REPRODUCTIVE HORMONES, EXTRALABEL USE, AND COMPOUNDING

M. Gatz Riddell, Jr. DVM, MS, DACT

The drug approval process is a long, expensive, resource consuming effort on the part of the pioneer pharmaceutical companies. Time to approval for animal products is measured in years and costs are counted by millions of dollars. But for products that are approved and garner a major amount of the market share for a specific use or indication, the potential profits can be financially rewarding. Products, which have achieved FDA approval, are considered to be both safe and efficacious. The length of the approval process separates research findings from approved product by up to ten years leaving a void in up to date therapies for the progressive practitioner. Extralabel drug use and the availability of compounded products create some difficult issues for the practitioner wanting to provide the best for their patients and stay on the correct side of those who regulate their practice.

The regulatory environment for animal drugs has been impacted by numerous changes in the regulations as well as specific issues such as antimicrobial susceptibility in zoonotic pathogens of food born origins. The intent of this paper is to introduce some of the numerous regulatory issues, which impact the availability of drugs with an emphasis on those drugs, which would be used in reproductive management programs or for the treatment of reproductive tract diseases/conditions. While some of these issues may enhance the potential for future approvals and many in the profession are familiar with the Animal Medicinal Drug Use Clarification ACT (AMDUCA), its a little discussed fact that extralabel use of reproductive hormones is not allowed. Further, review of many pharmaceutical or distributor catalogs reveals the availability of compounded products. While these products may provide practitioners and their patients with pharmaceutical capabilities reflective of very recent literature, the use of such products involves issues, which reach beyond drug therapy itself.

AMDUCA

In the early 1980's (specifically in1983 at the AABP Annual Conference in Oklahoma City for the author), the legality of extralabel drug use (ELDU) was brought to the profession’s attention. Peripheral issues were compounding and manufacturing of unapproved products, particularly for use in food producing animals. It was apparent at that time that the Code of Federal Regulations (CFR) did not recognize ELDU and that the Compliance Policy Guidelines written by the Bureau of Veterinary Medicine (now Center for Veterinary Medicine) established policies of regulatory discretion. This regulatory discretion was not law and could be changed at any time and with probably little notice. To say the least, this was an uncomfortable feeling for those people who were made aware of it. There was concern voiced about a wide variety of products from injectable vitamins to antimicrobials. At that time, practitioner awareness of what was legal and what was illegal and what defined the gray areas was less developed than it is today.

Various descriptions exist of the chain of events leading up to the passage of AMDUCA and the resulting promulgation of regulations. One section in the proposed regulations that was unchanged in the final version, despite input from SFT, ACT, AABP and AVMA was the
position on the extralabel use of reproductive hormones. Unfortunately, the bottom line is that the Center for Veterinary Medicine did not and does not feel that AMDUCA applies to the extralabel use of reproductive hormones. The agency agreed that comments had, at that time, been provided which identified some important reasons for extralabel use of drugs for nontherapeutic reproductive uses. The CVM feels that AMDUCA’s intent was directed at treating animal illnesses. Therapeutic uses for drugs would be those directed at preventing animal pain and suffering. Therapies that involve hormones and other drugs used in the reproductive management of a species are considered to be production uses. The conclusion of the agency was that allowing extralabel nontherapeutic use would impact drug availability issues which were/are to be addressed by the Animal Drug Availability Act of 1996 and that extralabel use of reproductive hormones would not be allowed under AMDUCA.

Based upon this opinion from CVM, any extralabel use of a reproductive hormone would not be legalized by the AMDUCA regulations and therefore would be illegal. Some timely examples would be the use of gonadotropin releasing hormone to synchronize ovulation and prostaglandins to generate an ecbolic effect in the postpartum cow. There are, no doubt, numerous other examples, which would not pose a threat to either the target animal or to the human food supply, but these uses are technically illegal. The AVMA’s Council of Biologic and Therapeutic Agents (COBTA) has considered this issue at length with one possible solution being to ask CVM for an official policy (a Compliance Policy Guideline). Further deliberations have suggested three possible responses to such a request. One response might be that compared to the antimicrobial susceptibility and pathogen load issues the extralabel use of reproductive hormones did not warrant any resource investment, and that their stated opinion remained. Another would be that such a policy would be a good idea, and it would be accomplished in short order. A third possible outcome would be that the agency would become officially aware of some of the extralabel uses and would not only remind the profession that such use was illegal but would also devote some resources to enforcement. The concern about generating this latter response prompted COBTA to reconsider approaching the agency for a policy of regulatory discretion.

The AMDUCA algorithm (appendix I) is pretty straightforward in the approach to a general interpretation of the regulations generated to enact the Act. However, all of the considerations about class of animal, species of food animal, species of animal, and approved human drugs are not relevant to reproductive hormones. The argument that animals, which do not perform reproductively and have to be sold for slaughter, will suffer is not considered relevant. An additional consideration is that reproduction is considered production by the agency and extralabel use of production drugs or feed additives is considered illegal. A case in point was the agency’s position on the use of oxytocin to increase milk production. An exception to the ban on extralabel feed additives will be found in the compliance policy guide “Extra-label Use of Medicated Feeds for Minor Species”. But, again, this use is dictated only by circumstances which threaten the health of the animal or when suffering and death would result from failure to treat the affected animals.

While regulatory discretion may be the approach of the Center for Veterinary Medicine, there are several important points, which must be considered by all practitioners. The most important one when it comes to food animals will focus on the impacts of the specific drug use
on human food safety issues. If the product is approved for the species under treatment but for a different use, the potential for product residues in meat and milk will be limited. For products that are unapproved, which includes all compounded products, there is much less scientific information available to guide practitioners on the issue of residue avoidance. Practitioners involved with extralabel drug therapies and those that involve compounded products are liable in the event that residues are detected. Residues that involve hormones are as “headline worthy” as those involving antimicrobials.

Animal Drug Availability Act of 1996

The purposes of the Animal Drug Availability Act (ADAA) were to increase the flexibility of the drug approval process, increase interaction between animal drug sponsors and FDA, and create a new category of drugs and support “flexible labeling”. The enhancement of the flexibility of the drug approval process has been addressed by re-defining the definition of substantial evidence of effectiveness. This would permit increased flexibility in studies required to demonstrate a new animal drug’s effectiveness. The final rule gives FDA greater flexibility to make case-specific scientific determinations regarding the number and types of adequate and well-controlled studies that will provide, in an efficient manner, substantial evidence that a new animal drug is effective.

The ADAA also called for greater direct interaction between animal drug sponsors and the FDA during the drug development process. This would entail a presubmission conference at the sponsor’s request and discretion in order to reach an understanding of the data needed to prove safety and efficacy.

A new category of drugs, Veterinary Feed Directive Drugs, was established to address new approvals for antibiotics in feed. To make a feed additive a prescription drug, as CVM has stated their intention to approve no new over-the-counter drugs for either parenteral or feed additive routes, would have placed significant burdens on feed manufacturing mills due to pharmacy requirements. To date, only one Veterinary Feed Directive Drug has been approved, but the industry and the sponsors have accepted the concept.

The concept of professional flexible labeling or flexible labeling permits a range of acceptable/recommended doses to appear on animal drug product labeling, rather than one optimum dose was also included with ADAA. This effort was the culmination of two years worth of deliberation by the Agency, the veterinary profession and the pharmaceutical industry. The concept resulted in the publication of a “strawman” label4 as a prototype/example of what this type of drug label might look like. Unfortunately, in early 2002, CVM published their intention to withdraw this as a model for antimicrobials. The issue of antimicrobial susceptibility has impacted the drug approval process in this and other areas.

The ADAA has resulted in the development of regulations in two required areas, the definition of substantial evidence and the formalization of the presubmission communication processes between the agency and drug sponsors. Prior to the ADAA, the requirements for numbers of trials repeated at separate geographic locations increased the amount and detail of data required for approvals. The current definition of “substantial evidence” now states one or

427
more adequate and well-controlled study where it can be reasonably concluded by experts that
the new animal drug will have the effect it claims. This definition is directed solely at efficacy
claims while the human food and target animal safety issues are still appropriately rigorous. The
concept of the presubmission conference details interaction between the agency and the sponsor
prior to submission of a drug for approval. The regulation details how the conference can be
requested and the procedures for the conduct of the conference.

Minor Use and Minor Species (MUMS) Initiative

In the current legislative session, the MUMS bill is under consideration by both houses of
Congress. The concept is viable and enjoys a broad base of support throughout the industry, the
profession, and the regulatory agencies. The focus for this legislation is to ease the approval
requirements for efficacy on approval submissions for indications where the potential for usage
is low and the economic return to the sponsor may not justify submission under the current
guidelines. Human food safety and target animals safety would still have to be assured. The
granting of “conditional approval” status would allow for a period of 5 years for the final
efficacy data to be submitted.

The definition of a minor species is a matter of regulation but the concept of a minor use
is a gray area. Early in the consideration of this issue, it became apparent that the veterinary
profession did not have good statistics on disease incidence, which increases the difficulty of
stating that a disease occurs at an incidence rate of 2 per 100,000 in the animal population, for
example. The human side of the drug approval process has an “orphan” drug category for
treatments of diseases, which fall, below a certain incidence level.

One interpretation of this gray area would suggest that developing a product for treating
embryo transfer donors would address a more limited population than a drug directed at
synchronizing estrus or ovulation in a specific species or class of animal. Therefore, one of the
many currently used protocols for synchronizing ovulation for timed artificial insemination
would be used on a population of animals too large to qualify for “minor use” status. The
concept was probably intended for anesthetics and specific disease indications such as abomasal
ulcers where the need for therapy was relatively infrequent.

Supplemental Claims for Approved Products

Because AMDUCA does not extend the privileges of ELDU to the use of reproductive
hormones, the label indications become increasingly important. Estrus synchronization is not
ovulation synchronization and treating pyometra is not administering an ecbolic agent to a cow
with a postpartum metritis. Supplemental label claims are a route to increasing the usefulness of
a reproductive drug but there are several concerns to be faced by the drug sponsors.

The minimal studies required for adding a new claim/indication to a currently approved
drug would be dose determination and clinical efficacy studies. This is assuming that the dose
for the new indication is close to the currently approved dose which would reduce or eliminate
the need for any further toxicity or safety studies. These reduced requirements for a
supplemental label claim, by some estimation, could cost upwards of a million dollars. The drug
sponsors have to be assured of a reasonable likelihood that the investment of money and resources will be a profitable decision.

One final concern for the drug sponsors would be the possibility of CVM asking to review part or all of the data on the original submission. If scientific methodology had advanced regarding residues detection limits, pharmacokinetic studies or drug metabolism and elimination or if some concerns about the original efficacy studies surfaces, the sponsor may actually be at risk of losing the original label claim. There may be some understandable hesitation on the part of the sponsors to place a major indication at risk when the supplemental indication would not increase product sales to any great degree.

Compounded Drugs

As mentioned earlier, compounded reproductive hormones are available through distributor catalogs, from the Internet pharmacies and from numerous compounding pharmacies. The compounding of drugs brings serious new considerations to the use of reproductive hormones. The language found in the regulations defining AMDUCA regulates the compounding of drugs for food producing animals. Compounding is typically only to be done from already approved and not from unapproved and/or bulk drugs. Compounding from bulk drugs is only to be done in extremely limited circumstances, and then primarily for the production of certain antidotes. Any product that is compounded from raw bulk drugs or from a product that is not an FDA approved product is considered to be an adulterated product. The use of adulterated products, particularly in food animals, is considered to be illegal.

The CVM currently is revising their compliance policy guideline\(^5\) relating to compounding. The current guidelines consider the compounding of large quantities, the compounding of “look-a-like” products, the absence of a VCPR, the use of fanciful names and the compounding from bulk drugs for use in food animals to be high regulatory priorities. There are other areas of high regulatory priority but these are the most pertinent to many veterinary practices.

Quality assurance is an issue that impacts target animal safety and efficacy. Products, which have not been produced in an FDA inspected facility, may pose a threat to the health of the treated animals. Good manufacturing practices, as insured by FDA inspections and adequate quality control, are more likely to result in a product with is safe, potent and efficacious. Compounded products that are produced in large quantities and not upon the receipt of a prescription from a veterinarian are considered to be manufactured and therefore adulterated. As such, any adverse events which include failure of therapy pose significant liability concerns for participating practitioners.

Summary

The use of drugs in the treatment of conditions of the reproductive tract or in the development and implementation of reproductive management programs on an operation is an area of significant regulatory concern. AMDUCA does not legalize ELDU of reproductive hormones and legislative changes at this point in time do not seem likely or indicated. The MUMS initiative does not really address many of the needs, particularly in reproductive
management programs, which might have relatively broad application. The regulations promulgating the ADAA in the area of substantial evidence may enhance a sponsor’s ability to obtain an additional label claim, but such supplemental claims are not without cost or risk. Compounded products may provide a source of drugs which research has identified as being effective in reproductive management protocols, but quality control, residues, safety and efficacy are issues that the practitioner has to take into consideration before use. The regulatory environment for reproductive hormones, particularly in light of the larger issues such as antimicrobial susceptibility, may be in a holding pattern in terms of policy and future approvals.

EXTRALABEL DRUG USE ALGORITHM

YOU MADE A CAREFUL DIAGNOSIS IN THE PRESENCE OF A VALID VETERINARIAN/CLIENT/PATIENT RELATIONSHIP. YOU ARE CONTEMPLATING EXTRALABEL DRUG USE. YOU MUST ASK YOURSELF...

ARE THE ANIMALS TO BE TREATED FOOD ANIMALS?

YES

DOES A DRUG LABELED FOR FOOD ANIMALS EXIST WHICH FULFILLS ALL OF THE FOLLOWING:
- CONTAINS THE NEEDED INGREDIENT,
- IN THE PROPER DOSAGE FORM,
- LABELED FOR THE INDICATION,
- AND IS CLINICALLY EFFECTIVE?

NO

THERE ARE FEW RESTRICTIONS ON EXTRALABEL USE IN NON-FOOD ANIMALS. DOES AN ANIMAL DRUG EXIST WHICH FULFILLS ALL OF THE FOLLOWING:
- CONTAINS THE NEEDED INGREDIENT,
- IN THE PROPER DOSAGE FORM,
- LABELED FOR THE INDICATION,
- AND IS CLINICALLY EFFECTIVE?

YES

YOU MUST USE THIS DRUG PER LABEL, AS EXTRALABEL DRUG USE IS UNNECESSARY. OBSERVE LABEL DIRECTIONS AND WITHDRAWAL TIME.

NO

PROCEED WITH EXTRALABEL USE OF FOOD ANIMAL DRUG.

YES

IS THERE A DRUG APPROVED FOR FOOD ANIMALS WHICH COULD BE USED EXTRALABELLY?

NO

IS THERE A HUMAN DRUG OR DRUG APPROVED FOR NON-FOOD ANIMALS WHICH COULD BE USED EXTRALABELLY?

YES

USE THIS DRUG PER LABEL, AS EXTRALABEL DRUG USE IS UNNECESSARY.

HUMAN DRUG

IN NON-FOOD ANIMALS YOU MAY USE A HUMAN DRUG EXTRALABELLY, EVEN WHEN AN ANIMAL DRUG EXISTS. ECONOMIC REASONS ARE VALID. MAINTAIN REQUIRED RECORDS.* LABEL DRUG APPROPRIATELY.**

NO

PROCEED WITH EXTRALABEL USE OF AN ANIMAL DRUG, IF AVAILABLE. MAINTAIN REQUIRED RECORDS.* LABEL DRUG APPROPRIATELY.**

YES

IS THERE ADEQUATE SCIENTIFIC INFORMATION AVAILABLE TO DETERMINE A WITHDRAWAL TIME?

NO

IF COMPOUNDING OF APPROVED DRUGS WILL PREVENT ANIMAL PAIN AND SUFFERING, REFER TO CPG 608.400 FOR COMPOUNDING GUIDANCE.***

YES

PROCEED WITH EXTRALABEL USE OF HUMAN OR NON-FOOD ANIMAL DRUG. ESTABLISH EXTENDED WITHDRAWAL TIME. ENSURE FOOD SAFETY. MAINTAIN REQUIRED RECORDS.* LABEL DRUG APPROPRIATELY.**

NO

DRUG MUST NOT BE USED, OR TREATED ANIMAL MUST NOT ENTER FOOD SUPPLY.

†Drugs Prohibited for Extralabel Use in Food Animals
(Current as of January 1998)

Chloramphenicol
Clenbuterol
Diethylstilbestrol (DES)
Dimetridazole
Iproniazide
Other Nitroimidazoles
Fluralanilone (except for approved topical use)
Nitrofurazone (except for approved topical use)
Sulfonamide drugs in lactating dairy cows (except approved use of sulfadimethoxine, sulfabromomethazine, and sulfaethoxypyridazine)
Fluoroquinolones
Glycopeptides (example: vancomycin)

* and ** - See reverse side for record and label requirements.
*** - Compounding of bulk drugs is generally illegal.
