus of planning—including recent spatial governance reforms—has largely failed to address these tensions, as science parks bypass conventional oversight and secure privileged access to national agencies and resource planning forums. In focusing on Taiwan's water reallocation regime, this article makes a broader intervention into planning scholarship by demonstrating how infrastructural systems—often imagined as technical fixes—operate as instruments of techno-industrial power and territorial control. Taiwan's case exposes the environmental and political contradictions of high-tech expansion under conditions of climate volatility and geopolitical insecurity, offering a critical lens through which to interrogate the ecological impacts of the digital economy's infrastructural expansion.

Finding the Best (and Worst) Alternative: Drinking Water Accessibility After the 2009 Zambia Flood

Abstract ID: 1844.0.0.318.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Dafeng Xu [University of Washington] dx42@cornell.edu, presenting author

Drinking water is a basic need, and it is crucial for planners and policymakers to understand how people respond to water crises (Lassiter, 2024), especially in the aftermath of natural disasters when water supply infrastructure faces significant strain (Zhai et al., 2024). The negative impacts of disasters on water accessibility are especially severe in the Global South, where infrastructure is vulnerable, and relevant utility services are often unreliable (Hargreaves et al., 2019; Dube et al., 2021).

We analyze short-term and long-term effects of the 2009 flood—the strongest and deadliest in Southern Africa in decades—on drinking water accessibility in Zambia, using population census and Demographic and Health Survey (DHS) data. Specifically, we analyze whether people’s ideal water source was negatively affected by the flood and, if so, how they chose alternative sources and what policy implications planners could draw from empirical results. As in many African countries, only a small proportion of households in Zambia have access to in-house drinking water supplied by the piped system. Even access to public piped water outside the property—the second-best option—is limited. Some local communities and organizations construct “third-best replacement infrastructure,” namely public boreholes and wells. In the worst-case scenario, people obtain drinking water from open water sources, such as rivers.

Zambia’s three western and southern provinces were affected by the disaster, while other seven provinces remained generally unaffected. We exploit this spatial setting and first present difference-in-differences estimates using 1990-2010 census data to document the flood’s immediate effects. We observe no significant effects of the flood on the access to in-house piped water, which was used by fewer than 20 percent of households, most of which belonged to the highest wealth quartile. In contrast, there was a 9-percentage point decline in access to public piped water (used by around 20 percent of households), corresponding to a 40-percent increase in the proportion of households that had to fetch water from various non-piped water sources.

We present more nuanced understandings of responses to the destruction of water supply infrastructure using 1996-2018 DHS-Zambia data. Compared to census data, DHS data include longer panels of surveys and encompass the specific types of non-piped sources (boreholes, wells, and open water). DHS-based estimates present numerically similar short-term effects: the flood had no significant effects on in-house piped water supply, but access to public piped water declined considerably. But the flood not only had short-term effects; these negative effects persisted nearly a decade.

We further study how people responded to the decline in public piped water. The flood did not increase the time households spent fetching water, but there was a sharp increase in the proportion of households using open water sources, accompanied by an insignificant increase in the use of boreholes and wells. For households without in-house water, the reliance on open water sources was a practical approach to maintaining acceptable travel times, yet it raises concerns about water safety, especially in socioeconomically disadvantaged communities that traditionally experience greater challenges in post-disaster recovery (Rivera et al., 2022).

Our results present key policy lessons. First, the recovery of water supply is fast only in wealthy communities, suggesting social inequality in disaster management. Second, in a country with vast freshwater resources such as Zambia, the destruction of infrastructure may not increase the difficulty of fetching water. But this is because

households prioritize accessibility over quality. Third, policymakers must closely monitor public health issues as people rely on open water sources in the absence of public pipes or replacement infrastructure.

Flood Vulnerability and Leaders' Perceptions in Coastal and Rural Vietnam

Abstract ID: 1844.0.0.597.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Sunmin Jun [Pusan National University] sunminjun@pusan.ac.kr, presenting author

Donghyun Kim [Pusan National University] donghyun-kim@pusan.ac.kr

Climate-induced flooding increasingly threatens communities worldwide, particularly in low-lying areas with insufficient infrastructure. Effective climate adaptation strategies require integrating local knowledge and perspectives into community-based approaches (Ayers & Forsyth, 2009). This study comparatively analyzes flood vulnerability and community leaders' perceptions in two flood-prone communities in Vietnam—Da Loc, a coastal area experiencing urbanization pressures, and Ben Voi, a traditional agricultural inland community. Both areas share common vulnerabilities, including inadequate drainage systems, aging levees, and limited evacuation accessibility, yet exhibit nuanced differences shaped by their geographic and socioeconomic contexts.

Employing a multi-method approach, this study utilized community mapping, surveys, in-depth interviews, and Q-methodology to capture local risk perceptions and identify specific vulnerabilities, as recommended by van Aalst et al. (2008). Community mapping highlighted shared issues, such as frequent flooding of residential areas and critical infrastructure. However, differences emerged in perceived priorities: leaders in Da Loc emphasized improving urban drainage infrastructure and flood prevention facilities to cope with urban growth and tidal influences, whereas Ben Voi leaders prioritized maintaining agricultural productivity and enhancing levee management and rural economic support.

Q-methodology revealed three dominant perception typologies across both regions: infrastructure-focused, economic recovery-focused, and nature-adaptive strategies. While infrastructure improvements were broadly favored, the emphasis varied significantly between the communities, reflecting their unique geographical and socioeconomic circumstances. Da Loc leaders placed greater urgency on structural solutions and urban planning measures, while Ben Voi leaders stressed agricultural resilience and rural economic recovery. These differentiated responses underline the importance of adaptive strategies that recognize local contexts across multiple scales (Adger et al., 2005).

The findings suggest that a community-based adaptation (CBA) approach, recognizing both common vulnerabilities and local differences, can inform more targeted and effective climate adaptation strategies. This comparative perspective contributes valuable insights for policymakers and planners aiming to enhance resilience in similar flood-prone contexts.

Food Security from Genes to Fields: Planning Super-Rice Farms in China

Abstract ID: 1844.0.0.619.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Ettore Santi [Northeastern University] e.santi@northeastern.edu, presenting author

Food-based trade wars are a defining characteristic of contemporary geopolitics. In present-day China, the logic of national security is profoundly reshaping agricultural regions. Since the mid-2000s, the Ministry of Land and Resources has launched national campaigns aimed at increasing agricultural outputs under the “food security” imperative. Following directives from the central government, local state agencies have mobilized architects, planners, bioengineers, and agronomists to redesign agricultural villages into spaces optimized for corporate agribusiness and high-yield crop varieties. Through these interventions, experts have facilitated the transfer of farmers’ land to specialized agricultural enterprises (often state-owned), effectively transforming many small farmers into waged agricultural workers. The state expects that corporate control over rural land will enhance national food self-sufficiency in anticipation of future crises, including a war. This paper investigates these planning practices emerging at the intersection of agricultural efficiency and national security. It asks: What forms of spatial governance does food security take in present-day China? And what are their effects on agricultural villages? The paper argues that a new mode of planning has taken shape—one that interprets food security as a strategic imperative for national sovereignty, economic stability, and the political legitimacy of the Communist Party. This shift marks a departure from previous decades, when local governments prioritized rural land conversion for urban real estate development under what scholars called the “land revenue regime.” Findings reveal that under this emerging mode of governance, termed in this paper “food security regime,” local government officials have little choice but to plan for large-scale corporate agriculture at the expense of small farmers. The paper argues that the food security mentality and associated planning thinking are driving one of the most significant agrarian transitions in recent human history.

The paper examines the planning of hybrid super-rice farms as a case study for the territorialization of the food security regime. Hybrid super-rice, a high-yield staple cereal developed through the genetic modification of hybrid rice, plays a central role in state propaganda on food security and is now a symbol of the geopolitical strength of Chinese science. The paper combines multiscalar analyses of rice genetic design and agricultural planning documents with ethnographic research conducted in rural villages between 2015 and 2018. Findings reveal that bioengineers had initially designed hybrid super-rice as a universal solution to boost smallholder yields and strengthen small farmers’ economy. However, this approach failed to account for the high costs associated with its production, which requires precision farming techniques, mechanization, and large-scale landholdings. As food security concerns intensified in the early 2000s, the Ministry of Land shifted its focus from protecting small farmers to facilitating large-scale agribusiness. Local governments began hiring experts to restructure agricultural land within their jurisdictions, making it more attractive to corporate investors. Planning strategies prescribed farmland consolidation, land clearances, new road networks for industrial transport, hydropower-driven irrigation systems, and designated areas for potential eco-tourism development—all while reclaiming land use rights from villagers. Within the food security regime, the paper shows, high-yield varieties emerged as a “revolutionary” force: their improved genetic tied the state to the prescription of agribusiness land transfers and the national replanning of a corporate agricultural social space.

Individual Paper Presentation Submission

Huijoo Shon [University of North Carolina at Chapel Hill] hjshon@unc.edu, presenting author

Nikhil Kaza [University of North Carolina at Chapel Hill] nkaza@unc.edu

Reliable access to basic infrastructure such as water, sanitation, and energy remains limited in many vulnerable settlements across African countries while climate change continues to reinforce associated social inequalities (Trisos et al., 2022). Although a growing body of literature has examined the intersection of infrastructure, urbanization, and environmental change (Anand et al., 2018; Beard et al., 2022; Dos Santos et al., 2017; Vanegas Cantarero, 2020), empirical studies tend to adopt either place-based or people-based approaches. The former emphasizes the collective management of communal and shared infrastructure, while the latter often explores practices of households and individuals in accessing infrastructure. While the interdependence between these levels has been widely acknowledged, few empirical studies have explicitly examined their interconnection.

Building on the literature, we examine the multilevel structure of infrastructure by analyzing the dynamics between the community-level infrastructure environment and actual household access and practices. The focus is to identify the factors that shape such configurations—particularly diverse settlement types and climate anomalies—given that rapid urbanization and heightened climate risks undermine infrastructure stability. The analysis centers on water, sanitation, and energy, which are essential for daily life and depend on interconnected systems across spatial scales. We address the following questions: (1) How do the presence of water, sanitation, and energy infrastructure at the community level and the reliability of household access diverge within and across communities? (2) To what extent do settlement types (urban, peri-urban, town, and rural village) and precipitation anomalies (droughts and heavy rainfall) affect infrastructure conditions at both community and household levels?

To address these questions, we construct a repeated cross-sectional data frame by harmonizing multiple sources over the past two decades, including Demographic and Health Surveys (DHS), Afrobarometer, Global Human Settlement (GHS) layers, and Climate Hazards Group InfraRed Precipitation with Station data (CHIRPS). We use descriptive statistics to characterize infrastructure configurations and apply multilevel regression models to estimate the effects of settlement types and rainfall anomalies on both the presence of community-level infrastructure and the reliability of household-level access.

Our analysis reveals substantial disparities in infrastructure across communities, with limited coverage particularly in peri-urban areas and rural villages. Even where improved infrastructure exists at the community level, household access remains uneven—largely shaped by household-level characteristics and the degree of settlement urbanicity. In areas that repeatedly experience rainfall anomalies, household-level access and reliability are lower, regardless of the presence of infrastructure at the community level. These findings suggest that while infrastructure may be present to address climate risks, its delivery is constrained by compound social and environmental barriers. The study underscores a persistent disconnect between infrastructure presence and actual reach, highlighting the need for multilevel approaches to infrastructure and adaptation planning that incorporate both spatial and institutional variation across settlement types and climate conditions.

Hierarchy and Global South Network Embeddedness of Nepal's Urban System: A Transport Flow Analysis

Abstract ID: 1844.0.0.956.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Haoyu Liu [Southeast University] 837228863@qq.com, presenting author

Kailun Li [School of Architecture, Southeast University] 779120194@qq.com

In the context of globalization and regional integration, urban network research has progressively emerged as a critical lens for analyzing regional development disparities. Nepal, as a representative developing nation in South Asia, demonstrates an urban system persistently constrained by fragmented topography, inadequate infrastructure, and limited participation in globalization processes. These structural constraints have resulted in pronounced urban-rural dualism and lagging regional coordinated development. Recent years have witnessed transformative spatial restructuring of population mobility and logistics networks within Nepal's urban system, driven by the Belt and Road Initiative's implementation in the trans-Himalayan region. However, existing scholarship predominantly focuses on individual cities or conventional economic indicators, lacking systematic analysis of urban hierarchy dynamics and Global South network embeddedness through the lens of multimodal transport flows.

This study aims to address three pivotal research questions: 1) How to construct a hierarchical model of Nepal's urban system through multimodal transport flow data encompassing road transport, air connectivity, and cross-border logistics? 2) What spatial heterogeneity characterizes Nepalese cities' embeddedness within Global South urban networks? 3) Through what corridor-node-hinterland mechanisms do transport flow networks influence urban systems' globalization pathways? These inquiries critically examine the transformational challenges facing mountainous developing cities in global integration processes.

Adopting a tripartite analytical framework of "data integration-network modeling-spatial verification," this research first synthesizes OpenStreetMap road networks, domestic/international flight data, and World Bank logistics datasets. Subsequently, Social Network Analysis (SNA) quantifies node centrality metrics (betweenness, closeness) and community structures to delineate urban hierarchies. Spatial syntax modeling further deciphers topological characteristics of transport networks, complemented by field investigations validating how international investment projects drive urban network evolution. Preliminary findings reveal: 1) A multi-tiered urban hierarchy centered on Kathmandu, with a Kathmandu-Lumbini-Pokhara fan-shaped structure exhibiting core-periphery fractures in network power distribution; 2) Multidimensional interactions between core and border cities in Global South network embeddedness, particularly demonstrating 2-3 order deeper integration along Nepal-China cross-border highway corridors compared to administrative hierarchies.

This study elucidates Nepal's transport flow-driven hierarchical restructuring and reveals its Global South network embeddedness follows a "transit corridor primacy" principle. The conclusions challenge conventional administrative hierarchy determinism, proposing that mountainous developing nations require resilient transport network construction to achieve network power transition. Policy implications advocate establishing cross-border transport flow monitoring platforms and upgrading regional logistics hubs from corridor-oriented to platform-based models. Theoretically, this research pioneers an interdisciplinary analytical paradigm integrating transport geography and political economy for Global South urban network studies.

How Do Residents Construct and Modify Informal Housing in Informal Settlements of Dhaka, Bangladesh?

Abstract ID: 1844.0.0.509.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Hanae Soma [University of Michigan] hsoma@umich.edu, presenting author

Informal settlements are a prevalent type of housing worldwide, serving as spaces where millions build their lives, driving urban and socio-economic transformations. Recent studies underline the role of informal settlements as essential modes of housing production and forms of urban development (Dovey et al., 2020). Scholars increasingly advocate recognizing informal settlements as legitimate housing and as “permanent fixture(s) of the global urban landscape” (Pojani, 2019, p. 294). Urban resilience and sustainability efforts must start by including informal settlements in the conversation, rather than disregarding them as problems to eliminate. However, while informal settlements have been widely discussed in informal urbanism and housing debates, aspects of urban form and understandings of architecture remain understudied, and mostly disconnected from debates on incremental housing (Kamalipour and Iranmanesh, 2021).

Incremental housing consists of homes that evolve gradually, expanding or adapting over time. Within housing scholarship and architectural narratives on incremental housing, informal settlements are frequently framed as self-help solutions to housing shortages. Individuals and households drive this housing production, navigating financial, material, and labor constraints (Alam, 2023). In practice, incremental housing is not simply a linear process of improvement but is shaped by opportunities and limitations that change over time. So why do scholars and practitioners often assume a linear progression? I argue that a crucial area for further research is the lack of understanding regarding the networks of materials, knowledge, relationships, and power that influence these processes. Addressing this gap, this study asks: how do physical and social factors shape the construction and modification practices of informal housing? I draw on literature in urban informality and assemblage theory to construct my theoretical and methodological approach.

Assemblage theory examines socio-spatial interconnections, where identities and functions emerge through flows, alliances, and synergies (McFarlane, 2011). Using assemblage thinking as an analytical tool, the study examines how informal housing is built, rebuilt, renovated, and decorated, and how these housing processes inform approaches to urban informality challenges. This study was conducted in three informal settlements of Dhaka in the neighbourhoods of Karail and Tejgaon. These settlements were selected to provide a broad understanding of informal settlements of varying sizes, land status, and housing ownership types. Fieldwork conducted in June 2023 included an observational study, photography-focused visual methods, and in-depth interviews with 23 households. Purposive and snowball sampling were used to recruit participants. The length of interviews varied from 20 minutes to 1 hour, depending on the residents’ availability and weather conditions during the monsoon season.

By uncovering the socio-spatial assemblage of the residents’ housing processes, the study found informal housing to be a product of diverse social, material, and political forces interacting or counteracting one another. These forces should not be viewed in isolation but as part of a relational assemblage that adapts and transforms over time. The findings call for urban development policies that reflect the heterogeneous and dynamic nature of informal settlements, challenging the reliance on the hope that incremental housing will eventually lead to the end of precarity. Moreover, the study highlights the constraints and opportunities residents navigate, offering a counter-narrative to depictions of informal housing as either a site of heroic self-sufficiency or a space of inevitable

precarity. Instead, the findings foreground the everyday complexities of informal housing production and modification, demonstrating the nuanced realities of life in informal settlements.

Inclusive Resettlement Design for Chinese Peri-Urban Land-losing Farmer Communities

Abstract ID: 1844.0.0.24.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Xinyi Huang [City Investment & Operation Co. Ltd. of CCTEB] xinyih.99@gmail.com, presenting author

Peri-urban communities in China face complex transitions and reduced well-being due to rapid urbanization driven by decades of a neoliberal 'growth first' strategy (He&Wu, 2009), resulting in numerous resettlement communities for land-losing farmers following land expropriation and in-situ urbanization. While previous research has explored social and economic challenges, the built environment's role in facilitating rural-urban transitions remains underexplored. Current studies primarily focus on critiquing current paradigms and recognizing general patterns and space usage, leaving a research gap in providing systematic suggestions for future resettlement design that facilitates the rural-urban lifestyle transition for land-losing farmers. This research thus explores how community-level design can support a smoother rural-urban lifestyle shift for land-losing farmers in Chinese peri-urban resettlement communities. It pursues three objectives: identifying transition issues relative to built environment design, exploring transition-friendly design principles and programs for resettling existing communities, and developing a scalable and transition-sensitive spatial design framework.

Given the limited successful cases where resettlement was intentionally designed to address transition issues, this research incorporates a 'research-by-design' method, structured in three iterative phases: pre-design, design, and post-design (Roggema, 2017). In the pre-design phase, literature was reviewed, and three in-situ resettlement case studies with different distances to urban areas (Liede Village, New Tan Village, Daliushu Village) were analyzed using archival research, spatial analysis, observations, and interviews. Data on physical design, social dynamics, and programmatic initiatives from the cases were collected and analyzed through an adapted Peri-urban Turbulence framework (Hutchings et al., 2022), which categorizes infrastructure into five types—natural, engineered, social, institutional, and cultural—to identify service gaps affecting farmers' transitions. By examining how design solutions in the case studies restore, substitute, or enhance these infrastructures, the research derived design principles, objectives, and tools, synthesized into a design framework. In the design phase, the design framework was tested through the design of Jixing Community, a peri-urban resettlement site in Wuhan, China. In the post-design phase, both the design outcome and the framework will be analyzed to expose limitations and implications.

This research argues that a more inclusive design for land-losing farmers' resettlement is possible through: 1) Preserving and reinstating the natural and social infrastructures of the original farmers' community while enhancing the engineered and institutional infrastructures, 2) Ensuring authentic narratives that employ the spatial structure, landscapes, design elements, texts, and symbols of the original farmers' community, and 3) Enabling participatory design process and informal spatial adaptation.

Academically, this research introduces a potential peri-urban spatial prototype for reimagining the built environment of peri-urban areas and tests the explanatory usefulness of the newly developed Peri-urban Turbulence theory. Practically, it offers people- and community-oriented design alternatives for both China and the Global South, where rapid urbanization and large agrarian-skilled population present unique challenges. The research-by-design method offers a new lens to synthesize and analyze peri-urban issues, appealing to more tailored design alternatives in practice and engaging both academia and practitioners. Finally, this research calls for increased effort and attention to be focused on the peri-urban area as a major subject in its own right. This is particularly important as urbanization rates are expected to slow down, necessitating a more sustainable form of peri-urban area.

Informalities often encroach into formal structures and blur the boundaries between legalized land use and informal existence. Urban informality, a phenomenon where informal settlements blur the boundaries of legal land use, is often framed as a challenge unique to the Global South (Dovey, et.al. 2023). Yet, its manifestations reveal a global struggle between formal planning ideologies and the lived realities of marginalized communities. This research interrogates how informalities in the physical fabric of Jakarta are connected to how 'coloniality' is practiced as a form of power that categorizes people and wealth, consequently resulting in socio-spatial exclusion and uneven power dynamics in urban planning. Focusing on Jakarta Kampung Aquarium, the research addresses two questions: 1) How do formal representations of urban space juxtapose with the informal settlements? 2) What tactics do residents employ to reclaim agency over their environments?

We utilize a mixed-methods framework combining historical mapping, planning policy analysis and archival research. Historical mapping via Google Earth traces land-use transformations from 2003 to 2024, contrasting formal zoning policies with residents' functional adaptation of space. Planning policy analysis examines inconsistencies in Jakarta's regulatory frameworks, particularly the legal ambiguities highlighted in Regional Land Use Document No. 1 (2014). Archival research of newspaper articles and government records reconstructs the 2016 eviction and subsequent Community Action Planning (CAP) process initiated in 2017. It captures participatory engagement with residents, activists, and planners as grassroots tactics and political bargaining during elections and insurgent rebuilding post-eviction.

This paper contributes to understanding planning strategies in upgrading and formalizing informal settlements as a meeting of planning activities between those outside the formal regulatory procedures with state-mediated planning processes in 'cocreating informality' (Marlies and Huib 2022). Building on planning scholarship that reframes informality not as a "problem" but as a site of innovation and resilience (Holston & Sandercock 2020; Miraftab 2009), we demonstrate how co-production models like CAP might help mitigate displacement by integrating community voices. This approach stands in sharp contrast to top-down eviction policies while also navigating contested legalities of land. As such, these processes challenge Western-centered planning activities and its citizenship-centered divides toward more humane urbanism in responding to local and global displacements (Huq and Miraftab 2020). The study underscores the urgency of decolonial urbanism, advocating for policies that address historical injustices and redistribute spatial power.

Individual Paper Presentation Submission

Pranav Kuttaiah [University of California, Berkeley] kuttaiah@berkeley.edu, presenting author

The future of work in urban economies is being radically transformed by social, economic, and techno-political disruptions in labor intermediation. As digital technologies proliferate, a fundamental question emerges for urban theory: Does the smartphone herald an era of socio-economic mobility untethered from spatial proximity? Urban Planning literature has long posited cities as essential to economic development through agglomeration, concentration of labor, and productivity gains. Yet digital technologies potentially democratize information access beyond physical boundaries, challenging these assumptions. This paper investigates this question through research in Bengaluru, India's 'Silicon Valley'. India's trajectory—moving from agricultural labor directly to service-oriented work without an industrial transition—creates a unique laboratory for testing whether the urban advantage is being replaced, reconfigured, or complemented by the smartphone, the platform, and the gig economy. The study employed a year-long multi-sited ethnographic approach, examining migrants in Bengaluru while also tracing their journeys back to their places of origin in Assam. This methodological triangulation allowed for a comprehensive understanding of migration patterns, their social networks, and technological adaptations across geographical contexts; providing insight on how new socio-technical 'intermediation assemblages' are reshaping both labor markets and social institutions.

I argue that these assemblages manifest through three transformative shifts. First, friendship networks increasingly supplant kinship ties as primary information conduits, creating more diverse labor mobility pathways. Despite this however, 'caste logics' continue to graft themselves onto the ways individuals perceive the dignity and desirability of available work, demonstrating the persistence of traditional social attitudes alongside technological innovation. Second, digital technologies—social media, job-matching apps, and improved search interfaces—promote greater individuation in work-searching. Contrary to advocacy for stabilizing or formalizing gig work, many migrants strategically view the city as a flexible resource reservoir—a cash pool they can access or leave according to their individual needs. This flexibility, rather than job security or permanence, proves most valuable in sustaining their 'multilocal' households that maintain connections across multiple locations. Third, labor-intensive urban industries now embrace high worker turnover instead of prioritizing retention, transforming human intermediaries from enforcers of social discipline into professional transaction facilitators.

The empirical findings demonstrate that while digital platforms facilitate novel information conduits, they do not supplant the 'tacit knowledge' acquired through direct urban immersion. For labor migrants, the embodied understanding of market dynamics, wage structures, and livelihood strategies constitutes an irreplaceable foundation upon which digital intermediation mechanisms may subsequently augment access to opportunities. The physical act of migration and its attendant learnings remain prerequisite to effective labor market navigation, despite the proliferation of digital technologies. Once established within urban spaces, however, these technologies significantly expand migrants' informational horizons beyond the constrained social and institutional universes of rural life. The conceptual framework of socio-technical 'intermediation assemblages' thus elucidates how the dynamic interplay between social networks, technological platforms, and institutional arrangements generates distinctive new patterns of labor market access and mobility, reconfiguring traditional pathways without rendering spatial proximity obsolete.

Zhuoni Zhang [The Hong Kong University of Science and Technology (Guangzhou)] znzhang@hkust-gz.edu.cn

Growth coalitions have historically been recognized as pivotal drivers of urban development. However, they currently face a significant challenge: adapting their strategies to promote equitable and resilient urban futures in light of evolving global trends. One pressing issue is the rapid urban expansion driven by these coalitions in China, which raises important questions regarding environmental justice—specifically, the availability of sufficient green spaces in newly built residential areas. This situation highlights the necessity of thoroughly examining how growth coalitions influence urban development while ensuring environmental justice. This study investigates the roles of various growth coalitions—comprising state-owned enterprises (SOEs) and foreign-funded ventures—alongside non-coalition actors, including public institutions, private developers, and individual entities, in influencing neighborhood-level vegetation, quantified using the Normalized Difference Vegetation Index (NDVI). We employ a dataset of 9,444 newly developed residential parcels from 2002 to 2021, incorporating city-level fixed effects to provide a more refined estimate of how different types of coalitions relate to greenery levels in these neighborhoods.

The results indicate that parcels managed by private enterprises or individual entities exhibit significantly lower NDVI scores compared to those led by coalitions that include SOEs. This finding suggests that development strategies associated with specific coalition types can enhance green coverage in urban areas. In contrast, foreign-funded joint ventures and government-led projects show no substantial difference from the baseline established by SOEs. Additionally, time trends reveal modest improvements in average NDVI scores, which are counterbalanced by increasing land price pressures in certain districts. By identifying the coalitions associated with reduced greenness, this study emphasizes the critical role of governance structures in influencing environmental justice within China's rapidly growing urban landscape. The evidence presented highlights the importance of collaborative governance models in fostering sustainable urban development.

Mapping the Implementation of Land Value Capture Instruments within CDMX Planning System

Abstract ID: 1844.0.0.1030.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Pedro Leonardo Ramos Pastrana [Columbia University] pr2692@columbia.edu, presenting author

Innovative land value capture instruments in Mexico City face social, legal, and institutional challenges that complicate their implementation. On the one hand, the city stands out for incorporating a series of “traditional” fiscal and land value capture instruments into its urban development apparatus (Bolaños et al., 2001; Smolka, 2013). On the other hand, “innovative” land value capture instruments have faced challenges that hinder the city’s capacity for conducting urban development. While property tax is reasonably well established, instruments like Contribucion de Mejoras (Improvements Contributions) report multiple years with minimum or zero income, and more sophisticated instruments like the Sistemas de Actuacion por Coperacion (Cooperative Action Systems) have been questioned and scrutinized by society due to its complex legal structure and opaque operation.

This situation becomes even more complex when we consider changes on the scale of the Polity that define the limits for this type of policy instrument's operation. In 2018, Mexico City enacted a new Political Constitution, which set in motion an institutional restructuring with direct effects on the architecture and operation of its planning system. My research aims to understand the challenges and opportunities this institutional restructuring offers for developing and enacting land value capture instruments by asking: What were the main challenges to implementing land value capture instruments between 2012-2018 and 2018-2024? Does recently enacted planning legislation provide ways for implementing land value capture instruments? I research these questions by examining the land value and urban planning instruments implemented during the last two city-level administrations. By bridging literature on urban planning, public policy, law, and grey literature, I examine the mechanisms that prevent land value capture from being enacted and identify structural and legal conditions that allow for its implementation under a renewed planning legal framework. I employ content analysis and in-depth interviews with local experts, state employees, and real estate developers to understand how different instruments have been deployed, as well as the main challenges to implementing this type of instrument. I argue that the implementation of innovative land value capture instruments has been hindered by their perceived character as obscure ad-hoc solutions that fail to fully integrate into a comprehensive long-term planning apparatus. The proposed research is relevant to discussions about Land and Housing in Latin America as it aims to identify how specific instruments fit within a larger planning system, and sheds light on how these interactions affect specific implementation efforts.

As global temperatures approach the critical 1.5°C threshold above pre-industrial levels, the need for comprehensive climate action has never been more pressing. Successful responses require coordinated efforts across three critical dimensions: First, global cooperation is essential given the inherently transnational nature of climate challenges. Second, holistic strategies must address the complex interplay between environmental and societal issues. Third, particular attention must be paid to urban areas, as cities simultaneously represent major sources of emissions and frontline victims of climate impacts.

The past decade has seen significant progress in climate governance, particularly through the establishment of international frameworks like the United Nations' 17 Sustainable Development Goals (SDGs) adopted in 2015. Within this framework, Climate Action (SDG 13) serves as a foundational element for achieving the interconnected goals of people, planet, and prosperity, demonstrating how climate initiatives affect multiple sectors. Nations and cities worldwide have responded by implementing various climate action plans and programs.

However, critical gaps remain in our understanding of how effectively cities are aligning climate actions with other SDGs, and what factors determine successful integration. Current scholarship primarily examines this interconnectedness through three limited approaches: analysis of target overlaps within SDG 13, statistical correlations between SDG indicators, or expert assessments. While valuable, these approaches lack empirical examination of actual implementation practices at the urban level.

This study addresses these limitations by investigating how cities operationalize climate action within the SDG framework. Our analysis of over 300 Voluntary Local Reviews (VLRs) from 2018-2024 seeks to answer three pivotal questions: First, how do cities implement SDG 13 targets while pursuing broader SDG objectives, as revealed through their self-reported actions and outcomes? Second, to what extent do cities explicitly incorporate climate considerations when evaluating progress on other SDGs? Third, what contextual factors—including municipal resources, institutional capacities, and national policy environments—influence both climate action implementation and its integration with other sustainable development goals? Building on existing SDG target and indicator research, we develop systematic coding protocols for analyzing VLR content. Using NVivo, we identify and categorize climate-related actions and policy frameworks. Our quantitative analysis employs Linear Mixed Models to examine patterns across time and regions, assessing how variables like city resources and national priorities affect SDG 13 implementation and integration.

The study's significance operates at multiple levels. Theoretically, it applies the Pressure-State-Response framework to identify systemic barriers preventing optimal alignment between climate action and related challenges including poverty alleviation, energy transitions, and water management. Practically, it evaluates the suitability of the SDG framework—originally designed for national implementation—for guiding and assessing urban climate governance,

addressing emerging concerns about potential mismatches between global goals and municipal realities. By bridging this research-practice divide, the project generates actionable insights for policymakers, urban planners, and international organizations seeking to design more effective, integrated interventions. In doing so, it advances both scholarship and practice in sustainable urban development, while contributing to the broader field of applied urban planning research. The findings will help optimize the localization of global climate agendas while respecting the unique capacities and constraints of city governments.

Multi-Scalar Urban Transformation: Global geo-politics in the streets of Old Havana

Abstract ID: 1844.0.0.789.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Joanna Kocsis [Cornell University] joanna.kocsis@cornell.edu, presenting author

One of few alternatives to capitalism, Cuba represents an important opportunity to explore the impacts of economic and political transitions on urban space. The current post-socialist transition of Cuba has created opportunities for both locally and internationally driven economic interventions which are transforming urban space in several ways. This paper explores how Cuba's transition is impacting urban form at the neighbourhood scale, documenting changes in land use, built form, the movement of people and resources, and neighbourhood character, and tracing the multi-scalar catalysts of these changes through the municipal, national, and global scales.

Beginning with President Obama's efforts to normalize diplomatic relations between the USA and Cuba in 2017, through the Cuban leadership transition from the Castro family to President Diaz-Canel in 2019, and the impacts of his economic reforms, the most severe of which were implemented in the height of the COVID-19 pandemic, to the global impacts of the Russian invasion of Ukraine in 2022, and the rapid growth of the Cuban migration crisis in anticipation of the re-election of President Trump in 2024, this paper connects decisions made in faraway places to tangible changes one can observe while walking down any street in Old Havana, inserting the problematic of geographic scale "into the very heart of the urban question" (Brenner, 2003: 366).

Diaz-Canel's efforts to alter the structure and functioning of the centrally planned Cuban economy rely heavily on increasing the role of the private sector and severe monetary reform. The speed and opacity with which economic reforms are being tested on the island have created a de facto urban policy vacuum in which the form and function of space in the city is rapidly changing in response to both domestic financial and global geo-political factors. This paper traces this 'explosion of spaces' (Lefebvre, 1979), the multi-scalar flows of money, materials, people, and ideas that are changing the urban form of Old Havana, a neighbourhood which is particularly exposed to such territorial redifferentiation (Lefebvre, 1979).

The neighbourhood of Old Havana is a UNESCO World Heritage location, the site of the state's largest investment in heritage tourism efforts, one of the country's main tourist destinations, and one of the poorest and most racialized communities in the country's capital. Old Havana, abandoned first by wealthy colonial families moving to larger estates outside the walled city, and then by the Revolutionary government which invested in rural, rather than urban housing stock, became the site of economic tension when framed as a heritage tourism asset with the potential to stimulate the Cuban economy after the fall of its main economic ally, the Soviet Union, in 1989 (García, 2016). The multi-scalar influences of Cuba's current economic crisis can be traced through changes in this neighbourhood, highlighting how the country's transition has upset the tradition of urban master planning in the city (Segre et al., 1997), and making tangible global influences on urban space.

Inspired by Miraftab's (2021) attention to how forgotten places are "intensely nestled in global processes" and call for attention to "the socio-spatial dynamics of globalization" (139), this paper highlights how Cuba's post-socialist transition has created the conditions for unplanned urban development driven by multi-scalar actors beyond the city and state scales, and has undermined the power of urban planning authorities to direct urban change. This critical case study contributes valuable insights into the force of economic change on the face of the city, documenting how sixty years of strict master planning has been disrupted, radically changing the use of urban

space over the past five years, and traces the origins of these economic influences to the global scale, disrupting the metrocentric focus of planners on the local scale.

Negotiating Food Security and Development: Chengdu High-tech Monitoring Regime and Landscape Changes

Abstract ID: 1844.0.0.630.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Lei Fan [Singapore ETH Center / Department of Architecture, National University of Singapore] lei.fan@sec.ethz.ch, presenting author

For over 2000 years, Chengdu has been one of the most important grain-producing regions in the Yangtze River basin characterized by stable and high yields. However, as a rapidly expanding metropolitan region in western China, Chengdu has lost significant agriculture land and consequently agricultural productivity over the past three decades. 2018 was a turning point, as China prioritized food security as a national objective and formulated a strategy to balance preservation, security, and economic growth in land and resource governance. This paradigm shift optimizes the territorial structure of ecosystems, agriculture and urban spaces by leveraging a unified spatial big data “One Map” for coordinating planning decisions and real-time monitoring. Chengdu is one of the pioneers to implement this institutional and technological reform. The plan aims to preserve and manage exactly 277,898.88 hectares of “basic agriculture land”—demarcated by GIS polygons in the “One Map” system. This dedicated land is literally named “basic agriculture land polygons” (BALP) in the system and are constantly updated by satellite monitoring to enforce the preservation of agricultural production on the ground and ensure that only approved grains are cultivated. Chinese media report local conflicts arising from BALP surveillance and enforcement, particularly due to technical discrepancies. These include inaccurate detection of actual ground conditions, rigid and inflexible rectification standards that overlook original land use and agricultural production cycles, and challenges in conveying ground-level feedback to systems managed by higher government authorities.

This paper takes a technopolitical lens to understand the evolution, impacts and contradictions that arise from operationalizing the BALP systems. The study asks how the use of remote-sensing to define BALPs reflects the transformation of land institutions in Chengdu’s per-urban agricultural areas under the conflicting mandates of food security and development. How do communities navigate the strict enforcement of BALP rectification standards and the accompanying landscape transformations? Drawing from policy documentation, site observations, and mapping, two in-depth case studies demonstrate the complex changes in the physical landscape, crop choices and productivity, and everyday life to meet the needs of national food security.

The analysis shows that the demarcation of BALP through remote-sensing and monitoring regimes purely based on land cover data oversimplifies the complex social, ecological, and cultural processes already at play at the village-scale. Because of the centralized monitoring and information systems, the use of BALPs limits channels for negotiation and relegates the role village officials as mere implementers of land control targets, undermining their original autonomy and promise for grassroot self-governance through site-specific and localized strategies. Technologically, the discrepancies and errors in the monitoring regime negatively affect planning decisions, resulting in increased conflicts and inefficiencies in practice. Despite the challenges, the villagers refuse to simply comply. Instead, they have found creative ways to adapt, using a mix of strategies and local land-use practices to meet BALP monitoring requirements while still maintaining some autonomy over their land. Chengdu’s data-driven agrarian reform contributes to broader questions of monitoring, rural governance, and infrastructural transformation under the mandate of national security.

Opportunities and Challenges of Self-Financing Urban Development – Case of Sabarmati Riverfront

Abstract ID: 1844.0.0.1182.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Jay Mittal [Auburn University] jay.mittal@auburn.edu, presenting author

This paper examines the Sabarmati River Front Development Project (SRFD) in Ahmedabad, India, highlighting its opportunities and challenges in self-financing urban development. Initially proposed as a beautification initiative, the project included channelizing and narrowing the river, creating embankments, and developing recreational spaces. The SRFD aimed at addressing social issues by relocating approximately 14,000 slum families to safer housing and enhancing infrastructure through the construction of interceptor sewers and public amenities. The project's estimated cost was \$60 million, financed through the sale of reclaimed land, which was expected to generate \$76 million. A financial feasibility study projected an internal rate of return of 17.23% over ten years; however, actual financial results likely deviated due to political delays and funding challenges (Mittal and Byahut 2020; Bhatt 2016).

Key Insights are:

- The SRFD was designed to address both aesthetic and socio-economic issues in Ahmedabad.
- Key infrastructure developments included recreational spaces and housing for slum families.
- Financial projections indicated a positive internal rate of return, suggesting confidence in the project's viability.
- Political delays and funding challenges significantly impacted the project's execution.
- The project exemplifies the complexities of balancing financial feasibility with social responsibility in urban planning.

The paper reflects on the complexities faced in planning and executing a self-financed urban development project.

Perspectives on governance, autonomy and efficiency from Bermuda's effort to end municipal elections

Abstract ID: 1844.0.0.502.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Michael Hooper [University of British Columbia] michael.hooper@ubc.ca, presenting author

What is the value of urban local government? This question has often been raised in debates over how best to manage and deliver services and respond to urban residents' needs (Wagenaar et al., 2004). These debates reach back centuries but have persisted to the present in the form of disputes over municipal amalgamation, decentralization and subsidiarity. This project examines Bermuda's efforts to abolish elected municipal government. The case provides a useful window onto longstanding questions about the merits and demerits of municipal government and the value of urban autonomy. Bermuda's effort to radically limit municipal government seeks to replace locally elected councillors with central-government appointees and diminish local governments as sites of democratic decision making. To understand arguments for and against cities as sites of governance, this project draws on interviews with key informants familiar with the Bermuda case and examines how they view the arguments for and against urban local government.

Tensions between decentralization and centralization are a classic theme in spatial governance (Dickovick, 2011; Faguet, 2021). In the Bermuda case, which has been little researched, advocates on different side of this debate have expressed their positions in the media, legislative chambers and in court proceedings. This project builds on those public sentiments by interviewing key figures in the fight over the future of municipal government in Bermuda. The research makes a contribution by using this case as a lense for better understanding the tensions between decentralization and centralization which, while heightened in Bermuda, lie under the surface of many planning and policy debates in cities around the world.

The changes proposed to urban local government in Bermuda are found in the Municipalities Reform Bill 2019. Under the Bill, the government would appoint the mayors and half of councillors of all municipal corporations, while the remaining councillors would be appointed by the relevant government minister following recommendation by a selection committee. While the Act passed in 2019, the City of Hamilton appealed the case to the Bermuda Court of Appeal arguing that it was unconstitutional. The Court of Appeal in 2022 rejected the appeal. In 2023, the City of Hamilton launched an appeal to the Privy Council in London. The Judicial Council of the Privy Council (JCPC) is the final court of appeal of UK overseas territories and Crown dependencies. The JCPC heard the appeal and will render its decision in 2025.

This project draws on interviews with 12 key individuals familiar with the Municipalities Reform Bill 2019. These individuals were selected to include people both advocating for and against the changes. The interviewees were selected using purposive and snowball sampling. The results were coded into a series of non-overlapping thematic categories and patterns in the results were identified. The full quotes were then drawn upon to flesh out and provide detail on these patterns. The results indicate that most interviewees and members of the public do not support an end to local elections. Most view Bermuda's municipalities as centres of competent and relatively responsive governance and service delivery. Four key differences of opinion regarding the bill were identified across the interviewees. These are competing interpretations of how "efficiency" relates to municipal governance, divergent perspectives on the value of local autonomy, different beliefs regarding how best to respond to historic inequities in governance and differences in opinion concerning whether incremental revisions to democratic institutions are preferable to more sweeping changes. The paper concludes by drawing lessons from this effort to

abolish municipal elections for both Bermuda and other places experiencing debates over the scale at which urban decisions ought to be made.

Planning for transitional spaces: Understanding the rural-urban transformations happening in India

Abstract ID: 1844.0.0.741.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Eshan Fotedar [Georgia State University] efotedar1@student.gsu.edu, presenting author

Major work on Indian urbanization is concentrated on megacities; however, around one-third of all urban population growth in India can be attributed to the urbanization of rural areas, and 80% of total urban growth stems from organic growth rather than migration (Pradhan, 2017). This transformation of rural places involves declining employment in agriculture and increasing participation in a variety of non-farm economic activities (Ramachandran, 2019; Mukhopadhyay et al, 2020). Relatively little is understood about the structure of the emerging non-farm economy or its implications for urban planning, policy, and local economic development.

This paper focuses on the evolving role of land and labor in such places. We ask: (1) What factors are currently driving changes in the division of labor and new land-uses at these sites? And 2) How does the difference in India's urban and rural policy structure impact their process of urbanization? I explore how agricultural land is being converted for urban uses like housing, commerce, and infrastructure, driven by factors including population growth, market forces, and government policies. The study focuses on the interplay between land use conversion, labor shifts, and their impact on social stratification, livelihoods, and household decisions about land and work.

I investigated these questions by studying two small towns in Bihar, Ghoghardiha and Koath, at early stages of urbanization in the state of Bihar. Both sites are statutory towns with a population of around 18,000. Bihar's rapid economic shift away from agriculture, low official urbanization levels, and high migration rates make it a good case to study urbanization processes and livelihood transitions in resource-constrained contexts. The study relies on both primary and secondary data collection. The changing economic structures of the sites have been analyzed via conducting primary surveys and interviews at the sites. I also analyzed urban and rural policy frameworks via critical reading of government policy documents and economic surveys.

The study finds a coexistence of rural and urban economies in these small towns—similar to McGee's (1991) *desakota* regions. But unlike *desakotas*, these sites are far from established urban settlements. The present urban policies, though beneficial in some ways, place too much emphasis on infrastructure and entrepreneurship while negating the important and persistent role of agriculture in these urban towns.

The paper builds on existing work from Randolph (2024), who argues that because such places are urbanizing in unconventional ways—through a combination of natural population growth and out-migration—their planning and policy challenges differ from those of megacities in the Global South or North. The demand for decent employment opportunities, sustainable development, and effective land-use planning is distinct. Therefore, understanding the economic transformations occurring in these spaces is crucial, as is identifying how policies and planning instruments can support their economic development. My research seeks to address a critical gap in literature by understanding how current governance and planning strategies do and do not meet their unique needs.

Planning from the Periphery: Brokerage, Dispossession, and Urban Expansion in Dhaka

Abstract ID: 1844.0.0.833.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Shoshana Goldstein [Trinity College] shoshanarg@gmail.com, presenting author

This paper examines how informal and semi-formal land brokering practices drive urban expansion through dispossession and enclosure in the urbanizing edges of Greater Dhaka, Bangladesh. It asks: How are peri-urban spaces being transformed into real estate frontiers through locally embedded brokerage, and what are the implications for urban planning in rapidly growing cities of the global South? Drawing on ethnographic fieldwork and interviews in Kanchan, a municipality on Dhaka's eastern fringe, the study analyzes how land brokers—*jomir dalals*—mediate between real estate developers, state agencies, and partially dispossessed landowners to reshape the political and institutional dynamics of land governance.

The paper engages the theoretical lens of planetary urbanization (Brenner & Schmid, 2015), which emphasizes that urbanization extends beyond core city boundaries into dispersed infrastructural and ecological zones. Rather than treat the peri-urban as a passive site of sprawl, the paper demonstrates that it is an active and contested terrain where new modes of accumulation, regulation, and resistance emerge (Caldeira, 2017; Miraftab, 2009). This research reveals that land brokers are key intermediaries in this transformation, leveraging kinship networks, political patronage, and informal coercion to consolidate landholdings and facilitate speculative development. These processes are not merely technical, but deeply political and ecological: they disrupt agrarian livelihoods, undermine floodplain ecologies, and restructure local governance by aligning municipal planning processes with private capital interests (Tanzir et al., 2024).

Planning agencies such as RAJUK, once tasked with regulatory oversight, increasingly operate as facilitators of speculative real estate, sidelining ecological zoning and master plans like the Dhaka Metropolitan Development Plan. This undermines the legitimacy of planning and its capacity to balance ecological integrity, social equity, and urban growth. By foregrounding the material practices of land transformation, this paper contributes to planning scholarship in three ways. First, it advances a situated understanding of urbanization in the global South, where planning is less a matter of technocratic design than of managing contested claims over land and infrastructure (Miraftab, 2009). Second, it highlights how speculative real estate development mobilizes and transforms planning institutions themselves, producing a new urban regime that rewards enclosure over regulation. Third, it calls for a rethinking of planning education to better account for informal actors and peri-urban dynamics that are central to contemporary urbanization.

The findings resonate with critiques of abstraction in planetary urbanization theory (Storper & Scott, 2016), advocating for greater attention to local institutions, land markets, and the politics of dispossession. As Dhaka's growth accelerates, this research offers timely insights into how planners, scholars, and activists might engage the peri-urban not just as a zone of expansion, but as a site for democratic contestation over the urban future.

Public Discourses and the Politics of Aestheticization in Addis Ababa's Beautifying Sheger Project

Abstract ID: 1844.0.0.88.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Ding Fei [Cornell University] dingfei@cornell.edu, presenting author

Jinpeng Yang [Cornell University] jy978@cornell.edu

Yucheng Zhang [Cornell University] yz2257@cornell.edu

This paper examines the elitization of urban space in African cities through the case of Beautifying Sheger, a riverside redevelopment project launched in 2019 in Addis Ababa, Ethiopia. As a flagship initiative of Africa's youngest reformist leader, the project reflects the new ruling party's urban development vision amid a broader political transition following years of domestic unrest. However, while positioned as a socio-technical imaginary balancing investment attraction, public benefit, and urban beautification, Beautifying Sheger has also sparked critical debates about inclusion, power, and spatial justice. Using a mixed-methods approach, this paper traces the project's development and analyzes public discourse on popular social media platforms through large-scale textual data analysis. The study highlights the risks of top-down urban development, where national leadership, foreign donors, and international expertise drive project design and planning with limited local consultation or capacity building. Sentiment and topical analyses using large language models reveal complex public perceptions, particularly regarding the project's social, political, economic, and environmental implications. The findings further demonstrate how key events, such as domestic political conflicts and the Covid-19 pandemic, triggered conflictual sentiments towards the project. By situating Beautifying Sheger within broader debates on aesthetics, power, and urban infrastructure, this paper foregrounds the entanglement of state infrastructural power and political legitimacy on the one hand and citizens' social differentiation and discursive agency on the other, which collectively shape the production and contestation of elite-driven urbanism in African cities.

Track 7: International Development Planning

Individual Paper Presentation Submission

Isabel Peñaranda Currie [University of California - Berkeley] ipenaranda@berkeley.edu, presenting author

Land-value capture (LVC) – broadly understood as a series of planning instruments for the recovery by governments of land value increments generated by actions other than the landowner’s direct investments– has been subject to a uniquely mixed set of interpretations within critical geography and urban studies. Many global north critical scholars argue that LVC structures incentives for local governments to promote increases in land value to increase its fiscal returns, and inserts a logic of financialized land speculation into public planning departments (Ryan-Collins et al., 2017; Stein, 2019; Weber, 2021; Wolf-Powers, 2023). And yet in Colombia, LVC instruments such as land taxes, betterment levies, land readjustments and increase of zoning windfall gains have been promoted and defended by progressive planners, Marxist economists and leftist lawyers. Based on 8 months of field work among planners, urban economists, lawyers and think-tanks in Bogotá, this paper in part of a broader dissertation research arguing that land-value capture is an “abstract technology” (Ewald, 2020)

which does not carry a univocal political charge. Following STS scholars such as Callon, (1998, 2009) and Collier, 2011), it explores the relationship between technical expertise of economics, law and planning and politics, and argues that expertise is both shaped by and defines the conditions of politics and particularly, how land value is shaped as an object of government that is (or fails to become) “public”.

This paper specifically contemplates the relationship between the theoretical justifications for LVC and its fiscal design and implementation by focusing on one particularly politicized instrument: that of Participación en Plusvalías, or participation in land value increments. This instrument – contemplated in the 1991 Constitution – allowed municipalities to capture up to 50% of the land value increments resulting from government regulatory actions, such as changing land uses or density by zoning changes, and led one expert to claim that “few if any other countries have attempted to so directly incorporate Georgian principles into actual legislation at the national level” (Doebele, 1998). And yet, for all its ambitions, its implementation has largely failed to capture even a fraction of the original projected amounts, leading Participación – for which Colombia is a model worldwide – to be suspended during the current master land use plan. This paper will explore the minutiae of tax instrument design as a site of unexpectedly heated contestation in which familiar ideological divisions and the distinction between the technical and political is blurred. In doing so, I hope to destabilize some of the familiar categories of the critical LVC literature – particularly around the public-private binary – in order to identify new terrains of struggle over the right to the value of the city.

Reconceptualizing Rural Transformation Amidst Urban-rural Circuits of Capital

Abstract ID: 1844.0.0.1032.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Wenlin Gao [Tongji University] 2130151@tongji.edu.cn, presenting author

Chen Chen [Tongji University] tjupchenchen@tongji.edu.cn

Rui Chen [Tongji University] 2152334@tongji.edu.cn

Research on rural transformation under urban-rural interactions has long been dominated by an urban-centric narrative, portraying the countryside as a passive recipient of urban expansion. This perspective has two key limitations: first, cross-sectional research paradigms overlook the dynamic cumulative effects of cyclical capital flows in reshaping rural socio-economic systems; second, rural transformation is often reduced to a passive response to unidirectional urban capital inflows, with macro-level political-economic narratives obscuring rural agency. To address these gaps, we extend Harvey's theory of the three circuits of capital to a long-term analysis of rural transformation under urban-rural interactions, aiming to reveal the cyclical patterns of urban-rural capital flows and the distinctive internal logic of capital circulation within rural systems. Additionally, drawing on the adaptive perspective of Complex Adaptive Systems (CAS) theory, this study highlights the capacity of diverse rural actors to respond to the embedded disruptions of urban capital. We argue that rural capital circulation under urban-rural interactions constitutes an active evolutionary process wherein rural systems transform external capital stimuli through adaptive interactions among multi-level actors.

Building on this theoretical foundation, we propose an innovative "External Switching–Internal Adaptation" framework and empirically validate it through a case study of Xiayang Village in Anji County, Zhejiang Province. Analysis of the village's developmental trajectory (1985–2024) reveals cyclical spatiotemporal linkages with Zhejiang's three urban capital circuits. Notably, its post-2020 shift toward an ecological camping industry exemplifies proactive engagement with urban capital's tertiary circuit, restructuring urban-rural value exchange: urban capital appropriates rural ecological and cultural resources, while rural systems leverage these as bargaining capital to catalyze self-driven transformation. This process fosters systemic adaptation anchored in environmental restoration, cultural identity, and economic value creation.

The findings underscore that sustainable rural transformation hinges on adaptive capacities to convert external capital shocks into endogenous developmental momentum, challenging static, passive conceptions of rural roles in urban-rural dynamics. This study advances a novel research paradigm transcending urban-centrism by bridging macro-political-economic structures and micro-level rural agency. It offers fresh theoretical and practical insights for rethinking China's urban-rural integration and global rural transformation, emphasizing rural systems' resilience and proactive agency in reshaping development pathways.

Renewable Energy for Whom? Recreating Idealized Futures with Solar Mini Grids in Uganda

Abstract ID: 1844.0.0.189.2025

Track 7: International Development Planning

Individual Paper Presentation Submission

Yujin Lee [Cornell University] yl3276@cornell.edu, presenting author

Despite a modest increase in access to electricity in Uganda, from 41% in 2000 to 47.1% in 2022, a stark rural-urban electrification gap persists: only 35.9% of rural residents are electrified, compared to 72% in urban areas. While 86% of Uganda's total electricity is generated via hydropower, the overall energy supply remains dominated by biofuels and waste (89%). This indicates continued dependence on non-renewable sources of energy among unelectrified and off-grid communities. With the occurrence of rapid urbanization and the urban sprawl shifting the energy use landscape in the Global South, energy planning has become paramount (Cajot et al., 2015).

We adopt the socio-technical energy transition (STET) framework to examine how the process of energy planning and transition occurs in the context of the Global South. STET provides a holistic and interdisciplinary lens that captures relation between technological development and societal change (Sovacool et al., 2021), thus making it useful for examining decentralized energy planning in rural contexts. Rooted in science and technology studies, STET integrates foundational theories such as Actor-Network Theory, Technological Innovation Framework, and Social Construction of Technology. This multifaceted approach enables a broader view of energy systems that encompasses "not only the natural and built components, such as energy resources or infrastructures, but the societal and institutional elements as well" (Li et al., 2015: 290).

Our study investigates the intersection between community-governed mini-grids, spatial dynamics, and idealized futures, questioning how community members experience and perceive changes in space and social dynamics in relation to the introduction of mini-grids and community governance. Specifically, we explore how the installation and location of mini grids influence individual and community-level understandings about opportunities for education, income-generation, and shifts social networks and dynamics. In addition, we will examine how the introduction of community-managed grids contributes to creating new understandings of space and alter idealized futures, or 'imaginaries', on how electrification and access to clean energy can shape community futures (Chateau et al., 2021). Our work addresses a major gap in the literature: whereas energy planning research often calls for collaborative planning, few studies center on the lived experiences and evolving aspirations of community members. Our research contributes to a more grounded understanding of energy transitions in sub-Saharan Africa.
