Kansas does not enforce a uniform state-wide building energy code. Building owners should consider meeting or exceeding the requirements of the most current version of the International Energy Conservation Code (IECC) when installing a new or replacement roof system in order to improve energy efficiency and reduce operating costs. The IECC’s minimum insulation requirements apply both to new construction and roof replacements on existing buildings. Information on applicable local building energy codes is available from the Kansas Corporation Commission [here](#).

**Minimum R-value Requirements for Insulation Entirely Above the Roof Deck**

- Climate Zone 5: R-30ci
- Climate Zone 4: R-30ci

**Notes**

- **About R-value**: R-value is a measurement of a material’s ability to resist heat flow. The higher the R-value, the greater the insulating power. Installers should consult data sheets provided by polyiso manufacturers for information on product-specific R-values.

- **Code Compliance**: The International Energy Conservation Code recognizes ASHRAE 90.1 as an alternate compliance option for both new construction and existing buildings.

**About PIMA**

Since 1987, PIMA has served as the voice of the North American rigid polyiso insulation industry. PIMA is a leading advocate for safe, cost-effective, sustainable, and energy-efficient construction. The Association is comprised of polyiso manufacturers and industry suppliers, and represents the public policy interests of its membership at the local, national, and international levels to advance high-performance building practices.

**About Polyiso Insulation**

Polyiso is a rigid foam insulation used in more than 70% of commercial roof construction and offers a continuous insulation solution for commercial and residential wall assemblies. As one of North America’s most widely used and readily available building products, polyiso is a cost-effective insulation option for reducing building energy use and improving the overall service-life of roofs and walls.
