

Evaluating the impact of pharmacy driven interventions on patients with hyperglycemia who have been identified by use of a clinical surveillance software system.

Michael Wisner, PharmD  
 PGY1 Pharmacy Resident  
 Norman Regional Health System,  
 Norman, OK

Abstract # 11  
 IRB Approved

1

## Background

- Quality improvement project
- Goal:
  - Assess the impact of implementing a pharmacist focused glycemic management tool
  - Assess the feasibility of system wide implementation of such a tool

4

## Disclosures

- Michael Wisner
- Potential conflicts of interest: none
- Sponsorship: none
- Proprietary information or results of ongoing research may be subject to different interpretations
- Speaker's presentation is educational in nature and indicates agreement to abide by the non-commercialism guidelines provided

2

## Impact of Hyperglycemia

- Increased risk of infections, cardiovascular events and mortality
- Longer lengths of stay
- Quality Measures
  - Surgical Care Improvement Project
    - SCIP-Inf-4 - Retired
  - National Quality Forum (NQF) Measures
    - Recommended for endorsement
      - NQF 2362 – Inpatient - Hyperglycemia
      - NQF 2363 – Inpatient - Severe Hypoglycemia

5

## Objectives

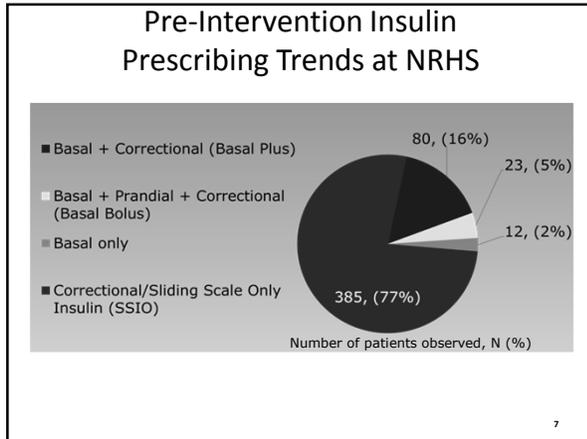

- To identify the benefits and limitations associated with the use of a clinical surveillance software system.
- To describe the barriers related to implementing and measuring outcomes related to a pharmacist driven glycemic management program.

3

## Glucometrics

- Patients with only Sliding Scale Insulin
- Patient groups - ICU vs non-ICU patients
- Source of lab data - Point of care glucose tests
- How to measure hyperglycemia
  - Patient day weighted mean glucose level
  - Patient days with weighted mean glucose > X
- How to measure hypoglycemia
  - Patient days with one reported glucose < X
- Benchmarking
  - Remote Automated Laboratory Systems (RALS), Yale Glucometrics, and Society of Hospital Medicine

6

- ### Identifying Patients for Interventions
- Senti7
    - Clinical Surveillance Software System
    - Identifies patients based on user built rules
  - Hyperglycemia
    - 2 or more POC-BG > 200 in past 24h
    - 1 or more BG > 300 in past 48h
  - Hypoglycemia
    - Any BG < 70 in past 48h

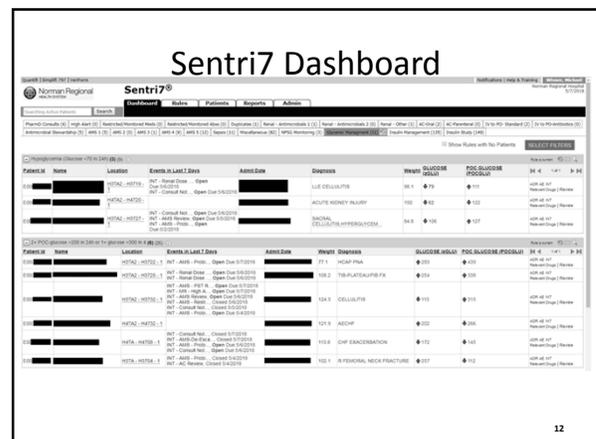

### Pre-intervention Comparison of NRHS Glucometrics with a National Benchmark

	Benchmark Study (Non-ICU)	Norman Regional Health System
Time period	1/1/12 – 12/31/12	8/1/17 – 10/31/17
Location	635 hospitals nation wide	Medical/Surgical unit and Cardiac PCU
Day weighted mean blood glucose	167	172
% of patient days with mean blood glucose		
> 180 mg/dL	32.3%	37.9%
> 200 mg/dL	21.9%	27.2%
> 250 mg/dL	7.4%	10.0%
> 300 mg/dL	2.3%	3.6%
Patient day prevalence of hypoglycemia		
< 70 mg/dL	6.1%	3.3%
< 60 mg/dL	3.5%	1.6%
< 50 mg/dL	1.7%	0.5%
< 40 mg/dL	0.7%	0.1%

Bersoux S, Cook CB, Kongable GL, et al. Benchmarking Glycemic Control in U.S. Hospitals. *Endocr Pract.* 2014 Sep;20(9):876-83. doi: 10.4158/EP131516.OR.

- ### Five Rights of Clinician Decision Support
- Right information
  - Right person
  - Right CDS intervention format
  - Right channel
  - Right time in workflow

- ### Methods
- Location: med/surg and cardiac PCU floor of Norman Regional Healthplex Hospital
  - Time frame: January 2018
  - Interventions included:
    - Identifying and addressing medication errors
    - Admission medication reconciliation
    - Suggesting adjustments to medication therapy to patient’s prescriber

### Sentri7 Dashboard

POC glucose >200 in 24h or 1+ glucose >300 in 4 (3) (25)

13

- ### Results: Rule performance
- Patients identified – 157
  - Daily rule catch per month – 474
    - Identified by rule once in any given day
  - Potentially reviewable daily rule catches per month – **183 (76 patients)**
    - Active on rule for > 4 hours during the normal working hours for clinical pharmacist at NRHS
- 16

5/5/2018 4:19 PM	195	MG/DLH

\*Viewing Medications from the past 7 days

15

- ### Barriers
- Time needed to assess patients
  - Physician acceptance of suggested medication changes
  - Necessary information not immediately available
  - Reactive vs proactive interventions
- 18

### Primary Outcome

- Day weighted mean blood glucose
  - Pre Study period: 172 mg/dL
  - Study Period: 164 mg/dL
  - Results were **not significant**
    - Kruskal-Wallis chi-squared, p-value = 0.5773

19

### Medication Error Specific Senti7 Rules

- Proposed new Senti7 rules
  - Hypoglycemia and an active order for a sulfonylurea
  - Mismatched insulin type for prandial and correctional insulin
  - Duplicate basal insulin orders
  - Recent hyperglycemia or active order for insulin and no finger stick blood glucose level in last 24h
- More specific and less time consuming for a pharmacist to review

22

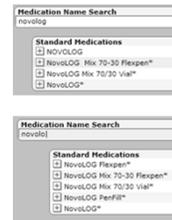

### Results: Glucometrics

	Benchmark Study (Non-ICU)	Norman Regional Health System (Medical/Surgical unit and Cardiac PCU)	
Time period	1/1/12 -12/31/12	8/1/17 - 10/31/17	1/1/18 - 1/31/18
Day weighted mean blood glucose	167	172	164
% of patient days with mean blood glucose			
> 180 mg/dL	32.3%	37.9%	30.9%
> 200 mg/dL	21.9%	27.2%	22.3%
> 250 mg/dL	7.4%	10.0%	9.8%
> 300 mg/dL	2.3%	3.6%	4.2%
Patient day prevalence of hypoglycemia			
< 70 mg/dL	6.1%	3.3%	5.9%
< 60 mg/dL	3.5%	1.6%	3.3%
< 50 mg/dL	1.7%	0.5%	1.3%
< 40 mg/dL	0.7%	0.1%	0.2%

20

### Systems based changes: NovoLOG Mix

- Medication errors related to NovoLOG Mix 70/30 Flexpen
- Updated drug names in drug dictionary used for medication reconciliation

23

### Discussion

- A statistically significant impact on the primary outcome was not observed but several types of medication errors were identified
- Reviewing patients with this Senti7 rule is too time consuming to consider implementing hospital wide
- Some of these medication errors can be addressed and corrected independently from the methods used in this project

21

### Systems Based Changes: Hyperglycemia Order Set

- Order strings for correctional insulin differed based upon if the order was submitted via CPOE vs manually entered by pharmacy
- CPOE
  - ADD TO meal coverage as necessary. GIVE ALONE at BEDTIME. ADMINISTER even if patient is NPO.
- Manual entry
  - PRN meal coverage,give alone at bedtime,admin. even if NPO.
- Order strings standardized to CPOE version

24

## Late and Missed Doses of Insulin

- Not identified as an issue until late in the project
- Potentially a huge problem
- Currently no effective tool to track cases of late or missed doses of prn correctional insulin
- Retrospective review of sample of patients performed
- Will encourage nursing management to undertake process review

25

## Self Assessment

1. CMS currently enforces two quality measures, NQR 2362 and NQR 2363, for measuring inpatient glycemic control.
  - A. True
  - B. False
2. Which of the following are potential barriers to implementing a pharmacist driven glycemic management program?
  - A. Time necessary for patient case review
  - B. Difficulty finding relevant data points at the right time and place
  - C. Buy-in from other healthcare providers
  - D. All of the above

28

## Conclusion

- Systematically screening all patients who are persistently hyperglycemic may not be a feasible option for improving glycemic control in the inpatient setting.
- Screening a sample of patients in this manner can be helpful to identify certain negative trends that can be then be addressed and corrected by other means.
