CIGAR USE, SENSATION SEEKING TENDENCIES, AND FLAVORS
Presenting Author: Anna Wilkinson, UT School of Public Health

Sensation seeking tendencies are associated with a variety of tobacco product use including cigarettes, cigars, and smokeless tobacco. To date little is known about specific attributes of the product that appeal to sensation seekers or whether such attributes appeal equally to men and women. Here we examine the relationship between flavored cigar use and sensation seeking tendencies, by gender.

Participants were 5,482 18-29 year old students (M age=20.49; SD=2.36; 64% female; 36% non-Hispanic white, 31% Hispanic, 19% Asian, 9% African American/black and 5% other) attending one of 24 colleges in Texas. Students completed an online tobacco survey, which included images of products to facilitate recognition. Student’s t-tests, conducted by gender, were completed to examine mean differences in sensation seeking tendencies by initial and current use of flavors, among ever cigar users. Overall, 37% of the sample used a cigar product in their lifetime and just under 10% were current users. Among women, sensation seeking tendencies were not associated with either first or current use of flavored cigars. Among women who ever used a cigar (n=1,049), the majority (89%) reported that their first experience was with a flavored product. Similarly, among current female cigar smokers (n=204), the majority (87%) reported using flavored cigars. Among men, higher sensation seeking tendencies were associated with flavored use when first trying cigars and current cigar use (p<0.05 for both). Among first time users (n=897), the majority (68%) used flavored products, but among current users (n=308), the majority (65%) used non-flavored cigars. Fruit (vs. mint or alcohol) flavors were the most popular flavor among first time users.

These results indicate that sensation seeking tendencies have a more pronounced influence on male cigar smokers than females, and among males, sensation seekers prefer flavored to non-flavored cigars. Fruit flavors appear to facilitate initiation among high sensation seeking males. Our results contribute to the evidence base for the FDA to make decisions about allowable constituents and additives during manufacturing, such as banning the use of flavors.

FACTORS ASSOCIATED WITH DUAL USE OF CONVENTIONAL AND ELECTRONIC CIGARETTES: FOCUS GROUP STUDY AMONG CURRENT ADULT SMOKERS

New Title: REASONS FOR E-CIGARETTE USE AMONG CURRENT SMOKERS: A QUALITATIVE STUDY
Authors: Ban A. Majeed, PhD1, Cassandra A. Stanton, PhD2,3, Shanta R. Dube, PhD4, Kymberle L Sterling, DrPH1, Joy D. Burns, MEd1, Michael P. Eriksen, ScD1, 1School of Public Health, Georgia State University, Atlanta, Georgia, 2Westat, Center for Evaluation and Coordination of Training and Research (CECTR) in Tobacco Regulatory Science, 3Department of Oncology, Georgetown University Medical Center / Cancer Prevention and Control Program, Lombardi Comprehensive Cancer Center.

OBJECTIVES: This study explored psychological and social contexts of cigarette and e-cigarette dual use, and investigated influences that shaped current smokers’ use of e-cigarettes.

METHODS: Two focus groups with 14 current smokers who had ever used e-cigarettes were conducted in 2014. Group discussions were audio recorded and transcribed. Thematic analysis was used to identify themes related to reasons for use, first experiences, and patterns of use among experimenters and regular users of e-cigarettes.

Results: Themes that emerged from accounts of initial use included curiosity and the social environment, in particular a persuasive person. Themes related to regular e-cigarette use included the importance of sensory experience and perception of reduced harm. Both groups endorsed cravings, image (i.e., “looking cool”), and convenience as associated with their use regardless of intensity. Two main patterns of use emerged: using e-cigarettes to replace conventional cigarettes (substitution) or to supplement conventional cigarette smoking (complimentary).

CONCLUSION: Emergent themes associated with e-cigarette use among current smokers were related to nicotine dependence, social influence, and product appeal. Understanding the contextual nuances of these factors through more explicit measurement will inform local and national regulatory policy making and more effective public health communication.
