I usually handle stormwater control or rainwater collection for irrigation. I have a customer that wants a 40,000 gallon system using an underground design that basically is a large sand filter. I use this design often, but I have never taken it into a house. I know the laws stating that once the pipes go into the house, a licensed plumber must take over.

My question is this... What UV filtration system is the best for purifying water for potable use? Also, do you use a regular pump or a booster pump. I'm open to any suggestions or what has worked for you.
