

Sample script – Current final message of 2018 Astronomy program of our mobile planetarium

“Astronomy has made it very clear to us that we are part of an immeasurable Universe, and that the great distances and time that separate us from other places in space, make it unlikely that we will find other life forms near us in the short term.

There are regions of the Universe that perplex us. The magnitude of events that occur there are surprising, and challenge our familiar laws of physics. Fortunately, our solar system is located in a relatively quiet place in this galaxy.

However, it is natural that our species wants to reach new places in space. The planet Mars would be just a simple test, to continue then with even more challenging and ambitious destinations. What we do now will totally define the destiny of our descendants.

The study of the Universe is extremely important for our species. It allows us to properly evaluate our planet Earth, and make the best decisions to take advantage of our existence.

And now that we know where we are, and who we are, it is up to us to decide what we are going to do with ourselves.”

Marco Avalos, Producer at Planetario Aventura
