Position Statement

Definition of EMS

The National EMS Management Association understands that the phrase emergency medical services (EMS) has evolved to mean different things to different groups. NEMSMA substantially agrees with the definition adopted by National Association of State EMS Officials (NASEMSO) in 2012 and has made some modifications to read:

Emergency Medical Services (EMS) is the integrated system of medical response established and designed to respond, assess, treat, and facilitate the disposition of victims of acute injury or illness and those in need of medically safe transportation. The EMS System includes the full spectrum of response from recognition of the emergency to access of the healthcare system, dispatch of an appropriate response, pre-arrival instructions, direct patient care by trained personnel, and appropriate transport or disposition. A provider participating in any component of this response system is practicing EMS. EMS also includes medical response provided in hazardous environments, rescue situations, disasters and mass casualties, mass gathering events, as well as interfacility transfer of patients and participation in community health activities.

EMS does not include the following:

- Care rendered by professionals within an established healthcare facility.
- Good Samaritan care: emergency care provided by someone regardless of their level of training and experience outside of an established and organized response and the individual is not receiving any type of compensation for care rendered.
- Basic first aid, CPR, and public access defibrillator use provided outside the established EMS system.
- Public health programs and home health care programs unaffiliated with the EMS system.

It should be noted that this definition is not intended to exclude any aspects of EMS not formally described (e.g., oversight, administration, education and research). EMS is an evolving discipline that is maturing as a partner in the healthcare system. As such, EMS must be flexible enough to accommodate new roles.

(Over)
NEMSMA further defines the following elements that comprise EMS:

**Paramedic Service** is the deployment of vehicles, equipment and personnel that respond to requests for emergency medical services (EMS) within a community. Paramedic service may be provided by governmental and/or non-governmental agencies and may include transport and non-transport components. This definition is intended to conform to internationally adopted usage of the term paramedic which includes basic and advanced life support response and transport by EMTs (international equivalent: primary care paramedic), AEMTs (intermediate care paramedic) and paramedics (advanced care paramedic).

**Emergency Medical Dispatch** refers to the elements of the EMS system that receive requests for service, provide medical instructions to callers, dispatch resources and serve as controllers of deployed resources.

**Ambulance Service** is defined as the provision of ground or air ambulance transportation in conjunction with emergency response or interfacility medical transportation.

**Medical First Response** is defined as the provision of EMS response that arrives on scene in a manner that does not have capability to transport (on foot, bicycle, ATV, automobile, fire apparatus etc.) The intent of medical first response is to provide rapid lifesaving interventions for patients who require immediate medical attention and to provide additional resources on an EMS scene when needed.

Medical first response may be provided by one or more organizations in the context of an EMS system.
