Press Release

Thermopatch Announces Production Release of Improved HiQ Thermal Label

Syracuse, NY – September 2017:

Thermopatch is excited to announce the production launch of their improved HiQ TC thermal label which will be replacing their existing HiQ TT material. The improved TC HiQ product, boasts an increase on pull strength and improved scan-ability on high dye content materials.

Independent lab testing has shown substantial improvements over the previous HiQ TT material in “reducing the occurrence of dye re-deposition”. The TC label will stay whiter longer with the addition of top coat components that help block dye migration from the label. The improved adhesive is exceptionally helpful on specialty materials such as jeans and F/R garments which are sometimes more challenging to label.

Thermopatch’s HiQ labels come in a variety of sizes and configurations that will work on almost any thermal transfer printer on the market. Thermopatch also carries the full line of thermal transfer printers, ranging from low to heavy volume by Cab Technologies. Pair the new HiQ TC label and a Cab Technologies thermal printer with the award-winning Bartender label printing software by Seagull Scientific and you will have an unbeatable combination.

Thermopatch is a worldwide company headquartered in Syracuse, New York, specializing in supplying garment/textile identification labeling systems including an emphasis on the manufacture and distribution of various garment embellishment products to the apparel manufacturing industries across the globe.
