David Holland Receives Certificate of Recognition
Chip Richardson Receives Certificate of Recognition
David Doyle Receives Honorary VAS Membership
RTK-Net® Management Portal

Knowledge is power. RTK-Net delivers more than just an accurate position. The most advanced GPS infrastructure available now empowers owners and managers with advanced reporting tools to better manage and maximize their GPS investments. Utilization Charts are available to track GPS rover usage. Real-Time Connection Logs provide detailed event logging of each rover connection to RTK-Net. Interactive Google™ Maps automatically plot your rover locations! Your secure login profile keeps your records private yet readily available for management review and analysis.

Never before has this level of visibility been available from any GPS network... anywhere. And, this is just the beginning.

How well does your GPS network deliver?
Contact us for a complete demonstration.

2 April 2008 | The Old Dominion Surveyor
The Point of Beginning . . . Back to Basics

This is a complicated world we surveyors live in. There is so much technology out there it’s hard to keep up. There are new data collectors, Bluetooth-capable devices, virtual GPS networks, laser scanners which look more and more like total stations, total stations which look more and more like laser scanners, and ever present email (even in the woods). We are bombarded with requests from clients for different products on quicker deadlines. Planners and legislators are constantly regulating us into different corners where we must defend our profession. We are so darn productive that we multitask in our sleep.

I’m not sure if all this makes us better surveyors. How many times have we gone out to a property corner only to find multiple new rebars set in the vicinity of an old stone? Have you ever sent your crew out to set a corner and they report back that they hit an old pipe while setting a new corner? Are our field crews more comfortable with coordinates or evidence? Our new party chiefs can run a data collector with very fast fingers, but do they even have a clue that the results they are getting may or may not be correct? I’ve lost track of the number of times that I have been assured that GPS RTK radial stakeout will produce sub centimeter “accurate” corners.

Aren’t we supposed to be “following in the footsteps” of the original surveyor? It has long been my contention that we need to instill in our new field crews (and perhaps our newer professionals) a healthy respect for error propagation, mathematics, instrument calibration, and evidence. Education is the answer. This is why programs such as apprenticeship and the certified survey technician (CST) are real winners. The Northern Virginia apprenticeship program has produced many fine surveyors, as has VDOT’s in house educational program. I’m particularly excited about the Certified Survey Technician program from NSPS where our field crews can learn the vital elements of surveying and advance themselves at the same time. We now have a CST committee at the State Board of Directors level and are encouraging Chapters to learn about the program and implement a class during the coming year.

Finally, how about mentoring? There probably is no better way to pass along our expertise to younger surveyors. I urge us all to take a little time out of our busy days to try and establish a mentoring relationship with a young up and coming surveyor. Remember, she may be the future of our profession!

— Doug Richmond, VAS President

Editor’s Note

This is the first edition of The Old Dominion Surveyor for 2008; and, I hope everyone enjoys this edition of your magazine. Included in this issue are highlights of our annual meeting held in January in Hampton, Virginia. As editor of The Old Dominion Surveyor, I am reminding each of you that this is your magazine; and, as members of VAS, you have a lot to say into its content. As editor, I want to be responsive to the needs of the membership and endeavor to provide articles of interest and information for everyone. Towards this end, I am encouraging all members to submit articles of interest to the surveying profession. These can be articles on new equipment and technology, the historical aspects of the profession, current issues affecting the profession, and, yes, even humorous articles, as we must all keep our sense of humor. If you run across an interesting article, and if you believe that the membership might find it interesting, by all means please send it to either myself or Judy Hite in the Central Office. We will make every attempt to secure permission to reprint any article and include it in your magazine. At the same time, I would also encourage all members to provide me with their ideas on how the magazine can be improved and be more responsive to the needs of the membership.

I look forward to hearing from you, the members of the VAS.

— Charles F. Dunlap, Editor, The Old Dominion Surveyor and VAS 2nd Vice-President

The Old Dominion Surveyor is the official publication of the Virginia Association of Surveyors and is published four times annually for the membership and the betterment of the surveying profession.

President: Douglas A. Richmond
Printing: Canaan Printing, Richmond, VA
Editor: Charles F. Dunlap
Publisher: Judy Hite
Design: Cersley Design, Kents Store, VA

Deadlines for articles to The Old Dominion Surveyor:
April Newsletter: March 1
July Newsletter: June 1
November Newsletter: October 1
December Newsletter: November 1

Please submit all articles in news release form either by e-mail attachments, diskette, or CD/RW (Microsoft Word-compatible). Image files should be formatted as JPEG, TIFF, or PDF files. Please mail or e-mail to:

The Old Dominion Surveyor
Many times have you heard the phrase, “My battery pack is holding a memory”? Being in the battery business, this is something we hear all the time. This term is used to explain the tendency of a rechargeable battery to remember the point up to which it was discharged over several cycles, before full discharge was attained. Subsequently, the battery behaves as if this point is the point of full discharge. This is a generally misunderstood phenomenon and a term often misused to explain various battery problems. There are many scientific and theoretical explanations for why rechargeable batteries behave poorly at times. But in a practical sense, these problems can be analyzed and addressed without having to have a degree in chemical engineering.

So, if your battery has “Alzheimer’s”, based on the explanation above, it’s a good thing.

“Memory Effect” is essentially caused when a rechargeable battery is recharged to full capacity, and then used in the field to a point where the battery never reaches full discharge before being placed on recharge again. For argument’s sake, let’s imagine a battery being a container of sugar, where you fill it up and then use what you need before refilling it again. If you constantly use only the top portion of the container and refill it with new sugar, the remaining portion you have not touched in a while begins to get stale. The same is true for a battery. The remaining charge, that you never allow the instrument to access, over time starts to stagnate.

Initially, the charge in a battery is at a uniform voltage throughout the cells. The voltage begins to drop immediately after removal from the charger. If all the charge in the battery is not consumed before recharging, the portion that is left unused continues to drop in voltage and becomes “stale”. Eventually, the voltage in this “stale” portion drops so low that when your instrument is finished gorging up all the “fresh” charge, it hits this “stale” portion like a brick wall. The instrument is confronted with a sudden drop in voltage, at a level below the “low battery” indicator threshold. The battery cannot power the instrument now without being recharged again.

The only way to recover the performance of the battery is to somehow remove that “stale” charge in the battery and restore a fresh new charge. Unfortunately, some total station manufacturers have designed their instruments and chargers in a way that makes it almost impossible to correct this problem. Chargers with a “discharge” function built in may not work to correct the problem at this point either. The low voltage point of stale charge will also cause the discharge operation to cease prematurely, leaving the stale charge still in the battery. In a case like this, a battery service shop with the proper equipment, can analyze the battery, remove the stale charge and solve the problem.

Trying to live with the problem will only make it worse and can actually ruin the chances of correcting the problem at all. Just like the container of sugar example, eventually this stale part will become so solid and entrenched in the battery that it will permanently ruin that part of the battery and diminish its ability to accept a usable charge again. What also appears to happen is the portion of the battery that is able to receive fresh charge, now goes through many rapid cycles and in effect “wears out” that portion of the battery prematurely. You are now left with a container of hard packed stale sugar at the bottom, with the top part of the container so worn out that it can barely contain the new sugar that you keep replenishing it with.

Here are several things that can be done to avoid this problem. Some I am sure you have heard before, but they are still worth repeating.

1. Always fully discharge the battery each time you use it in the field. Number all your batteries and learn the run-time of each one through regular use. If you still carry enough battery power with you for the next day’s work, wait and use that all up before recharging again. Always avoid recharging any batteries that have not been fully run down.

2. At the first sign of a sudden decrease in performance, set that battery aside until returning to the office. At the office, put this problem battery back into the instrument and set the instrument on a heavy battery demand operation (like “tracking mode” measuring against a prism). Now run the instrument to the point where it shuts off on its own from lack of battery power. Wait five minutes and repeat the procedure. Repeat this until you feel the instrument has drained as much as possible from the battery. Now put the battery on charge (preferably a slow charge, if your charger has that setting).

3. If storing the instrument away for a week or two, do not recharge the battery until the night before it is needed in the field again.

4. If storing the instrument for a month or two, or even longer, charge up the battery before storage and then once a month until the storage period is over. Every second month, fully discharge the battery before recharging.

5. Always let the battery reach room temperature before recharging. Excessively cold batteries will resist being charged and actually fool auto shut-off chargers into thinking the battery is fully recharged when in reality it is not. When the battery is not allowed to fully recharge over many cycles, you may end up with the same problem as the “memory effect”.

Within the last few years, many instrument manufacturers have switched to Nickel-Metal Hydride (NiMH) cells in their battery packs instead of the old industry workhorse, NiCd. The main advantage of NiMH cells is their ability to hold much more charge in the same size cell as the equivalent NiCd and they are more environmentally friendly as well. NiMH cells have also been touted as not having the memory effect problem of the NiCd cells. However, our experience has shown that this is not always the case. Although they may resist the effect from taking hold as easily as NiCds, the same maintenance procedure should be followed…
TPS 1200+

- Built for speed, accuracy, ease-of-use and reliability
- Performs complex tasks more efficiently than ever with superb measurement technology
- Together with GPS1200 integrates the unique X-functions of uniform operating concept; identical data management; standardized accessories; powerful application programs
- Software LEICA Geo Office
- High-precision measurement technology
- Time-saving measurement aids:
  — Angle and distance measurement (IR)
  — PinPoint – reflectorless EDM (RL)
  — Automatic Target Recognition (ATR)
  — Automatic Target Tracking (LOCK)
  — PowerSearch (PS)
  — Remote Control Unit (RX1220)

CLOSE OUT ON REMAINING TPS 1200 SERIES UNITS IN STOCK
HUGE SAVINGS

TPS 400 Package

- Easy and direct operations using the function keys
- Large, high resolution screen guarantees a clear display
- Intuitive program structure
- Integrated application programs
- Compatible with external data storage
- Definable start-up screen
- Dual axis compensator
- Reflectorless measurements
- Anti-theft protection

AVAILABLE IN 3”, 5” AND 7” ACCURACIES

STARTING AS LOW AS $129/mo.

The Plat Contest was held in conjunction with the 60th Virginia Association of Surveyors Annual Meeting held in Hampton, Virginia January 16–19, 2008. This year 17 firms entered plats in the five announced categories. I want to acknowledge Chip Richardson, Dave Holland John Sehl, John Krobath, Kenney Moore, Judy Hite, and Joyce Brooks for their assistance in organizing and hanging the entries.

Our judges this year were: Bill Coleman, NSPS Area 3 Director; Jim Whitehead, Maryland; Randall Myers, West Virginia/Pennsylvania; and Michael Bazis, District of Columbia.
Our deepest gratitude is hereby expressed to those surveyors and friends who donated to the Education Supplement Fund in 2007. Our contributions totaled $12,590.31 and were distributed as follows:

<table>
<thead>
<tr>
<th>Institution</th>
<th>Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>East Tennessee State University</td>
<td>$5,707.66</td>
</tr>
<tr>
<td>Old Dominion University</td>
<td>$2,450.00</td>
</tr>
<tr>
<td>Northern Virginia Apprenticeship</td>
<td>$4,132.65</td>
</tr>
<tr>
<td>Tidewater Community College</td>
<td>$100.00</td>
</tr>
</tbody>
</table>

The difference in disbursements was due to how some of the contributions were designated and that ODU and TCC did not submit requests for funds. Realizing the state of our economy, we still encourage all surveyors to contribute to this worthwhile cause, as you are able. I would also like to apologize to John Pataky for omitting his name from the 2006 list of donors.

The following is a listing of those who donated in 2007 as of 10/25/07:

- Doyle Allen
- James H. Bell
- Jim Berckman
- Thomas C. Brooks, Sr.
- Gerard P. Brunick, Jr.

Monitor structural movement in any kind of city.  
Well, almost any kind.

Introducing our most powerful surveying and monitoring system yet. The Trimble® S8™ Total Station. A top-of-the-line performer, it offers the ultimate in flexibility and surveying precision. The Trimble S8 also packs a punch with structural monitoring capabilities ideal for handling a wide range of applications, from tunneling to transportation, with unsurpassed ease and accuracy.

Featuring innovative new FineLock™ technology, the Trimble S8 can detect any structural movement—crucial, when working in high-consequence situations. Add to this, state-of-the-art software for lightning fast data analysis, and you have a total package certain to expand your options and your business, instantly.

Learn more about the all-powerful Trimble S8 for yourself.

always fully discharge the battery before recharging again. NiMH cells also have one big drawback compared to their NiCd counterparts—their internal resistance is higher. The internal resistance of a cell will govern how readily it will accept a charge when applied, and how easily it will release that charge while maintaining its voltage when required to do so. Internal resistance also explains why NiMH battery packs sometimes get much warmer during recharge than NiCds. Since internal resistance is a problem that gets worse with the age of the cell for both NiCd and NiMH, designing the instrument and charger to meet these demands is a difficult balancing act, with some manufacturers having done a better job at it than others. A NiMH charger that is designed to charge the battery in a 10 to 14 hour period will always do a better job of topping up the battery than a charger that is designed to do it in 2 to 3 hours. The internal resistance of the battery will always force the charger to apply a higher voltage during recharging to overcome the resistance. This resistance is more pronounced during a fast charge procedure than during a slow charge. Eventually the charger is forced to such a high voltage that it assumes the battery is recharged and shuts off, never recharging the battery to its full potential. As the NiMH battery gets older, the problem gets worse. It is always best, if your field working procedure allows for it, to choose a slow overnight charger cycle. Many OEM chargers for NiMH cells offer both fast and slow charge cycles. Also, chargers that monitor the internal temperature of the battery during a fast charge seem to do the best job of recharging the NiMH batteries quickly.

Another point worth mentioning is the idea of replacing old NiCd cells in a pack with NiMH cells during a re-cell procedure. This is only recommended if you have just that one battery to run your instrument. You must also be prepared to accept that NiMH cells do not maintain original performance through as many cycles as NiCd cells. But since the NiMH cells start out with the ability to hold much more charge than their NiCd counterparts, the advantages of the NiMH cells are still something worth considering. Unfortunately, your old NiCd charger may never properly recharge the NiMH cells to their full potential because it was not designed for the different requirements of the NiMHs. Even at less than 100% performance, however, the greater capacity of the NiMH cells will generally be realized if that battery is properly maintained from the beginning. In reality though, many users will just add this NiMH battery into a mix of other NiCd batteries being carried into the field for the instrument. Our experience has found that in short order, the NiMH battery will

---

get “lazy” and settle into a performance that is no better than if it had been re-celled using NiCd cells. The advantages of converting to NiMH cells over the original NiCd cells would be lost, not to mention, this “misfit” battery pack now has a diminished life cycle.

The final bit of advice I can give is similar to the advice that we often get from our own doctor: Batteries stay healthier through regular exercise on a daily basis!

* Arthur Dias is a founding partner of Dias & Dias Electronics and www.surveybattery.com. His company has been repairing battery packs for surveying equipment worldwide for over 11 years now.
