

Mobile Interfacing Within Water/Wastewater

Presenter(s):

Todd Steege, Industrial Network Systems

Abstract: Real time operational intelligence is a philosophy of collaboration enabled by mobility. Mobility equates to information at your fingertips anywhere and anytime. Where not only your role, but your physical location can be used to steer you to the information needed to do your job. Real-time operational intelligence is the collaboration of data, locations and people - all of which are assets that can be GEO-physically located within your organization. The data that pertains to the process as well as the health of the asset can be seen in real-time and accompanied by whatever other information is required (drawings, history, maintenance information). A mobile enabled workforce allows managers, maintenance and operation personnel to collaborate through notes, pictures and workflows in real time.
