Case Presentation

**Patient:** 64 year-old Caucasian male.

**History of Present Illness:** The patient presented in August 2016 with multiple, new, asymptomatic growths located on the scrotum. He denied itching, pain or burning. The patient was treated with Imiquimod 5% cream 3 times per week. After 4 weeks of treatment, he developed erythema and irritation primarily on the bilateral inguinal creases and penile shaft, without significant erythema on the scrotum. Imiquimod was continued for a total of 10 weeks. There was little improvement of the scrotal lesions. Interestingly, the patient was treated for pruritus scroti from 2009 to 2011.

**Medical/Surgical History:** Hypertension, asthma, benign prostatic hyperplasia, rosacea, seborrheic dermatitis, folliculitis, basal cell carcinoma, tarsal conjunctivitis, appendectomy, wisdom tooth extraction

**Family History:** Hypertension, heart disease, asthma

**Medications:** Aspirin, Lisinopril-hydrochlorothiazide, Lisinopril, hydrochlorothiazide, tamsulosin, rosuvastatin, pseudoephedrine, azelastine/fluticasone propionate nasal paste, tamsulosin, azelastine/fluticasone nasal, metronidazole 0.75% gel, clindamycin 1% gel, doxycycline 20mg BID, ketoconazole 2% shampoo, ketoconazole 2% cream, metronidazole 0.75% gel, clindamycin 1% gel, pseudoephedrine, azelastine/fluticasone nasal, metronidazole 0.75% gel, clindamycin 1% gel, doxycycline 20mg, ketoconazole 2% cream, metronidazole 0.75% gel, clindamycin 1% gel, tamsulosin, rosuvastatin, ciclesonide inhaled, albuterol inhaled, Lisinopril-hydrochlorothiazide, aspirin, hydrochlorothiazide, tamsulosin, rosuvastatin, pseudoephedrine, azelastine/fluticasone nasal, metronidazole 0.75% gel, clindamycin 1% gel, pseudoephedrine, azelastine/fluticasone nasal, metronidazole 0.75% gel, clindamycin 1% gel, tamsulosin, rosuvastatin, ciclesonide inhaled, albuterol inhaled

**Allergies:** Sulfonamides

**Physical Examination:** Multiple tan to light pink flat-topped 2-3mm keratotic papules located on the scrotum.

**Biopsy:** Advanced Dermatology Associates, LTD. (AD16-09835, 8/29/2016) Left inferior scrotal sack: "Epidermolytic acanthoma is rendered."

**Reason for Presentation:** Interest

Discussion

Epidermolytic acanthomas are rare benign tumors that can appear in two varieties: an isolated form which was initially described in 1970, as well as a disseminated form described in 1973. Individual lesions appear as an asymptomatic tumor less than 1 cm in diameter with a verrucous surface. Epidermolytic acanthomas can occur anywhere on the body with a predilection for the trunk, although involvement of the genitalia has been increasingly reported. They present during adulthood, with no particular predilection for a particular race or gender.

Epidermolytic hyperkeratosis is a characteristic histopathologic feature consisting of compact hyperkeratosis and vacuolar degeneration of keratinocytes in the spinous and granular layers. These findings are also seen in bullous congenital ichthyosiform erythroderma, which is also known as epidermolytic hyperkeratosis (EHK), a genodermatosis caused by mutations in keratin 1 and keratin 10 genes. Therefore, it has been hypothesized that epidermolytic acanthomas may represent a localized variant of generalized EHK. However, recent studies have failed to find gene mutations associated with the isolated form.

The pathogenesis of epidermolytic acanthomas remains unclear. Both clinically and histopathologically, these lesions are often mistaken for verrucae and condyloma acuminata. Therefore, a viral etiology has also been considered. There has been little evidence of human papillomavirus DNA found in these lesions, although Jung et al. recently reported a case of multiple epidermolytic acanthomas on the scrotum associated with human papillomavirus 16. Other exogenous factors may play a role such as other viral infections, ultraviolet radiation, sunburn, immunosuppression, and trauma.

Treatment is not necessary unless the appearance or associated symptoms are particularly bothersome to the patient. Some treatment modalities include surgical excision or other destructive options such as cryotherapy. Jang et al. also reported a case of multiple epidermolytic acanthomas successfully treated with topical imiquimod, and Tan et al. reported effective treatment of associated pruritus with 0.1% tacrolimus ointment.
