MESSAGE FROM THE PROGRAM CHAIR

Dear Colleagues,

On behalf of the SRNT Program Committee, we welcome you to the 26th Annual Meeting of the Society for Research on Nicotine and Tobacco (SRNT) in New Orleans!

This year, the overarching program theme focuses on “Reducing Tobacco Use in Young People.” This theme has guided our selection of plenary sessions and we have aimed to include content in the program from basic science, epidemiological surveys, clinical studies, and policy to better understand, prevent, and treat tobacco use in youth and young adults. As always, the annual meeting offers you cutting-edge scientific presentations across the full spectrum of basic and applied research on nicotine and tobacco. There will be presentations on pivotal clinical trials, new nicotine products, effective mobile strategies for treatment and engagement, insights from basic science on the effects of nicotine, plus hot topics in the areas of nicotine reduction, tobacco use epidemiology, genomics, biomarkers, non-cigarette tobacco products, tobacco product regulation, cessation, and tobacco control policy.

Several key highlights for the meeting are:

**Wednesday, March 11, 2020**
5:30 p.m.-6:45 p.m.

**President’s Symposium on Adolescent Tobacco Use Cessation**
Chair: Suzanne M. Colby, PhD, Professor of Psychiatry and Human Behavior and Postdoctoral Training Director Center for Alcohol & Addiction Studies, Brown University School of Public Health, Providence, RI

Overview: This symposium focuses on the persistent and evolving challenge of effectively addressing adolescent tobacco-use cessation. Presentations will consider youth tobacco use in all its forms, including multiple tobacco product use. Dr. Jamal will draw on both U.S. and international data from multiple sources to describe the current nature of youth tobacco use, dependence, motivation to quit, and actual quit attempts, all of which have relevance for determining potential need and demand for treatment. Dr. Krishnan-Sarin will summarize key findings from prior youth tobacco cessation research, and will review what is known about e-cigarette appeal in youth, and then will consider how this knowledge can inform intervention development. Dr. Mermelstein will discuss the dual developmental contexts (i.e., adolescence as a life stage and initiation and progression as stages of the tobacco use continuum) that are essential considerations for youth tobacco cessation treatment development and implementation. Dr. Colby will moderate Q&A with the panel following the presentations.

2020 Award Recipient:

Ron Borland, PhD, FASSA  
Professor of Psychology – Health Behaviour  
Deputy Director  
Melbourne Centre for Behaviour Change  
Melbourne School of Psychological Sciences  
The University of Melbourne

JOHN SLADE

Dr. John Slade was an expert on the treatment of alcohol, tobacco, and drug addiction and one of America’s pioneer advocates for tobacco control.

He was a member of the team that conducted the first scholarly analysis of previously secret documents from the Brown and Williamson Tobacco Company, which formed the basis for the film “The Insider.” John’s analysis led to a landmark series of articles in the Journal of the American Medical Association in 1995, as well as a book, “The Cigarette Papers.” His groundbreaking research to prove that cigarettes are nicotine delivery devices helped make it possible for the Food and Drug Administration to claim regulatory authority over tobacco products under then-FDA Commissioner Dr. David Kessler.
John was appointed Professor of Medicine, Robert Wood Johnson Medical School of the UMDNJ, in 1998. He emerged as a leader in substance abuse prevention and tobacco control for the state of New Jersey through his teaching and clinical work as well as through his active involvement with the Medical Society of New Jersey and the New Jersey Public Health Association. John played a major role in helping New Jersey develop its tobacco prevention and treatment program, funded as part of the 1998 $206 billion settlement with tobacco companies.

He co-edited the first major clinical textbook on nicotine addiction and founded the Committee on Nicotine Dependence of the American Society of Addiction Medicine (ASAM).

MURRAY E. JARVIK

Dr. Murray Jarvik was born in New York City in 1923. Following medical school, Murray worked at the Yerkes Laboratory in Florida. It was here that he serendipitously witnessed a monkey that would smoke cigarettes. A Fellowship at Mount Sinai Hospital in New York followed, where Murray became one of the pre-eminent researchers studying a newly discovered substance: LSD.

LSD research pivoted Murray into the emerging field of psychopharmacology in the mid-1950s and to a professorial position at the newly created Albert Einstein School of Medicine. It was here that Murray established himself as a premier researcher on effects of drugs on learning and behavior.

Murray’s interests in the mid-1960s turned toward tobacco smoking. Although Murray continued, initially, to study the effects of other drugs and memory, he eventually shifted his focus to smoking and nicotine addiction almost entirely.

One of the first projects he attempted, spurred by the very memorable observation at Yerkes, was to attempt to get monkeys to smoke. This was partially successful and led to experiments with humans and rats so that by 1970 Murray had collected sufficient data to suggest that nicotine was key in the reinforcement of smoking. His work was included in subsequent Surgeon General reports on smoking and nicotine addiction.

Perhaps Murray Jarvik’s most notable achievement was work done with Jed Rose in the 1980s investigating the possibility of delivering nicotine through the skin in sufficient quantities to affect smoking behavior. At first, their approach was quite simple, a basic poultice of nicotine. After much development, they were able to patent the concept of a nicotine transdermal patch, which they turned over to UCLA. It soon made it into production as the second FDA-approved pharmacologic treatment for smoking cessation after nicotine gum. With both established efficacy and ease of use, it was highly successful, for several years among the top three most profitable patents for the University of California.

MICHAEL RUSSELL

By the 1960s, the emerging evidence of the danger of cigarette smoking was clear, but there was very little understanding of why people smoked. Cigarette smoking was generally thought of as a habit, with pharmacological factors receiving little or no attention.

Michael Russell was the man who did most to revolutionize our understanding. His research led to the 1988 report of the US Surgeon General, Nicotine Addiction, which finally brought recognition that cigarette smoking is a classic drug dependence.
Russell was a psychiatrist in training at the Maudsley Hospital in south London, when he chose the topic of cigarette smoking for his research thesis in 1967. Based on his review of what was then fragmentary research literature, he concluded in a 1971 paper that the drug nicotine was the motivating force underlying smoking behavior. He made the study of the interacting pharmacological and psychological determinants of tobacco dependence his life’s work.

Mike is regarded by many as the father of effective treatment to help smokers quit, but he is probably best known in the cessation field for a non-pharmacological intervention. In 1979 he published a trial examining the effectiveness of brief advice to quit smoking given by GPs in the course of routine consultations. The one-year success rate was 5%, compared with less than 1% in controls. A successful trial of nicotine chewing gum combined with brief advice in primary care followed. Mike Russell moved toward the concept of an integrated district smoking cessation service, in which routine delivery of advice and pharmacological therapy in primary care was combined with intensive clinic support. That vision has now been realized in Great Britain’s National Health Service.

The Doll-Wynder Award honors scientists who have made groundbreaking advances in public health, public policy, or epidemiological research.

RICHARD DOLL

Sir William Richard Shaboe Doll was a British physiologist who became the foremost epidemiologist of the 20th century, turning the subject into a rigorous science. He was a pioneer in research linking smoking to health problems. With Ernst Wynder, Bradford Hill, and Evarts Graham, he was credited with being the first to prove that smoking caused lung cancer and increased the risk of heart disease.

In 1948, he joined a research team under Dr. Francis Avery-Jones at the Central Middlesex Hospital, run under the auspices of the statistical research unit of the Medical Research Council. Over a 21-year career in the unit, Doll rose to become its director. In 1950, with Austin Bradford Hill, he undertook a study of lung cancer patients in 20 London hospitals, at first under the belief that it was due to the new material tarmac or motor car fumes, but rapidly discovering that tobacco smoking was the only factor they had in common. Doll himself stopped smoking as a result of his findings, published in the British Medical Journal in 1950, which concluded; “The risk of developing the disease increases in proportion to the amount smoked. It may be 50 times as great among those who smoke 25 or more cigarettes a day as among non-smokers.”

Four years later, in 1954 the British Doctors Study, a study of some 40,000 doctors over 20 years, confirmed the suggestion, which led to a government-issued advice that smoking and lung cancer rates were related.

In 1966, Doll was elected to the Royal Society. The citation stated: Doll is distinguished for his researches in epidemiology, and particularly the epidemiology of cancer where in the last 10 years he has played a prominent part in (a) elucidating the causes of lung cancer in industry (asbestos, nickel
& coal tar workers) and more generally, in relation to cigarette smoking; and (b) in the investigation of leukaemia particularly in relation to radiation, where using the mortality of patients treated with radiotherapy he has reached a quantitative estimate of the leukaemogenic effects of such radiation. In clinical medicine he has made carefully controlled trials of treatments for gastric ulcer. He has been awarded the United Nations Prize for outstanding research into the causes and control of cancer and the Bisset Hawkins Medal of the Royal College of Physicians for his contributions to preventative medicine. Doll was made a Fellow of the Royal Society in 1966, knighted in 1971, and awarded the Edward Jenner Medal of the Royal Society of Medicine in 1981. In 1996, he was made a Companion of Honour for “services of national importance”. International honours included the Presidential Award of the New York Academy of Sciences as well as a UN Award for his research into cancer. In April 2005, he was awarded the Saudi Arabian King Faisal International Prize for medicine jointly with Richard Peto for their work on diseases related to smoking. In 2004, he was awarded the inaugural Shaw Prize for Life Sciences and Medicine for his contribution to modern cancer epidemiology. He was also awarded honorary degrees by 13 different universities.

ERNST WYNDER

Ernst Ludwig Wynder was an American epidemiology and public health researcher who studied the risk factors of smoking tobacco. His 1950 coauthored publication entitled, “Tobacco Smoking as a Possible Etiologic Factor in Bronchiogenic Carcinoma: A Study of 684 Proved Cases” appeared in the Journal of the American Medical Association. It was one of the first major scientific publications identifying smoking as a contributory cause of lung cancer.

Wynder began collaborating with his coauthor on the article, Evarts Ambrose Graham, as a medical student at Washington University in St. Louis in 1947. The previous summer he had conducted epidemiological studies of smoking behavior among 146 lung cancer patients in New York City. The project was funded by the American Cancer Society. Now, with Graham, Wynder collected extensive data on 604 patients with lung cancer at hospitals across the United States. Departing from a tradition of using anecdotal evidence (e.g., clinical interviews) to develop explanations of disease causation, Wynder and Graham applied rudimentary statistical methods to their study. They divided patients into crude categories of “moderate” or “heavy” smokers, based on retrospective interviews of each patient’s smoking behavior over a 20-year period. They also measured and controlled for important confounding factors (e.g., age, types of tobacco use, inhalation level). Most importantly, with regard to an ability to demonstrate causation, Wynder and Graham also studied a control group of cancer-free individuals in hospitals. They used this control group to systematically compare their lung cancer patients.

On May 27, 1950, the Journal of the American Medical Association published the resulting scientific report. Wynder and Graham found that lung cancer could develop among nonsmokers, such that smoking is not the single factor in the induction of disease. But they identified smoking’s role as a significant risk factor for lung cancer, providing four reasons to support this argument: 1) lung cancer prevalence was found to be rare in nonsmokers; 2) among patients with lung cancer, cigarette use tended to be high; 3) lung cancer prevalence among men and women matched patterns of smoking behavior in men and women; and 4) “the enormous increase in the sale of cigarettes in this country approximately parallels the increase in [lung cancer].” As further scientific evidence of smoking’s role in causing lung cancer began to mount in the United States and Great Britain, Wynder and Graham investigated the biological plausibility of the association between smoking and lung disease. In 1950, they initiated a study of the impact of tars from tobacco smoke on mice. After a year of exposure to tar, 44 percent of the mice developed cancers. Wynder also discovered specific carcinogens in tar (e.g., benzopyrenes, arsenic), but was unable to identify the contributions of these chemicals to cancer.
