## **Introduction**

In March 2020 the World Health Organization declared COVID-19 a global pandemic. Countries around the world responded with disease control measures, such as stay-at-home orders, and school closures and encouraged individuals to wear masks, social distance, clean and disinfect surfaces, etc. While the disease itself naturally remains a top public health concern, unemployment, isolation, stress, changes to the availability of medical/mental health/injury prevention services, and other related unintended effects may have the potential to impact the magnitude and patterns of injuries in communities.

Researchers from around the world are beginning to examine and comment on injury patterns (and issues) seen during the global pandemic. We believe there is a need to conduct a review of the injury scientific literature and to identify, catalog, and organize (by selected injury topics) these published articles for the benefit of the injury epidemiology and prevention community.

## **Methods**

We used [SafetyLit](#) to identify articles related to COVID-19 and injury because it provides a comprehensive database of scholarly journal articles and technical reports on all issues of unintentional injuries, interpersonal violence, self-harm and the risk-factors for these as well as the individual and societal costs and consequences when injuries occur. SafetyLit provides an index with abstracts to reports from authors working in more than 30 distinct professional disciplines relevant to safety. SafetyLit staff and volunteers perform sensitive daily searches of several key databases under license (PubMed, Global Index Medicus, etc.) and weekly searches of more than 4000 additional journals published in 158 of the world's nations that are not included in these biomedical databases. At least 500 recently-published items are added each week. Additional journals' contents are searched quarterly. The curated nature of the bibliographical database contents and the specialty thesaurus facilitate queries that provide focused results.

SafetyLit records contain bibliographic information, an abstract (if available), and a link to the publishers' website or digital object identifier (DOI). SafetyLit has a searchable function, by boolean logic, by author, title, journal, year, text word, and text word and synonym. Literature found from a query of the SafetyLit database can be exported to reference management software.

The SafetyLit database was searched during the week of December 6th, 2020, for COVID-19 and injury-related articles. We selected 17 injury categories to focus on. These injury topics were: bicycling injuries, burns, child abuse, drownings, drug overdose, falls, home and consumer product safety, homicide, intimate partner violence, pedestrian injuries, pediatric sleep-related deaths, road traffic, sports injuries, suicide, trauma, unintentional firearm injuries, and unintentional poisonings.

For each injury category, a search was conducted using a specific set of key terms connected by boolean logic. The article's title and abstract were searched for these key terms. To determine the most appropriate key term combinations, test searches using different key term combinations were first conducted and evaluated on the number and type of articles produced. All searches were conducted using a text word exact search for the terms: "COVID" OR "pandemic" OR "coronavirus" OR "corona" OR "SARS CoV-2", followed by "AND" and then a text word + synonym search for the set of key terms (interrelated by "OR" logic) relevant to the specific injury category. For example, the set of key terms used for the suicide category was "COVID" OR "pandemic" OR "coronavirus" OR "corona" OR "SARS CoV-2", AND "suicide" OR "self-injurious behavior". The complete list of key term combinations used for each injury category can be found in Appendix A. The search results were restricted to articles published in 2020 and all article types were included.

Bibliographic information on every article identified by the searches was saved using the free and open-source Zotero reference management software's browser extension. A line list of articles by injury category was then exported from Zotero to Microsoft Excel 2011 (Microsoft Corporation, Redmond WA) file. After sorting articles by DOI, duplicate articles that appeared in more than one injury category were removed, and each article was given, for this project, a unique project citation number.

Every article was then reviewed to determine its country of focus and date of publication. Country of focus was defined as the country discussed as the primary subject matter of the article. Articles that discussed more than one country or discussed the global phenomena were labeled "multiple," while articles that had no identifiable country of focus were labeled with "?". Date of publication was defined as the date the article first became available online. For some articles, the specific date of publication could not be determined, but the month of publication was available; for some articles, neither the specific date nor month of publication could be determined, and these fields were labeled "?".

We descriptively analyze the articles by injury category, specific date of publication, month of publication, country of focus, and publication title. A compendium of selected bibliographic information of identified articles was created (Appendix B).

## **Results**

An initial search of COVID-19-related articles in the SafetyLit database yielded nearly 1,000 articles (881).

From there, we found nearly 500 (473) unique articles across our 17 injury categories. These 473 unique articles were then analyzed by injury category, date of publication, month of publication, country of focus, and publication title.

*Injury Category*

Table 1 shows the number of articles that were identified by injury category. Articles could be identified in more than one injury category; about a quarter (150/473; 24%) were duplicate articles appearing in two or more of the injury categories.

As Table 1 shows, the injury categories of suicide and intimate partner violence yielded the greatest numbers of articles with 160 (26%) and 134 (22%), respectively. Those related to trauma (94), road traffic (67), and child abuse (42) followed. There were fewer than 25 articles each for falls, unintentional poisonings, unintentional firearm injuries, homicide, and sports injuries. And there were fewer than 10 articles each for burns, drug overdose, pedestrian injuries, bicycling injuries, drownings, home and consumer product safety, and pediatric sleep-related deaths.

Table 1. Frequency of Articles by Injury Category	
<b>Injury Category</b>	<b>Number of Articles</b>
Suicide	160
Intimate partner violence	134
Trauma	94
Road traffic	67
Child abuse	42
Falls	22
Unintentional poisonings	22
Unintentional firearm injuries	20
Homicide	16
Sports injuries	15
Burns	8
Drug overdose	8
Pedestrian injuries	7
Bicycling injuries	4
Drownings	2
Home and consumer product safety	1
Pediatric sleep-related deaths	1

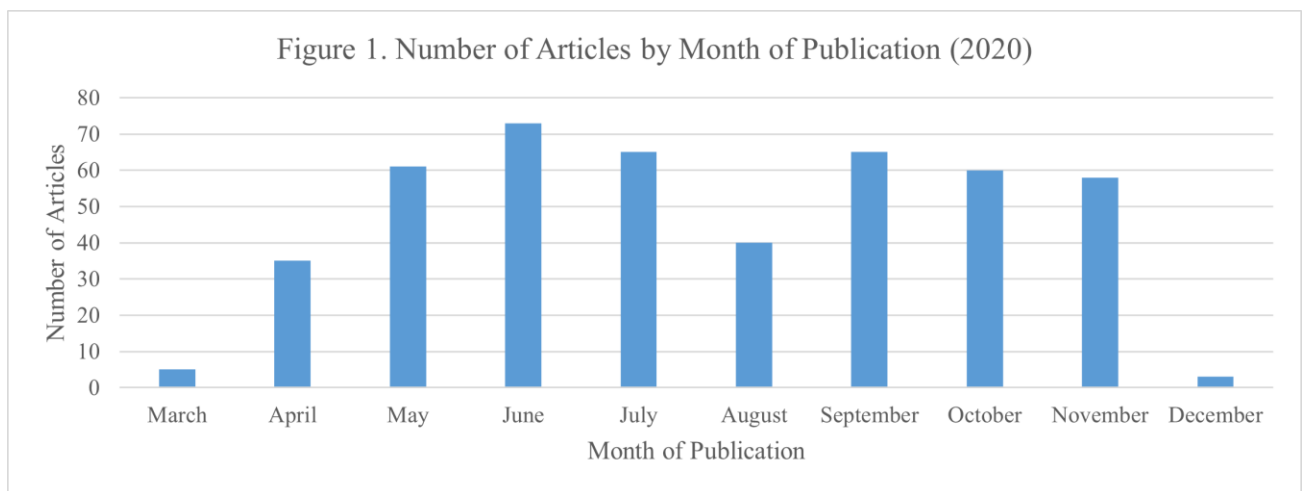

*Note: Articles could be identified in more than one injury category*

### *Date of Publication (2020)*

The specific date of publication was found for nearly all (460/473; 96%) of the articles. The first article was published on March 19th (just 8 days following WHO's March 11th global pandemic declaration) and the last was published on December 10th. The most articles published on any one day (September 1st) was ten.

### *Month of Publication (2020)*

The month of publication was determined for nearly all (465/473; 98%) of the articles. Between April and November, an average of 57 articles were published monthly. As Figure 1 shows, June had the greatest number of articles published (73) while April had the lowest number of articles published (35) (excluding March and December).

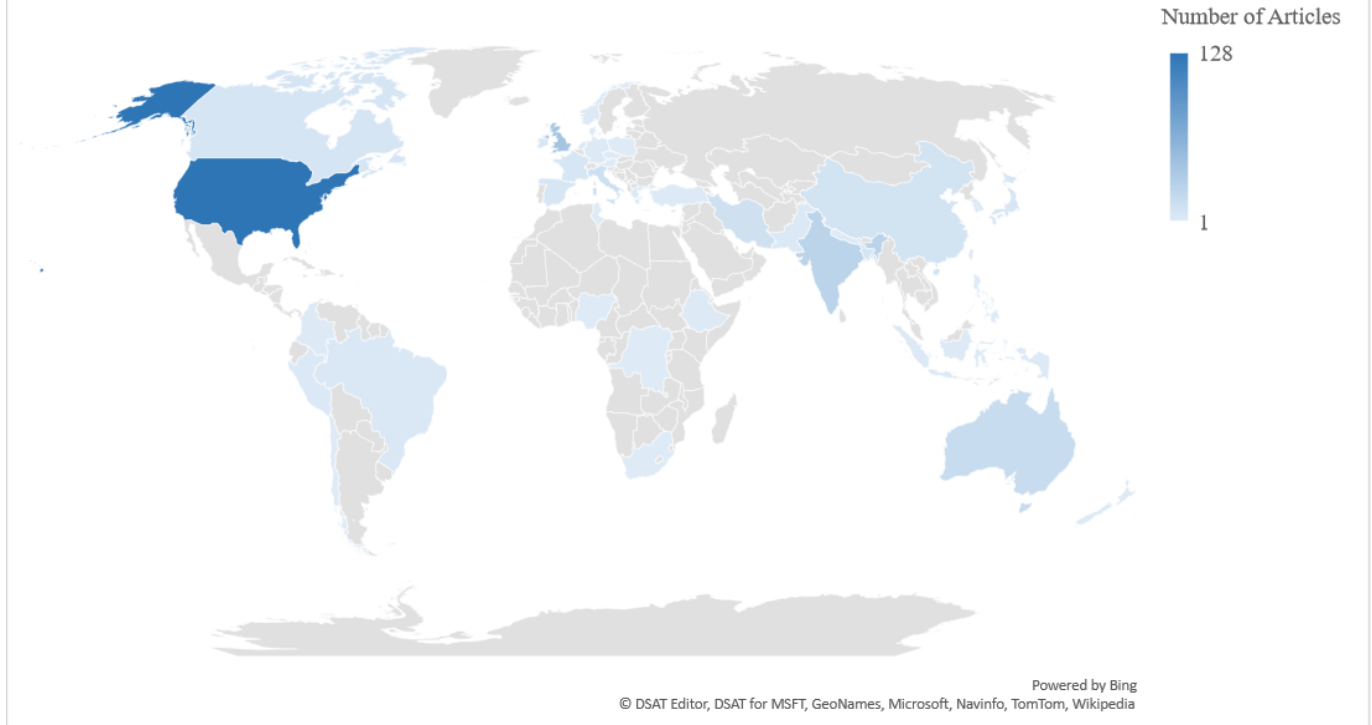

### *Country of Focus*

A singular country of focus was identified for nearly three-quarters (337/473; 71%) of the articles; 8% (38/473) had no identifiable country of focus, and nearly a quarter (98/473; 21%) had multiple countries or a global focus. As Table 2 shows, where a country of focus could be identified (337), 40% of the articles were from countries in North America, 26% from Europe, 23% from Asia, 6% from Oceania, 3% from South America, and 2% from Africa. Forty different countries across every continent (except Antarctica) were identified. The United States was the most common country (128; 38%), followed by the United Kingdom (43; 13%). The remaining top ten countries with the most number of articles were as follows: India (26), Australia (17), Italy (13), Iran (12), China (10), Bangladesh (8), Canada (7), France, Ireland, Japan, and Spain, (6 each). Figure 2 is a global map identifying these countries.

Table 2. Frequency of Articles by Country of Focus		
Country	Number of Articles	Percent of Articles
<b>North America</b>	<b>135</b>	<b>40%</b>
Canada	7	
United States	128	
<b>Europe</b>	<b>89</b>	<b>26%</b>

South Africa	1	
Tunisia	1	
<b>Grand Total</b>	<b>337</b>	<b>100%</b>

Figure 2. Number of Articles by Country of Focus

*Publication Title*

A publication title was identified for all articles. In total, 254 different publications published all of these 473 unique articles. The top ten publications by number of articles are listed in Table 3.

<b>Publication Title</b>	<b>Number of Articles</b>
Asian Journal of Psychiatry	20
Bone & Joint Open	13
Psychological Trauma: Theory, Research, Practice, and Policy	12
Child Abuse and Neglect	11
Lancet Psychiatry	10
Journal of Family Violence	8
BMJ	8
Psychiatry Research	8
Transportation Research Interdisciplinary Perspectives	7
American Journal of Criminal Justice	7
<b>Subtotal</b>	<b>104</b>

## *Appendix B*

All articles identified in our searches were cataloged and organized by injury category (Appendix B). The same article may appear in multiple injury categories. The injury category, our unique project citation number, article title, publication title, DOI hyperlink (or website/abstract hyperlink), date of publication, month of publication, and country of focus (if available) were included for every article, if available.

### **Discussion**

We believe that this is the first report to explore the injury scientific literature regarding COVID-19 and injuries. Our findings indicate the existence of a sizable, growing, and diverse body of published articles from across the world.

We identified nearly 500 (473) unique articles published in 2020 touching on 17 selected injury topics. Though nearly half fell under the topics of suicide and intimate partner violence, other articles were related to trauma, road traffic, child abuse, and many other important injury areas. Interestingly, we found that there were an average of over 50 articles published monthly and there were articles about countries from every continent (excluding Antarctica).

It was beyond the scope of this project to read every article in depth. However, we choose four articles here to illustrate the value of injury epidemiology applied during this global pandemic. These four examples pertain to [sport injuries](#), [unintentional poisoning](#), [burn injuries](#), and [drug overdose](#).

Again, in Appendix B, we identified, cataloged and organized current scientific literature related to COVID-19 and our selected injury categories. We hope that it will be a valuable resource to injury epidemiologists and researchers, who are encouraged to read the full injury articles of their interest and identify methods, data sources, and conclusions to inform possible epidemiologic approaches in their own communities in response to this pandemic.

As more articles are published, future literature reviews, like the approach taken here, may prove useful for public health scientists in identifying other injury categories and research gaps in this emerging field of study of COVID-19 and injury.

### *Limitations*

There are several limitations with our literature search. First, other researchers may select alternative key search terms to define injury categories. For instance, adding another key term (“poison”) to our existing unintentional poisoning search criteria would have identified a handful

of additional articles, like this [one](#). Second, our article search was a “snapshot in time;” we anticipate that the literature on this topic will grow. Third, assigning the date of publication to articles depended on what dates the publishers made available. In most cases, the initial date the article became available online was listed and was used as the date of publication. However, some publishers listed only the date the article was accepted or simply a “date published” so in these instances, whatever date was available was used as the date of publication for the purposes of this project. It is important to note that SafetyLit contains both articles with a final publication date of 2020 as well as ahead-of-print articles that were released this year. Fourth, we did not assess the quality of the article or the strength of the “relatedness” of the article to COVID-19 and injury; if the title or abstract contained our identified search criteria, it was captured. Fifth, our search parameters focused on only 17 injury categories (and the resulting identification of 473 unique articles); we did not explore the vast range of injury categories. Our initial search (“COVID” OR “pandemic” OR “coronavirus” OR “corona” OR “SARS CoV-2”) of the injury literature identified 881 articles; this suggests the existence, at the time, of over 400 (408) other unique articles related to COVID-19 and other injury topics that were not identified by our selected injury category searches. It is not known specifically what other injury topics those other articles focused on, but they could have included such areas as mental health, sexual abuse, rural issues, and disasters.

### *Next Steps*

Despite these limitations, we believe there is value, for the benefit of the injury epidemiology and prevention community, to review the injury scientific literature and to identify, catalog, and organize (by selected injury topics) these published articles. And therefore, we propose the following next steps:

#### 1) Share this report with:

- Austin Public Health epidemiologist and prevention colleagues
- Texas Injury Prevention Leadership Collaborative
- Texas Department of State Health Services colleagues (Health Service Region 7, Office of Injury Prevention, State Public Health Library)
- SafetyLit
- Safe States Alliance
- Council of State and Territorial Epidemiologist’s *Injury Epidemiology and Surveillance Committee*
- Centers for Disease Control and Prevention’s *National Center for Injury Prevention and Control*
- National Center for Health Statistics
- American Foundation for Suicide Prevention
- Southeastern and Southwestern Injury Prevention Network
- Public health faculty at the University of Texas at Austin

- Other injury epidemiologists and colleagues

2) Present this report at the University of Texas (Austin) Student Research Showdown and the Longhorn Research Poster Session

3) Encourage injury epidemiologists and scientists to read the full injury articles of their interest and identify methods, data sources, and conclusions to inform possible epidemiologic approaches in their own communities in response to the pandemic

### *Acknowledgements*

We thank Dr. David Lawrence, Director of SafetyLit Foundation, for his impeccable assistance in this project.

Davis Roe wishes to thank Dr. Marilyn Felkner, University of Texas at Austin, for her thoughtful recommendation for inclusion on this project.

David Zane wishes to thank David McLellan and Anne Tarpey, public health librarians at the Texas Department of State Health Services (Austin), for their ongoing support.
